AMCFGR_EL0, Activity Monitors Configuration Register

The AMCFGR_EL0 characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR_EL0 is applicable to both the architected and the auxiliary counter groups.

Configuration

AArch64 System register AMCFGR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMCFGR\[31:0\]](#).

AArch64 System register AMCFGR_EL0 bits [31:0] are architecturally mapped to External register [AMCFGR\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR_EL0 are UNDEFINED.

Attributes

AMCFGR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																																			
NCG				RES0				HDBG				RAZ												SIZE				N							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Bits [63:32]

Reserved, RES0.

NCG, bits [31:28]

Defines the number of counter groups.

The number of implemented counter groups is ~~defined as~~ $[AMCFGR_EL0.NCG + 1]$.

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

~~This~~From Armv8, this feature must be supported, and so this bit is 0b1.

HDBG	Meaning
0b0	AMCR_EL0 .HDBG is RES0.
0b1	AMCR_EL0 .HDBG is read/write.

Access to this field is **RO**.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

~~From Armv8, the counters are 64-bit, and so this field is 0b111111.~~

The size of the activity monitor event counters implemented by the activity monitors Extension is ~~defined as~~ [AMCFGR_EL0.SIZE + 1].

Note

Software also uses this field to determine the spacing of counters in the memory-map. From Armv8, the counters are at doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is **RO**.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is ~~defined as~~ [AMCFGR_EL0.N + 1].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMCFGR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, AMCFGR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0010	0b001

```

AMCGCR_EL0, Activity Monitors Counter Group Configuration Register

The AMCGCR_EL0 characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configuration

AArch64 System register AMCGCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMCGCR\[31:0\]](#).

AArch64 System register AMCGCR_EL0 bits [31:0] are architecturally mapped to External register [AMCGCR\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR_EL0 are UNDEFINED.

Attributes

AMCGCR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is 0x0 to 0x10.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

Reads as 0x04.

In an implementation that includes FEAT_AMUv1, the value of this field is 0x4.

Access to this field is **RO**.

Accessing AMCGCR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, AMCGCR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0010	0b010

This field [15:N] is reserved for additional architected activity monitor event counters RAZ/WI, which where Armv8 might define in a future version of the Activity Monitors architecture. in AMCGCR_EL0.CG0NC.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for AMEVCNTR0<n>_EL0.

Note

AMCGCR_EL0.CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR0<n>_EL0 is disabled. When written, has no effect.
0b1	When read, means that AMEVCNTR0<n>_EL0 is enabled. When written, disables AMEVCNTR0<n>_EL0.

The reset behaviour of this field is:

- On an AMU reset, this field resets to 0.

AMCNTENCLR1_EL0, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1_EL0 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>_EL0](#).

Configuration

AArch64 System register AMCNTENCLR1_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENCLR1\[31:0\]](#).

AArch64 System register AMCNTENCLR1_EL0 bits [31:0] are architecturally mapped to External register [AMCNTENCLR1\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1_EL0 are UNDEFINED.

Attributes

AMCNTENCLR1_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

AMEVCNTR0<n>_EL0, Activity Monitors Event Counter Registers 0, n = 0 - 315

The AMEVCNTR0<n>_EL0 characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configuration

- AArch64 System register AMEVCNTR0<n>_EL0 bits [63:0] are architecturally mapped to AArch32 System register [AMEVCNTR0<n>\[63:0\]](#).
- AArch64 System register AMEVCNTR0<n>_EL0 bits [63:0] are architecturally mapped to External register [AMEVCNTR0<n>\[63:0\]](#).
- This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n>_EL0 are UNDEFINED.

Attributes

AMEVCNTR0<n>_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																ACNT															
																ACNT															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ACNT, bits [63:0]

- Architected activity monitor event counter n.
- Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to **315**.
- If FEAT_AMUv1p1 is implemented, [HCR_EL2](#).AMVOFFEN is 1, [SCR_EL3](#).AMVOFFEN is 1, [HCR_EL2](#).{E2H, TGE} is not {1,1}, and EL2 is implemented in the current Security state, access to these registers at EL0 or EL1 return (PCount<63:0> - [AMEVCNTVOFF0<n>_EL2](#)<63:0>).
- PCount is the physical count returned when AMEVCNTR0<n>_EL0 is read from EL2 or EL3.
- If the counter is enabled, writes to this register have UNPREDICTABLE results.
- The reset behaviour of this field is:
 - On an AMU reset, this field resets to 0.

Accessing AMEVCNTR0<n>_EL0

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n>_EL0 are UNDEFINED.

Note

[AMCGCR_EL0](#).CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, AMEVCNTR0<n>_EL0

op0	op1	CRn	CRm	op2

AMEVTYPER0<n>_EL0, Activity Monitors Event Type Registers 0, n = 0 - 315

The AMEVTYPER0<n>_EL0 characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter [AMEVCNTR0<n>_EL0](#) counts.

Configuration

AArch64 System register AMEVTYPER0<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [AMEVTYPER0<n>\[31:0\]](#).

AArch64 System register AMEVTYPER0<n>_EL0 bits [31:0] are architecturally mapped to External register [AMEVTYPER0<n>\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n>_EL0 are UNDEFINED.

Attributes

AMEVTYPER0<n>_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																evtCount															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter [AMEVCNTR0<n>_EL0](#). The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

evtCount	Meaning	Applies when
0x0011	Processor frequency cycles	When n == 0
0x4004	Constant frequency cycles	When n == 1
0x0008	Instructions retired	When n == 2
0x4005	Memory stall cycles	When n == 3

Accessing AMEVTYPER0<n>_EL0

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPER0<n>_EL0 are UNDEFINED.

Note

[AMCGCR_EL0](#).CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

AT S1E1RP, Address Translate Stage 1 EL1 Read PAN

The AT S1E1RP characteristics are:

Purpose

Performs a stage 1 address translation, where the value of PSTATE.PAN determines if a read from a location will generate a ~~Permission~~permission fault for a privileged access, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of [SCR_EL3.NS](#):
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the EL1&0 translation regime, accessed from EL1.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the EL2&0 translation regime, accessed from EL2.
- Otherwise, the EL1&0 translation regime, accessed from EL1.

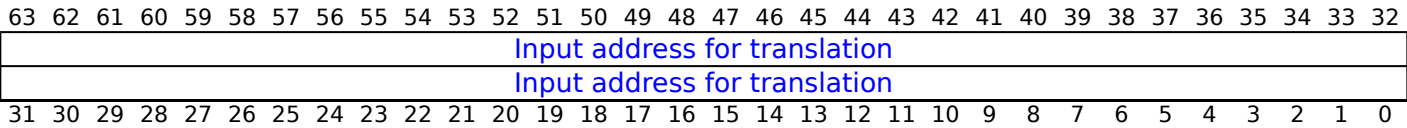

Configuration

This instruction is present only when FEAT_PAN2 is implemented. Otherwise, direct accesses to AT S1E1RP are UNDEFINED.

Attributes

AT S1E1RP is a 64-bit System instruction.

Field descriptions

Bits [63:0]

Input address for translation. The resulting address can be read from the [PAR_EL1](#).

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

Executing the AT S1E1RP instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

AT S1E1RP, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1001	0b000

BRBCR_EL2, Branch Record Buffer Control Register (EL2)

The BRBCR_EL2 characteristics are:

Purpose

Controls the Branch Record Buffer.

Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBCR_EL2 are UNDEFINED.

Attributes

BRBCR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32																
RES0																																															
RES0				EXCEPTION				ERTN				RES0				FZP				RES0				TS				MPRED				CC				RES0				E2BRE				E0HBRE			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																

Bits [63:24]

Reserved, RES0.

EXCEPTION, bit [23]

Enable the recording of entry to EL2 via an exception.

EXCEPTION	Meaning
0b0	Disable the recording of Branch records for exceptions when taken to EL2.
0b1	Enable the recording of Branch records for exceptions when taken to EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ERTN, bit [22]

Allow the recording Branch records for exception return instructions from EL2.

ERTN	Meaning
0b0	Disable the recording Branch records for exception return instructions from EL2.
0b1	Enable the recording Branch records for exception return instructions from EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [21:9]

Reserved, RES0.

FZP, bit [8]

When FEAT_PMUv3 is implemented:

Freeze BRBE on PMU overflow.

FZP	Meaning
0b0	Branch recording is not affected by this control.
0b1	A BRBE freeze event occurs when a PMU overflow occurs.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control.

TS	Meaning	Applies when
0b00	Timestamp controlled by BRBCR_EL1.TS .	
0b01	Virtual timestamp. The BRBE recorded timestamp is the physical counter value, minus the value of CNTVOFF_EL2 .	
0b10	Guest physical timestamp. The BRBE recorded timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2 : <ul style="list-style-type: none"> EL3 is implemented and SCR_EL3.ECVEn == 0. EL2 is implemented and CNTHCTL_EL2.ECV == 0. 	When FEAT_ECV is implemented
0b11	Physical timestamp. The BRBE recorded timestamp is the physical counter value.	

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPRED, bit [4]

Mask the recording of mispredicts.

MPRED	Meaning
0b0	Disable the recording of mispredict information.
0b1	Allow the recording of mispredict information.

If EL2 is not implemented, then the Effective value of this field is 1, other than for a direct read of the register.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CC, bit [3]

Enable the recording of cycle count information.

CC	Meaning
0b0	Disable the recording of cycle count information.
0b1	Allow the recording of cycle count information.

If EL2 is not implemented, then the Effective value of this field is 1, other than for a direct read of the register.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E2BRE, bit [1]

EL2 Branch recording enable.

E2BRE	Meaning
0b0	Branch recording prohibited at EL2.
0b1	Branch recording enabled at EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

EOHBRE, bit [0]

EL0 Branch recording enable.

EOHBRE	Meaning
0b0	Branch recording prohibited at EL0 when HCR_EL2.TGE == 1.
0b1	Branch recording enabled at EL0 when HCR_EL2.TGE == 1.

This field is ignored by the PE when any of the following are true:

- [HCR_EL2.TGE](#) == 0.
- EL2 is disabled in the current Security state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing BRBCR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, accesses from EL2 using the register name BRBCR_EL2 or BRBCR_EL1 are not guaranteed to be ordered with respect to accesses using the other register name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, BRBCR_EL1

op0	op1	CRn	CRm	op2
-----	-----	-----	-----	-----

0b10	0b001	0b1001	0b0000	0b000
------	-------	--------	--------	-------

```

BRBINFINJ_EL1, Branch Record Buffer Information Injection Register

The BRBINFINJ_EL1 characteristics are:

Purpose

The information of a Branch record for injection.

Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBINFINJ_EL1 are UNDEFINED.

Attributes

BRBINFINJ_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																	CCU		CC												
RES0														LASTFAILED		T	RES0		TYPE					EL	MPRED	RES0		VALID			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:47]

Reserved, RES0.

CCU, bit [46]

The number of PE clock cycles since the last Branch record entry is UNKNOWN.

CCU	Meaning
0b0	Indicates that the number of PE clock cycles since the last Branch record is indicated by BRBINFINJ_EL1.CC.
0b1	Indicates that the number of PE clock cycles since the last Branch record is UNKNOWN.

The value in this field is only valid when BRBINFINJ_EL1.VALID != 0b00.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINFINJ_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

CC, bits [45:32]

The number of PE clock cycles since the last Branch record entry.

The format of this field uses a mantissa and exponent to express the cycle count value, as follows:

- CC bits[7:0] indicate the mantissa M.
- CC bits[13:8] indicate the exponent E.

The cycle count is expressed using the following function:

if IsZero(E) then UInt(M) else UInt('1':M:Zeros(UInt(E)-1))

If required, the cycle count is rounded to a multiple of $2^{(E-1)}$ towards zero before being encoded.

A value of all ones in both the mantissa and exponent indicates the cycle count value exceeded the size of the cycle counter.

The value in this field is only valid when BRBINFINJ_EL1.VALID != 0b00.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **RES0** if any of the following are true:
 - `BRBINFINJ_EL1.CCUArch64` BRBINFINJ_EL1.CCU == 1
 - `BRBINFINJ_EL1.VALIDArch64` BRBINFINJ_EL1.VALID == 0b00
- Otherwise, access to this field is **RW**.

Bits [31:18]

Reserved, RES0.

LASTFAILED, bit [17]

When FEAT_TME is implemented:

Indicates transaction failure or cancellation.

LASTFAILED	Meaning
0b0	Indicates that no transactions in a non-prohibited region have failed or been canceled between the previous Branch record and this Branch record.
0b1	Indicates that at least one transaction in a non-prohibited region has failed or been canceled between the previous Branch record and this Branch record.

The value in this field is only valid when BRBINFINJ_EL1.VALID != 0b00.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINFINJ_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

T, bit [16]

When FEAT_TME is implemented:

Transactional state.

T	Meaning
0b0	The branch or exception was not executed in Transactional state.
0b1	The branch or exception was executed in Transactional state.

The value in this field is only valid when BRBINFINJ_EL1.VALID == 0b10 or BRBINFINJ_EL1.VALID == 0b11.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- RES0** if any of the following are true:
 - BRBINFINJ_EL1.VALID == 0b00
 - BRBINFINJ_EL1.VALID == 0b01
- Otherwise, access to this field is **RW**.

Otherwise:

Reserved, RES0.

Bits [15:14]

Reserved, RES0.

TYPE, bits [13:8]

Branch type.

TYPE	Meaning
0b000000	Unconditional direct branch, excluding Branch with link.
0b000001	Indirect branch, excluding Branch with link, Return from subroutine, and Exception return.
0b000010	Direct Branch with link.
0b000011	Indirect Branch with link.
0b000101	Return from subroutine.
0b000111	Exception return.
0b001000	Conditional direct branch.
0b100001	Debug halt.
0b100010	Call.
0b100011	Trap.
0b100100	Error.
0b100110	Instruction debug.
0b100111	Data debug.
0b101010	Alignment.
0b101011	Inst Fault.
0b101100	Data Fault.
0b101110	IRQ.
0b101111	FIQ.
0b111001	Debug State Exit.

All other values are reserved.

The value in this field is only valid when BRBINFINJ_EL1.VALID != 0b00.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINFINJ_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

EL, bits [7:6]

The Exception Level at the target address.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.

All other values are reserved.

The value in this field is only valid when BRBINFINJ_EL1.VALID == 0b11 or BRBINFINJ_EL1.VALID == 0b01.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- RES0** if any of the following are true:
 - BRBINFINJ_EL1.VALIDAArch64-BRBINFINJ_EL1.VALID == 0b00'00'
 - BRBINFINJ_EL1.VALIDAArch64-BRBINFINJ_EL1.VALID == 0b10'10'
- Otherwise, access to this field is **RW**.

MPRED, bit [5]

Branch mispredict.

MPRED	Meaning
0b0	Branch was correctly predicted or the result of the prediction was not captured.
0b1	Branch was incorrectly predicted.

The value in this field is only valid when BRBINFINJ_EL1.VALID == 0b11 or BRBINFINJ_EL1.VALID == 0b10.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- RES0** if any of the following are true:
 - BRBINFINJ_EL1.VALIDAArch64-BRBINFINJ_EL1.VALID == 0b00'00'
 - BRBINFINJ_EL1.VALIDAArch64-BRBINFINJ_EL1.VALID == 0b01'01'
 - BRBINFINJ_EL1.TYPEAArch64-BRBINFINJ_EL1.TYPE[5] == '1'
- Otherwise, access to this field is **RW**.

Bits [4:2]

Reserved, RES0.

VALID, bits [1:0]

The Branch record is valid.

VALID	Meaning
0b00	This Branch record is not valid. The values of following fields are not valid: <ul style="list-style-type: none"> • BRBTGTINJ_EL1.ADDRESS. • BRBSRCINJ_EL1.ADDRESS. • BRBINFINJ_EL1.LASTFAILED. • BRBINFINJ_EL1.T. • BRBINFINJ_EL1.EL. • BRBINFINJ_EL1.TYPE. • BRBINFINJ_EL1.CC. • BRBINFINJ_EL1.CCU.
0b01	This Branch record is valid. The values of following fields are not valid: <ul style="list-style-type: none"> • BRBSRCINJ_EL1.ADDRESS. • BRBINFINJ_EL1.T. • BRBINFINJ_EL1.MPRED.
0b10	This Branch record is valid. The values of following fields are not valid: <ul style="list-style-type: none"> • BRBTGTINJ_EL1.ADDRESS. • BRBINFINJ_EL1.EL.
0b11	This Branch record is valid.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing BRBINFINJ_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, BRBINFINJ_EL1

op0	op1	CRn	CRm	op2
0b10	0b001	0b1001	0b0001	0b000

BRBINF<n>_EL1, Branch Record Buffer Information Register <n>, n = 0 - 31

The BRBINF<n>_EL1 characteristics are:

Purpose

The information for Branch record n + (BRBFCCR_EL1.BANK × 32).

Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBINF<n>_EL1 are UNDEFINED.

Attributes

BRBINF<n>_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																	CCU		CC												
RES0														LASTFAILED		T	RES0		TYPE					EL	MPRED	RES0		VALID			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:47]

Reserved, RES0.

CCU, bit [46]

The number of PE clock cycles since the last Branch record entry is UNKNOWN.

CCU	Meaning
0b0	Indicates that the number of PE clock cycles since the last Branch record is indicated by BRBINF<n>_EL1.CC.
0b1	Indicates that the number of PE clock cycles since the last Branch record is UNKNOWN.

The value in this field is only valid when BRBINF<n>_EL1.VALID != 0b00.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINF<n>_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RO**.

CC, bits [45:32]

The number of PE clock cycles since the last Branch record entry.

The format of this field uses a mantissa and exponent to express the cycle count value, as follows:

- CC bits[7:0] indicate the mantissa M.
- CC bits[13:8] indicate the exponent E.

The cycle count is expressed using the following function:

if IsZero(E) then UInt(M) else UInt('1':M:Zeros(UInt(E)-1))

If required, the cycle count is rounded to a multiple of $2^{(E-1)}$ towards zero before being encoded.

A value of all ones in both the mantissa and exponent indicates the cycle count value exceeded the size of the cycle counter.

The value in this field is only valid when BRBINF<n>_EL1.VALID != 0b00.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **RES0** if any of the following are true:
 - ~~BRBINF~~Arch64-~~BRBINF~~<n>_EL1.CCU == ~~1~~
 - ~~BRBINF~~Arch64-~~BRBINF~~<n>_EL1.VALID == ~~0b00'00'~~
- Otherwise, access to this field is **RO**.

Bits [31:18]

Reserved, RES0.

LASTFAILED, bit [17]

When FEAT_TME is implemented:

Indicates transaction failure or cancellation.

LASTFAILED	Meaning
0b0	Indicates that no transactions in a non-prohibited region have failed or been canceled between the previous Branch record and this Branch record.
0b1	Indicates that at least one transaction in a non-prohibited region has failed or been canceled between the previous Branch record and this Branch record.

The value in this field is only valid when BRBINF<n>_EL1.VALID != 0b00.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINF<n>_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

T, bit [16]

When FEAT_TME is implemented:

Transactional state.

T	Meaning
0b0	The branch or exception was not executed in Transactional state.
0b1	The branch or exception was executed in Transactional state.

The value in this field is only valid when BRBINF<n>_EL1.VALID == 0b10 or BRBINF<n>_EL1.VALID == 0b11.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- RES0** if any of the following are true:
 - BRBINF<n>_EL1.VALID == 0b00'00'
 - BRBINF<n>_EL1.VALID == 0b01'01'
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [15:14]

Reserved, RES0.

TYPE, bits [13:8]

Branch type.

TYPE	Meaning
0b000000	Unconditional direct branch, excluding Branch with link.
0b000001	Indirect branch, excluding Branch with link, Return from subroutine, and Exception return.
0b000010	Direct Branch with link.
0b000011	Indirect Branch with link.
0b000101	Return from subroutine.
0b000111	Exception return.
0b001000	Conditional direct branch.
0b100001	Debug halt.
0b100010	Call.
0b100011	Trap.
0b100100	Error.
0b100110	Instruction debug.
0b100111	Data debug.
0b101010	Alignment.
0b101011	Inst Fault.
0b101100	Data Fault.
0b101110	IRQ.
0b101111	FIQ.
0b111001	Debug State Exit.

All other values are reserved.

The value in this field is only valid when BRBINF<n>_EL1.VALID != 0b00.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When BRBINF<n>_EL1.VALID == 0b00, access to this field is **RES0**.
- Otherwise, access to this field is **RO**.

EL, bits [7:6]

The Exception Level at the target address.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.

All other values are reserved.

The value in this field is only valid when BRBINF<n>_EL1.VALID == 0b11 or BRBINF<n>_EL1.VALID == 0b01.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- RES0** if any of the following are true:
 - BRBINF<AArch64>-BRBINF<n>_EL1.VALID == 0b00'00'
 - BRBINF<AArch64>-BRBINF<n>_EL1.VALID == 0b10'10'
- Otherwise, access to this field is **RO**.

MPRED, bit [5]

Branch mispredict.

MPRED	Meaning
0b0	Branch was correctly predicted or the result of the prediction was not captured.
0b1	Branch was incorrectly predicted.

The value in this field is only valid when BRBINF<n>_EL1.VALID == 0b11 or BRBINF<n>_EL1.VALID == 0b10.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- RES0** if any of the following are true:
 - BRBINF<AArch64>-BRBINF<n>_EL1.VALID == 0b00'00'
 - BRBINF<AArch64>-BRBINF<n>_EL1.VALID == 0b01'01'
 - BRBINF<AArch64>-BRBINF<n>_EL1.TYPE[5] == 1
- Otherwise, access to this field is **RO**.

Bits [4:2]

Reserved, RES0.

VALID, bits [1:0]

The Branch record is valid.

VALID	Meaning
0b00	This Branch record is not valid. The values of following fields are not valid: <ul style="list-style-type: none"> • BRBTGT<n>_EL1.ADDRESS. • BRBSRC<n>_EL1.ADDRESS. • BRBINF<n>_EL1.LASTFAILED. • BRBINF<n>_EL1.T. • BRBINF<n>_EL1.EL. • BRBINF<n>_EL1.TYPE. • BRBINF<n>_EL1.CC. • BRBINF<n>_EL1.CCU.
0b01	This Branch record is valid. The values of following fields are not valid: <ul style="list-style-type: none"> • BRBSRC<n>_EL1.ADDRESS. • BRBINF<n>_EL1.T. • BRBINF<n>_EL1.MPRED.
0b10	This Branch record is valid. The values of following fields are not valid: <ul style="list-style-type: none"> • BRBTGT<n>_EL1.ADDRESS. • BRBINF<n>_EL1.EL.
0b11	This Branch record is valid.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing BRBINF<n>_EL1

BRBINF<n>_EL1 reads-as-zero if $n + (\text{BRBFCR_EL1.BANK} \times 32) \geq \text{BRBIDR0_EL1.NUMREC}$.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, BRBINF<n>_EL1

op0	op1	CRn	CRm	op2
0b10	0b001	0b1000	n[3:0]	n[4]:0b00

BRBSRCINJ_EL1, Branch Record Buffer Source Address Injection Register

The BRBSRCINJ_EL1 characteristics are:

Purpose

The source address of a Branch record for injection.

Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBSRCINJ_EL1 are UNDEFINED.

Attributes

BRBSRCINJ_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ADDRESS																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDRESS																															

ADDRESS, bits [63:0]

Source virtual address of the Branch record.

When a direct write occurs with a value with ADDRESS bits [63:P] being other than all zeroes or all ones, an UNKNOWN value which is not all zeroes or all ones is written to bits [63:P]. P is defined as the virtual address size supported by the PE, as returned by VAMax(). The value in bits [P-1:0] are the value written.

When a direct write occurs with a value with ADDRESS bits [63:P] being all zeroes or all ones, the written value is written to bits [63:0], and a read of the register returns the written value.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- RES0** if any of the following are true:
 - BRBINFINJ_EL1.VALID**Arch64-BRBINFINJ_EL1.VALID == 0b00'00'
 - BRBINFINJ_EL1.VALID**Arch64-BRBINFINJ_EL1.VALID == 0b01'01'
- Otherwise, access to this field is **RW**.

Accessing BRBSRCINJ_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, BRBSRCINJ_EL1

ADDRESS, bits [63:0]

Source virtual address of the Branch record.

When an indirect write occurs with a value with ADDRESS bits [63:P] being other than all zeroes or all ones, an UNKNOWN value which is not all zeroes or all ones is written to bits [63:P]. P is defined as the virtual address size supported by the PE, as returned by VAMax(). The value in bits [P-1:0] are the value written.

When an indirect write occurs with a value with ADDRESS bits [63:P] being all zeroes or all ones, the written value is written to bits [63:0], and a read of the register returns the written value.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- RES0** if any of the following are true:
 - [BRBINFAArch64-BRBINF](#)<n>_EL1.VALID == [0b00'00'](#)
 - [BRBINFAArch64-BRBINF](#)<n>_EL1.VALID == [0b01'01'](#)
- Otherwise, access to this field is **RO**.

Accessing BRBSRC<n>_EL1

BRBSRC<n>_EL1 is RES0 if n + ([BRBFCCR_EL1](#).BANK × 32) >= [BRBIDR0_EL1](#).NUMREC.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, BRBSRC<n>_EL1

op0	op1	CRn	CRm	op2
0b10	0b001	0b1000	n[3:0]	n[4]:0b01

```

BRBTGTINJ_EL1, Branch Record Buffer Target Address Injection Register

The BRBTGTINJ_EL1 characteristics are:

Purpose

The target address of a Branch record for injection.

Configuration

This register is present only when FEAT_BRBE is implemented. Otherwise, direct accesses to BRBTGTINJ_EL1 are UNDEFINED.

Attributes

BRBTGTINJ_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ADDRESS																															

ADDRESS, bits [63:0]

Target virtual address of the Branch record.

When a direct write occurs with a value with ADDRESS bits [63:P] being other than all zeroes or all ones, an UNKNOWN value which is not all zeroes or all ones is written to bits [63:P]. P is defined as the virtual address size supported by the PE, as returned by VAMax(). The value in bits [P-1:0] are the value written.

When a direct write occurs with a value with ADDRESS bits [63:P] being all zeroes or all ones, the written value is written to bits [63:0], and a read of the register returns the written value.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- RES0** if any of the following are true:
 - BRBINFINJ_EL1.VALID**Arch64-BRBINFINJ_EL1.VALID == 0b00'00'
 - BRBINFINJ_EL1.VALID**Arch64-BRBINFINJ_EL1.VALID == 0b10'10'
- Otherwise, access to this field is **RW**.

Accessing BRBTGTINJ_EL1

CFP RCTX, Control Flow Prediction Restriction by Context

The CFP RCTX characteristics are:

Purpose

Control Flow Prediction Restriction by Context applies to all Control Flow Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

Control flow predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when FEAT_SPECRES is implemented. Otherwise, direct accesses to CFP RCTX are UNDEFINED.

Attributes

CFP RCTX is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0															GVMID	VMID																
RES0				NSE	NS	EL	RES0								GASID	ASID																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:49]

Reserved, RES0.

GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==1](#) and [HCR_EL2.TGE==1](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

If the implementation supports 16 bits of VMID, then the upper 8 bits of the VMID must be written to 0 by software when the context being affected only uses 8 bits.

Bits [31:28]

Reserved, RES0.

NSE, bit [27]

When FEAT_RME is implemented:

Together with the NS field, selects the Security state.

For a description of the values derived by evaluating NS and NSE together, see CFP_RCTX.NS.

Otherwise:

Reserved, RES0.

NS, bit [26]

When FEAT_RME is implemented:

Together with the NSE field, selects the Security state. Defined values are:

NSE	NS	Meaning
0b0	0b0	Secure.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Some Effective values are determined by the current Security state:

When executed in Secure state, the Effective value of NSE is 0.

When executed in Non-secure state, the Effective value of {NSE, NS} is {0, 1}.

When executed in Realm state, the Effective value of {NSE, NS} is {1, 1}.

- When executed in Secure state, the Effective value of NSE is 0.
- When executed in Non-secure state, the Effective value of {NSE, NS} is {0, 1}.
- When executed in Realm state, the Effective value of {NSE, NS} is {1, 1}.

An instruction with an EL field that has a value other than 0b11 (EL3) is treated as a NOP when executed at EL3 with CFP_RCTX.{NSE, NS} == {1, 0}.

Otherwise:

Security State. Defined values are:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASID for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being affected only uses 8 bits.

Executing the CFP RCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

CFP RCTX, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b100

```

if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTL_EL1.EnRCTX == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGITR_EL2.CFPRCTX == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> == '11' && SCTL_EL2.EnRCTX == '0' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            CFP_RCTX(X[t]);
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.NV == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.CFPRCTX == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            CFP_RCTX(X[t]);
    elsif PSTATE.EL == EL2 then
        CFP_RCTX(X[t]);
    elsif PSTATE.EL == EL3 then
        CFP_RCTX(X[t]);

```

CNTHCTL_EL2, Counter-timer Hypervisor Control register

The CNTHCTL_EL2 characteristics are:

Purpose

Controls the generation of an event stream from the physical counter, and access from EL1 to the physical counter and the EL1 physical timer.

Configuration

AArch64 System register CNTHCTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register [CNTHCTL\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

CNTHCTL_EL2 is a 64-bit register.

Field descriptions

When FEAT_VHE is implemented and HCR_EL2.E2H == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42
RES0												RES0

RES0												CNTPMASK	CNTVMASK	EVNTIS	EL1NVVCT	EL1NVPCT	EL1TVCT	EL1TVT	ECV	EL1PTEN	EL1PCTE

Bits [63:20]

Reserved, RES0.

CNTPMASK, bit [19]

When FEAT_RME is implemented:

CNTPMASK	Meaning
0b0	This control has no affect on CNTP_CTL_EL0.IMASK .
0b1	CNTP_CTL_EL0.IMASK behaves as if set to 1 for all purposes other than a direct read of the field.

This bit is RES0 in Non-secure and Secure state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CNTVMASK, bit [18]**When FEAT_RME is implemented:**

CNTVMASK	Meaning
0b0	This control has no affect on CNTV_CTL_EL0.IMASK .
0b1	CNTV_CTL_EL0.IMASK behaves as if set to 1 for all purposes other than a direct read of the field.

This bit is RES0 in Non-secure and Secure state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENTIS, bit [17]**When FEAT_ECV is implemented:**

Controls the scale of the generation of the event stream.

EVENTIS	Meaning
0b0	The CNTHCTL_EL2.EVENTI field applies to CNTPCT_EL0 [15:0].
0b1	The CNTHCTL_EL2.EVENTI field applies to CNTPCT_EL0 [23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVVCT, bit [16]**When FEAT_ECV is implemented:**

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H ==1 && HCR_EL2.TGE ==1) HCR_EL2.NV2 ==0 HCR_EL2.NV1 ==1 HCR_EL2.NV ==0), this control does not cause any instructions to be trapped. If ((HCR_EL2.E2H ==0 HCR_EL2.TGE ==0) && HCR_EL2.NV2 ==1 && HCR_EL2.NV1 ==0 && HCR_EL2.NV ==1), then EL1 accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVPCT, bit [15]

When FEAT_ECV is implemented:

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVPCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H ==1 && HCR_EL2.TGE ==1) HCR_EL2.NV2 ==0 HCR_EL2.NV1 ==1 HCR_EL2.NV ==0), this control does not cause any instructions to be trapped. If (HCR_EL2.E2H ==0 HCR_EL2.TGE ==0) && HCR_EL2.NV2 ==1 && HCR_EL2.NV1 ==0 && HCR_EL2.NV ==1, then EL1 accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02, are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVCT, bit [14]

When FEAT_ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

EL1TVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If HCR_EL2 .{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then: <ul style="list-style-type: none"> In AArch64 state, traps EL0 and EL1 accesses to CNTVCT_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN. In AArch32 state, traps EL0 and EL1 accesses to CNTVCT to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN or CNTKCTL.PL0VCTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVT, bit [13]**When FEAT_ECV is implemented:**

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

EL1TVT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If HCR_EL2 .{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If HCR_EL2 .E2H is 0 or HCR_EL2 .TGE is 0, then: <ul style="list-style-type: none"> In AArch64 state, traps EL0 and EL1 accesses to CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.ELOVTEN. In AArch32 state, traps EL0 and EL1 accesses to CNTV_CTL, CNTV_CVAL, and CNTV_TVAL to EL2, unless they are trapped by CNTKCTL_EL1.ELOVTEN or CNTKCTL.PLOVTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECV, bit [12]**When FEAT_ECV is implemented:**

Enables the Enhanced Counter Virtualization functionality registers.

ECV	Meaning
0b0	Enhanced Counter Virtualization functionality is disabled.
0b1	When HCR_EL2 .{E2H, TGE} == {1, 1} or SCR_EL3 .{NS, EEL2} == {0, 0}, then Enhanced Counter Virtualization functionality is disabled. When SCR_EL3 .NS or SCR_EL3 .EEL2 are 1, and HCR_EL2 .E2H or HCR_EL2 .TGE are 0, then Enhanced Counter Virtualization functionality is enabled when EL2 is enabled for the current Security state. This means that: <ul style="list-style-type: none"> An MRS to CNTPCT_EL0 from either EL0 or EL1 that is not trapped will return the value (PCount<63:0> - CNTPOFF_EL2<63:0>). The EL1 physical timer interrupt is triggered when ((PCount<63:0> - CNTPOFF_EL2<63:0>) - PCVal<63:0>) is greater than or equal to 0. PCount<63:0> is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3. PCVal<63:0> is the EL1 physical timer compare value for this timer.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1PTEN, bit [11]

When [HCR_EL2.TGE](#) is 0, traps EL0 and EL1 accesses to the E1 physical timer registers to EL2 when EL2 is enabled in the current Security state.

EL1PTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTP_CTL_EL0 , CNTP_CVAL_EL0 , and CNTP_TVAL_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.ELOPTEN . From AArch32 state: EL0 and EL1 accesses to the CNTP_CTL , CNTP_CVAL , and CNTP_TVAL are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.ELOPTEN or CNTKCTL.PL0PTEN .
0b1	This control does not cause any instructions to be trapped.

When [HCR_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCTEN, bit [10]

When [HCR_EL2.TGE](#) is 0, traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [CNTPCT_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRRC or MCRR accesses to [CNTPCT](#) are trapped to EL2, reported using EC syndrome value 0x04.

EL1PCTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTPCT_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN . From AArch32 state: EL0 and EL1 accesses to the CNTPCT are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN or CNTKCTL.PL0PCTEN .
0b1	This control does not cause any instructions to be trapped.

When [HCR_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ELOPTEN, bit [9]

When [HCR_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR_EL2.TGE](#) is 1, traps EL0 accesses to the physical timer registers to EL2.

ELOPTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the CNTP_CTL_EL0 , CNTP_CVAL_EL0 , and CNTP_TVAL_EL0 registers are trapped to EL2. EL0 using AArch32: EL0 accesses to the CNTP_CTL , CNTP_CVAL and CNTP_TVAL registers are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ELOVTEN, bit [8]

When [HCR_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR_EL2.TGE](#) is 1, traps EL0 accesses to the virtual timer registers to EL2.

ELOVTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the CNTV_CTL_EL0 , CNTV_CVAL_EL0 , and CNTV_TVAL_EL0 registers are trapped to EL2. EL0 using AArch32: EL0 accesses to the CNTV_CTL , CNTV_CVAL , and CNTV_TVAL registers are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of the counter register [CNTPCT_EL0](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register [CNTPCT_EL0](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register [CNTPCT_EL0](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from the counter register [CNTPCT_EL0](#).

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ELOVCTEN, bit [1]

When [HCR_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR EL2.TGE](#) is 1, traps EL0 accesses to the frequency register and virtual counter register to EL2.

EL0VCTEN	Meaning
0b0	<p>EL0 using AArch64: EL0 accesses to the CNTVCT_EL0 are trapped to EL2.</p> <p>EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 register are trapped to EL2, if CINTHCTL_EL2.EL0PCTEN is also 0.</p> <p>EL0 using AArch32: EL0 accesses to the CNTVCT are trapped to EL2.</p> <p>EL0 using AArch32: EL0 accesses to the CNTFRQ register are trapped to EL2, if CINTHCTL.EL0PCTEN is also 0.</p>
0b1	This control does not cause any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ELOPCTEN, bit [0]

When [HCR_EL2.TGE](#) is 0, this control does not cause any instructions to be trapped.

When [HCR_EL2.TGE](#) is 1, traps EL0 accesses to the frequency register and physical counter register to EL2.

EL0PCTEN	Meaning
0b0	<p>EL0 using AArch64: EL0 accesses to the CNTPCT_EL0 are trapped to EL2.</p> <p>EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 register are trapped to EL2, if CNTHCTL_EL2.EL0VCTEN is also 0.</p> <p>EL0 using AArch32: EL0 accesses to the CNTPCT are trapped to EL2.</p> <p>EL0 using AArch32: EL0 accesses to the CNTFRQ and register are trapped to EL2, if CNTHCTL_EL2.EL0VCTEN is also 0.</p>
0b1	This control does not cause any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

636261605958575655545352	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36

This format applies in all Armv8.0 implementations, and it also contains a description of the behavior when EL3 is implemented and EL2 is not implemented.

Bits [63:20]

Reserved, RES0.

CNTPMASK, bit [19]

When FEAT_RME is implemented:

CNTPMASK	Meaning
0b0	This control has no affect on CNTP_CTL_ELO .IMASK.
0b1	CNTP_CTL_ELO .IMASK behaves as if set to 1 for all purposes other than a direct read of the field.

This bit is RES0 in Non-secure and Secure state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CNTVMASK, bit [18]

When FEAT_RME is implemented:

CNTVMASK	Meaning
0b0	This control has no affect on CNTV_CTL_ELO .IMASK.
0b1	CNTV_CTL_ELO .IMASK behaves as if set to 1 for all purposes other than a direct read of the field.

This bit is RES0 in Non-secure and Secure state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVNTIS, bit [17]

When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_ELO [15:0].
0b1	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_ELO [23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVVCT, bit [16]**When FEAT_ECV is implemented:**

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H==1 && HCR_EL2.TGE==1) HCR_EL2.NV2==0 HCR_EL2.NV1==1 HCR_EL2.NV==0), this control does not cause any instructions to be trapped. If ((HCR_EL2.E2H==0 HCR_EL2.TGE==0) && HCR_EL2.NV2==1 && HCR_EL2.NV1==0 && HCR_EL2.NV==1), then EL1 accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVPCT, bit [15]**When FEAT_ECV is implemented:**

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVPCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H==1 && HCR_EL2.TGE==1) HCR_EL2.NV2==0 HCR_EL2.NV1==1 HCR_EL2.NV==0), this control does not cause any instructions to be trapped. If (HCR_EL2.E2H==0 HCR_EL2.TGE==0) && HCR_EL2.NV2==1 && HCR_EL2.NV1==0 && HCR_EL2.NV==1 , then EL1 accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02, are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVCT, bit [14]**When FEAT_ECV is implemented:**

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

EL1TVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If HCR_EL2 .{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If HCR_EL2 .E2H is 0 or HCR_EL2 .TGE is 0, then: In AArch64 state, traps EL0 and EL1 accesses to CNTVCT_EL0 to EL2, unless they are trapped by CNTKCTL_EL1 .EL0VCTEN. In AArch32 state, traps EL0 and EL1 accesses to CNTVCT to EL2, unless they are trapped by CNTKCTL_EL1 .EL0VCTEN or CNTKCTL .PL0VCTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVT, bit [13]**When FEAT_ECV is implemented:**

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

EL1TVT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If HCR_EL2 .{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If HCR_EL2 .E2H is 0 or HCR_EL2 .TGE is 0, then: <ul style="list-style-type: none"> In AArch64 state, traps EL0 and EL1 accesses to CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN. In AArch32 state, traps EL0 and EL1 accesses to CNTV_CTL, CNTV_CVAL, and CNTV_TVAL to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN or CNTKCTL.PL0VTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECV, bit [12]**When FEAT_ECV is implemented:**

Enables the Enhanced Counter Virtualization functionality registers.

ECV	Meaning
0b0	Enhanced Counter Virtualization functionality is disabled.
0b1	When HCR_EL2 .{E2H, TGE} == {1, 1} or SCR_EL3 .{NS, EEL2} == {0, 0}, then Enhanced Counter Virtualization functionality is disabled. When SCR_EL3 .NS or SCR_EL3 .EEL2 are 1, and HCR_EL2 .E2H or HCR_EL2 .TGE are 0, then Enhanced Counter Virtualization functionality is enabled when EL2 is enabled for the current Security state. This means that: <ul style="list-style-type: none"> An MRS to CNTPCT_EL0 from either EL0 or EL1 that is not trapped will return the value (PCount<63:0> - CNTPOFF_EL2<63:0>). The EL1 physical timer interrupt is triggered when ((PCount<63:0> - CNTPOFF_EL2<63:0>) - PCVal<63:0>) is greater than or equal to 0. PCount is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3. PCVal<63:0> is the EL1 physical timer compare value for this timer.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [11:8]

Reserved, RES0.

EVNTI, bits [7:4]

Selects which bit of the counter register [CNTPCT_EL0](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register [CNTPCT_EL0](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register [CNTPCT_EL0](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from the counter register [CNTPCT_EL0](#).

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCEN, bit [1]

Traps EL0 and EL1 accesses to the EL1 physical timer registers to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [CNTP_CTL_EL0](#), [CNTP_CVAL_EL0](#), [CNTP_TVAL_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x3 and MRRC and MCRR accesses are trapped to EL2, reported using EC syndrome value 0x04:
 - [CNTP_CTL](#), [CNTP_CVAL](#), [CNTP_TVAL](#).

EL1PCEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTP_CTL_EL0 , CNTP_CVAL_EL0 , and CNTP_TVAL_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PTEN . From AArch32 state: EL0 and EL1 accesses to the CNTP_CTL , CNTP_CVAL , and CNTP_TVAL are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PTEN or CNTKCTL.PL0PTEN .
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCTEN, bit [0]

Traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [CNTPCT_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRRC or MCRR accesses to [CNTPCT](#) are trapped to EL2, reported using EC syndrome value 0x04.

EL1PCTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTPCT_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN . From AArch32 state: EL0 and EL1 accesses to the CNTPCT are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN or CNTKCTL.PL0PCTEN .
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHCTL_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHCTL_EL2 or CNTKCTL_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTHCTL_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return CNTHCTL_EL2;
elsif PSTATE.EL == EL3 then
    return CNTHCTL_EL2;

```

MSR CNTHCTL_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    CNTHCTL_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    CNTHCTL_EL2 = X[t];

```

MRS <Xt>, CNTKCTL_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1110	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    return CNTKCTL_EL1;
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        return CNTHCTL_EL2;
    else
        return CNTKCTL_EL1;
elsif PSTATE.EL == EL3 then
    return CNTKCTL_EL1;

```

MSR CNTKCTL_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1110	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    CNTKCTL_EL1 = X[t];
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        CNTHCTL_EL2 = X[t];
    else
        CNTKCTL_EL1 = X[t];
elsif PSTATE.EL == EL3 then
    CNTKCTL_EL1 = X[t];

```

CNTKCTL_EL1, Counter-timer Kernel Control register

The CNTKCTL_EL1 characteristics are:

Purpose

When FEAT_VHE is not implemented, or when [HCR_EL2](#).{E2H, TGE} is not {1, 1}, this register controls the generation of an event stream from the virtual counter, and access from EL0 to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

When FEAT_VHE is implemented and [HCR_EL2](#).{E2H, TGE} is {1, 1}, this register does not cause any event stream from the virtual counter to be generated, and does not control access to the counters and timers. The access to counters and timers at EL0 is controlled by [CNTHCTL_EL2](#).

Configuration

AArch64 System register CNTKCTL_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CNTKCTL\[31:0\]](#).

Attributes

CNTKCTL_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																EVNTIS	RES0								ELOPTEN	ELOVTEN	EVNTI	EVNTDIR	EVNTEN	ELOVCTEN	ELOPCTEN
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:18]

Reserved, RES0.

EVNTIS, bit [17]

When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTKCTL_EL1.EVNTI field applies to CNTVCT_ELO [15:0].
0b1	The CNTKCTL_EL1.EVNTI field applies to CNTVCT_ELO [23:8].

This control applies regardless of the value of the [CNTHCTL_EL2](#).ECV bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:10]

Reserved, RES0.

ELOPTEN, bit [9]

Traps EL0 accesses to the physical timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value 0x18:
 - [CNTP_CTL_EL0](#), [CNTP_CVAL_EL0](#), and [CNTP_TVAL_EL0](#).
- In AArch32 state, MRC and MCR accesses to the following registers are trapped, reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped, reported using EC syndrome value 0x04:
 - [CNTP_CTL](#), [CNTP_CVAL](#), [CNTP_TVAL](#).

ELOPTEN	Meaning
0b0	EL0 accesses to the physical timer registers are trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented and [HCR_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ELOVTEN, bit [8]

Traps EL0 accesses to the virtual timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value 0x18:
 - [CNTV_CTL_EL0](#), [CNTV_CVAL_EL0](#), and [CNTV_TVAL_EL0](#).
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped using EC syndrome value 0x04:
 - [CNTV_CTL](#), [CNTV_CVAL](#), and [CNTV_TVAL](#).

ELOVTEN	Meaning
0b0	EL0 accesses to the virtual timer registers are trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented and [HCR_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of the counter register [CNTVCT_EL0](#) is the trigger for the event stream generated from that counter, when that stream is enabled.

If FEAT_ECV is implemented, and CNTKCTL_EL1.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of the counter register [CNTVCT_EL0](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of the counter register.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the counter register [CNTVCT_EL0](#) trigger bit, defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

When FEAT_VHE is not implemented, or when [HCR_EL2](#).{E2H, TGE} is not {1, 1}, enables the generation of an event stream from the counter register [CNTVCT_EL0](#).

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

When FEAT_VHE is implemented and [HCR_EL2](#).{E2H, TGE} is {1, 1}, this control does not enable the event stream.

The reset behaviour of this field is:

- On a Warm reset, this field resets to **an architecturally UNKNOWN0 value.**

ELOVCTEN, bit [1]

Traps EL0 accesses to the frequency register and virtual counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2](#).TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped and reported using EC syndrome value 0x18:
 - [CNTVCT_EL0](#) and if [CNTKCTL_EL1](#).ELOPCTEN is 0, [CNTFRQ_EL0](#).
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value 0x03, MRRC and MCRR accesses are trapped and reported using EC syndrome value 0x04:
 - [CNTVCT](#) and if [CNTKCTL_EL1](#).ELOPCTEN is 0, [CNTFRQ](#).

ELOVCTEN	Meaning
0b0	EL0 accesses to the frequency register and virtual counter registers are trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented and [HCR_EL2](#).{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ELOPCTEN, bit [0]

Traps EL0 accesses to the frequency register and physical counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2](#).TGE is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value 0x18:
 - [CNTPCT_EL0](#) and if [CNTKCTL_EL1](#).ELOVCTEN is 0, [CNTFRQ_EL0](#).

- In AArch32 state, MCR or MRC accesses the following registers are trapped, reported using EC syndrome value 0x03, MCRR or MRRC accesses are trapped and reported using EC syndrome value 0x04:
 - [CNTPCT](#) and if [CNTKCTL_EL1.EL0VCTEN](#) is 0, [CNTFRQ](#).

EL0PCTEN	Meaning
0b0	EL0 accesses to the frequency register and physical counter register are trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented and [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this control does not cause any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTKCTL_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CNTKCTL_EL1 or CNTKCTL_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTKCTL_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1110	0b0001	0b000

CPACR_EL1, Architectural Feature Access Control Register

The CPACR_EL1 characteristics are:

Purpose

Controls access to trace, **SME, Streaming SVE**, SVE, and Advanced SIMD and floating-point functionality.

Configuration

AArch64 System register CPACR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [CPACR\[31:0\]](#).

When EL2 is implemented and enabled in the current Security state and [HCR_EL2](#).{E2H, TGE} == {1, 1}, the fields in this register have no effect on execution at EL0 and EL1. In this case, the controls provided by [CPTR_EL2](#) are used.

Attributes

CPACR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0			TTA	RES0		SMEN	FPEN	RES0		FPEN	ZEN	RES0		ZEN	RES0																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:29]

Reserved, RES0.

TTA, bit [28]

Traps EL0 and EL1 System register accesses to all implemented trace registers from both Execution states to EL1, or to EL2 when it is implemented and enabled in the current Security state and [HCR_EL2](#).TGE is 1, as follows:

- In AArch64 state, accesses to trace registers are trapped, reported using ESR_ELx.EC value 0x18.
- In AArch32 state, MRC and MCR accesses to trace registers are trapped, reported using ESR_ELx.EC value 0x05.
- In AArch32 state, MRRC and MCRR accesses to trace registers are trapped, reported using ESR_ELx.EC value 0x0C.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	This control causes EL0 and EL1 System register accesses to all implemented trace registers to be trapped.

Note

- The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4 or FEAT_ETE, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of [CPACR_EL1](#).TTA is 1.

-
- The Arm architecture does not provide traps on trace register accesses through the optional memory-mapped interface.
-

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not implemented, this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26:22]

Reserved, RES0.

SMEN, bits [25:24]

When FEAT_SME is implemented:

Traps execution at EL1 and EL0 of SME instructions, SVE instructions when FEAT_SVE is not implemented or the PE is in Streaming SVE mode, and instructions that directly access the [SVCR](#) or [SMCR_EL1](#) System registers to EL1, or to EL2 when EL2 is implemented and enabled in the current Security state and [HCR_EL2.TGE](#) is 1.

When instructions that directly access the [SVCR](#) System register are trapped with reference to this control, the MSR_SVCRSM, MSR_SVCRZA, and MSR_SVCRSMZA instructions are also trapped.

The exception is reported using ESR_ELx.EC value of 0x1D, with an ISS code of 0x0000000.

This field does not affect whether Streaming SVE or SME register values are valid.

A trap taken as a result of CPACR_EL1.SMEN has precedence over a trap taken as a result of CPACR_EL1.FPEN.

SMEN	Meaning
0b00	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b01	This control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL1 to be trapped.
0b10	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:22]

Reserved, RES0.

FPEN, bits [21:20]

Traps execution at EL1 and EL0 of instructions that access the Advanced SIMD and floating-point registers from both Execution states to EL1, reported using ESR_ELx.EC value 0x07, or to EL2 reported using ESR_ELx.EC value 0x00 when EL2 is implemented and enabled in the current Security state and [HCR_EL2.TGE](#) is 1, as follows:

- In AArch64 state, accesses to [FPCR](#), [FPSR](#), any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-S31 registers.
- In AArch32 state, [FPSCR](#), and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-S31 registers.

Traps execution at EL1 and EL0 of **SME and SVE** instructions to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1. The exception is reported using [ESR_ELx.EC](#) value 0x07.

A trap taken as a result of CPACR_EL1.SMEN has precedence over a trap taken as a result of CPACR_EL1.FPEN.

A trap taken as a result of CPACR_EL1.ZEN has precedence over a trap taken as a result of CPACR_EL1.FPEN.

FPEN	Meaning
0b00	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b01	This control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL1 to be trapped.
0b10	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

Writes to [MVFR0](#), [MVFR1](#), and [MVFR2](#) from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

Note

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), and [FPEXC](#) are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR_EL1.FPEN is not 0b11.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:18]

Reserved, RES0.

ZEN, bits [17:16]

When FEAT_SVE is implemented:

Traps execution at EL1 and EL0 of SVE instructions **when the PE is not in Streaming SVE mode**, and instructions that directly access the [ZCR_EL1](#) System register to EL1, or to EL2 when EL2 is implemented and enabled in the current Security state and [HCR_EL2.TGE](#) is 1.

The exception is reported using [ESR_ELx.EC](#) value 0x19.

A trap taken as a result of CPACR_EL1.ZEN has precedence over a trap taken as a result of CPACR_EL1.FPEN.

ZEN	Meaning
0b00	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b01	This control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL1 to be trapped.
0b10	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:0]

Reserved, RES0.

Accessing CPACR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic CPACR_EL1 or CPACR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CPACR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b010

```

if PSTATE.EL == EL0 then

CPP RCTX, Cache Prefetch Prediction Restriction by Context

The CPP RCTX characteristics are:

Purpose

Cache Prefetch Prediction Restriction by Context applies to all Cache Allocation Resources that predict cache allocations based on information gathered within the target execution context or contexts.

Cache prefetch predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction applies to all:

- Instruction caches.
- Data caches.
- TLB prefetching hardware used by the executing PE that applies to the supplied context or contexts.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when FEAT_SPECRES is implemented. Otherwise, direct accesses to CPP RCTX are UNDEFINED.

Attributes

CPP RCTX is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0															GVMID	VMID																
RES0				NSE	NS	EL	RES0								GASID	ASID																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:49]

Reserved, RES0.

GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 and EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==1](#) and [HCR_EL2.TGE==1](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

If the implementation supports 16 bits of VMID, then the upper 8 bits of the VMID must be written to 0 by software when the context being affected only uses 8 bits.

Bits [31:28]

Reserved, RES0.

NSE, bit [27]

When FEAT_RME is implemented:

Together with the NS field, selects the Security state.

For a description of the values derived by evaluating NS and NSE together, see CPP_RCTX.NS.

Otherwise:

Reserved, RES0.

NS, bit [26]

When FEAT_RME is implemented:

Together with the NSE field, selects the Security state. Defined values are:

NSE	NS	Meaning
0b0	0b0	Secure.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Some Effective values are determined by the current Security state:

When executed in Secure state, the Effective value of NSE is 0.

When executed in Non-secure state, the Effective value of {NSE, NS} is {0, 1}.

When executed in Realm state, the Effective value of {NSE, NS} is {1, 1}.

- When executed in Secure state, the Effective value of NSE is 0.
- When executed in Non-secure state, the Effective value of {NSE, NS} is {0, 1}.
- When executed in Realm state, the Effective value of {NSE, NS} is {1, 1}.

An instruction with an EL field that has a value other than 0b11 (EL3) is treated as a NOP when executed at EL3 with CPP_RCTX.{NSE, NS} == {1, 0}.

Otherwise:

Security State. Defined values are:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASID for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being affected only uses 8 bits.

Executing the CPP RCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

CPP RCTX, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b111

```

if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTL_EL1.EnRCTX == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGITR_EL2.CPPRCTX == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && HCR_EL2.<E2H,TGE> == '11' && SCTL_EL2.EnRCTX == '0' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            CPP_RCTX(X[t]);
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.NV == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.CPPRCTX == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            CPP_RCTX(X[t]);
    elsif PSTATE.EL == EL2 then
        CPP_RCTX(X[t]);
    elsif PSTATE.EL == EL3 then
        CPP_RCTX(X[t]);

CPTR_EL2, Architectural Feature Trap Register (EL2)

The CPTR_EL2 characteristics are:

Purpose

Controls trapping to EL2 of accesses to [CPACR](#), [CPACR_EL1](#), trace, Activity Monitor, [SME, Streaming SVE](#), SVE, and Advanced SIMD and floating-point functionality.

Configuration

AArch64 System register CPTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HCPTR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

CPTR_EL2 is a 64-bit register.

Field descriptions

When FEAT_VHE is implemented and HCR_EL2.E2H == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TCPAC	TAM	RES0	TTA	RES0	SMEN	FPEN	RES0	FPEN	ZEN	RES0	ZEN	RES0																			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

In AArch64 state, traps accesses to [CPACR_EL1](#) from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value 0x18.

In AArch32 state, traps accesses to [CPACR](#) from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value 0x03.

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to CPACR_EL1 and CPACR are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

Note

[CPACR_EL1](#) and [CPACR](#) are not accessible at EL0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value 0x18:
 - [AMUSERENR_EL0](#), [AMCFGR_EL0](#), [AMCGCR_EL0](#), [AMCNTENCLR0_EL0](#), [AMCNTENCLR1_EL0](#), [AMCNTENSET0_EL0](#), [AMCNTENSET1_EL0](#), [AMCR_EL0](#), [AMEVCNTR0<n>_EL0](#), [AMEVCNTR1<n>_EL0](#), [AMEVTYPER0<n>_EL0](#), and [AMEVTYPER1<n>_EL0](#).
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using ESR_ELx.EC value 0x03:
 - [AMUSERENR](#), [AMCFGR](#), [AMCGCR](#), [AMCNTENCLR0](#), [AMCNTENCLR1](#), [AMCNTENSET0](#), [AMCNTENSET1](#), [AMCR](#), [AMEVTYPER0<n>](#), and [AMEVTYPER1<n>](#).
- In AArch32 state, MRRC or MCRR accesses to [AMEVCNTR0<n>](#) and [AMEVCNTR1<n>](#), are trapped to EL2, reported using ESR_ELx.EC value 0x04.

TAM	Meaning
0b0	Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.
0b1	Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [29]

Reserved, RES0.

TTA, bit [28]

Traps System register accesses to all implemented trace registers from both Execution states to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to trace registers with op0=2, op1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCR accesses to trace registers with cpnum=14, opc1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x05.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at EL0, EL1 or EL2, to execute a System register access to an implemented trace register is trapped to EL2, when EL2 is enabled in the current Security state, unless HCR_EL2.TGE is 0 and it is trapped by CPACR.NSTRCDIS or CPACR_EL1.TTA . When HCR_EL2.TGE is 1, any attempt at EL0 or EL2 to execute a System register access to an implemented trace register is trapped to EL2, when EL2 is enabled in the current Security state.

Note

The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4 or ETE, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.TTA is 1.

EL2 does not provide traps on trace register accesses through the optional Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26:22]

Reserved, RES0.

SMEN, bits [25:24]

When FEAT_SME is implemented:

Traps execution at EL2, EL1, and EL0 of SME instructions, SVE instructions when FEAT_SVE is not implemented or the PE is in Streaming SVE mode, and instructions that directly access the [SVCR](#), [SMCR_EL1](#), or [SMCR_EL2](#) System registers to EL2, when EL2 is enabled in the current Security state.

When instructions that directly access the [SVCR](#) System register are trapped with reference to this control, the MSR_SVCRSM, MSR_SVCRZA, and MSR_SVCRSMZA instructions are also trapped.

The exception is reported using ESR_EL2.EC value of 0x1D, with an ISS code of 0x0000000.

This field does not affect whether Streaming SVE or SME register values are valid.

A trap taken as a result of CPTR_EL2.SMEN has precedence over a trap taken as a result of CPTR_EL2.FPEN.

SMEN	Meaning
0b00	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b01	When HCR_EL2.TGE is 0, this control does not cause execution of any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL2 to be trapped.
0b10	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:22]

Reserved, RES0.

FPEN, bits [21:20]

Traps execution at EL2, EL1, and EL0 of instructions that access the Advanced SIMD and floating-point registers from both Execution states to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value 0x07.

Traps execution at EL2, EL1, and EL0 of **SME and SVE** instructions to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value 0x07.

A trap taken as a result of CPTR_EL2.SMEN has precedence over a trap taken as a result of CPTR_EL2.FPEN.

A trap taken as a result of CPTR_EL2.ZEN has precedence over a trap taken as a result of CPTR_EL2.FPEN.

FPEN	Meaning
0b00	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b01	When HCR_EL2.TGE is 0, this control does not cause execution of any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL2 to be trapped.
0b10	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

Writes to [MVFR0](#), [MVFR1](#), and [MVFR2](#) from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

Note

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), and [FPEXC](#) are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.FPEN is not 0b11.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:18]

Reserved, RES0.

ZEN, bits [17:16]

When FEAT_SVE is implemented:

Traps execution at EL2, EL1, and EL0 of SVE instructions **when the PE is not in Streaming SVE mode**, and instructions that directly access the [ZCR_EL1](#) or [ZCR_EL2](#) System registers to EL2, when EL2 is enabled in the current Security state.

The exception is reported using ESR_ELx.EC value 0x19.

A trap taken as a result of CPTR_EL2.ZEN has precedence over a trap taken as a result of CPTR_EL2.FPEN.

ZEN	Meaning
0b00	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b01	When HCR_EL2.TGE is 0, this control does not cause execution of any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL2 to be trapped.
0b10	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b11	This control does not cause execution of any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:0]

Reserved, RES0.

Otherwise:

This format applies in all Armv8.0 implementations.

Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

In AArch64 state, traps accesses to [CPACR_EL1](#) from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value 0x18.

In AArch32 state, traps accesses to [CPACR](#) from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value 0x03.

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to CPACR_EL1 and CPACR are trapped to EL2, when EL2 is enabled in the current Security state.

When [HCR_EL2.TGE](#) is 1, this control does not cause any instructions to be trapped.

Note

[CPACR_EL1](#) and [CPACR](#) are not accessible at EL0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]**When FEAT_AMUv1 is implemented:**

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value 0x18:
 - [AMUSERENR_EL0](#), [AMCFGR_EL0](#), [AMCGCR_EL0](#), [AMCNTENCLR0_EL0](#), [AMCNTENCLR1_EL0](#), [AMCNTENSET0_EL0](#), [AMCNTENSET1_EL0](#), [AMCR_EL0](#), [AMEVCNTR0<n>_EL0](#), [AMEVCNTR1<n>_EL0](#), [AMEVTYPEP0<n>_EL0](#), and [AMEVTYPEP1<n>_EL0](#).
- In AArch32 state, MCR or MRC accesses to the following registers are trapped to EL2 and reported using ESR_ELx.EC value 0x03:
 - [AMUSERENR](#), [AMCFGR](#), [AMCGCR](#), [AMCNTENCLR0](#), [AMCNTENCLR1](#), [AMCNTENSET0](#), [AMCNTENSET1](#), [AMCR](#), [AMEVTYPEP0<n>](#), and [AMEVTYPEP1<n>](#).
- In AArch32 state, MCRR or MRRC accesses to [AMEVCNTR0<n>](#) and [AMEVCNTR1<n>](#), are trapped to EL2, reported using ESR_ELx.EC value 0x04.

TAM	Meaning
0b0	Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.
0b1	Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Traps System register accesses to all implemented trace registers from both Execution states to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to trace registers with op0=2, op1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCR accesses to trace registers with cpnum=14, opc1=1, and CRn<0b1000 are trapped to EL2, reported using EC syndrome value 0x05.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at EL0, EL1, or EL2, to execute a System register access to an implemented trace register is trapped to EL2, when EL2 is enabled in the current Security state, unless it is trapped by CPACR .TRCDIS or CPACR_EL1 .TTA.

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of [CPTR_EL2](#).TTA is 1.
- EL2 does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

Bit [13]

Reserved, RES1.

TSM, bit [12]

When FEAT_SME is implemented:

Traps execution at EL2, EL1, and EL0 of SME instructions, SVE instructions when FEAT_SVE is not implemented or the PE is in Streaming SVE mode, and instructions that directly access the [SVCR](#), [SMCR_EL1](#), or [SMCR_EL2](#) System registers to EL2, when EL2 is enabled in the current Security state.

When instructions that directly access the [SVCR](#) System register are trapped with reference to this control, the MSR_SVCRSM, MSR_SVCRZA, and MSR_SVCRSMZA instructions are also trapped.

The exception is reported using ESR_EL2.EC value of 0x1D, with an ISS code of 0x0000000.

This field does not affect whether Streaming SVE or SME register values are valid.

A trap taken as a result of CPTR_EL2.TSM has precedence over a trap taken as a result of CPTR_EL2.TFP.

TSM	Meaning
0b0	This control does not cause execution of any instructions to be trapped.
0b1	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [11]

Reserved, RES0.

TFP, bit [10]

Traps execution of instructions which access the Advanced SIMD and floating-point functionality, from both Execution states to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value 0x07:
 - [FPCR](#), [FPSR](#), [FPEXC32_EL2](#), any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value 0x07:
 - [MVFR0](#), [MVFR1](#), [MVFR2](#), [FPSCR](#), [FPEXC](#), and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers. For the purposes of this trap,

the architecture defines a VMSR access to [FPSID](#) from EL1 or higher as an access to a SIMD and ~~floating-point~~ ~~floating point~~ register. Otherwise, permitted VMSR accesses to [FPSID](#) are ignored.

Traps execution at the same Exception levels of [SME and SVE](#) instructions to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value 0x07.

A trap taken as a result of CPTR_EL2.TSM has precedence over a trap taken as a result of CPTR_EL2.TFP.

A trap taken as a result of CPTR_EL2.TZ has precedence over a trap taken as a result of CPTR_EL2.TFP.

TFP	Meaning
0b0	This control does not cause execution of any instructions to be trapped.
0b1	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.

Note

[FPEXC32_EL2](#) is not accessible from EL0 using AArch64.

[FPSID](#), [MVFR0](#), [MVFR1](#), and [FPEXC](#) are not accessible from EL0 using AArch32.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES1.

TZ, bit [8]

When FEAT_SVE is implemented:

Traps execution at EL2, EL1, and EL0 of SVE instructions [when the PE is not in Streaming SVE mode](#), and instructions that directly access the [ZCR_EL2](#) or [ZCR_EL1](#) System registers to EL2, when EL2 is enabled in the current Security state.

The exception is reported using ESR_ELx.EC value 0x19.

A trap taken as a result of CPTR_EL2.TZ has precedence over a trap taken as a result of CPTR_EL2.TFP.

TZ	Meaning
0b0	This control does not cause execution of any instructions to be trapped.
0b1	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [7:0]

Reserved, RES1.

CPTR_EL3, Architectural Feature Trap Register (EL3)

The CPTR_EL3 characteristics are:

Purpose

Controls trapping to EL3 of accesses to [CPACR](#), [CPACR_EL1](#), [HCPTR](#), [CPTR_EL2](#), trace, Activity Monitor, [SME](#), [Streaming SVE](#), SVE, and Advanced SIMD and floating-point functionality.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to CPTR_EL3 are UNDEFINED.

Attributes

CPTR_EL3 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

Traps all of the following to EL3, from both Execution states and any Security state.

- EL2 accesses to [CPTR_EL2](#), reported using ESR_ELx.EC value 0x18, or [HCPTR](#), reported using ESR_ELx.EC value 0x03.
- EL2 and EL1 accesses to [CPACR_EL1](#) reported using ESR_ELx.EC value 0x18, or [CPACR](#) reported using ESR_ELx.EC value 0x03.

When CPTR_EL3.TCPAC is:

TCPAC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 accesses to the CPTR_EL2 or HCPTR , and EL2 and EL1 accesses to the CPACR_EL1 or CPACR , are trapped to EL3, unless they are trapped by CPTR_EL2 .TCPAC.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL2, EL1 and EL0 accesses to all Activity Monitor registers to EL3.

Accesses to the Activity Monitors registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported with ESR_ELx.EC value 0x18:
 - [AMUSERENR_EL0](#), [AMCFGR_EL0](#), [AMCGCR_EL0](#), [AMCNTENCLR0_EL0](#), [AMCNTENCLR1_EL0](#), [AMCNTENSET0_EL0](#), [AMCNTENSET1_EL0](#), [AMCR_EL0](#), [AMEVCNTR0<n>_EL0](#), [AMEVCNTR1<n>_EL0](#), [AMEVTYPER0<n>_EL0](#), and [AMEVTYPER1<n>_EL0](#).
- In AArch32 state, accesses with MRC or MCR to the following registers reported with ESR_ELx.EC value 0x03:
 - [AMUSERENR](#), [AMCFGR](#), [AMCGCR](#), [AMCNTENCLR0](#), [AMCNTENCLR1](#), [AMCNTENSET0](#), [AMCNTENSET1](#), [AMCR](#), [AMEVTYPER0<n>](#), and [AMEVTYPER1<n>](#).
- In AArch32 state, accesses with MRRC or MCRR to the following registers, reported with ESR_ELx.EC value 0x04:
 - [AMEVCNTR0<n>](#), [AMEVCNTR1<n>](#).

TAM	Meaning
0b0	Accesses from EL2, EL1, and EL0 to Activity Monitor registers are not trapped.
0b1	Accesses from EL2, EL1, and EL0 to Activity Monitor registers are trapped to EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Traps System register accesses. Accesses to the trace registers, from all Exception levels, any Security state, and both Execution states are trapped to EL3 as follows:

- In AArch64 state, Trace registers with op0=2, op1=1, and CRn<0b1000 are trapped to EL3 and reported using EC syndrome value 0x18.
- In AArch32 state, accesses using MCR or MRC to the Trace registers with cpnum=14, opc1=1, and CRn<0b1000 are reported using EC syndrome value 0x05.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any System register access to the trace registers is trapped to EL3, unless it is trapped by CPACR .TRCDIS, CPACR_EL1 .TTA, or CPTR_EL2 .TTA.

If System register access to trace functionality is not supported, this bit is RES0.

Note

The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4 or FEAT_ETE, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than this trap exception.

EL3 does not provide traps on trace register accesses through the Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, no side-effects occur before the exception is taken, see 'Traps on instructions'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:13:11]

Reserved, RES0.

ESM, bit [12]

When FEAT_SME is implemented:

Traps execution of SME instructions, SVE instructions when FEAT_SVE is not implemented or the PE is in Streaming SVE mode, and instructions that directly access the [SMCR_EL1](#), [SMCR_EL2](#), [SMCR_EL3](#), [SMPRI_EL1](#), [SMPRIMAP_EL2](#), or [SVCR](#) System registers, from all Exception levels and any Security state, to EL3.

When instructions that directly access the [SVCR](#) System register are trapped with reference to this control, the MSR SVCRSM, MSR SVCRZA, and MSR SVCRSMZA instructions are also trapped.

The exception is reported using ESR_EL3.EC value of 0x1D, with an ISS code of 0x0000000.

This field does not affect whether Streaming SVE or SME register values are valid.

A trap taken as a result of CPTR_EL3.ESM has precedence over a trap taken as a result of CPTR_EL3.TFP.

ESM	Meaning
0b0	This control causes execution of these instructions at all Exception levels to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES0.

TFP, bit [10]

Traps execution of instructions which access the Advanced SIMD and floating-point functionality, from all Exception levels, any Security state, and both Execution states, to EL3.

This includes the following registers, all reported using ESR_ELx.EC value 0x07:

- [FPCR](#), [FPSR](#), [FPEXC32_EL2](#), and any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or [S0-S31](#) ~~S0-31~~ registers.
- [MVFR0](#), [MVFR1](#), [MVFR2](#), [FPSCR](#), [FPEXC](#), and any of the SIMD and floating-point registers [Q0-Q15](#) ~~Q0-15~~, including their views as D0-D31 registers or [S0-S31](#) ~~S0-31~~ registers.
- VMSR accesses to [FPSID](#).

Permitted VMSR accesses to [FPSID](#) are ignored, but for the purposes of this trap the architecture ~~defines~~ ~~define~~ a VMSR access to the [FPSID](#) from EL1 or higher as an access to a SIMD and floating-point register.

Traps execution at all Exception levels of [SME](#) and SVE instructions to EL3 from any Security state. The exception is reported using ESR_ELx.EC value 0x07.

A trap taken as a result of CPTR_EL3.ESM has precedence over a trap taken as a result of CPTR_EL3.TFP.

A trap taken as a result of CPTR_EL3.EZ has precedence over a trap taken as a result of CPTR_EL3.TFP.

Defined values are:

TFP	Meaning
0b0	This control does not cause execution of any instructions to be trapped.
0b1	This control causes execution of these instructions at all Exception levels to be trapped.

Note

[FPEXC32_EL2](#) is not accessible from EL0 using AArch64.

[FPSID](#), [MVFR0](#), [MVFR1](#), and [FPEXC](#) are not accessible from EL0 using AArch32.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

EZ, bit [8]

When FEAT_SVE is implemented:

Traps execution of SVE instructions **when the PE is not in Streaming SVE mode**, and instructions that directly access the [ZCR_EL3](#), [ZCR_EL2](#), or [ZCR_EL1](#) System registers, from all Exception levels and **anyboth** Security **states**, to EL3.

The exception is reported using ESR_ELx.EC value 0x19.

A trap taken as a result of CPTR_EL3.EZ has precedence over a trap taken as a result of CPTR_EL3.TFP.

EZ	Meaning
0b0	This control causes execution of these instructions at all Exception levels to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [7:0]

Reserved, RES0.

Accessing CPTR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CPTR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return CPTR_EL3;
```

MSR CPTR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    CPTR_EL3 = X[t];
```

DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>_EL1](#).

Configuration

AArch64 System register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBCR<n>\[31:0\]](#).

AArch64 System register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to External register [DBGBCR<n>_EL1\[31:0\]](#).

If breakpoint n is not implemented, accesses to this register are UNDEFINED.

Attributes

DBGBCR<n>_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0	SSCE	RES0				BT				LBN				SSC	HMC	RES0				BAS				RES0	PMC	E					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:30]

Reserved, RES0.

SSCE, bit [29]

When FEAT_RME is implemented:

Security State Control Extended.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [28:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

BT	Meaning
0b0000	Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.
0b0001	As 0b0000, but linked to a Context matching breakpoint.
0b0010	Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value
0b0011	As 0b0010, with linking enabled.
0b0110	Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1 .
0b0111	As 0b0110, with linking enabled.
0b1000	Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID .
0b1001	As 0b1000, with linking enabled.
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1 , and DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID .
0b1011	As 0b1010, with linking enabled.
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBVR<n>_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2 .
0b1101	As 0b1100, with linking enabled.
0b1110	Unlinked Full Context ID match. DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1 , and DBGBVR<n>_EL1.ContextID2 is compared against CONTEXTIDR_EL2 .
0b1111	As 0b1110, with linking enabled.

All other values are reserved. Constraints on breakpoint programming mean other values are reserved under some conditions.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved value, see 'Reserved DBGBCR<n>_EL1.BT values'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>_EL1.E is 0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information, see DBGBCR<n>_EL1.SSC.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When AArch32 is supported at EL0 any Exception level:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions

All other values are reserved. For more information, see 'Reserved DBGBCR<n>_EL1.BAS values'.

For more information on using the BAS field in address match breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information, see DBGBCR<n>_EL1.SSC.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint [DBGBVR<n>_EL1](#).

E	Meaning
0b0	Breakpoint disabled.
0b1	Breakpoint enabled.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>_EL1

Accesses to this register use the following encodings in the System register encoding space:

DC CGDSW, Clean of Data and Allocation Tags by Set/Way

The DC CGDSW characteristics are:

Purpose

Clean data and Allocation Tags in data cache by set/way.

Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC CGDSW are UNDEFINED.

Attributes

DC CGDSW is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
SetWay																													Level		RES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \log_2(\text{ASSOCIATIVITY})$, $L = \log_2(\text{LINELEN})$, $B = (L + S)$, $S = \log_2(\text{NSETS})$.

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DC CGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC CGDSW, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1010	0b110

DC CGDVAC, Clean of Data and Allocation Tags by VA to PoC

The DC CGDVAC characteristics are:

Purpose

Clean data and Allocation Tags in data cache by address to Point of Coherency.

Configuration

This instruction is present only when FEAT_MTE is implemented. Otherwise, direct accesses to DC CGDVAC are UNDEFINED.

Attributes

DC CGDVAC is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual address to use																															
Virtual address to use																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DC CGDVAC instruction

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission **fault** ~~Fault~~, subject to the constraints described in 'Permission fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC CGDVAC, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b1010	0b101

```

DC CGDVADP, Clean of Data and Allocation Tags by VA to PoDP

The DC CGDVADP characteristics are:

Purpose

Clean Allocation Tags and data in data cache by address to Point of Deep Persistence.

If the memory system does not identify a Point of Deep Persistence, then this instruction behaves as a [DC CGDVAP](#).

Configuration

This instruction is present only when FEAT_DPB2 is implemented and FEAT_MTE is implemented. Otherwise, direct accesses to DC CGDVADP are UNDEFINED.

Attributes

DC CGDVADP is a 64-bit System instruction.

Field descriptions

DC CGDVAP, Clean of Data and Allocation Tags by VA to PoP

The DC CGDVAP characteristics are:

Purpose

Clean data and Allocation Tags in data cache by address to Point of Persistence.

If the memory system does not identify a Point of Persistence, then this instruction behaves as a [DC CGDVAC](#).

Configuration

This instruction is present only when FEAT_MTE is implemented. Otherwise, direct accesses to DC CGDVAP are UNDEFINED.

Attributes

DC CGDVAP is a 64-bit System instruction.

Field descriptions

Executing the DC CGSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC CGSW, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1010	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TSW == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.DCCSW == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \log_2(\text{ASSOCIATIVITY})$, $L = \log_2(\text{LINELEN})$, $B = (L + S)$, $S = \log_2(\text{NSETS})$.

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DC CIGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC CIGDSW, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1110	0b110

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

DC CIGDVAC, Clean and Invalidate of Data and Allocation Tags by VA to PoC

The DC CIGDVAC characteristics are:

Purpose

Clean and Invalidate data and Allocation Tags in data cache by address to Point of Coherency.

Configuration

This instruction is present only when FEAT_MTE is implemented. Otherwise, direct accesses to DC CIGDVAC are UNDEFINED.

Attributes

DC CIGDVAC is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DC CIGDVAC instruction

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission **fault**, subject to the constraints described in 'Permission fault'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC CIGDVAC, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b1110	0b101

```

if PSTATE.EL == EL0 then

- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$, $L = \text{Log}_2(\text{LINELEN})$, $B = (L + S)$, $S = \text{Log}_2(\text{NSETS})$.

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DC CSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC CSW, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1010	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TSW == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.DCCSW == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        AArch64.DC_CSW(X[t], CacheType_Data, CacheOp_Clean, CacheOpScope_SetWay);
elsif PSTATE.EL == EL2 then
        AArch64.DC_CSW(X[t], CacheType_Data, CacheOp_Clean, CacheOpScope_SetWay);
elsif PSTATE.EL == EL3 then
        AArch64.DC_CSW(X[t], CacheType_Data, CacheOp_Clean, CacheOpScope_SetWay);

```

DC CVAC, Data or unified Cache line Clean by VA to PoC

The DC CVAC characteristics are:

Purpose

Clean data cache by address to Point of Coherency.

When FEAT_MTE2 is implemented, this instruction might clean Allocation Tags from caches.

Configuration

AArch64 System instruction DC CVAC performs the same function as AArch32 System instruction [DCCMVAC](#).

Attributes

DC CVAC is a 64-bit System instruction.

Field descriptions

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DC CVAC instruction

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission ~~fault~~Fault, subject to the constraints described in 'Permission fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC CVAC, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b1010	0b001

```

if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLRL_EL1.UCI == '0' then

DC GVA, Data Cache set Allocation Tag by VA

The DC GVA characteristics are:

Purpose

Write a value to the Allocation Tags of a naturally aligned block of N bytes, where the size of N is identified in [DCZID_EL0](#). The Allocation Tag used is determined by the input address.

Configuration

This instruction is present only when FEAT_MTE is implemented. Otherwise, direct accesses to DC GVA are UNDEFINED.

Attributes

DC GVA is a 64-bit System instruction.

Field descriptions

Bits [63:0]

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

Executing the DC GVA instruction

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is not set.

If the memory region being modified is any type of Device memory, this instruction can give an alignment fault that is prioritized in the same way as other alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of stores to each Allocation Tag within the block being accessed, and so it:

- Generates a Permission ~~fault~~**Fault** if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC GVA, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0100	0b011

```

DC IGDSW, Invalidate of Data and Allocation Tags by Set/Way

The DC IGDSW characteristics are:

Purpose

Invalidate data and Allocation Tags in data cache by set/way.

Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC IGDSW are UNDEFINED.

Attributes

DC IGDSW is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																																	
SetWay																															Level		RES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \log_2(\text{ASSOCIATIVITY})$, $L = \log_2(\text{LINELEN})$, $B = (L + S)$, $S = \log_2(\text{NSETS})$.

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DC IGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC IGDSW, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0110	0b110

```

DC IGDVAC, Invalidate of Data and Allocation Tags by VA to PoC

The DC IGDVAC characteristics are:

Purpose

Invalidate data and Allocation Tags in data cache by address to Point of Coherency.

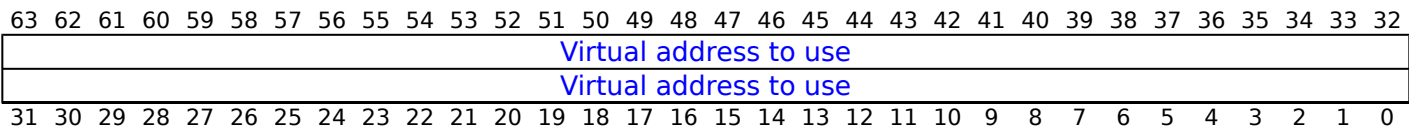

Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC IGDVAC are UNDEFINED.

Attributes

DC IGDVAC is a 64-bit System instruction.

Field descriptions

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DC IGDVAC instruction

When the instruction is executed, it can generate a watchpoint, which is prioritized in the same way as other watchpoints. If a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 1.

This instruction requires write access permission to the VA, otherwise it generates a Permission fault~~Fault~~, subject to the constraints described in 'Permission fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC IGDVAC, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0110	0b101

```

if PSTATE.EL == EL0 then

DC ZVA, Data Cache Zero by VA

The DC ZVA characteristics are:

Purpose

Zero data cache by address. Zeroes a naturally aligned block of N bytes, where the size of N is identified in [DCZID_EL0](#).

Configuration

There are no configuration notes.

Attributes

DC ZVA is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual address to use																															
Virtual address to use																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

Executing the DC ZVA instruction

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 0.

If the memory region being zeroed is any type of Device memory, this instruction can give an Alignment fault which is prioritized in the same way as other Alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of Stores to each byte within the block being accessed, and so it:

- Generates a Permission **fault** if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings in the System instruction encoding space:

DC ZVA, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0100	0b001

```

DIT, Data Independent Timing

The DIT characteristics are:

Purpose

Allows access to the Data Independent Timing bit.

Configuration

This register is present only when FEAT_DIT is implemented. Otherwise, direct accesses to DIT are UNDEFINED.

Attributes

DIT is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:25]

Reserved, RES0.

DIT, bit [24]

Data Independent Timing.

DIT	Meaning
0b0	The architecture makes no statement about the timing properties of any instructions.
0b1	The architecture requires that: <ul style="list-style-type: none">The timing of every load and store instruction is insensitive to the value of the data being loaded or stored.For certain data processing instructions, the instruction takes a time which is independent of:<ul style="list-style-type: none">The values of the data supplied in any of its registers.The values of the NZCV flags.For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on:<ul style="list-style-type: none">The values of the data supplied in any of its registers.The values of the NZCV flags.

The data processing instructions affected by this bit are:

- All cryptographic instructions. These instructions are:
 - AESD, AESE, AESIMC, AESMC, SHA1C, SHA1H, SHA1M, SHA1P, SHA1SU0, SHA1SU1, SHA256H, SHA256H2, SHA256SU0, SHA256SU1, SHA512H, SHA512H2, SHA512SU0, SHA512SU1, EOR3, RAX1, XAR, BCAX, SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, SM3PARTW2, SM4E, and SM4EKEY.

- A subset of those instructions which use the general-purpose register file. These instructions are:
 - ADC, ADCS, ADD, ADDS, AND, ANDS, ASR, ASRV, BFC, BFI, BFM, BFXIL, BIC, BICS, CCMN, CCMP, CFINV, CINC, CINV, CLS, CLZ, CMN, CMP, CNEG, CSEL, CSET, CSETM, CSINC, CSINV, CSNEG, EON, EOR, EXTR, LSL, LSLV, LSR, LSRV, MADD, MNEG, MOV, MOVK, MOVN, MOVZ, MSUB, MUL, MVN, NEG, NEGS, NGC, NGCS, NOP, ORN, ORR, RBIT, RET, REV, REV16, REV32, REV64, RMIF, ROR, RORV, SBC, SBBS, SBFIZ, SBFM, SBFX, SETF8, SETF16, SMADDL, SMNEGL, SMSUBL, SMULH, SMULL, SUB, SUBS, SXTB, SXTH, SXTW, TST, UBFIZ, UBFM, UBFX, UMADDL, UMNEGL, UMSUBL, UMULH, UMULL, UXTB, and UXTH.
 - ADC, ADCS, ADD, ADDS, AND, ANDS, ASR, ASRV, BFC, BFI, BFM, BFXIL, BIC, BICS, CCMN, CCMP, CFINV, CINC, CINV, CLS, CLZ, CMN, CMP, CNEG, CSEL, CSET, CSETM, CSINC, CSINV, CSNEG, EON, EOR, EXTR, LSL, LSLV, LSR, LSRV, MADD, MNEG, MOV, MOVK, MOVN, MOVZ, MSUB, MUL, MVN, NEG, NEGS, NGC, NGCS, NOP, ORN, ORR, RBIT, RET, REV, REV16, REV32, REV64, RMIF, ROR, RORV, SBC, SBBS, SBFIZ, SBFM, SBFX, SETF8, SETF16, SMADDL, SMNEGL, SMSUBL, SMULH, SMULL, SUB, SUBS, SXTB, SXTH, SXTW, TST, UBFIZ, UBFM, UBFX, UMADDL, UMNEGL, UMSUBL, UMULH, UMULL, UXTB, and UXTH.
 - If FEAT_CRC32 is implemented, CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX.
- A subset of those instructions which use the SIMD&FP register file. These instructions are:
 - If FEAT_CRC32 is implemented, CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX.
 - ABS, ADD, ADDHN, ADDHN2, ADDP, ADDV, AND, BIC, BIF, BIT, BSL, CLS, CLZ, CMEQ, CMGE, CMGT, CMHI, CMHS, CMLE, CMLT, CMTST, CNT, DUP, EOR, EXT, FCSEL, INS, MLA, MLS, MOV, MOVI, MUL, MVN, MVNI, NEG, NOT, ORN, ORR, PMUL, PMULL, PMULL2, RADDHN, RADDHN2, RBIT, REV16, REV32, RSHRN, RSHRN2, RSUBHN, RSUBHN2, SABAB, SABD, SABAL, SABAL2, SABDL, SABDL2, SADALP, SADDL, SADDL2, SADDLP, SADDLV, SADDW, SADDW2, SHADD, SHL, SHLL, SHLL2, SHRIN, SHRIN2, SHSUB, SLI, SMAX, SMAXP, SMAXV, SMIN, SMINP, SMINV, SMLAL, SMLAL2, SMLS, SMLS2, SMOV, SMULL, SMULL2, SRI, SSHL, SSHLL, SSHLL2, SSHR, SSRA, SSUB, SSUB2, SSUBW, SSUBW2, SUB, SUBH, SUBH2, SXTL, SXTL2, TBL, TBX, TRN1, TRN2, UABA, UABAL, UABAL2, UABD, UABDL, UABDL2, UADALP, UADDL, UADDL2, UADDLP, UADDLV, UADDW, UADDW2, UHADD, UHSUB, UMAX, UMAXP, UMAXV, UMIN, UMINP, UMINV, UMLAL, UMLAL2, UMLS, UMLS2, UMULL, UMULL2, USHL, USHLL, USHLL2, USHR, USRA, USUB, USUB2, USUBW, USUBW2, UXTL, UXTL2, UZP1, UZP2, XTN, XTN2, ZIP1, and ZIP2.
 - ABS, ADD, ADDHN, ADDHN2, ADDP, ADDV, AND, BIC, BIF, BIT, BSL, CLS, CLZ, CMEQ, CMGE, CMGT, CMHI, CMHS, CMLE, CMLT, CMTST, CNT, DUP, EOR, EXT, FCSEL, INS, MLA, MLS, MOV, MOVI, MUL, MVN, MVNI, NEG, NOT, ORN, ORR, PMUL, PMULL, PMULL2, RADDHN, RADDHN2, RBIT, REV16, REV32, RSHRN, RSHRN2, RSUBHN, RSUBHN2, SABAB, SABD, SABAL, SABAL2, SABDL, SABDL2, SADALP, SADDL, SADDL2, SADDLP, SADDLV, SADDW, SADDW2, SHADD, SHL, SHLL, SHLL2, SHRIN, SHRIN2, SHSUB, SLI, SMAX, SMAXP, SMAXV, SMIN, SMINP, SMINV, SMLAL, SMLAL2, SMLS, SMLS2, SMOV, SMULL, SMULL2, SRI, SSHL, SSHLL, SSHLL2, SSHR, SSRA, SSUB, SSUB2, SSUBW, SSUBW2, SUB, SUBH, SUBH2, SXTL, SXTL2, TBL, TBX, TRN1, TRN2, UABA, UABAL, UABAL2, UABD, UABDL, UABDL2, UADALP, UADDL, UADDL2, UADDLP, UADDLV, UADDW, UADDW2, UHADD, UHSUB, UMAX, UMAXP, UMAXV, UMIN, UMINP, UMINV, UMLAL, UMLAL2, UMLS, UMLS2, UMULL, UMULL2, USHL, USHLL, USHLL2, USHR, USRA, USUB, USUB2, USUBW, USUBW2, UXTL, UXTL2, UZP1, UZP2, XTN, XTN2, ZIP1, and ZIP2.

Note

The architecture makes no statement about the timing properties when the PSTATE.DIT bit is not set. However, it is likely that many of these instructions have timing that is invariant of the data in many situations.

In particular, Arm strongly recommends that the Armv8.3 pointer authentication instructions do not have their timing dependent on the key value used in the pointer authentication in all cases, regardless of the PSTATE.DIT bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Bits [23:0]

Reserved, RES0.

Accessing DIT

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DIT

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b101

```
if PSTATE.EL == EL0 then
    return Zeros(39):PSTATE.DIT:Zeros(24);
elsif PSTATE.EL == EL1 then
    return Zeros(39):PSTATE.DIT:Zeros(24);
elsif PSTATE.EL == EL2 then
    return Zeros(39):PSTATE.DIT:Zeros(24);
elsif PSTATE.EL == EL3 then
    return Zeros(39):PSTATE.DIT:Zeros(24);
```

MSR DIT, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b101

```

DSPSR_EL0, Debug Saved Program Status Register

The DSPSR_EL0 characteristics are:

Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

Configuration

AArch64 System register DSPSR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DSPSR\[31:0\]](#).

Attributes

DSPSR_EL0 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0** ~~any Exception level~~ and exiting Debug state to AArch32 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]	DIT	SSBS	PAN	SS	IL	GE	IT[7:2]	E	A	I	F	T	M[4]	M[3:0]												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Copied to PSTATE.N on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Copied to PSTATE.Z on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Copied to PSTATE.C on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Copied to PSTATE.V on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Copied to PSTATE.Q on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Copied to PSTATE.IT on exiting Debug state.

DPSR_EL0.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is DPSR_EL0[26:25].
- IT[7:2] is DPSR_EL0[15:10].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Copied to PSTATE.DIT on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Copied to PSTATE.SSBS on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Copied to PSTATE.PAN on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Copied to PSTATE.SS on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Copied to PSTATE.IL on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Copied to PSTATE.GE on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR_EL0.E is RES0. If the implementation does not support little-endian operation, DSPSR_EL0.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR_EL0.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR_EL0.E is RES1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Copied to PSTATE.A on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Copied to PSTATE.I on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Copied to PSTATE.F on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Copied to PSTATE.T on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Copied to PSTATE.nRW on exiting Debug state.

M[4]	Meaning
0b1	AArch32 execution state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Copied to PSTATE.M[3:0] on exiting Debug state.

M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0110	Monitor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If DPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When AArch64 is supported at the highest implemented any Exception level and entering or exiting Debug state from or to AArch64 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	RES0	TC	DIT	UA	OP	AN	SS	IL	RES0				SSBS	BTYPE	D	A	I	F	RES0	M[4]	M[3:0]							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on entering Debug state, and copied to PSTATE.TCO on exiting Debug state.

When FEAT_MTE2 is not implemented, it is CONSTRAINED UNPREDICTABLE whether this field is RES0 or behaves as if FEAT_MTE is implemented.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on entering Debug state, and copied to PSTATE.UAO on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:13]

Reserved, RES0.

SSBS, bit [12]**When FEAT_SSBS is implemented:**

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYP, bits [11:10]**When FEAT_BTI is implemented:**

Branch Type Indicator. Set to the value of PSTATE.BTYPE on entering Debug state, and copied to PSTATE.BTYPE on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on entering Debug state, and copied to PSTATE.D on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

Error interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on entering Debug state from AArch64 state, and copied to PSTATE.nRW on exiting Debug state.

M[4]	Meaning
0b0	AArch64 execution state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.
0b1000	EL2t.
0b1001	EL2h.
0b1100	EL3t.
0b1101	EL3h.

Other values are reserved. If DPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on entering Debug state and copied to PSTATE.EL on exiting Debug state.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on entering Debug state and copied to PSTATE.SP on exiting Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DPSR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DPSR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    return DPSR_EL0;
```

MSR DSPSR_EL0, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    DSPSR_EL0 = X[t];
```

DVP RCTX, Data Value Prediction Restriction by Context

The DVP RCTX characteristics are:

Purpose

Data Value Prediction Restriction by Context applies to all Data Value Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

Data value predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when FEAT_SPECRES is implemented. Otherwise, direct accesses to DVP RCTX are UNDEFINED.

Attributes

DVP RCTX is a 64-bit System instruction.

RES0															GVMID	VMID																
RES0				NSENS	EL	RES0									GASID	ASID																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:49]

Reserved, RES0.

GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==1](#) and [HCR_EL2.TGE==1](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

If the implementation supports 16 bits of VMID, then the upper 8 bits of the VMID must be written to 0 by software when the context being affected only uses 8 bits.

Bits [31:28]

Reserved, RES0.

NSE, bit [27]

When FEAT_RME is implemented:

Together with the NS field, selects the Security state.

For a description of the values derived by evaluating NS and NSE together, see DVP_RCTX.NS.

Otherwise:

Reserved, RES0.

NS, bit [26]

When FEAT_RME is implemented:

Together with the NSE field, selects the Security state. Defined values are:

NSE	NS	Meaning
0b0	0b0	Secure.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Some Effective values are determined by the current Security state:

When executed in Secure state, the Effective value of NSE is 0.

When executed in Non-secure state, the Effective value of {NSE, NS} is {0, 1}.

When executed in Realm state, the Effective value of {NSE, NS} is {1, 1}.

- When executed in Secure state, the Effective value of NSE is 0.
- When executed in Non-secure state, the Effective value of {NSE, NS} is {0, 1}.
- When executed in Realm state, the Effective value of {NSE, NS} is {1, 1}.

An instruction with an EL field that has a value other than 0b11 (EL3) is treated as a NOP when executed at EL3 with DVP_RCTX.{NSE, NS} == {1, 0}.

Otherwise:

Security State. Defined values are:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASID for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being affected only uses 8 bits.

Executing the DVP RCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

DVP RCTX, <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b101

```

if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTL_EL1.EnRCTX == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);

ERXADDR_EL1, Selected Error Record Address Register

The ERXADDR_EL1 characteristics are:

Purpose

Accesses [ERR<n>ADDR](#) for the error record <n> selected by [ERRSELR_EL1](#).SEL.

Configuration

AArch64 System register ERXADDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERXADDR\[31:0\]](#).

AArch64 System register ERXADDR_EL1 bits [63:32] are architecturally mapped to AArch32 System register [ERXADDR2\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR_EL1 are UNDEFINED.

Attributes

ERXADDR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ERR<n>ADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ERR<n>ADDR																															

Bits [63:0]

ERXADDR_EL1 accesses [ERR<n>ADDR](#), where <n> is the value in [ERRSELR_EL1](#).SEL.

Accessing ERXADDR_EL1

If [ERRIDR_EL1](#).NUM **is==** 0x0000 or [ERRSELR_EL1](#).SEL is greater than or equal to [ERRIDR_EL1](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR_EL1 is RAZ/WI.
- Direct reads and writes of ERXADDR_EL1 are NOPs.
- Direct reads and writes of ERXADDR_EL1 are UNDEFINED.

[ERR<n>ADDR](#) describes additional constraints that also apply when [ERR<n>ADDR](#) is accessed through ERXADDR_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERXADDR_EL1

ERXCTLR_EL1, Selected Error Record Control Register

The ERXCTLR_EL1 characteristics are:

Purpose

Accesses [ERR<n>CTLR](#) for the error record <n> selected by [ERRSELR_EL1](#).SEL.

Configuration

AArch64 System register ERXCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ERXCTLR\[31:0\]](#).

AArch64 System register ERXCTLR_EL1 bits [63:32] are architecturally mapped to AArch32 System register [ERXCTLR2\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXCTLR_EL1 are UNDEFINED.

Attributes

ERXCTLR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ERR<n>CTLR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ERR<n>CTLR																															

Bits [63:0]

ERXCTLR_EL1 accesses [ERR<n>CTLR](#), where <n> is the value in [ERRSELR_EL1](#).SEL.

Accessing ERXCTLR_EL1

If [ERRIDR_EL1](#).NUM is `0x0000` or [ERRSELR_EL1](#).SEL is greater than or equal to [ERRIDR_EL1](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTLR_EL1 is RAZ/WI.
- Direct reads and writes of ERXCTLR_EL1 are NOPs.
- Direct reads and writes of ERXCTLR_EL1 are UNDEFINED.

If [ERRSELR_EL1](#).SEL is not the index of the first error record owned by a node, then [ERR<n>CTLR](#) is not present, meaning reads and writes of ERXCTLR_EL1 are RES0.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERXCTLR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0100	0b001

```

ERXPFGCDN_EL1, Selected Pseudo-fault Generation Countdown register

The ERXPFGCDN_EL1 characteristics are:

Purpose

Accesses [ERR<n>PFGCDN](#) for the error record <n> selected by [ERRSELR_EL1](#).SEL.

Configuration

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXPFGCDN_EL1 are UNDEFINED.

Attributes

ERXPFGCDN_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ERR<n>PFGCDN																															
ERR<n>PFGCDN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

ERXPFGCDN_EL1 accesses [ERR<n>PFGCDN](#), where <n> is the value in [ERRSELR_EL1](#).SEL.

Accessing ERXPFGCDN_EL1

If [ERRIDR_EL1](#).NUM **is** 0x0000 or [ERRSELR_EL1](#).SEL is greater than or equal to [ERRIDR_EL1](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXPFGCDN_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCDN_EL1 are NOPs.
- Direct reads and writes of ERXPFGCDN_EL1 are UNDEFINED.

If [ERRSELR_EL1](#).SEL selects an error record owned by a node that does not implement the **RAS** Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGCDN_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCDN_EL1 are NOPs.
- Direct reads and writes of ERXPFGCDN_EL1 are UNDEFINED.

Note

A node does not implement the **RAS** Common Fault Injection Model Extension **ifwhen** [ERR<q>FR](#).INJ **reads as** 0b00. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in [ERRSELR_EL1](#).SEL. If the node owns a single record, then q = n.

If [ERRSELR_EL1](#).SEL is not the index of the first error record owned by a node, then [ERR<n>PFGCDN](#) is not present, meaning reads and writes of ERXPFGCDN_EL1 are RES0.

[ERR<n>PFGCDN](#) describes additional constraints that also apply when [ERR<n>PFGCDN](#) is accessed through ERXPFPGCDN_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ERXPFPGCDN_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0100	0b110

ESR_EL1, Exception Syndrome Register (EL1)

The ESR_EL1 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL1.

Configuration

AArch64 System register ESR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DFSR\[31:0\]](#).

Attributes

ESR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																																ISS2			
EC								IL		ISS																									
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

ESR_EL1 is made UNKNOWN as a result of an exception return from EL1.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL1, the value of ESR_EL1 is UNKNOWN. The value written to ESR_EL1 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:37]

Reserved, RES0.

ISS2, bits [36:32]

When FEAT_LS64 is implemented:

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

Otherwise:

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WF* instruction	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported at EL0any Exception level
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported at EL0any Exception level
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported at EL0any Exception level
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: <ul style="list-style-type: none"> An STC to write data to memory from DBGDTRRXint. An LDC to read data from memory to DBGDTRTXint. 	ISS encoding for an exception from an LDC or STC instruction	When AArch32 is supported at EL0any Exception level
0b000111	Access to SME , SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN , CPTR_EL2.FPEN , CPTR_EL2.TFP , or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1'.	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality resulting from the FPEN and TFP traps	
0b001010	Trapped execution of an LD64B, ST64B, ST64BV, or	ISS encoding for an exception from an LD64B	When FEAT_LS64 is implemented

0b001100	ST64BV0 instruction. Trapped MRRC access with (coproc==0b1110).	or ST64B* instruction ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported at EL0 any Exception level
0b001101	Branch Target Exception.	ISS encoding for an exception from Branch Target Identification instruction	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b010001	SVC instruction execution in AArch32 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch32 is supported at EL0 any Exception level
0b010101	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported at the highest implemented any Exception level
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001, or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	When AArch64 is supported at the highest implemented any Exception level
0b011001	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN , CPTR_EL2.ZEN , CPTR_EL2.TZ , or CPTR_EL3.EZ , that is not reported using EC 0b000000.	ISS encoding for an exception from an access to SVE functionality resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ	When FEAT_SVE is implemented
0b011011	Exception from an access to a TSTART instruction at EL0 when SCTLR_EL1.TME0 == 0, EL0 when SCTLR_EL2.TME0 == 0, at EL1 when SCTLR_EL1.TME == 0, at EL2 when	ISS encoding for an exception from a TSTART instruction	When FEAT_TME is implemented

	SCTLR_EL2.TME == 0 or at EL3 when SCTLR_EL3.TME == 0.		
0b011100	Exception from a Pointer Authentication instruction authentication failure	ISS encoding for an exception from a Pointer Authentication instruction authentication failure	When FEAT_FPAC is implemented
0b011101	Access to SME functionality trapped as a result of CPACR_EL1.SMEN , CPTR_EL2.SMEN , CPTR_EL2.TSM , CPTR_EL3.ESM , or an attempted execution of an instruction that is illegal because of the value of PSTATE.SM or PSTATE.ZA , that is not reported using EC 0b000000 .	ISS encoding for an exception due to SME functionality	When FEAT_SME is implemented
0b011110	Exception from a Granule Protection Check	ISS encoding for an exception from a Granule Protection Check	When FEAT_RME is implemented
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug- related exceptions.	ISS encoding for an exception from an Instruction Abort	
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug- related exceptions.	ISS encoding for an exception from an Instruction Abort	
0b100010	PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b100100	Data Abort from a lower Exception level.	ISS encoding for an exception from a Data Abort	

	Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.		
0b100101	Data Abort taken without a change in Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort	
0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b101000	Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	When AArch32 is supported at EL0 any Exception level
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a	ISS encoding for an exception from a trapped floating-point exception	When AArch64 is supported at the highest implemented any Exception level

	floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.		
0b101111	SError interrupt.	ISS encoding for an SError interrupt	
0b110000	Breakpoint exception from a lower Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110001	Breakpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110010	Software Step exception from a lower Exception level.	ISS encoding for an exception from a Software Step exception	
0b110011	Software Step exception taken without a change in Exception level.	ISS encoding for an exception from a Software Step exception	
0b110100	Watchpoint exception from a lower Exception level.	ISS encoding for an exception from a Watchpoint exception	
0b110101	Watchpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Watchpoint exception	
0b111000	BKPT instruction execution in AArch32 state.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch32 is supported at EL0 any Exception level
0b111100	BRK instruction execution in AArch64 state.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch64 is supported at the highest implemented any Exception level

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: <ul style="list-style-type: none"> • An SError interrupt. • An Instruction Abort exception. • A PC alignment fault exception. • An SP alignment fault exception. • A Data Abort exception for which the value of the ISV bit is 0. • An Illegal Execution state exception. • Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning: <ul style="list-style-type: none"> ◦ 0b0: 16-bit T32 BKPT instruction. ◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction. • An exception reported using EC value 0b000000.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
 - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
 - The value 0b11111.

ISS encoding for exceptions with an unknown reason

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												

Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
 - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
 - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
 - Instruction encodings that are unallocated.
 - Instruction encodings for instructions or System registers that are not implemented in the implementation.

- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR_EL1](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
 - An HVC instruction when disabled by [HCR_EL2](#).HCD or [SCR_EL3](#).HCE.
 - An SMC instruction when disabled by [SCR_EL3](#).SMD.
 - An HLT instruction when disabled by [EDSCR](#).HDE.
- Attempted execution of an MSR or MRS instruction to access [SP_EL0](#) when the value of [SPSel](#).SP is 0.
- Attempted execution of an MSR or MRS instruction using a [_EL12](#) register name when [HCR_EL2](#).E2H == 0.
- Attempted execution, in Debug state, of:
 - A DCPS1 instruction when the value of [HCR_EL2](#).TGE is 1 and EL2 is disabled or not implemented in the current Security state.
 - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
 - A DCPS3 instruction when the value of [EDSCR](#).SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using [R13_mon](#). See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- In Debug state when the value of [EDSCR](#).SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to [SPSR_mon](#), [SP_mon](#), or [LR_mon](#).
- An exception that is taken to EL2 because the value of [HCR_EL2](#).TGE is 1 that, if the value of [HCR_EL2](#).TGE was 0 would have been reported with an [ESR_ELx](#).EC value of 0b000111.
- In Non-transactional state, attempted execution of a TCOMMIT instruction.

ISS encoding for an exception from a WF* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0										RNTI		RES0		RV	TI				

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:102]

Reserved, RES0.

RN, bits [9:5]

When FEAT_WFXT2 is implemented:

Indicates the Register Number supplied for a WFET or WFIT instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

RV, bit [2]

When FEAT_WFXT2 is implemented:

Register field Valid.

If TI[1] == 1, then this field indicates whether RN holds a valid register number for the register argument to the trapped WFET or WFIT instruction.

RV	Meaning
0b0	Register field invalid.
0b1	Register field valid.

If TI[1] == 0, then this field is RES0.

When FEAT_WFXT2 is implemented, RV is set to 1 on a trap on WFET or WFIT.

When FEAT_WFXT2 is not implemented, RV is set to 0 on a trap on WFET or WFIT.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b00	WFI trapped.	
0b01	WFE trapped.	
0b10	WFIT trapped.	When FEAT_WFXT is implemented
0b11	WFET trapped.	When FEAT_WFXT is implemented

When FEAT_WFXT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- [SCTLR_EL1](#).{nTWE, nTWI}.
- [HCR_EL2](#).{TWE, TWI}.
- [SCR_EL3](#).{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc2			Opc1			CRn			Rt			CRm			Direction				

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

If the Rt value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.

- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, ELOPCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TCPAC, for accesses to [CPACR_EL1](#) or [CPACR](#) using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HSTR_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL_EL2](#).EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.

- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL3](#).TCPAC, for accesses to [CPACR](#) from EL1 and EL2, and accesses to [HCPTR](#) from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- For information on other traps using EC value 0b000011, see 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- If FEAT_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [CPACR_EL1](#).TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDSCR_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [HCR_EL2](#).TID0, for accesses to the [JIDR](#) register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL2](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and [DBGDSAR](#) using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL3](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR_EL3](#).TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR_EL3](#).TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- [HCR_EL2](#).TID0, for accesses to the [FPSID](#) register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- [HCR_EL2](#).TID3, for accesses to registers in ID group 3 including [MVFR0](#), [MVFR1](#) and [MVFR2](#), VMRS access trapped to EL2.

ISS encoding for an exception from an LD64B or ST64B* instruction

ISS, bits [24:0]

ISS	Meaning
0b00000000000000000000000000000000	ST64BV instruction trapped.
0b00000000000000000000000000000001	ST64BV0 instruction trapped.
0b00000000000000000000000000000010	LD64B or ST64B instruction trapped.

All other values are reserved.

ISS encoding for an exception from an MCRR or MRRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc1				RES0	Rt2				Rt				CRm				Direction		

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

If the Rt2 value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt2 value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

If the Rt value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [HSTR_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT_FGT is implemented, [HDFGRTR_EL2](#).PMCCNTR_EL0 for MRRC access and [HDFGWTR_EL2](#).PMCCNTR_EL0 for MCRR access to [PMCCNTR](#) at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- [MDSCR_EL1](#).TDCC, for accesses to the Debug ROM registers [DBGDSAR](#) and [DBGDRAR](#) at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and [DBGDSAR](#) using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL3](#).TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- [CPACR_EL1](#).TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [CPTR_EL2](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL3](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

ISS encoding for an exception from an LDC or STC instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
CV	COND				imm8								RES0		Rn				Offset		AM		Direction		

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer.

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

If the Rn value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rn value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b1111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b1111.

See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- [MDSCR_EL1](#).TDCC, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) trapped to EL1 or EL2.
- [MDCR_EL2](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL2.
- [MDCR_EL3](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL3.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPen and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.
- Execution of SME instructions.

For an implementation that does not include either SVE or support for Advanced SIMD and floating-point, the exception is reported using the EC value 0b000000.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000111:

- [CPACR_EL1.FPEN](#), for accesses to SIMD and floating-point registers trapped to EL1.
- [CPTR_EL2.FPEN](#) and [CPTR_EL2.TFP](#), for accesses to SIMD and floating-point registers trapped to EL2.
- [CPTR_EL3.TFP](#), for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTTR_EL2.ZEN, CPTTR_EL2.TZ, or CPTTR_EL3.EZ

The accesses covered by this trap include:

- Execution of SVE instructions when the PE is not in Streaming SVE mode. instructions.
- Accesses to the SVE System registers, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

Bits [24:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value 0b011001:

- [CPACR_EL1](#).ZEN, for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL1.
- [CPTR_EL2](#).ZEN and [CPTR_EL2](#).TZ, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- [CPTR_EL3](#).EZ, for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions, see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from HVC or SVC instruction execution

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
 - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
 - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT_FGT is implemented, [HFGITR_EL2](#).{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
CV	COND				CCKNOWNPASS				RES0																

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR_EL2](#).TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

Note

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

[HCR_EL2.TSC](#) describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from SMC instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										imm16														

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

[HCR_EL2.TSC](#) describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				Op0		Op2		Op1			CRn				Rt				CRm			Direction		

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- [SCTLR_EL1](#).UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).UCT, for accesses to [CTR_EL0](#) using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [CPACR_EL1](#).TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [MDSCR_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TCPAC, for accesses to [CPACR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TTRF, for accesses to the trace filter control register, [TRFCR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.

- [HCR_EL2](#).{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR_EL2](#).AT, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR_EL2](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- [SCR_EL3](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR_EL3](#).ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR_EL3](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TCPAC, for accesses to [CPTR_EL2](#) and [CPACR_EL1](#) using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TTRF, for accesses to the trace filter control registers, [TRFCR_EL1](#) and [TRFCR_EL2](#), using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
 - [HCR_EL2](#).{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
 - [HCR2](#).{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT_FGT is implemented:
 - [SCR_EL3](#).FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
 - [HFGTR_EL2](#) for reads and [HFGWTR_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
 - [HFGITR_EL2](#) for execution of system instructions, MSR or MRS access trapped to EL2
 - [HDFGTR_EL2](#) for reads and [HDFGWTR_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
 - [HAFGTR_EL2](#) for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																								

IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Instruction Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												SET	FnV	EA	RES0	S1PTW	RES0	IFSC						

Bits [24:13]

Reserved, RES0.

SET, bits [12:11]**When FEAT_RAS is implemented:**

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or	When FEAT_RAS is

0b011111	hardware update of translation table, level 2. Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	not implemented When FEAT_RAS is not implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception due to SME functionality

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																							SMTc	

The accesses covered by this trap include:

- Execution of SME instructions.
- Execution of SVE and Advanced SIMD instructions, when the PE is in Streaming SVE mode.
- Direct accesses of the [SVCR](#), and the SME System registers [SMCR_EL1](#), [SMCR_EL2](#), [SMCR_EL3](#), [SMPRI_EL1](#), and [SMPRMAP_EL2](#).

Bits [24:2]

Reserved, RES0.

SMTC, bits [1:0]

SME Trap Code. Identifies the reason for instruction trapping.

SMTC	Meaning
0b00	Access to SME functionality trapped as a result of CPACR_EL1.SMEN , CPTR_EL2.SMEN , CPTR_EL2.TSM , or CPTR_EL3.ESM , that is not reported using EC 0b000000.
0b01	Advanced SIMD, SVE, or SVE2 instruction trapped because PSTATE.SM is 1.
0b10	SME instruction trapped because PSTATE.SM is 0.
0b11	SME instruction trapped because PSTATE.ZA is 0.

The following fields describe the configuration settings for the traps that are reported using the EC value 0b011101:

- [CPACR_EL1.SMEN](#), for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access the [SVCR](#) and [SMCR_EL1](#) System registers at EL1 and EL0 to EL1.
- [CPTR_EL2.SMEN](#) and [CPTR_EL2.TSM](#), for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access the [SVCR](#), [SMCR_EL1](#), and [SMCR_EL2](#) System registers at EL2, EL1, or EL0 to EL2.
- [CPTR_EL3.ESM](#), for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access the [SVCR](#) and other SME System registers from all Exception levels and any Security state, to EL3.

ISS encoding for an exception from a Granule Protection Check

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0		S2PTW		InD	GPCSC					VNCR		RES0	RES0	CM	S1PTW	WnR	xFSC							

Bits [24:22]

Reserved, RES0.

S2PTW, bit [21]

Indicates whether the Granule Protection Check exception was on an access made for a stage 2 translation table walk.

S2PTW	Meaning
0b0	Fault not on a stage 2 translation table walk.
0b1	Fault on a stage 2 translation table walk.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

InD, bit [20]

Indicates whether the Granule Protection Check exception was on an instruction or data access.

InD	Meaning
0b0	Data access.
0b1	Instruction access.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GPCSC, bits [19:14]

Granule Protection Check Status Code.

GPCSC	Meaning
0b000000	GPT address size fault at level 0.
0b000001	GPT address size fault at level 1.
0b000100	GPT walk fault at level 0.
0b000101	GPT walk fault at level 1.
0b001100	Granule protection fault at level 0.
0b001101	Granule protection fault at level 1.
0b010100	Synchronous External abort on GPT fetch at level 0.
0b010101	Synchronous External abort on GPT fetch at level 1.

All other values are reserved.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VNCR, bit [13]

When FEAT_NV2 is implemented:

Indicates that the fault came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

When InD is '1', this field is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:11]

Reserved, RES0.

Bits [10:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

Indicates whether the Granule Protection Check exception was on an access for stage 2 translation for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

When InD is '1', this field is RES0.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

xFSC, bits [5:0]

Instruction or Data Fault Status Code.

xFSC	Meaning	Applies when
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	SAS	SSE				SRT			SF	AR	VNCR	Bits[12:11]	FnV	EA	CM	S1PTW	WnR						DFSC	

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
 - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
 - Is not performing register writeback.
 - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR_EL1 or ESR_EL3.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT_MTE2 is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR_ELx.FNV is 0 and FAR_ELx is valid.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

When ISV == 1:

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSE, bit [21]**When ISV == 1:**

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SRT, bits [20:16]**When ISV == 1:**

Syndrome Register Transfer. The register number of the Wt/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SF, bit [15]**When ISV == 1:**

Width of the register accessed by the instruction is Sixty-Four.

SF	Meaning
0b0	Instruction loads/stores a 32-bit wide register.
0b1	Instruction loads/stores a 64-bit wide register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AR, bit [14]

When ISV == 1:

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VNCR, bit [13]

When FEAT_NV2 is implemented:

Indicates that the fault came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SET, bits [12:11]

When FEAT_RAS is implemented and FEAT_LS64 is not implemented:

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_LS64 is implemented:

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

LST	Meaning
0b01	An ST64BV instruction generated the Data Abort.
0b10	An LD64B or ST64B instruction generated the Data Abort.
0b11	An ST64BV0 instruction generated the Data Abort.

All other values are reserved.

This field is valid only if the DFSC code is 0b110101. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE2 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented

0b0111110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b0111111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV							RES0						VECITR		IDF	RES0	IXF	UFF	OFF	DZF	IOF		

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from an instruction that is performing floating-point operations on more than one lane of a vector.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from an instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the [FPCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the [FPSCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDS	RES0										IESB	AET			EA	RES0			DFSC					

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
Note If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]

When **FEAT_IESB** is implemented:

Implicit error synchronization event.

IESB	Meaning
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]

When **FEAT_RAS** is implemented:

Asynchronous Error Type.

When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

AET	Meaning
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]**When FEAT_RAS is implemented:**

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]**When FEAT_RAS is implemented:**

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																			IFSC					

Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

ISS encoding for an exception from a Software Step exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
ISV		RES0																	EX		IFSC				

ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Software Step exceptions'.

ISS encoding for an exception from a Watchpoint exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
RES0										RES0VNCR		RES0				CMRES0WnR				DFSC					

Bits [24:15]

Reserved, RES0.

Bit [14]

Reserved, RES0.

VNCR, bit [13]

When FEAT_NV2 is implemented:

Indicates that the watchpoint came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR_EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

ISS encoding for an exception from execution of a Breakpoint instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										Comment														

Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																						ERET		ERETA

This EC value applies when FEAT_FGT is implemented, or when [HCR_EL2.NV](#) is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2.

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [HCR_EL2.NV](#).

If FEAT_FGT is implemented, [HFGITR_EL2](#).ERET controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

ISS encoding for an exception from a TSTART instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0															Rd					RES0				

Bits [24:10]

Reserved, RES0.

Rd, bits [9:5]

The Rd value from the issued instruction, the general purpose register used for the destination.

Bits [4:0]

Reserved, RES0.

ISS encoding for an exception from Branch Target Identification instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																							BTTYPE	

Bits [24:2]

Reserved, RES0.

BTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0

**Bits [24:0]**

Reserved, RES0.

For more information about generating these exceptions, see:

- [HCR_EL2.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- [SCR_EL3.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure

**Bits [24:2]**

Reserved, RES0.

Bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

Meaning	
0b0	Instruction Key.
0b1	Data Key.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a Translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

Accessing ESR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic ESR_EL1 or ESR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ESR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0010	0b000

ESR_EL2, Exception Syndrome Register (EL2)

The ESR_EL2 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL2.

Configuration

AArch64 System register ESR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HSR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ESR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
EC																ISS															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ESR_EL2 is made UNKNOWN as a result of an exception return from EL2.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of ESR_EL2 is UNKNOWN. The value written to ESR_EL2 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:37]

Reserved, RES0.

ISS2, bits [36:32]

When FEAT_LS64 is implemented:

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

Otherwise:

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WF* instruction	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported at EL0any Exception level
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported at EL0any Exception level
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported at EL0any Exception level
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: <ul style="list-style-type: none"> An STC to write data to memory from DBGDTRRXint. An LDC to read data from memory to DBGDTRTXint. 	ISS encoding for an exception from an LDC or STC instruction	When AArch32 is supported at EL0any Exception level
0b000111	Access to SME , SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN , CPTR_EL2.FPEN , CPTR_EL2.TFP , or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1'.	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality resulting from the FPEN and TFP traps	
0b001000	Trapped VMRS access, from ID group trap, that is	ISS encoding for an exception	When AArch32 is supported at

0b001001	not reported using EC 0b000111. Trapped use of a Pointer authentication instruction because HCR_EL2.API == 0 SCR_EL3.API == 0 .	from an MCR or MRC access ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 SCR_EL3.API == 0	EL0any Exception level When FEAT_PAuth is implemented
0b001010	Trapped execution of an LD64B, ST64B, ST64BV, or ST64BV0 instruction.	ISS encoding for an exception from an LD64B or ST64B* instruction	When FEAT_LS64 is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported at EL0any Exception level
0b001101	Branch Target Exception.	ISS encoding for an exception from Branch Target Identification instruction	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b010001	SVC instruction execution in AArch32 state. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TGE is 1.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch32 is supported at EL0any Exception level
0b010010	HVC instruction execution in AArch32 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch32 is supported at EL0any Exception level
0b010011	SMC instruction execution in AArch32 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.	ISS encoding for an exception from SMC instruction execution in AArch32 state	When AArch32 is supported at EL0any Exception level
0b010101	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported at the highest implementedany Exception level
0b010110	HVC instruction execution in AArch64 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported at the highest implementedany Exception level
0b010111	SMC instruction execution in AArch64 state, when SMC is not disabled.	ISS encoding for an exception from SMC instruction	When AArch64 is supported at the highest

	This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.	execution in AArch64 state	implemented any Exception level
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	When AArch64 is supported at the highest implemented any Exception level
0b011001	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN , CPTR_EL2.ZEN , CPTR_EL2.TZ , or CPTR_EL3.EZ , that is not reported using EC 0b000000.	ISS encoding for an exception from an access to SVE functionality resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ	When FEAT_SVE is implemented
0b011010	Trapped ERET, ERETAA, or ERETAB instruction execution.	ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction	When FEAT_PAuth is implemented and FEAT_NV is implemented
0b011011	Exception from an access to a TSTART instruction at EL0 when SCTLR_EL1.TME0 == 0, EL0 when SCTLR_EL2.TME0 == 0, at EL1 when SCTLR_EL1.TME == 0, at EL2 when SCTLR_EL2.TME == 0 or at EL3 when SCTLR_EL3.TME == 0.	ISS encoding for an exception from a TSTART instruction	When FEAT_TME is implemented
0b011100	Exception from a Pointer Authentication instruction authentication failure	ISS encoding for an exception from a Pointer Authentication instruction authentication failure	When FEAT_FPAC is implemented
0b011101	Access to SME functionality trapped as a result of	ISS encoding for an exception due to SME functionality	When FEAT_SME is implemented

	CPACR_EL1.SMEN , CPTR_EL2.SMEN , CPTR_EL2.TSM , CPTR_EL3.ESM , or an attempted execution of an instruction that is illegal because of the value of PSTATE.SM or PSTATE.ZA, that is not reported using EC 0b000000.		
0b011110	Exception from a Granule Protection Check	ISS encoding for an exception from a Granule Protection Check	When FEAT_RME is implemented
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	
0b100010	PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b100100	Data Abort from a lower Exception level, excluding Data Aborts taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. These Data Aborts might be generated from Exception levels in any Execution state. Used for MMU faults generated by data accesses, alignment faults	ISS encoding for an exception from a Data Abort	

	other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.		
0b100101	Data Abort without a change in Exception level, or Data Aborts taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort	
0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b101000	Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	When AArch32 is supported at EL0 any Exception level
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of	ISS encoding for an exception from a trapped floating-point exception	When AArch64 is supported at the highest implemented any Exception level

	floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.		
0b101111	SError interrupt.	ISS encoding for an SError interrupt	
0b110000	Breakpoint exception from a lower Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110001	Breakpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110010	Software Step exception from a lower Exception level.	ISS encoding for an exception from a Software Step exception	
0b110011	Software Step exception taken without a change in Exception level.	ISS encoding for an exception from a Software Step exception	
0b110100	Watchpoint from a lower Exception level, excluding Watchpoint Exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. These Watchpoint Exceptions might be generated from Exception levels using any Execution state.	ISS encoding for an exception from a Watchpoint exception	
0b110101	Watchpoint exceptions without a change in Exception level, or Watchpoint exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support.	ISS encoding for an exception from a Watchpoint exception	
0b111000	BKPT instruction execution in AArch32 state.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch32 is supported at EL0 any Exception level

0b111010	Vector Catch exception from AArch32 state. The only case where a Vector Catch exception is taken to an Exception level that is using AArch64 is when the exception is routed to EL2 and EL2 is using AArch64.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	When AArch32 is supported at EL0, any Exception level
0b111100	BRK instruction execution in AArch64 state.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch64 is supported at the highest implemented any Exception level

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: <ul style="list-style-type: none"> • An SError interrupt. • An Instruction Abort exception. • A PC alignment fault exception. • An SP alignment fault exception. • A Data Abort exception for which the value of the ISV bit is 0. • An Illegal Execution state exception. • Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning: <ul style="list-style-type: none"> ◦ 0b0: 16-bit T32 BKPT instruction. ◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction. • An exception reported using EC value 0b000000.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b11111.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
 - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
 - The value 0b11111.

ISS encoding for exceptions with an unknown reason

Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
 - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
 - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
 - Instruction encodings that are unallocated.
 - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR_EL1](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
 - An HVC instruction when disabled by [HCR_EL2](#).HCD or [SCR_EL3](#).HCE.
 - An SMC instruction when disabled by [SCR_EL3](#).SMD.
 - An HLT instruction when disabled by [EDSCR](#).HDE.
- Attempted execution of an MSR or MRS instruction to access [SP_EL0](#) when the value of [SPSel](#).SP is 0.
- Attempted execution of an MSR or MRS instruction using a [_EL12](#) register name when [HCR_EL2](#).E2H == 0.
- Attempted execution, in Debug state, of:
 - A DCPS1 instruction when the value of [HCR_EL2](#).TGE is 1 and EL2 is disabled or not implemented in the current Security state.
 - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
 - A DCPS3 instruction when the value of [EDSCR](#).SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon. See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- In Debug state when the value of [EDSCR](#).SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to [SPSR_mon](#), [SP_mon](#), or [LR_mon](#).
- An exception that is taken to EL2 because the value of [HCR_EL2](#).TGE is 1 that, if the value of [HCR_EL2](#).TGE was 0 would have been reported with an ESR_ELx.EC value of 0b000111.

- In Non-transactional state, attempted execution of a TCOMMIT instruction.

ISS encoding for an exception from a WF* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0										RNTI		RES0		RV	TI				

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:102]

Reserved, RES0.

RN, bits [9:5]**When FEAT_WFXT2 is implemented:**

Indicates the Register Number supplied for a WFET or WFIT instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

RV, bit [2]**When FEAT_WFXT2 is implemented:**

Register field Valid.

If TI[1] == 1, then this field indicates whether RN holds a valid register number for the register argument to the trapped WFET or WFIT instruction.

RV	Meaning
0b0	Register field invalid.
0b1	Register field valid.

If TI[1] == 0, then this field is RES0.

When FEAT_WFXT2 is implemented, RV is set to 1 on a trap on WFET or WFIT.

When FEAT_WFXT2 is not implemented, RV is set to 0 on a trap on WFET or WFIT.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b00	WFI trapped.	
0b01	WFE trapped.	
0b10	WFIT trapped.	When FEAT_WFXT is implemented
0b11	WFET trapped.	When FEAT_WFXT is implemented

When FEAT_WFXT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- [SCTLR_EL1](#).{nTWE, nTWI}.
- [HCR_EL2](#).{TWE, TWI}.

- [SCR_EL3](#).{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc2			Opc1			CRn			Rt			CRm			Direction				

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

If the Rt value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, ELOPCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TLTB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TCPAC, for accesses to [CPACR_EL1](#) or [CPACR](#) using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HSTR_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL_EL2](#).EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL3](#).TCPAC, for accesses to [CPACR](#) from EL1 and EL2, and accesses to [HCPTR](#) from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- For information on other traps using EC value 0b000011, see 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- If FEAT_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [CPACR_EL1](#).TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDSCR_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT_FGT is implemented, [MDSCR_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDSCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [HCR_EL2](#).TID0, for accesses to the [JIDR](#) register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL2](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and [DBGDSAR](#) using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.

- [MDCR_EL2](#).TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL3](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR_EL3](#).TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR_EL3](#).TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- [HCR_EL2](#).TID0, for accesses to the [FPSID](#) register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- [HCR_EL2](#).TID3, for accesses to registers in ID group 3 including [MVFR0](#), [MVFR1](#) and [MVFR2](#), VMRS access trapped to EL2.

ISS encoding for an exception from an LD64B or ST64B* instruction

ISS, bits [24:0]

ISS	Meaning
0b000000000000000000000000000000	ST64BV instruction trapped.
0b000000000000000000000000000001	ST64BV0 instruction trapped.
0b000000000000000000000000000010	LD64B or ST64B instruction trapped.

All other values are reserved.

ISS encoding for an exception from an MCRR or MRRC access

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

~~The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.~~

If the Rt2 value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt2 value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b1111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b1111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

If the Rt value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b1111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b1111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, ELOPCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [HSTR_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.

- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT_FGT is implemented, [HDFGRTR_EL2](#).PMCCNTR_EL0 for MRRC access and [HDFGWTR_EL2](#).PMCCNTR_EL0 for MCRR access to [PMCCNTR](#) at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- [MDSCR_EL1](#).TDCC, for accesses to the Debug ROM registers [DBGDSAR](#) and [DBGDRAR](#) at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and [DBGDSAR](#) using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL3](#).TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- [CPACR_EL1](#).TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [CPTR_EL2](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL3](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

ISS encoding for an exception from an LDC or STC instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				imm8								RES0	Rn				Offset	AM		Direction			

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer.

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

If the Rn value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rn value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b1111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b1111.

See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- [MDSCR_EL1](#).TDCC, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) trapped to EL1 or EL2.
- [MDCR_EL2](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL2.
- [MDCR_EL3](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL3.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEX and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.
- **Execution of SME instructions.**

For an implementation that does not include either SVE or support for Advanced SIMD and floating-point, the exception is reported using the EC value 0b000000.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000111:

- [CPACR_EL1.FPEN](#), for accesses to SIMD and floating-point registers trapped to EL1.
- [CPTR_EL2.FPEN](#) and [CPTR_EL2.TFP](#), for accesses to SIMD and floating-point registers trapped to EL2.
- [CPTR_EL3.TFP](#), for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ

The accesses covered by this trap include:

- Execution of SVE instructions when the PE is not in Streaming SVE mode. instructions.
- Accesses to the SVE System registers, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

Bits [24:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value 0b011001:

- [CPACR_EL1.ZEN](#), for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL1.
- [CPTR_EL2.ZEN](#) and [CPTR_EL2.TZ](#), for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- [CPTR_EL3.EZ](#), for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

**Bits [24:0]**

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions, see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from HVC or SVC instruction execution

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
 - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
 - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT_FGT is implemented, [HFGITR_EL2](#).{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR_EL2](#).TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

Note

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

[HCR_EL2.TSC](#) describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from SMC instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										imm16														

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

[HCR_EL2.TSC](#) describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0		Op0		Op2		Op1		CRn				Rt				CRm				Direction				

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- [SCTLR_EL1](#).UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).UCT, for accesses to [CTR_EL0](#) using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [CPACR_EL1](#).TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [MDSCR_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.

- [HCR_EL2](#).TLTB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TCPAC, for accesses to [CPACR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TTRF, for accesses to the trace filter control register, [TRFCR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR_EL2](#).AT, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR_EL2](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- [SCR_EL3](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR_EL3](#).ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR_EL3](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TCPAC, for accesses to [CPTR_EL2](#) and [CPACR_EL1](#) using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TTRF, for accesses to the trace filter control registers, [TRFCR_EL1](#) and [TRFCR_EL2](#), using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
 - [HCR_EL2](#).{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
 - [HCR2](#).{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT_FGT is implemented:
 - [SCR_EL3](#).FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
 - [HFGTR_EL2](#) for reads and [HFGWTR_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
 - [HFGITR_EL2](#) for execution of system instructions, MSR or MRS access trapped to EL2
 - [HDFGTR_EL2](#) for reads and [HDFGWTR_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
 - [HAFGTR_EL2](#) for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

ISS encoding for an IMPLEMENTATION DEFINED exception to EL3**IMPLEMENTATION DEFINED, bits [24:0]**

IMPLEMENTATION DEFINED.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Instruction Abort**Bits [24:13]**

Reserved, RES0.

SET, bits [12:11]

When FEAT_RAS is implemented:

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or	When FEAT_RAS is

0b011111	hardware update of translation table, level 2. Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	not implemented When FEAT_RAS is not implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception due to SME functionality

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																							SMTc	

The accesses covered by this trap include:

- Execution of SME instructions.
- Execution of SVE and Advanced SIMD instructions, when the PE is in Streaming SVE mode.
- Direct accesses of the [SVCR](#), and the SME System registers [SMCR_EL1](#), [SMCR_EL2](#), [SMCR_EL3](#), [SMPRI_EL1](#), and [SMPRMAP_EL2](#).

Bits [24:2]

Reserved, RES0.

SMTC, bits [1:0]

SME Trap Code. Identifies the reason for instruction trapping.

SMTC	Meaning
0b00	Access to SME functionality trapped as a result of CPACR_EL1.SMEN , CPTR_EL2.SMEN , CPTR_EL2.TSM , or CPTR_EL3.ESM , that is not reported using EC 0b000000.
0b01	Advanced SIMD, SVE, or SVE2 instruction trapped because PSTATE.SM is 1.
0b10	SME instruction trapped because PSTATE.SM is 0.
0b11	SME instruction trapped because PSTATE.ZA is 0.

The following fields describe the configuration settings for the traps that are reported using the EC value 0b011101:

- [CPACR_EL1.SMEN](#), for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access the [SVCR](#) and [SMCR_EL1](#) System registers at EL1 and EL0 to EL1.
- [CPTR_EL2.SMEN](#) and [CPTR_EL2.TSM](#), for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access the [SVCR](#), [SMCR_EL1](#), and [SMCR_EL2](#) System registers at EL2, EL1, or EL0 to EL2.
- [CPTR_EL3.ESM](#), for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access the [SVCR](#) and other SME System registers from all Exception levels and any Security state, to EL3.

ISS encoding for an exception from a Granule Protection Check

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	S2PTW	InD						GPCSC			VNCR	RES0	RES0	RES0	CM	S1PTW	WnR					xFSC		

Bits [24:22]

Reserved, RES0.

S2PTW, bit [21]

Indicates whether the Granule Protection Check exception was on an access made for a stage 2 translation table walk.

S2PTW	Meaning
0b0	Fault not on a stage 2 translation table walk.
0b1	Fault on a stage 2 translation table walk.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

InD, bit [20]

Indicates whether the Granule Protection Check exception was on an instruction or data access.

InD	Meaning
0b0	Data access.
0b1	Instruction access.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GPCSC, bits [19:14]

Granule Protection Check Status Code.

GPCSC	Meaning
0b000000	GPT address size fault at level 0.
0b000001	GPT address size fault at level 1.
0b000100	GPT walk fault at level 0.
0b000101	GPT walk fault at level 1.
0b001100	Granule protection fault at level 0.
0b001101	Granule protection fault at level 1.
0b010100	Synchronous External abort on GPT fetch at level 0.
0b010101	Synchronous External abort on GPT fetch at level 1.

All other values are reserved.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VNCR, bit [13]

When FEAT_NV2 is implemented:

Indicates that the fault came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

When InD is '1', this field is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:11]

Reserved, RES0.

Bits [10:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

Indicates whether the Granule Protection Check exception was on an access for stage 2 translation for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

When InD is '1', this field is RES0.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

xFSC, bits [5:0]

Instruction or Data Fault Status Code.

xFSC	Meaning	Applies when
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	SAS	SSE	SRT			SF	AR	VNCR	Bits[12:11]			FnV	EA	CM	S1PTW	WnR	DFSC							

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
 - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
 - Is not performing register writeback.
 - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR_EL1 or ESR_EL3.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT_MTE2 is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR_ELx.FNV is 0 and FAR_ELx is valid.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

When ISV == 1:

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSE, bit [21]**When ISV == 1:**

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SRT, bits [20:16]**When ISV == 1:**

Syndrome Register Transfer. The register number of the Wt/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SF, bit [15]**When ISV == 1:**

Width of the register accessed by the instruction is Sixty-Four.

SF	Meaning
0b0	Instruction loads/stores a 32-bit wide register.
0b1	Instruction loads/stores a 64-bit wide register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AR, bit [14]

When ISV == 1:

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VNCR, bit [13]

When FEAT_NV2 is implemented:

Indicates that the fault came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SET, bits [12:11]

When FEAT_RAS is implemented and FEAT_LS64 is not implemented:

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_LS64 is implemented:

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

LST	Meaning
0b01	An ST64BV instruction generated the Data Abort.
0b10	An LD64B or ST64B instruction generated the Data Abort.
0b11	An ST64BV0 instruction generated the Data Abort.

All other values are reserved.

This field is valid only if the DFSC code is 0b110101. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE2 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented

0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV	RES0										VECITR			IDF	RES0	IXF	UFF	OFF	DZF	IOF			

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from an instruction that is performing floating-point operations on more than one lane of a vector.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from an instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the [FPCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the [FPSCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
IDS		RES0										IESB		AET			EA		RES0			DFSC				

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
Note If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]

When FEAT_IESB is implemented:

Implicit error synchronization event.

IESB	Meaning
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]

When FEAT_RAS is implemented:

Asynchronous Error Type.

When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

AET	Meaning
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]**When FEAT_RAS is implemented:**

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]**When FEAT_RAS is implemented:**

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																				IFSC				

Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

ISS encoding for an exception from a Software Step exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
ISV		RES0																	EX		IFSC				

ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Software Step exceptions'.

ISS encoding for an exception from a Watchpoint exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										RES0VNCR		RES0			CMRES0WnR		DFSC							

Bits [24:15]

Reserved, RES0.

Bit [14]

Reserved, RES0.

VNCR, bit [13]

When FEAT_NV2 is implemented:

Indicates that the watchpoint came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR_EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

ISS encoding for an exception from execution of a Breakpoint instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										Comment														

Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																						ERET		ERETA

This EC value applies when FEAT_FGT is implemented, or when [HCR_EL2.NV](#) is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2.

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [HCR_EL2.NV](#).

If FEAT_FGT is implemented, [HFGITR_EL2.ERET](#) controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

ISS encoding for an exception from a TSTART instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0															Rd			RES0						

Bits [24:10]

Reserved, RES0.

Rd, bits [9:5]

The Rd value from the issued instruction, the general purpose register used for the destination.

Bits [4:0]

Reserved, RES0.

ISS encoding for an exception from Branch Target Identification instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																						BTTYPE		

Bits [24:2]

Reserved, RES0.

BTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0

**Bits [24:0]**

Reserved, RES0.

For more information about generating these exceptions, see:

- [HCR_EL2.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- [SCR_EL3.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure

**Bits [24:2]**

Reserved, RES0.

Bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

Meaning	
0b0	Instruction Key.
0b1	Data Key.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a Translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

Accessing ESR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic ESR_EL2 or ESR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ESR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0010	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

ESR_EL3, Exception Syndrome Register (EL3)

The ESR_EL3 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to ESR_EL3 are UNDEFINED.

Attributes

ESR_EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32					
RES0																											ISS2									
EC						IL	ISS																													
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					

ESR_EL3 is made UNKNOWN as a result of an exception return from EL3.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL3, the value of ESR_EL3 is UNKNOWN. The value written to ESR_EL3 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:37]

Reserved, RES0.

ISS2, bits [36:32]

When FEAT_LS64 is implemented:

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

Otherwise:

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WF* instruction	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported at EL0any Exception level
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported at EL0any Exception level
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported at EL0any Exception level
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: <ul style="list-style-type: none"> An STC to write data to memory from DBGDTRRXint. An LDC to read data from memory to DBGDTRTXint. 	ISS encoding for an exception from an LDC or STC instruction	When AArch32 is supported at EL0any Exception level
0b000111	Access to SME , SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN , CPTR_EL2.FPEN , CPTR_EL2.TFP , or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1'.	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps	
0b001001	Trapped use of a Pointer authentication instruction because	ISS encoding for an exception from a Pointer Authentication	When FEAT_PAuth is implemented

	HCR_EL2.API == 0 SCR_EL3.API == 0 .	instruction when HCR_EL2.API == 0 SCR_EL3.API == 0	
0b001010	Trapped execution of an LD64B, ST64B, ST64BV, or ST64BV0 instruction.	ISS encoding for an exception from an LD64B or ST64B* instruction	When FEAT_LS64 is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported at EL0any Exception level
0b001101	Branch Target Exception.	ISS encoding for an exception from Branch Target Identification instruction	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b010011	SMC instruction execution in AArch32 state, when SMC is not disabled.	ISS encoding for an exception from SMC instruction execution in AArch32 state	When AArch32 is supported at EL0any Exception level
0b010101	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported at the highest implementedany Exception level
0b010110	HVC instruction execution in AArch64 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported at the highest implementedany Exception level
0b010111	SMC instruction execution in AArch64 state, when SMC is not disabled.	ISS encoding for an exception from SMC instruction execution in AArch64 state	When AArch64 is supported at the highest implementedany Exception level
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	When AArch64 is supported at the highest implementedany Exception level
0b011001	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN , CPTR_EL2.ZEN ,	ISS encoding for an exception from access to SVE functionality resulting from	When FEAT_SVE is implemented

0b011011	CPTR_EL2.TZ , or CPTR_EL3.EZ , that is not reported using EC 0b000000. Exception from an access to a TSTART instruction at EL0 when SCTLR_EL1.TME0 == 0, EL0 when SCTLR_EL2.TME0 == 0, at EL1 when SCTLR_EL1.TME == 0, at EL2 when SCTLR_EL2.TME == 0 or at EL3 when SCTLR_EL3.TME == 0.	CPACR_EL1.ZEN , CPTR_EL2.ZEN , CPTR_EL2.TZ , or CPTR_EL3.EZ ISS encoding for an exception from a TSTART instruction	When FEAT_TME is implemented
0b011100	Exception from a Pointer Authentication instruction authentication failure	ISS encoding for an exception from a Pointer Authentication instruction authentication failure	When FEAT_FPAC is implemented
0b011101	Access to SME functionality trapped as a result of CPACR_EL1.SMEN , CPTR_EL2.SMEN , CPTR_EL2.TSM , CPTR_EL3.ESM , or an attempted execution of an instruction that is illegal because of the value of PSTATE.SM or PSTATE.ZA, that is not reported using EC 0b000000.	ISS encoding for an exception due to SME functionality	When FEAT_SME is implemented
0b011110	Exception from a Granule Protection Check	ISS encoding for an exception from a Granule Protection Check	When FEAT_RME is implemented
0b011111	IMPLEMENTATION DEFINED exception to EL3.	ISS encoding for an IMPLEMENTATION DEFINED exception to EL3	
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug- related exceptions.	ISS encoding for an exception from an Instruction Abort	
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by	ISS encoding for an exception from an Instruction Abort	

0b100010	instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions. PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b100100	Data Abort from a lower Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort	
0b100101	Data Abort taken without a change in Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort	
0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point	ISS encoding for an exception from a trapped floating-point exception	When AArch64 is supported at the highest implemented any Exception level

	exceptions is IMPLEMENTATION DEFINED.		
0b101111	SError interrupt.	ISS encoding for an SError interrupt	
0b111100	BRK instruction execution in AArch64 state. This is reported in ESR_EL3 only if a BRK instruction is executed in EL3. This is the only debug exception that can be taken to EL3 when EL3 is using AArch64.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch64 is supported at the highest implemented any Exception level

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped. This value is also used when the exception is one of the following: <ul style="list-style-type: none"> • An SError interrupt. • An Instruction Abort exception. • A PC alignment fault exception. • An SP alignment fault exception. • A Data Abort exception for which the value of the ISV bit is 0. • An Illegal Execution state exception. • Any debug exception except for Breakpoint instruction exceptions. • An exception reported using EC value 0b000000.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is 0b1111, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value 0b111111.

- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
 - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
 - The value 0b11111.

ISS encoding for exceptions with an unknown reason

Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
 - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
 - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
 - Instruction encodings that are unallocated.
 - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR_EL1](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
 - An HVC instruction when disabled by [HCR_EL2](#).HCD or [SCR_EL3](#).HCE.
 - An SMC instruction when disabled by [SCR_EL3](#).SMD.
 - An HLT instruction when disabled by [EDSCR](#).HDE.
- Attempted execution of an MSR or MRS instruction to access [SP_EL0](#) when the value of [SPSel](#).SP is 0.
- Attempted execution of an MSR or MRS instruction using a [_EL12](#) register name when [HCR_EL2](#).E2H == 0.
- Attempted execution, in Debug state, of:
 - A DCPS1 instruction when the value of [HCR_EL2](#).TGE is 1 and EL2 is disabled or not implemented in the current Security state.
 - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
 - A DCPS3 instruction when the value of [EDSCR](#).SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon. See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- In Debug state when the value of [EDSCR](#).SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to [SPSR_mon](#), [SP_mon](#), or [LR_mon](#).
- An exception that is taken to EL2 because the value of [HCR_EL2](#).TGE is 1 that, if the value of [HCR_EL2](#).TGE was 0 would have been reported with an [ESR_ELx](#).EC value of 0b000111.
- In Non-transactional state, attempted execution of a TCOMMIT instruction.

ISS encoding for an exception from a WF* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0										RNTI		RES0		RV	TI				

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:102]

Reserved, RES0.

RN, bits [9:5]

When FEAT_WFXT2 is implemented:

Indicates the Register Number supplied for a WFET or WFIT instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

RV, bit [2]**When FEAT_WFXT2 is implemented:**

Register field Valid.

If TI[1] == 1, then this field indicates whether RN holds a valid register number for the register argument to the trapped WFET or WFIT instruction.

RV	Meaning
0b0	Register field invalid.
0b1	Register field valid.

If TI[1] == 0, then this field is RES0.

When FEAT_WFXT2 is implemented, RV is set to 1 on a trap on WFET or WFIT.

When FEAT_WFXT2 is not implemented, RV is set to 0 on a trap on WFET or WFIT.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b00	WFI trapped.	
0b01	WFE trapped.	
0b10	WFIT trapped.	When FEAT_WFXT is implemented
0b11	WFET trapped.	When FEAT_WFXT is implemented

When FEAT_WFXT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- [SCTLR_EL1](#).{nTWE, nTWI}.
- [HCR_EL2](#).{TWE, TWI}.
- [SCR_EL3](#).{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc2			Opc1			CRn			Rt			CRm			Direction				

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

~~The Rt value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.~~

If the Rt value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- [CNTCTL_EL1](#).{ELOPTEN, EL0VTEN, ELOPCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HCR_EL2](#).{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TCPAC, for accesses to [CPACR_EL1](#) or [CPACR](#) using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [HSTR_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL_EL2](#).EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL3](#).TCPAC, for accesses to [CPACR](#) from EL1 and EL2, and accesses to [HCPTR](#) from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- For information on other traps using EC value 0b000011, see 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- If FEAT_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- [CPACR_EL1](#).TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDCR_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [HCR_EL2](#).TID0, for accesses to the [JIDR](#) register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL2](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and [DBGDSAR](#) using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL2](#).TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL3](#).TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- [MDCR_EL3](#).TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

- [MDCR_EL3.TDA](#), for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- [HCR_EL2.TID0](#), for accesses to the [FPSID](#) register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- [HCR_EL2.TID3](#), for accesses to registers in ID group 3 including [MVFR0](#), [MVFR1](#) and [MVFR2](#), VMRS access trapped to EL2.

ISS encoding for an exception from an LD64B or ST64B* instruction

ISS																								

ISS, bits [24:0]

ISS	Meaning
0b000000000000000000000000000000	ST64BV instruction trapped.
0b000000000000000000000000000001	ST64BV0 instruction trapped.
0b000000000000000000000000000010	LD64B or ST64B instruction trapped.

All other values are reserved.

ISS encoding for an exception from an MCRR or MRRC access

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				Opc1				RES0	Rt2				Rt				CRm				Direction		

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.

- If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

~~The Rt2 value from the issued instruction, the second general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.~~

If the Rt2 value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt2 value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b1111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b1111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

~~The Rt value from the issued instruction, the first general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.~~

If the Rt value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [HSTR_EL2](#).T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CNTHCTL_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.

- If FEAT_FGT is implemented, [HDFGRTR_EL2](#).PMCCNTR_EL0 for MRRC access and [HDFGWTR_EL2](#).PMCCNTR_EL0 for MCRR access to [PMCCNTR](#) at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- [MDSCR_EL1](#).TDCC, for accesses to the Debug ROM registers [DBGDSAR](#) and [DBGDRAR](#) at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers [DBGDRAR](#) and [DBGDSAR](#) using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [MDCR_EL3](#).TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- [CPACR_EL1](#).TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- [CPTR_EL2](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- [CPTR_EL3](#).TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

ISS encoding for an exception from an LDC or STC instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				imm8								RES0	Rn				Offset	AM		Direction			

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer.

The Rn value from the issued instruction, the general-purpose register used for the transfer. The reported value gives the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

If the Rn value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rn value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b1111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
 - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
 - The value 0b1111.

See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- [MDSCR_EL1](#).TDCC, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) trapped to EL1 or EL2.
- [MDCR_EL2](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL2.
- [MDCR_EL3](#).TDA, for accesses using AArch32 state, LDC access to [DBGDTRTXint](#) or STC access to [DBGDTRRXint](#) MCR or MRC access trapped to EL3.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPen and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.

- Accesses to the Advanced SIMD and floating-point System registers.
- **Execution of SME instructions.**

For an implementation that does not include either SVE or support for Advanced SIMD and floating-point, the exception is reported using the EC value 0b000000.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000111:

- [CPACR_EL1.FPEN](#), for accesses to SIMD and floating-point registers trapped to EL1.
- [CPTR_EL2.FPEN](#) and [CPTR_EL2.TFP](#), for accesses to SIMD and floating-point registers trapped to EL2.

- [CPTR_EL3.TFP](#), for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ

The accesses covered by this trap include:

- Execution of SVE instructions when the PE is not in Streaming SVE mode. instructions.
- Accesses to the SVE System registers, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value 0b000000.

Bits [24:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value 0b011001:

- [CPACR_EL1.ZEN](#), for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL1.
- [CPTR_EL2.ZEN](#) and [CPTR_EL2.TZ](#), for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- [CPTR_EL3.EZ](#), for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions, see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from HVC or SVC instruction execution

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
 - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
 - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT_FGT is implemented, [HFGITR_EL2](#).{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				CCKNOWNPASS								RES0											

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because [HCR_EL2](#).TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
 - If the instruction is conditional, COND is set to the condition code field value from the instruction.
 - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
 - With COND set to 0b1110, the value for unconditional.
 - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
 - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
 - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

Note

In an implementation in which an SMC instruction that fails its code check is not trapped, this field can always return the value 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

[HCR_EL2.TSC](#) describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from SMC instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										imm16														

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

[HCR_EL2](#).TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				Op0		Op2		Op1		CRn			Rt				CRm			Direction				

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- [SCTLR_EL1](#).UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).UCT, for accesses to [CTR_EL0](#) using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [SCTLR_EL1](#).UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [CPACR_EL1](#).TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [MDSCR_EL1](#).TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT_FGT is implemented, [MDCR_EL2](#).TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and [MDCR_EL3](#).TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- [CNTKCTL_EL1](#).{ELOPTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [PMUSERENR_EL0](#).{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [AMUSERENR_EL0](#).EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- [HCR_EL2](#).{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TACR, for accesses to the Auxiliary Control Register, [ACTLR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.

- [HCR_EL2](#).{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TCPAC, for accesses to [CPACR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TTRF, for accesses to the trace filter control register, [TRFCR_EL1](#), using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [CNTHCTL_EL2](#).{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- [MDCR_EL2](#).{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [CPTR_EL2](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- [HCR_EL2](#).{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR_EL2](#).AT, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- [HCR_EL2](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- [SCR_EL3](#).APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR_EL3](#).ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [SCR_EL3](#).{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TCPAC, for accesses to [CPTR_EL2](#) and [CPACR_EL1](#) using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TTRF, for accesses to the trace filter control registers, [TRFCR_EL1](#) and [TRFCR_EL2](#), using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [MDCR_EL3](#).TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- [CPTR_EL3](#).TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
 - [HCR_EL2](#).{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
 - [HCR2](#).{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT_FGT is implemented:
 - [SCR_EL3](#).FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
 - [HFGTR_EL2](#) for reads and [HFGWTR_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
 - [HFGITR_EL2](#) for execution of system instructions, MSR or MRS access trapped to EL2
 - [HDFGRTR_EL2](#) for reads and [HDFGWTR_EL2](#) for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
 - [HAFGRTR_EL2](#) for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																								

IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Instruction Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
RES0													SET	FnV	EA	RES0	S1PTW	RES0	IFSC						

Bits [24:13]

Reserved, RES0.

SET, bits [12:11]**When FEAT_RAS is implemented:**

Synchronous Error Type. When IFSC is 0b010000, describes the PE error state after taking the Instruction Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or	When FEAT_RAS is

0b011111	hardware update of translation table, level 2. Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	not implemented When FEAT_RAS is not implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception due to SME functionality

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																							SMTc	

The accesses covered by this trap include:

- Execution of SME instructions.
- Execution of SVE and Advanced SIMD instructions, when the PE is in Streaming SVE mode.
- Direct accesses of the [SVCR](#), and the SME System registers [SMCR_EL1](#), [SMCR_EL2](#), [SMCR_EL3](#), [SMPRI_EL1](#), and [SMPRMAP_EL2](#).

Bits [24:2]

Reserved, RES0.

SMTC, bits [1:0]

SME Trap Code. Identifies the reason for instruction trapping.

SMTC	Meaning
0b00	Access to SME functionality trapped as a result of CPACR_EL1.SMEN , CPTR_EL2.SMEN , CPTR_EL2.TSM , or CPTR_EL3.ESM , that is not reported using EC 0b000000.
0b01	Advanced SIMD, SVE, or SVE2 instruction trapped because PSTATE.SM is 1.
0b10	SME instruction trapped because PSTATE.SM is 0.
0b11	SME instruction trapped because PSTATE.ZA is 0.

The following fields describe the configuration settings for the traps that are reported using the EC value 0b011101:

- [CPACR_EL1.SMEN](#), for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access the [SVCR](#) and [SMCR_EL1](#) System registers at EL1 and EL0 to EL1.
- [CPTR_EL2.SMEN](#) and [CPTR_EL2.TSM](#), for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access the [SVCR](#), [SMCR_EL1](#), and [SMCR_EL2](#) System registers at EL2, EL1, or EL0 to EL2.
- [CPTR_EL3.ESM](#), for execution of SME instructions, SVE instructions when the PE is in Streaming SVE mode, and instructions that directly access the [SVCR](#) and other SME System registers from all Exception levels and any Security state, to EL3.

ISS encoding for an exception from a Granule Protection Check

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0		S2PTW		InD	GPCSC				VNCR		RES0	RES0	CM	S1PTW	WnR	xFSC								

Bits [24:22]

Reserved, RES0.

S2PTW, bit [21]

Indicates whether the Granule Protection Check exception was on an access made for a stage 2 translation table walk.

S2PTW	Meaning
0b0	Fault not on a stage 2 translation table walk.
0b1	Fault on a stage 2 translation table walk.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

InD, bit [20]

Indicates whether the Granule Protection Check exception was on an instruction or data access.

InD	Meaning
0b0	Data access.
0b1	Instruction access.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GPCSC, bits [19:14]

Granule Protection Check Status Code.

GPCSC	Meaning
0b000000	GPT address size fault at level 0.
0b000001	GPT address size fault at level 1.
0b000100	GPT walk fault at level 0.
0b000101	GPT walk fault at level 1.
0b001100	Granule protection fault at level 0.
0b001101	Granule protection fault at level 1.
0b010100	Synchronous External abort on GPT fetch at level 0.
0b010101	Synchronous External abort on GPT fetch at level 1.

All other values are reserved.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VNCR, bit [13]

When FEAT_NV2 is implemented:

Indicates that the fault came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

When InD is '1', this field is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:11]

Reserved, RES0.

Bits [10:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

Indicates whether the Granule Protection Check exception was on an access for stage 2 translation for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location. The possible values of this bit are:

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

When InD is '1', this field is RES0.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

xFSC, bits [5:0]

Instruction or Data Fault Status Code.

xFSC	Meaning	Applies when
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISV	SAS	SSE				SRT			SF	AR	VNCR	Bits[12:11]	FnV	EA	CM	S1PTW	WnR						DFSC	

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
0b0	No valid instruction syndrome. ISS[23:14] are RES0.
0b1	ISS[23:14] hold a valid instruction syndrome.

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with 0b11111, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
 - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
 - Is not performing register writeback.
 - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR_EL1 or ESR_EL3.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT_MTE2 is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR_ELx.FNV is 0 and FAR_ELx is valid.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

When ISV == 1:

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0b11.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSE, bit [21]**When ISV == 1:**

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SRT, bits [20:16]**When ISV == 1:**

Syndrome Register Transfer. The register number of the Wt/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SF, bit [15]**When ISV == 1:**

Width of the register accessed by the instruction is Sixty-Four.

SF	Meaning
0b0	Instruction loads/stores a 32-bit wide register.
0b1	Instruction loads/stores a 64-bit wide register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AR, bit [14]

When ISV == 1:

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VNCR, bit [13]

When FEAT_NV2 is implemented:

Indicates that the fault came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2 , by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SET, bits [12:11]

When FEAT_RAS is implemented and FEAT_LS64 is not implemented:

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_LS64 is implemented:

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

LST	Meaning
0b01	An ST64BV instruction generated the Data Abort.
0b10	An LD64B or ST64B instruction generated the Data Abort.
0b11	An ST64BV0 instruction generated the Data Abort.

All other values are reserved.

This field is valid only if the DFSC code is 0b110101. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of 0b110101 or 0b110001, indicating an unsupported Exclusive or atomic access.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE2 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented

0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV							RES0						VECITR		IDF	RES0	IXF	UFF	OFF	DZF	IOF		

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from an instruction that is performing floating-point operations on more than one lane of a vector.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from an instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the [FPCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the [FPSCR](#).{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
IDS		RES0										IESB		AET			EA		RES0			DFSC				

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding.
Note If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.	
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]

When **FEAT_IESB** is implemented:

Implicit error synchronization event.

IESB	Meaning
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]

When **FEAT_RAS** is implemented:

Asynchronous Error Type.

When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

AET	Meaning
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]**When FEAT_RAS is implemented:**

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]**When FEAT_RAS is implemented:**

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																			IFSC					

Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

ISS encoding for an exception from a Software Step exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
ISV		RES0																	EX		IFSC				

ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Software Step exceptions'.

ISS encoding for an exception from a Watchpoint exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										RES0VNCR		RES0				CMRES0WnR		DFSC						

Bits [24:15]

Reserved, RES0.

Bit [14]

Reserved, RES0.

VNCR, bit [13]

When FEAT_NV2 is implemented:

Indicates that the watchpoint came from use of [VNCR_EL2](#) register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR_EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA , DC GVA , and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

ISS encoding for an exception from execution of a Breakpoint instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										Comment														

Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																						ERET		ERETA

This EC value applies when FEAT_FGT is implemented, or when [HCR_EL2.NV](#) is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2.

ERET	Meaning
0b0	ERET instruction trapped to EL2.
0b1	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

ERETA	Meaning
0b0	ERETAA instruction trapped to EL2.
0b1	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see [HCR_EL2.NV](#).

If FEAT_FGT is implemented, [HFGITR_EL2](#).ERET controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

ISS encoding for an exception from a TSTART instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0															Rd			RES0						

Bits [24:10]

Reserved, RES0.

Rd, bits [9:5]

The Rd value from the issued instruction, the general purpose register used for the destination.

Bits [4:0]

Reserved, RES0.

ISS encoding for an exception from Branch Target Identification instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																							BTTYPE	

Bits [24:2]

Reserved, RES0.

BTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0

**Bits [24:0]**

Reserved, RES0.

For more information about generating these exceptions, see:

- [HCR_EL2.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- [SCR_EL3.API](#), for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure

**Bits [24:2]**

Reserved, RES0.

Bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

Meaning	
0b0	Instruction Key.
0b1	Data Key.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a Translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

Accessing ESR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ESR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

FPCR, Floating-point Control Register

The FPCR characteristics are:

Purpose

Controls floating-point behavior.

Configuration

AArch64 System register FPCR bits [26:15] are architecturally mapped to AArch32 System register [FPSCR\[26:15\]](#).

AArch64 System register FPCR bits [12:8] are architecturally mapped to AArch32 System register [FPSCR\[12:8\]](#).

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

Attributes

FPCR is a 64-bit register.

Field descriptions

Bits [63:27]

Reserved, RES0.

AHP, bit [26]

Alternative half-precision control bit.

AHP	Meaning
0b0	IEEE half-precision format selected.
0b1	Alternative half-precision format selected.

This bit is used only for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the FEAT_FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DN, bit [25]

Default NaN use for NaN propagation.

DN	Meaning
0b0	NaN operands propagate through to the output of a floating-point operation.
0b1	Any operation involving one or more NaNs returns the Default NaN. This bit has no effect on the output of FABS, FMAX*, FMIN*, and FNEG instructions, and a default NaN is never returned as a result of these instructions.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ, bit [24]

Flushing denormalized numbers to zero control bit.

FZ	Meaning
0b0	If FPCR.AH is 0, the disables flushing to zero of single-precision inputs and double-precision outputs denormalized that inputs are to single-precision, and outputs of double-precision, floating-point and instructions BF16 not denormalized enabled numbers, by other than control, for but some other instructions. factors For might more cause information, the see input 'Flushing denormalized numbers to be flushed to zero.zero'.
0b1	If FPCR.AH is 1, the disables flushing to zero of outputs that are single-precision, double-precision, and double-precision BF16 denormalized outputs numbers, of other floating-point than instructions for not some enabled instructions. by For this more control information, but see other 'Flushing factors might cause the input denormalized numbers to be flushed to zero.zero'.

For The more value information, of see this 'Flushing bit denormalized controls numbers both to scalar zero' and the Advanced pseudocode SIMD of the floating-point instructions arithmetic.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RMode, bits [23:22]

Rounding Mode control field.

RMode	Meaning
0b00	Round to Nearest (RN) mode.
0b01	Round towards Plus Infinity (RP) mode.
0b10	Round towards Minus Infinity (RM) mode.
0b11	Round towards Zero (RZ) mode.

The specified rounding mode is used by both scalar and Advanced SIMD floating-point instructions.

If FPCR.AH is 1, then the following instructions use Round to Nearest mode regardless of the value of this bit:

- The FRECPE, FRECPX, FRSQRTE, and FRSQRTS instructions.
- The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Stride, bits [21:20]

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state.

This field is included only for context saving and restoration of the AArch32 [FPSCR](#).Stride field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ16, bit [19]

When FEAT_FP16 is implemented:

Flushing denormalized numbers to zero control bit on half-precision data-processing instructions.

FZ16	Meaning
0b0	For some instructions, this bit disables flushing to zero of inputs and outputs that are half-precision denormalized numbers. For more information, see 'Flushing denormalized numbers to zero'.
0b1	Flushing denormalized numbers to zero enabled. For some instructions that do not convert a half-precision input to a higher precision output, this bit enables flushing to zero of inputs and outputs that are half-precision denormalized numbers. For more information, see 'Flushing denormalized numbers to zero'.

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations.

For more information, see 'Flushing denormalized numbers to zero' and the pseudocode of the floating-point instructions.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Len, bits [18:16]

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state.

This field is included only for context saving and restoration of the AArch32 [FPSCR](#).Len field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDE, bit [15]

Input Denormal floating-point exception trap enable.

IDE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.IDC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IDC bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BitBits [14:13]

Reserved, RES0.

EBF, bit [13]

When FEAT_SME is implemented:

The value of this bit controls the numeric behaviors of BFloat16 dot product calculations performed by the BFDOT, BFMMMLA, BFMMOPA, and BFMMOPS instructions.

When [ID_AA64ISAR1_EL1.BF16](#) and [ID_AA64ZFR0_EL1.BF16](#) are 0b0010, the PE supports the FPCR.EBF field. Otherwise, FPCR.EBF is RES0.

EBF	Meaning
0b0	These instructions use the standard BFloat16 behaviors: <ul style="list-style-type: none"> Ignoring the FPCR.RMode control and using the rounding mode defined for BFloat16. For more information, see 'Round to Odd mode'. Flushing denormalized inputs and outputs to zero, as if the FPCR.FZ and FPCR.FIZ controls had the value '1'. Performing unfused multiplies and additions with intermediate rounding of all products and sums.
0b1	These instructions use the extended BFloat16 behaviors: <ul style="list-style-type: none"> Supporting all four IEEE 754 rounding modes selected by the FPCR.RMode control. Optionally, flushing denormalized inputs and outputs to zero, as governed by the FPCR.FZ and FPCR.FIZ controls. Performing a fused sum-of-products without intermediate rounding of the products, but rounding the single-precision sum before addition to the accumulator. Generating the default NaN as intermediate sum-of-products when any multiplier input is a NaN, or any product is infinity \times 0.0, or there are infinite products with differing signs. Generating an intermediate sum-of-products of the same infinity when there are infinite products all with the same sign.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IXE, bit [12]

Inexact floating-point exception trap enable.

IXE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.IXC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IXC bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFE, bit [11]

Underflow floating-point exception trap enable.

UFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.UFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs and Flush-to-zero is not enabled, the PE does not update the FPSR.UFC bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFE, bit [10]

Overflow floating-point exception trap enable.

OFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.OFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.OFC bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZE, bit [9]

Divide by Zero floating-point exception trap enable.

DZE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.DZC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.DZC bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOE, bit [8]

Invalid Operation floating-point exception trap enable.

IOE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.IOC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IOC bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:3]

Reserved, RES0.

NEP, bit [2]

When FEAT_AFP is implemented:

Controls how the output elements other than the lowest element of the vector are determined for Advanced SIMD scalar instructions.

NEP	Meaning
0b0	Does not affect how the output elements other than the lowest are determined for Advanced SIMD scalar instructions.
0b1	The output elements other than the lowest are taken from the following registers: <ul style="list-style-type: none"> For 3-input scalar versions of the FMLA (by element) and FMLS (by element) instructions, the <Hd>, <Sd>, or <Dd> register. For 3-input versions of the FMADD, FMSUB, FNMADD, and FNMSUB instructions, the <Ha>, <Sa>, or <Da> register. For 2-input scalar versions of the FACGE, FACGT, FCMEQ (register), FCMGE (register), and FCMGT (register) instructions, the <Hm>, <Sm>, or <Dm> register. For 2-input scalar versions of the FABD, FADD (scalar), FDIV (scalar), FMAX (scalar), FMAXNM (scalar), FMIN (scalar), FMINNM (scalar), FMUL (by element), FMUL (scalar), FMULX (by element), FMULX, FNMUL (scalar), FRECPS, FRSQRTS, and FSUB (scalar) instructions, the <Hn>, <Sn>, or <Dn> register. For 1-input scalar versions of the following instructions, the <Hd>, <Sd>, or <Dd> register: <ul style="list-style-type: none"> The (vector) versions of the FCVTAS, FCVTAU, FCVTMS, FCVTMU, FCVTNS, FCVTNU, FCVTPS, and FCVTPU instructions. The (vector, fixed-point) and (vector, integer) versions of the FCVTZS, FCVTZU, SCVTF, and UCVTF instructions. The (scalar) versions of the FABS, FNEG, FRINT32X, FRINT32Z, FRINT64X, FRINT64Z, FRINTA, FRINTI, FRINTM, FRINTN, FRINTP, FRINTX, FRINTZ, and FSQRT instructions. The (scalar, fixed-point) and (scalar, integer) versions of the SCVTF and UCVTF instructions. The BFCVT, FCVT, FCVTXN, FRECPE, FRECPX, and FRSQRTE instructions.

The value of FPCR.NEP is treated as 0 for all purposes other than a direct read or write of the FPCR when the PE is in Streaming SVE mode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AH, bit [1]

When FEAT_AFP is implemented:

Alternate Handling. Controls alternate handling of denormalized floating-point numbers.

AH	Meaning
0b0	FPCR.FZ controls flushing to zero of inputs and outputs that are single-precision, double-precision, and BF16 denormalized numbers. FPCR.FIZ is RES0. For half-precision, single-precision, and double-precision numbers, the test for a denormalized number for the purpose of flushing the output to zero occurs before rounding. For more information, see 'Flushing denormalized numbers to zero'.
0b1	FPCR.FZ controls flushing to zero of outputs that are single-precision, double-precision, and BF16 denormalized numbers. For all precisions, the test for a denormalized number for the purpose of flushing the output to zero occurs after rounding with an unbounded exponent. FPCR.FIZ controls flushing to zero of inputs that are single-precision, double-precision, and BF16 denormalized numbers. Some instructions unconditionally flush to zero. For more information, see 'Flushing denormalized numbers to zero'.

The AH bit affects the generation and operation of floating-point exceptions. For more information, see 'Floating-point exceptions and exception traps'.

The Arm architecture supports two models for handling some of the corner cases of the floating-point behaviors, such as the nature of flushing of denormalized numbers, the detection of tininess and other exceptions and a range of other behaviors. The value of the FPCR.AH bit selects between these models.

For more information on the FPCR.AH bit, see 'Flushing denormalized numbers to zero', 'Floating-point exceptions and exception traps' and the pseudocode of the floating-point instructions.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FIZ, bit [0]

When FEAT_AFP is implemented:

Flush Inputs to Zero. Controls whether single-precision, double-precision, and BFloat16 input operands that are denormalized numbers are flushed to zero.

FIZ	Meaning
0b0	If FPCR.AH is 1, disables flushing to zero of inputs that are single-precision, double-precision, and BF16 denormalized numbers, other than for some instructions. For more information, see 'Flushing denormalized numbers to zero'. The flushing to zero of single-precision and double-precision denormalized inputs to floating-point instructions not enabled by this control, but other factors might cause the input denormalized numbers to be flushed to zero.
0b1	If FPCR.AH is 0, this bit is RES0. If FPCR.AH is 1, enables flushing to zero of inputs that are single-precision, double-precision, and BF16 denormalized numbers, other than for some instructions. For more information, see 'Flushing denormalized numbers to zero'. Denormalized single-precision and double-precision inputs to most floating-point instructions flushed to zero. If FPCR.AH is 0, this bit is RES0.

For more information, see 'Flushing denormalized numbers to zero' and the pseudocode of the floating-point instructions.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing FPCR

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, FPCR

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0100	0b000

FPEXC32_EL2, Floating-Point Exception Control register

The FPEXC32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register [FPEXC](#) from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register FPEXC32_EL2 bits [31:0] are architecturally mapped to AArch32 System register [FPEXC\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to FPEXC32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPEXC32_EL2 is a 64-bit register.

EX, bit [31]

Exception bit. From Armv8, this bit is RAZ/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [30]

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMRS accesses to the [FPEXC](#) or [FPSID](#).
- VMRS accesses from the [FPEXC](#), [FPSID](#), [MVFR0](#), [MVFR1](#), or [MVFR2](#).

EN	Meaning
0b0	Accesses to the FPSCR , and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.
0b1	This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of Advanced SIMD and floating-point instructions in AArch32 state can be disabled or trapped by the following controls:

- [CPACR](#).cp10, or, if executing at EL0, [CPACR_EL1](#).FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
 - [HCPTR](#).TCP10, or if EL2 is using AArch64, [CPTR_EL2](#).TFP.
 - [NSACR](#).cp10, or if EL3 is using AArch64, [CPTR_EL3](#).TFP.
- For Advanced SIMD instructions only:
 - [CPACR](#).ASEDIS.
 - If executing in Non-secure state, [HCPTR](#).TASE and [NSACR](#).NSTRCDIS.

See the descriptions of the controls for more information.

Note

When executing at EL0 using AArch32:

- If EL2 is using AArch64 and enabled in the current Security state, and the value of [HCR_EL2](#).{RW, TGE} is {0, 1} then it is IMPLEMENTATION DEFINED whether the behavior is:
 - As if the value of FPEXC.EN is 1.
 - Determined by the value of FPEXC32_EL2.EN, as described in this field description. However, Arm deprecates using the value of FPEXC32_EL2.EN to determine behavior.
- If EL1 is using AArch64, then behavior is as if the Effective value of FPEXC.EN is 1. FPEXC.EN is 1.
- If EL2 is using AArch64 and is enabled in the current Security state, and the value of [HCR_EL2](#).{RW, TGE} is {1, and 1} then behavior is as if the Effective value of FPEXC.EN is 1. [HCR_EL2](#).RW is 1, then the Effective value of FPEXC.EN is 1. However, Arm deprecates using the value of FPEXC32_EL2.EN to determine behavior.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DEX, bit [29]

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC32_EL2.TFV field is valid.

The meaning of this bit is:

DEX	Meaning
0b0	The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC32_EL2.TFV is RW then it is invalid and UNKNOWN. If FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
0b1	The exception was generated during the execution of an allocated encoding. FPEXC32_EL2.TFV is valid and indicates the cause of the exception.

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the AArch32 [FPSCR](#).{Stride, Len} fields as RAZ, this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FP2V, bit [28]

FPINST2 instruction valid bit. From Armv8, this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VV, bit [27]

VECITR valid bit. From Armv8, this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

TFV	Meaning
0b0	The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of FPSCR .{Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.
0b1	FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements [FPSCR](#).{Stride, Len} as RAZ, this bit is RAO/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:11]

Reserved, RES0.

VECITR, bits [10:8]

Vector iteration count. From Armv8, this field is RES1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while [FPSCR.IDE](#) was 1:

IDF	Meaning
0b0	Input Denormal exception has not occurred.
0b1	Input Denormal exception has occurred.

Input Denormal exceptions can occur only when [FPSCR.FZ](#) is 1.

Note

A half-precision floating-point value that is flushed to zero because the value of [FPSCR.FZ16](#) is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while [FPSCR.IXE](#) was 1:

IXF	Meaning
0b0	Inexact exception has not occurred.
0b1	Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while [FPSCR.UFE](#) was 1:

UFF	Meaning
0b0	Underflow exception has not occurred.
0b1	Underflow exception has occurred.

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when [FPSCR.FZ16](#) is 0.
- Otherwise only when [FPSCR.FZ](#) is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while [FPSCR.OFE](#) was 1:

OFF	Meaning
0b0	Overflow exception has not occurred.
0b1	Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while [FPSCR.DZE](#) was 1:

DZF	Meaning
0b0	Divide by Zero exception has not occurred.
0b1	Divide by Zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while [FPSCR.IOE](#) was 1:

IOF	Meaning
0b0	Invalid Operation exception has not occurred.
0b1	Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FPEXC32_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, FPEXC32_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0011	0b000

```

FPSR, Floating-point Status Register

The FPSR characteristics are:

Purpose

Provides floating-point system status information.

Configuration

AArch64 System register FPSR bits [31:27] are architecturally mapped to AArch32 System register [FPSCR\[31:27\]](#).

AArch64 System register FPSR bit [7] is architecturally mapped to AArch32 System register [FPSCR\[7\]](#).

AArch64 System register FPSR bits [4:0] are architecturally mapped to AArch32 System register [FPSCR\[4:0\]](#).

Attributes

FPSR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:32]

Reserved, RES0.

N, bit [31]

When AArch32 is supported at **EL0any Exception level** and AArch32 floating-point is implemented:

Negative condition flag for AArch32 floating-point comparison operations.

Note

AArch64 floating-point comparisons set the PSTATE.N flag instead.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Z, bit [30]

When AArch32 is supported at **EL0any Exception level** and AArch32 floating-point is implemented:

Zero condition flag for AArch32 floating-point comparison operations.

Note

AArch64 floating-point comparisons set the PSTATE.Z flag instead.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [29]

When AArch32 is supported at **EL0any Exception level** and AArch32 floating-point is implemented:

Carry condition flag for AArch32 floating-point comparison operations.

Note

AArch64 floating-point comparisons set the PSTATE.C flag instead.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

V, bit [28]

When AArch32 is supported at **EL0any Exception level** and AArch32 floating-point is implemented:

Overflow condition flag for AArch32 floating-point comparison operations.

Note

AArch64 floating-point comparisons set the PSTATE.V flag instead.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

QC, bit [27]

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [26:8]

Reserved, RES0.

IDC, bit [7]

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.IDE](#) bit. This bit is set to 1 to indicate a floating-point exception only if [FPCR.IDE](#) is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXC, bit [4]

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.IXE](#) bit. This bit is set to 1 to indicate a floating-point exception only if [FPCR.IXE](#) is 0.

The criteria for the Inexact floating-point exception to occur are affected by whether denormalized numbers are flushed to zero and by the value of the [FPCR.AH](#) bit. For more information, see 'Floating-point exceptions and exception traps'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFC, bit [3]

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.UFE](#) bit. This bit is set to 1 to indicate a floating-point exception only if [FPCR.UFE](#) is 0 or if flushing denormalized numbers to zero is enabled.

The criteria for the Underflow floating-point exception to occur are affected by whether denormalized numbers are flushed to zero and by the value of the [FPCR.AH](#) bit. For more information, see 'Floating-point exceptions and exception traps'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFC, bit [2]

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.OFE](#) bit. This bit is set to 1 to indicate a floating-point exception only if [FPCR.OFE](#) is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZC, bit [1]

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.DZE](#) bit. This bit is set to 1 to indicate a floating-point exception only if [FPCR.DZE](#) is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOC, bit [0]

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the [FPCR.IOE](#) bit. This bit is set to 1 to indicate a floating-point exception only if [FPCR.IOE](#) is 0.

The criteria for the Invalid Operation floating-point exception to occur are affected by the value of the [FPCR.AH](#) bit. For more information, see 'Floating-point exceptions and exception traps'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GPTBR_EL3, Granule Protection Table Base Register

The GPTBR_EL3 characteristics are:

Purpose

The control register for Granule Protection Table base address.

Configuration

This register is present only when FEAT_RME is implemented. Otherwise, direct accesses to GPTBR_EL3 are UNDEFINED.

Attributes

GPTBR_EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																								BADDR											
BADDR																																			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Bits [63:40]

Reserved, RES0.

BADDR, bits [39:0]

Base address for the level 0 GPT.

This field represents bits [51:12] of the level 0 GPT base address.

The level 0 GPT is aligned in memory to the greater of:

- The size of the level 0 GPT in bytes.
- 4KB.

Bits [x:0] of the base address are ~~treated~~ ~~taken~~ ~~as~~ ~~to be~~ zero, where:

- $x = \text{Max}(\text{pps} - \text{l0gptsz} + 2, 11)$
- pps is derived from [GPCCR_EL3](#).PPS as follows:

GPCCR_EL3.PPS	pps
0b000	32
0b001	36
0b010	40
0b011	42
0b100	44
0b101	48
0b110	52

- l0gptsz is derived from [GPCCR_EL3](#).L0GPTSZ as follows:

GPCCR_EL3.LOGPTSZ	logptsz
0b0000	30
0b0100	34
0b0110	36
0b1001	39

If x is greater than 11, then BADDR[x - 12:0] are RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GPTBR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, GPTBR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0001	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return GPTBR_EL3;
```

MSR GPTBR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0001	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    GPTBR_EL3 = X[t];
```

htmldiff from-

(new)

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID5, bit [58]

When FEAT_MTE2 is implemented:

Trap ID group 5. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- [GMID_EL1](#).

TID5	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 5 registers are trapped to EL2.

When the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has an Effective value of 0 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DCT, bit [57]

When FEAT_MTE2 is implemented:

Default Cacheability Tagging. When HCR_EL2.DC is in effect, controls whether stage 1 translations are treated as Tagged or Untagged.

DCT	Meaning
0b0	Stage 1 translations are treated as Untagged.
0b1	Stage 1 translations are treated as Tagged.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [56]

When FEAT_MTE2 is implemented:

Allocation Tag Access. When HCR_EL2.{E2H,TGE} != {1,1}, controls EL1 and EL0 access to Allocation Tags.

ATA	Meaning
0b0	Access to Allocation Tags is prevented. Accesses at EL1 to GCR_EL1 , RGSRR_EL1 , TFSRR_EL1 , TFSRR_EL2 , or TFSRRE0_EL1 that are not UNDEFINED are trapped to EL2.
0b1	This control does not prevent access to Allocation Tags.

This field is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBOS, bit [55]

When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Outer Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

[TLBI VMALLE1OS](#), [TLBI VAE1OS](#), [TLBI ASIDE1OS](#), [TLBI VAAE1OS](#), [TLBI VALE1OS](#), [TLBI VAALE1OS](#), [TLBI RVAE1OS](#), [TLBI RVAAE1OS](#), [TLBI RVALE1OS](#), and [TLBI RVAALE1OS](#).

TTLBOS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBIS, bit [54]

When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, [TLBI VMALLE1IS](#), [TLBI VAE1IS](#), [TLBI ASIDE1IS](#), [TLBI VAAE1IS](#), [TLBI VALE1IS](#), [TLBI VAALE1IS](#), [TLBI RVAE1IS](#), [TLBI RVAAE1IS](#), [TLBI RVALE1IS](#), and [TLBI RVAALE1IS](#).
- When EL1 is using AArch32, [TLBIALLIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAAIS](#), [TLBIMVALIS](#), and [TLBIMVAALIS](#).

TTLBIS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [53]**When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:**

Enable Access to the [SCXTNUM_EL1](#) and [SCXTNUM_EL0](#) registers. The defined values are:

EnSCXT	Meaning
0b0	When HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, and EL2 is enabled in the current Security state, EL1 and EL0 access to SCXTNUM_EL0 and EL1 access to SCXTNUM_EL1 is disabled by this mechanism, causing an exception to EL2, and the values of these registers to be treated as 0. When HCR_EL2.{E2H, TGE} is {1, 1} and EL2 is enabled in the current Security state, EL0 access to SCXTNUM_EL0 is disabled by this mechanism, causing an exception to EL2, and the value of this register to be treated as 0.
0b1	This control does not cause accesses to SCXTNUM_EL0 or SCXTNUM_EL1 to be trapped.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TOCU, bit [52]**When FEAT_EVT is implemented:**

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When [SCTLR_EL1](#).UCI is 1, HCR_EL2.{TGE, E2H} is not {1, 1}, and EL0 is using AArch64, [IC IVAU](#), [DC CVAU](#).
- When EL1 is using AArch64, [IC IVAU](#), [IC IALLU](#), [DC CVAU](#).
- When EL1 is using AArch32, [ICIMVAU](#), [IC IALLU](#), [DCCMVAU](#).

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- [IC IALLUIS](#) and [IC IALLU](#) are always UNDEFINED at EL0 using AArch64.
- [ICIMVAU](#), [IC IALLU](#), [IC IALLUIS](#), and [DCCMVAU](#) are always UNDEFINED at EL0 using AArch32.

TOCU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [51]

When FEAT_AMUv1p1 is implemented:

Activity Monitors Virtual Offsets Enable.

AMVOFFEN	Meaning
0b0	Virtualization of the Activity Monitors is disabled. Indirect reads of the virtual offset registers are zero.
0b1	Virtualization of the Activity Monitors is enabled.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TICAB, bit [50]

When FEAT_EVT is implemented:

Trap ICIALLUIS/IC IALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, [IC IALLUIS](#).
- When EL1 is using AArch32, [IC IALLUIS](#).

TICAB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified instructions is trapped to EL2.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID4, bit [49]

When FEAT_EVT is implemented:

Trap ID group 4. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- EL1 reads of [CCSIDR_EL1](#), [CCSIDR2_EL1](#), [CLIDR_EL1](#), and [CSSELR_EL1](#).

- EL1 writes to [CSSELR_EL1](#).

AArch32:

- EL1 reads of [CCSIDR](#), [CCSIDR2](#), [CLIDR](#), and [CSSELR](#).
- EL1 writes to [CSSELR](#).

TID4	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GPF, bit [48]

When FEAT_RME is implemented:

Controls the reporting of Granule protection faults at EL0 and EL1.

GPF	Meaning
0b0	This control does not cause exceptions to be routed from EL0 and EL1 to EL2.
0b1	Instruction Aborts and Data Aborts due to GPFs from EL0 and EL1 are routed to EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FIEN, bit [47]

When FEAT_RASv1p1 is implemented:

Fault Injection Enable. Unless this bit is set to 1, accesses to the [ERXPFPGCDN_EL1](#), [ERXPFPGCTL_EL1](#), and [ERXPFPGF_EL1](#) registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18.

FIEN	Meaning
0b0	Accesses to the specified registers from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

If EL2 is disabled in the current Security state, the Effective value of HCR_EL2.FIEN is 0b1.

If [ERRIDR_EL1](#).NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FWB, bit [46]**When FEAT_S2FWB is implemented:**

Forced Write-Back. Defines the combined cacheability attributes in a 2 stage translation regime.

Note

When FEAT_MTE2 is implemented, if the stage 1 page or block descriptor specifies the Tagged attribute, the final memory type is Tagged only if the final cacheable memory type is Inner and Outer Write-back cacheable and the final allocation hints are Read-Allocate, Write-Allocate.

FWB	Meaning
0b0	<p>When this bit is 0, then:</p> <ul style="list-style-type: none"> The combination of stage 1 and stage 2 translations on memory type and cacheability attributes are as described in the Armv8.0 architecture. For more information, see 'Combining the stage 1 and stage 2 attributes, EL1&0 translation regime'. The encoding of the stage 2 memory type and cacheability attributes in bits[5:2] of the stage 2 page or block descriptors are as described in the Armv8.0 architecture.
0b1	<p>When this bit is 1, then:</p> <ul style="list-style-type: none"> Bit[5] of stage 2 page or block descriptor is RES0. When bit[4] of stage 2 page or block descriptor is 1 and when: <ul style="list-style-type: none"> Bits[3:2] of stage 2 page or block descriptor are 0b11, the resultant memory type and inner or outer cacheability attribute is the same as the stage 1 memory type and inner or outer cacheability attribute. Bits[3:2] of stage 2 page or block descriptor are 0b10, the resultant memory type and attribute is Normal Write-Back. Bits[3:2] of stage 2 page or block descriptor are 0b0x, the resultant memory type will be Normal Non-cacheable except where the stage 1 memory type was Device-<attr> the resultant memory type will be Device-<attr> When bit[4] of stage 2 page or block descriptor is 0 the memory type is Device, and when: <ul style="list-style-type: none"> Bits[3:2] of stage 2 page or block descriptor are 0b00, the stage 2 memory type is Device-nGnRnE. Bits[3:2] of stage 2 page or block descriptor are 0b01, the stage 2 memory type is Device-nGnRE. Bits[3:2] of stage 2 page or block descriptor are 0b10, the stage 2 memory type is Device-nGRE. Bits[3:2] of stage 2 page or block descriptor are 0b11, the stage 2 memory type is Device-GRE. If the stage 1 translation specifies a cacheable memory type, then the stage 1 cache allocation hint is applied to the final cache allocation hint where the final memory type is cacheable. If the stage 1 translation does not specify a cacheable memory type, then if the final memory type is cacheable, it is treated as read allocate, write allocate. <p>The stage 1 and stage 2 memory types are combined in the manner described in 'Combining the stage 1 and stage 2 attributes, EL1&0 translation regime'.</p>

In Secure state, this bit applies to both the Secure stage 2 translation and the Non-secure stage 2 translation.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV2, bit [45]

When FEAT_NV2 is implemented:

Nested Virtualization. Changes the behaviors of HCR_EL2.{NV1, NV} to provide a mechanism for hardware to transform reads and writes from System registers into reads and writes from memory.

NV2	Meaning
0b0	This bit has no effect on the behavior of HCR_EL2.{NV1, NV}. The behavior of HCR_EL2.{NV1, NV} is as defined for FEAT_NV.
0b1	Redefines behavior of HCR_EL2{NV1, NV} to enable: <ul style="list-style-type: none"> • Transformation of read/writes to registers into read/writes to memory. • Redirection of EL2 registers to EL1 registers. Any exception taken from EL1 and taken to EL1 causes SPSR_EL1.M[3:2] to be set to 0b10 and not 0b01.

When HCR_EL2.NV is 0, the Effective value of this field is 0 and this field is treated as 0 for all purposes other than direct reads and writes of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AT, bit [44]

When FEAT_NV is implemented:

Address Translation. EL1 execution of the following address translation instructions is trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- [AT S1E0R](#), [AT S1E0W](#), [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#).

AT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified instructions is trapped to EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV1, bit [43]

When FEAT_NV2 is implemented:

Nested Virtualization.

NV1	Meaning
0b0	If HCR_EL2.{NV2, NV} are both 1, accesses executed from EL1 to implemented EL12, EL02, or EL2 registers are transformed to loads and stores. If HCR_EL2.NV2 is 0 or HCR_EL2.{NV2, NV} == {1, 0}, this control does not cause any instructions to be trapped.
0b1	If HCR_EL2.NV2 is 1, accesses executed from EL1 to implemented EL2 registers are transformed to loads and stores. If HCR_EL2.NV2 is 0, EL1 accesses to VBAR_EL1 , ELR_EL1 , SPSR_EL1 , and, when FEAT_CSV2_2 or FEAT_CSV2_1p2 is implemented, SCXTNUM_EL1 , are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.

If HCR_EL2.NV2 is 1, the value of HCR_EL2.NV1 defines which EL1 register accesses are transformed to loads and stores. These transformed accesses have priority over the trapping of registers.

The trapping of EL1 registers caused by other control bits has priority over the transformation of these accesses.

If a register is specified that is not implemented by an implementation, then access to that register are UNDEFINED.

For the list of registers affected, see 'Enhanced support for nested virtualization'.

If HCR_EL2.{NV1, NV} is {0, 1}, any exception taken from EL1, and taken to EL1, causes the [SPSR_EL1](#).M[3:2] to be set to 0b10, and not 0b01.

If HCR_EL2.{NV1, NV} is {1, 1}, then:

- The EL1 translation table Block and Page descriptors:
 - Bit[54] holds the PXN instead of the UXN.
 - Bit[53] is RES0.
 - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
 - Bit[61] is treated as 0 regardless of the actual value.
 - Bit[60] holds the PXNTable instead of the UXNTable.
 - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.{NV1, NV} are {1, 0}, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading **than reading** back the value of the HCR_EL2.NV bit.
- Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading **than reading** back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_NV is implemented:

Nested Virtualization. EL1 accesses to certain registers are trapped to EL2, when EL2 is enabled in the current Security state.

NV1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to VBAR_EL1 , ELR_EL1 , SPSR_EL1 , and, when FEAT_CSV2_2 or FEAT_CSV2_1p2 is implemented, SCXTNUM_EL1 , are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.

If HCR_EL2.NV is 1 and HCR_EL2.NV1 is 0, then the following effects also apply:

- Any exception taken from EL1, and taken to EL1, causes the [SPSR_EL1.M\[3:2\]](#) to be set to 0b10, and not 0b01.

If HCR_EL2.NV and HCR_EL2.NV1 are both set to 1, then the following effects also apply:

- The EL1 translation table Block and Page descriptors:
 - Bit[54] holds the PXN instead of the UXN.
 - Bit[53] is RES0.
 - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
 - Bit[61] is treated as 0 regardless of the actual value.
 - Bit[60] holds the PXNTable instead of the UXNTable.
 - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.NV is 0 and HCR_EL2.NV1 is 1, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading ~~than reading~~ back the value of the HCR_EL2.NV bit.
- Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading ~~than reading~~ back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV, bit [42]

When FEAT_NV2 is implemented:

Nested Virtualization.

When HCR_EL2.NV2 is 1, redefines register accesses so that:

- Instructions accessing the Special purpose registers [SPSR_EL2](#) and [ELR_EL2](#) instead access [SPSR_EL1](#) and [ELR_EL1](#) respectively.
- Instructions accessing the System registers [ESR_EL2](#) and [FAR_EL2](#) instead access [ESR_EL1](#) and [FAR_EL1](#).

When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

NV	Meaning
0b0	When this bit is set to 0, then the PE behaves as if HCR_EL2.NV2 is 0 for all purposes other than reading this register. This control does not cause any instructions to be trapped. When HCR_EL2.NV2 is 1, no FEAT_NV2 functionality is implemented.
0b1	When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the CurrentEL register return a value of 0x2. When HCR_EL2.NV2 is 1, this control redefines EL1 register accesses so that instructions accessing SPSR_EL2 , ELR_EL2 , ESR_EL2 , and FAR_EL2 instead access SPSR_EL1 , ELR_EL1 , ESR_EL1 , and FAR_EL1 respectively.

When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, then:

- The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:
 - Registers accessed using MRS or MSR with a name ending in _EL2, except [SP_EL2](#).
 - Registers accessed using MRS or MSR with a name ending in _EL12.
 - Registers accessed using MRS or MSR with a name ending in _EL02.
 - Special-purpose registers [SPSR_irq](#), [SPSR_abt](#), [SPSR_und](#) and [SPSR_fiq](#), accessed using MRS or MSR.
 - Special-purpose register [SP_EL1](#) accessed using the dedicated MRS or MSR instruction.
- The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:
 - EL2 translation regime Address Translation instructions and TLB maintenance instructions.
 - EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.
- The instructions for which the execution is trapped as follows:
 - SMC in an implementation that does not include EL3 and when HCR_EL2.TSC is 1. HCR_EL2.TSC bit is not RES0 in this case. This is reported using EC syndrome value 0x17.
 - The ERET, ERETAA, and ERETAB instructions, reported using EC syndrome value 0x1A.

Note

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_NV is implemented:

Nested Virtualization. Traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

The possible values are:

NV	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the CurrentEL register return a value of 0x2.

The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:

- Registers accessed using MRS or MSR with a name ending in _EL2, except [SP_EL2](#).
- Registers accessed using MRS or MSR with a name ending in _EL12.
- Registers accessed using MRS or MSR with a name ending in _EL02.
- Special-purpose registers [SPSR_irq](#), [SPSR_abt](#), [SPSR_und](#) and [SPSR_fiq](#), accessed using MRS or MSR.
- Special-purpose register [SP_EL1](#) accessed using the dedicated MRS or MSR instruction.

The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:

- EL2 translation regime Address Translation instructions and TLB maintenance instructions.
- EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.

The execution of the ERET, ERETAA, and ERETAB instructions are trapped and reported using EC syndrome value 0x1A.

Note

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

The execution of the SMC instructions in an implementation that does not include EL3 and when HCR_EL2.TSC is 1 are trapped and reported using EC syndrome value 0x17. HCR_EL2.TSC bit is not RES0 in this case.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [41]

When FEAT_PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- In EL0, when HCR_EL2.TGE==0 or HCR_EL2.E2H==0, and the associated [SCTLR_EL1](#).En<N><M>==1.
- In EL1, the associated [SCTLR_EL1](#).En<N><M>==1.

Traps are reported using EC syndrome value 0x09. The Pointer Authentication instructions trapped are:

- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB.
- PACGA, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB.
- RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB, LDRAA and LDRAB.

API	Meaning
0b0	<p>The instructions related to Pointer Authentication are trapped to EL2, when EL2 is enabled in the current Security state and the instructions are enabled for the EL1&0 translation regime, from:</p> <ul style="list-style-type: none"> EL0 when HCR_EL2.TGE==0 or HCR_EL2.E2H==0. EL1. <p>If HCR_EL2.NV is 1, the HCR_EL2.NV trap takes precedence over the HCR_EL2.API trap for the ERETAA and ERETAB instructions.</p> <p>If EL2 is implemented and enabled in the current Security state and HFGITR_EL2.ERET == 1, execution at EL1 using AArch64 of ERETAA or ERETAB instructions is reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the HCR_EL2.API == 0.</p>
0b1	This control does not cause any instructions to be trapped.

If FEAT_PAAuth is implemented but EL2 is not implemented or disabled in the current Security state, the system behaves as if this bit is 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [40]

When FEAT_PAAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers from EL1 to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- [APIAKeyLo_EL1](#), [APIAKeyHi_EL1](#), [APIBKeyLo_EL1](#), [APIBKeyHi_EL1](#), [APDAKeyLo_EL1](#), [APDAKeyHi_EL1](#), [APDBKeyLo_EL1](#), [APDBKeyHi_EL1](#), [APGAKeyLo_EL1](#), and [APGAKeyHi_EL1](#).

APK	Meaning
0b0	Access to the registers holding "key" values for pointer authentication from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

Note

If FEAT_PAAuth is implemented but EL2 is not implemented or is disabled in the current Security state, the system behaves as if this bit is 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [39]

When FEAT_TME is implemented:

Enables access to the TSTART, TCOMMIT, TTEST, and TCANCEL instructions at EL0 and EL1.

TME	Meaning
0b0	EL0 and EL1 accesses to TSTART, TCOMMIT, TTEST, and TCANCEL instructions are UNDEFINED.
0b1	This control does not cause any instruction to be UNDEFINED.

If EL2 is not implemented or is disabled in the current Security state, the Effective value of this bit is 0b1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MIOCNCNCE, bit [38]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the EL1&0 translation regimes.

MIOCNCNCE	Meaning
0b0	For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.
0b1	For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

For more information, see 'Mismatched memory attributes'.

This field can be implemented as RAZ/WI.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TEA, bit [37]

When FEAT_RAS is implemented:

Route synchronous External abort exceptions to EL2.

TEA	Meaning
0b0	This control does not cause exceptions to be routed from EL0 and EL1 to EL2.
0b1	Route synchronous External abort exceptions from EL0 and EL1 to EL2, when EL2 is enabled in the current Security state, if not routed to EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [36]**When FEAT_RAS is implemented:**

Trap Error record accesses. Trap accesses to the RAS error registers from EL1 to EL2 as follows:

- If EL1 is using AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
 - [ERRIDR_EL1](#), [ERRSELR_EL1](#), [ERXADDR_EL1](#), [ERXCTLR_EL1](#), [ERXFR_EL1](#), [ERXMISC0_EL1](#), [ERXMISC1_EL1](#), and [ERXSTATUS_EL1](#).
 - When FEAT_RASv1p1 is implemented, [ERXMISC2_EL1](#), and [ERXMISC3_EL1](#).
- If EL1 is using AArch32 state, MCR or MRC accesses are trapped to EL2, reported using EC syndrome value 0x03, MCRR or MRRC accesses are trapped to EL2, reported using EC syndrome value 0x04:
 - [ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#).
 - When FEAT_RASv1p1 is implemented, [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), and [ERXMISC7](#).

TERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses to the specified registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [35]**When FEAT_LOR is implemented:**

Trap LOR registers. Traps Non-secure EL1 accesses to [LORSA_EL1](#), [LOREA_EL1](#), [LORN_EL1](#), [LORC_EL1](#), and [LORID_EL1](#) registers to EL2.

TLOR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 accesses to the LOR registers are trapped to EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2H, bit [34]**When FEAT_VHE is implemented:**

EL2 Host. Enables a configuration where a Host Operating System is running in EL2, and the Host Operating System's applications are running in EL0.

E2H	Meaning
0b0	The facilities to support a Host Operating System at EL2 are disabled.
0b1	The facilities to support a Host Operating System at EL2 are enabled.

For information on the behavior of this bit see 'Behavior of HCR_EL2.E2H'.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ID, bit [33]

Stage 2 Instruction access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

ID	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime.
0b1	Forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CD, bit [32]

Stage 2 Data access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

CD	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime for data accesses and translation table walks.
0b1	Forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RW, bit [31]

When EL1 is capable of using AArch32:

Execution state control for lower Exception levels:

RW	Meaning
0b0	Lower levels are all AArch32.
0b1	The Execution state for EL1 is AArch64. The Execution state for EL0 is determined by the current value of PSTATE.nRW when executing at EL0.

In an implementation that includes EL3, when EL2 is not enabled in Secure state, the PE behaves as if this bit has the same value as the [SCR_EL3.RW](#) bit for all purposes other than a direct read or write access of HCR_EL2.

The RW bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 1 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.

TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18.
 - [SCTLR_EL1](#), [TTBR0_EL1](#), [TTBR1_EL1](#), [TCR_EL1](#), [ESR_EL1](#), [FAR_EL1](#), [AFSR0_EL1](#), [AFSR1_EL1](#), [MAIR_EL1](#), [AMAIR_EL1](#), [CONTEXTIDR_EL1](#).
- If EL1 is using AArch32 state, accesses using MRC to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MRRC are trapped to EL2 and reported using EC syndrome value 0x04:
 - [SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIR0](#), [MAIR1](#), [AMAIR0](#), [AMAIR1](#), [CONTEXTIDR](#).

TRVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 read accesses to the specified Virtual Memory controls are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

EL2 provides a second stage of address translation, that a hypervisor can use to remap the address map defined by a Guest OS. In addition, a hypervisor can trap attempts by a Guest OS to write to the registers that control the memory system. A hypervisor might use this trap as part of its virtualization of memory management.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HCD, bit [29]

When EL3 is not implemented:

HVC instruction disable. Disables EL1 execution of HVC instructions, from both Execution states, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x00.

HCD	Meaning
0b0	HVC instruction execution is enabled at EL2 and EL1.
0b1	HVC instructions are UNDEFINED at EL2 and EL1. Any resulting exception is taken to the Exception level at which the HVC instruction is executed.

Note

HVC instructions are always UNDEFINED at EL0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDZ, bit [28]

Trap [DC ZVA](#) instructions. Traps EL0 and EL1 execution of [DC ZVA](#) instructions to EL2, when EL2 is enabled in the current Security state, from AArch64 state only, reported using EC syndrome value 0x18.

If FEAT_MTE is implemented, this trap also applies to [DC GVA](#) and [DC GZVA](#).

TDZ	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	In AArch64 state, any attempt to execute an instruction this trap applies to at EL1, or at EL0 when the instruction is not UNDEFINED at EL0, is trapped to EL2 when EL2 is enabled in the current Security state. Reading the DCZID_EL0 returns a value that indicates that the instructions this trap applies to are not supported.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TGE, bit [27]

Trap General Exceptions, from EL0.

TGE	Meaning
0b0	This control has no effect on execution at EL0.
0b1	<p>When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0.</p> <p>When EL2 is enabled in the current Security state, in all cases:</p> <ul style="list-style-type: none"> • All exceptions that would be routed to EL1 are routed to EL2. • If EL1 is using AArch64, the SCTLR_EL1.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR_EL1. • If EL1 is using AArch32, the SCTLR.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR. • All virtual interrupts are disabled. • Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled. • An exception return to EL1 is treated as an illegal exception return. • The MDCR_EL2.{TDRA, TDOSA, TDA, TDE} fields are treated as being 1 for all purposes other than returning the result of a direct read of MDCR_EL2. <p>In addition, when EL2 is enabled in the current Security state, if:</p> <ul style="list-style-type: none"> • HCR_EL2.E2H is 0, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 1. • HCR_EL2.E2H is 1, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 0. <p>For further information on the behavior of this bit when E2H is 1, see 'Behavior of HCR_EL2.E2H'.</p>

HCR_EL2.TGE must not be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TVM, bit [26]

Trap Virtual Memory controls. Traps EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18:
 - [SCTLR_EL1](#), [TTBR0_EL1](#), [TTBR1_EL1](#), [TCR_EL1](#), [ESR_EL1](#), [FAR_EL1](#), [AFSR0_EL1](#), [AFSR1_EL1](#), [MAIR_EL1](#), [AMAIR_EL1](#), [CONTEXTIDR_EL1](#).
- If EL1 is using AArch32 state, accesses using MCR to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MCRR are trapped to EL2 and reported using EC syndrome value 0x04:
 - [SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIR0](#), [MAIR1](#), [AMAIR0](#), [AMAIR1](#), [CONTEXTIDR](#).

TVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 write accesses to the specified EL1 virtual memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TTLB, bit [25]

Trap TLB maintenance instructions. Traps EL1 execution of TLB maintenance instructions to EL2, when EL2 is enabled in the current Security state, as follows:

- When EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
 - [TLBI VMALLE1](#), [TLBI VAE1](#), [TLBI ASIDE1](#), [TLBI VAAE1](#), [TLBI VALE1](#), [TLBI VAALE1](#).
 - [TLBI VMALLE1IS](#), [TLBI VAE1IS](#), [TLBI ASIDE1IS](#), [TLBI VAAE1IS](#), [TLBI VALE1IS](#), [TLBI VAALE1IS](#).
 - If FEAT_TLBIOS is implemented, this trap applies to [TLBI VMALLE1OS](#), [TLBI VAE1OS](#), [TLBI ASIDE1OS](#), [TLBI VAAE1OS](#), [TLBI VALE1OS](#), [TLBI VAALE1OS](#).
 - If FEAT_TLBIRANGE is implemented, this trap applies to [TLBI RVAE1](#), [TLBI RVAAE1](#), [TLBI RVALE1](#), [TLBI RVAALE1](#), [TLBI RVAE1IS](#), [TLBI RVAAE1IS](#), [TLBI RVALE1IS](#), [TLBI RVAALE1IS](#).
 - If FEAT_TLBIOS and FEAT_TLBIRANGE are implemented, this trap **appliesapplies** to [TLBI RVAE1OS](#), [TLBI RVAAE1OS](#), [TLBI RVALE1OS](#), [TLBI RVAALE1OS](#).
- When EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
 - [TLBIALLIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAAIS](#), [TLBIMVALIS](#), [TLBIMVAALIS](#).
 - [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [TLBIMVAA](#), [TLBIMVAL](#), [TLBIMVAAL](#).
 - [ITLBIALL](#), [ITLBIMVA](#), [ITLBIASID](#).
 - [DTLBIALL](#), [DTLBIMVA](#), [DTLBIASID](#).

TTLB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

The TLB maintenance instructions are UNDEFINED at EL0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of [SCTLR_EL1](#).UCI is not 0, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
 - [IC IVAU](#), [DC CVAU](#). If the value of [SCTLR_EL1](#).UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
 - [IC IVAU](#), [IC IALLU](#), [IC IALLUIS](#), [DC CVAU](#).
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
 - [ICIMVAU](#), [IC IALLU](#), [IC IALLUIS](#), [DCCMVAU](#).

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- [IC IALLUIS](#) and [IC IALLU](#) are always UNDEFINED at EL0 using AArch64.
- [ICIMVAU](#), [IC IALLU](#), [IC IALLUIS](#), and [DCCMVAU](#) are always UNDEFINED at EL0 using AArch32.

TPU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TCPC, bit [23]

When FEAT_DPB is implemented:

Trap data or unified cache maintenance instructions that operate to the Point of Coherency or Persistence. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of [SCTLR_EL1](#).UCI is not 0, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
 - [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#). If the value of [SCTLR_EL1](#).UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
 - [DC IVAC](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#).
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
 - [DCIMVAC](#), [DCCIMVAC](#), [DCCMVAC](#).

If FEAT_DPB2 is implemented, this trap also applies to [DC CVADP](#).

If FEAT_MTE is implemented, this trap also applies to [DC CIGVAC](#), [DC CIGDVAC](#), [DC IGVAC](#), [DC IGDVAC](#), [DC CGVAC](#), [DC CGDVAC](#), [DC CGVAP](#) and [DC CGDVAP](#).

If FEAT_DPB2 and FEAT_MTE are implemented, this trap also applies to [DC CGVADP](#) and [DC CGDVADP](#).

Note

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
 - AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
 - [DCIMVAC](#), [DCCIMVAC](#), and [DCCMVAC](#) are always UNDEFINED at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2, it is named TCPC.

TCPC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If HCR_EL2.{E2H, TGE} is set to {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of [SCTLR_EL1](#).UCI is not 0, accesses to the following registers are trapped and reported using EC syndrome value 0x18:
 - [DC CIVAC](#), [DC CVAC](#). However, if the value of [SCTLR_EL1](#).UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, accesses to [DC IVAC](#), [DC CIVAC](#), [DC CVAC](#) are trapped and reported using EC syndrome value 0x18.
- When EL1 is using AArch32, accesses to [DCIMVAC](#), [DCCIMVAC](#), and [DCCMVAC](#) are trapped and reported using EC syndrome value 0x03.

Note

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
 - AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
 - [DCIMVAC](#), [DCCIMVAC](#), and [DCCMVAC](#) are always UNDEFINED at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2, it is named TPCP.

TPC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to [DC ISW](#), [DC CSW](#), [DC CISW](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL1 is using AArch32 state, accesses to [DCISW](#), [DCCSW](#), [DCCISW](#) are trapped to EL2, reported using EC syndrome value 0x03.

If FEAT_MTE2 is implemented, this trap also applies to [DC IGSW](#), [DC IGDSW](#), [DC CGSW](#), [DC CGDW](#), [DC CIGSW](#), and [DC CIGDSW](#).

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TSW	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TACR, bit [21]

Trap Auxiliary Control Registers. Traps EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, accesses to [ACTLR_EL1](#) to EL2, are trapped to EL2 and reported using EC syndrome value 0x18.
- If EL1 is using AArch32 state, accesses to [ACTLR](#) and, if implemented, [ACTLR2](#) are trapped to EL2 and reported using EC syndrome value 0x03.

TACR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

[ACTLR_EL1](#) is not accessible at EL0.

[ACTLR](#) and [ACTLR2](#) are not accessible at EL0.

The Auxiliary Control Registers are IMPLEMENTATION DEFINED registers that might implement global control bits for the PE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps EL1 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, access to any of the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome 0x18:
 - IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}.
 - IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the [S3_<op1>_<Cn>_<Cm>_<op2>](#) register name.
- In AArch32 state, MCR and MRC access to instructions with the following encodings are trapped and reported using EC syndrome 0x03:
 - All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}.
 - All coproc==p15, CRn==c10, opc1 == {0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}.
 - All coproc==p15, CRn==c11, opc1 == {0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

When the value of HCR_EL2.TIDCP is 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from EL0 is trapped to EL2. If it is not, then it is UNDEFINED, and any attempt to access it from EL0 generates an exception that is taken to EL1.

TIDCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to or execution of the specified encodings reserved for IMPLEMENTATION DEFINED functionality are trapped to EL2, when EL2 is enabled in the current Security state.

An implementation can also include IMPLEMENTATION DEFINED registers that provide additional controls, to give finer-grained control of the trapping of IMPLEMENTATION DEFINED features.

Note

Arm expects the trapping of EL0 accesses to these functions to EL2 to be unusual, and used only when the hypervisor is virtualizing EL0 operation. Arm strongly recommends that unless the hypervisor must virtualize EL0 operation, an EL0 access to any of these functions is UNDEFINED, as it would be if the implementation did not include EL2. The PE then takes any resulting exception to EL1.

The trapping of accesses to these registers from EL1 is higher priority than an exception resulting from the register access being UNDEFINED.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TSC, bit [19]

Trap SMC instructions. Traps EL1 execution of SMC instructions to EL2, when EL2 is enabled in the current Security state.

If execution is in AArch64 state, the trap is reported using EC syndrome value 0x17.

If execution is in AArch32 state, the trap is reported using EC syndrome value 0x13.

Note

HCR_EL2.TSC traps execution of the SMC instruction. It is not a routing control for the SMC exception. Trap exceptions and SMC exceptions have different preferred return addresses.

TSC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	<p>If EL3 is implemented, then any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state, regardless of the value of SCR_EL3.SMD.</p> <p>If EL3 is not implemented, FEAT_NV is implemented, and HCR_EL2.NV is 1, then any attempt to execute an SMC instruction at EL1 using AArch64 is trapped to EL2, when EL2 is enabled in the current Security state.</p> <p>If EL3 is not implemented, and either FEAT_NV is not implemented or HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether:</p> <ul style="list-style-type: none"> Any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state. Any attempt to execute an SMC instruction is UNDEFINED.

In AArch32 state, the Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

SMC instructions are UNDEFINED at EL0.

If EL3 is not implemented, and either FEAT_NV is not implemented or HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether this bit is:

- RES0.
- Implemented with the functionality as described in HCR_EL2.TSC.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID3, bit [18]

Trap ID group 3. Traps EL1 reads of group 3 ID registers to EL2, when EL2 is enabled in the current Security state, as follows:

In AArch64 state:

- Reads of the following registers are trapped to EL2, reported using EC syndrome value 0x18:
 - [ID_PFR0_EL1](#), [ID_PFR1_EL1](#), [ID_PFR2_EL1](#), [ID_DFR0_EL1](#), [ID_AFR0_EL1](#), [ID_MMFR0_EL1](#), [ID_MMFR1_EL1](#), [ID_MMFR2_EL1](#), [ID_MMFR3_EL1](#), [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), [ID_ISAR4_EL1](#), [ID_ISAR5_EL1](#), [MVFR0_EL1](#), [MVFR1_EL1](#), [MVFR2_EL1](#).
 - [ID_AA64PFR0_EL1](#), [ID_AA64PFR1_EL1](#), [ID_AA64DFR0_EL1](#), [ID_AA64DFR1_EL1](#), [ID_AA64ISAR0_EL1](#), [ID_AA64ISAR1_EL1](#), [ID_AA64MMFR0_EL1](#), [ID_AA64MMFR1_EL1](#), [ID_AA64AFR0_EL1](#), [ID_AA64AFR1_EL1](#).
 - If FEAT_FGT is implemented:
 - [ID_MMFR4_EL1](#) and [ID_MMFR5_EL1](#) are trapped to EL2.
 - [ID_AA64MMFR2_EL1](#) and [ID_ISAR6_EL1](#) are trapped to EL2.
 - [ID_DFR1_EL1](#) is trapped to EL2.
 - [ID_AA64ZFR0_EL1](#) is trapped to EL2.
 - [ID_AA64SMFR0_EL1](#) [ID_AA64ISAR2_EL1](#) is trapped to EL2.
 - [ID_AA64ISAR2_EL1](#) is This trapped field traps all MRS accesses to EL2 registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.
 - This field traps all MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.
 - If FEAT_FGT is not implemented:
 - [ID_MMFR4_EL1](#) and [ID_MMFR5_EL1](#) are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID_MMFR4_EL1](#) or [ID_MMFR5_EL1](#) are trapped to EL2.
 - [ID_AA64MMFR2_EL1](#) and [ID_ISAR6_EL1](#) are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID_AA64MMFR2_EL1](#) or [ID_ISAR6_EL1](#) are trapped to EL2.
 - [ID_DFR1_EL1](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID_DFR1_EL1](#) are trapped to EL2.
 - [ID_AA64ZFR0_EL1](#) is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to [ID_AA64ZFR0_EL1](#) are trapped to EL2.
 - [ID_AA64SMFR0_EL1](#) [ID_AA64ISAR2_EL1](#) is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to [ID_AA64SMFR0_EL1](#) [ID_AA64ISAR2_EL1](#) are trapped to EL2.
 - [ID_AA64ISAR2_EL1](#) is trapped to EL2 Otherwise, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to [ID_AA64ISAR2_EL1](#) are whether trapped this bit traps MRS accesses to EL2 registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.
 - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.

In AArch32 state:

- VMRS access to [MVFR0](#), [MVFR1](#), and [MVFR2](#), are trapped to EL2, reported using EC syndrome value 0x08, unless access is also trapped by [HCPTR](#) which takes priority.
- MRC access to the following registers are trapped to EL2, reported using EC syndrome value 0x03:
 - [ID_PFR0](#), [ID_PFR1](#), [ID_PFR2](#), [ID_DFR0](#), [ID_AFR0](#), [ID_MMFR0](#), [ID_MMFR1](#), [ID_MMFR2](#), [ID_MMFR3](#), [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR3](#), [ID_ISAR4](#), [ID_ISAR5](#).
 - If FEAT_FGT is implemented:
 - [ID_MMFR4](#) and [ID_MMFR5](#) are trapped to EL2.
 - [ID_ISAR6](#) is trapped to EL2.
 - [ID_DFR1](#) is trapped to EL2.
 - This field traps all MRC accesses to encodings in the following range that are not already mentioned in this field description: coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.
 - If FEAT_FGT is not implemented:
 - [ID_MMFR4](#) and [ID_MMFR5](#) are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID_MMFR4](#) or [ID_MMFR5](#) are trapped.
 - [ID_ISAR6](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID_ISAR6](#) are trapped to EL2.
 - [ID_DFR1](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID_DFR1](#) are trapped to EL2.
 - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps all MRC accesses to registers in the following range not already mentioned in this field description with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

TID3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 3 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, reads of [CTR_EL0](#), [CCSIDR_EL1](#), [CCSIDR2_EL1](#), [CLIDR_EL1](#), and [CSSELR_EL1](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 is using AArch64 and the value of [SCTLR_EL1](#).UCT is not 0, reads of [CTR_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18. If the value of [SCTLR_EL1](#).UCT is 0, then EL0 reads of [CTR_EL0](#) are trapped to EL1 and the resulting exception takes precedence over this trap.
- If EL1 is using AArch64, writes to [CSSELR_EL1](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL1 is using AArch32, reads of [CTR](#), [CCSIDR](#), [CCSIDR2](#), [CLIDR](#), and [CSSELR](#) are trapped to EL2, reported using EC syndrome value 0x03.
- If EL1 is using AArch32, writes to [CSSELR](#) are trapped to EL2, reported using EC syndrome value 0x03.

TID2	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 2 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID1, bit [16]

Trap ID group 1. Traps EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, accesses of REVIDR_EL1, AIDR_EL1, reported using EC syndrome value SMIDR_EL1, reported using EC syndrome value 0x18.
- In AArch32 state, accesses of TCMTR, TLBTR, REVIDR, AIDR, reported using EC syndrome value 0x03.

TID1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 1 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID0, bit [15]

When AArch32 is supported at EL0 any Exception level:

Trap ID group 0. Traps the following register accesses to EL2:

- EL1 reads of the JIDR, reported using EC syndrome value 0x05.
- If the JIDR is RAZ from EL0, EL0 reads of the JIDR, reported using EC syndrome value 0x05.
- EL1 accesses using VMRS of the FPSID, reported using EC syndrome value 0x08.

Note

- It is IMPLEMENTATION DEFINED whether the JIDR is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0, then any resulting exception takes precedence over this trap.
- The FPSID is not accessible at EL0 using AArch32.
- Writes to the FPSID are ignored, and not trapped by this control.

TID0	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 0 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [14]

Traps EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction. FEAT_WFxT2 is implemented, this trap also applies to the WFET instruction.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE or SCTLR_EL1.nTWE.

In AArch32 state, the attempted execution of a conditional WFE instruction is trapped only if the instruction passes its condition code check.

Note

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TWI, bit [13]

Traps EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction. FEAT_WFxT2 is implemented, this trap also applies to the WFIT instruction.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI or SCTLR_EL1.nTWI.

In AArch32 state, the attempted execution of a conditional WFI instruction is trapped only if the instruction passes its condition code check.

Note

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DC, bit [12]

Default Cacheability.

DC	Meaning
0b0	This control has no effect on the EL1&0 translation regime.
0b1	In any Security state: <ul style="list-style-type: none"> When EL1 is using AArch64, the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of SCTLR_EL1. When EL1 is using AArch32, the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of SCTLR. The PE behaves as if the value of the HCR_EL2.VM field is 1 for all purposes other than returning the value of a direct read of HCR_EL2. The memory type produced by stage 1 of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.

This field has no effect on the EL2, EL2&0, and EL3 translation regimes.

This field is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BSU, bits [11:10]

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from EL1 or EL0:

BSU	Meaning
0b00	No effect.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0b00 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FB, bit [9]

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from EL1:

AArch32: [BPIALL](#), [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [DTLBIALL](#), [DTLBIMVA](#), [DTLBIASID](#), [ITLBIALL](#), [ITLBIMVA](#), [ITLBIASID](#), [TLBIMVAA](#), [ICIALLU](#), [TLBIMVAL](#), [TLBIMVAAL](#).

AArch64: [TLBI VMALLE1](#), [TLBI VAE1](#), [TLBI ASIDE1](#), [TLBI VAAE1](#), [TLBI VALE1](#), [TLBI VAALE1](#), [IC IALLU](#), [TLBI RVAE1](#), [TLBI RVAAE1](#), [TLBI RVALE1](#), [TLBI RVAALE1](#).

FB	Meaning
0b0	This field has no effect on the operation of the specified instructions.
0b1	When one of the specified instruction is executed at EL1, the instruction is broadcast within the Inner Shareable shareability domain.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VSE, bit [8]

Virtual SError interrupt.

VSE	Meaning
0b0	This mechanism is not making a virtual SError interrupt pending.
0b1	A virtual SError interrupt is pending because of this mechanism.

The virtual SError interrupt is enabled only when the value of HCR_EL2.{TGE, AMO} is {0, 1}.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VI, bit [7]

Virtual IRQ Interrupt.

VI	Meaning
0b0	This mechanism is not making a virtual IRQ pending.
0b1	A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of HCR_EL2.{TGE, IMO} is {0, 1}.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VF, bit [6]

Virtual FIQ Interrupt.

VF	Meaning
0b0	This mechanism is not making a virtual FIQ pending.
0b1	A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR_EL2.{TGE, FMO} is {0, 1}.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AMO, bit [5]

Physical SError interrupt routing.

AMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> When the value of HCR_EL2.TGE is 0, Physical SError interrupts are not taken to EL2. When the value of HCR_EL2.TGE is 10, Physical SError interrupts are not taken to EL2 unless they are routed to EL3 by the SCR_EL3.EA bit. Virtual SError interrupts are disabled.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> Physical SError interrupts are taken to EL2, unless they are routed to EL3. When the value of HCR_EL2.TGE is 0, then virtual SError interrupts are enabled.

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the AMO bit physical asynchronous External aborts and SError interrupts target EL2 unless they are routed to EL3.
- When FEAT_VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When FEAT_VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMO, bit [4]

Physical IRQ Routing.

IMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> When the value of HCR_EL2.TGE is 0, Physical IRQ interrupts are not taken to EL2. When the value of HCR_EL2.TGE is 10, Physical IRQ interrupts are not taken to EL2 unless they are routed to EL3 by the SCR_EL3.IRQ bit. Virtual IRQ interrupts are disabled.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> Physical IRQ interrupts are taken to EL2, unless they are routed to EL3. When the value of HCR_EL2.TGE is 0, then Virtual IRQ interrupts are enabled.

If EL2 is enabled in the current Security state, and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the IMO bit, physical IRQ Interrupts target EL2 unless they are routed to EL3.
- When FEAT_VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When FEAT_VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FMO, bit [3]

Physical FIQ Routing.

FMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> When the value of HCR_EL2.TGE is 0, Physical FIQ interrupts are not taken to EL2. When the value of HCR_EL2.TGE is 1, Physical FIQ interrupts are not taken to EL2 unless they are routed to EL3 by the SCR_EL3.FIQ bit. Virtual FIQ interrupts are disabled.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: <ul style="list-style-type: none"> Physical FIQ interrupts are taken to EL2, unless they are routed to EL3. When HCR_EL2.TGE is 0, then Virtual FIQ interrupts are enabled.

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the FMO bit, physical FIQ Interrupts target EL2 unless they are routed to EL3.
- When FEAT_VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When FEAT_VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [2]

Protected Table Walk. In the EL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs, then the value of this bit determines the behavior:

PTW	Meaning
0b0	The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.
0b1	The memory access generates a stage 2 Permission fault.

This field is permitted to be cached in a TLB.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SWIO, bit [1]

Set/Way Invalidation Override. Causes EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way:

SWIO	Meaning
0b0	This control has no effect on the operation of data cache invalidate by set/way instructions.
0b1	Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When the value of this bit is 1:

AArch32: [DCISW](#) performs the same invalidation as a [DCCISW](#) instruction.

AArch64: [DC ISW](#) performs the same invalidation as a [DC CISW](#) instruction.

This bit can be implemented as RES1.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the EL1&0 translation regime, when EL2 is enabled in the current Security state.

VM	Meaning
0b0	EL1&0 stage 2 address translation disabled.
0b1	EL1&0 stage 2 address translation enabled.

When the value of this bit is 1, data cache invalidate instructions executed at EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR_EL2.SWIO bit.

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x078];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HCR_EL2;
elsif PSTATE.EL == EL3 then
    return HCR_EL2;

```

MSR HCR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x078] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HCR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    HCR_EL2 = X[t];

```

The HCRX_EL2 characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

Configuration

This register is present only when FEAT_HCX is implemented. Otherwise, direct accesses to HCRX_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

The bits in this register behave as if they are 0 for all purposes other than direct reads of the register if:

- EL2 is not enabled in the current Security state.
- [SCR_EL3](#).HXEn is 0.

Attributes

HCRX_EL2 is a 64-bit register.

Field descriptions

6362616059585756555453525150494847464544434241403938 37 36 35 34 33

RESO SMPME FGTnXS FGTnXS FnXS FnXS EnASR EnASR EnALS EnALS

31302928272625242322212019181716151413121110 9 8 7 6 5 4 3 2 1

Bits [63:65]

Reserved, RES0.

SMPME, bit [5]

When FEAT_SME is implemented:

Streaming Mode Priority Mapping Enable.

Controls mapping of the value of [SMPRI_EL1](#). Priority for streaming execution priority at EL0 or EL1.

SMPME	Meaning
0b0	The effective priority value is taken from SMPRI_EL1 .Priority.
0b1	The effective priority value is: <ul style="list-style-type: none"> • When the current Exception level is EL2 or EL3, the value of SMPRI_EL1.Priority. • When the current Exception level is EL0 or EL1, the value of the SMPRMAP_EL2 field corresponding to the value of SMPRI_EL1.Priority.

When [SMIDR_EL1.SMPS](#) is '0', this field is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTnXS, bit [4]**When FEAT_XS is implemented:**

Determines if the fine-grained traps in HFGITR_EL2 that apply to each of the TLBI maintenance instructions that are accessible at EL1 also apply to the corresponding TLBI maintenance instructions with the nXS qualifier.

FGTnXS	Meaning
0b0	The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 also applies to the corresponding TLBI instruction with the nXS qualifier at EL1.
0b1	The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 does not apply to the corresponding TLBI instruction with the nXS qualifier at EL1.

The reset behaviour of this field is:

- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

FnXS, bit [3]**When FEAT_XS is implemented:**

Determines the behavior of TLBI instructions affected by the XS attribute.

This control bit also determines whether an AArch64 DSB instruction behaves as a DSB instruction with an nXS qualifier when executed at EL0 and EL1.

FnXS	Meaning
0b0	This control does not have any effect on the behavior of the TLBI maintenance instructions.
0b1	A TLBI maintenance instruction without the nXS qualifier executed at EL1 behaves in the same way as the corresponding TLBI maintenance instruction with the nXS qualifier. An AArch64 DSB instruction executed at EL1 or EL0 behaves in the same way as the corresponding DSB instruction with the nXS qualifier executed at EL1 or EL0.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

EnASR, bit [2]**When FEAT_LS64 is implemented:**

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an ST64BV instruction at EL0 or EL1 to EL2.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1 .EnASR. Execution of an ST64BV instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

The reset behaviour of this field is:

- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

EnALS, bit [1]**When FEAT_LS64 is implemented:**

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 or EL1 to EL2.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1 .EnALS. Execution of an LD64B or ST64B instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

The reset behaviour of this field is:

- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

EnAS0, bit [0]**When FEAT_LS64 is implemented:**

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an ST64BV0 instruction at EL0 or EL1 to EL2.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1 .EnAS0. Execution of an ST64BV0 instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

The reset behaviour of this field is:

- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to 0.

Otherwise:

Reserved, RES0.

Accessing HCRX_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HCRX_EL2

HFGRTR_EL2, Hypervisor Fine-Grained Read Trap Register

The HFGRTR_EL2 characteristics are:

Purpose

Provides controls for traps of MRS and MRC reads of System registers.

Configuration

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HFGRTR_EL2 are UNDEFINED.

Attributes

HFGRTR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55
RES0								nTPIDR2_EL0
SCXTNUM_EL0	SCXTNUM_EL1	SCTLR_EL1	REVIDR_EL1	PAR_EL1	MPIDR_EL1	MIDR_EL1	MAIR_EL1	LORSA_EL1
31	30	29	28	27	26	25	24	23

Bits [63:56]

Reserved, RES0.

nTPIDR2_EL0, bit [55]
When FEAT_SME is implemented:

Trap MRS reads of TPIDR2_EL0 at EL1 and EL0 using AArch64 to EL2.

nTPIDR2_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TPIDR2_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TPIDR2_EL0 are not trapped by this mechanism.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nSMPRI_EL1, bit [54]**When FEAT_SME is implemented:**Trap MRS reads of [SMPRI_EL1](#) at EL1 using AArch64 to EL2.

nSMPRI_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SMPRI_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SMPRI_EL1 are not trapped by this mechanism.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [53:51]

Reserved, RES0.

nACCDATA_EL1, bit [50]**When FEAT_LS64 is implemented:**Trap MRS reads of [ACCDATA_EL1](#) at EL1 using AArch64 to EL2.

nACCDATA_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of ACCDATA_EL1 are not trapped by this mechanism.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXADDR_EL1, bit [49]**When FEAT_RAS is implemented:**Trap MRS reads of [ERXADDR_EL1](#) at EL1 using AArch64 to EL2.

ERXADDR_EL1	Meaning
0b0	MRS reads of ERXADDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFPGCDN_EL1, bit [48]

When FEAT_RASv1p1 is implemented:

Trap MRS reads of [ERXPFPGCDN_EL1](#) at EL1 using AArch64 to EL2.

ERXPFPGCDN_EL1	Meaning
0b0	MRS reads of ERXPFPGCDN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFPGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFPGCTL_EL1, bit [47]

When FEAT_RASv1p1 is implemented:

Trap MRS reads of [ERXPFPGCTL_EL1](#) at EL1 using AArch64 to EL2.

ERXPFPGCTL_EL1	Meaning
0b0	MRS reads of ERXPFPGCTL_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFPGCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFGF_EL1, bit [46]

When FEAT_RAS is implemented:

Trap MRS reads of [ERXPFGF_EL1](#) at EL1 using AArch64 to EL2.

ERXPFGF_EL1	Meaning
0b0	MRS reads of ERXPFGF_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFGF_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXMISCN_EL1, bit [45]

When FEAT_RAS is implemented:

Trap MRS reads of [ERXMISCN_EL1](#) at EL1 using AArch64 to EL2.

ERXMISCN_EL1	Meaning
0b0	MRS reads of ERXMISCN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXMISCN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXSTATUS_EL1, bit [44]

When FEAT_RAS is implemented:

Trap MRS reads of [ERXSTATUS_EL1](#) at EL1 using AArch64 to EL2.

ERXSTATUS_EL1	Meaning
0b0	MRS reads of ERXSTATUS_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXCTLR_EL1, bit [43]

When FEAT_RAS is implemented:

Trap MRS reads of [ERXCTLR_EL1](#) at EL1 using AArch64 to EL2.

ERXCTLR_EL1	Meaning
0b0	MRS reads of ERXCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXFR_EL1, bit [42]

When FEAT_RAS is implemented:

Trap MRS reads of [ERXFR_EL1](#) at EL1 using AArch64 to EL2.

ERXFR_EL1	Meaning
0b0	MRS reads of ERXFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERRSEL_EL1, bit [41]

When FEAT_RAS is implemented:

Trap MRS reads of [ERRSEL_EL1](#) at EL1 using AArch64 to EL2.

ERRSEL_EL1	Meaning
0b0	MRS reads of ERRSEL_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERRSEL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERRIDR_EL1, bit [40]

When FEAT_RAS is implemented:

Trap MRS reads of [ERRIDR_EL1](#) at EL1 using AArch64 to EL2.

ERRIDR_EL1	Meaning
0b0	MRS reads of ERRIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERRIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ICC_IGRPENn_EL1, bit [39]

When FEAT_GICv3 is implemented:

Trap MRS reads of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 to EL2.

ICC_IGRPEN _n _EL1	Meaning
0b0	MRS reads of ICC_IGRPEN<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

VBAR_EL1, bit [38]

Trap MRS reads of [VBAR_EL1](#) at EL1 using AArch64 to EL2.

VBAR_EL1	Meaning
0b0	MRS reads of VBAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of VBAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TTBR1_EL1, bit [37]

Trap MRS reads of [TTBR1_EL1](#) at EL1 using AArch64 to EL2.

TTBR1_EL1	Meaning
0b0	MRS reads of TTBR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TTBR0_EL1, bit [36]

Trap MRS reads of [TTBR0_EL1](#) at EL1 using AArch64 to EL2.

TTBR0_EL1	Meaning
0b0	MRS reads of TTBR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDR_EL0, bit [35]

Trap MRS reads of [TPIDR_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [TPIDRURW](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDR_EL0	Meaning
0b0	MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURW at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MRC reads of TPIDRURW at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDRRO_EL0, bit [34]

Trap MRS reads of [TPIDRRO_EL0](#) at EL1 and EL0 using AArch64 and MRC reads of [TPIDRURO](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDRRO_EL0	Meaning
0b0	MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURO at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: <ul style="list-style-type: none"> MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MRC reads of TPIDRURO at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDR_EL1, bit [33]

Trap MRS reads of [TPIDR_EL1](#) at EL1 using AArch64 to EL2.

TPIDR_EL1	Meaning
0b0	MRS reads of TPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TCR_EL1, bit [32]

Trap MRS reads of [TCR_EL1](#) at EL1 using AArch64 to EL2.

TCR_EL1	Meaning
0b0	MRS reads of TCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

SCXTNUM_EL0, bit [31]

When [FEAT_CSV2_2](#) is implemented or [FEAT_CSV2_1p2](#) is implemented:

Trap MRS reads of [SCXTNUM_EL0](#) at EL1 and EL0 using AArch64 to EL2.

SCXTNUM_EL0	Meaning
0b0	MRS reads of SCXTNUM_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCXTNUM_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

SCXTNUM_EL1, bit [30]

When [FEAT_CSV2_2](#) is implemented or [FEAT_CSV2_1p2](#) is implemented:

Trap MRS reads of [SCXTNUM_EL1](#) at EL1 using AArch64 to EL2.

SCXTNUM_EL1	Meaning
0b0	MRS reads of SCXTNUM_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCXTNUM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

SCTLR_EL1, bit [29]

Trap MRS reads of [SCTLR_EL1](#) at EL1 using AArch64 to EL2.

SCTLR_EL1	Meaning
0b0	MRS reads of SCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

REVIDR_EL1, bit [28]

Trap MRS reads of [REVIDR_EL1](#) at EL1 using AArch64 to EL2.

REVIDR_EL1	Meaning
0b0	MRS reads of REVIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of REVIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

PAR_EL1, bit [27]

Trap MRS reads of [PAR_EL1](#) at EL1 using AArch64 to EL2.

PAR_EL1	Meaning
0b0	MRS reads of PAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

MPIDR_EL1, bit [26]

Trap MRS reads of [MPIDR_EL1](#) at EL1 using AArch64 to EL2.

MPIDR_EL1	Meaning
0b0	MRS reads of MPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

MIDR_EL1, bit [25]

Trap MRS reads of [MIDR_EL1](#) at EL1 using AArch64 to EL2.

MIDR_EL1	Meaning
0b0	MRS reads of MIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

MAIR_EL1, bit [24]

Trap MRS reads of [MAIR_EL1](#) at EL1 using AArch64 to EL2.

MAIR_EL1	Meaning
0b0	MRS reads of MAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

LORSA_EL1, bit [23]**When FEAT_LOR is implemented:**

Trap MRS reads of [LORSA_EL1](#) at EL1 using AArch64 to EL2.

LORSA_EL1	Meaning
0b0	MRS reads of LORSA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORSA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORN_EL1, bit [22]**When FEAT_LOR is implemented:**

Trap MRS reads of [LORN_EL1](#) at EL1 using AArch64 to EL2.

LORN_EL1	Meaning
0b0	MRS reads of LORN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORID_EL1, bit [21]**When FEAT_LOR is implemented:**

Trap MRS reads of [LORID_EL1](#) at EL1 using AArch64 to EL2.

LORID_EL1	Meaning
0b0	MRS reads of LORID_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORID_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LOREA_EL1, bit [20]

When FEAT_LOR is implemented:

Trap MRS reads of [LOREA_EL1](#) at EL1 using AArch64 to EL2.

LOREA_EL1	Meaning
0b0	MRS reads of LOREA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LOREA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORC_EL1, bit [19]

When FEAT_LOR is implemented:

Trap MRS reads of [LORC_EL1](#) at EL1 using AArch64 to EL2.

LORC_EL1	Meaning
0b0	MRS reads of LORC_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORC_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ISR_EL1, bit [18]

Trap MRS reads of [ISR_EL1](#) at EL1 using AArch64 to EL2.

ISR_EL1	Meaning
0b0	MRS reads of ISR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ISR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

FAR_EL1, bit [17]

Trap MRS reads of [FAR_EL1](#) at EL1 using AArch64 to EL2.

FAR_EL1	Meaning
0b0	MRS reads of FAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of FAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ESR_EL1, bit [16]

Trap MRS reads of [ESR_EL1](#) at EL1 using AArch64 to EL2.

ESR_EL1	Meaning
0b0	MRS reads of ESR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ESR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCZID_EL0, bit [15]

Trap MRS reads of [DCZID_EL0](#) at EL1 and EL0 using AArch64 to EL2.

DCZID_EL0	Meaning
0b0	MRS reads of DCZID_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DCZID_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CTR_EL0, bit [14]

Trap MRS reads of [CTR_EL0](#) at EL1 and EL0 using AArch64 to EL2.

CTR_EL0	Meaning
0b0	MRS reads of CTR_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then MRS reads of CTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CSSELR_EL1, bit [13]

Trap MRS reads of [CSSELR_EL1](#) at EL1 using AArch64 to EL2.

CSSELR_EL1	Meaning
0b0	MRS reads of CSSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then MRS reads of CSSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CPACR_EL1, bit [12]

Trap MRS reads of [CPACR_EL1](#) at EL1 using AArch64 to EL2.

CPACR_EL1	Meaning
0b0	MRS reads of CPACR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then MRS reads of CPACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CONTEXTIDR_EL1, bit [11]

Trap MRS reads of [CONTEXTIDR_EL1](#) at EL1 using AArch64 to EL2.

CONTEXTIDR_EL1	Meaning
0b0	MRS reads of CONTEXTIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then MRS reads of CONTEXTIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CLIDR_EL1, bit [10]

Trap MRS reads of [CLIDR_EL1](#) at EL1 using AArch64 to EL2.

CLIDR_EL1	Meaning
0b0	MRS reads of CLIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CLIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CCSIDR_EL1, bit [9]

Trap MRS reads of [CCSIDR_EL1](#) at EL1 using AArch64 to EL2.

CCSIDR_EL1	Meaning
0b0	MRS reads of CCSIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CCSIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

APIBKey, bit [8]

When FEAT_PAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIBKeyHi_EL1](#).
- [APIBKeyLo_EL1](#).

APIBKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APIAKey, bit [7]**When FEAT_PAuth is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIAKeyHi_EL1](#).
- [APIAKeyLo_EL1](#).

APIAKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APGAKey, bit [6]**When FEAT_PAuth is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APGAKeyHi_EL1](#).
- [APGAKeyLo_EL1](#).

APGAKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APDBKey, bit [5]**When FEAT_PAuth is implemented:**

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDBKeyHi_EL1](#).
- [APDBKeyLo_EL1](#).

APDBKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APDAKey, bit [4]

When FEAT_PAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDAKeyHi_EL1](#).
- [APDAKeyLo_EL1](#).

APDAKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

AMAIR_EL1, bit [3]

Trap MRS reads of [AMAIR_EL1](#) at EL1 using AArch64 to EL2.

AMAIR_EL1	Meaning
0b0	MRS reads of AMAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AMAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

AIDR_EL1, bit [2]

Trap MRS reads of [AIDR_EL1](#) at EL1 using AArch64 to EL2.

AIDR_EL1	Meaning
0b0	MRS reads of AIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then MRS reads of AIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

AFSR1_EL1, bit [1]

Trap MRS reads of [AFSR1_EL1](#) at EL1 using AArch64 to EL2.

AFSR1_EL1	Meaning
0b0	MRS reads of AFSR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then MRS reads of AFSR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

AFSR0_EL1, bit [0]

Trap MRS reads of [AFSR0_EL1](#) at EL1 using AArch64 to EL2.

AFSR0_EL1	Meaning
0b0	MRS reads of AFSR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then MRS reads of AFSR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HFGTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HFGTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then

The HFGWTR_EL2 characteristics are:

Purpose

Provides controls for traps of MSR and MCR writes of System registers.

Configuration

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HFGWTR_EL2 are UNDEFINED.

Attributes

HFGWTR_EL2 is a 64-bit register.

Field descriptions

Bits [63:5651]

Reserved, RES0.

nTPIDR2_EL0, bit [55]

When FEAT_SME is implemented:

Trap MSR writes of [TPIDR2_EL0](#) at EL1 and EL0 using AArch64 to EL2.

nTPIDR2_ELO	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, HCR_EL2 .{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3 .FGTEn == 1, then MSR writes of TPIDR2_ELO at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TPIDR2_ELO are not trapped by this mechanism.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nSMPRI_EL1, bit [54]**When FEAT_SME is implemented:**Trap MSR writes of [SMPRI_EL1](#) at EL1 using AArch64 to EL2.

nSMPRI_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SMPRI_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SMPRI_EL1 are not trapped by this mechanism.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [53:51]

Reserved, RES0.

nACCDATA_EL1, bit [50]**When FEAT_LS64 is implemented:**Trap MSR writes of [ACCDATA_EL1](#) at EL1 using AArch64 to EL2.

nACCDATA_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of ACCDATA_EL1 are not trapped by this mechanism.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXADDR_EL1, bit [49]**When FEAT_RAS is implemented:**Trap MSR writes of [ERXADDR_EL1](#) at EL1 using AArch64 to EL2.

ERXADDR_EL1	Meaning
0b0	MSR writes of ERXADDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFPGCDN_EL1, bit [48]

When FEAT_RASv1p1 is implemented:

Trap MSR writes of [ERXPFPGCDN_EL1](#) at EL1 using AArch64 to EL2.

ERXPFPGCDN_EL1	Meaning
0b0	MSR writes of ERXPFPGCDN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXPFPGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFPGCTL_EL1, bit [47]

When FEAT_RASv1p1 is implemented:

Trap MSR writes of [ERXPFPGCTL_EL1](#) at EL1 using AArch64 to EL2.

ERXPFPGCTL_EL1	Meaning
0b0	MSR writes of ERXPFPGCTL_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXPFPGCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [46]

Reserved, RES0.

ERXMISCn_EL1, bit [45]

When FEAT_RAS is implemented:

Trap MSR writes of ERXMISC<n>_EL1 at EL1 using AArch64 to EL2.

ERXMISCn_EL1	Meaning
0b0	MSR writes of ERXMISC<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXMISC<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXSTATUS_EL1, bit [44]

When FEAT_RAS is implemented:

Trap MSR writes of [ERXSTATUS_EL1](#) at EL1 using AArch64 to EL2.

ERXSTATUS_EL1	Meaning
0b0	MSR writes of ERXSTATUS_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXCTLR_EL1, bit [43]

When FEAT_RAS is implemented:

Trap MSR writes of [ERXCTLR_EL1](#) at EL1 using AArch64 to EL2.

ERXCTLR_EL1	Meaning
0b0	MSR writes of ERXCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

ERRSELR_EL1, bit [41]

When [FEAT_RAS](#) is implemented:

Trap MSR writes of [ERRSELR_EL1](#) at EL1 using AArch64 to EL2.

ERRSELR_EL1	Meaning
0b0	MSR writes of ERRSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERRSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [40]

Reserved, RES0.

ICC_IGRPENn_EL1, bit [39]

When [FEAT_GICv3](#) is implemented:

Trap MSR writes of [ICC_IGRPEN<n>_EL1](#) at EL1 using AArch64 to EL2.

ICC_IGRPEN _n _EL1	Meaning
0b0	MSR writes of ICC_IGRPEN<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

VBAR_EL1, bit [38]

Trap MSR writes of [VBAR_EL1](#) at EL1 using AArch64 to EL2.

VBAR_EL1	Meaning
0b0	MSR writes of VBAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of VBAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TTBR1_EL1, bit [37]

Trap MSR writes of [TTBR1_EL1](#) at EL1 using AArch64 to EL2.

TTBR1_EL1	Meaning
0b0	MSR writes of TTBR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TTBR0_EL1, bit [36]

Trap MSR writes of [TTBR0_EL1](#) at EL1 using AArch64 to EL2.

TTBR0_EL1	Meaning
0b0	MSR writes of TTBR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDR_EL0, bit [35]

Trap MSR writes of [TPIDR_EL0](#) at EL1 and EL0 using AArch64 and MCR writes of [TPIDRURW](#) at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDR_EL0	Meaning
0b0	MSR writes of TPIDR_EL0 at EL1 and EL0 using AArch64 and MCR writes of TPIDRURW at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: <ul style="list-style-type: none"> MSR writes of TPIDR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. MCR writes of TPIDRURW at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDRRO_EL0, bit [34]

Trap MSR writes of [TPIDRRO_EL0](#) at EL1 using AArch64 to EL2.

TPIDRRO_EL0	Meaning
0b0	MSR writes of TPIDRRO_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDRRO_EL0 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDR_EL1, bit [33]

Trap MSR writes of [TPIDR_EL1](#) at EL1 using AArch64 to EL2.

TPIDR_EL1	Meaning
0b0	MSR writes of TPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TCR_EL1, bit [32]

Trap MSR writes of [TCR_EL1](#) at EL1 using AArch64 to EL2.

TCR_EL1	Meaning
0b0	MSR writes of TCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

SCXTNUM_EL0, bit [31]

When [FEAT_CSV2_2](#) is implemented or [FEAT_CSV2_1p2](#) is implemented:

Trap MSR writes of [SCXTNUM_EL0](#) at EL1 and EL0 using AArch64 to EL2.

SCXTNUM_EL0	Meaning
0b0	MSR writes of SCXTNUM_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCXTNUM_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

SCXTNUM_EL1, bit [30]

When [FEAT_CSV2_2](#) is implemented or [FEAT_CSV2_1p2](#) is implemented:

Trap MSR writes of [SCXTNUM_EL1](#) at EL1 using AArch64 to EL2.

SCXTNUM_EL1	Meaning
0b0	MSR writes of SCXTNUM_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCXTNUM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

SCTLR_EL1, bit [29]

Trap MSR writes of [SCTLR_EL1](#) at EL1 using AArch64 to EL2.

SCTLR_EL1	Meaning
0b0	MSR writes of SCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [28]

Reserved, RES0.

PAR_EL1, bit [27]

Trap MSR writes of [PAR_EL1](#) at EL1 using AArch64 to EL2.

PAR_EL1	Meaning
0b0	MSR writes of PAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bits [26:25]

Reserved, RES0.

MAIR_EL1, bit [24]

Trap MSR writes of [MAIR_EL1](#) at EL1 using AArch64 to EL2.

MAIR_EL1	Meaning
0b0	MSR writes of MAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of MAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

LORSA_EL1, bit [23]

When FEAT_LOR is implemented:

Trap MSR writes of [LORSA_EL1](#) at EL1 using AArch64 to EL2.

LORSA_EL1	Meaning
0b0	MSR writes of LORSA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORSA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORN_EL1, bit [22]

When FEAT_LOR is implemented:

Trap MSR writes of [LORN_EL1](#) at EL1 using AArch64 to EL2.

LORN_EL1	Meaning
0b0	MSR writes of LORN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [21]

Reserved, RES0.

LOREA_EL1, bit [20]

When FEAT_LOR is implemented:

Trap MSR writes of [LOREA_EL1](#) at EL1 using AArch64 to EL2.

LOREA_EL1	Meaning
0b0	MSR writes of LOREA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LOREA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORC_EL1, bit [19]

When FEAT_LOR is implemented:

Trap MSR writes of [LORC_EL1](#) at EL1 using AArch64 to EL2.

LORC_EL1	Meaning
0b0	MSR writes of LORC_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORC_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

FAR_EL1, bit [17]

Trap MSR writes of [FAR_EL1](#) at EL1 using AArch64 to EL2.

FAR_EL1	Meaning
0b0	MSR writes of FAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of FAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ESR_EL1, bit [16]

Trap MSR writes of [ESR_EL1](#) at EL1 using AArch64 to EL2.

ESR_EL1	Meaning
0b0	MSR writes of ESR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ESR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bits [15:14]

Reserved, RES0.

CSSELR_EL1, bit [13]

Trap MSR writes of [CSSELR_EL1](#) at EL1 using AArch64 to EL2.

CSSELR_EL1	Meaning
0b0	MSR writes of CSSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CSSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CPACR_EL1, bit [12]

Trap MSR writes of [CPACR_EL1](#) at EL1 using AArch64 to EL2.

CPACR_EL1	Meaning
0b0	MSR writes of CPACR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CPACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CONTEXTIDR_EL1, bit [11]

Trap MSR writes of [CONTEXTIDR_EL1](#) at EL1 using AArch64 to EL2.

CONTEXTIDR_EL1	Meaning
0b0	MSR writes of CONTEXTIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CONTEXTIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bits [10:9]

Reserved, RES0.

APIBKey, bit [8]

When FEAT_PAAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIBKeyHi_EL1](#).
- [APIBKeyLo_EL1](#).

APIBKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APIAKey, bit [7]**When FEAT_PAuth is implemented:**

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APIAKeyHi_EL1](#).
- [APIAKeyLo_EL1](#).

APIAKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APGAKey, bit [6]**When FEAT_PAuth is implemented:**

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APGAKeyHi_EL1](#).
- [APGAKeyLo_EL1](#).

APGAKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APDBKey, bit [5]**When FEAT_PAuth is implemented:**

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDBKeyHi_EL1](#).
- [APDBKeyLo_EL1](#).

APDBKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APDAKey, bit [4]

When FEAT_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- [APDAKeyHi_EL1](#).
- [APDAKeyLo_EL1](#).

APDAKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

AMAIR_EL1, bit [3]

Trap MSR writes of [AMAIR_EL1](#) at EL1 using AArch64 to EL2.

AMAIR_EL1	Meaning
0b0	MSR writes of AMAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AMAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [2]

Reserved, RES0.

AFSR1_EL1, bit [1]

Trap MSR writes of [AFSR1_EL1](#) at EL1 using AArch64 to EL2.

AFSR1_EL1	Meaning
0b0	MSR writes of AFSR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AFSR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

AFSR0_EL1, bit [0]

Trap MSR writes of [AFSR0_EL1](#) at EL1 using AArch64 to EL2.

AFSR0_EL1	Meaning
0b0	MSR writes of AFSR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AFSR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HFGWTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HFGWTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;

HSTR_EL2, Hypervisor System Trap Register

The HSTR_EL2 characteristics are:

Purpose

Controls trapping to EL2 of EL1 or lower AArch32 accesses to the System register in the coproc == 0b1111 encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCRR or MRRC instruction, this is the CRm value used to access the register.

Configuration

AArch64 System register HSTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HSTR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

HSTR_EL2 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0**any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
RES0																T15	RES0	T13	T12	T11	T10	T9	T8	T7	T6	T5	RES0	T3	T2	T1	T0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:16, 14, 4]

Reserved, RES0.

T<n>, bit [n], for n = 15, 13 to 5, 3 to 0

The remaining fields control whether EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 0b1111 encoding space, are trapped to EL2 as follows:

- MCR or MRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x03, unless the access is UNDEFINED.
- MCRR or MRRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x04, unless the access is UNDEFINED.

T<n>	Meaning
0b0	This control has no effect on EL0 or EL1 accesses to System registers.
0b1	<p>System registers in the coproc == 0b1111 encoding space and CRn == <n> or CRm == <n> where T<n> is the name of this field, are trapped as follows:</p> <ul style="list-style-type: none"> • An EL1 MCR or MRC access is trapped to EL2. • An EL0 MCR or MRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0. • An EL1 MCRR or MRRC access is trapped to EL2. • An EL0 MCRR or MRRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0. <p>It is IMPLEMENTATION DEFINED whether an EL0 access using AArch32 is trapped to EL2, or is UNDEFINED.</p> <p>If the access is UNDEFINED, and generates an exception that is taken to EL1 or EL2 using AArch64, this is reported with EC syndrome value 0x00.</p> <hr/> <p>Note</p> <p>Arm expects that trapping to EL2 of EL0 accesses to these registers is unusual and used only when the hypervisor must virtualize EL0 operation. Arm recommends that, whenever possible, EL0 accesses to these registers behave as they would if the implementation did not include EL2. This means that, if the architecture does not support the EL0 access, then the register access instruction is treated as UNDEFINED and generates an exception that is taken to EL1.</p>

For example, when HSTR_EL2.T7 is 1, for instructions executed at EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to EL2.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to EL2.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																RES0																
																RES0																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:0]

Reserved, RES0.

Accessing HSTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HSTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b011

```

IC IALLU, Instruction Cache Invalidate All to PoU

The IC IALLU characteristics are:

Purpose

Invalidate all instruction caches **of the PE executing the instruction** to **the** Point of Unification.

Configuration

AArch64 System instruction IC IALLU performs the same function as AArch32 System instruction [ICIALLU](#).

Attributes

IC IALLU is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the IC IALLU instruction

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

Accesses to this instruction use the following encodings in the System instruction encoding space:

IC IALLU{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0101	0b000

```

if PSTATE.EL == EL0 then

The IC IVAU characteristics are:

Purpose

Invalidate instruction cache by address to Point of Unification.

Configuration

AArch64 System instruction IC IVAU performs the same function as AArch32 System instruction [ICIMVAU](#).

Attributes

IC IVAU is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32					
																Virtual address to use																				
																Virtual address to use																				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the IC IVAU instruction

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The instruction cache maintenance instruction (IC)'.

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it is IMPLEMENTATION DEFINED whether it generates a Permission **fault**, see 'Permission fault'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

IC IVAU{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0101	0b001

```

ICC_ASGI1R_EL1, Interrupt Controller Alias Software Generated Interrupt Group 1 Register

The ICC_ASGI1R_EL1 characteristics are:

Purpose

Generates Group 1 SGIs for the Security state that is not the current Security state.

Configuration

AArch64 System register ICC_ASGI1R_EL1 performs the same function as AArch32 System register [ICC_ASGI1R](#).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_ASGI1R_EL1 are UNDEFINED.

Under certain conditions a write to ICC_ASGI1R_EL1 can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_ASGI1R_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								Aff3								RS				RES0		IRM	Aff2								
RES0				INTID				Aff1								TargetList															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the ~~cluster~~cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When [ICC_CTLR_EL1](#).RSS==0, RS is RES0.

When [ICC_CTLR_EL1](#).RSS==1 and [GICD_TYPER](#).RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16. If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing ICC_ASGI1R_EL1

This register allows software executing in a Secure state to generate Non-secure Group 1 SGIs. It will also allow software executing in a Non-secure state to generate Secure Group 1 SGIs, if permitted by the settings of [GICR_NSACR](#) in the Redistributor corresponding to the target PE.

When [GICD_CTLR.DS](#)==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the [GICR_NSACR](#) register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding'.

Note

Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_ASGI1R_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b110

```

ICC_SGI0R_EL1, Interrupt Controller Software Generated Interrupt Group 0 Register

The ICC_SGI0R_EL1 characteristics are:

Purpose

Generates Secure Group 0 SGIs.

Configuration

AArch64 System register ICC_SGI0R_EL1 performs the same function as AArch32 System register [ICC_SGI0R](#).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_SGI0R_EL1 are UNDEFINED.

Attributes

ICC_SGI0R_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								Aff3								RS				RES0		IRM	Aff2								
RES0				INTID				Aff1								TargetList															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value $((RS * 16) + n)$.

When [ICC_CTLR_EL1](#).RSS==0, RS is RES0.

When [ICC_CTLR_EL1](#).RSS==1 and [GICD_TYPER](#).RSS==0, writing this register with $RS \neq 0$ is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16.

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing ICC_SGI0R_EL1

This register allows software executing in a Secure state to generate Group 0 SGIs. It will also allow software executing in a Non-secure state to generate Group 0 SGIs, if permitted by the settings of [GICR_NSACR](#) in the Redistributor corresponding to the target PE.

When [GICD_CTLR.DS==0](#), Non-secure writes do not generate an interrupt for a target PE if not permitted by the [GICR_NSACR](#) register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_SGI0R_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b111

```

ICC_SGI1R_EL1, Interrupt Controller Software Generated Interrupt Group 1 Register

The ICC_SGI1R_EL1 characteristics are:

Purpose

Generates Group 1 SGIs for the current Security state.

Configuration

AArch64 System register ICC_SGI1R_EL1 performs the same function as AArch32 System register [ICC_SGI1R](#).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_SGI1R_EL1 are UNDEFINED.

Under certain conditions a write to ICC_SGI1R_EL1 can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_SGI1R_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								Aff3								RS				RES0		IRM	Aff2								
RES0				INTID				Aff1								TargetList															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value $((RS * 16) + n)$.

When [ICC_CTLR_EL1](#).RSS==0, RS is RES0.

When [ICC_CTLR_EL1](#).RSS==1 and [GICD_TYPER](#).RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

This restricts a system to sending targeted SGIs to PEs with an affinity 0 number that is less than 16.

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing ICC_SGI1R_EL1**Note**

Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_SGI1R_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b101

ICV_BPR1_EL1, Interrupt Controller Virtual Binary Point Register 1

The ICV_BPR1_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 1 interrupt preemption.

Configuration

AArch64 System register ICV_BPR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV_BPR1\[31:0\]](#).
This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_BPR1_EL1 are UNDEFINED.

Attributes

ICV_BPR1_EL1 is a 64-bit register.

Field descriptions

Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for **virtual** Group 0 and **virtual** Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. **This is done as follows:**

Binary point value	Group priority field	Subpriority field	Field with binary point
0	-	-	-
1	[7:1]	[0]	ggggggg-s
2	[7:2]	[1:0]	ggggggg-ss
3	[7:3]	[2:0]	ggggg-sss
4	[7:4]	[3:0]	gggg-ssss
5	[7:5]	[4:0]	ggg-sssss
6	[7:6]	[5:0]	gg-ssssss
7	[7]	[6:0]	g-sssssss

For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

An attempt to program this field to a value less than the minimum value sets the field to the minimum value.

If [ICV_CTLR_EL1](#).CBPR is set to 1, Non-secure EL1 reads return [ICV_BPR0_EL1](#) + 1 saturated to 0b111. Non-secure EL1 writes are ignored.

If [ICV_CTLR_EL1](#).CBPR is set to 1, Secure EL1 reads return [ICV_BPR0_EL1](#). Secure EL1 writes modify [ICV_BPR0_EL1](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR1_EL1

For Non-secure writes, the minimum value of this field is the minimum value of [ICH_VMCR_EL2](#).VBPR0 plus one.

For Secure writes, the minimum value of this field is the minimum value of [ICH_VMCR_EL2](#).VBPR0.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_BPR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b011

ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0

The ID_AA64DFR0_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

The external register [EDDFR](#) gives information from this register.

Attributes

ID_AA64DFR0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								BRBE				MTPMU				TraceBuffer				TraceFilt				DoubleLock				PMSVer			
CTX_CMPs				RES0				WRPs				RES0				BRPs				PMUVer				TraceVer				DebugVer			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:56]

Reserved, RES0.

BRBE, bits [55:52]

Branch Record Buffer Extension. Defined values are:

BRBE	Meaning
0b0000	Branch Record Buffer Extension not implemented.
0b0001	Branch Record Buffer Extension implemented, FEAT BRBE.

All other values are reserved.

FEAT_BRBE implements the functionality identified by the value 0b0001.

MTPMU, bits [51:48]

Multi-threaded PMU extension. Defined values are:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPEPER<n>_EL0.MT and PMEVTYPEPER<n>.MT are read/write or RES0.
0b0001	FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPEPER<n>_EL0.MT and PMEVTYPEPER<n>.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPEPER<n>_EL0.MT and PMEVTYPEPER<n>.MT are 0.
0b1111	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPEPER<n>_EL0.MT and PMEVTYPEPER<n>.MT are RES0.

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

TraceBuffer, bits [47:44]

Trace Buffer Extension. Defined values are:

TraceBuffer	Meaning
0b0000	Trace Buffer Extension not implemented.
0b0001	Trace Buffer Extension implemented, FEAT_TRBE.

All other values are reserved.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if an Embedded Trace Macrocell Architecture PE Trace Unit is implemented, the value 0b0000 is not permitted.

DoubleLock, bits [39:36]

OS Double Lock implemented. Defined values are:

DoubleLock	Meaning
0b0000	OS Double Lock implemented. OSDLR_EL1 is RW.
0b1111	OS Double Lock not implemented. OSDLR_EL1 is RAZ/WI.

All other values are reserved.

FEAT_DoubleLock implements the functionality identified by the value 0b0000.

In Armv8.0, the only permitted value is 0b0000.

If FEAT_Debugv8p2 is implemented and FEAT_DoPD is not implemented, the permitted values are 0b0000 and 0b1111.

If FEAT_DoPD is implemented, the only permitted value is 0b1111.

PMSVer, bits [35:32]

Statistical Profiling Extension version. Defined values are:

PMSVer	Meaning
0b0000	Statistical Profiling Extension not implemented.
0b0001	Statistical Profiling Extension implemented.
0b0010	As 0b0001, and adds: <ul style="list-style-type: none"> Support for the Event packet Alignment flag. If FEAT_SVE is implemented, support for the Scalable Vector extensions to Statistical Profiling.
0b0011	As 0b0010, and adds: <ul style="list-style-type: none"> The last branch target Address packet. Discard mode. Extended event filtering, including the PMSNEVER_EL1 System register. SupportIf forFEAT_PMUv3 is implemented, controls to freeze the PMU event counters after an SPE buffer management event occurs. OPTIONAL previous branch target Address packet. If FEAT_PMUv3 is implemented, the SAMPLE_FEED_BR, SAMPLE_FEED_EVENT, SAMPLE_FEED_LAT, SAMPLE_FEED_LD, SAMPLE_FEED_OP, and SAMPLE_FEED_ST PMU events. FEAT_PMUv3 is implemented, controls to freeze the PMU event counters after an SPE buffer management event occurs. If FEAT_PMUv3 is implemented, the SAMPLE_FEED_BR, SAMPLE_FEED_EVENT, SAMPLE_FEED_LAT, SAMPLE_FEED_LD, SAMPLE_FEED_OP, and SAMPLE_FEED_ST PMU events.

All other values are reserved.

FEAT_SPE implements the functionality identified by the value 0b0001.

FEAT_SPEv1p1 implements the functionality identified by the value 0b0010.

FEAT_SPEv1p2 implements the functionality identified by the value 0b0011.

In Armv8.5, if FEAT_SPE is implemented, the value 0b0001 is not permitted.

From Armv8.7, if FEAT_SPE is implemented, the value 0b0010 is not permitted.

CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and also includes support for: <ul style="list-style-type: none"> Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. If EL2 is implemented, the MDCR_EL2.HPMD control bit.
0b0101	PMUv3 for Armv8.4. As 0b0100, and also includes support for the PMMIR_EL1 register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and also includes support for: <ul style="list-style-type: none"> 64-bit event counters. If EL2 is implemented, the MDCR_EL2.HCCD control bit. If EL3 is implemented, the MDCR_EL3.SCCD control bit.
0b0111	PMUv3 for Armv8.7. As 0b0110, and also includes support for: <ul style="list-style-type: none"> The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO control bits. If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} control bits.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value **0b0001**.

FEAT_PMUv3p1 implements the functionality identified by the value **0b00010b0100**.

FEAT_PMUv3p1 implements the functionality identified by the value **0b01000b0101**.

FEAT_PMUv3p4 implements the functionality identified by the value **0b01010b0110**.

FEAT_PMUv3p5 implements the functionality identified by the value **0b01100b0111**.

FEAT_PMUv3p7 implements the functionality identified by the value **0b01110b0001**. In the Armv8.1, if **FEAT_PMUv3** is implemented, the value **0b01110b0001** is not permitted.

In Armv8.1, if **FEAT_PMUv3** is implemented, the value **0b0001** is not permitted. In Armv8.4, if **FEAT_PMUv3** is implemented, the value **0b0100** is implemented, the value **0b0001** is not permitted.

In Armv8.4, if **FEAT_PMUv3** is implemented, the value **0b0100** is implemented, the value **0b0100** is not permitted. In Armv8.5, if **FEAT_PMUv3** is implemented, the value **0b0101** is implemented, the value **0b0100** is not permitted.

In Armv8.5, if **FEAT_PMUv3** is implemented, the value **0b0101** is implemented, the value **0b0101** is not permitted. In Armv8.7, if **FEAT_PMUv3** is implemented, the value **0b0110** is implemented, the value **0b0101** is not permitted.

From Armv8.7, if **FEAT_PMUv3** is implemented, the value **0b0110** is not permitted.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

TraceVer	Meaning
0b0000	PE trace unit System registers not implemented.
0b0001	PE trace unit System registers implemented.

All other values are reserved.

When PE trace unit System registers are implemented, see [TRCIDR1](#) for tracing capabilities of the trace unit.

DebugVer, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

DebugVer	Meaning
0b0110	Armv8 debug architecture.
0b0111	Armv8 debug architecture with Virtualization Host Extensions.
0b1000	Armv8.2 debug architecture.
0b1001	Armv8.4 debug architecture.

All other values are reserved.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

In Armv8.1, the value 0b0110 is not permitted.

In Armv8.2, the value 0b0111 is not permitted.

From Armv8.4, the value 0b1000 is not permitted.

Accessing ID_AA64DFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64DFR0_EL1

ID_AA64ISAR0_EL1, AArch64 Instruction Set Attribute Register 0

The ID_AA64ISAR0_EL1 characteristics are:

Purpose

Provides information about the instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64ISAR0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RNDR					TLB				TS				FHM			DP				SM4			SM3				SHA3				
RDM					TME				Atomic				CRC32			SHA2				SHA1			AES				RES0				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RNDR, bits [63:60]

Indicates support for Random Number instructions in AArch64 state.

When FEAT_RNG_TRAP is implemented, the value returned by a direct read of ID_AA64ISAR0_EL1.RNDR is further controlled by the value of [SCR_EL3.TRNDR](#).

Defined values are:

RNDR	Meaning
0b0000	No Random Number instructions are implemented.
0b0001	RNDR and RNDRRS registers are implemented.

All other values are reserved.

FEAT_RNG implements the functionality identified by the value 0b0001.

From Armv8.5, the permitted values are 0b0000 and 0b0001.

TLB, bits [59:56]

Indicates support for Outer shareable and TLB range maintenance instructions. Defined values are:

TLB	Meaning
0b0000	Outer shareable and TLB range maintenance instructions are not implemented.
0b0001	Outer shareable TLB maintenance instructions are implemented.
0b0010	Outer shareable and TLB range maintenance instructions are implemented.

All other values are reserved.

FEAT_TLBIOS implements the functionality identified by the values 0b0001 and 0b0010.

FEAT_TLBIRANGE implements the functionality identified by the value 0b0010.

From Armv8.4, the only permitted value is 0b0010.

TS, bits [55:52]

Indicates support for flag manipulation instructions. Defined values are:

TS	Meaning
0b0000	No flag manipulation instructions are implemented.
0b0001	CFINV, RMIF, SETF16, and SETF8 instructions are implemented.
0b0010	CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented.

All other values are reserved.

FEAT_FlagM implements the functionality identified by the value 0b0001.

FEAT_FlagM2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

In Armv8.4, the only permitted value is 0b0001.

From Armv8.5, the only permitted value is 0b0010.

FHM, bits [51:48]

Indicates support for FMLAL and FMLSL instructions. Defined values are:

FHM	Meaning
0b0000	FMLAL and FMLSL instructions are not implemented.
0b0001	FMLAL and FMLSL instructions are implemented.

All other values are reserved.

FEAT_FHM implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

DP, bits [47:44]

Indicates support for Dot Product instructions in AArch64 state. Defined values are:

DP	Meaning
0b0000	No Dot Product instructions implemented.
0b0001	UDOT and SDOT instructions implemented.

All other values are reserved.

FEAT_DotProd implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

SM4, bits [43:40]

Indicates support for SM4 instructions in AArch64 state. Defined values are:

SM4	Meaning
0b0000	No SM4 instructions implemented.
0b0001	SM4E and SM4EKEY instructions implemented.

All other values are reserved.

If FEAT_SM4 is not implemented, the value 0b0001 is reserved.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM3.

SM3, bits [39:36]

Indicates support for SM3 instructions in AArch64 state. Defined values are:

SM3	Meaning
0b0000	No SM3 instructions implemented.
0b0001	SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 instructions implemented.

All other values are reserved.

If FEAT_SM3 is not implemented, the value 0b0001 is reserved.

FEAT_SM3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM4.

SHA3, bits [35:32]

Indicates support for SHA3 instructions in AArch64 state. Defined values are:

SHA3	Meaning
0b0000	No SHA3 instructions implemented.
0b0001	EOR3, RAX1, XAR, and BCAX instructions implemented.

All other values are reserved.

If FEAT_SHA3 is not implemented, the value 0b0001 is reserved.

FEAT_SHA3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0001, ID_AA64ISAR0_EL1.SHA2 must have the value 0b0010.

RDM, bits [31:28]

Indicates support for SQRDMLAH and SQRDMLSH instructions in AArch64 state. Defined values are:

RDM	Meaning
0b0000	No RDMA instructions implemented.
0b0001	SQRDMLAH and SQRDMLSH instructions implemented.

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

TME, bits [27:24]

Indicates support for TME instructions. Defined values are:

TME	Meaning
0b0000	TME instructions are not implemented.
0b0001	TCANCEL, TCOMMIT, TSTART, and TTEST instructions are implemented.

If [HCR_EL2](#).TME == 0, reads of this field at EL1 return 0.

If [SCR_EL3](#).TME == 0, reads of this field at EL1 or EL2 return 0.

All other values are reserved.

Atomic, bits [23:20]

Indicates support for Atomic instructions in AArch64 state. Defined values are:

Atomic	Meaning
0b0000	No Atomic instructions implemented.
0b0010	LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.

All other values are reserved.

FEAT_LSE implements the functionality identified by the value 0b0010.

From Armv8.1, the only permitted value is 0b0010.

CRC32, bits [19:16]

Indicates support for CRC32 instructions in AArch64 state. Defined values are:

CRC32	Meaning
0b0000	No CRC32 instructions implemented.
0b0001	CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates support for SHA2 instructions in AArch64 state. Defined values are:

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	Implements instructions: SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.
0b0010	Implements instructions: <ul style="list-style-type: none"> SHA256H, SHA256H2, SHA256SU0, and SHA256SU1. SHA512H, SHA512H2, SHA512SU0, and SHA512SU1.

All other values are reserved.

FEAT_SHA256 implements the functionality identified by the value 0b0001.

FEAT_SHA512 implements the functionality identified by the value 0b0010.

In Armv8, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0010, ID_AA64ISAR0_EL1.SHA3 must have the value 0b0001.

SHA1, bits [11:8]

Indicates support for SHA1 instructions in AArch64 state. Defined values are:

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented.

All other values are reserved.

FEAT_SHA1 implements the functionality identified by the value 0b0001.

From Armv8, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA2 is 0b0000, this field must have the value 0b0000.

AES, bits [7:4]

Indicates support for AES instructions in AArch64 state. Defined values are:

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC instructions implemented.
0b0010	As for 0b0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.

FEAT_AES implements the functionality identified by the value 0b0001.

FEAT_PMULL implements the functionality identified by the value 0b0010.

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0010.

Bits [3:0]

Reserved, RES0.

Accessing ID_AA64ISAR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ISAR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64ISAR0_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_AA64ISAR0_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_AA64ISAR0_EL1;

ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1

The ID_AA64ISAR1_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

If ID_AA64ISAR1_EL1.{API, APA} == {0000, 0000}, then:

- The [TCR_EL1](#).{TBID,TBID0}, [TCR_EL2](#).{TBID0,TBID1}, [TCR_EL2](#).TBID and [TCR_EL3](#).TBID bits are RES0.
- [APIAKeyHi_EL1](#), [APIAKeyLo_EL1](#), [APIBKeyHi_EL1](#), [APIBKeyLo_EL1](#), [APDAKeyHi_EL1](#), [APDAKeyLo_EL1](#), [APDBKeyHi_EL1](#), [APDBKeyLo_EL1](#) are not allocated.
- [SCTLR_ELx](#).EnIA, [SCTLR_ELx](#).EnIB, [SCTLR_ELx](#).EnDA, [SCTLR_ELx](#).EnDB are all RES0.

If ID_AA64ISAR1_EL1.{GPI, GPA, API, APA} == {0000, 0000, 0000, 0000}, then:

- [HCR_EL2](#).APK and [HCR_EL2](#).API are RES0.
- [SCR_EL3](#).APK and [SCR_EL3](#).API are RES0.

Attributes

ID_AA64ISAR1_EL1 is a 64-bit register.

Field descriptions

LS64, bits [63:60]

Indicates support for LD64B and ST64B* instructions, and the [ACCDATA_EL1](#) register. Defined values of this field are:

LS64	Meaning
0b0000	The LD64B and ST64B* instructions, the ACCDATA_EL1 register, and associated traps are not supported.
0b0001	The LD64B and ST64B instructions are supported.
0b0010	The LD64B, ST64B, and ST64BV instructions, and their associated traps are supported.
0b0011	The LD64 and ST64B* instructions, the ACCDATA_EL1 register, and their associated traps are supported.

All other values are reserved.

FEAT_LS64 implements the functionality identified by 0b0001.

FEAT_LS64_V implements the functionality identified by 0b0010.

FEAT_LS64_ACCDATA implements the functionality identified by 0b0011.

From Armv8.7, the permitted values are 0b0000, 0b0001, 0b0010, and 0b0011.

XS, bits [59:56]

Indicates support for the XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the [HCRX_EL2](#).{FGTnXS, FnXS} fields in AArch64 state. Defined values are:

XS	Meaning
0b0000	The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2 .{FGTnXS, FnXS} fields are not supported.
0b0001	The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2 .{FGTnXS, FnXS} fields are supported.

All other values are reserved.

FEAT_XS implements the functionality identified by 0b0001.

From Armv8.7, the only permitted value is 0b0001.

I8MM, bits [55:52]

Indicates support for Advanced SIMD and Floating-point Int8 matrix multiplication instructions in AArch64 state. Defined values are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.

All other values are reserved.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID_AA64ZFR0_EL1](#).I8MM.

From Armv8.6, the only permitted value is 0b0001.

DGH, bits [51:48]

Indicates support for the Data Gathering Hint instruction. Defined values are:

DGH	Meaning
0b0000	Data Gathering Hint is not implemented.
0b0001	Data Gathering Hint is implemented.

All other values are reserved.

FEAT_DGH implements the functionality identified by 0b0001.

From ~~Armv8.0~~ **Armv8.0**, the permitted values are 0b0000 and 0b0001.

If the DGH instruction has no effect in preventing the merging of memory accesses, the value of this field is 0b0000.

BF16, bits [47:44]

Indicates support for Advanced SIMD and Floating-point BFloat16 instructions in AArch64 state. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	BFCVT, BFCVTN, BFCVTN2, BFDOT, BFMLALB, BFMLALT, and BFMMMLA instructions are implemented.
0b0010	As 0b0001, but the EPCR.EBF field is also supported.

All other values are reserved.

FEAT_BF16 implements the functionality identified by 0b0001.

FEAT_EBF16 implements the functionality identified by 0b0010.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ZFR0_EL1.BF16.

From Armv8.6, if the FEAT_SME only is implemented, the permitted values are 0b0001 and 0b0010.

From Armv8.6, if FEAT_SME is not implemented, the only permitted value is 0b0001.

SPECRES, bits [43:40]

Indicates support for prediction invalidation instructions in AArch64 state. Defined values are:

SPECRES	Meaning
0b0000	CFP RCTX, DVP RCTX, and CPP RCTX instructions are not implemented.
0b0001	CFP RCTX, DVP RCTX, and CPP RCTX instructions are implemented.

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [39:36]

Indicates support for SB instruction in AArch64 state. Defined values are:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

FRINTTS, bits [35:32]

Indicates support for the FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented. Defined values are:

FRINTTS	Meaning
0b0000	FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are not implemented.
0b0001	FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented.

All other values are reserved.

FEAT_FRINTTS implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

GPI, bits [31:28]

Indicates support for an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

GPI	Meaning
0b0000	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPA is non-zero, this field must have the value 0b0000.

GPA, bits [27:24]

Indicates whether the QARMA, QARMA5 or Architected algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

GPA	Meaning
0b0000	Generic Authentication using thean QARMA5Architected algorithm is not implemented.
0b0001	Generic Authentication using the QARMA5QARMA algorithm is implemented. This includes the PACGA instruction. PACGA instruction.

All other values are reserved.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPI is non-zero, this field must have the value 0b0000.

LRCPC, bits [23:20]

Indicates support for weaker release consistency, RCpc, based model. Defined values are:

LRCPC	Meaning
0b0000	The LDAPR*, LDAPUR*, and STLUR* instructions are not implemented.
0b0001	The LDAPR* instructions are implemented. The LDAPUR*, and STLUR* instructions are not implemented.
0b0010	The LDAPR*, LDAPUR*, and STLUR* instructions are implemented.

All other values are reserved.

FEAT_LRCPC implements the functionality identified by the value 0b0001.

FEAT_LRCPC2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

In Armv8.3, the permitted values are 0b0001 and 0b0010.

From Armv8.4, the only permitted value is 0b0010.

FCMA, bits [19:16]

Indicates support for complex number addition and multiplication, where numbers are stored in vectors. Defined values are:

FCMA	Meaning
0b0000	The FCMLA and FCADD instructions are not implemented.
0b0001	The FCMLA and FCADD instructions are implemented.

All other values are reserved.

FEAT_FCMA implements the functionality identified by the value 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

JSCVT, bits [15:12]

Indicates support for JavaScript conversion from double precision floating point values to integers in AArch64 state. Defined values are:

JSCVT	Meaning
0b0000	The FJCVTZS instruction is not implemented.
0b0001	The FJCVTZS instruction is implemented.

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

API, bits [11:8]

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

API	Meaning
0b0000	Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE, and the HaveEnhancedPAC2() function returning FALSE.
0b0011	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.
0b0100	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT_PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

FEAT_PAuth2 implements the functionality added by the value 0b0011.

FEAT_FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.APA is non-zero, this field must have the value 0b0000.

APA, bits [7:4]

Indicates whether the **QARMA**, **QARMA5** or **Architected** algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the **PACGA** instruction. Defined values are: **PACGA** instruction. Defined values are:

APA	Meaning
0b0000	Address Authentication using the QARMA algorithm is not implemented.
0b0001	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE.
0b0011	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0100	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT_PAuth implements the functionality added by the values 0b0000, 0b0001, and 0b0010.

FEAT_PAuth2 implements the functionality added by the value 0b0011.

FEAT_FPAC implements the functionality added by the values 0b0100 and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of the ID_AA64ISAR1_EL1.API is non-zero, this field must have the value 0b0000.

DPB, bits [3:0]

Data Persistence writeback. Indicates support for the **DC CVAP** and **DC CVADP** instructions in AArch64 state. Defined values are:

DPB	Meaning
0b0000	DC CVAP not supported.
0b0001	DC CVAP supported.
0b0010	DC CVAP and DC CVADP supported.

All other values are reserved.

FEAT_DPB implements the functionality identified by the value 0b0001.

FEAT_DPB2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0001 and 0b0010.

From Armv8.5, the only permitted value is 0b0010.

Accessing ID_AA64ISAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ISAR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then

ID_AA64ISAR2_EL1, AArch64 Instruction Set Attribute Register 2

The ID_AA64ISAR2_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see [Principles of the ID scheme for fields in ID registers](#).

Configuration

~~This register is present only from Armv8.7. Otherwise, direct accesses to ID_AA64ISAR2_EL1 are UNDEFINED.~~

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64ISAR2_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																RES0								RPRES				WFXT			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:8]

Reserved, RES0.

RPRES, bits [7:4]

When [FPCR.AH](#) is 1, indicates support for 12 bits of mantissa in reciprocal and reciprocal square root instructions in AArch64 state. Defined values are:

RPRES	Meaning
0b0000	Reciprocal and reciprocal square root estimates give 8 bits of mantissa.
0b0001	Reciprocal and reciprocal square root estimates give 12 bits of mantissa.

All other values are reserved.

FEAT_RPRES implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

WfXT, bits [3:0]

Indicates support for the WFET and WFIT instructions in AArch64 state. Defined values are:

WfXT	Meaning
0b0000	WFET and WFIT are not supported.
0b0001	WFET and WFIT are supported, and the register number is not reported in the ESR_ELx on exceptions.
0b0010	WFET and WFIT are supported, and the register number is reported in the ESR_ELx on exceptions.

All other values are reserved.

FEAT_WfXT implements the functionality identified by the value 0b0001.

FEAT_WfXT2 implements From Armv8.7, the functionality only identified by the value 0b0010.

From Armv8.7, the permitted values are 0b0001 and 0b0010.

Note

Arm deprecates not implementing FEAT_WfXT2.

Accessing ID_AA64ISAR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ISAR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64ISAR2_EL1;
elseif PSTATE.EL == EL2 then
    return ID_AA64ISAR2_EL1;
elseif PSTATE.EL == EL3 then
    return ID_AA64ISAR2_EL1;

```

ID_AA64MMFR0_EL1, AArch64 Memory Model Feature Register 0

The ID_AA64MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64MMFR0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ECV				FGT				RES0								ExS				TGran4_2				TGran64_2				TGran16_2			
TGran4				TGran64				TGran16				BigEndEL0				SNSMem				BigEnd				ASIDBits				PARange			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ECV, bits [63:60]

Indicates presence of Enhanced Counter Virtualization. Defined values are:

ECV	Meaning
0b0000	Enhanced Counter Virtualization is not implemented.
0b0001	Enhanced Counter Virtualization is implemented. Supports CNTHCTL_EL2 .{EL1TVT, EL1TVCT, EL1NVPCT, EL1NVVCT, EVNTIS}, CNTKCTL_EL1 .EVNTIS, CNTPTSS_EL0 counter views, and CNTVCTSS_EL0 counter views. Extends the PMSCR_EL1 .PCT, PMSCR_EL2 .PCT, TRFCR_EL1 .TS, and TRFCR_EL2 .TS fields.
0b0010	As 0b0001, and also includes support for CNTHCTL_EL2 .ECV and CNTPOFF_EL2 .

All other values are reserved.

FEAT_ECV implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.6, the only permitted values are 0b0001 and 0b0010.

FGT, bits [59:56]

Indicates presence of the Fine-Grained Trap controls:

- If EL2 is implemented, the [HAFGRTR_EL2](#), [HDFGRTR_EL2](#), [HDFGWTR_EL2](#), [HFGTRTR_EL2](#), [HFGITR_EL2](#) and [HFGWTR_EL2](#) registers, and their associated traps.
- If EL2 is implemented, [MDCR_EL2](#).TDCC.
- If EL3 is implemented, [MDCR_EL3](#).TDCC.

- If both EL2 and EL3 are implemented, [SCR_EL3.FGTEn](#).

Defined values are:

FGT	Meaning
0b0000	The fine-grained trap controls are not implemented.
0b0001	The fine-grained trap controls are implemented.

All other values are reserved.

FEAT_FGT implements the functionality identified by the value 0b0001.

From Armv8.6, the only permitted value is 0b0001.

Bits [55:48]

Reserved, RES0.

ExS, bits [47:44]

Indicates support for disabling context synchronizing exception entry and exit. Defined values are:

ExS	Meaning
0b0000	All exception entries and exits are context synchronization events.
0b0001	Non-context synchronizing exception entry and exit are supported.

All other values are reserved.

FEAT_ExS implements the functionality identified by the value 0b0001.

TGran4_2, bits [43:40]

Indicates support for 4KB memory granule size at stage 2. Defined values are:

TGran4_2	Meaning	Applies when
0b0000	Support for 4KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran4 field.	
0b0001	4KB granule not supported at stage 2.	
0b0010	4KB granule supported at stage 2.	
0b0011	4KB granule at stage 2 supports 52-bit input and output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

The 0b0000 value is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

TGran64_2, bits [39:36]

Indicates support for 64KB memory granule size at stage 2. Defined values are:

TGran64_2	Meaning
0b0000	Support for 64KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran64 field.
0b0001	64KB granule not supported at stage 2.
0b0010	64KB granule supported at stage 2.

All other values are reserved.

The 0b0000 value is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

TGran16_2, bits [35:32]

Indicates support for 16KB memory granule size at stage 2. Defined values are:

TGran16_2	Meaning	Applies when
0b0000	Support for 16KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran16 field.	
0b0001	16KB granule not supported at stage 2.	
0b0010	16KB granule supported at stage 2.	
0b0011	16KB granule at stage 2 supports 52-bit input and output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

The 0b0000 value is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

TGran4, bits [31:28]

Indicates support for 4KB memory translation granule size. Defined values are:

TGran4	Meaning	Applies when
0b0000	4KB granule supported.	
0b0001	4KB granule supports 52-bit input and output addresses.	When FEAT_LPA2 is implemented
0b1111	4KB granule not supported.	

All other values are reserved.

TGran64, bits [27:24]

Indicates support for 64KB memory translation granule size. Defined values are:

TGran64	Meaning
0b0000	64KB granule supported.
0b1111	64KB granule not supported.

All other values are reserved.

TGran16, bits [23:20]

Indicates support for 16KB memory translation granule size. Defined values are:

TGran16	Meaning	Applies when
0b0000	16KB granule not supported.	
0b0001	16KB granule supported.	
0b0010	16KB granule supports 52-bit input and output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

BigEndEL0, bits [19:16]

Indicates support for mixed-endian at EL0 only. Defined values are:

BigEndEL0	Meaning
0b0000	No mixed-endian support at EL0. The SCTLR_EL1.E0E bit has a fixed value.
0b0001	Mixed-endian support at EL0. The SCTLR_EL1.E0E bit can be configured.

All other values are reserved.

This field is invalid and is RES0 if ID_AA64MMFR0_EL1.BigEnd is not 0b0000.

SNSMem, bits [15:12]

Indicates support for a distinction between Secure and Non-secure Memory. Defined values are:

SNSMem	Meaning
0b0000	Does not support a distinction between Secure and Non-secure Memory.
0b0001	Does support a distinction between Secure and Non-secure Memory.

Note

If EL3 is implemented, the value 0b0000 is not permitted.

All other values are reserved.

BigEnd, bits [11:8]

Indicates support for mixed-endian configuration. Defined values are:

BigEnd	Meaning
0b0000	No mixed-endian support. The 'SCTLR_ELx'.EE bits have a fixed value. See the BigEndEL0 field, bits[19:16], for whether EL0 supports mixed-endian.
0b0001	Mixed-endian support. The 'SCTLR_ELx'.EE and SCTLR_EL1.E0E bits can be configured.

All other values are reserved.

ASIDBits, bits [7:4]

Number of ASID bits. Defined values are:

ASIDBits	Meaning
0b0000	8 bits.
0b0010	16 bits.

All other values are reserved.

PARange, bits [3:0]

Physical Address range supported. Defined values are:

PARange	Meaning
0b0000	32 bits, 4GB.
0b0001	36 bits, 64GB.
0b0010	40 bits, 1TB.
0b0011	42 bits, 4TB.
0b0100	44 bits, 16TB.
0b0101	48 bits, 256TB.
0b0110	52 bits, 4PB.

All other values are reserved.

The value 0b0110 is permitted only if the implementation includes FEAT_LPA, otherwise it is reserved.

Accessing ID_AA64MMFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b000

```
if PSTATE.EL == EL0 then
  if IsFeatureImplemented(FEAT_IDST) then
    if EL2Enabled() && HCR_EL2.TGE == '1' then
      AArch64.SystemAccessTrap(EL2, 0x18);
    else
      AArch64.SystemAccessTrap(EL1, 0x18);
  else
    UNDEFINED;
elsif PSTATE.EL == EL1 then
  if EL2Enabled() && HCR_EL2.TID3 == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
  else
    return ID_AA64MMFR0_EL1;
elsif PSTATE.EL == EL2 then
  return ID_AA64MMFR0_EL1;
elsif PSTATE.EL == EL3 then
  return ID_AA64MMFR0_EL1;
```

ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2

The ID_AA64MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64MMFR2_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
EOPD				EVT				BBM				TTL				RES0				FWB				IDS				AT			
ST				NV				CCIDX				VARange				IESB				LSM				UAO				CnP			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EOPD, bits [63:60]

Indicates support for the EOPD mechanism. Defined values are:

EOPD	Meaning
0b0000	EOPDx mechanism is not implemented.
0b0001	EOPDx mechanism is implemented.

All other values are reserved.

FEAT_EOPD implements the functionality identified by the value 0b0001.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_EOPD is implemented, FEAT_CSV3 must be implemented.

EVT, bits [59:56]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the [HCR_EL2](#).{TTLBOS, TLBIS, TOCU, TICAB, TID4} traps. Defined values are:

EVT	Meaning
0b0000	HCR_EL2 .{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	HCR_EL2 .{TOCU, TICAB, TID4} traps are supported. HCR_EL2 .{TTLBOS, TTLBIS} traps are not supported.
0b0010	HCR_EL2 .{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

FEAT_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

BBM, bits [55:52]

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block size for a translation.

BBM	Meaning
0b0000	Level 0 support for changing block size is supported.
0b0001	Level 1 support for changing block size is supported.
0b0010	Level 2 support for changing block size is supported.

All other values are reserved.

FEAT_BBIM implements the functionality identified by the values 0b0000, 0b0001, and 0b0010.

From Armv8.4, the permitted values are 0b0000, 0b0001, and 0b0010.

TTL, bits [51:48]

Indicates support for TTL field in address operations. Defined values are:

TTL	Meaning
0b0000	TLB maintenance instructions by address have bits[47:44] as RES0.
0b0001	TLB maintenance instructions by address have bits[47:44] holding the TTL field.

All other values are reserved.

FEAT_TTL implements the functionality identified by the value 0b0001.

This field affects [TLBI IPAS2E1](#), [TLBI IPAS2E1IS](#), [TLBI IPAS2E1OS](#), [TLBI IPAS2LE1](#), [TLBI IPAS2LE1IS](#), [TLBI IPAS2LE1OS](#), [TLBI VAAE1](#), [TLBI VAAE1IS](#), [TLBI VAAE1OS](#), [TLBI VAALE1](#), [TLBI VAALE1IS](#), [TLBI VAALE1OS](#), [TLBI VAE1](#), [TLBI VAE1IS](#), [TLBI VAE1OS](#), [TLBI VAE2](#), [TLBI VAE2IS](#), [TLBI VAE2OS](#), [TLBI VAE3](#), [TLBI VAE3IS](#), [TLBI VAE3OS](#), [TLBI VALE1](#), [TLBI VALE1IS](#), [TLBI VALE1OS](#), [TLBI VALE2](#), [TLBI VALE2IS](#), [TLBI VALE2OS](#), [TLBI VALE3](#), [TLBI VALE3IS](#), [TLBI VALE3OS](#).

From Armv8.4, the only permitted value is 0b0001.

Bits [47:44]

Reserved, RES0.

FWB, bits [43:40]

Indicates support for [HCR_EL2](#).FWB. Defined values are:

FWB	Meaning
0b0000	HCR_EL2 .FWB bit is not supported.
0b0001	HCR_EL2 .FWB is supported.

All other values reserved.

FEAT_S2FWB implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

IDS, bits [39:36]

Indicates the value of ESR_ELx.EC that reports an exception generated by a read access to the feature ID space. Defined values are:

IDS	Meaning
0b0000	An exception which is generated by a read access to the feature ID space, other than a trap caused by HCR_EL2 .TIDx, SCTLR_EL1 .UCT, or SCTLR_EL2 .UCT, is reported by ESR_ELx.EC == 0x0.
0b0001	All exceptions generated by an AArch64 read access to the feature ID space are reported by ESR_ELx.EC == 0x18.

All other values are reserved.

The Feature ID space is defined as the System register space in AArch64 with op0==3, op1=={0, 1, 3}, CRn==0, CRm=={0-7}, op2=={0-7}.

FEAT_IDST implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AT, bits [35:32]

Identifies support for unaligned single-copy atomicity and atomic functions. Defined values are:

AT	Meaning
0b0000	Unaligned single-copy atomicity and atomic functions are not supported.
0b0001	Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.

All other values are reserved.

FEAT_LSE2 implements the functionality identified by the value 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

ST, bits [31:28]

Identifies support for small translation tables. Defined values are:

ST	Meaning
0b0000	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 39.
0b0001	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.

All other values are reserved.

FEAT_TTST implements the functionality identified by the value 0b0001.

If FEAT_SEL2 is implemented, the only permitted value is 0b0001.

In an implementation which does not support FEAT_SEL2, the permitted values are 0b0000 and 0b0001.

NV, bits [27:24]

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are:

NV	Meaning
0b0000	Nested virtualization is not supported.
0b0001	The HCR_EL2 .{AT, NV1, NV} bits are implemented.
0b0010	The VNCR_EL2 register and the HCR_EL2 .{NV2, AT, NV1, NV} bits are implemented.

All other values are reserved.

If EL2 is not implemented, the only permitted value is 0b0000.

FEAT_NV implements the functionality identified by the value 0b0001.

FEAT_NV2 implements the functionality identified by the value 0b0010.

In Armv8.3, if EL2 is implemented, the permitted values are 0b0000 and 0b0001.

From Armv8.4, if EL2 is implemented, the permitted values are 0b0000, 0b0001, and 0b0010.

CCIDX, bits [23:20]

Support for the use of revised [CCSIDR_EL1](#) register format. Defined values are:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR_EL1 .
0b0001	64-bit format implemented for all levels of the CCSIDR_EL1 .

All other values are reserved.

FEAT_CCIDX implements the functionality identified by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

VARange, bits [19:16]

Indicates support for a larger virtual address. Defined values are:

VARange	Meaning
0b0000	VMSAv8-64 supports 48-bit VAs.
0b0001	VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The size for other translation granules is not defined by this field.

All other values are reserved.

FEAT_LVA implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

IESB, bits [15:12]

Indicates support for the IESB bit in the [SCTLR_ELx](#) registers. Defined values are:

IESB	Meaning
0b0000	IESB bit in the SCTLR_ELx registers is not supported.
0b0001	IESB bit in the SCTLR_ELx registers is supported.

All other values are reserved.

FEAT_IESB implements the functionality identified by the value 0b0001.

LSM, bits [11:8]

Indicates support for LSMAOE and nTLSMD bits in [SCTLR_EL1](#) and [SCTLR_EL2](#). Defined values are:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

UAO, bits [7:4]

User Access Override. Defined values are:

UAO	Meaning
0b0000	UAO not supported.
0b0001	UAO supported.

All other values are reserved.

FEAT_UAO implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

CnP, bits [3:0]

Indicates support for Common not Private translations. Defined values are:

CnP	Meaning
0b0000	Common not Private translations not supported.
0b0001	Common not Private translations supported.

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Accessing ID_AA64MMFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b010

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!IsZero(ID_AA64MMFR2_EL1) || boolean IMPLEMENTATION_DEFINED "ID_AA64MMFR2
trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64MMFR2_EL1;
elseif PSTATE.EL == EL2 then
    return ID_AA64MMFR2_EL1;
elseif PSTATE.EL == EL3 then
    return ID_AA64MMFR2_EL1;

```

ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0

The ID_AA64PFR0_EL1 characteristics are:

Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

The external register [EDPFR](#) gives information from this register.

Attributes

ID_AA64PFR0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CSV3				CSV2				RME				DIT				AMU				MPAM				SEL2				SVE			
RAS				GIC				AdvSIMD				FP				EL3				EL2				EL1				EL0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CSV3, bits [63:60]

Speculative use of faulting data. Defined values are:

CSV3	Meaning
0b0000	This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions instructions newer than the load in the speculative sequence.
0b0001	Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by other instructions instructions newer than the load in the speculative sequence.

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

CSV2, bits [59:56]

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	This PE does not disclose whether branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context.
0b0001	Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Contexts do not include the SCXTNUM_ELx register contexts. Support for the SCXTNUM_ELx registers is defined in ID_AA64PFR1_EL1.CSV2_frac .
0b0010	Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. The SCXTNUM_ELx registers are supported and the contexts include the SCXTNUM_ELx register contexts.

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the value 0b0001.

FEAT_CSV2_2 implements the functionality identified by the value 0b0010.

In Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

RME, bits [55:52]

Realm Management Extension (RME). Defined values are:

RME	Meaning
0b0000	Realm Management Extension not implemented.
0b0001	RMEv1 is implemented.

All other values are reserved.

FEAT_RME implements the functionality identified by the value 0b0001.

DIT, bits [51:48]

Data Independent Timing. Defined values are:

DIT	Meaning
0b0000	AArch64 does not guarantee constant execution time of any instructions.
0b0001	AArch64 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

MPAM, bits [43:40]

Indicates support for MPAM Extension. Defined values are:

MPAM	Meaning
0b0000	If ID_AA64PFR1_EL1.MPAM_frac == 0b0000, MPAM Extension is not implemented.
	If ID_AA64PFR1_EL1.MPAM_frac == 0b0001, MPAM Extension version 0.1 is implemented.
0b0001	If ID_AA64PFR1_EL1.MPAM_frac == 0b0000, MPAM Extension version 1.0 is implemented.
	If ID_AA64PFR1_EL1.MPAM_frac == 0b0001, MPAM Extension version 1.1 is implemented.

All other values are reserved.

SEL2, bits [39:36]

Secure EL2. Defined values are:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

All other values are reserved.

FEAT_SEL2 implements the functionality identified by the value 0b0001.

SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

SVE	Meaning
0b0000	SVE architectural state and programmers' model are not implemented.
0b0001	SVE architectural state and programmers' model are implemented.

All other values are reserved.

If implemented, refer to [ID_AA64ZFR0_EL1](#) for information about which SVE instructions are available.

RAS, bits [31:28]

RAS Extension version. Defined values are:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	RAS Extension implemented.
0b0010	FEAT_RASv1p1 implemented and, if EL3 is implemented, FEAT_DoubleFault implemented. As 0b0001, and adds support for: <ul style="list-style-type: none"> • If EL3 is implemented, FEAT_DoubleFault. • Additional ERXMISC<m>_EL1 System registers. • Additional System registers ERXPFCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 and FEAT_DoubleFault implement the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT_DoubleFault is not implemented, and [ERRIDR_EL1](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

Note

When the value of this field is 0b0001, [ID_AA64PFR1_EL1](#).RAS_frac indicates whether FEAT_RASv1p1 is implemented.

GIC, bits [27:24]

System register GIC CPU interface. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following Sisd and SIMD operations: <ul style="list-style-type: none"> Integer byte, halfword, word and doubleword element operations. Single-precision and double-precision floating-point arithmetic. Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

FP, bits [19:16]

Floating-point. Defined values are:

FP	Meaning
0b0000	Floating-point is implemented, and includes support for: <ul style="list-style-type: none"> Single-precision and double-precision floating-point types. Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with floating-point support that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without floating-point support.

EL3, bits [15:12]

EL3 Exception level handling. Defined values are:

EL3	Meaning
0b0000	EL3 is not implemented.
0b0001	EL3 can be executed in AArch64 state only.
0b0010	EL3 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL2, bits [11:8]

EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL1, bits [7:4]

EL1 Exception level handling. Defined values are:

EL1	Meaning
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL0, bits [3:0]

EL0 Exception level handling. Defined values are:

EL0	Meaning
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

Accessing ID_AA64PFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64PFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b000

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else

CSV2_frac	Meaning
0b0000	This PE does not disclose whether branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context. The SCXTNUM_ELx registers are not supported.
0b0001	If ID_AA64PFR0_EL1.CSV2 is 0b0001, branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Within a hardware-described context, branch targets trained for branches situated at one address can control speculative execution of branches situated at different addresses only in a hard-to-determine way. The SCXTNUM_ELx registers are not supported and the contexts do not include the SCXTNUM_ELx register contexts.
0b0010	If ID_AA64PFR0_EL1.CSV2 is 0b0001, branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Within a hardware-described context, branch targets trained for branches situated at one address can control speculative execution of branches situated at different addresses only in a hard-to-determine way. The SCXTNUM_ELx registers are supported, but the contexts do not include the SCXTNUM_ELx register contexts.

All other values are reserved.

FEAT_CSV2_1p1 implements the functionality identified by the value 0b0001.

FEAT_CSV2_1p2 implements the functionality identified by the value 0b0010.

From Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

This field is valid only if [ID_AA64PFR0_EL1.CSV2](#) is 0b0001.

Random Number trap to EL3 field. Defined values are:

RNDR_trap	Meaning
0b0000	Trapping of RNDR and RNDRRS to EL3 is not supported.
0b0001	Trapping of RNDR and RNDRRS to EL3 is supported. SCR_EL3.TRNDR is present.

All other values are reserved.

FEAT_RNG_TRAP implements the functionality identified by the value 0b0001.

Bits [27:20]

Bits [RNDR_trap](#), bits [31:28]

Reserved, RES0.

SME, bits [27:24]

Scalable Matrix Extension field. Defined values are:

SME	Meaning
0b0000	SME architectural state and programmers' model are not implemented.
0b0001	SME architectural state and programmers' model are implemented.

All other values are reserved.

FEAT_SME implements the functionality identified by the value 0b0001.

From Armv9.2, the permitted values are 0b0000 and 0b0001.

Bits [23:20]

Reserved, RES0.

MPAM_frac, bits [19:16]

MPAM Extension fractional field. Defined values are:

MPAM_frac	Meaning
0b0000	If ID_AA64PFR0_EL1 .MPAM == 0b0000, MPAM Extension not implemented.
	If ID_AA64PFR0_EL1 .MPAM == 0b0001, MPAM Extension v1.0 is implemented.
0b0001	If ID_AA64PFR0_EL1 .MPAM == 0b0000, implements MPAM v0.1, which is like v1.1 but reduces support for Secure PARTIDs.
	If ID_AA64PFR0_EL1 .MPAM == 0b0001, implements MPAM v1.1 and adds support for MPAM2_EL2 .TIDR to provide trapping of MPAMIDR_EL1 when MPAMHCR_EL2 is not present.

All other values are reserved.

RAS_frac, bits [15:12]

RAS Extension fractional field. Defined values are:

RAS_frac	Meaning
0b0000	If ID_AA64PFR0_EL1 .RAS == 0b0001, RAS Extension implemented.
0b0001	If ID_AA64PFR0_EL1 .RAS == 0b0001, as 0b0000 and adds support for: <ul style="list-style-type: none"> Additional ERXMISC<m>_EL1 System registers. Additional System registers ERXPFPCDN_EL1, ERXPFPCCTL_EL1, and ERXPFPCGE_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS , and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

FEAT_RASv1p1 implements the functionality identified by the value 0b0001.

This field is valid only if [ID_AA64PFR0_EL1](#).RAS == 0b0001.

MTE, bits [11:8]

Support for the Memory Tagging Extension. Defined values are:

MTE	Meaning
0b0000	Memory Tagging Extension is not implemented.
0b0001	Instruction-only Memory Tagging Extension is implemented.
0b0010	Full Memory Tagging Extension is implemented.
0b0011	Memory Tagging Extension is implemented with support for asymmetric Tag Check Fault handling.

All other values are reserved.

FEAT_MTE implements the functionality identified by the value 0b0001.

~~FEAT_MTE2 implements the functionality identified by the value 0b0010~~

~~FEAT_MTE2~~FEAT_MTE3 implements the functionality identified by the value 0b0010~~0b0011~~.

FEAT_MTE3 implements the functionality identified by the value 0b0011.

In Armv8.5, the permitted values are 0b0000, 0b0001 and 0b0010.

From Armv8.7, the value 0b0001 is not permitted.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

SSBS	Meaning
0b0000	AArch64 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.
0b0010	AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypassing Safe, and the MSR and MRS instructions to directly read and write the PSTATE.SSBS field.

All other values are reserved.

FEAT_SSBS implements the functionality identified by the value 0b0001.

FEAT_SSBS2 implements the functionality identified by the value 0b0010.

BT, bits [3:0]

Branch Target Identification mechanism support in AArch64 state. Defined values are:

BT	Meaning
0b0000	The Branch Target Identification mechanism is not implemented.
0b0001	The Branch Target Identification mechanism is implemented.

All other values are reserved.

FEAT_BTI implements the functionality identified by the value 0b0001.

From Armv8.5, the only permitted value is 0b0001.

Accessing ID_AA64PFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64PFR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b001

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else

ID_AA64SMFR0_EL1, SME Feature ID register 0

The ID_AA64SMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented features of the AArch64 Scalable Matrix Extension, when the [ID_AA64PFR1_EL1](#).SME field is not zero.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64SMFR0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32																																
RES0								I16I64				RES0				F64F64				RES0								I8I32				F16F32				B16F32				RES0				F32F32																			
RES0																																																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																																

Bits [63:56]

Reserved, RES0.

I16I64, bits [55:52]

Indicates SME support for accumulating 16-bit integer outer products into 64-bit integer tiles. Defined values are:

I16I64	Meaning
0b0000	Instructions that accumulate 16-bit outer products into 64-bit tiles are not implemented.
0b1111	The SMOPA, SMOPS, SUMOPA, SUMOPS, UMOPA, UMOPS, USMOPA, and USMOPS instructions that accumulate 16-bit outer products into 64-bit tiles are implemented.

All other values are reserved.

The only permitted values are 0b0000 and 0b1111.

Bits [51:49]

Reserved, RES0.

F64F64, bit [48]

Indicates SME support for accumulating double-precision floating-point outer products into double-precision tiles. Defined values are:

F64F64	Meaning
0b0	Instructions that accumulate double-precision outer products into double-precision tiles are not implemented.
0b1	The FMOPA and FMOPS instructions that accumulate double-precision outer products into double-precision tiles are implemented.

Bits [47:40]

Reserved, RES0.

I8I32, bits [39:36]

Indicates SME support for accumulating 8-bit integer outer products into 32-bit integer tiles. Defined values are:

I8I32	Meaning
0b0000	Instructions that accumulate 8-bit outer products into 32-bit tiles are not implemented.
0b1111	The SMOPA, SMOPS, SUMOPA, SUMOPS, UMOA, UMOPS, USMOPA, and USMOPS instructions that accumulate 8-bit outer products into 32-bit tiles are implemented.

All other values are reserved.

If FEAT_SME is implemented, the only permitted value is 0b1111.

F16F32, bit [35]

Indicates SME support for accumulating half-precision floating-point outer products into single-precision floating-point tiles. Defined values are:

F16F32	Meaning
0b0	Instructions that accumulate FP16 outer products into FP32 tiles are not implemented.
0b1	The FMOPA and FMOPS instructions that accumulate half-precision outer products into single-precision tiles are implemented.

If FEAT_SME is implemented, the only permitted value is 0b1.

B16F32, bit [34]

Indicates SME support for accumulating BFloat16 outer products into single-precision floating-point tiles. Defined values are:

B16F32	Meaning
0b0	Instructions that accumulate BFloat16 outer products into single-precision tiles are not implemented.
0b1	The BFMOA and BFMOPS instructions that accumulate BFloat16 outer products into single-precision tiles are implemented.

If FEAT_SME is implemented, the only permitted value is 0b1.

Bit [33]

Reserved, RES0.

F32F32, bit [32]

Indicates SME support for accumulating single-precision floating-point outer products into single-precision floating-point tiles. Defined values are:

F32F32	Meaning
0b0	Instructions that accumulate single-precision outer products into single-precision tiles are not implemented.
0b1	The FMOPA and FMOPS instructions that accumulate single-precision outer products into single-precision tiles are implemented.

If FEAT_SME is implemented, the only permitted value is 0b1.

Bits [31:0]

Reserved, RES0.

Accessing ID_AA64SMFR0_EL1

This register is read-only and can be accessed from EL1 and higher.

This register is only accessible from the AArch64 state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64SMFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b101

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64SMFR0_EL1;
elseif PSTATE.EL == EL2 then
    return ID_AA64SMFR0_EL1;
elseif PSTATE.EL == EL3 then
    return ID_AA64SMFR0_EL1;

```

ID_AA64ZFR0_EL1, SVE Feature ID register 0

The ID_AA64ZFR0_EL1 characteristics are:

Purpose

Provides additional information about the implemented features of the AArch64 Scalable Vector Extension **instruction set**, when **either or both of the ID_AA64PFR0_EL1.SVE and field is not zero. ID_AA64PFR1_EL1.SME are not zero.**

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64ZFR0_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0				F64MM				F32MM				RES0				I8MM				SM4				RES0				SHA3			
RES0								BF16				BitPerm				RES0								AES				SVEver			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:60]

Reserved, RES0.

F64MM, bits [59:56]

Indicates support for SVE FP64 double-precision floating-point matrix multiplication instructions. Defined values are:

F64MM	Meaning
0b0000	FP64 matrix multiplication and related instructions are not implemented.
0b0001	FP64 variant of the FMMLA instruction, and LD1RO* instructions are implemented. The 128-bit element variations of TRN1, TRN2, UZP1, UZP2, ZIP1, and ZIP2 are also implemented.

All other values are reserved.

When the PE is in Streaming SVE mode, software should ignore and treat as zero the value in this field.

FEAT_F64MM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

F32MM, bits [55:52]

Indicates support for the SVE FP32 single-precision floating-point matrix multiplication instruction. Defined values are:

F32MM	Meaning
0b0000	FP32 matrix multiplication instruction is not implemented.
0b0001	FP32 variant of the FMMLA instruction is implemented.

All other values are reserved.

When the PE is in Streaming SVE mode, software should ignore and treat as zero the value in this field.

FEAT_F32MM implements the functionality identified by 0b0001.

From Arm v8.2, the permitted values are 0b0000 and 0b0001.

Bits [51:48]

Reserved, RES0.

I8MM, bits [47:44]

Indicates support for SVE Int8 matrix multiplication instructions. Defined values are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.

All other values are reserved.

When the PE is in Streaming SVE mode, software should ignore and treat as zero the value in this field.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID_AA64ISAR1_EL1.I8MM](#).

From Armv8.6, the only permitted value is 0b0001.

SM4, bits [43:40]

Indicates support for SVE SM4 instructions. Defined values are:

SM4	Meaning
0b0000	SVE SM4 instructions are not implemented.
0b0001	SVE SM4E and SM4EKEY instructions are implemented.

All other values are reserved.

When the PE is in Streaming SVE mode, software should ignore and treat as zero the value in this field.

FEAT_SVE_SM4 implements the functionality identified by 0b0001.

Bits [39:36]

Reserved, RES0.

SHA3, bits [35:32]

Indicates support for the SVE SHA3 instructions. Defined values are:

SHA3	Meaning
0b0000	SVE SHA3 instructions are not implemented.
0b0001	SVE RAX1 instruction is implemented.

All other values are reserved.

When the PE is in Streaming SVE mode, software should ignore and treat as zero the value in this field.

FEAT_SVE_SHA3 implements the functionality identified by 0b0001.

Bits [31:24]

Reserved, RES0.

BF16, bits [23:20]

Indicates support for SVE BFloat16 instructions. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	BFCVT, BFCVTNT, BFDOT, BFMLALB, BFMLALT, and BFMMLA instructions are implemented.
0b0010	As 0b0001, but the FPCR .EBF field is also supported.

All other values are reserved.

FEAT_BF16 implements the functionality identified by 0b0001.

FEAT_EBF16 implements the functionality identified by 0b0010.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID_AA64ISAR1_EL1](#).BF16.

From Armv8.6, if the FEAT_SME only is implemented, the permitted values are 0b0001 and 0b0010.

From Armv8.6, if FEAT_SME is not implemented, the only permitted value is 0b0001.

BitPerm, bits [19:16]

Indicates support for SVE bit permute instructions. Defined values are:

BitPerm	Meaning
0b0000	SVE bit permute instructions are not implemented.
0b0001	SVE BDEP, BEXT, and BGRP instructions are implemented.

All other values are reserved.

When the PE is in Streaming SVE mode, software should ignore and treat as zero the value in this field.

FEAT_SVE_BitPerm implements the functionality identified by 0b0001.

Bits [15:8]

Reserved, RES0.

AES, bits [7:4]

Indicates support for SVE AES instructions. Defined values are:

AES	Meaning
0b0000	SVE AES instructions are not implemented.
0b0001	SVE AESE, AESD, AESMC, and AESIMC instructions are implemented.
0b0010	As 0b0001, plus SVE PMULLB and PMULLT instructions with 64-bit source.

All other values are reserved.

When the PE is in Streaming SVE mode, software should ignore and treat as zero the value in this field.

FEAT_SVE_AES implements the functionality identified by the value 0b0001.

FEAT_SVE_PMULL128 implements the functionality identified by the value 0b0010.

The permitted values are 0b0000 and 0b0010.

SVEver, bits [3:0]

Indicates support for SVE. Defined values are:

SVEver	Meaning
0b0000	SVE instructions are implemented.
0b0001	The SVE and the non-optional SVE2 instructions are implemented.

All other values are reserved.

FEAT_SVE2 and FEAT_SME implement implements the functionality identified by the value 0b0001.

From Armv9, if FEAT_SME is implemented, the only permitted value is 0b0001. This value indicates that SVE and SVE2 instructions are implemented when the PE is in Streaming SVE mode.

Note

Irrespective of the value of ID_AA64ZFR0_EL1.SVEver, when the PE is in Streaming SVE mode, software should not attempt to execute any of the SVE and SVE2 instructions that are illegal in Streaming SVE mode.

Accessing ID_AA64ZFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ZFR0_EL1

op0	op1	CRn	CRm	op2

ID_DFR0_EL1, AArch32 Debug Feature Register 0

The ID_DFR0_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_DFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_DFR0\[31:0\]](#).

Attributes

ID_DFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0** any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TraceFilt				PerfMon				MProfDbg				MMapTrc				CopTrc				MMapDbg				CopSDBG				CopDbg			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PerfMon	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv1 implemented.
0b0010	Performance Monitors Extension, PMUv2 implemented.
0b0011	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0011, and also includes support for: <ul style="list-style-type: none"> Extended 16-bit PMEVTYPER<n>.evtCount field. If EL2 is implemented, the HDCR.HPMD control bit.
0b0101	PMUv3 for Armv8.4. As 0b0100, and also includes support for the PMMIR register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and also includes support for: <ul style="list-style-type: none"> 64-bit event counters. If EL2 is implemented, the HDCR.HCCD control bit. If EL3 is implemented, the MDCR_EL3.SCCD control bit.
0b0111	PMUv3 for Armv8.7. As 0b0110, and also includes support for: <ul style="list-style-type: none"> The PMCR.FZO and, if EL2 is implemented, HDCR.HPMFZO control bits. If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} control bits.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.

FEAT_PMUv3p1 implements the functionality identified by the value 0b00110b0100.

FEAT_PMUv3p1 implements the functionality identified by the value 0b01000b0101.

FEAT_PMUv3p4 implements the functionality identified by the value 0b01010b0110.

FEAT_PMUv3p5 implements the functionality identified by the value 0b01100b0111.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

Note

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

MProfDbg, bits [23:20]

M-profile Debug. Support for memory-mapped debug model for M-profile processors. Defined values are:

MProfDbg	Meaning
0b0000	Not supported.
0b0001	Support for M-profile Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

MMapTrc, bits [19:16]

Memory-mapped Trace. Support for memory-mapped trace model. Defined values are:

MMapTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

CopTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with System registers access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

MMapDbg, bits [11:8]

Memory-mapped Debug. Support for Armv7 memory-mapped debug model for A and R-profile processors. Defined values are:

MMapDbg	Meaning
0b0000	Not supported.
0b0100	Support for Armv7, v7 Debug architecture, with memory-mapped access.
0b0101	Support for Armv7, v7.1 Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

The optional memory map defined by Armv8 is not compatible with Armv7.

CopSDBG, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A-profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

CopDbg, bits [3:0]

Support for System registers-based debug model, using registers in the coproc == 0b1110 encoding space, for A and R-profile processors. Defined values are:

CopDbg	Meaning
0b0000	Not supported.
0b0010	Support for Armv6, v6 Debug architecture, with System registers access.
0b0011	Support for Armv6, v6.1 Debug architecture, with System registers access.
0b0100	Support for Armv7, v7 Debug architecture, with System registers access.
0b0101	Support for Armv7, v7.1 Debug architecture, with System registers access.
0b0110	Support for Armv8 debug architecture, with System registers access.
0b0111	Support for Armv8 debug architecture, with System registers access, and Virtualization Host Extensions.
0b1000	Support for Armv8.2 debug architecture.
0b1001	Support for Armv8.4 debug architecture.

All other values are reserved.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

In Armv8.0, the only permitted value is 0b0110.

In Armv8.1, the only permitted value is 0b0111.

In Armv8.2, the only permitted value is 0b1000.

From Armv8.4, the only permitted value is 0b1001.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
														UNKNOWN

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMuV3, the value 0b0001 is not permitted.

Otherwise:

ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0

The ID_ISAR0_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), [ID_ISAR4_EL1](#), and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR0\[31:0\]](#).

Attributes

ID_ISAR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0** any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0				Divide				Debug				Coprocc				CmpBranch				BitField				BitCount				Swap			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:28]

Reserved, RES0.

Divide, bits [27:24]

Indicates the implemented Divide instructions. Defined values are:

Divide	Meaning
0b0000	None implemented.
0b0001	Adds SDIV and UDIV in the T32 instruction set.
0b0010	As for 0b0001, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Debug, bits [23:20]

Indicates the implemented Debug instructions. Defined values are:

Debug	Meaning
0b0000	None implemented.
0b0001	Adds BKPT.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Coproc, bits [19:16]

Indicates the implemented System register access instructions. Defined values are:

Coproc	Meaning
0b0000	None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.
0b0001	Adds generic CDP, LDC, MCR, MRC, and STC.
0b0010	As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.
0b0011	As for 0b0010, and adds generic MCRR and MRRC.
0b0100	As for 0b0011, and adds generic MCRR2 and MRRC2.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

CmpBranch	Meaning
0b0000	None implemented.
0b0001	Adds CBNZ and CBZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:

BitField	Meaning
0b0000	None implemented.
0b0001	Adds BFC, BFI, SBFX, and UBFX.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:

BitCount	Meaning
0b0000	None implemented.
0b0001	Adds CLZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

Swap	Meaning
0b0000	None implemented.
0b0001	Adds SWP and SWPB.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN

ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1

The ID_ISAR1_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), [ID_ISAR4_EL1](#), and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR1\[31:0\]](#).

Attributes

ID_ISAR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0** any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Jazelle				Interwork				Immediate				IfThen				Extend				Except_AR				Except				Endian			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions. Defined values are:

Jazelle	Meaning
0b0000	No support for Jazelle.
0b0001	Adds the BXJ instruction and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Interwork, bits [27:24]

Indicates the implemented Interworking instructions. Defined values are:

Interwork	Meaning
0b0000	None implemented.
0b0001	Adds the BX instruction, and the T bit in the PSR.
0b0010	As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.
0b0011	As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

Immediate	Meaning
0b0000	None implemented.
0b0001	Adds: <ul style="list-style-type: none"> The MOVT instruction. The MOV instruction encodings with zero-extended 16-bit immediates. The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

IfThen	Meaning
0b0000	None implemented.
0b0001	Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

Extend	Meaning
0b0000	No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.
0b0001	Adds the SXTB, SXTH, UXTB, and UXTH instructions.
0b0010	As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Except_AR, bits [11:8]

Indicates the implemented A and R-profile exception-handling instructions. Defined values are:

Except_AR	Meaning
0b0000	None implemented.
0b0001	Adds the SRS and RFE instructions, and the A and R-profile forms of the CPS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:

Except	Meaning
0b0000	Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.
0b0001	Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Endian, bits [3:0]

Indicates the implemented Endian instructions. Defined values are:

Endian	Meaning
0b0000	None implemented.
0b0001	Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2

The ID_ISAR2_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR3_EL1](#), [ID_ISAR4_EL1](#), and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR2\[31:0\]](#).

Attributes

ID_ISAR2_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0** any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Reversal				PSR_AR				MultU				MultS				Mult				MultiAccessInt				MemHint				LoadStore			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

Reversal, bits [31:28]

Indicates the implemented Reversal instructions. Defined values are:

Reversal	Meaning
0b0000	None implemented.
0b0001	Adds the REV, REV16, and REVSH instructions.
0b0010	As for 0b0001, and adds the RBIT instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

PSR_AR, bits [27:24]

Indicates the implemented A and R-profile instructions to manipulate the PSR. Defined values are:

PSR_AR	Meaning
0b0000	None implemented.
0b0001	Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

MultiU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

MultiU	Meaning
0b0000	None implemented.
0b0001	Adds the UMULL and UMLAL instructions.
0b0010	As for 0b0001, and adds the UMAAL instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

MultiS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions. Defined values are:

MultiS	Meaning
0b0000	None implemented.
0b0001	Adds the SMULL and SMLAL instructions.
0b0010	As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
0b0011	As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Multi, bits [15:12]

Indicates the implemented additional Multiply instructions. Defined values are:

Multi	Meaning
0b0000	No additional instructions implemented. This means only MUL is implemented.
0b0001	Adds the MLA instruction.
0b0010	As for 0b0001, and adds the MLS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions. Defined values are:

MultiAccessInt	Meaning
0b0000	No support. This means the LDM and STM instructions are not interruptible.
0b0001	LDM and STM instructions are restartable.
0b0010	LDM and STM instructions are continuable.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:

MemHint	Meaning
0b0000	None implemented.
0b0001	Adds the PLD instruction.
0b0010	Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)
0b0011	As for 0b0001 (or 0b0010), and adds the PLI instruction.
0b0100	As for 0b0011, and adds the PLDW instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

LoadStore	Meaning
0b0000	No additional load/store instructions implemented.
0b0001	Adds the LDRD and STRD instructions.
0b0010	As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3

The ID_ISAR3_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR4_EL1](#), and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR3\[31:0\]](#).

Attributes

ID_ISAR3_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0** any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
T32EE				TrueNOP				T32Copy				TabBranch				SynchPrim				SVC				SIMD				Saturate			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

T32EE, bits [31:28]

Indicates the implemented T32EE instructions. Defined values are:

T32EE	Meaning
0b0000	None implemented.
0b0001	Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions. Defined values are:

TrueNOP	Meaning
0b0000	None implemented. This means there are no NOP instructions that do not have any register dependencies.
0b0001	Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

T32Copy	Meaning
0b0000	Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.
0b0001	Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

TabBranch	Meaning
0b0000	None implemented.
0b0001	Adds the TBB and TBH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

SynchPrim	Meaning
0b0000	If SynchPrim_frac == 0b0000, no Synchronization Primitives implemented.
0b0001	If SynchPrim_frac == 0b0000, adds the LDREX and STREX instructions.
	If SynchPrim_frac == 0b0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.
0b0010	If SynchPrim_frac == 0b0000, as for [0b0001, 0b0011] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

SVC	Meaning
0b0000	Not implemented.
0b0001	Adds the SVC instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:

SIMD	Meaning
0b0000	None implemented.
0b0001	Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
0b0011	As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports Advanced SIMD and floating-point instructions, [MVFR0](#), [MVFR1](#), and [MVFR2](#) give information about the implemented Advanced SIMD instructions.

Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

Saturate	Meaning
0b0000	None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
0b0001	Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN

ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4

The ID_ISAR4_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR4\[31:0\]](#).

Attributes

ID_ISAR4_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0** any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
SWP_frac				PSR_M				SynchPrim_frac				Barrier				SMC				Writeback				WithShifts				Unpriv			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

SWP_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

SWP_frac	Meaning
0b0000	SWP or SWPB instructions not implemented.
0b0001	SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if [ID_ISAR0.Swap](#) is 0b0000.

In Armv8-A, the only permitted value is 0b0000.

PSR_M, bits [27:24]

Indicates the implemented M-profile instructions to modify the PSRs. Defined values are:

PSR_M	Meaning
0b0000	None implemented.
0b0001	Adds the M-profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

SynchPrim_frac, bits [23:20]

Used in conjunction with [ID_ISAR3.SynchPrim](#) to indicate the implemented Synchronization Primitive instructions. Possible values are:

SynchPrim_frac	Meaning
0b0000	If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.
0b0011	If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

Barrier	Meaning
0b0000	None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.
0b0001	Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SMC, bits [15:12]

Indicates the implemented SMC instructions. Defined values are:

SMC	Meaning
0b0000	None implemented.
0b0001	Adds the SMC instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32, then this field has the value 0b0000.

- If EL3 is implemented and EL1 can use AArch32, the only permitted value is 0b0001.
- If neither EL3 nor EL2 is implemented, the only permitted value is 0b0000.

If EL1 cannot use AArch32, this field has the value 0b0000.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes. Defined values are:

Writeback	Meaning
0b0000	Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.
0b0001	Adds support for all of the writeback addressing modes.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

WithShifts	Meaning
0b0000	Nonzero shifts supported only in MOV and shift instructions.
0b0001	Adds support for shifts of loads and stores over the range LSL 0-3.
0b0011	As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.
0b0100	As for 0b0011, and adds support for register-controlled shift options.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

Unpriv	Meaning
0b0000	None implemented. No T variant instructions are implemented.
0b0001	Adds the LDRBT, LDRT, STRBT, and STRT instructions.
0b0010	As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN

ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5

The ID_ISAR5_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), and [ID_ISAR4_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR5\[31:0\]](#).

Attributes

ID_ISAR5_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0** any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
VCMA				RDM				RES0				CRC32				SHA2				SHA1				AES				SEVL			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

VCMA, bits [31:28]

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

VCMA	Meaning
0b0000	The VCMLA and VCADD instructions are not implemented in AArch32.
0b0001	The VCMLA and VCADD instructions are implemented in AArch32.

All other values are reserved.

FEAT_FCMA implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, the only permitted value is 0b0001.

RDM, bits [27:24]

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

RDM	Meaning
0b0000	No VQRDMLAH and VQRDMLSH instructions implemented.
0b0001	VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

In Armv8.0, the only permitted value is 0b0000.

From Armv8.1, the only permitted value is 0b0001.

Bits [23:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates whether the CRC32 instructions are implemented in AArch32 state.

CRC32	Meaning
0b0000	No CRC32 instructions implemented.
0b0001	CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates whether the SHA2 instructions are implemented in AArch32 state.

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SHA1, bits [11:8]

Indicates whether the SHA1 instructions are implemented in AArch32 state.

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

AES, bits [7:4]

Indicates whether the AES instructions are implemented in AArch32 state.

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC implemented.
0b0010	As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

SEVL, bits [3:0]

Indicates whether the SEVL instruction is implemented in AArch32 state.

SEVL	Meaning
0b0000	SEVL is implemented as a NOP.
0b0001	SEVL is implemented as Send Event Local.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Otherwise:

ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6

The ID_ISAR6_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), [ID_ISAR4_EL1](#) and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR6_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR6\[31:0\]](#).

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_ISAR6_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0**any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0				I8MM				BF16				SPECRES				SB				FHM				DP				JSCVT			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:28]

Reserved, RES0.

I8MM, bits [27:24]

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values of this field are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.

All other values are reserved.

FEAT_AA32I8MM implements the functionality identified by 0b0001.

BF16, bits [23:20]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	VCVT, VCVTB, VCVTT, VDOT, VFMA, VFMA, and VMMLA instructions with BF16 operand or result types are implemented.

All other values are reserved.

FEAT_AA32BF16 implements the functionality identified by 0b0001.

SPECRES, bits [19:16]

Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:

SPECRES	Meaning
0b0000	Prediction invalidation instructions are not implemented.
0b0001	CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [15:12]

Indicates support for the SB instruction in AArch32 state. Defined values are:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

FHM, bits [11:8]

Indicates support for Advanced SIMD and floating-point VFMA and VFMSL instructions in AArch32 state. Defined values are:

FHM	Meaning
0b0000	VFMA and VFMSL instructions are not implemented.
0b0001	VFMA and VFMSL instructions are implemented.

All other values are reserved.

FEAT_FHM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

DP, bits [7:4]

Indicates support for dot product instructions in AArch32 state. Defined values are:

DP	Meaning
0b0000	Dot product instructions are not implemented.
0b0001	VUDOT and VSDOT instructions are implemented.

All other values are reserved.

FEAT_DotProd implements the functionality identified by 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

JSCVT, bits [3:0]

Indicates support for the VJCVT instruction in AArch32 state. Defined values are:

JSCVT	Meaning
0b0000	The VJCVT instruction is not implemented.
0b0001	The VJCVT instruction is implemented.

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

Otherwise:

ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0

The ID_MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_MMFR0\[31:0\]](#).

Attributes

ID_MMFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0**any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
InnerShr				FCSE				AuxReg				TCM				ShareLvl				OuterShr				PMSA				VMSA			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

InnerShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0_EL1.ShareLvl having the value 0b0001.

When ID_MMFR0_EL1.ShareLvl is zero, this field is UNKNOWN.

FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE. Defined values are:

FCSE	Meaning
0b0000	Not supported.
0b0001	Support for FCSE.

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

AuxReg	Meaning
0b0000	None supported.
0b0001	Support for Auxiliary Control Register only.
0b0010	Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

TCM	Meaning
0b0000	Not supported.
0b0001	Support is IMPLEMENTATION DEFINED. Armv7 requires this setting.
0b0010	Support for TCM only, Armv6 implementation.
0b0011	Support for TCM and DMA, Armv6 implementation.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

ShareLvl	Meaning
0b0000	One level of shareability implemented.
0b0001	Two levels of shareability implemented.

All other values are reserved.

From Armv8 the only permitted value is 0b0001.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

OuterShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

PMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED PMSA.
0b0010	Support for PMSAv6, with a Cache Type Register implemented.
0b0011	Support for PMSAv7, with support for memory subsections. Armv7-R profile.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

VMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED VMSA.
0b0010	Support for VMSAv6, with Cache and TLB Type Registers implemented.
0b0011	Support for VMSAv7, with support for remapping and the Access flag. Armv7-A profile.
0b0100	As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
0b0101	As for 0b0100, and adds support for the Long-descriptor translation table format.

All other values are reserved.

In Armv8-A the only permitted value is 0b0101.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:32]

Reserved, RES0.

BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

BPred	Meaning
0b0000	No branch predictor, or no MMU present. Implies a fixed MPU configuration.
0b0001	Branch predictor requires flushing on: <ul style="list-style-type: none"> • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Changes to the TTBR0, TTBR1, or TTBCR registers. • Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.
0b0010	Branch predictor requires flushing on: <ul style="list-style-type: none"> • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.
0b0011	Branch predictor requires flushing only on writing new data to instruction locations.
0b0100	For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In Armv8-A, the permitted values are 0b0010, 0b0011, and 0b0100. For values other than 0b0000 and 0b0100 the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

L1TstCln	Meaning
0b0000	None supported.
0b0001	Supported Level 1 data cache test and clean operations are: <ul style="list-style-type: none"> • Test and clean data cache.
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> • Test, clean, and invalidate data cache.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

L1Uni	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: <ul style="list-style-type: none"> • Invalidate cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> • Clean cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

L1Hvd	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: <ul style="list-style-type: none"> • Invalidate instruction cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate data cache. • Invalidate data cache and instruction cache, including branch predictor if appropriate.
0b0011	As for 0b0010, and adds: <ul style="list-style-type: none"> • Clean data cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

L1UniSW	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by set/way are: <ul style="list-style-type: none"> • Clean cache line by set/way.
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> • Clean and invalidate cache line by set/way.
0b0011	As for 0b0010, and adds: <ul style="list-style-type: none"> • Invalidate cache line by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

L1HvdSW	Meaning
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by set/way are: <ul style="list-style-type: none"> • Clean data cache line by set/way. • Clean and invalidate data cache line by set/way.
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate data cache line by set/way.
0b0011	As for 0b0010, and adds: <ul style="list-style-type: none"> • Invalidate instruction cache line by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

L1UniVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by VA are: <ul style="list-style-type: none"> • Clean cache line by VA. • Invalidate cache line by VA. • Clean and invalidate cache line by VA.
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

L1HvdVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by VA are: <ul style="list-style-type: none"> • Clean data cache line by VA. • Invalidate data cache line by VA. • Clean and invalidate data cache line by VA. • Clean instruction cache line by VA.
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

ID_MMFR2_EL1, AArch32 Memory Model Feature Register 2

The ID_MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_MMFR2\[31:0\]](#).

Attributes

ID_MMFR2_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0**any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

HWAccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

HWAccFlg	Meaning
0b0000	Not supported.
0b0001	Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

WFISall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

WFISall	Meaning
0b0000	Not supported.
0b0001	Support for WFI stalling.

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0001.

MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==0b1111) encoding space:

MemBarr	Meaning
0b0000	None supported.
0b0001	Supported memory barrier System instructions are: <ul style="list-style-type: none"> • Data Synchronization Barrier (DSB).
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> • Instruction Synchronization Barrier (ISB). • Data Memory Barrier (DMB).

All other values are reserved.

From Armv8, the only permitted value is 0b0010.

Arm deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

UniTLB	Meaning
0b0000	Not supported.
0b0001	Supported unified TLB maintenance operations are: <ul style="list-style-type: none"> • Invalidate all entries in the TLB. • Invalidate TLB entry by VA.
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate TLB entries by ASID match.
0b0011	As for 0b0010, and adds: <ul style="list-style-type: none"> • Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.
0b0100	As for 0b0011, and adds: <ul style="list-style-type: none"> • Invalidate Hyp mode unified TLB entry by VA. • Invalidate entire Non-secure PL1&0 unified TLB. • Invalidate entire Hyp mode unified TLB.
0b0101	As for 0b0100, and adds the following operations: TLBIMVALIS , TLBIMVAALIS , TLBIMVALHIS , TLBIMVAL , TLBIMVAAL , TLBIMVALH .
0b0110	As for 0b0101, and adds the following operations: TLBIIPAS2IS , TLBIIPAS2LIS , TLBIIPAS2 , TLBIIPAS2L .

All other values are reserved.

In Armv8-A, the only permitted value is 0b0110.

HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

L1HvdRng	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache maintenance range operations are: <ul style="list-style-type: none"> • Invalidate data cache range by VA. • Invalidate instruction cache range by VA. • Clean data cache range by VA. • Clean and invalidate data cache range by VA.

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

L1HvdBG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache background fetch operations are: <ul style="list-style-type: none"> • Fetch instruction cache range by VA. • Fetch data cache range by VA.

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

L1HvdFG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache foreground fetch operations are: <ul style="list-style-type: none"> • Fetch instruction cache range by VA. • Fetch data cache range by VA.

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

Otherwise:

-------	----------------	-------

ID_MMFR3_EL1, AArch32 Memory Model Feature Register 3

The ID_MMFR3_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_MMFR3\[31:0\]](#).

Attributes

ID_MMFR3_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0**any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
Supersec				CMemSz				CohWalk				PAN				MaintBcst				BPMaint				CMaintSW				CMaintVA			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

Supersec	Meaning
0b0000	Supersections supported.
0b1111	Supersections not supported.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b1111.

CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

CMemSz	Meaning
0b0000	4GB, corresponding to a 32-bit physical address range.
0b0001	64GB, corresponding to a 36-bit physical address range.
0b0010	1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b0010.

CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

CohWalk	Meaning
0b0000	Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.
0b0001	Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

PAN, bits [19:16]

Privileged Access Never. Indicates support for the PAN bit in [CPSR](#), [SPSR](#), and [DPSR](#) in AArch32 state. Defined values are:

PAN	Meaning
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and ATS1CPRP and ATS1CPWP instructions supported.

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

In Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the only permitted value is 0b0010.

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

MaintBcst	Meaning
0b0000	Cache, TLB, and branch predictor operations only affect local structures.
0b0001	Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.
0b0010	Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

BPMaint	Meaning
0b0000	None supported.
0b0001	Supported branch predictor maintenance operations are: <ul style="list-style-type: none"> Invalidate all branch predictors.
0b0010	As for 0b0001, and adds: <ul style="list-style-type: none"> Invalidate branch predictors by VA.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

CMaintSW	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance instructions by set/way are: <ul style="list-style-type: none"> Invalidate data cache by set/way. Clean data cache by set/way. Clean and invalidate data cache by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

CMaintVA	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance operations by VA are: <ul style="list-style-type: none"> Invalidate data cache by VA. Clean data cache by VA. Clean and invalidate data cache by VA. Invalidate instruction cache by VA. Invalidate all instruction cache entries.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ID_MMFR4_EL1, AArch32 Memory Model Feature Register 4

The ID_MMFR4_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_MMFR4\[31:0\]](#).

Attributes

ID_MMFR4_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0**any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
EVT				CCIDX				LSM				HPDS				CnP				XNX				AC2				SpecSEI			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

EVT, bits [31:28]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the [HCR2](#).{TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

EVT	Meaning
0b0000	HCR2 .{TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	HCR2 .{TOCU, TICAB, TID4} traps are supported. HCR2 .TTLBIS trap is not supported.
0b0010	HCR2 .{TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

FEAT_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented supporting AArch32, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented or does not support AArch32.implemented.
- 0b0010 when EL2 is implemented and supports AArch32.implemented.

CCIDX, bits [27:24]

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.
0b0001	64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.

All other values are reserved.

FEAT_CCIDX implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

LSM, bits [23:20]

Indicates support for LSMAOE and nTLSMD bits in [HSCTLR](#) and [SCTLR](#). Defined values are:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

HPDS, bits [19:16]

Hierarchical permission disables bits in translation tables. Defined values are:

HPDS	Meaning
0b0000	Disabling of hierarchical controls not supported.
0b0001	Supports disabling of hierarchical controls using the TTBCR2 .HPD0, TTBCR2 .HPD1, and HTCR .HPD bits.
0b0010	As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

FEAT_AA32HPD implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality added by the value 0b0010.

Note

The value 0b0000 implies that the encoding for [TTBCR2](#) is UNDEFINED.

CnP, bits [15:12]

Common not Private translations. Defined values are:

CnP	Meaning
0b0000	Common not Private translations not supported.
0b0001	Common not Private translations supported.

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2 the only permitted value is 0b0001.

XNX, bits [11:8]

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

When FEAT_XNX is implemented:

- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4_EL1.XNX is 0b0000 or 0b0001:
 - [ID_AA64MMFR1_EL1.XNX](#) == 1.
 - EL2 cannot use AArch32.
 - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0b0001.

AC2, bits [7:4]

Indicates the extension of the [ACTLR](#) and [HACTLR](#) registers using [ACTLR2](#) and [HACTLR2](#). Defined values are:

AC2	Meaning
0b0000	ACTLR2 and HACTLR2 are not implemented.
0b0001	ACTLR2 and HACTLR2 are implemented.

All other values are reserved.

In Armv8.0 and Armv8.1 the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [3:0]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

SpecSEI	Meaning
0b0000	The PE never generates an SError interrupt due to an External abort on a speculative read.
0b0001	The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

Otherwise:

Bits [63:8]

Reserved, RES0.

nTLBPA, bits [7:4]

Indicates support for intermediate caching of translation table walks. Defined values are:

nTLBPA	Meaning
0b0000	The intermediate caching of translation table walks might include non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE where either: <ul style="list-style-type: none"> The caching is indexed by the physical address of the location holding the translation table entry. The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.
0b0001	The intermediate caching of translation table walks does not include non-coherent caches of previous valid translation table entries since the last completed TLBI applicable to the PE where either: <ul style="list-style-type: none"> The caching is indexed by the physical address of the location holding the translation table entry. The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.

All other values are reserved.

FEAT_nTLBPA implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

ETS, bits [3:0]

Indicates support for Enhanced Translation Synchronization. Defined values are:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is supported.

All other values are reserved.

FEAT_ETS implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

Otherwise:

ID_PFR0_EL1, AArch32 Processor Feature Register 0

The ID_PFR0_EL1 characteristics are:

Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with [ID_PFR1_EL1](#).

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_PFR0\[31:0\]](#).

Attributes

ID_PFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0**any Exception level:

Bits [63:32]

Reserved, RES0.

RAS, bits [31:28]

RAS Extension version. Defined values are:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	RAS Extension implemented.
0b0010	FEAT_RASv1p1 implemented. As 0b0001, and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT_DoubleFault is not implemented, and [ERRIDR_EL1.NUM](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

Note

When the value of this field is 0b0001, [ID_PFR2_EL1.RAS_frac](#) indicates whether FEAT_RASv1p1 is implemented.

DIT, bits [27:24]

Data Independent Timing. Defined values are:

DIT	Meaning
0b0000	AArch32 does not guarantee constant execution time of any instructions.
0b0001	AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [23:20]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

CSV2, bits [19:16]

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	This PE does not disclose whether branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context.
0b0001	Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way.
0b0010	Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Within a hardware-described context, branch targets trained for branches situated at one address can control speculative execution of branches situated at different addresses only in a hard-to-determine way.

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

State3, bits [15:12]

T32EE instruction set support. Defined values are:

State3	Meaning
0b0000	Not implemented.
0b0001	T32EE instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

State2, bits [11:8]

Jazelle extension support. Defined values are:

State2	Meaning
0b0000	Not implemented.
0b0001	Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.
0b0010	Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

State1, bits [7:4]

T32 instruction set support. Defined values are:

State1	Meaning
0b0000	T32 instruction set not implemented.
0b0001	T32 encodings before the introduction of Thumb-2 technology implemented: <ul style="list-style-type: none"> • All instructions are 16-bit. • A BL or BLX is a pair of 16-bit instructions. • 32-bit instructions other than BL and BLX cannot be encoded.
0b0011	T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

State0, bits [3:0]

A32 instruction set support. Defined values are:

State0	Meaning
0b0000	A32 instruction set not implemented.
0b0001	A32 instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN

ID_PFR1_EL1, AArch32 Processor Feature Register 1

The ID_PFR1_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with [ID_PFR0_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_PFR1\[31:0\]](#).

Attributes

ID_PFR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0**any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
GIC				Virt_frac				Sec_frac				GenTimer				Virtualization				MProgMod				Security				ProgMod			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for Virtualization Extensions. Defined values are:

Virt_frac	Meaning
0b0000	No Virtualization Extensions are implemented.
0b0001	The following Virtualization Extensions are implemented: <ul style="list-style-type: none"> • The SCR.SIF bit, if EL3 is implemented. • The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented. • The MSR (banked register) and MRS (banked register) instructions. • The ERET instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Virtualization is 0, otherwise it holds the value 0b0000.

Note

The ID_ISAR registers do not identify whether the instructions added by the Virtualization Extensions are implemented.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for Security Extensions. Defined values are:

Sec_frac	Meaning
0b0000	No Security Extensions are implemented.
0b0001	The following Security Extensions are implemented: <ul style="list-style-type: none"> • The VBAR register. • The TTBCR.PD0 and TTBCR.PD1 bits.
0b0010	As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is only valid when the value of ID_PFR1_EL1.Security is 0, otherwise it holds the value 0b0000.

GenTimer, bits [19:16]

Generic Timer support. Defined values are:

GenTimer	Meaning
0b0000	Generic Timer is not implemented.
0b0001	Generic Timer is implemented.
0b0010	Generic Timer is implemented, and also includes support for CNTHCTL .EVNTIS and CNTKCTL .EVNTIS fields, and CNTPCTSS and CNTVCTSS counter views.

All other values are reserved.

FEAT_ECV implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0001.

From Armv8.6, the only permitted value is 0b0010.

Virtualization, bits [15:12]

Virtualization support. Defined values are:

Virtualization	Meaning
0b0000	EL2, Hyp mode, and the HVC instruction not implemented.
0b0001	EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Note

The ID_ISARs do not identify whether the HVC instruction is implemented.

MProgMod, bits [11:8]

M-profile programmers' model support. Defined values are:

MProgMod	Meaning
0b0000	Not supported.
0b0010	Support for two-stack programmers' model.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Security, bits [7:4]

Security support. Defined values are:

Security	Meaning
0b0000	EL3, Monitor mode, and the SMC instruction not implemented.
0b0001	EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.
0b0010	As for 0b0001, and adds the ability to set the NSACR .RFR bit. Not permitted in Armv8 as the NSACR .RFR bit is RES0.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

ProgMod, bits [3:0]

Support for the standard programmers' model for Armv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

ProgMod	Meaning
0b0000	Not supported.
0b0001	Supported.

All other values are reserved.

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN

The ID_PFR2_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with [ID PFR0 EL1](#) and [ID PFR1 EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_PFR2\[31:0\]](#).

Attributes

ID_PFR2_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at EL0 any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																RES0																
RES0																RAS_frac				SSBS				CSV3								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:12]

Reserved, RES0.

RAS_frac, bits [11:8]

RAS Extension fractional field. Defined values are:

RAS_frac	Meaning
0b0000	If ID_PFR0_EL1 .RAS == 0b0001, RAS Extension implemented.
0b0001	If ID_PFR0_EL1 .RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

This field is valid only if [ID_PFR0_EL1](#).RAS == 0b0001.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

SSBS	Meaning
0b0000	AArch32 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

CSV3, bits [3:0]

Speculative use of faulting data. Defined values are:

CSV3	Meaning
0b0000	This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions newer than the load in the speculative sequence .
0b0001	Data loaded under speculation with a permission or domain fault cannot be used to form an address or generate condition codes or SVE predicate values to be used by other instructions newer than the load in the speculative sequence .

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_EOPD is implemented, FEAT_CSV3 must be implemented.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ISR_EL1, Interrupt Status Register

The ISR_EL1 characteristics are:

Purpose

Shows the pending status of the IRQ, FIQ, or SError interrupt.

When executing at EL2, EL3 or Secure EL1 when [SCR_EL3.EEL2](#) == 0b0, this shows the pending status of the physical IRQ, FIQ, or SError interrupts.

When executing at either Non-secure EL1 or at Secure EL1 when [SCR_EL3.EEL2](#) == 0b1:

- If the [HCR_EL2](#).{IMO,FMO,AMO} bit has a value of 1, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the [HCR_EL2](#).{IMO,FMO,AMO} bit has a value of 0, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the physical IRQ, FIQ, or SError.

Configuration

AArch64 System register ISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ISR\[31:0\]](#).

Attributes

ISR_EL1 is a 64-bit register.

Field descriptions

Bits [63:9]

Reserved, RES0.

A, bit [8]

SError interrupt pending bit. **Indicates whether an SError interrupt is pending.**

A	Meaning
0b0	No pending SError.
0b1	An SError interrupt is pending.

If the SError interrupt is edge-triggered, this field is cleared to zero when the physical SError interrupt is taken.

I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is **pending**.~~pending:~~

I	Meaning
0b0	No pending IRQ.
0b1	An IRQ interrupt is pending.

F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

F	Meaning
0b0	No pending FIQ.
0b1	An FIQ interrupt is pending.

Bits [5:0]

Reserved, RES0.

Accessing ISR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ISR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.ISR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ISR_EL1;
elsif PSTATE.EL == EL2 then
    return ISR_EL1;
elsif PSTATE.EL == EL3 then
    return ISR_EL1;
```

MDCR_EL3, Monitor Debug Configuration Register (EL3)

The MDCR_EL3 characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

Configuration

AArch64 System register MDCR_EL3 bits [31:0] can be mapped to AArch32 System register [SDCR\[31:0\]](#), but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to MDCR_EL3 are UNDEFINED.

Attributes

MDCR_EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38

Bits [63:37]

Reserved, RES0.

EnPMSN, bit [36]

When FEAT_SPEv1p2 is implemented:

Trap accesses to [PMSNEVFR_EL1](#). Controls access to Statistical Profiling [PMSNEVFR_EL1](#) System register from EL2 and EL1.

EnPMSN	Meaning
0b0	Accesses to PMSNEVFR_EL1 at EL2 and EL1 generate a Trap exception to EL3.
0b1	Do not trap PMSNEVFR_EL1 to EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MPMX, bit [35]**When FEAT_PMUv3p7 is implemented:**

Monitor Performance Monitors Extended control. In conjunction with MDCR_EL3.SPME, controls when event counters are enabled at EL3 and in other Secure Exception levels.

MPMX	Meaning
0b0	Event counting and PMCCNTR_EL0 are not affected by this mechanism.
0b1	Event counting by some or all event counters is prohibited at EL3. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled at EL3. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.

If EL2 is implemented, MDCR_EL3.SPME == 1, and [MDCR_EL2.HPMN](#) is less than [PMCR_EL0.N](#) then all the following are true:

- This field affects the operation of event counters in the range [0 .. ([MDCR_EL2.HPMN](#)-1)] at EL3, and if [PMCR_EL0.DP](#) is 1, the operation of [PMCCNTR_EL0](#) at EL3.
- This field does not affect the operation of event counters in the range [[MDCR_EL2.HPMN](#) .. ([PMCR_EL0.N](#)-1)].
- This applies even when EL2 is disabled in Secure state.

If EL2 is not implemented, MDCR_EL3.SPME == 0, or [MDCR_EL2.HPMN](#) is equal to [PMCR_EL0.N](#) then this field affects the operation of all event counters at EL3, and if [PMCR_EL0.DP](#) is 1, the operation of [PMCCNTR_EL0](#) at EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

MCCD, bit [34]**When FEAT_PMUv3p7 is implemented:**

Monitor Cycle Counter Disable. Prohibits the Cycle Counter, [PMCCNTR_EL0](#), from counting at EL3.

MCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited at EL3.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SBRBE, bits [33:32]**When FEAT_BRBE is implemented:**

Secure Branch Record Buffer Enable. Controls branch recording by the BRBE, and access to BRBE registers and instructions at EL2 and EL1.

SBRBE	Meaning
0b00	Direct accesses to BRBE registers and instructions, except when in EL3, generate a Trap exception to EL3. EL0, All EL1, Exception and EL2 levels are prohibited regions.
0b01	Direct accesses to BRBE registers and instructions in Secure state, except when in EL3, generate a Trap exception to EL3. EL0, EL1, and EL2 in Secure state are a prohibited regions. region. This control does not cause any direct accesses to BRBE registers when not in Secure state to be trapped, and does not cause any Exception levels when not in Secure state to be a prohibited region.
0b10	Direct accesses to BRBE registers and instructions, except when in EL3, generate a Trap exception to EL3. This control does not cause any Exception levels to be a prohibited regions. region.
0b11	This control does not cause any direct accesses to BRBE registers or instruction to be trapped, and does not cause any Exception levels to be a prohibited region.

The Branch Record Buffer registers trapped by this control are: [BRBCR_EL1](#), [BRBCR_EL2](#), [BRBCR_EL12](#), [BRBFCR_EL1](#), [BRBIDRO_EL1](#), [BRBINF<n>_EL1](#), [BRBINFINJ_EL1](#), [BRBSRC<n>_EL1](#), [BRBSRCINJ_EL1](#), [BRBTGT<n>_EL1](#), [BRBTGTINJ_EL1](#), and [BRBTS_EL1](#).

The Branch Record Buffer instructions trapped by this control are:

- [BRB IALL](#).
- [BRB INJ](#).

If EL3 is not implemented, then the Effective value of this field is 0b11.

Note

EL3 is a prohibited region.

If EL3 is not implemented then the Effective value of this field is 0b11.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [31:29]

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the [PMEVTYPEPER<n>_EL0](#).MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of PMEVTYPEPER<n>_EL0 .MT is zero.
0b1	PMEVTYPEPER<n>_EL0 .MT bits not affected by this field.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]**When FEAT_FGT is implemented:**

Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: [OSDTRRX_EL1](#), [OSDTRTX_EL1](#), [MDCCSR_EL0](#), [MDCCINT_EL1](#), and, when the PE is in Non-debug state, [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#).

AArch32: [DBGDTRRXext](#), [DBGDTRTXext](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL3.TDCC does not trap any accesses to:

AArch64: [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#).

AArch32: [DBGDTRRXint](#) and [DBGDTRTXint](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSTBE, bit [26]**When FEAT_TRBE is implemented and FEAT_RME is implemented:**

Non-secure Trace Buffer Extended. Together with MDCR_EL3.NSTB, controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.

For a description of the values derived by evaluating NSTB and NSTBE together, see MDCR_EL3.NSTB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSTB, bits [25:24]**When FEAT_TRBE is implemented and FEAT_RME is implemented:**

Non-secure Trace Buffer. Together with MDCR_EL3.NSTBE, controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.

NSTB	Meaning
0b00	When MDCR_EL3.NSTBE == 0b0: Trace Buffer owning security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3. When MDCR_EL3.NSTBE == 0b1: Reserved.
0b01	When MDCR_EL3.NSTBE == 0b0: Trace Buffer owning security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure and Realm state generate Trap exceptions to EL3. When MDCR_EL3.NSTBE == 0b1: Reserved.
0b10	When MDCR_EL3.NSTBE == 0b0: Trace Buffer owning security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3. When MDCR_EL3.NSTBE == 0b1: Trace Buffer owning security state is Realm state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure and Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.
0b11	When MDCR_EL3.NSTBE == 0b0: Trace Buffer owning security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 in Secure and Realm state generate Trap exceptions to EL3. When MDCR_EL3.NSTBE == 0b1: Trace Buffer owning security state is Realm state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure and Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure and Secure state generate Trap exceptions to EL3.

The Trace Buffer control registers trapped by this control are: [TRBBASER_EL1](#), [TRBLIMITR_EL1](#), [TRBMAR_EL1](#), [TRBPTR_EL1](#), [TRBSR_EL1](#), and [TRBTRG_EL1](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_TRBE is implemented and FEAT_RME is not implemented:

Non-secure Trace Buffer. Controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.

NSTB	Meaning
0b00	Trace Buffer owning security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.
0b01	Trace Buffer owning security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.
0b10	Trace Buffer owning security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3.
0b11	Trace Buffer owning security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.

The Trace Buffer control registers trapped by this control are: [TRBBASER_EL1](#), [TRBLIMITR_EL1](#), [TRBMAR_EL1](#), [TRBPTR_EL1](#), [TRBSR_EL1](#), and [TRBTRG_EL1](#).

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 1, then the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 0b01.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

Secure Cycle Counter Disable. Prohibits [PMCCNTR_EL0](#) from counting in Secure state.

SCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited in Secure state.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

ETAD, bit [22]

When FEAT_RME is implemented, external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable. Together with MDCR_EL3.ETADE, controls access to PE Trace Unit registers by an external debugger.

ETADE	ETAD	Meaning
0b0	0b0	Access to PE Trace Unit registers by an external debugger is permitted.
0b0	0b1	Root and Secure access to PE Trace Unit registers by an external debugger is permitted. Realm and Non-secure access to PE Trace Unit registers by an external debugger is not permitted.
0b1	0b0	Root and Realm access to PE Trace Unit registers by an external debugger is permitted. Secure and Non-secure access to PE Trace Unit registers by an external debugger is not permitted.
0b1	0b1	Root access to PE Trace Unit registers by an external debugger is permitted. Secure, Non-secure, and Realm access to PE Trace Unit registers by an external debugger is not permitted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

When external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable. Controls Non-secure access to PE Trace Unit registers by an external debugger.

ETAD	Meaning
0b0	Non-secure accesses from an external debugger to PE Trace Unit are allowed.
0b1	Non-secure accesses from an external debugger to some PE Trace Unit registers are prohibited. See individual registers for the effect of this field.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EPMADE, bit [21]

When FEAT_RME is implemented, FEAT_PMUV3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

External Performance Monitors Access Disable. Together with MDCR_EL3.EPMADE, controls access to Performance Monitor registers by an external debugger.

EPMADE	EPMAD	Meaning
0b0	0b0	Access to Performance Monitor registers by an external debugger is permitted.
0b0	0b1	Root and Secure access to Performance Monitor registers by an external debugger is permitted. Realm and Non-secure access to Performance Monitor registers by an external debugger is not permitted.
0b1	0b0	Root and Realm access to Performance Monitor registers by an external debugger is permitted. Secure and Non-secure access to Performance Monitor registers by an external debugger is not permitted.
0b1	0b1	Root access to Performance Monitor registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Performance Monitor registers by an external debugger is not permitted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_Debugv8p4 is implemented, FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

External Performance Monitors Non-secure Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

EPMAD	Meaning
0b0	Non-secure access to Performance Monitor registers from external debugger is permitted.
0b1	Non-secure access to Performance Monitor registers from external debugger is not permitted.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

EPMAD	Meaning
0b0	Access to Performance Monitor registers from external debugger is permitted.
0b1	Access to Performance Monitor registers from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EDAD, bit [20]**When FEAT_RME is implemented:**

External Debug Access Disable. Together with MDCR_EL3.EDADE, controls access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) by an external debugger.

EDADE	EDAD	Meaning
0b0	0b0	Access to Debug registers by an external debugger is permitted.
0b0	0b1	Root and Secure access to Debug registers by an external debugger is permitted. Realm and Non-secure access to Debug registers by an external debugger is not permitted.
0b1	0b0	Root and Realm access to Debug registers by an external debugger is permitted. Secure and Non-secure access to Debug registers by an external debugger is not permitted.
0b1	0b1	Root access to Debug registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Debug registers by an external debugger is not permitted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_Debugv8p4 is implemented:

External Debug Non-secure Access Disable. Controls Non-secure access to breakpoint, watchpoint, and [OSLAR_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Non-secure access to debug registers from external debugger is permitted.
0b1	Non-secure access to breakpoint and watchpoint registers, and OSLAR_EL1 from external debugger is not permitted.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable. Controls access to breakpoint, watchpoint, and [OSLAR_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers, and to OSLAR_EL1 from external debugger is permitted.
0b1	Access to breakpoint and watchpoint registers, and to OSLAR_EL1 from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

External Debug Access disable. Controls access to breakpoint, watchpoint, and optionally [OSLAR_EL1](#) registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers from external debugger is permitted.
0b1	Access to breakpoint and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

TTRF, bit [19]**When FEAT_TRF is implemented:**

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

The Trace Filter registers trapped by this control are:

- [TRFCR_EL2](#), TRFCR_EL12, [TRFCR_EL1](#), reported using EC syndrome value 0x18.
- [HTRFCR](#) and [TRFCR](#), reported using EC syndrome value 0x03.

TTRF	Meaning
0b0	Accesses to Trace Filter registers at EL2 and EL1 are not affected by this bit.
0b1	Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception.

Otherwise:

Reserved, RES0.

STE, bit [18]**When FEAT_TRF is implemented:**

Secure Trace enable. Enables tracing in Secure state.

STE	Meaning
0b0	Trace prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Secure state is not affected by this bit.

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, the Effective value of this bit is 0b1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SPME, bit [17]

When FEAT_PMUv3 is implemented and FEAT_PMUv3p7 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state and EL3.

SPME	Meaning
0b0	When MDCR_EL3.MPMX == 0: Event counting is prohibited in Secure state. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.
0b1	When MDCR_EL3.MPMX == 0: Event counting and PMCCNTR_EL0 are not affected by this mechanism.

When MDCR_EL3.MPMX is 0, this field affects the operation of all event counters in Secure state, and if [PMCR_EL0.DP](#) is 1, the operation of [PMCCNTR_EL0](#) in Secure state.

When MDCR_EL3.MPMX is 1, this field affects the operation of event counters at EL3 only, and if [PMCR_EL0.DP](#) is 1, the operation of [PMCCNTR_EL0](#) at EL3 only. See MDCR_EL3.MPMX for more information.

When [PMCR_EL0.DP](#) is 0, [PMCCNTR_EL0](#) is not affected by this field.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
0b0	Event counting is prohibited in Secure state. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.
0b1	Event counting and PMCCNTR_EL0 are not affected by this mechanism.

This field affects the operation of all event counters in Secure state, and if [PMCR_EL0.DP](#) is 1, the operation of [PMCCNTR_EL0](#) in Secure state. When [PMCR_EL0.DP](#) is 0, [PMCCNTR_EL0](#) is not affected by this field.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
0b0	If ExternalSecureNoninvasiveDebugEnabled() is FALSE, event counting is prohibited in Secure state, and if PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state.
0b1	Event counting and PMCCNTR_EL0 are not affected by this mechanism.

If ExternalSecureNoninvasiveDebugEnabled() is TRUE, the event counters and [PMCCNTR_EL0](#) are not affected by this field.

Otherwise, this field affects the operation of all event counters in Secure state, and if [PMCR_EL0](#).DP is 1, the operation of [PMCCNTR_EL0](#) in Secure state. When [PMCR_EL0](#).DP is 0, [PMCCNTR_EL0](#) is not affected by this field.

If EL3 is not implemented and the Effective value of [SCR_EL3](#).NS is 0, then the Effective value of this field is 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SDD, bit [16]

AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

SDD	Meaning
0b0	Debug exceptions in Secure state are not affected by this bit.
0b1	Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of [SCR_EL3](#).RW is 0b1.

If Secure EL2 is implemented and enabled, and Secure EL1 is using AArch32, then:

- If debug exceptions from Secure EL1 are enabled, debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of [SDER32_EL3](#).SUIDEN is 0b1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SPD32, bits [15:14]

When EL1 is capable of using AArch32:

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

SPD32	Meaning
0b00	Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.
0b10	Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.
0b11	Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored unless both of the following are true:

- The PE is in Secure state.

- The Effective value of [SCR_EL3.RW](#) is 0b0.

If Secure EL1 is using AArch32, then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of [SDER32_EL3.SUIDEN](#) is 0b1.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this field is 0b11.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSPB, bits [13:12]

When FEAT_SPE is implemented and FEAT_RME is implemented:

Non-secure Profiling Buffer. Together with MDCR_EL3.NSPBE, controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

NSPB	Meaning
0b00	When MDCR_EL3.NSPBE == 0b0: Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in all Security states generate Trap exceptions to EL3. When MDCR_EL3.NSPBE == 0b1: Reserved.
0b01	When MDCR_EL3.NSPBE == 0b0: Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Realm states generate Trap exceptions to EL3. When MDCR_EL3.NSPBE == 0b1: Reserved.
0b10	When MDCR_EL3.NSPBE == 0b0: Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in all Security states generate Trap exceptions to EL3. When MDCR_EL3.NSPBE == 0b1: Profiling Buffer uses Realm Virtual Addresses. Statistical Profiling enabled in Realm state and disabled in Non-secure and Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in all Security states generate Trap exceptions to EL3.
0b11	When MDCR_EL3.NSPBE == 0b0: Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure and Realm states generate Trap exceptions to EL3. When MDCR_EL3.NSPBE == 0b1: Profiling Buffer uses Realm Virtual Addresses. Statistical Profiling enabled in Realm state and disabled in Non-secure and Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Secure states generate Trap exceptions to EL3.

The Statistical Profiling and Profiling Buffer control registers trapped by this control are:

- [PMBLIMITR_EL1](#), [PMBPTR_EL1](#), [PMBSR_EL1](#), [PMSCR_EL1](#), [PMSCR_EL2](#), [PMSCR_EL12](#), [PMSEVFR_EL1](#), [PMSFCR_EL1](#), [PMSICR_EL1](#), [PMSIDR_EL1](#), [PMSIRR_EL1](#), and [PMSLATFR_EL1](#).
- If FEAT_SPEv1p2 is implemented, [PMSNEVER_EL1](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SPE is implemented and FEAT_RME is not implemented:

Non-secure Profiling Buffer. Controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

NSPB	Meaning
0b00	Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Secure states generate Trap exceptions to EL3.
0b01	Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.
0b10	Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Secure states generate Trap exceptions to EL3.
0b11	Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.

The Statistical Profiling and Profiling Buffer control registers trapped by this control are:

- [PMBLIMITR_EL1](#), [PMBPTR_EL1](#), [PMBSR_EL1](#), [PMSCR_EL1](#), [PMSCR_EL2](#), [PMSCR_EL12](#), [PMSEVFR_EL1](#), [PMSFCR_EL1](#), [PMSICR_EL1](#), [PMSIDR_EL1](#), [PMSIRR_EL1](#), and [PMSLATFR_EL1](#).
- If FEAT_SPEv1p2 is implemented, [PMSNEVER_EL1](#).

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 1, then the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 0b01.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSPBE, bit [11]

When FEAT_RME is implemented:

Non-secure Profiling Buffer Extended. Together with MDCR_EL3.NSPB, controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

For a description of the values derived by evaluating NSPB and NSPBE together, see MDCR_EL3.NSPB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDOSA, bit [10]**When FEAT_DoubleLock is implemented:**

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:

- Accesses from AArch64 state, [OSLAR_EL1](#), [OSLSR_EL1](#), [OSDLR_EL1](#), [DBGPRCR_EL1](#), and any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit, are trapped to EL3 and reported using EC syndrome value 0x18.
- Accesses using MCR or MRC to [DBGOSLAR](#), [DBGOSLSR](#), [DBGOSDLR](#), and [DBGPRCR](#), are trapped to EL3 and reported using EC syndrome value 0x05.
- Accesses to any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA .

Note

The powerdown debug registers are not accessible at EL0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:

- AArch64: [OSLAR_EL1](#), [OSLSR_EL1](#), and [DBGPRCR_EL1](#).
- AArch32: [DBGOSLAR](#), [DBGOSLSR](#), and [DBGPRCR](#).
- AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- It is IMPLEMENTATION DEFINED whether accesses to [OSDLR_EL1](#) and [DBGOSDLR](#) are trapped.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA .

Note

The powerdown debug registers are not accessible at EL0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the MDCR_EL3.TDOSA field.

Accesses to the debug registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported using EC syndrome value 0x18:
 - [DBGBVR<n>_EL1](#), [DBGBCR<n>_EL1](#), [DBGWVR<n>_EL1](#), [DBGWCR<n>_EL1](#), [DBGCLAIMSET_EL1](#), [DBGCLAIMCLR_EL1](#), [DBGAUTHSTATUS_EL1](#), [DBGVCR32_EL2](#).
 - AArch64: [MDCR_EL2](#), [MDRAR_EL1](#), [MDCCSR_EL0](#), [MDCCINT_EL1](#), [MDSCR_EL1](#), [OSDTRRX_EL1](#), [OSDTRTX_EL1](#), [OSECCR_EL1](#).
- In AArch32 state, [SDER](#) is trapped to EL3 and reported using EC syndrome value 0x03.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x05, accesses using MCRR or MRRC are reported using EC syndrome value 0x0C:
 - [HDCR](#), [DBGDRAR](#), [DBGDSAR](#), [DBGDIDR](#), [DBGDCCINT](#), [DBGWFAR](#), [DBGVCR](#), [DBGBVR<n>](#), [DBGBCR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#).
 - [DBGCLAIMSET](#), [DBGCLAIMCLR](#), [DBGAUTHSTATUS](#), [DBGDEVID](#), [DBGDEVID1](#), [DBGDEVID2](#), [DBGOSECCR](#).
- In AArch32 state, STC accesses to [DBGDTRRXint](#) and LDC accesses to [DBGDTRTXint](#) are reported using EC syndrome value 0x06.
- When not in Debug state, the following registers are also trapped to EL3:
 - AArch64 accesses to [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#), reported using EC syndrome value 0x18.
 - AArch32 accesses using MCR or MRC to [DBGDTRRXint](#) and [DBGDTRTXint](#), reported using EC syndrome value 0x05.

TDA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by MDCR_EL3.TDOSA, are trapped to EL3, from any Security state and both Execution states, unless it is trapped by DBGDSCRExt .UDCCdis, MDSCR_EL1 .TDCC, HDCR .TDA or MDCR_EL2 .TDA.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:7]

Reserved, RES0.

TPM, bit [6]

When FEAT_PMUv3 is implemented:

Trap Performance Monitor register accesses. Accesses to all Performance Monitor registers from EL0, EL1, and EL2 to EL3, from any Security state and both Execution states are trapped as follows:

- In AArch64 state, accesses to the following registers are trapped to EL3 and are reported using EC syndrome value 0x18:
 - [PMCR_EL0](#), [PMCNTENSET_EL0](#), [PMCNTENCLR_EL0](#), [PMOVSLR_EL0](#), [PMSWINC_EL0](#), [PMSELR_EL0](#), [PMCEID0_EL0](#), [PMCEID1_EL0](#), [PMCCNTR_EL0](#), [PMXEVTYPER_EL0](#), [PMXEVCNTR_EL0](#), [PMUSERENR_EL0](#), [PMINTENSET_EL1](#), [PMINTENCLR_EL1](#), [PMOVSET_EL0](#), [PMEVCNTR<n>_EL0](#), [PMEVTYPER<n>_EL0](#), [PMCCFILTR_EL0](#).
 - If FEAT_PMUv3p4 is implemented, [PMMIR_EL1](#).
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses using MCRR or MRRC are reported using EC syndrome value 0x04:
 - [PMCR](#), [PMCNTENSET](#), [PMCNTENCLR](#), [PMOVSR](#), [PMSWINC](#), [PMSELR](#), [PMCEID0](#), [PMCEID1](#), [PMCCNTR](#), [PMXEVTYPER](#), [PMXEVCNTR](#), [PMUSERENR](#), [PMINTENSET](#), [PMINTENCLR](#), [PMOVSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMCCFILTR](#).
 - If FEAT_PMUv3p1 is implemented, [PMCEID2](#), and [PMCEID3](#).
 - If FEAT_PMUv3p4 is implemented, [PMMIR](#).

TPM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2, EL1, and EL0 System register accesses to all Performance Monitor registers are trapped to EL3, unless it is trapped by HDCR .TPM or MDCR_EL2 .TPM.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

EDADE, bit [4]

When FEAT_RME is implemented:

External Debug Access Disable Extended. Together with MDCR_EL3.EDAD, controls access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) by an external debugger.

For a description of the values derived by evaluating EDAD and EDADE together, see MDCR_EL3.EDAD.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

ETADE, bit [3]

When FEAT_RME is implemented, external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable Extended. Together with MDCR_EL3.ETAD, controls access to PE Trace Unit registers by an external debugger.

For a description of the values derived by evaluating ETAD and ETADE together, see MDCR_EL3.ETAD.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EPMAD, bit [2]

When FEAT_RME is implemented, FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

External Performance Monitors Access Disable Extended. Together with MDCR_EL3.EPMAD, controls access to Performance Monitor registers by an external debugger.

For a description of the values derived by evaluating EPMAD and EPMAD together, see MDCR_EL3.EPMAD.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RTTE, bit [1]

When FEAT_RME is implemented and FEAT_TRF is implemented:

Root Trace enable. Enables tracing in Root state.

RTTE	Meaning
0b0	Trace prohibited in Root state, unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Root state is not affected by this bit.

This bit also controls the level of authentication that is required by an external debugger to enable external tracing.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RLTE, bit [0]

When FEAT_RME is implemented and FEAT_TRF is implemented:

Realm Trace enable. Enables tracing in Realm state.

RLTE	Meaning
0b0	Trace prohibited in Realm state, unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Realm state is not affected by this bit.

This bit also controls the level of authentication that is required by an external debugger to enable external tracing.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Accessing MDCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDCR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0011	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MDCR_EL3;

```

MSR MDCR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0011	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MDCR_EL3 = X[t];

```

MDRAR_EL1, Monitor Debug ROM Address Register

The MDRAR_EL1 characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

Configuration

AArch64 System register MDRAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register [DBGDRAR\[63:0\]](#).

Attributes

MDRAR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0												ROMADDR																					
ROMADDR																				RES0												Valid	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

Bits [63:52]

Reserved, RES0.

ROMADDR, bits [51:12]

ROMADDR encoding when FEAT_LPA is implemented

39	38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ROMADDR																																							

ROMADDR, bits [39:0]

The ROM table physical address.

Bits [11:0] of the ROM table physical address are defined to be zero.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

If MDRAR_EL1.Valid == 0b00, then this field is UNKNOWN.

The upper part of the address value.

If the physical address size in bits (PAsize) is less than 52, then the register bits corresponding to ROMADDR [39:PAsize] are RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ROMADDR encoding when FEAT_LPA is not implemented or AArch32 is supported at EL0any Exception level

39	38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
RES0				ROMADDR																																					

Bits [39:36]

Reserved, RES0.

ROMADDR, bits [35:0]

The ROM table physical address.

Bits [11:0] of the ROM table physical address are defined to be zero.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

If MDRAR_EL1.Valid == 0b00, then this field is UNKNOWN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid.

Valid	Meaning
0b00	ROM Table address is not valid. Software must ignore ROMADDR.
0b11	ROM Table address is valid.

Other values are reserved.

Arm recommends implementations set this field to zero.

Accessing MDRAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDRAR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elsif EL2Enabled() && MDCR_EL2.<TDE,TDRA> != '00' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif HaveEL(EL3) && MDCR_EL3.TDA == '1' then

MDSCR_EL1, Monitor Debug System Control Register

The MDSCR_EL1 characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

AArch64 System register MDSCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGDSCRExt\[31:0\]](#).

AArch64 System register MDSCR_EL1 bit [15] is architecturally mapped to AArch32 System register [DBGDSCRint\[15\]](#).

AArch64 System register MDSCR_EL1 bit [12] is architecturally mapped to AArch32 System register [DBGDSCRint\[12\]](#).

AArch64 System register MDSCR_EL1 bits [5:2] are architecturally mapped to AArch32 System register [DBGDSCRint\[5:2\]](#).

Attributes

MDSCR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
TFO	RXfull	TXfull	RES0	RXOT	TXU	RES0	INTdis	TD	RES0	SC2	RAZ/WI	MDE	HDE	KDE	TDCC	RES0	ERR	RES0	SS												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

TFO, bit [31]

When FEAT_TRF is implemented:

Trace Filter override. Used for save/restore of [EDSCR.TFO](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.TFO](#). Reads and writes of this bit are indirect accesses to [EDSCR.TFO](#).

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

Used for save/restore of [EDSCR.RXfull](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.RXfull](#). Reads and writes of this bit are indirect accesses to [EDSCR.RXfull](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is **RO**.

TXfull, bit [29]

Used for save/restore of [EDSCR.TXfull](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.TXfull](#). Reads and writes of this bit are indirect accesses to [EDSCR.TXfull](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is **RO**.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of [EDSCR.RXO](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.RXO](#). Reads and writes of this bit are indirect accesses to [EDSCR.RXO](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is **RO**.

TXU, bit [26]

Used for save/restore of [EDSCR.TXU](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.TXU](#). Reads and writes of this bit are indirect accesses to [EDSCR.TXU](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Bits [25:24]

Reserved, RES0.

INTdis, bits [23:22]

Used for save/restore of [EDSCR](#).INTdis.

When [OSLSR_EL1](#).OSLK == 0, and software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this field holds the value of [EDSCR](#).INTdis. Reads and writes of this field are indirect accesses to [EDSCR](#).INTdis.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

TDA, bit [21]

Used for save/restore of [EDSCR](#).TDA.

When [OSLSR_EL1](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this bit holds the value of [EDSCR](#).TDA. Reads and writes of this bit are indirect accesses to [EDSCR](#).TDA.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Bit [20]

Reserved, RES0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented and FEAT_PCSRv8p2 is not implemented:

Used for save/restore of [EDSCR](#).SC2.

When [OSLSR_EL1](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this bit holds the value of [EDSCR](#).SC2. Reads and writes of this bit are indirect accesses to [EDSCR](#).SC2.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [18:16]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

MDE, bit [15]

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

MDE	Meaning
0b0	Breakpoint, Watchpoint, and Vector Catch exceptions disabled.
0b1	Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HDE, bit [14]

Used for save/restore of [EDSCR.HDE](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.HDE](#). Reads and writes of this bit are indirect accesses to [EDSCR.HDE](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is **RO**.

KDE, bit [13]

Local (kernel) debug enable. If EL_D is using AArch64, enable debug exceptions within EL_D . Permitted values are:

KDE	Meaning
0b0	Debug exceptions, other than Breakpoint Instruction exceptions, disabled within EL_D .
0b1	All debug exceptions enabled within EL_D .

RES0 if EL_D is using AArch32.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDCC, bit [12]

Traps EL_0 accesses to the Debug Communication Channel (DCC) registers to EL_1 , or to EL_2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from both Execution states, as follows:

- In AArch64 state, MRS or MSR accesses to the following DCC registers are trapped, reported using EC syndrome value 0x18:
 - [MDCCSR_EL0](#).
 - If not in Debug state, [DBGDTR_EL0](#), [DBGDTRTX_EL0](#), and [DBGDTRRX_EL0](#).

- In AArch32 state, MRC or MCR accesses to the following registers are trapped, reported using EC syndrome value 0x05.
 - [DBGDSCRint](#), [DBGDIDR](#), [DBGDSAR](#), [DBGDRAR](#).
 - If not in Debug state, [DBGDTRRXint](#), and [DBGDTRTXint](#).
- In AArch32 state, LDC access to [DBGDTRRXint](#) and STC access to [DBGDTRTXint](#) are trapped, reported using EC syndrome value 0x06.
- In AArch32 state, MRRC accesses to [DBGDSAR](#) and [DBGDRAR](#) are trapped, reported using EC syndrome value 0x0C.

TDCC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 using AArch64: EL0 accesses to the AArch64 DCC registers are trapped. EL0 using AArch32: EL0 accesses to the AArch32 DCC registers are trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of [EDSCR](#).ERR.

When [OSLSR_EL1](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this bit holds the value of [EDSCR](#).ERR. Reads and writes of this bit are indirect accesses to [EDSCR](#).ERR.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1](#).OSLK == 1, access to this field is **RW**.
- When [OSLSR_EL1](#).OSLK == 0, access to this field is **RO**.

Bits [5:1]

Reserved, RES0.

SS, bit [0]

Software step control bit. If EL_D is using AArch64, enable Software step. Permitted values are:

SS	Meaning
0b0	Software step disabled
0b1	Software step enabled.

RES0 if EL_D is using AArch32.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MDSCR_EL1

Individual fields within this register might have restricted accessibility when [OSLSR_EL1](#).OSLK == 0 (the OS lock is unlocked). See the field descriptions for more detail.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDSCR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0010	0b010

MPAM1_EL1, MPAM1 Register (EL1)

The MPAM1_EL1 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL1.

When EL2 is implemented and enabled in the current Security state, the MPAM virtualization option is present, [MPAMHCR_EL2.GSTAPP_PLK](#) == 1 and [HCR_EL2.TGE](#) == 0, MPAM1_EL1 is used instead of [MPAM0_EL1](#) to generate MPAM labels for memory requests when executing at EL0.

MPAM1_EL1 is an alias for [MPAM2_EL2](#) when executing at EL2 with [HCR_EL2.E2H](#) == 1.

MPAM1_EL12 is an alias for MPAM1_EL1 when executing at EL2 or EL3 with [HCR_EL2.E2H](#) == 1.

If EL2 is implemented and enabled in the current Security state, the MPAM virtualization option is present and [MPAMHCR_EL2.EL1_VPMEN](#) == 1, MPAM PARTIDs in MPAM1_EL1 are virtual and mapped into physical PARTIDs for the current Security state. This mapping of MPAM1_EL1 virtual PARTIDs to physical PARTIDs when EL1_VPMEN is 1 also applies when MPAM1_EL1 is used at EL0 due to [MPAMHCR_EL2.GSTAPP_PLK](#).

Configuration

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register [MPAM3_EL3\[63\]](#) when EL3 is implemented.

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register [MPAM2_EL2\[63\]](#) when EL3 is not implemented and EL2 is implemented.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM1_EL1 are UNDEFINED.

Attributes

MPAM1_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
MPAMEN	RES0	FORCED_NS	RES0	ALTSP_FRCD	RES0				PMG_D				PMG_I																		
PARTID_D																PARTID_I															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

If neither EL3 nor EL2 is implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write bit [MPAM3_EL3.MPAMEN](#).

If EL3 is not implemented and EL2 is implemented, this field is read-only and reads the current value of the read/write bit [MPAM2_EL2.MPAMEN](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- RW** if all of the following are true:
 - `!HaveEL(EL3 is not implemented)`
 - `!HaveEL(EL2 is not implemented)`
- Otherwise, access to this field is **RO**.

Bits [62:61]

Reserved, RES0.

FORCED_NS, bit [60]

When FEAT_MPAMv0p1 is implemented:

In the Secure state, FORCED_NS indicates the state of [MPAM3_EL3.FORCE_NS](#).

FORCED_NS	Meaning
0b0	In the Non-secure state, always reads as 0. In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 0.
0b1	In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 1.

Always reads as 0 in the Non-secure state.

Writes are ignored.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [59:55]

Reserved, RES0.

ALTSP_FRCD, bit [54]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Alternative PARTID forced for PARTIDs in this register.

ALTSP_FRCD	Meaning
0b0	The PARTIDs in MPAM1_EL1 and MPAM0_EL1 are using the primary PARTID space.
0b1	The PARTIDs in MPAM1_EL1 and MPAM0_EL1 are using the alternative PARTID space.

This bit indicates that a higher Exception level has forced the PARTIDs in this register to use the alternative PARTID space defined for the current Security state.

In MPAM1_EL1, it also indicates that [MPAM0_EL1](#) is forced to use alternative PARTID space.

For more information, see 'Alternative PARTID spaces and selection' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598).

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [53:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group property for PARTID_I.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM1_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, accesses from EL3 using the mnemonic MPAM1_EL1 or MPAM1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAM1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0101	0b000

MPAM2_EL2, MPAM2 Register (EL2)

The MPAM2_EL2 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL2.

Configuration

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register [MPAM3_EL3\[63\]](#) when EL3 is implemented.

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register [MPAM1_EL1\[63\]](#).

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAM2_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49
MPAMEN	RES0	TIDR	RES0	ALTSP_HFC	ALTSP_EL2	ALTSP_FRCD	RES0	En	MPAMSM	TRAPMPAMOEL1	TRAPMPAMOEL1	TRAPMPAMOEL1	TRAPMPAMOEL1	TRAPMPAMOEL1
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17
PARTID_D														

MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information from all Exception levels.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according to the MPAM configuration.

If EL3 is not implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write [MPAM3_EL3.MPAMEN](#) bit.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When EL3 is not implemented, access to this field is **RW**.
- Otherwise, access to this field is **RO**.

Bits [62:59]

Reserved, RES0.

TIDR, bit [58]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMIDR_EL1.HAS_TIDR == 1:

TIDR traps accesses to [MPAMIDR_EL1](#) from EL1 to EL2.

TIDR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Trap accesses to MPAMIDR_EL1 from EL1 to EL2.

[MPAMHCR_EL2](#).TRAP_MPAMIDR_EL1 == 1 also traps [MPAMIDR_EL1](#) accesses from EL1 to EL2. If either TIDR or TRAP_MPAMIDR_EL1 are 1, accesses are trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [57]

Reserved, RES0.

ALTSP_HFC, bit [56]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Hierarchical force of alternative PARTID space controls. When [MPAM3_EL3](#).ALTSP_HEN is 0, ALTSP controls in MPAM2_EL2 have no effect. When MPAM3_EL3.ALTSP_HEN is 1, this bit selects whether the PARTIDs in [MPAM1_EL1](#) and [MPAM0_EL1](#) are in the primary (0) or alternative (1) PARTID space for the security state.

ALTSP_HFC	Meaning
0b0	When MPAM3_EL3 .ALTSP_HEN is 1, the PARTID space of MPAM1_EL1 .PARTID_I, MPAM1_EL1 .PARTID_D, MPAM0_EL1 .PARTID_I, and MPAM0_EL1 .PARTID_D are in the primary PARTID space for the Security state.
0b1	When MPAM3_EL3 .ALTSP_HEN is 1, the PARTID space of MPAM1_EL1 .PARTID_I, MPAM1_EL1 .PARTID_D, MPAM0_EL1 .PARTID_I, and MPAM0_EL1 .PARTID_D are in the alternative PARTID space for the Security state.

This control has no effect when [MPAM3_EL3](#).ALTSP_HEN is 0.

For more information, see 'Alternative PARTID spaces and selection' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_EL2, bit [55]**When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:**

Select alternative PARTID space for PARTIDs in MPAM2_EL2 when [MPAM3_EL3.ALTSP_HEN](#) is 1.

ALTSP_EL2	Meaning
0b0	When MPAM3_EL3.ALTSP_HEN is 1, selects the primary PARTID space for MPAM2_EL2.PARTID_I and MPAM2_EL2.PARTID_D.
0b1	When MPAM3_EL3.ALTSP_HEN is 1, selects the alternative PARTID space for MPAM2_EL2.PARTID_I and MPAM2_EL2.PARTID_D.

For more information, see 'Alternative PARTID spaces and selection' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_FRCD, bit [54]**When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:**

Alternative PARTID forced for PARTIDs in this register.

ALTSP_FRCD	Meaning
0b0	The PARTIDs in this register are using the primary PARTID space.
0b1	The PARTIDs in this register are using the alternative PARTID space.

This bit indicates that a higher Exception level has forced the PARTIDs in this register to use the alternative PARTID space defined for the current Security state. In EL2, it is also 1 when MPAM2_EL2.ALTSP_EL2 is 1.

For more information, see 'Alternative PARTID spaces and selection' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [53:5150]

Reserved, RES0.

EnMPAMSM, bit [50]**When FEAT_SME is implemented:**

Traps execution at EL1 of instructions that directly access the [MPAMSM_EL1](#) register to EL2. The exception is reported using ESR_ELx.EC value 0x18.

EnMPAMSM	Meaning
0b0	This control causes execution of these instructions at EL1 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

This field has no effect on accesses to [MPAMSM_EL1](#) from EL2 or EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRAPMPAM0EL1, bit [49]

TRAPMPAM0EL1: Trap accesses from EL1 to the [MPAM0_EL1](#) register trap to EL2.

TRAPMPAM0EL1	Meaning
0b0	Accesses to MPAM0_EL1 from EL1 are not trapped.
0b1	Accesses to MPAM0_EL1 from EL1 are trapped to EL2.

The reset behaviour of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 1.
 - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

TRAPMPAM1EL1, bit [48]

TRAPMPAM1EL1: Trap accesses from EL1 to the [MPAM1_EL1](#) register trap to EL2.

TRAPMPAM1EL1	Meaning
0b0	Accesses to MPAM1_EL1 from EL1 are not trapped.
0b1	Accesses to MPAM1_EL1 from EL1 are trapped to EL2.

The reset behaviour of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 1.
 - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

PMG_D, bits [47:40]

Performance monitoring group for data accesses.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group for instruction accesses.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM2_EL2

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAM2_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0101	0b000

The reset behaviour of this field is:

- On a Warm reset, this field resets to 1.

SDEFLT, bit [61]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMIDR_EL1.HAS_SDEFLT == 1:

SDEFLT overrides the PARTID and PMG with the default PARTID and default PMG when executing in the Secure state.

SDEFLT	Meaning
0b0	The PARTID and PMG are determined normally in the Secure state.
0b1	When executing in the Secure state, the PARTID is always PARTID 0, and when the executing PMG is the always Secure PMG 0 state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FORCE_NS, bit [60]

When FEAT_MPAMv0p1 is implemented and MPAMIDR_EL1.HAS_FORCE_NS == 1:

FORCE_NS forces MPAM_NS to always be 1 in the Secure state.

FORCE_NS	Meaning
0b0	MPAM_NS is 0 when executing in the Secure state.
0b1	MPAM_NS is 1 when executing in the Secure state.

An implementation is permitted to have this field as RAO if the implementation does not support generating MPAM_NS as 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [59:58]

Reserved, RES0.

ALTSP_HEN, bit [57]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Hierarchical enable for alternative PARTID space controls. Alternative PARTID space controls in [MPAM2_EL2](#) have no effect when this field is zero.

ALTSP_HEN	Meaning
0b0	Disable alternative PARTID space controls in MPAM2_EL2 . The PARTID space for PARTIDs in MPAM2_EL2 , MPAM1_EL1 , and MPAM0_EL1 is selected by MPAM3_EL3.ALTSP_HFC.
0b1	Enable alternative PARTID space controls in MPAM2_EL2 to control the PARTID space used for PARTIDs in MPAM2_EL2 , MPAM1_EL1 , and MPAM0_EL1 .

For more information, see 'Alternative PARTID spaces and selection' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_HFC, bit [56]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Hierarchical force of alternative PARTID space controls. When MPAM3_EL3.ALTSP_HEN is 0, the PARTID space for PARTIDs in [MPAM2_EL2](#), [MPAM1_EL1](#), and [MPAM0_EL1](#) is selected by the value of this bit.

ALTSP_HFC	Meaning
0b0	When MPAM3_EL3.ALTSP_HEN is 0, the PARTID space of MPAM2_EL2 .PARTID, MPAM1_EL1 .PARTID and MPAM0_EL1 .PARTID are the primary PARTID space for the security state.
0b1	When MPAM3_EL3.ALTSP_HEN is 0, the PARTID space of MPAM2_EL2 .PARTID and MPAM1_EL1 .PARTID and MPAM0_EL1 .PARTID are the alternative PARTID space for the security state.

For more information, see 'Alternative PARTID spaces and selection' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_EL3, bit [55]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Select alternative PARTID space for PARTIDs in MPAM3_EL3.

ALTSP_EL3	Meaning
0b0	Selects the primary PARTID space of MPAM3_EL3 .PARTID_I and MPAM3_EL3.PARTID_D.
0b1	Selects the alternative PARTID space of MPAM3_EL3 .PARTID_I and MPAM3_EL3.PARTID_D.

For more information, see 'Alternative PARTID spaces and selection' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [54:53]

Reserved, RES0.

RT_ALTSP_NS, bit [52]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Alternative PARTID space selection for the Root security state.

RT_ALTSP_NS	Meaning
0b0	The alternative PARTID space in the Root security state is the Secure PARTID space.
0b1	The alternative PARTID space in the Root security state is the Non-secure PARTID space.

This field has no effect except in the Root security state (EL3).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [51:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group for data accesses.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group for instruction accesses.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The reset behaviour of this field is:

- ## Accessing MPAM3_EL3

Accesses to this register use the following encodings in the System register encoding space:

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b000

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b000

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMIDR_EL1, MPAM ID Register (EL1)

The MPAMIDR_EL1 characteristics are:

Purpose

Indicates the presence and maximum PARTID and PMG values supported in the implementation. It also indicates whether the implementation supports MPAM virtualization.

Configuration

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMIDR_EL1 are UNDEFINED.

Attributes

MPAMIDR_EL1 is a 64-bit register.

Field descriptions

63 62		61		60		59		58		57		56		55		54		53		52		51		50		49		48		47		46		45		44		43		42		41		40		39		38					
RES0		HAS_SDEFLT		HAS_FORCE_NS		SP4		HAS_TIDR		HAS_ALTSP		RES0												P																													
RES0																											VPMR_MAX						HAS_HCR		RES0		PARTID_MA																
31 30		29		28		27		26		25		24		23		22		21		20		19		18		17		16		15		14		13		12		11		10		9		8		7		6					

MPAMIDR_EL1 indicates the MPAM implementation parameters of the PE.

Bits [63:62]

Reserved, RES0.

HAS_SDEFLT, bit [61]

HAS_SDEFLT indicates support for [MPAM3_EL3](#).SDEFLT bit. Defined values are:

HAS_SDEFLT	Meaning
0b0	The SDEFLT bit is not implemented in MPAM3_EL3 .
0b1	The SDEFLT bit is implemented in MPAM3_EL3 .

When [MPAM3_EL3](#).SDEFLT == 1, accesses from the Secure Execution state use the default PARTID, PARTID == 0.

HAS_FORCE_NS, bit [60]

HAS_FORCE_NS indicates support for [MPAM3_EL3](#).FORCE_NS bit. Defined values are:

HAS_FORCE_NS	Meaning
0b0	The FORCE_NS bit is not implemented in MPAM3_EL3 .
0b1	The FORCE_NS bit is implemented in MPAM3_EL3 .

When [MPAM3_EL3](#).FORCE_NS == 1, accesses from the Secure Execution state have MPAM_NS == 1.

SP4, bit [59]

Supports 4 MPAM PARTID spaces.

SP4	Meaning
0b0	MPAM supports 2 PARTID spaces.
0b1	MPAM supports 4 PARTID spaces.

HAS_TIDR, bit [58]

HAS_TIDR indicates support for [MPAM2_EL2.TIDR](#) bit. Defined values are:

HAS_TIDR	Meaning
0b0	The TIDR bit is not implemented in MPAM2_EL2 .
0b1	The TIDR bit is implemented in MPAM2_EL2 .

Note

Arm recommends that when the MPAM version is MPAM v0.1 or MPAM v1.1, MPAMIDR_EL1.HAS_TIDR is 1 and that the MPAM2_EL2.TIDR field is implemented.

HAS_ALTSP, bit [57]

HAS_ALTSP indicates support for alternative PARTID spaces.

HAS_ALTSP	Meaning
0b0	Alternative PARTID spaces are not implemented.
0b1	Alternative PARTID spaces are implemented with control bits in MPAM3_EL3 and MPAM2_EL2 .

Bits [56:40]

Reserved, RES0.

PMG_MAX, bits [39:32]

The largest value of PMG that the implementation can generate. The PMG_I and PMG_D fields of every MPAMn_ELx must implement at least enough bits to represent PMG_MAX.

Bits [31:21]

Reserved, RES0.

VPMR_MAX, bits [20:18]

When MPAMIDR_EL1.HAS_HCR == 1:

Indicates the maximum register index n for the MPAMVPM<n>_EL2 registers.

Otherwise:

Reserved, RAZ.

HAS_HCR, bit [17]

HAS_HCR indicates that the PE implementation supports MPAM virtualization, including [MPAMHCR_EL2](#), [MPAMVPMV_EL2](#), and MPAMVPM<n>_EL2 with n in the range 0 to VPMR_MAX. Must be 0 if EL2 is not implemented in either Security state.

HAS_HCR	Meaning
0b0	MPAM virtualization is not supported.
0b1	MPAM virtualization is supported.

Bit [16]

Reserved, RES0.

PARTID_MAX, bits [15:0]

The largest value of PARTID that the implementation can generate. The PARTID_I and PARTID_D fields of every MPAMn_ELx must implement at least enough bits to represent PARTID_MAX.

Accessing MPAMIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAMIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b100

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if HaveEL(EL3) && MPAM3_EL3.TRAPLOWER == '1' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
        elsif EL2Enabled() && MPAMIDR_EL1.HAS_HCR == '1' && MPAMHCR_EL2.TRAP_MPAMIDR_EL1 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() && MPAMIDR_EL1.HAS_TIDR == '1' && MPAM2_EL2.TIDR == '1' then

MPAMSM_EL1, MPAM Streaming Mode Register

The MPAMSM_EL1 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests issued by SME, SVE, and SIMD&FP load and store instructions when the PE is in Streaming SVE mode. For those requests, the MPAM labels in this register have precedence over the labels in [MPAM0_EL1](#), [MPAM1_EL1](#), [MPAM2_EL2](#), and [MPAM3_EL3](#).

It is IMPLEMENTATION DEFINED whether the MPAM labels in this register are used for memory requests due to hardware page table walks and page table updates performed as a result of SME, SVE, and SIMD&FP load/store instructions, and SVE prefetch instructions, when the PE is in Streaming SVE mode.

For memory requests issued from EL0, the MPAM PARTID in this register is virtual and mapped into a physical PARTID when all of the following are true:

- EL2 is implemented and enabled in the current Security state, and [HCR_EL2](#).{E2H, TGE} != {1, 1}.
- The MPAM virtualization option is implemented and [MPAMHCR_EL2](#).EL0_VPMEN == 1.

For memory requests issued from EL1, the MPAM PARTID in this register is virtual and mapped into a physical PARTID when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The MPAM virtualization option is implemented and [MPAMHCR_EL2](#).EL1_VPMEN == 1.

Configuration

This register is present only when FEAT_MPAM is implemented and FEAT_SME is implemented. Otherwise, direct accesses to MPAMSM_EL1 are UNDEFINED.

Attributes

MPAMSM_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [39:32]

Reserved, RES0.

PARTID_D, bits [31:16]

Partition ID for data accesses due to the execution of SME, SVE, and SIMD&FP load and store instructions performed when the PE is in Streaming SVE mode, at any Exception level.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:0]

Reserved, RES0.

Accessing MPAMSM_EL1

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAMSM_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0101	0b011

```

MVFR0_EL1, AArch32 Media and VFP Feature Register 0

The MVFR0_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR1_EL1](#) and [MVFR2_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register MVFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MVFR0\[31:0\]](#).

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0** any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
FPRound				FPSHVec				FPSqrt				FPDivide				FPTrap				FPDP				FPSP				SIMDReg			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

FPRound	Meaning
0b0000	Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.
0b0001	All rounding modes supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

FPSHVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

FPSHVec	Meaning
0b0000	Short vectors not supported.
0b0001	Short vector operation supported.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

FPSqrt	Meaning
0b0000	Not supported in hardware.
0b0001	Supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

FPDivide	Meaning
0b0000	Not supported in hardware.
0b0001	Supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

FPTrap	Meaning
0b0000	Not supported.
0b0001	Supported.

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

FPDP, bits [11:8]

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:

FPDP	Meaning
0b0000	Not supported in hardware.
0b0001	Supported, VFPv2.
0b0010	Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.
- VDIV.F64 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

FPSP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

FPSP	Meaning
0b0000	Not supported in hardware.
0b0001	Supported, VFPv2.
0b0010	Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

SIMDReg	Meaning
0b0000	The implementation has no Advanced SIMD and floating-point support.
0b0001	The implementation includes floating-point support with 16 x 64-bit registers.
0b0010	The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MVFR1_EL1, AArch32 Media and VFP Feature Register 1

The MVFR1_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0_EL1](#) and [MVFR2_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register MVFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MVFR1\[31:0\]](#).

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0** any Exception level:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
SIMDFMAC				FPHP				SIMDHP				SIMDSP				SIMDInt				SIMDLS				FPDNaN				FPFtZ			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

SIMDFMAC	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

FPHP, bits [27:24]

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

FPHP	Meaning
0b0000	Not supported.
0b0001	Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds instructions for conversion between double-precision and half-precision.
0b0011	As for 0b0010, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- 0b0011 in an implementation with floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

Half Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

SIMDHP, bits [23:20]

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

SIMDHP	Meaning
0b0000	Not supported.
0b0001	SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0001 in an implementation with SIMD floating-point support that does not include the FEAT_FP16 extension.
- 0b0010 in an implementation with SIMD floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

Half Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

SIMDSP, bits [19:16]

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

SIMDSP	Meaning
0b0000	Not implemented.
0b0001	Implemented. This value is permitted only if the SIMDInt field is 0b0001.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SIMDInt, bits [15:12]

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

SIMDInt	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SIMDLS, bits [11:8]

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

SIMDLS	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

FPDNAN, bits [7:4]

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

FPDNAN	Meaning
0b0000	Not implemented, or hardware supports only the Default NaN mode.
0b0001	Hardware supports propagation of NaN values.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

FPFtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

FPFtZ	Meaning
0b0000	Not implemented, or hardware supports only the Flush-to-Zero mode of operation.
0b0001	Hardware supports full denormalized number arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

MVFR2_EL1, AArch32 Media and VFP Feature Register 2

The MVFR2_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0_EL1](#) and [MVFR1_EL1](#).

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register MVFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MVFR2\[31:0\]](#).

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR2_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0** ~~any Exception level~~:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																RES0								FPMisc				SIMDMisc

Bits [63:8]

Reserved, RES0.

FPMisc, bits [7:4]

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

FPMisc	Meaning
0b0000	Not implemented, or no support for miscellaneous features.
0b0001	Support for Floating-point selection.
0b0010	As 0b0001, and Floating-point Conversion to Integer with Directed Rounding modes.
0b0011	As 0b0010, and Floating-point Round to Integer Floating-point.
0b0100	As 0b0011, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0100.

SIMDMisc, bits [3:0]

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

SIMDMisc	Meaning
0b0000	Not implemented, or no support for miscellaneous features.
0b0001	Floating-point Conversion to Integer with Directed Rounding modes.
0b0010	As 0b0001, and Floating-point Round to Integer Floating-point.
0b0011	As 0b0010, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0011.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS Lock.

Configuration

AArch64 System register OSLAR_EL1 bits [31:0] are architecturally mapped to External register [OSLAR_EL1\[31:0\]](#).

The OS **Locklock** can also be locked or unlocked using **the AArch32 System register** [DBGOSLAR](#).

Attributes

OSLAR_EL1 is a 64-bit register.

Field descriptions

Bits [63:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use [OSLSR_EL1](#).OSLK to check the current status of the lock.

Accessing OSLAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MSR OSLAR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0000	0b100

```

The OLSR_EL1 characteristics are:

Purpose

Provides the status of the OS Lock.

Configuration

AArch64 System register OSLSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGOSLSR\[31:0\]](#).

Attributes

OSLSR_EL1 is a 64-bit register.

Field descriptions

Bits [63:4]

Reserved, RES0.

OSLM, bits [3, 0]

OS **Locklock** model implemented. Identifies the form of OS save and restore mechanism implemented.

OSLM	Meaning
0b00	OS Lock not implemented.
0b10	OS Lock implemented.

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is OLSR_EL1[3].
- OSLM[0] is OLSR_EL1[0].

nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

OSLK, bit [1]

OS Lock Status.

OSLK	Meaning
0b0	OS Lock unlocked.
0b1	OS Lock locked

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 1.

Accessing OSLSR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSLSR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0001	0b100

```

PMBIDR_EL1, Profiling Buffer ID Register

The PMBIDR_EL1 characteristics are:

Purpose

Provides information to software as to whether the buffer can be programmed at the current Exception level.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBIDR_EL1 are UNDEFINED.

Attributes

PMBIDR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																F		P		Align											
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:6]

Reserved, RES0.

F, bit [5]

Flag updates. Defines whether the address translation performed by the Profiling Buffer manages the Access Flag and dirty state. **Defined values are:**

F	Meaning
0b0	Hardware management of the Access Flag and dirty state for accesses made by the Statistical Profiling Extension is always disabled for all translation stages.
0b1	Hardware management for the Access Flag and dirty state for accesses made by the Statistical Profiling Extension is controlled in the same way as explicit memory accesses in the owning translation regime.

If hardware management of the Access Flag is disabled for a stage of translation, an access to Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

P, bit [4]

Programming not allowed. **When read at EL3, this field reads as zero. Otherwise, indicates that the Profiling Buffer is owned by a higher Exception level or another Security state. Defined values are:**

P	Meaning
0b0	Programming Profiling Buffer is allowed, owned by the current or a lower Exception level in the current Security state.
0b1	Programming Profiling Buffer not allowed, is owned by a higher Exception level or the other Security state.

The value read from this field depends on the current Exception level and the Effective values of [MDCR_EL3.NSPB](#), and [MDCR_EL3.NSPBE](#), and [MDCR_EL2.E2PB](#):

- If EL3 is implemented, and the owning Security state is Secure state, this field reads as one from:
 - Non-secure EL1 and Non-secure EL2.
 - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
 - If Secure EL2 is implemented and enabled, and [MDCR_EL2.E2PB](#) is 0b00, Secure EL1.
- If EL3 is implemented, and either [MDCR_EL3.NSPB](#) == 0b00 or [MDCR_EL3.NSPB](#) == 0b01, this bit reads as one from:
 - Non-secure EL1.
 - Non-secure EL2.
 - If Secure EL2 is implemented and enabled, and [MDCR_EL2.E2PB](#) == 0b00, Secure EL1.
- If EL3 is implemented, and the owning Security state is Non-secure state, this field reads as one from:
 - Secure EL1.
 - If Secure EL2 is implemented, Secure EL2.
 - If EL2 is implemented and [MDCR_EL2.E2PB](#) is 0b00, Non-secure EL1.
 - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
- If EL3 is implemented, and either [MDCR_EL3.NSPB](#) == 0b10 or [MDCR_EL3.NSPB](#) == 0b11, this bit reads as one from:
 - Secure EL1.
 - If Secure EL2 is implemented, Secure EL2.
 - If EL2 is implemented and [MDCR_EL2.E2PB](#) == 0b00, Non-secure EL1.
- If FEAT_RME is implemented, and the owning Security state is Realm state, this field reads as one from:
 - Non-secure EL1 and Non-secure EL2.
 - Secure EL1 and Secure EL2.
 - If [MDCR_EL2.E2PB](#) is 0b00, Realm EL1.
- If EL3 is not implemented, EL2 is implemented, and [MDCR_EL2.E2PB](#) == 0b00, this bit reads as one from EL1.
- Otherwise, EL3 this is bit not reads implemented, as EL2 is implemented, and zero. [MDCR_EL2.E2PB](#) is 0b00, this field reads as one from EL1.
- Otherwise, this field reads as zero.

Align, bits [3:0]

Defines the minimum alignment constraint for [PMBPTR_EL1](#). If this field is non-zero, then the PE must pad every record up to a multiple of this size. Defined values are:

Align	Meaning
0b0000	Byte
0b0001	Halfword.
0b0010	Word.
0b0011	Doubleword.
0b0100	16 Bytes.
0b0101	32 Bytes.
0b0110	64 Bytes.
0b0111	128 Bytes.
0b1000	256 Bytes.
0b1001	512 Bytes.
0b1010	1KB.
0b1011	2KB.

For more information, see 'Restrictions on the current write pointer'.

Accessing PMBIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBIDR_EL1

op0	op1	CRn	CRm	op2
-----	-----	-----	-----	-----

0b11	0b000	0b1001	0b1010	0b111
------	-------	--------	--------	-------

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HDFGRTR_EL2.PMBIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return PMBIDR_EL1;
elsif PSTATE.EL == EL2 then
    return PMBIDR_EL1;
elsif PSTATE.EL == EL3 then
    return PMBIDR_EL1;

```

PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR_EL0](#), increments.

Configuration

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCCFILTR\[31:0\]](#).

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to External register [PMCCFILTR_EL0\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are UNDEFINED.

Attributes

PMCCFILTR_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMCCFILTR_EL0.RLK bit.

P	Meaning
0b0	Count cycles in EL1.
0b1	Do not count cycles in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMCCFILTR_EL0.RLU bit.

U	Meaning
0b0	Count cycles in EL0.
0b1	Do not count cycles in EL0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMCCFILTR_EL0.RLH bit.

NSH	Meaning
0b0	Do not count cycles in EL2.
0b1	Count cycles in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]**When EL3 is implemented:**

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]**When FEAT_SEL2 is implemented and EL3 is implemented:**

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is disabled, this field is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

T, bit [23]**When FEAT_TME is implemented:**

Non-transactional state filtering bit.

T	Meaning
0b0	This bit has no effect on filtering of cycles.
0b1	Do not count cycles in Non-transactional state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, Bits bit [22:0]**When FEAT_RME is implemented:**

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Realm EL1 are counted.

Otherwise, cycles in Realm EL1 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]**When FEAT_RME is implemented:**

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Realm EL0 are counted.

Otherwise, cycles in Realm EL0 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]**When FEAT_RME is implemented:**

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Realm EL2 are counted.

Otherwise, cycles in Realm EL2 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0

PMCCFILTR_EL0 can also be accessed by using [PMXEVTYPER_EL0](#) with [PMSELR_EL0.SEL](#) set to 0b11111.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCCFILTR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b1111	0b111

PMCEID0_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0_EL0 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F.

For more information about the common events and the use of the PMCEID<n>_EL0 registers see 'The PMU event number space and common events'.

Configuration

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID0\[31:0\]](#).

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to AArch32 System register [PMCEID2\[31:0\]](#).

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to External register [PMCEID0\[31:0\]](#).

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to External register [PMCEID2\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0_EL0 are UNDEFINED.

Attributes

PMCEID0_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47
IDhi31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16	IDhi15
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15

IDhi<n>, bit [n+32], for n = 31 to 0

When FEAT_PMUv3p1 is implemented:

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:

IDhi<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

Note

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to common event n.

For each bit:

ID<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

Note

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Accessing PMCEID0_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCEID0_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b110

```

PMCEID1_EL0, Performance Monitors Common Event Identification register 1

The PMCEID1_EL0 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0020 to 0x003F and 0x4020 to 0x403F.

For more information about the common events and the use of the PMCEID<n>_EL0 registers see 'The PMU event number space and common events'.

Configuration

AArch64 System register PMCEID1_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID1\[31:0\]](#).

AArch64 System register PMCEID1_EL0 bits [63:32] are architecturally mapped to AArch32 System register [PMCEID3\[31:0\]](#).

AArch64 System register PMCEID1_EL0 bits [31:0] are architecturally mapped to External register [PMCEID1\[31:0\]](#).

AArch64 System register PMCEID1_EL0 bits [63:32] are architecturally mapped to External register [PMCEID3\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID1_EL0 are UNDEFINED.

Attributes

PMCEID1_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47
IDhi31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16	IDhi15
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15

IDhi<n>, bit [n+32], for n = 31 to 0

When FEAT_PMUv3p1 is implemented:

IDhi[n] corresponds to common event (0x4020 + n).

For each bit:

IDhi<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

Note

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to common event (0x0020 + n).

For each bit:

ID<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

Note

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Accessing PMCEID1_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCEID1_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b111

```

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

AArch64 System register PMCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCR\[31:0\]](#).

AArch64 System register PMCR_EL0 bits [7:0] are architecturally mapped to External register [PMCR_EL0\[7:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR_EL0 are UNDEFINED.

Attributes

PMCR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																																FZS
IMP								IDCODE								N				RES0	FZ0	RES0	LP	LC	DP	X	D	C	P	E		
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:33]

Reserved, RES0.

FZS, bit [32]

When FEAT_SPEv1p2 is implemented:

Freeze-on-SPE event. Stop counters when [PMBLIMITR_EL1](#).{PMFZ,E} == {1,1} and [PMBSR_EL1](#).S == 1.

FZS	Meaning
0b0	Do not freeze on Statistical Profiling Buffer Management event.
0b1	Event counters do not count following a Statistical Profiling Buffer Management event.

If EL2 is implemented, then:

- This field affects the operation of event counters in the range [0 .. ([MDCR_EL2](#).HPMN-1)].
- If [MDCR_EL2](#).HPMN is less than PMCR_EL0.N:
 - This field does not affect the operation of event counters in the range [[MDCR_EL2](#).HPMN .. (PMCR_EL0.N-1)].
- This applies even when EL2 is disabled in the current Security state.

This field does not affect the operation of [PMCCNTR_EL0](#).

The reset behaviour of this field is:

- On a Warm reset:
 - When AArch32 is supported at [EL0](#) any Exception level, this field resets to 0.

- When the implementation only supports execution in AArch64 state, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMP, bits [31:24]

When FEAT_PMUv3p7 is not implemented:

Implementer code.

If this field is zero, then PMCR_EL0.IDCODE is RES0 and software must use [MIDR_EL1](#) to identify the PE.

Otherwise, this field and PMCR_EL0.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as [MIDR_EL1](#).Implementer.

Use of this field is deprecated.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

IDCODE, bits [23:16]

When PMCR_EL0.IMP != 0x00:

Identification code. Use of this field is deprecated. This field has an IMPLEMENTATION DEFINED value.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of 0b000000-0b11111. If the value is 0b000000 then only [PMCCNTR_EL0](#) is implemented. If the value is 0b11111 [PMCCNTR_EL0](#) and 31 event counters are implemented.

When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the value of [MDCR_EL2](#).HPMN.

Access to this field is **RO**.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

FZO	Meaning
0b0	Do not freeze on overflow.
0b1	Event counters do not count when PMOVSCLR_EL0 [(N-1):0] is nonzero, where N is the value of MDCR_EL2 .HPMN if EL2 is implemented, and PMCR_EL0.N otherwise.

If EL2 is implemented, then:

- This field affects the operation of event counters in the range [0 .. ([MDCR_EL2](#).HPMN-1)].
- If [MDCR_EL2](#).HPMN is less than PMCR_EL0.N:
 - This field does not affect the operation of event counters in the range [[MDCR_EL2](#).HPMN .. (PMCR_EL0.N-1)].
 - The operation of this field ignores the values of [PMOVSCLR_EL0](#)[(PMCR_EL0.N-1):[MDCR_EL2](#).HPMN].
- This applies even when EL2 is disabled in the current Security state.

This field does not affect the operation of [PMCCNTR_EL0](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [63:0].

If EL2 is implemented and [MDCR_EL2](#).HPMN or [HDCR](#).HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [[HDCR](#).HPMN..(PMCR_EL0.N-1)] or [[MDCR_EL2](#).HPMN..(PMCR_EL0.N-1)].

Note

The effect of [MDCR_EL2](#).HPMN or [HDCR](#).HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of [MDCR_EL2](#).HPMN or [HDCR](#).HPMN.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LC, bit [6]**When AArch32 is supported at EL0any Exception level:**

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0 [31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0 [63:0].

Arm deprecates use of [PMCR_EL0](#).LC = 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]**When EL3 is implemented or (FEAT_PMuV3p1 is implemented and EL2 is implemented):**

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this bit.
0b1	When event counting for counters in the range [0..(MDCR_EL2 .HPMN-1)] is prohibited, cycle counting by PMCCNTR_EL0 is disabled.

For more information see 'Prohibiting event counting'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]**When the implementation includes a PMU event export bus:**

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

When AArch32 is supported at **EL0** any Exception level:

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR_EL0 counts every clock cycle.
0b1	When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR_EL0 to zero.

Note

Resetting [PMCCNTR_EL0](#) does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is **WO/RAZ**.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

P	Meaning
0b0	No action.
0b1	Reset all event counters accessible in the current Exception level, not including PMCCNTR_EL0 , to zero.

In EL0 and EL1:

- If EL2 is implemented and enabled in the current Security state, and [MDCR_EL2](#).HPMN is less than PMCR_EL0.N, a write of 1 to this bit does not reset event counters in the range [[MDCR_EL2](#).HPMN..(PMCR_EL0.N-1)].
- If EL2 is not implemented, EL2 is disabled in the current Security state, or [MDCR_EL2](#).HPMN equals PMCR_EL0.N, a write of 1 to this bit resets all the event counters.

In EL2 and EL3, a write of 1 to this bit resets all the event counters.

Note

Resetting the event counters does not change the event counter overflow bits. If FEAT_PMUv3p5 is implemented, the values of [MDCR_EL2.HLP](#) and [PMCR_EL0.LP](#) are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

E, bit [0]

Enable.

E	Meaning
0b0	All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0 , are disabled.
0b1	All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0 , are enabled by PMCNTENSET_EL0 .

If EL2 is implemented, then:

- If EL2 is using AArch32, PMN is [HDCR.HPMN](#).
- If EL2 is using AArch64, PMN is [MDCR_EL2.HPMN](#).
- If PMN is less than [PMCR_EL0.N](#), this bit does not affect the operation of event counters in the range [PMN..(PMCR_EL0.N-1)].

If EL2 is not implemented, PMN is [PMCR_EL0.N](#).

Note

The effect of [MDCR_EL2.HPMN](#) or [HDCR.HPMN](#) on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of [MDCR_EL2.HPMN](#) or [HDCR.HPMN](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMCR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCR_EL0

PMSIDR_EL1, Sampling Profiling ID Register

The PMSIDR_EL1 characteristics are:

Purpose

Describes the Statistical Profiling implementation to software

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSIDR_EL1 are UNDEFINED.

Attributes

PMSIDR_EL1 is a 64-bit register.

Field descriptions

Bits [63:25:24]

Reserved, RES0.

PBT, bit [24]

Previous branch target Address packet. Defined values are:

PBT	Meaning
0b0	Previous branch target Address packet not supported.
0b1	Previous branch target Address packet support implemented.

FEAT_SPEv1p2 adds the OPTIONAL functionality identified by the value 1.

Format, bits [23:20]

From Armv8.7:

Defines the format of the sample records. Defined values are:

Format	Meaning
0b0000	Format 0.

All other values are reserved.

Otherwise:

Reserved, RAZ.

CountSize, bits [19:16]

Defines the size of the counters. Defined values are:

CountSize	Meaning
0b0010	12-bit saturating counters.

All other values are reserved.

Reserved values might be defined in a future version of the architecture.

MaxSize, bits [15:12]

Defines the largest size for a single record, rounded up to a power-of-two. If this is the same as the minimum alignment (PMBIDR_EL1.Align), then each record is exactly this size. Defined values are:

MaxSize	Meaning
0b0100	16 bytes
0b0101	32 bytes
0b0110	64 bytes
0b0111	128 bytes
0b1000	256 bytes
0b1001	512 bytes
0b1010	1024 bytes
0b1011	2KB

All other values are reserved.

The Reserved values might be defined in a future version of the architecture. 0b0100 and 0b0101 are not permitted for an implementation.

Interval, bits [11:8]

Recommended minimum sampling interval. This provides guidance from the implementer to the smallest minimum sampling interval, N. Defined values are:

Interval	Meaning
0b0000	256
0b0001	512
0b0011	768
0b0100	1,024
0b0101	1,536
0b0110	2,048
0b0111	3,072
0b1000	4,096

All other values are reserved.

Reserved values might be defined in a future version of the architecture.

Bit [7]

Reserved, RES0.

FnE, bit [6]

Filtering by events, inverted. Defined values are:

FnE	Meaning
0b0	PMSNEVFR_EL1 is not implemented and PMSFCR_EL1 .FnE is RES0.
0b1	PMSNEVFR_EL1 and PMSFCR_EL1 .FnE are implemented.

The value 1 indicates support for the FEAT_SPEv1p2 feature.

ERnd, bit [5]

Defines how the random number generator is used in determining the interval between samples, when enabled by PMSIRR_EL1.RND. Defined values are:

ERnd	Meaning
0b0	The random number is added at the start of the interval, and the sample is taken and a new interval started when the combined interval expires.
0b1	The random number is added and the new interval started after the interval programmed in PMSIRR_EL1.INTERVAL expires, and the sample is taken when the random interval expires.

LDS, bit [4]

Data source indicator for sampled load instructions. Defined values are:

LDS	Meaning
0b0	Loaded data source not implemented.
0b1	Loaded data source implemented.

ArchInst, bit [3]

Architectural instruction profiling. Defined values are:

ArchInst	Meaning
0b0	Micro-op sampling implemented.
0b1	Architecture instruction sampling implemented.

FL, bit [2]

Filtering by latency. This bit is RAO.

FT, bit [1]

Filtering by operation type. This bit is RAO.

FE, bit [0]

Filtering by events. This bit is RAO.

Accessing PMSIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1001	0b111

RNDR, Random Number

The RNDR characteristics are:

Purpose

Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is 0.

Configuration

This register is present only when FEAT_RNG is implemented or FEAT_RNG_TRAP is implemented. Otherwise, direct accesses to RNDR are UNDEFINED.

Attributes

RNDR is a 64-bit register.

Field descriptions

RNDR, bits [63:0]

Random Number. Returns a 64-bit Random Number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing RNDR

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RNDR

op0	op1	CRn	CRm	op2
0b11	0b011	0b0010	0b0100	0b000

```

if PSTATE.EL == EL0 then

RNDRRS, Reseeded Random Number

The RNDRRS characteristics are:

Purpose

Reseeded Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source immediately before the read of the random number.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is 0.

Configuration

This register is present only when FEAT_RNG is implemented or FEAT_RNG_TRAP is implemented. Otherwise, direct accesses to RNDRRS are UNDEFINED.

Attributes

RNDRRS is a 64-bit register.

Field descriptions

RNDRRS, bits [63:0]

Reseeded Random Number. Returns a 64-bit Random Number which is reseeded from the True Random Number source immediately before this read.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing RNDRRS

Accesses to this register use the following encodings in the System register encoding space:

SCR_EL3, Secure Configuration Register

The SCR_EL3 characteristics are:

Purpose

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0, EL1, and EL2. The Security state is Secure, Non-secure, or Realm.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ, SError interrupts, and External abort exceptions are taken to EL3.
- Whether various operations are trapped to EL3.

Configuration

AArch64 System register SCR_EL3 bits [31:0] can be mapped to AArch32 System register [SCR\[31:0\]](#), but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCR_EL3 are UNDEFINED.

Attributes

SCR_EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41

Bit [63]

Reserved, RES0.

NSE, bit [62]

When FEAT_RME is implemented:

This field, evaluated with SCR_EL3.NS, selects the Security state of EL2 and lower Exception levels.

For a description of the values derived by evaluating NS and NSE together, see SCR_EL3.NS.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [61:49]

Reserved, RES0.

GPF, bit [48]**When FEAT_RME is implemented:**

Controls the reporting of Granule protection faults at EL0, EL1 and EL2.

GPF	Meaning
0b0	This control does not cause exceptions to be routed from EL0, EL1 or EL2 to EL3.
0b1	GPFs at EL0, EL1 and EL2 are routed to EL3 and reported as Granule Protection Check exceptions.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [47:42]

Reserved, RES0.

EnTP2TRNDR, bit [41]**When FEAT_SMEFEAT_RNG_TRAP is implemented:**

Traps instructions executed at EL2, EL1, and EL0 that access [TPIDR2_EL0](#) to EL3. The exception is reported using ESR_ELx.EC value 0x18.

Controls trapping of reads of [RNDR](#) and [RNDRRS](#) registers.

EnTP2TRNDR	Meaning
0b0	This control causes execution not to be trapped and these any instructions at EL2, EL1, and EL0 have no effect on reads of ID_AA64ISAR0_EL1.RNDR .
0b1	When FEAT_RNG is not implemented, reads of ID_AA64ISAR0_EL1.RNDR return the value 0b0001. This Any control attempt does not cause execution of any instructions to be trapped. read RNDR or RNDRRS is trapped to EL3.

When FEAT_RNG is not implemented, Arm recommends that SCR_EL3.TRNDR is initialized before entering Exception levels below EL3 and not subsequently changed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [40:39]

Reserved, RES0.

HXEn, bit [38]**When FEAT_HCX is implemented:**

Enables access to the [HCRX_EL2](#) register at EL2 from EL3.

HXEn	Meaning
0b0	Accesses at EL2 to HCRX_EL2 are trapped to EL3. Indirect reads of HCRX_EL2 return 0.
0b1	This control does not cause any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ADEn, bit [37]

When FEAT_LS64 is implemented:

Enables access to the [ACCDATA_EL1](#) register at EL1 and EL2.

ADEn	Meaning
0b0	Accesses to ACCDATA_EL1 at EL1 and EL2 are trapped to EL3, unless the accesses are trapped to EL2 by the EL2 fine-grained trap.
0b1	This control does not cause accesses to ACCDATA_EL1 to be trapped.

If the [HFGWTR_EL2](#).nACCDATA_EL1 or [HFGRTR_EL2](#).nACCDATA_EL1 traps are enabled, they take priority over this trap.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [36]

When FEAT_LS64 is implemented:

Traps execution of an ST64BV0 instruction at EL0, EL1, or EL2 to EL3.

EnAS0	Meaning
0b0	EL0 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL1 by SCTLR_EL1 .EnAS0, or to EL2 by either HCRX_EL2 .EnAS0 or SCTLR_EL2 .EnAS0. EL1 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL2 by HCRX_EL2 .EnAS0. EL2 execution of an ST64BV0 instruction is trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [35]**When FEAT_AMUv1p1 is implemented:**

Activity Monitors Virtual Offsets Enable.

AMVOFFEN	Meaning
0b0	Accesses to AMEVCNTVOFF0<n>_EL2 and AMEVCNTVOFF1<n>_EL2 at EL2 are trapped to EL3. Indirect reads of the virtual offset registers are zero.
0b1	Accesses to AMEVCNTVOFF0<n>_EL2 and AMEVCNTVOFF1<n>_EL2 are not affected by this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [34]**When FEAT_TME is implemented:**

Enables access to the TSTART, TCOMMIT, TTEST and TCANCEL instructions at EL0, EL1 and EL2.

TME	Meaning
0b0	EL0, EL1 and EL2 accesses to TSTART, TCOMMIT, TTEST and TCANCEL instructions are UNDEFINED.
0b1	This control does not cause any instruction to be UNDEFINED.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [33:30]**When FEAT_TWED is implemented:**TWE Delay. A 4-bit unsigned number that, when SCR_EL3.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCR_EL3.TWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [29]**When FEAT_TWED is implemented:**

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCR_EL3.TWE.

Traps are reported using an ESR_ELx.EC value of 0x01.

TWEDEn	Meaning
0b0	The delay for taking the trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking the trap is at least the number of cycles defined in SCR_EL3.TWEDEL.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECVEn, bit [28]

When FEAT_ECV is implemented:

ECV Enable. Enables access to the [CNTPOFF_EL2](#) register.

ECVEn	Meaning
0b0	EL2 accesses to CNTPOFF_EL2 are trapped to EL3, and the value of CNTPOFF_EL2 is treated as 0 for all purposes other than direct reads or writes to the register from EL3.
0b1	EL2 accesses to CNTPOFF_EL2 are not trapped to EL3 by this mechanism.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTEn, bit [27]

When FEAT_FGT is implemented:

Fine-Grained Traps Enable. When EL2 is implemented, enables the traps to EL2 controlled by [HAFGRTR_EL2](#), [HDFGRTR_EL2](#), [HDFGWTR_EL2](#), [HFGTRTR_EL2](#), [HFGITR_EL2](#), and [HFGWTR_EL2](#), and controls access to those registers.

Note

If EL2 is not implemented but EL3 is implemented, FEAT_FGT implements the [MDCR_EL3](#).TDCC traps.

FGTEn	Meaning
0b0	EL2 accesses to HAFGRTR_EL2 , HDFGRTR_EL2 , HDFGWTR_EL2 , HFGTRTR_EL2 , HFGITR_EL2 and HFGWTR_EL2 registers are trapped to EL3, and the traps to EL2 controlled by those registers are disabled.
0b1	EL2 accesses to HAFGRTR_EL2 , HDFGRTR_EL2 , HDFGWTR_EL2 , HFGTRTR_EL2 , HFGITR_EL2 and HFGWTR_EL2 registers are not trapped to EL3 by this mechanism.

Traps caused by accesses to the fine-grained trap registers are reported using an ESR_ELx.EC value of 0x18 and its associated ISS.

Otherwise:

Reserved, RES0.

ATA, bit [26]**When FEAT_MTE2 is implemented:**

Allocation Tag Access. Controls access at EL2, EL1 and EL0 to Allocation Tags.

ATA	Meaning
0b0	Access to Allocation Tags is prevented. Accesses at EL1 and EL2 to GCR_EL1 , RGSR_EL1 , TFSR_EL1 , TFSR_EL2 or TFSRE0_EL1 that are not UNDEFINED or trapped to a lower Exception level are trapped to EL3. Accesses at EL2 to TFSR_EL12 that are not UNDEFINED are trapped to EL3.
0b1	This control does not prevent access to Allocation Tags.

This field is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [25]**When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:**

Enable access to the [SCXTNUM_EL2](#), [SCXTNUM_EL1](#), and [SCXTNUM_EL0](#) registers.

EnSCXT	Meaning
0b0	Accesses at EL0, EL1 and EL2 to SCXTNUM_EL0 , SCXTNUM_EL1 , or SCXTNUM_EL2 registers are trapped to EL3 if they are not trapped by a higher priority exception, and the values of these registers are treated as 0.
0b1	This control does not cause any accesses to be trapped, or register values to be treated as 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:22]

Reserved, RES0.

FIEN, bit [21]**When FEAT_RASv1p1 is implemented:**

Fault Injection enable. Trap accesses to the registers [ERXPFgcdN_EL1](#), [ERXPFgctl_EL1](#), and [ERXPFgf_EL1](#) from EL1 and EL2 to EL3, reported using an ESR_ELx.EC value of 0x18.

FIEN	Meaning
0b0	Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.
0b1	This control does not cause any instructions to be trapped.

If EL3 is not implemented, the Effective value of SCR_EL3.FIEN is 0b1.

If [ERRIDR_EL1.NUM](#) is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [20]

When FEAT_DoubleFault is implemented:

Non-maskable External Aborts. When [SCR_EL3.EA](#) == 1, controls whether PSTATE.A masks SError interrupts at EL3.

NMEA	Meaning
0b0	If SCR_EL3.EA == 1, asserted SError interrupts are not taken at EL3 if PSTATE.A == 1.
0b1	If SCR_EL3.EA == 1, asserted SError interrupts are taken at EL3 regardless of the value of PSTATE.A.

When [SCR_EL3.EA](#) == 0:

- Asserted SError interrupts are not taken at EL3 regardless of the value of PSTATE.A and this field.
- This field is ignored and its Effective value is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EASE, bit [19]

When FEAT_DoubleFault is implemented:

External aborts to SError interrupt vector.

EASE	Meaning
0b0	Synchronous External abort exceptions taken to EL3 are taken to the appropriate synchronous exception vector offset from VBAR_EL3 .
0b1	Synchronous External abort exceptions taken to EL3 are taken to the appropriate SError interrupt vector offset from VBAR_EL3 .

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EEL2, bit [18]

When FEAT_SEL2 is implemented:

Secure EL2 Enable.

EEL2	Meaning
0b0	All behaviors associated with Secure EL2 are disabled. All registers, including timer registers, defined by FEAT_SEL2 are UNDEFINED, and those timers are disabled.
0b1	All behaviors associated with Secure EL2 are enabled.

When the value of this bit is 1, then:

- When SCR_EL3.NS == 0, the SCR_EL3.RW bit is treated as 1 for all purposes other than reading or writing the register.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2, using the EC value of [ESR_EL2.EC](#) == 0x3 :
 - A read or write of the [SCR](#).
 - A read or write of the [NSACR](#).
 - A read or write of the [MVBAR](#).
 - A read or write of the [SDCR](#).
 - Execution of an ATS12NSO** instruction.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using the EC value of [ESR_EL2.EC](#) == 0x0 :
 - Execution of an SRS instruction that uses R13_mon.
 - Execution of an MRS (Banked register) or MSR (Banked register) instruction that would access [SPSR_mon](#), R13_mon, or R14_mon.

Note

If the Effective value of SCR_EL3.EEL2 is 0, then these operations executed in Secure EL1 using AArch32 are trapped to EL3.

A Secure only implementation that does not implement EL3 but implements EL2, behaves as if SCR_EL3.EEL2 == 1.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [17]

When FEAT_SEL2 is implemented and FEAT_PAuth is implemented:

Controls the use of the following instructions related to Pointer Authentication. Traps are reported using an ESR_ELx.EC value of 0x09:

- PACGA, which is always enabled.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAZ when:
 - In EL0, when [HCR_EL2.TGE](#) == 0 or [HCR_EL2.E2H](#) == 0, and the associated [SCTLR_EL1.En<N><M>](#) == 1.
 - In EL0, when [HCR_EL2.TGE](#) == 1 and [HCR_EL2.E2H](#) == 1, and the associated [SCTLR_EL2.En<N><M>](#) == 1.
 - In EL1, when the associated [SCTLR_EL1.En<N><M>](#) == 1.
 - In EL2, when the associated [SCTLR_EL2.En<N><M>](#) == 1.

API	Meaning
0b0	The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.API bit.
0b1	This control does not cause any instructions to be trapped.

An instruction is trapped only if Pointer Authentication is enabled for that instruction, for more information, see 'System register control of pointer authentication'.

Note

If FEAT_PAAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SEL2 is not implemented and FEAT_PAAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- PACGA.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZ, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAB when:
 - In Non-secure EL0, when [HCR_EL2.TGE](#) == 0 or [HCR_EL2.E2H](#) == 0, and the associated [SCTLR_EL1.En<N><M>](#) == 1.
 - In Non-secure EL0, when [HCR_EL2.TGE](#) == 1 and [HCR_EL2.E2H](#) == 1, and the associated [SCTLR_EL2.En<N><M>](#) == 1.
 - In Secure EL0, when the associated [SCTLR_EL1SCTLR_EL2.En<N><M>](#) == 1.
 - In Secure or Non-secure EL1, when the associated [SCTLR_EL1.En<N><M>](#) == 1.
 - In EL2, when the associated [SCTLR_EL2.En<N><M>](#) == 1.

API	Meaning
0b0	The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.API bit.
0b1	This control does not cause any instructions to be trapped.

Note

If FEAT_PAAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [16]

When FEAT_PAAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers, using an ESR_ELx.EC value of 0x18, from EL1 or EL2 to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps:

- [APIAKeyLo_EL1](#), [APIAKeyHi_EL1](#), [APIBKeyLo_EL1](#), [APIBKeyHi_EL1](#).

- [APDAKeyLo_EL1](#), [APDAKeyHi_EL1](#), [APDBKeyLo_EL1](#), [APDBKeyHi_EL1](#).
- [APGAKeyLo_EL1](#), and [APGAKeyHi_EL1](#).

APK	Meaning
0b0	Access to the registers holding "key" values for pointer authentication from EL1 or EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2 .APK bit or other traps.
0b1	This control does not cause any instructions to be trapped.

For more information, see 'System register control of pointer authentication'.

Note

If FEAT_PAAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [15]

When FEAT_RAS is implemented:

Trap Error record accesses. Accesses to the RAS ERR* and RAS ERX* registers from EL1 and EL2 to EL3 are trapped as follows:

- Accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x18:
 - [ERRIDR_EL1](#), [ERRSELR_EL1](#), [ERXADDR_EL1](#), [ERXCTLR_EL1](#), [ERXFR_EL1](#), [ERXMISC0_EL1](#), [ERXMISC1_EL1](#), and [ERXSTATUS_EL1](#).
- If FEAT_RASv1p1 is implemented, accesses from EL1 and EL2 using AArch64 to [ERXMISC2_EL1](#), and [ERXMISC3_EL1](#), are trapped and reported using an ESR_ELx.EC value of 0x18.
- Accesses from EL1 and EL2 using AArch32, to the following registers are trapped and reported using an ESR_ELx.EC value of 0x03:
 - [ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#).
- If FEAT_RASv1p1 is implemented, accesses from EL1 and EL2 using AArch32 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x03:
 - [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), and [ERXMISC7](#).

TERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [14]**When FEAT_LOR is implemented:**

Trap LOR registers. Traps accesses to the [LORSA_EL1](#), [LOREA_EL1](#), [LORN_EL1](#), [LORC_EL1](#), and [LORID_EL1](#) registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

TLOR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped HCR_EL2.TLOR .

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [13]

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from any Security state and both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT **is implemented, this trap also applies to the WFET instruction.** **FEAT_WFxT2 is implemented, this trap also applies to the WFET instruction.**

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE , HCR.TWE , SCTLR_EL1.nTWE , SCTLR_EL2.nTWE , or HCR_EL2.TWE .

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TWI, bit [12]

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from any Security state and both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT **is implemented, this trap also applies to the WFIT instruction.** **FEAT_WFxT2 is implemented, this trap also applies to the WFIT instruction.**

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI , HCR.TWI , SCTLR_EL1.nTWI , SCTLR_EL2.nTWI , or HCR_EL2.TWI .

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ST, bit [11]

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

ST	Meaning
0b0	Secure EL1 using AArch64 accesses to the CNTPS_TVAL_EL1 , CNTPS_CTL_EL1 , and CNTPS_CVAL_EL1 are trapped to EL3 when Secure EL2 is disabled. If Secure EL2 is enabled, the behavior is as if the value of this field was 0b1.
0b1	This control does not cause any instructions to be trapped.

Note

Accesses to the Counter-timer Physical Secure timer registers are always enabled at EL3. These registers are not accessible at EL0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RW, bit [10]

When EL1 is capable of using AArch32 or EL2 is capable of using AArch32:

Execution state control for lower Exception levels.

RW	Meaning
0b0	Lower levels are all AArch32.
0b1	The next lower level is AArch64. If EL2 is present: <ul style="list-style-type: none"> EL2 is AArch64. EL2 controls EL1 and EL0 behaviors. If EL2 is not present: <ul style="list-style-type: none"> EL1 is AArch64. EL0 is determined by the Execution state described in the current process state when executing at EL0.

If AArch32 state is supported by the implementation at EL1, SCR_EL3.NS == 1 and AArch32 state is not supported by the implementation at EL2, the Effective value of this bit is 1.

If AArch32 state is supported by the implementation at EL1, FEAT_SEL2 is implemented and SCR_EL3.{EEL2, NS} == {1, 0}, the Effective value of this bit is 1.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.

SIF, bit [9]

When FEAT_SEL2 is implemented:

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from memory marked in the first stage of translation as being Non-secure. The possible values for this bit are:

SIF	Meaning
0b0	Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are permitted.
0b1	Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are not permitted.

When FEAT_PAN3 is implemented, it is IMPLEMENTATION DEFINED whether SCR_EL3.SIF is also used to determine instruction access permission for the purpose of PAN.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory.

SIF	Meaning
0b0	Secure state instruction fetches from Non-secure memory are permitted.
0b1	Secure state instruction fetches from Non-secure memory are not permitted.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HCE, bit [8]

Hypervisor Call instruction enable. Enables HVC instructions at EL3 and, if EL2 is enabled in the current Security state, at EL2 and EL1, in both Execution states, reported using an ESR_ELx.EC value of 0x00.

HCE	Meaning
0b0	HVC instructions are UNDEFINED.
0b1	HVC instructions are enabled at EL3, EL2, and EL1.

Note

HVC instructions are always UNDEFINED at EL0 and, if Secure EL2 is disabled, at Secure EL1. Any resulting exception is taken from the current Exception level to the current Exception level.

If EL2 is not implemented, this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SMD, bit [7]

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from any Security state and both Execution states, reported using an ESR_ELx.EC value of 0x00.

SMD	Meaning
0b0	SMC instructions are enabled at EL3, EL2 and EL1.
0b1	SMC instructions are UNDEFINED.

Note

SMC instructions are always UNDEFINED at EL0. Any resulting exception is taken from the current Exception level to the current Exception level.

If [HCR_EL2.TSC](#) or [HCR.TSC](#) traps attempted EL1 execution of SMC instructions to EL2, that trap has priority over this disable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

EA, bit [3]

External Abort and SError interrupt routing.

EA	Meaning
0b0	When executing at Exception levels below EL3, External aborts and SError interrupts are not taken to EL3. In addition, when executing at EL3: <ul style="list-style-type: none"> • SError interrupts are not taken. • External aborts are taken to EL3.
0b1	When executing at any Exception level, External aborts and SError interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIQ, bit [2]

Physical FIQ Routing.

FIQ	Meaning
0b0	When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3.
0b1	When executing at EL3, physical FIQ interrupts are not taken. When executing at any Exception level, physical FIQ interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRQ, bit [1]

Physical IRQ Routing.

IRQ	Meaning
0b0	When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3.
0b1	When executing at EL3, physical IRQ interrupts are not taken. When executing at any Exception level, physical IRQ interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [0]

When FEAT_RME is implemented:

Non-secure bit. This field is used in combination with SCR_EL3.NSE to select the Security state of EL2 and lower Exception levels.

NSE	NS	Meaning
0b0	0b0	Secure.
0b0	0b1	Non-secure.
0b1	0b0	Reserved.
0b1	0b1	Realm.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure bit.

NS	Meaning
0b0	Indicates that EL0 and EL1 are in Secure state.
0b1	Indicates that Exception levels lower than EL3 are in Non-secure state, so memory accesses from those Exception levels cannot access Secure memory.

When SCR_EL3.{EEL2, NS} == {1, 0}, then EL2 is using AArch64 and in Secure state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return SCR_EL3;

```

MSR SCR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SCR_EL3 = X[t];

```

SCTLR_EL1, System Control Register (EL1)

The SCTLR_EL1 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL1 and EL0.

Configuration

AArch64 System register SCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [SCTLR\[31:0\]](#).

Attributes

SCTLR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51
RES0			EnTP2	EPAN	RES0	EnALS	EPAN	EnAS0	EnALS	EnASR	EnAS0	TME
EnIA	EnIB	LSMAOE	nTLSMD	EnDA	UCI	EE	E0E	SPAN	EIS	IESB	TSCXT	WXP
31	30	29	28	27	26	25	24	23	22	21	20	19

Bits [63:6158]

Reserved, RES0.

EnTP2, bit [60]

When FEAT_SME is implemented:

Traps instructions executed at EL0 that access [TPIDR2_EL0](#) to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1. The exception is reported using [ESR_ELx.EC](#) value 0x18.

EnTP2	Meaning
0b0	This control causes execution of these instructions at EL0 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

If FEAT_VHE is implemented, EL2 is implemented and enabled in the current Security state, and [HCR_EL2.{E2H, TGE}](#) == {1, 1}, this field has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [59:58]

Reserved, RES0.

EPAN, bit [57]**When FEAT_PAN3 is implemented:**

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL1 data access to a page with stage 1 EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

EPAN	Meaning
0b0	No additional Permission faults are generated by this mechanism.
0b1	An EL1 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault. Any speculative data accesses that would generate a Permission fault if the accesses were not speculative will not cause an allocation into a cache.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [56]**When FEAT_LS64 is implemented:**

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 to EL1.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]**When FEAT_LS64 is implemented:**

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an ST64BV0 instruction at EL0 to EL1.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [54]

When FEAT_LS64 is implemented:

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an ST64BV instruction at EL0 to EL1.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [53]

When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL1.

TME	Meaning
0b0	Any attempt to execute a TSTART instruction at EL1 is trapped to EL1, unless HCR_EL2 .TME or SCR_EL3 .TME causes TSTART instructions to be UNDEFINED at EL1.
0b1	This control does not cause any TSTART instruction to be trapped.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME0, bit [52]

When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL0.

TME0	Meaning
0b0	Any attempt to execute a TSTART instruction at EL0 is trapped to EL1, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL0.
0b1	This control does not cause any TSTART instruction to be trapped.

If FEAT_VHE is implemented, EL2 is implemented and enabled in the current Security state, and [HCR_EL2.{E2H, TGE}](#) == {1, 1}, this field has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT, bit [51]

When FEAT_TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL1.

TMT	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL1, the transaction fails with a TRIVIAL failure cause.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT0, bit [50]

When FEAT_TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL0.

TMT0	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause.

If FEAT_VHE is implemented, EL2 is implemented and enabled in the current Security state, and [HCR_EL2.{E2H, TGE}](#) == {1, 1}, this field has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [49:46]**When FEAT_TWED is implemented:**

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL1.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCTLR_EL1.nTWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]**When FEAT_TWED is implemented:**

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCTLR_EL1.nTWE.

TWEDEn	Meaning
0b0	The delay for taking the trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking the trap is at least the number of cycles defined in SCTLR_EL1.TWEDEL.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]**When FEAT_SSBS is implemented:**

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL1.
0b1	PSTATE.SSBS is set to 1 on an exception to EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]**When FEAT_MTE2 is implemented:**

Allocation Tag Access in EL1. When [SCR_EL3.ATA=1](#) and [HCR_EL2.ATA=1](#), controls EL1 access to Allocation Tags.

ATA	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	This control does not prevent access to Allocation Tags.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL0. When [SCR_EL3.ATA](#)=1, [HCR_EL2.ATA](#)=1, and [HCR_EL2.{E2H, TGE}](#) != {1, 1}, controls EL0 access to Allocation Tags.

ATA0	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	This control does not prevent access to Allocation Tags.

This field is permitted to be cached in a TLB.

Note

Software may change this control bit on a context switch.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:

Tag Check Fault in EL1. Controls the effect of Tag Check Faults due to Loads and Stores in EL1.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	When FEAT_MTE3 is implemented
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]**When FEAT_MTE2 is implemented:**

Tag Check Fault in EL0. When [HCR_EL2](#).{E2H,TGE} != {1,1}, controls the effect of Tag Check Faults due to Loads and Stores in EL0.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

Note

Software may change this control bit on a context switch.

TCF0	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]**When FEAT_MTE2 is implemented:**

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL1, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into [TFSRE0_EL1](#) and [TFSR_EL1](#) registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL1.
0b1	Tag Check Faults are synchronized on entry to EL1.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT1, bit [36]**When FEAT_BT1 is implemented:**

PAC Branch Type compatibility at EL1.

BT1	Meaning
0b0	When the PE is executing at EL1, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL1, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]

When FEAT_BT1 is implemented:

PAC Branch Type compatibility at EL0.

BT0	Meaning
0b0	When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

When the value of HCR_EL2.{E2H, TGE} == is {1, 1}, the value of SCTLR_EL1.BT0 has no effect on execution at EL0. && HCR_EL2.TGE == 1, the value of the SCTLR_EL1.BT0 has no effect on execution at EL0

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [34:32]

Reserved, RES0.

EnIA, bit [31]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnIA	Meaning
0b0	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA

returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When FEAT_PAAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnIB	Meaning
0b0	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]

When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]

When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnDA, bit [27]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnDA	Meaning
0b0	Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

Traps EL0 execution of cache maintenance instructions, to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from AArch64 state only, reported using an [ESR_ELx.EC](#) value of 0x18.

This applies to [DC CVAU](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#), and [IC IVAU](#).

If FEAT_DPB2 is implemented, this trap also applies to [DC CVADP](#).

If FEAT_MTE is implemented, this trap also applies to [DC CIGVAC](#), [DC CIGDVAC](#), [DC CGVAC](#), [DC CGDVAC](#), [DC CGVAP](#), and [DC CGDVAP](#).

If FEAT_DPB2 and FEAT_MTE are implemented, this trap also applies to [DC CGVADP](#) and [DC CGDVADP](#).

UCI	Meaning
0b0	Execution of the specified instructions at EL0 using AArch64 is trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

EE, bit [25]

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

The possible values of this bit are:

EE	Meaning
0b0	Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.
0b1	Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on the PE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

EOE, bit [24]

Endianness of data accesses at EL0.

The possible values of this bit are:

EOE	Meaning
0b0	Explicit data accesses at EL0 are little-endian.
0b1	Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0, then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0, then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SPAN, bit [23]

When FEAT_PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 on taking an exception to EL1.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EIS, bit [22]

When FEAT_ExS is implemented:

Exception Entry is Context Synchronizing.

EIS	Meaning
0b0	The taking of an exception to EL1 is not a context synchronizing event.
0b1	The taking of an exception to EL1 is a context synchronizing event.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EIS is set to 0b0:

- Indirect writes to [ESR_EL1](#), [FAR_EL1](#), [SPSR_EL1](#), [ELR_EL1](#) are synchronized on exception entry to EL1, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EIS:

- Changes to the PSTATE information on entry to EL1.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When FEAT_IESB is implemented:

Implicit Error Synchronization event enable. Possible values are:

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: <ul style="list-style-type: none"> • At each exception taken to EL1. • Before the operational pseudocode of each ERET instruction executed at EL1.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL1 and before each DRPS instruction executed at EL1, in addition to the other cases where it is added.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap EL0 Access to the [SCXTNUM_EL0](#) register, when EL0 is using AArch64.

TSCXT	Meaning
0b0	EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.
0b1	EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The value of SCXTNUM_EL0 is treated as 0.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL1&0 translation regime is forced to XN for accesses from software executing at EL1 or EL0.

This bit applies only when SCTLR_EL1.M bit is set.

The WXN bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2](#).TGE is 1, from both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFXT is implemented, this trap also applies to the WFET instruction. FEAT_WFXT2 is implemented, this trap also applies to the WFET instruction.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from both Execution states, reported using an [ESR_ELx.EC](#) value of 0x01.

When FEAT_WFXT is implemented, this trap also applies to the WFIT instruction. FEAT_WFXT2 is implemented, this trap also applies to the WFIT instruction.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

UCT, bit [15]

Traps EL0 accesses to the [CTR_EL0](#) to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from AArch64 state only, reported using an [ESR_ELx.EC](#) value of 0x18.

UCT	Meaning
0b0	Accesses to the CTR_EL0 from EL0 using AArch64 are trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

DZE, bit [14]

Traps EL0 execution of [DC ZVA](#) instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from AArch64 state only, reported using an [ESR_ELx.EC](#) value of 0x18.

If FEAT_MTE is implemented, this trap also applies to [DC GVA](#) and [DC GZVA](#).

DZE	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions this trap applies to are not supported.
0b1	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

EnDB, bit [13]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnDB	Meaning
0b0	Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Stage 1 instruction access Cacheability control, for accesses at EL0 and EL1:

I	Meaning
0b0	All instruction access to Stage 1 Normal memory from EL0 and EL1 are Stage 1 Non-cacheable. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Stage 1 Cacheability of instruction access to Stage 1 Normal memory from EL0 and EL1. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

When the value of the [HCR_EL2.DC](#) bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the SCTLR_EL1.I bit.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

EOS, bit [11]

When FEAT_ExS is implemented:

Exception Exit is Context Synchronizing.

EOS	Meaning
0b0	An exception return from EL1 is not a context synchronizing event
0b1	An exception return from EL1 is a context synchronizing event

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EOS:

- The indirect write of the PSTATE and PC values from [SPSR_EL1](#) and [ELR_EL1](#) on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]

When FEAT_SPECRES is implemented:

Enable EL0 Access to the following instructions:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2 .TGE is 1.
0b1	EL0 access to these instructions is enabled.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UMA, bit [9]

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.{D, A, I, F} masks to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

UMA	Meaning
0b0	Any attempt at EL0 using AArch64 to execute an MRS, MSR(REGISTER), or MSR(IMMEDIATE) instruction that accesses the DAIF is trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SED, bit [8]

When EL0 is capable of using AArch32:

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

SED	Meaning
0b0	SETEND instruction execution is enabled at EL0 using AArch32.
0b1	SETEND instructions are UNDEFINED at EL0 using AArch32 and any attempt at EL0 to access a SETEND instruction generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, reported using an ESR_ELx.EC value of 0x00.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

ITD, bit [7]

When EL0 is capable of using AArch32:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL0 using AArch32.
0b1	<p>Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED and generates an exception, reported using an ESR_ELx.EC value of 0x00, to EL1 or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1:</p> <ul style="list-style-type: none"> • All encodings of the IT instruction with hw1[3:0]! = 1000. • All encodings of the subsequent instruction with the following values for hw1: <ul style="list-style-type: none"> ◦ 0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. ◦ 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5. ◦ 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm ◦ 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm] ◦ 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. ◦ 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. <p>These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.</p> <p>It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:</p> <ul style="list-style-type: none"> • A 16-bit instruction, that can only be followed by another 16-bit instruction. • The first half of a 32-bit instruction. <p>This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.</p> <p>An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.</p>

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information, see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR_EL1 then it must also be implemented in the SCTLR_EL2, HSCTLR, and SCTLRL then it must also be implemented in the SCTLR_EL1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

Otherwise:

Reserved, RES1.

nAA, bit [6]

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions.

nAA	Meaning
0b0	LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1	This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]

When EL0 is capable of using AArch32:

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

CP15BEN	Meaning
0b0	EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is UNDEFINED and generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2 .TGE is 1. The exception is reported using an ESR_ELx.EC value of 0x00.
0b1	EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the [SCTLR_EL1](#) then it must also be implemented in the [SCTLR_EL2](#), [HSCTLR](#), and [SCTLR](#). ~~then it must also be implemented in the SCTLR_EL1.~~

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement CP15BEN, access to this field is **RAO/WI**.

Otherwise:

Reserved, RES0.

SA0, bit [4]

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then **ana** SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then [ana](#) SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Stage 1 Cacheability control, for data accesses.

C	Meaning
0b0	All data access to Stage 1 Normal memory from EL0 and EL1, and all Normal memory accesses from unified cache to the EL1&0 Stage 1 translation tables, are treated as Stage 1 Non-cacheable.
0b1	This control has no effect on the Stage 1 Cacheability of: <ul style="list-style-type: none"> Data access to Normal memory from EL0 and EL1. Normal memory accesses to the EL1&0 Stage 1 translation tables.

When the value of the [HCR_EL2](#).DC bit is 1, the PE ignores SCTLR.C. This means that Non-secure EL0 and Non-secure EL1 data accesses to Normal memory are Cacheable.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and [EL0](#).

A	Meaning
0b0	Alignment fault checking disabled when executing at EL1 or EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at EL1 or EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL1&0 stage 1 address translation.

M	Meaning
0b0	EL1&0 stage 1 address translation disabled. See the SCTLR_EL1.I field for the behavior of instruction accesses to Normal memory.
0b1	EL1&0 stage 1 address translation enabled.

If the value of [HCR_EL2](#).{DC, TGE} is not {0, 0} then in Non-secure state the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of the field.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

Accessing SCTLR_EL1

When [HCR_EL2](#).E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SCTLR_EL1 or SCTLR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b000

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.SCTLR_EL1 == '1'
    then

SCTLR_EL2, System Control Register (EL2)

The SCTLR_EL2 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL2.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, these controls apply also to execution at EL0.

Configuration

AArch64 System register SCTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HSCTLR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SCTLR_EL2 is a 64-bit register.

Field descriptions

Bits [63:6158]

Reserved, RES0.

EnTP2, bit [60]

When FEAT_SME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps instructions executed at EL0 that access [TPIDR2_EL0](#) to EL2 when EL2 is implemented and enabled for the current Security state. The exception is reported using ESR_ELx.EC value 0x18.

EnTP2	Meaning
0b0	This control causes execution of these instructions at EL0 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [59:58]

Reserved, RES0.

EPAN, bit [57]**When FEAT_PAN3 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL2 data access to a page with EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

EPAN	Meaning
0b0	No additional Permission faults are generated by this mechanism.
0b1	An EL2 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault. Any speculative data accesses that would generate a Permission fault if the accesses were not speculative will not cause an allocation into a cache.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [56]**When FEAT_LS64 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Traps execution of an LD64B or ST64B instruction at EL0 to EL2.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]**When FEAT_LS64 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Traps execution of an ST64BV0 instruction at EL0 to EL2.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [54]

When FEAT_LS64 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of an ST64BV instruction at EL0 to EL2.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [53]

When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL2.

TME	Meaning
0b0	Any attempt to execute a TSTART instruction at EL2 is trapped, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL2.
0b1	This control does not cause any TSTART instruction to be trapped.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME0, bit [52]

When FEAT_TME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Enables the Transactional Memory Extension at EL0.

TME0	Meaning
0b0	Any attempt to execute a TSTART instruction at EL0 is trapped to EL2, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL0.
0b1	This control does not cause any TSTART instruction to be trapped.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT, bit [51]

When FEAT_TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL2.

TMT	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL2, the transaction fails with a TRIVIAL failure cause.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT0, bit [50]

When FEAT_TME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Forces a trivial implementation of the Transactional Memory Extension at EL0.

TMT0	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [49:46]

When FEAT_TWED is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL2.TWEDen is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR_EL2.nTWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDn, bit [45]

When FEAT_TWED is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR_EL2.nTWE.

TWEDn	Meaning
0b0	The delay for taking a WFE trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking a WFE trap is at least the number of cycles defined in SCTLR_EL2.TWEDEL.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL2.
0b1	PSTATE.SSBS is set to 1 on an exception to EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL2. When [SCR_EL3.ATA](#) is 1, controls EL2 access to Allocation Tags.

ATA	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	This control does not prevent access to Allocation Tags.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]

When FEAT_MTE2 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Allocation Tag Access in EL0. When [SCR_EL3.ATA](#) is 1, controls EL0 access to Allocation Tags.

ATA0	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	This control does not prevent access to Allocation Tags.

This field is permitted to be cached in a TLB.

Note

Software may change this control bit on a context switch.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:

Tag Check Fault in EL2. Controls the effect of Tag Check Faults due to Loads and Stores in EL2.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	When FEAT_MTE3 is implemented
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]

When FEAT_MTE2 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Tag Check Fault in EL0. Controls the effect of Tag Check Faults due to Loads and Stores in EL0.

TCF0	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

Note

Software may change this control bit on a context switch.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]

When FEAT_MTE2 is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL2, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into [TFSRE0_EL1](#), [TFSR_EL1](#) and [TFSR_EL2](#) registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL2.
0b1	Tag Check Faults are synchronized on entry to EL2.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bit [36]

When FEAT_BT1 is implemented:

PAC Branch Type compatibility at EL2.

When [HCR_EL2](#).{E2H, TGE} == {1, 1}, this bit is named BT1.

BT	Meaning
0b0	When the PE is executing at EL2, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL2, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]

When FEAT_BT1 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

PAC Branch Type compatibility at EL0.

BT0	Meaning
0b0	When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [34:32]

Reserved, RES0.

EnIA, bit [31]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnIA	Meaning
0b0	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnIB	Meaning
0b0	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]**When FEAT_LSMAOC is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]

When FEAT_LSMAOC is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnDA, bit [27]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnDA	Meaning
0b0	Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of cache maintenance instructions at EL0 to EL2, from AArch64 state only. This applies to [DC CVAU](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#), and [IC IVAU](#).

If FEAT_DPB2 is implemented, this trap also applies to [DC CVADP](#).

If FEAT_MTE is implemented, this trap also applies to [DC CIGVAC](#), [DC CIGDVAC](#), [DC CGVAC](#), [DC CGDVAC](#), [DC CGVAP](#), and [DC CGDVAP](#).

If FEAT_DPB2 and FEAT_MTE are implemented, this trap also applies to [DC CGVADP](#) and [DC CGDVADP](#).

UCI	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are little-endian.
0b1	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

EOE, bit [24]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Endianness of data accesses at EL0.

EOE	Meaning
0b0	Explicit data accesses at EL0 are little-endian.
0b1	Explicit data accesses at EL0 are big-endian.

If an implementation only supports Little-endian accesses at EL0, then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0, then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPAN, bit [23]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Set Privileged Access Never, on taking an exception to EL2.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 on taking an exception to EL2.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL2.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EIS, bit [22]

When FEAT_ExS is implemented:

Exception entry is a context synchronization event.

EIS	Meaning
0b0	The taking of an exception to EL2 is not a context synchronization event.
0b1	The taking of an exception to EL2 is a context synchronization event.

If SCTLR_EL2.EIS is set to 0b0:

- Indirect writes to [ESR_EL2](#), [FAR_EL2](#), [SPSR_EL2](#), [ELR_EL2](#), and [HPFAR_EL2](#) are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]**When FEAT_IESB is implemented:**

Implicit Error Synchronization event enable.

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: <ul style="list-style-type: none"> At each exception taken to EL2. Before the operational pseudocode of each ERET instruction executed at EL2.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]**When (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented), HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.

TSCXT	Meaning
0b0	EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.
0b1	EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL2, and the SCXTNUM_EL0 value is treated as 0.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_CSV2_2 is not implemented, FEAT_CSV2_1p2 is not implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES1.

Otherwise:

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2.

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of WFE instructions at EL0 to EL2, from both Execution states.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of WFI instructions at EL0 to EL2, from both Execution states.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

UCT, bit [15]

When **HCR_EL2.E2H == 1** and **HCR_EL2.TGE == 1**:

Traps EL0 accesses to the [CTR_ELO](#) to EL2, from AArch64 state only.

UCT	Meaning
0b0	Accesses to the CTR_ELO from EL0 using AArch64 are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DZE, bit [14]

When **HCR_EL2.E2H == 1** and **HCR_EL2.TGE == 1**:

Traps execution of [DC ZVA](#) instructions at EL0 to EL2, from AArch64 state only.

If FEAT_MTE is implemented, this trap also applies to [DC GVA](#) and [DC GZVA](#).

DZE	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. Reading DCZID_ELO.DZP from EL0 returns 1, indicating that the instructions that this trap applies to are not supported.
0b1	This control does not cause any instructions to be trapped.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnDB, bit [13]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

EnDB	Meaning
0b0	Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2 and, when EL2 is enabled in the current Security state and [HCR_EL2](#).{E2H,TGE} == {1,1}, EL0.

I	Meaning
0b0	All instruction accesses to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. When EL2 is enabled in the current Security state and HCR_EL2 .{E2H, TGE} == {1, 1}, all instruction accesses to Normal memory from EL0 are Non-cacheable for all levels of instruction and unified cache. If SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and, when EL2 is enabled in the current Security state and HCR_EL2 .{E2H, TGE} == {1, 1}, instruction access to Normal memory from EL0. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL3 translation regime.

When EL2 is disabled in the current Security state or [HCR_EL2](#).{E2H,TGE} != {1,1}, this bit has no effect on the EL1&0 translation regime.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

EOS, bit [11]

When FEAT_ExS is implemented:

Exception exit is a context synchronization event.

EOS	Meaning
0b0	An exception return from EL2 is not a context synchronization event.
0b1	An exception return from EL2 is a context synchronization event.

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from [SPSR_EL2](#) and [ELR_EL2](#) on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]

When FEAT_SPECRES is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Enable EL0 Access to the following instructions:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL1.
0b1	EL0 access to these instructions is enabled.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SED, bit [8]

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

SED	Meaning
0b0	SETEND instruction execution is enabled at EL0 using AArch32.
0b1	SETEND instructions are UNDEFINED at EL0 using AArch32.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When EL0 can only use AArch64, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES1.

Otherwise:

Reserved, RES0.

ITD, bit [7]

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL0 using AArch32.
0b1	<p>Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED:</p> <ul style="list-style-type: none"> All encodings of the IT instruction with hw1[3:0] != 1000. All encodings of the subsequent instruction with the following values for hw1: <ul style="list-style-type: none"> 0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5. 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm] 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. 0b010001xx1xxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn. <p>These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.</p> <p>It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:</p> <ul style="list-style-type: none"> A 16-bit instruction, that can only be followed by another 16-bit instruction. The first half of a 32-bit instruction. <p>This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.</p> <p>An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.</p>

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR_EL2 then it must also be implemented in the SCTLR_EL1, HSCTLR, and SCTLR then it must also be implemented in the SCTLR_EL2.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

When EL0 can only use AArch64, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES1.

Otherwise:

Reserved, RES0.

nAA, bit [6]

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults under certain conditions at EL2, and, when EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}, EL0.

nAA	Meaning
0b0	LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1	This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

CP15BEN	Meaning
0b0	EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is UNDEFINED.
0b1	EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the **SCTLR_EL2** then it must also be implemented in the **SCTLR_EL1**, **HSCTLR**, and **SCTLR**. ~~then it must also be implemented in the SCTLR_EL2.~~

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement CP15BEN, access to this field is **RAO/WI**.

When EL0 can only use AArch64, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES0.

Otherwise:

Reserved, RES1.

SA0, bit [4]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then **ana** SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then **an** SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Data access Cacheability control, for accesses at EL2 and, when EL2 is enabled in the current Security state and [HCR_EL2](#).{E2H, TGE} == {1, 1}, EL0

C	Meaning
0b0	<p>The following are Non-cacheable for all levels of data and unified cache:</p> <ul style="list-style-type: none"> • Data accesses to Normal memory from EL2. • When HCR_EL2.{E2H, TGE} != {1, 1}, Normal memory accesses to the EL2 translation tables. • When EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}: <ul style="list-style-type: none"> ◦ Data accesses to Normal memory from EL0. ◦ Normal memory accesses to the EL2&0 translation tables.
0b1	<p>This control has no effect on the Cacheability of:</p> <ul style="list-style-type: none"> • Data access to Normal memory from EL2. • When HCR_EL2.{E2H, TGE} != {1, 1}, Normal memory accesses to the EL2 translation tables. • When EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}: <ul style="list-style-type: none"> ◦ Data accesses to Normal memory from EL0. ◦ Normal memory accesses to the EL2&0 translation tables.

This bit has no effect on the EL3 translation regime.

When EL2 is disabled in the current Security state or [HCR_EL2](#).{E2H, TGE} != {1, 1}, this bit has no effect on the EL1&0 translation regime.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and, when EL2 is enabled in the current Security state and [HCR_EL2](#).{E2H, TGE} == {1, 1}, EL0.

A	Meaning
0b0	Alignment fault checking disabled when executing at EL2. When EL2 is enabled in the current Security state and HCR_EL2 .{E2H, TGE} == {1, 1}, alignment fault checking disabled when executing at EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at EL2. When EL2 is enabled in the current Security state and HCR_EL2 .{E2H, TGE} == {1, 1}, alignment fault checking enabled when executing at EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 or EL2&0 stage 1 address translation.

M	Meaning
0b0	When HCR_EL2 .{E2H, TGE} != {1, 1}, EL2 stage 1 address translation disabled. When HCR_EL2 .{E2H, TGE} == {1, 1}, EL2&0 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.
0b1	When HCR_EL2 .{E2H, TGE} != {1, 1}, EL2 stage 1 address translation enabled. When HCR_EL2 .{E2H, TGE} == {1, 1}, EL2&0 stage 1 address translation enabled.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing SCTLR_EL2

When [HCR_EL2](#).E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCTLR_EL2 or SCTLR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0000	0b000

The SCTLR_EL3 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCTLR_EL3 are UNDEFINED.

Attributes

SCTLR_EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37

Bits [63:54]

Reserved, RES0.

TME, bit [53]

When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL3.

TME	Meaning
0b0	Any attempt to execute a TSTART instruction at EL3 is trapped, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL3.
0b1	This control does not cause any TSTART instruction to be trapped.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [52]

Reserved, RES0.

TMT, bit [51]**When FEAT_TME is implemented:**

Forces a trivial implementation of the Transactional Memory Extension at EL3.

TMT	Meaning
0b0	This control does not cause any TSTART instruction to fail.
0b1	When the TSTART instruction is executed at EL3, the transaction fails with a TRIVIAL failure cause.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [50:45]

Reserved, RES0.

DSSBS, bit [44]**When FEAT_SSBS is implemented:**

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL3.
0b1	PSTATE.SSBS is set to 1 on an exception to EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]**When FEAT_MTE2 is implemented:**

Allocation Tag Access in EL3. Controls EL3 access to Allocation Tags.

ATA	Meaning
0b0	Access to Allocation Tags is prevented.
0b1	This control does not prevent access to Allocation Tags.

This bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:

Tag Check Fault in EL3. Controls the effect of Tag Check Faults due to Loads and Stores in EL3.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE3 is implemented

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

ITFSB, bit [37]

When FEAT_MTE2 is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL3, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into [TFSRE0_EL1](#) and TFSR_ELx registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL3.
0b1	Tag Check Faults are synchronized on entry to EL3.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bit [36]

When FEAT_BT1 is implemented:

PAC Branch Type compatibility at EL3.

BT	Meaning
0b0	When the PE is executing at EL3, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11.
0b1	When the PE is executing at EL3, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:32]

Reserved, RES0.

EnIA, bit [31]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

EnIA	Meaning
0b0	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled.

For more information, see 'System register control of pointer authentication'.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

EnIB	Meaning
0b0	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled.
0b1	Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled.

For more information, see 'System register control of pointer authentication'.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL3 translation regime.

EnDA	Meaning
0b0	Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled.

For more information, see 'System register control of pointer authentication'.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian.
0b1	Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bit [23]

Reserved, RES1.

EIS, bit [22]

When FEAT_ExS is implemented:

Exception Entry is Context Synchronizing.

EIS	Meaning
0b0	The taking of an exception to EL3 is not a context synchronizing event.
0b1	The taking of an exception to EL3 is a context synchronizing event.

If SCTLR_EL3.EIS is set to 0b0:

- Indirect writes to [ESR_EL3](#), [FAR_EL3](#), [SPSR_EL3](#), [ELR_EL3](#) are synchronized on exception entry to EL3, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EIS:

- Changes to the PSTATE information on entry to EL3.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Debug state exit.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]**When FEAT_IESB is implemented:**

Implicit Error Synchronization event enable.

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: <ul style="list-style-type: none"> • At each exception taken to EL3. • Before the operational pseudocode of each ERET instruction executed at EL3.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field and, if implemented, [SCR_EL3.NMEA](#). If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL3 and before each DRPS instruction executed at EL3, in addition to the other cases where it is added.

When FEAT_DoubleFault is implemented, the PE is in Non-debug state, and the Effective value of [SCR_EL3.NMEA](#) is 1, this field is ignored and its Effective value is 1.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN. The possible values of this bit are:

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3.

This bit applies only when SCTLR_EL3.M bit is set.

The WXN bit is permitted to be cached in a TLB.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:14]

Reserved, RES0.

EnDB, bit [13]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL3 translation regime.

EnDB	Meaning
0b0	Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled.
0b1	Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled.

For more information, see 'System register control of pointer authentication'.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL3:

I	Meaning
0b0	All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL3. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

EOS, bit [11]

When FEAT_ExS is implemented:

Exception Exit is Context Synchronizing.

EOS	Meaning
0b0	An exception return from EL3 is not a context synchronizing event
0b1	An exception return from EL3 is a context synchronizing event

If SCTLR_EL3.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EOS:

- The indirect write of the PSTATE and PC values from [SPSR_EL3](#) and [ELR_EL3](#) on exception return is synchronized.
- If the PE enters Debug state before the first instruction after an Exception return from EL3 to Non-secure state, any pending Halting debug event completes execution.
- The GIC behavior that allocates interrupts to FIQ or IRQ changes simultaneously with leaving the EL3 Exception level.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [10:7]

Reserved, RES0.

nAA, bit [6]

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL3 under certain conditions.

nAA	Meaning
0b0	LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses.
0b1	This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

C	Meaning
0b0	All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	This control has no effect on the Cacheability of: <ul style="list-style-type: none"> Data access to Normal memory from EL3. Normal memory accesses to the EL3 translation tables.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL3.

A	Meaning
0b0	Alignment fault checking disabled when executing at EL3. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at EL3. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL3 stage 1 address translation disabled. See the SCTLR_EL3.I field for the behavior of instruction accesses to Normal memory.
0b1	EL3 stage 1 address translation enabled.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Accessing SCTLR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return SCTLR_EL3;
```

MSR SCTLR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0000	0b000

```

SMCR_EL1, SME Control Register (EL1)

The SMCR_EL1 characteristics are:

Purpose

This register controls aspects of Streaming SVE that are visible at Exception levels EL1 and EL0.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMCR_EL1 are UNDEFINED.

This register has no effect if the PE is not in Streaming SVE mode.

When [HCR_EL2](#).{E2H, TGE} == {1, 1} and EL2 is enabled in the current Security state, this register has no effect on execution at EL0.

Attributes

SMCR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																RES0															
RES0																RAZ/WI								LEN							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Effective Streaming SVE Vector Length (SVL).

Constrains the effective Streaming SVE vector register length for EL1 and EL0 to (LEN+1)*128 bits when the PE is in Streaming SVE mode.

For all purposes other than returning the result of a direct read of SMCR_EL1, this field selects the effective vector length as follows:

- If the requested length is smaller than the minimum implemented Streaming SVE vector length, then the minimum implemented Streaming SVE vector length is used.
- If the requested length is larger than the effective vector length at the next more privileged Exception level in the current Security state, if any, then the effective vector length at the more privileged Exception level is used.
- If the requested length is not implemented, then the requested length rounded down to the nearest implemented Streaming SVE vector length is used.

- Otherwise, the requested length is used.

An indirect read of SMCR_EL1.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMCR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic SMCR_EL1 or SMCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMCR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0010	0b110

SMCR_EL2, SME Control Register (EL2)

The SMCR_EL2 characteristics are:

Purpose

This register controls aspects of Streaming SVE that are visible at Exception levels EL2, EL1, and EL0.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMCR_EL2 are UNDEFINED.

This register has no effect if the PE is not in Streaming SVE mode, or if EL2 is not enabled in the current Security state.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

SMCR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Effective Streaming SVE Vector Length (SVL).

Constrains the effective Streaming SVE vector register length for EL2, EL1, and EL0 to (LEN+1)*128 bits when EL2 is enabled in the current Security state and when the PE is in Streaming SVE mode.

For all purposes other than returning the result of a direct read of SMCR_EL2, this field selects the effective vector length as follows:

- If the requested length is smaller than the minimum implemented Streaming SVE vector length, then the minimum implemented Streaming SVE vector length is used.
- If the requested length is larger than the effective vector length at the next more privileged Exception level in the current Security state, if any, then the effective vector length at the more privileged Exception level is used.
- If the requested length is not implemented, then the requested length rounded down to the nearest implemented Streaming SVE vector length is used.

- Otherwise, the requested length is used.

An indirect read of SMCR_EL2.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMCR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic SMCR_EL2 or SMCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0010	0b110

SMIDR_EL1, Streaming Mode Identification Register

The SMIDR_EL1 characteristics are:

Purpose

Provides additional identification mechanisms for scheduling purposes, for a PE that supports Streaming SVE mode.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMIDR_EL1 are UNDEFINED.

Attributes

SMIDR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
																RES0																
Implementer								Revision								SMPS	RES0				Affinity

Bits [63:32]

Reserved, RES0.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is **RO**.

Revision, bits [23:16]

Revision number for the Streaming Mode Compute Unit (SMCU).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SMPS, bit [15]

Indicates support for Streaming SVE mode execution priority.

SMPS	Meaning
0b0	Priority control not supported.
0b1	Priority control supported.

Bits [14:12]

Reserved, RES0.

Affinity, bits [11:0]

The SMCU affinity of the accessing PE.

- A value of zero indicates that the PE's implementation of Streaming SVE mode is not shared with other PEs.
- Otherwise, the value identifies which SMCU is associated with this PE. The Affinity value associated with each SMCU is unique within the system as a whole.

Accessing SMIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b110

```

if PSTATE.EL == EL0 then

SMPRI_EL1, Streaming Mode Priority Register

The SMPRI_EL1 characteristics are:

Purpose

Configures the streaming execution priority for instructions executed on a shared Streaming Mode Compute Unit (SMCU) when the PE is in Streaming SVE mode at any Exception Level.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMPRI_EL1 are UNDEFINED.

When [SMIDR_EL1](#).SMPS is '0', this register is RES0.

Attributes

SMPRI_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:4]

Reserved, RES0.

Priority, bits [3:0]

Streaming execution priority value.

Either this value is used directly, or it is mapped into an effective priority value using [SMPRMAP_EL2](#).

This value is used directly when any of the following are true:

- The current Exception level is EL3 or EL2.
- The current Exception level is EL1 or EL0, if EL2 is implemented and enabled in the current Security state and [HCRX_EL2](#).SMPME is '0'.
- The current Exception level is EL1 or EL0, if EL2 is either not implemented or not enabled in the current Security state.

The precise meaning and behavior of each streaming execution priority value is IMPLEMENTATION DEFINED.

In an implementation that shares execution resources between PEs, higher priority values are allocated more processing resource than other PEs configured with lower priority values in the same Priority domain.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMPRI_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMPRI_EL1

SMPRIMAP_EL2, Streaming Mode Priority Mapping Register

The SMPRIMAP_EL2 characteristics are:

Purpose

Maps the value in [SMPRI_EL1](#) to a streaming execution priority value for instructions executed at EL1 and EL0 in the same Security states as EL2.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMPRIMAP_EL2 are UNDEFINED.

When [SMIDR_EL1](#).SMPS is '0', this register is RES0.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

SMPRIMAP_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

When all of the following are true, the value in [SMPRI_EL1](#) is mapped to a streaming execution priority using this register:

- The current Exception level is EL1 or EL0.
- EL2 is implemented and enabled in the current Security state.
- [HCRX_EL2](#).SMPME is '1'.

Otherwise, [SMPRI_EL1](#) holds the streaming execution priority value.

P15, bits [63:60]

Priority Mapping Entry 15. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#).Priority value is '15'.

This value is the highest streaming execution priority.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P14, bits [59:56]

Priority Mapping Entry 14. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#).Priority value is '14'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P13, bits [55:52]

Priority Mapping Entry 13. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '13'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P12, bits [51:48]

Priority Mapping Entry 12. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '12'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P11, bits [47:44]

Priority Mapping Entry 11. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '11'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P10, bits [43:40]

Priority Mapping Entry 10. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '10'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P9, bits [39:36]

Priority Mapping Entry 9. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '9'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P8, bits [35:32]

Priority Mapping Entry 8. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '8'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P7, bits [31:28]

Priority Mapping Entry 7. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '7'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P6, bits [27:24]

Priority Mapping Entry 6. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '6'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P5, bits [23:20]

Priority Mapping Entry 5. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '5'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P4, bits [19:16]

Priority Mapping Entry 4. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '4'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P3, bits [15:12]

Priority Mapping Entry 3. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '3'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P2, bits [11:8]

Priority Mapping Entry 2. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '2'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P1, bits [7:4]

Priority Mapping Entry 1. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '1'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P0, bits [3:0]

Priority Mapping Entry 0. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '0'.

This value is the lowest streaming execution priority.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMPRIMAP_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMPRIMAP_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0010	0b101

```

SPSR_EL1, Saved Program Status Register (EL1)

The SPSR_EL1 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL1.

Configuration

AArch64 System register SPSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [SPSR_svc\[31:0\]](#).

Attributes

SPSR_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0** any Exception level and exception taken from AArch32 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]	DIT	SSBS	PAN	SS	IL	GE	IT[7:2]	E	A	I	F	T	M[4]	M[3:0]												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL1, and copied to PSTATE.Q on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL1, and copied to PSTATE.IT on executing an exception return operation in EL1.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL1[26:25].
- IT[7:2] is SPSR_EL1[15:10].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL1, and copied to PSTATE.GE on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL1, and copied to PSTATE.E on executing an exception return operation in EL1.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL1, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL1, and copied to PSTATE.T on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL1 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

M[4]	Meaning
0b1	AArch32 execution state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL1, and copied to PSTATE.M[3:0] on executing an exception return operation in EL1.

M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0111	Abort.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	RES0	TCO	DIT	UAO	PAN	SS	IL	RES0				SSBS	BTYPE	D	A	I	F	RES0	M[4]	M[3:0]								
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL1, and copied to PSTATE.TCO on executing an exception return operation in EL1.

When FEAT_MTE2 is not implemented, it is CONSTRAINED UNPREDICTABLE whether this field is RES0 or behaves as if FEAT_MTE is implemented.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL1, and copied to PSTATE.UAO on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:13]

Reserved, RES0.

SSBS, bit [12]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL1, and copied to PSTATE.BTYPE on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL1, and copied to PSTATE.D on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL1 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

M[4]	Meaning
0b0	AArch64 execution state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL1 and copied to PSTATE.EL on executing an exception return operation in EL1.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL1 and copied to PSTATE.SP on executing an exception return operation in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic SPSR_EL1 or SPSR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0000	0b000

```

SPSR_EL2, Saved Program Status Register (EL2)

The SPSR_EL2 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL2.

Configuration

AArch64 System register SPSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [SPSR_hyp\[31:0\]](#).

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SPSR_EL2 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0 any Exception level and exception taken from AArch32 state:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]		DIT	SSBS	PAN	SS	IL	GE			IT[7:2]					E	A	I	F	T	M[4]		M[3:0]				
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL2, and copied to PSTATE.Q on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL2, and copied to PSTATE.IT on executing an exception return operation in EL2.

SPSR_EL2.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL2[26:25].
- IT[7:2] is SPSR_EL2[15:10].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL2, and copied to PSTATE.GE on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL2, and copied to PSTATE.E on executing an exception return operation in EL2.

If the implementation does not support big-endian operation, SPSR_EL2.E is RES0. If the implementation does not support little-endian operation, SPSR_EL2.E is RES1. On executing an exception return operation in EL2, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL2.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL2.E is RES1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL2, and copied to PSTATE.T on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL2 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

M[4]	Meaning
0b1	AArch32 execution state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL2, and copied to PSTATE.M[3:0] on executing an exception return operation in EL2.

M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	RES0	TCO	DIT	UAO	PAN	SS	IL	RES0				SSBS	BT	YPE	D	A	I	F	RES0	M[4]	M[3:0]							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]**When FEAT_MTE is implemented:**

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL2, and copied to PSTATE.TCO on executing an exception return operation in EL2.

When FEAT_MTE2 is not implemented, it is CONSTRAINED UNPREDICTABLE whether this field is RES0 or behaves as if FEAT_MTE is implemented.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]**When FEAT_UAO is implemented:**

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL2, and copied to PSTATE.UAO on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:13]

Reserved, RES0.

SSBS, bit [12]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL2, and copied to PSTATE.BTYPE on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL2, and copied to PSTATE.D on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL2 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

M[4]	Meaning
0b0	AArch64 execution state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.
0b1000	EL2t.
0b1001	EL2h.

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL2 and copied to PSTATE.EL on executing an exception return operation in EL2.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL2 and copied to PSTATE.SP on executing an exception return operation in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic SPSR_EL2 or SPSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_EL2

SPSR_EL3, Saved Program Status Register (EL3)

The SPSR_EL3 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL3.

Configuration

AArch64 System register SPSR_EL3 bits [31:0] can be mapped to AArch32 System register [SPSR_mon\[31:0\]](#), but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to SPSR_EL3 are UNDEFINED.

Attributes

SPSR_EL3 is a 64-bit register.

Field descriptions

When AArch32 is supported at **EL0 any Exception level and exception taken from AArch32 state:**

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	Q	IT[1:0]	DIT	SSBS	PAN	SS	IL	GE				IT[7:2]				E	A	I	F	T	M[4]	M[3:0]						
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL3 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL3, and copied to PSTATE.Q on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL3, and copied to PSTATE.IT on executing an exception return operation in EL3.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL3[26:25].
- IT[7:2] is SPSR_EL3[15:10].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL3, and copied to PSTATE.GE on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL3, and copied to PSTATE.E on executing an exception return operation in EL3.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL3, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL3, and copied to PSTATE.T on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL3 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

M[4]	Meaning
0b1	AArch32 execution state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL3, and copied to PSTATE.M[3:0] on executing an exception return operation in EL3.

M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0110	Monitor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
N	Z	C	V	RES0	TCO	DIT	UAO	PAN	SS	IL	RES0				SSBS	BT	YPE	D	A	I	F	RES0	M[4]	M[3:0]							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL3 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]**When FEAT_MTE is implemented:**

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL3, and copied to PSTATE.TCO on executing an exception return operation in EL3.

When FEAT_MTE2 is not implemented, it is CONSTRAINED UNPREDICTABLE whether this field is RES0 or behaves as if FEAT_MTE is implemented.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]**When FEAT_UAO is implemented:**

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL3, and copied to PSTATE.UAO on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:13]

Reserved, RES0.

SSBS, bit [12]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYP, bits [11:10]

When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL3, and copied to PSTATE.BTYPE on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL3, and copied to PSTATE.D on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL3 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

M[4]	Meaning
0b0	AArch64 execution state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0t.
0b0100	EL1t.
0b0101	EL1h.
0b1000	EL2t.
0b1001	EL2h.
0b1100	EL3t.
0b1101	EL3h.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL3 and copied to PSTATE.EL on executing an exception return operation in EL3.
- M[1] is unused and is 0 for all non-reserved values.

- M[0] is set to the value of PSTATE.SP on taking an exception to EL3 and copied to PSTATE.SP on executing an exception return operation in EL3.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0100	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return SPSR_EL3;
```

MSR SPSR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0100	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SPSR_EL3 = X[t];
```

SVCR, Streaming Vector Control Register

The SVCR characteristics are:

Purpose

Controls Streaming SVE mode and SME behavior.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SVCR are UNDEFINED.

Attributes

SVCR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
																RES0																			
																RES0																Z	A	S	M
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Bits [63:2]

Reserved, RES0.

ZA, bit [1]

Enables ZA array storage. The possible values of this bit are:

ZA	Meaning
0b0	SME ZA array storage is invalid and not accessible. SME instructions that access the ZA array are illegal.
0b1	SME ZA array storage is valid and accessible. If SME instructions are not trapped, SME instructions that access the ZA array are legal.

When PSTATE.ZA is changed by any means from 0 to 1, the contents of the SME ZA storage are set to zero.

When PSTATE.ZA is changed by any means from 1 to 0, there is no observable change to SME ZA storage.

When PSTATE.ZA is changed by any means from 1 to 0 or from 0 to 1, there is no effect on the Streaming SVE vector and predicate registers and [FPSR](#) if PSTATE.SM remains set to 1.

A direct or indirect read of ZA appears to occur in program order relative to a direct write of SVCR, and to MSR SVCRZA and MSR SVCRSMZA instructions, without the need for explicit synchronization.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

SM, bit [0]

Enables Streaming SVE mode. The possible values of this bit are:

SM	Meaning
0b0	The PE is not in Streaming SVE mode.
0b1	The PE is in Streaming SVE mode.

When the effective value of PSTATE.SM is changed by any means from 0 to 1, an entry to Streaming SVE mode is performed, and each implemented bit of the SVE registers Z0-Z31 and P0-P15 in the new mode is set to an IMPLEMENTATION DEFINED choice of one of the following values:

- The value that bit held before the PE entered Streaming SVE mode, but only if that bit is also implemented when the PE is not in Streaming SVE mode.
- The value zero.

When the effective value of PSTATE.SM is changed by any means from 1 to 0, an exit from Streaming SVE mode is performed, and each implemented bit of the SVE registers Z0-Z31 and P0-P15 in the new mode is set to an IMPLEMENTATION DEFINED choice of one of the following values:

- The value that bit held before the PE exited Streaming SVE mode, but only if that bit is also implemented when the PE is in Streaming SVE mode.
- The value zero.

When the effective value of PSTATE.SM is changed by any means from from 1 to 0, each implemented bit of the FFR predicate register in the new mode is set to zero.

When the effective value of PSTATE.SM is changed by any means from 0 to 1 or from 1 to 0, the [FPSR](#) in the new mode is set to an IMPLEMENTATION DEFINED choice of one of the following values:

- The value that the [FPSR](#) held in the previous mode, before PSTATE.SM was changed.
- The value 0x0000_0000_0800_009f, in which all of the cumulative status bits are set to 1.

A direct or indirect read of SM appears to occur in program order relative to a direct write of SVCR, and to MSR SVCRSM and MSR SVCRSMZA instructions, without the need for explicit synchronization.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing SVCR

SVCR is read/write and can be accessed from any Exception level.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SVCR

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b010

TCR_EL1, Translation Control Register (EL1)

The TCR_EL1 characteristics are:

Purpose

The control register for stage 1 of the EL1&0 translation regime.

Configuration

AArch64 System register TCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [TTBCR\[31:0\]](#).

AArch64 System register TCR_EL1 bits [63:32] are architecturally mapped to AArch32 System register [TTBCR2\[31:0\]](#).

Attributes

TCR_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45
RES0	DS	TCMA1	TCMA0	EOPD1	EOPD0	NFD1	NFD0	TBID1	TBID0	HWU162	HWU161	HWU160	HWU159	HWU062	HWU061	HWU060	HWU059	HWU058
TG1	SH1	ORGN1	IRGN1	EPD1	A1	T1SZ										TG0		9
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13

Any of the bits in TCR_EL1, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

Bits [63:60]

Reserved, RES0.

DS, bit [59]

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL1&0 translation regime.

DS	Meaning
0b0	<p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p>
0b1	<p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of translation table descriptors hold output address[51:50].</p> <p>The shareability information of block and page descriptors for cacheable locations is determined by:</p> <ul style="list-style-type: none"> • TCR_EL1.SH0 if the VA is translated using tables pointed to by TTBR0_EL1. • TCR_EL1.SH1 if the VA is translated using tables pointed to by TTBR1_EL1. <p>The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of TTBR0_EL1 or TTBR1_EL1 are used to hold bits[51:48] of the output address in all cases.</p> <hr/> <p>Note</p> <p>As FEAT_LVA must be implemented if TCR_EL1.DS == 1, the minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12, as determined by that extension.</p> <hr/> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p> <hr/> <p>Note</p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p>

This field is RES0 for a 64KB translation granule.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA1, bit [58]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if [HCR_EL2](#).{E2H,TGE}!={1,1}, when address[59:55] = 0b11111.

TCMA1	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL1 or EL0.
0b1	All accesses at EL1 and EL0 are Unchecked.
Note	

Software may change this control bit on a context switch.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if [HCR_EL2](#).{E2H,TGE}!= {1,1}, when address[59:55] = 0b00000.

TCMA0	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL1 or EL0.
0b1	All accesses at EL1 and EL0 are Unchecked.

Note

Software may change this control bit on a context switch.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EOPD1, bit [56]

When FEAT_EOPD is implemented:

Faulting control for Unprivileged access to any address translated by [TTBR1_EL1](#).

EOPD1	Meaning
0b0	Unprivileged access to any address translated by TTBR1_EL1 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR1_EL1 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EOPD0, bit [55]**When FEAT_EOPD is implemented:**

Faulting control for Unprivileged access to any address translated by [TTBR0_EL1](#).

EOPD0	Meaning
0b0	Unprivileged access to any address translated by TTBR0_EL1 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR0_EL1 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]**When FEAT_SVE is implemented or FEAT_TME is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR1_EL1](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR1_EL1](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

NFD1	Meaning
0b0	Does not disable stage 1 translation table walks using TTBR1_EL1 .
0b1	A TLB miss on a virtual address that is translated using TTBR1_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]**When FEAT_SVE is implemented or FEAT_TME is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR0_EL1](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR0_EL1](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

NFD0	Meaning
0b0	Does not disable stage 1 translation table walks using TTBR0_EL1 .
0b1	A TLB miss on a virtual address that is translated using TTBR0_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

TBID1	Meaning
0b0	TCR_EL1.TBI1 applies to Instruction and Data accesses.
0b1	TCR_EL1.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR1_EL1](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

TBID0	Meaning
0b0	TCR_EL1.TBI0 applies to Instruction and Data accesses.
0b1	TCR_EL1.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL1](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

HWU162	Meaning
0b0	For translations using TTBR1_EL1 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU161, bit [49]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

HWU161	Meaning
0b0	For translations using TTBR1_EL1 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU160, bit [48]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

HWU160	Meaning
0b0	For translations using TTBR1_EL1 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU159, bit [47]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

HWU159	Meaning
0b0	For translations using TTBR1_EL1 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU062, bit [46]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU062	Meaning
0b0	For translations using TTBR0_EL1 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU061, bit [45]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU061	Meaning
0b0	For translations using TTBR0_EL1 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU060, bit [44]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU060	Meaning
0b0	For translations using TTBR0_EL1 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU059, bit [43]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU059	Meaning
0b0	For translations using TTBR0_EL1 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HPD1, bit [42]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR1_EL1](#).

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]**When FEAT_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0_EL1](#).

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]**When FEAT_HAFDBS is implemented:**

Hardware management of dirty state in stage 1 translations from EL0 and EL1.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]**When FEAT_HAFDBS is implemented:**

Hardware Access flag update in stage 1 translations from EL0 and EL1.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the [TTBR1_EL1](#) region, or ignored and used for tagged addresses.

TBI1	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by [TTBR1_EL1](#). It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL1.TBID1 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TBI0, bit [37]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL1](#) region, or ignored and used for tagged addresses.

TBI0	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL1](#). It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL1.TBID0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

ASID Size.

AS	Meaning
0b0	8 bit - the upper 8 bits of TTBR0_EL1 and TTBR1_EL1 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
0b1	16 bit - the upper 16 bits of TTBR0_EL1 and TTBR1_EL1 are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

IPS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL1 are 0b0000.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

Granule size for the [TTBR1_EL1](#).

TG1	Meaning
0b01	16KB.
0b10	4KB.
0b11	64KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1_EL1](#).

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1_EL1](#).

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1_EL1](#).

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Translation table walk disable for translations using [TTBR1_EL1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1_EL1](#). The encoding of this bit is:

EPD1	Meaning
0b0	Perform translation table walks using TTBR1_EL1 .
0b1	A TLB miss on an address that is translated using TTBR1_EL1 generates a Translation fault. No translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Selects whether [TTBR0_EL1](#) or [TTBR1_EL1](#) defines the ASID. The encoding of this bit is:

A1	Meaning
0b0	TTBR0_EL1 .ASID defines the ASID.
0b1	TTBR1_EL1 .ASID defines the ASID.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T1SZ, bits [21:16]

The size offset of the memory region addressed by [TTBR1_EL1](#). The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL1](#).

TG0	Meaning
0b00	4KB
0b01	64KB
0b10	16KB

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

SH0	Meaning
0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Translation table walk disable for translations using [TTBR0_EL1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0_EL1](#). The encoding of this bit is:

EPD0	Meaning
0b0	Perform translation table walks using TTBR0_EL1 .
0b1	A TLB miss on an address that is translated using TTBR0_EL1 generates a Translation fault. No translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL1](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TCR_EL1 or TCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.TCR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        return NVMem[0x120];
    else
        return TCR_EL1;
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        return TCR_EL2;
    else
        return TCR_EL1;
elsif PSTATE.EL == EL3 then
    return TCR_EL1;

```

MSR TCR_EL1, <Xt>

The TCR_EL2 characteristics are:

Purpose

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the Effective value of [HCR_EL2.E2H](#) is 0, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using [TTBR0_EL2](#).
- When the value of [HCR_EL2.E2H](#) is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
 - A lower VA range, translated using [TTBR0_EL2](#).
 - A higher VA range, translated using [TTBR1_EL2](#).

Configuration

AArch64 System register TCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HTCR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

TCR_EL2 is a 64-bit register.

Field descriptions

When HCR_EL2.E2H == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33		
RES0																																
RES1	TCMA	TBID	HWU62	HWU61	HWU60	HWU59	HPD	RES1	HD	HA	TBI	RES0	PS	TG0	SH0	ORGN0	IRGN0	RES0	T0SZ													
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1		

Any of the bits in TCR_EL2, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

Bits [63:33]

Reserved, RES0.

DS, bit [32]

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL2 translation regime.

DS	Meaning
0b0	<p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of TCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p>
0b1	<p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of translation table descriptors hold output address[51:50].</p> <p>The shareability information of block and page descriptors for cacheable locations is determined by TCR_EL2.SH0.</p> <p>The minimum value of TCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of TTBR0_EL2 are used to hold bits[51:48] of the output address in all cases.</p> <hr/> <p>Note</p> <p>As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.T0SZ field is 12, as determined by that extension.</p> <hr/> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p> <hr/> <p>Note</p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p> <hr/>

This field is RES0 for a 64KB translation granule.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

TCMA, bit [30]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL2 when address [59:56] = 0b0000.

TCMA	Meaning
0b0	This control has no effect on the generation of Unchecked accesses.
0b1	All accesses are Unchecked.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]

When FEAT_PAAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

TBID	Meaning
0b0	TCR_EL2.TBI applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL2](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU61, bit [27]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU59, bit [25]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HPD, bit [24]**When FEAT_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0_EL2](#).

HPD	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

Note
In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]**When FEAT_HAFDBS is implemented:**

Hardware management of dirty state in stage 1 translations from EL2.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]**When FEAT_HAFDBS is implemented:**

Hardware Access flag update in stage 1 translations from EL2.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL2](#) region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state'.

TBI	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID is 1, then this field only applies to Data accesses.

If the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

PS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL2](#).

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGNO, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

ORGNO	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL2](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_VHE is implemented and HCR_EL2.E2H == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45
RES0	DS	TCMA1	TCMA0	EOPD1	EOPD0	NFD1	NFD0	TBID1	TBID0	HWU162	HWU161	HWU160	HWU159	HWU158	HWU157	HWU156	HWU155	HWU154
TG1	SH1	ORGN1	IRGN1	EPD1	A1													
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13

This view of the register is only valid from Armv8.1 when [HCR_EL2.E2H](#) is 1.

Any of the bits in TCR_EL2 are permitted to be cached in a TLB.

Bits [63:60]

Reserved, RES0.

DS, bit [59]

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL2&0 translation regime.

DS	Meaning
0b0	<p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p>
0b1	<p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of translation table descriptors hold output address[51:50].</p> <p>The shareability information of block and page descriptors for cacheable locations is determined by:</p> <ul style="list-style-type: none"> • TCR_EL2.SH0 if the VA is an address that is translated using tables pointed to by TTBR0_EL2. • TCR_EL2.SH1 if the VA is an address that is translated using tables pointed to by TTBR1_EL2. <p>The minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 16 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of TTBR0_EL2 or TTBR1_EL2 are used to hold bits[51:48] of the output address in all cases.</p> <hr/> <p>Note</p> <p>As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 12, as determined by that extension.</p> <hr/> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p> <hr/> <p>Note</p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p> <hr/>

This field is RES0 for a 64KB translation granule.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA1, bit [58]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = 0b11111.

TCMA1	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL2 or EL0.
0b1	All accesses are Unchecked.
Note	

Software may change this control bit on a context switch.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = 0b00000.

TCMA0	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL2 or EL0.
0b1	All accesses are Unchecked.

Note

Software may change this control bit on a context switch.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EOPD1, bit [56]

When FEAT_EOPD is implemented:

Faulting control for Unprivileged access to any address translated by [TTBR1_EL2](#).

EOPD1	Meaning
0b0	Unprivileged access to any address translated by TTBR1_EL2 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR1_EL2 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EOPD0, bit [55]**When FEAT_EOPD is implemented:**

Faulting control for Unprivileged access to any address translated by [TTBR0_EL2](#).

EOPD0	Meaning
0b0	Unprivileged access to any address translated by TTBR0_EL2 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR0_EL2 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]**When FEAT_SVE is implemented or FEAT_TME is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR1_EL2](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR1_EL2](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

NFD1	Meaning
0b0	Does not disable stage 1 translation table walks using TTBR1_EL2 .
0b1	A TLB miss on a virtual address that is translated using TTBR1_EL2 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]**When FEAT_SVE is implemented or FEAT_TME is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR0_EL2](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR0_EL2](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

NFD0	Meaning
0b0	Does not disable stage 1 translation table walks using TTBR0_EL2 .
0b1	A TLB miss on a virtual address that is translated using TTBR0_EL2 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

TBID1	Meaning
0b0	TCR_EL2.TBI1 applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR1_EL2](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For more information, see 'Address tagging in AArch64 state'.

TBID0	Meaning
0b0	TCR_EL2.TBI0 applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL2](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

HWU162	Meaning
0b0	For translations using TTBR1_EL2 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU161, bit [49]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

HWU161	Meaning
0b0	For translations using TTBR1_EL2 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU160, bit [48]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

HWU160	Meaning
0b0	For translations using TTBR1_EL2 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU159, bit [47]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

HWU159	Meaning
0b0	For translations using TTBR1_EL2 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU062, bit [46]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU062	Meaning
0b0	For translations using TTBR0_EL1 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU061, bit [45]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU061	Meaning
0b0	For translations using TTBR0_EL1 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU060, bit [44]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU060	Meaning
0b0	For translations using TTBR0_EL1 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU059, bit [43]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

HWU059	Meaning
0b0	For translations using TTBR0_EL1 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HPD1, bit [42]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR1_EL2](#).

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0_EL2](#).

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL2.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL2.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR1_EL2](#) region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state'.

TBI1	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR1_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID1 is 1, then this field only applies to Data accesses.

If the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TBIO, bit [37]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL2](#) region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state'.

TBIO	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID0 is 1, then this field only applies to Data accesses.

If the value of TBIO is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

ASID Size.

AS	Meaning
0b0	8 bit - the upper 8 bits of TTBR0_EL2 and TTBR1_EL2 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
0b1	16 bit - the upper 16 bits of TTBR0_EL2 and TTBR1_EL2 are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

IPS	Meaning	Applies when
0b000	32 bits, 4GB.	
0b001	36 bits, 64GB.	
0b010	40 bits, 1TB.	
0b011	42 bits, 4TB.	
0b100	44 bits, 16TB.	
0b101	48 bits, 256TB.	
0b110	52 bits, 4PB.	When FEAT_LPA is implemented

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

Granule size for the [TTBR1_EL2](#).

TG1	Meaning
0b01	16KB.
0b10	4KB.
0b11	64KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Translation table walk disable for translations using [TTBR1_EL2](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1_EL2](#). The encoding of this bit is:

EPD1	Meaning
0b0	Perform translation table walks using TTBR1_EL2 .
0b1	A TLB miss on an address that is translated using TTBR1_EL2 generates a Translation fault. No translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Selects whether [TTBR0_EL2](#) or [TTBR1_EL2](#) defines the ASID. The encoding of this bit is:

A1	Meaning
0b0	TTBR0_EL2 .ASID defines the ASID.
0b1	TTBR1_EL2 .ASID defines the ASID.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T1SZ, bits [21:16]

The size offset of the memory region addressed by [TTBR1_EL2](#). The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL2](#).

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Translation table walk disable for translations using [TTBR0_EL2](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0_EL2](#). The encoding of this bit is:

EPD0	Meaning
0b0	Perform translation table walks using TTBR0_EL2 .
0b1	A TLB miss on an address that is translated using TTBR0_EL2 generates a Translation fault. No translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL2](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TCR_EL2 or TCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return TCR_EL2;
elsif PSTATE.EL == EL3 then
    return TCR_EL2;

```

MSR TCR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TCR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    TCR_EL2 = X[t];

```

MRS <Xt>, TCR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.TCR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        return NVMem[0x120];
    else
        return TCR_EL1;
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        return TCR_EL2;
    else
        return TCR_EL1;
elsif PSTATE.EL == EL3 then
    return TCR_EL1;

```

MSR TCR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGWTR_EL2.TCR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        NVMem[0x120] = X[t];
    else
        TCR_EL1 = X[t];
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        TCR_EL2 = X[t];
    else
        TCR_EL1 = X[t];
elsif PSTATE.EL == EL3 then
    TCR_EL1 = X[t];

```

The TCR EL3 characteristics are:

Purpose

The control register for stage 1 of the EL3 translation regime.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to TCR_EL3 are UNDEFINED.

Attributes

TCR_EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33		
RES0																																
RES1	TCMA	TBID	HWU62	HWU61	HWU60	HWU59	HPD	RES1	HD	HA	TBI	RES0	PS	TG0	SH0	ORGN0	IRGN0	RES0	T0SZ													
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1		

Any of the bits in TCR EL3 are permitted to be cached in a TLB.

Bits [63:33]

Reserved, RES0.

DS, bit [32]

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL3 translation regime.

DS	Meaning
0b0	<p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of TCR_EL3.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p>
0b1	<p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of table translation descriptors hold output address[51:50].</p> <p>The shareability information of block and page descriptors for cacheable locations is determined by TCR_EL3.SH0.</p> <p>The minimum value of TCR_EL3.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of TTBR0_EL3 are used to hold bits[51:48] of the output address in all cases.</p> <hr/> <p>Note</p> <p>As FEAT_LVA must be implemented if TCR_EL3.DS == 1, the minimum value of the TCR_EL3.T0SZ field is 12, as determined by that extension.</p> <hr/> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p> <hr/> <p>Note</p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p> <hr/>

This field is RES0 for a 64KB translation granule.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

TCMA, bit [30]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL3 when address [59:56] = 0b0000.

TCMA	Meaning
0b0	This control has no effect on the generation of Unchecked accesses.
0b1	All accesses are Unchecked.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]

When FEAT_PAAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

TBID	Meaning
0b0	TCR_EL3.TBI applies to Instruction and Data accesses.
0b1	TCR_EL3.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL3](#).

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU61, bit [27]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HWU59, bit [25]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Reserved, RES0.

HPD, bit [24]**When FEAT_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0_EL3](#).

HPD	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

Note
In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]**When FEAT_HAFDBS is implemented:**

Hardware management of dirty state in stage 1 translations from EL3.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]**When FEAT_HAFDBS is implemented:**

Hardware Access flag update in stage 1 translations from EL3.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL3](#) region, or ignored and used for tagged addresses.

TBI	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL3](#). It has an effect whether the EL3 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL3.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- An exception return to EL3.

For more information, see 'Address tagging in AArch64 state'.

Note

This control determines the scope of address tagging. It never causes an exception to be generated.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

PS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL3 are 0b0000.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL3](#).

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL3](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL3](#).

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL3](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL3](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL3

op0	op1	CRn	CRm	op2
-----	-----	-----	-----	-----

TCR_EL3, Translation Control Register (EL3)

0b11	0b110	0b0010	0b0000	0b010
------	-------	--------	--------	-------

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return TCR_EL3;

```

MSR TCR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0000	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    TCR_EL3 = X[t];

```

TLBI ASIDE1, TLBI ASIDE1NXS, TLB Invalidate by ASID, EL1

The TLBI ASIDE1, TLBI ASIDE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- **WhenIf FEAT_RME is implemented, when EL2 is implemented and enabled in the Security state described by the current Security value state of SCR_EL3.{NSE, NS}:**
 - **When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime for the Security state indicated by the current value of SCR_EL3.{NSE, NS}.**
 - **If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate an address using the EL1&0 translation regime for the Security state.state indicated by the current value of SCR_EL3.{NSE, NS}.**
 - **If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime for the Security state.state indicated by the current value of SCR_EL3.{NSE, NS}.**
- **If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate an address using the EL1&0 translation regime for the Security state indicated by the current value of SCR_EL3.NS.**
 - **If HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime for the Security state indicated by the current value of SCR_EL3.NS.**
 - **When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime for the Security state indicated by the current value of SCR_EL3.NS.**

WhenIf EL2FEAT_RME is not implemented, orwhen EL2 is disabledimplemented and enabled in the current Security state, thedescribed entryby would be required to translate an address using the EL1&0current translationvalue regime for the Security state.ofSCR_EL3.NS:

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI ASIDE1, TLBI ASIDE1NXS is a 64-bit System instruction.

Field descriptions

ASID, bits [63:48]

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this System instruction.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Bits [47:0]

Reserved, RES0.

Executing the TLBI ASIDE1, TLBI ASIDE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI ASIDE1{, <Xt>}

TLBI ASIDE1IS, TLBI ASIDE1ISNXS, TLB Invalidate by ASID, EL1, Inner Shareable

The TLBI ASIDE1IS, TLBI ASIDE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- **When** **FEAT_RME** is implemented, **when** **EL2** is implemented and enabled in the **Security state** described by the current **Security value state** of **SCR_EL3.{NSE, NS}**:
 - **When** **EL2** is not implemented or is disabled in the current **Security state**, the entry would be required to translate an address using the **EL1&0 translation regime** for the **Security state** indicated by the current value of **SCR_EL3.{NSE, NS}**.
 - If **HCR_EL2.{E2H, TGE}** is not {1, 1}, the entry would be used with the current VMID and would be required to translate an address using the **EL1&0 translation regime** for the **Security state** indicated by the current value of **SCR_EL3.{NSE, NS}**.
 - If **HCR_EL2.{E2H, TGE}** is {1, 1}, the entry would be required to translate an address using the **EL2&0 translation regime** for the **Security state** indicated by the current value of **SCR_EL3.{NSE, NS}**.
- **When** **FEAT_RME** is not implemented, **or** **when** **EL2** is disabled, **implemented** and enabled in the **current Security state**, the described entry would be required to translate an address using the **EL1&0 current translation value regime** for the **Security state** of **SCR_EL3.NS**:
 - If **HCR_EL2.{E2H, TGE}** is not {1, 1}, the entry would be used with the current VMID and would be required to translate an address using the **EL1&0 translation regime** for the **Security state** indicated by the current value of **SCR_EL3.NS**.
 - If **HCR_EL2.{E2H, TGE}** is {1, 1}, the entry would be required to translate an address using the **EL2&0 translation regime** for the **Security state** indicated by the current value of **SCR_EL3.NS**.
 - **When** **EL2** is not implemented or is disabled in the current **Security state**, the entry would be required to translate an address using the **EL1&0 translation regime** for the **Security state** indicated by the current value of **SCR_EL3.NS**.

When **FEAT_RME** is not implemented, **or** **when** **EL2** is disabled, **implemented** and enabled in the **current Security state**, the described entry would be required to translate an address using the **EL1&0 current translation value regime** for the **Security state** of **SCR_EL3.NS**.

The **Security state** is indicated by the value of **SCR_EL3.NS** if **FEAT_RME** is not implemented, or **SCR_EL3.{NSE, NS}** if **FEAT_RME** is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If **FEAT_XS** is implemented, the **nXS** variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the **nXS** qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the **nXS** qualifier is considered complete when the subset of these memory accesses with **XS** attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI ASIDE1IS, TLBI ASIDE1ISNXS is a 64-bit System instruction.

TLBI RIPAS2E1, TLBI RIPAS2E1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI RIPAS2E1, TLBI RIPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.~~

If `TTL==10` and `BaseADDR[28:16]` is not equal to `00000000000000`.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2E1, TLBI RIPAS2E1NXS are UNDEFINED.

Attributes

TLBI RIPAS2E1, TLBI RIPAS2E1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
NS	RES0														TG	SCALE	NUM					TTL	BaseADDR									
BaseADDR																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and `SCR_EL3.{NSE, NS} == {0, 0}`, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and `SCR_EL3.{NSE, NS} == {1, 1}`, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and `SCR_EL3.{NSE, NS} == {0, 1}`, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RIPAS2E1, TLBI RIPAS2E1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RIPAS2E1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b010

TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.

TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

- If `TTL==10` and `BaseADDR[28:16]` is not equal to `00000000000000`.

If `TTL==10` and `BaseADDR[28:16]` is not equal to `00000000000000`.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS are UNDEFINED.

Attributes

TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS is a 64-bit System instruction.

Field descriptions

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and `SCR_EL3.{NSE, NS} == {0, 0}`, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and `SCR_EL3.{NSE, NS} == {1, 1}`, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and `SCR_EL3.{NSE, NS} == {0, 1}`, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 0000000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 0000000000000000000000000000000000.

- If `TTL==10` and `BaseADDR[28:16]` is not equal to `00000000000000`.
- If `TTL==10` and `BaseADDR[28:16]` is not equal to `00000000000000`.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS are UNDEFINED.

Attributes

TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS is a 64-bit System instruction.

When the instruction is executed and `SCR_EL3.{NSE, NS} == {0, 1}`, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

Accesses to this instruction use the following encodings in the System instruction encoding space:

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b011

op0	op1	CRn	CRm	op2
0b01	0b100	0b1001	0b0100	0b011

```

```

TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.~~

TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

If $TTL == 10$ and $BaseADDR[28:16]$ is not equal to 00000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and $SCR_EL3.\{NSE, NS\} == \{0, 0\}$, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and $SCR_EL3.\{NSE, NS\} == \{1, 1\}$, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and $SCR_EL3.\{NSE, NS\} == \{0, 1\}$, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RIPAS2LE1{, <Xt>}

TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.

- If `TTL==10` and `BaseADDR[28:16]` is not equal to `00000000000000`.
- If `TTL==10` and `BaseADDR[28:16]` is not equal to `00000000000000`.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS is a 64-bit System instruction.

Field descriptions

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and `SCR_EL3.{NSE, NS} == {0, 0}`, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and `SCR_EL3.{NSE, NS} == {1, 1}`, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and `SCR_EL3.{NSE, NS} == {0, 1}`, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS instruction

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
- A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - **If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.**

If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.

- If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.

If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.

- If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NS	RES0														TG	SCALE	NUM						TTL	BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS instruction

TLBI RPALOS, TLB Range Invalidate GPT Information by PA, Last level, Outer Shareable

The TLBI RPALOS characteristics are:

Purpose

Invalidates cached copies of GPT entries from TLBs. Details:

- The invalidation applies to TLB entries containing GPT information relating to a physical address.
- The invalidation affects all TLBs in the Outer Shareable domain.
- Invalidates TLB entries containing GPT information from the last level of the GPT walk that relates to the supplied physical address.
- Invalidations are range-based, invalidating TLB entries starting from the address in BaseADDR, within the range as specified by SIZE.

The full set of TLB maintenance instructions that invalidate cached GPT entries is: [TLBI PAALL](#), [TLBI PAALLOS](#), [TLBI RPALOS](#), and [TLBI RPAOS](#).

These instructions have the same ordering, observability, and completion behavior as all other TLBI instructions.

Configuration

This instruction is present only when FEAT_RME is implemented. Otherwise, direct accesses to TLBI RPALOS are UNDEFINED.

Attributes

TLBI RPALOS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																SIZE				RES0				Address											
Address																																			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Bits [63:48]

Reserved, RES0.

SIZE, bits [47:44]

Size of the range for invalidation.

If SIZE is a reserved value, no TLB entries are required to be invalidated.

SIZE	Meaning
0b0000	4KB.
0b0001	16KB.
0b0010	64KB.
0b0011	2MB.
0b0100	32MB.
0b0101	512MB.
0b0110	1GB.
0b0111	16GB.
0b1000	64GB.
0b1001	512GB.

All other values are reserved.

If SIZE gives a range smaller than the configured physical granule size in [GPCCR_EL3.PGS](#), then the effective value of SIZE is taken to be the size configured by [GPCCR_EL3.PGS](#).

If [GPCCR_EL3.PGS](#) is configured to a reserved value, no TLB entries are required to be invalidated.

Bits [43:40]

Reserved, RES0.

Address, bits [39:0]

The starting address for the range of the maintenance instruction.

This field is decoded with reference to the value of [GPCCR_EL3.PGS](#) to give BaseADDR as follows:

GPCCR_EL3.PGS	BaseADDR
0b00 (4KB)	BaseADDR[51:12] = Xt[39:0]
0b10 (16KB)	BaseADDR[51:14] = Xt[39:2]
0b01 (64KB)	BaseADDR[51:16] = Xt[39:4]

Other If bits BaseADDR of is BaseADDR not are aligned treated with as the zero size specified in SIZE, to no give TLB the entries effective are value required of to BaseADDR be invalidated.

If Other the bits effective value of BaseADDR is not aligned to the size of the effective value of SIZE, no TLB entries are required taken to as be invalidated zero.

If [GPCCR_EL3.PGS](#) is configured to a reserved value, no TLB entries are required to be invalidated.

Executing the TLBI RPALOS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RPALOS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0100	0b111

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    AArch64.TLBI_RPA(TLBI_Level_Last, Xt[t], Shareability_OSH);

```

TLBI RVAAE1, TLBI RVAAE1NXS, TLB Range Invalidate by VA, All ASID, EL1

The TLBI RVAAE1, TLBI RVAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

If FEAT_RME is implemented, when EL2 is implemented and enabled in the Security state described by the current value of [SCR_EL3](#).{NSE, NS}:

- WhenIf FEAT_RME is not implemented, when EL2 is implemented and enabled in the Security state described by the current Security value state of [SCR_EL3](#).NS:
 - When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.

TLBI RVAAE1, TLBI RVAAE1NXS, TLB Range Invalidate by VA, All ASID, EL1

If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.

- If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.

- For the 64K translation granule:

- If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.

If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.

- If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAAE1, TLBI RVAAE1NXS are UNDEFINED.

Attributes

TLBI RVAAE1, TLBI RVAAE1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAAE1, TLBI RVAAE1NXS instruction

TLBI RVAAE1IS, TLBI RVAAE1ISNXS, TLB Range Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI RVAAE1IS, TLBI RVAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.

The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

If FEAT_RME is implemented, when EL2 is implemented and enabled in the Security state described by the current value of [SCR_EL3](#).{NSE, NS}:

- WhenIf FEAT_RME is not implemented, when EL2 is implemented and enabled in the Security state described by the current Securityvalue state.of [SCR_EL3](#).NS:
 - When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.state indicated by the current value of [SCR_EL3](#).NS.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.

- A PE with [SCR_EL3.EEL2==0](#) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3.EEL2==1](#).
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAAE1IS, TLBI RVAAE1ISNXS are UNDEFINED.

Attributes

TLBI RVAAE1IS, TLBI RVAAE1ISNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																TG	SCALE	NUM				TTL	BaseADDR										
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAAE1IS, TLBI RVAAE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAAE1IS{, <Xt>}

TLBI RVAAE1OS, TLBI RVAAE1OSNXS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI RVAAE1OS, TLBI RVAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

If FEAT_RME is implemented, when EL2 is implemented and enabled in the Security state described by the current value of [SCR_EL3](#).{NSE, NS}:

- WhenIf FEAT_RME is not implemented, when EL2 is implemented and enabled in the Security state described by the current Securityvalue state.of [SCR_EL3](#).NS:
 - When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.state indicated by the current value of [SCR_EL3](#).NS.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.

- A PE with [SCR_EL3.EEL2==0](#) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3.EEL2==1](#).
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAAE1OS, TLBI RVAAE1OSNXS are UNDEFINED.

Attributes

TLBI RVAAE1OS, TLBI RVAAE1OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAAE1OS, TLBI RVAAE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAAE1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0101	0b011

TLBI RVAALE1, TLBI RVAALE1NXS, TLB Range Invalidate by VA, All ASID, Last level, EL1

The TLBI RVAALE1, TLBI RVAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

If FEAT_RME is implemented, when EL2 is implemented and enabled in the Security state described by the current value of [SCR_EL3](#).{NSE, NS}:

- WhenIf FEAT_RME is not implemented, when EL2 is implemented and enabled in the Security state described by the current Securityvalue state.of [SCR_EL3](#).NS:
 - When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.state indicated by the current value of [SCR_EL3](#).NS.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If $TTL == 01$ and $BaseADDR[29:12]$ is not equal to 00000000000000000000 .

If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.

◦ If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.

If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.

- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00.
 - If TTL==01 and BaseADDR[41:16] is not equal to 00.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAALE1, TLBI RVAALE1NXS are UNDEFINED.

Attributes

TLBI RVAALE1, TLBI RVAALE1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAALE1, TLBI RVAALE1NXS instruction

TLBI RVAALE1IS, TLBI RVAALE1ISNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI RVAALE1IS, TLBI RVAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- - If `HCR_EL2.{E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of `SCR_EL3.{NSE, NS}`.
 - If `HCR_EL2.{E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of `SCR_EL3.{NSE, NS}`.
 - When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of `SCR_EL3.{NSE, NS}`.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

If FEAT_RME is implemented, when EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3.{NSE, NS}`:

- WhenIf FEAT_RME is not implemented, when EL2 is implemented and enabled in the Security state described by the current Securityvalue state of `SCR_EL3.NS`:
 - When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of `SCR_EL3.NS`.
 - If `HCR_EL2.{E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.state indicated by the current value of `SCR_EL3.NS`.
 - If `HCR_EL2.{E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.state indicated by the current value of `SCR_EL3.NS`.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The Security state is indicated by the value of `SCR_EL3.NS` if FEAT_RME is not implemented, or `SCR_EL3.{NSE, NS}` if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if `SCR_EL3.EEL2==1`, then:

- A PE with [SCR_EL3.EEL2==1](#) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3.EEL2==0](#).
- A PE with [SCR_EL3.EEL2==0](#) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3.EEL2==1](#).
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000000000000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000000000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAALE1IS, TLBI RVAALE1ISNXS are UNDEFINED.

Attributes

TLBI RVAALE1IS, TLBI RVAALE1ISNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAALE1IS, TLBI RVAALE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAALE1IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0010	0b111

TLBI RVAALE1OS, TLBI RVAALE1OSNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBI RVAALE1OS, TLBI RVAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- - If `HCR_EL2.{E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of `SCR_EL3.{NSE, NS}`.
 - If `HCR_EL2.{E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of `SCR_EL3.{NSE, NS}`.
 - When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of `SCR_EL3.{NSE, NS}`.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

If FEAT_RME is implemented, when EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3.{NSE, NS}`:

- WhenIf FEAT_RME is not implemented, when EL2 is implemented and enabled in the Security state described by the current Securityvalue state of `SCR_EL3.NS`:
 - When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of `SCR_EL3.NS`.
 - If `HCR_EL2.{E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of `SCR_EL3.NS`.
 - If `HCR_EL2.{E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of `SCR_EL3.NS`.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The Security state is indicated by the value of `SCR_EL3.NS` if FEAT_RME is not implemented, or `SCR_EL3.{NSE, NS}` if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if `SCR_EL3.EEL2==1`, then:

- A PE with [SCR_EL3.EEL2==1](#) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3.EEL2==0](#).
- A PE with [SCR_EL3.EEL2==0](#) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3.EEL2==1](#).
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAALE1OS, TLBI RVAALE1OSNXS are UNDEFINED.

Attributes

TLBI RVAALE1OS, TLBI RVAALE1OSNXS is a 64-bit System instruction.

Field descriptions

TLBI RVAE1, TLBI RVAE1NXS, TLB Range Invalidate by VA, EL1

The TLBI RVAE1, TLBI RVAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

If FEAT_RME is implemented, when EL2 is implemented and enabled in the Security state described by the current value of [SCR_EL3](#).{NSE, NS}:

- WhenIf FEAT_RME is not implemented, when EL2 is implemented and enabled in the Security state described by the current Securityvalue state:of [SCR_EL3](#).NS:
 - When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.state indicated by the current value of [SCR_EL3](#).NS.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:

- If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
- If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
- If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE1, TLBI RVAE1NXS are UNDEFINED.

Attributes

TLBI RVAE1, TLBI RVAE1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TG	SCALE	NUM				TTL		BaseADDR									
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE1, TLBI RVAE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0110	0b001

```

TLBI RVAE1IS, TLBI RVAE1ISNXS, TLB Range Invalidate by VA, EL1, Inner Shareable

The TLBI RVAE1IS, TLBI RVAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

If FEAT_RME is implemented, when EL2 is implemented and enabled in the Security state described by the current value of [SCR_EL3](#).{NSE, NS}:

- WhenIf FEAT_RME is not implemented, when EL2 is implemented and enabled in the Security state described by the current Securityvalue state:of [SCR_EL3](#).NS:
 - When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.state indicated by the current value of [SCR_EL3](#).NS.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3.EEL2==1](#), then:

- A PE with [SCR_EL3.EEL2==1](#) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3.EEL2==0](#).
- A PE with [SCR_EL3.EEL2==0](#) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3.EEL2==1](#).
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If [TTL==01](#) and [BaseADDR\[29:12\]](#) is not equal to 00000000000000000000.
 - If [TTL==01](#) and [BaseADDR\[29:12\]](#) is not equal to 00000000000000000000.
 - If [TTL==10](#) and [BaseADDR\[20:12\]](#) is not equal to 0000000000.
 - If [TTL==10](#) and [BaseADDR\[20:12\]](#) is not equal to 0000000000.
- For the 16K translation granule:
 - If [TTL==10](#) and [BaseADDR\[24:14\]](#) is not equal to 000000000000.
- For the 64K translation granule:
 - If [TTL==01](#) and [BaseADDR\[41:16\]](#) is not equal to 00000000000000000000000000000000.
 - If [TTL==01](#) and [BaseADDR\[41:16\]](#) is not equal to 00000000000000000000000000000000.
 - If [TTL==10](#) and [BaseADDR\[28:16\]](#) is not equal to 0000000000000000.
 - If [TTL==10](#) and [BaseADDR\[28:16\]](#) is not equal to 0000000000000000.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE1IS, TLBI RVAE1ISNXS are UNDEFINED.

Attributes

TLBI RVAE1IS, TLBI RVAE1ISNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TG	SCALE	NUM				TTL		BaseADDR									
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE1IS, TLBI RVAE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE1OS, TLBI RVAE1OSNXS, TLB Range Invalidate by VA, EL1, Outer Shareable

The TLBI RVAE1OS, TLBI RVAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

If FEAT_RME is implemented, when EL2 is implemented and enabled in the Security state described by the current value of [SCR_EL3](#).{NSE, NS}:

- When [FEAT_RME](#) is not implemented, when EL2 is implemented and enabled in the Security state described by the current Security value state of [SCR_EL3](#).NS:
 - When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3.EEL2==1](#), then:

- A PE with [SCR_EL3.EEL2==1](#) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3.EEL2==0](#).
- A PE with [SCR_EL3.EEL2==0](#) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3.EEL2==1](#).
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - **If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.**
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - **If TTL==10 and BaseADDR[20:12] is not equal to 000000000.**
If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - **If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.**
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - **If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.**
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE1OS, TLBI RVAE1OSNXS are UNDEFINED.

Attributes

TLBI RVAE1OS, TLBI RVAE1OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TG	SCALE	NUM				TTL		BaseADDR									
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE1OS, TLBI RVAE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE1OS{, <Xt>}

TLBI RVAE2, TLBI RVAE2NXS, TLB Range Invalidate by VA, EL2

The TLBI RVAE2, TLBI RVAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the **current** Security state, **invalidates selected cached copies of translation table entries from TLBs that meet all the following requirements:** ~~by SCR_EL3, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:~~

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$ ~~], using the EL2 or EL2&0 translation regime for the Security state.~~ ~~state indicated by the current value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.~~
- If **SCR_EL2.E2H == 0**, the entry is from any level of the translation table walk.
- If **SCR_EL2.E2H == 1**, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk ~~that~~ **and** matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE2, TLBI RVAE2NXS are UNDEFINED.

Attributes

TLBI RVAE2, TLBI RVAE2NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TG	SCALE	NUM					TTL		BaseADDR								
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

ASID, bits [63:48]
When HCR_EL2.E2H == 1:

- ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
- Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
- If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE2, TLBI RVAE2NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE2IS, TLBI RVAE2ISNXXS, TLB Range Invalidate by VA, EL2, Inner Shareable

The TLBI RVAE2IS, TLBI RVAE2ISNXXS characteristics are:

Purpose

When EL2 is implemented and enabled in the **current** Security state, **invalidates selected cached copies of translation table entries from TLBs that meet all the following requirements:** ~~by SCR_EL3, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:~~

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$, using the EL2 or EL2&0 translation regime for the Security **state**. ~~state indicated by the current value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.~~
- If **SCR_EL2.E2H == 0**, the entry is from any level of the translation table walk.
- If **SCR_EL2.E2H == 1**, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk **thatand** matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE2IS, TLBI RVAE2ISNXS are UNDEFINED.

Attributes

TLBI RVAE2IS, TLBI RVAE2ISNXS is a 64-bit System instruction.

Field descriptions

ASID, bits [63:48]
When HCR_EL2.E2H == 1:

- ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
- Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
- If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE2IS, TLBI RVAE2ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE2IS{, <Xt>}

op0	op1	CRn	CRm	op2

TLBI RVAE2OS, TLBI RVAE2OSNXS, TLB Range Invalidate by VA, EL2, Outer Shareable

The TLBI RVAE2OS, TLBI RVAE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the **current** Security state, **invalidates selected cached copies of translation table entries from TLBs that meet all the following requirements:** ~~by SCR_EL3, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:~~

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$, using the EL2 or EL2&0 translation regime for the Security **state**. ~~state indicated by the current value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.~~
- If **HCR_EL2.E2H == 0**, the entry is from any level of the translation table walk.
- If **HCR_EL2.E2H == 1**, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk ~~that~~ **and** matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE2OS, TLBI RVAE2OSNXS are UNDEFINED.

Attributes

TLBI RVAE2OS, TLBI RVAE2OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TG	SCALE	NUM					TTL		BaseADDR						
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE2OS, TLBI RVAE2OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE3, TLBI RVAE3NXS, TLB Range Invalidate by VA, EL3

The TLBI RVAE3, TLBI RVAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

TLBI RVAE3IS, TLBI RVAE3ISNXS, TLB Range Invalidate by VA, EL3, Inner Shareable

The TLBI RVAE3IS, TLBI RVAE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE3IS, TLBI RVAE3ISNXS are UNDEFINED.

Attributes

TLBI RVAE3IS, TLBI RVAE3ISNXXS is a 64-bit System instruction.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL3.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE3IS, TLBI RVAE3ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE3IS{, <Xt>}

TLBI RVAE3OS, TLBI RVAE3OSNXS, TLB Range Invalidate by VA, EL3, Outer Shareable

The TLBI RVAE3OS, TLBI RVAE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE3OS, TLBI RVAE3OSNXS are UNDEFINED.

Attributes

TLBI RVAE3OS, TLBI RVAE3OSNXS is a 64-bit System instruction.

TLBI RVALE1, TLBI RVALE1NXS, TLB Range Invalidate by VA, Last level, EL1

The TLBI RVALE1, TLBI RVALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

If FEAT_RME is implemented, when EL2 is implemented and enabled in the Security state described by the current value of [SCR_EL3](#).{NSE, NS}:

- WhenIf FEAT_RME is not implemented, when EL2 is implemented and enabled in the Security state described by the current Securityvalue state:of [SCR_EL3](#).NS:
 - When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.state indicated by the current value of [SCR_EL3](#).NS.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If $TTL == 01$ and $BaseADDR[29:12]$ is not equal to 00000000000000000000 .

TLBI RVALE1, TLBI RVALE1NXS, TLB Range Invalidate by VA, Last level, EL1

If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.

- If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

If TTL==10 and BaseADDR[20:12] is not equal to 000000000.

- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00.
 - If TTL==01 and BaseADDR[41:16] is not equal to 00.
 - If TTL==10 and BaseADDR[28:16] is not equal to 00.
 - If TTL==10 and BaseADDR[28:16] is not equal to 00.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE1, TLBI RVALE1NXS are UNDEFINED.

Attributes

TLBI RVALE1, TLBI RVALE1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
ASID																TG	SCALE	NUM				TTL	BaseADDR										
BaseADDR																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

ASID, bits [63:48]

- ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
- Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
- If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

- Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVALE1IS, TLBI RVALE1ISNXS, TLB Range Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI RVALE1IS, TLBI RVALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).{NSE, NS}.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

If FEAT_RME is implemented, when EL2 is implemented and enabled in the Security state described by the current value of [SCR_EL3](#).{NSE, NS}:

- When [FEAT_RME](#) is not implemented, when EL2 is implemented and enabled in the Security state described by the current [Security](#) value state of [SCR_EL3](#).NS:
 - When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of [SCR_EL3](#).NS.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLBI maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3.EEL2==1](#), then:

- A PE with [SCR_EL3.EEL2==1](#) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3.EEL2==0](#).
- A PE with [SCR_EL3.EEL2==0](#) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3.EEL2==1](#).
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If [TTL==01](#) and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If [TTL==01](#) and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If [TTL==10](#) and BaseADDR[20:12] is not equal to 0000000000.
 - If [TTL==10](#) and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If [TTL==10](#) and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If [TTL==01](#) and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If [TTL==01](#) and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If [TTL==10](#) and BaseADDR[28:16] is not equal to 0000000000000000.
 - If [TTL==10](#) and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE1IS, TLBI RVALE1ISNXS are UNDEFINED.

Attributes

TLBI RVALE1IS, TLBI RVALE1ISNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE1IS, TLBI RVALE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE1IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0010	0b101

TLBI RVALE1OS, TLBI RVALE1OSNXS, TLB Range Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI RVALE1OS, TLBI RVALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If `HCR_EL2.{E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of `SCR_EL3.{NSE, NS}`.
- If `HCR_EL2.{E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state indicated by the current value of `SCR_EL3.{NSE, NS}`.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of `SCR_EL3.{NSE, NS}`.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

If FEAT_RME is implemented, when EL2 is implemented and enabled in the Security state described by the current value of `SCR_EL3.{NSE, NS}`:

- WhenIf FEAT_RME is not implemented, when EL2 is implemented and enabled in the Security state described by the current Securityvalue state:of`SCR_EL3.NS`:
 - When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state indicated by the current value of `SCR_EL3.NS`.
 - If `HCR_EL2.{E2H, TGE}` is not `{1, 1}`, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.state indicated by the current value of `SCR_EL3.NS`.
 - If `HCR_EL2.{E2H, TGE}` is `{1, 1}`, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.state indicated by the current value of `SCR_EL3.NS`.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The Security state is indicated by the value of `SCR_EL3.NS` if FEAT_RME is not implemented, or `SCR_EL3.{NSE, NS}` if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3.EEL2==1](#), then:

- A PE with [SCR_EL3.EEL2==1](#) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3.EEL2==0](#).
- A PE with [SCR_EL3.EEL2==0](#) is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3.EEL2==1](#).
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If [TTL==01](#) and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If [TTL==01](#) and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If [TTL==10](#) and BaseADDR[20:12] is not equal to 0000000000.
 - If [TTL==10](#) and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If [TTL==10](#) and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If [TTL==01](#) and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If [TTL==01](#) and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If [TTL==10](#) and BaseADDR[28:16] is not equal to 0000000000000000.
 - If [TTL==10](#) and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE1OS, TLBI RVALE1OSNXS are UNDEFINED.

Attributes

TLBI RVALE1OS, TLBI RVALE1OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
ASID																TG	SCALE	NUM				TTL		BaseADDR								
BaseADDR																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE1OS, TLBI RVALE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE2, TLBI RVALE2NXS, TLB Range Invalidate by VA, Last level, EL2

The TLBI RVALE2, TLBI RVALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the **current** Security state, **invalidates selected cached copies of translation table entries from TLBs that meet all the following requirements:** ~~by SCR_EL3, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:~~

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$ using the EL2 or EL2&0 translation regime for the Security **state**. ~~state indicated by the current value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.~~
- If **HCR_EL2.E2H** == 0, the entry is from the final level of the translation table walk.
- If **HCR_EL2.E2H** == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of **SCR_EL3.NS** if FEAT_RME is not implemented, or **SCR_EL3.{NSE, NS}** if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE2, TLBI RVALE2NXS are UNDEFINED.

Attributes

TLBI RVALE2, TLBI RVALE2NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASID, bits [63:48]
When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE2, TLBI RVALE2NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE2{, <Xt>}

TLBI RVALE2IS, TLBI RVALE2ISNXS, TLB Range Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI RVALE2IS, TLBI RVALE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the **current** Security state, **invalidates selected cached copies of translation table entries from TLBs that meet all the following requirements:** ~~by SCR_EL3, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:~~

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$ using the EL2 or EL2&0 translation regime for the Security **state**. ~~state indicated by the current value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.~~
- If **HCR_EL2.E2H** == 0, the entry is from the final level of the translation table walk.
- If **HCR_EL2.E2H** == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of **SCR_EL3.NS** if **FEAT_RME** is not implemented, or **SCR_EL3.{NSE, NS}** if **FEAT_RME** is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If **FEAT_XS** is implemented, the **nXS** variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the **nXS** qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE2IS, TLBI RVALE2ISNXS are UNDEFINED.

Attributes

TLBI RVALE2IS, TLBI RVALE2ISNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
ASID																TG	SCALE	NUM				TTL	BaseADDR												
																BaseADDR																			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

ASID, bits [63:48]
When HCR_EL2.E2H == 1:

- ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
- Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
- If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

- Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

- The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

- The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE2IS, TLBI RVALE2ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE2OS, TLBI RVALE2OSNXS, TLB Range Invalidate by VA, Last level, EL2, Outer Shareable

The TLBI RVALE2OS, TLBI RVALE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the **current** Security state, **invalidates selected cached copies of translation table entries from TLBs that meet all the following requirements:** ~~by SCR_EL3, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:~~

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$ using the EL2 or EL2&0 translation regime for the Security **state**. ~~state indicated by the current value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.~~
- If **HCR_EL2.E2H == 0**, the entry is from the final level of the translation table walk.
- If **HCR_EL2.E2H == 1**, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of **SCR_EL3.NS** if FEAT_RME is not implemented, or **SCR_EL3.{NSE, NS}** if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE2OS, TLBI RVALE2OSNXS are UNDEFINED.

Attributes

TLBI RVALE2OS, TLBI RVALE2OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ASID																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASID, bits [63:48]
When HCR_EL2.E2H == 1:

- ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
- Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
- If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

- Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

- The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

- The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE2OS, TLBI RVALE2OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE3, TLBI RVALE3NXS, TLB Range Invalidate by VA, Last level, EL3

The TLBI RVALE3, TLBI RVALE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE3, TLBI RVALE3NXS are UNDEFINED.

Attributes

TLBI RVALE3IS, TLBI RVALE3ISNXS, TLB Range Invalidate by VA, Last level, EL3, Inner Shareable

The TLBI RVALE3IS, TLBI RVALE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - ~~If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.~~
If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - ~~If TTL==10 and BaseADDR[20:12] is not equal to 000000000.~~
If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - ~~If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.~~
If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - ~~If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.~~
If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE3IS, TLBI RVALE3ISNXS are UNDEFINED.

Attributes

TLBI RVALE3IS, TLBI RVALE3ISNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL3.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

- The starting address for the range of the maintenance instruction.
- When using a 4KB translation granule, this field is BaseADDR[48:12].
- When using a 16KB translation granule, this field is BaseADDR[50:14].
- When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE3IS, TLBI RVALE3ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE3IS{, <Xt>}

RES0																TG	SCALE	NUM				TTL		BaseADDR							
BaseADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	All entries to invalidate are Level 2 translation table entries.
0b11	All entries to invalidate are Level 3 translation table entries.

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL3.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE3OS, TLBI RVALE3OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI RVALE30S{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0101	0b101

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then

TLBI VAAE1, TLBI VAAE1NXS, TLB Invalidate by VA, All ASID, EL1

The TLBI VAAE1, TLBI VAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When **FEAT_RME** is implemented, when **EL2** is implemented and enabled in the Security state described by the current Security value state of **SCR_EL3.{NSE, NS}**:
 - When **EL2** is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.{NSE, NS}**.
 - If **HCR_EL2.{E2H, TGE}** is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.{NSE, NS}**.
 - If **HCR_EL2.{E2H, TGE}** is {1, 1}, the entry would be required to translate the specified VA using the **EL2&0** translation regime for the Security state indicated by the current value of **SCR_EL3.{NSE, NS}**.
- When **FEAT_RME** is not implemented, or when **EL2** is disabled, implemented and enabled in the current Security state, the described entry by would be required to translate the specified current VA value using the **EL1&0** translation regime for the Security state of **SCR_EL3.NS**:
 - If **HCR_EL2.{E2H, TGE}** is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.NS**.
 - If **HCR_EL2.{E2H, TGE}** is {1, 1}, the entry would be required to translate the specified VA using the **EL2&0** translation regime for the Security state indicated by the current value of **SCR_EL3.NS**.
 - When **EL2** is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.NS**.

When **FEAT_RME** is not implemented, or when **EL2** is disabled, implemented and enabled in the current Security state, the described entry by would be required to translate the specified current VA value using the **EL1&0** translation regime for the Security state of **SCR_EL3.NS**.

The Security state is indicated by the value of **SCR_EL3.NS** if **FEAT_RME** is not implemented, or **SCR_EL3.{NSE, NS}** if **FEAT_RME** is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the **EL1&0** and **EL2&0** translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If **FEAT_XS** is implemented, the **nXS** variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the **nXS** qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the **nXS** qualifier is considered complete when the subset of these memory accesses with **XS** attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAAE1, TLBI VAAE1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																TTL				VA[55:12]													
VA[55:12]																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAAE1, TLBI VAAE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAAE1{, <Xt>}

TLBI VAAE1IS, TLBI VAAE1ISNXS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI VAAE1IS, TLBI VAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When **FEAT_RME** is implemented, when **EL2** is implemented and enabled in the Security state described by the current Security value state of **SCR_EL3.{NSE, NS}**:
 - When **EL2** is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.{NSE, NS}**.
 - If **HCR_EL2.{E2H, TGE}** is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.{NSE, NS}**.
 - If **HCR_EL2.{E2H, TGE}** is {1, 1}, the entry would be required to translate the specified VA using the **EL2&0** translation regime for the Security state indicated by the current value of **SCR_EL3.{NSE, NS}**.
- When **FEAT_RME** is not implemented, or when **EL2** is disabled in the current Security state, the described entry would be required to translate the specified current VA value using the **EL1&0** translation regime for the Security state of **SCR_EL3.NS**:
 - If **HCR_EL2.{E2H, TGE}** is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.NS**.
 - If **HCR_EL2.{E2H, TGE}** is {1, 1}, the entry would be required to translate the specified VA using the **EL2&0** translation regime for the Security state indicated by the current value of **SCR_EL3.NS**.
 - When **EL2** is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.NS**.

When **FEAT_RME** is not implemented, or when **EL2** is disabled in the current Security state, the described entry would be required to translate the specified current VA value using the **EL1&0** translation regime for the Security state of **SCR_EL3.NS**.

The Security state is indicated by the value of **SCR_EL3.NS** if **FEAT_RME** is not implemented, or **SCR_EL3.{NSE, NS}** if **FEAT_RME** is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure **EL1&0** translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if **SCR_EL3.EEL2==1**, then:

- A PE with **SCR_EL3.EEL2==1** is not architecturally required to invalidate any entries in the Secure **EL1&0** translation of a PE in the same required shareability domain with **SCR_EL3.EEL2==0**.
- A PE with **SCR_EL3.EEL2==0** is not architecturally required to invalidate any entries in the Secure **EL1&0** translation of a PE in the same required shareability domain with **SCR_EL3.EEL2==1**.
- A PE is architecturally required to invalidate all relevant entries in the Secure **EL1&0** translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAAE1IS, TLBI VAAE1ISNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																TTL				VA[55:12]													
VA[55:12]																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAAE1IS, TLBI VAAE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAAE1IS{, <Xt>}

TLBI VAAE1OS, TLBI VAAE1OSNXS, TLB Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI VAAE1OS, TLBI VAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When **FEAT_RME** is implemented, when **EL2** is implemented and enabled in the Security state described by the current Security value state of **SCR_EL3.{NSE, NS}**:
 - When **EL2** is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.{NSE, NS}**.
 - If **HCR_EL2.{E2H, TGE}** is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.{NSE, NS}**.
 - If **HCR_EL2.{E2H, TGE}** is {1, 1}, the entry would be required to translate the specified VA using the **EL2&0** translation regime for the Security state indicated by the current value of **SCR_EL3.{NSE, NS}**.
- When **FEAT_RME** is not implemented, or when **EL2** is disabled, implemented and enabled in the current Security state, the described entry would be required to translate the specified current VA value using the **EL1&0** translation regime for the Security state of **SCR_EL3.NS**:
 - If **HCR_EL2.{E2H, TGE}** is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.NS**.
 - If **HCR_EL2.{E2H, TGE}** is {1, 1}, the entry would be required to translate the specified VA using the **EL2&0** translation regime for the Security state indicated by the current value of **SCR_EL3.NS**.
 - When **EL2** is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.NS**.

When **FEAT_RME** is not implemented, or when **EL2** is disabled, implemented and enabled in the current Security state, the described entry would be required to translate the specified current VA value using the **EL1&0** translation regime for the Security state of **SCR_EL3.NS**.

The Security state is indicated by the value of **SCR_EL3.NS** if **FEAT_RME** is not implemented, or **SCR_EL3.{NSE, NS}** if **FEAT_RME** is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure **EL1&0** translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if **SCR_EL3.EEL2==1**, then:

- A PE with **SCR_EL3.EEL2==1** is not architecturally required to invalidate any entries in the Secure **EL1&0** translation of a PE in the same required shareability domain with **SCR_EL3.EEL2==0**.
 - A PE with **SCR_EL3.EEL2==0** is not architecturally required to invalidate any entries in the Secure **EL1&0** translation of a PE in the same required shareability domain with **SCR_EL3.EEL2==1**.
 - A PE is architecturally required to invalidate all relevant entries in the Secure **EL1&0** translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAAE1OS, TLBI VAAE1OSNXS are UNDEFINED.

Attributes

TLBI VAAE1OS, TLBI VAAE1OSNXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																TTL				VA[55:12]													
VA[55:12]																																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAAE1OS, TLBI VAAE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAAE1OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0001	0b011

TLBI VAALE1, TLBI VAALE1NXS, TLB Invalidate by VA, All ASID, Last level, EL1

The TLBI VAALE1, TLBI VAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When **FEAT_RME** is implemented, when **EL2** is implemented and enabled in the Security state described by the current Security value state of **SCR_EL3.{NSE, NS}**:
 - When **EL2** is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.{NSE, NS}**.
 - If **HCR_EL2.{E2H, TGE}** is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.{NSE, NS}**.
 - If **HCR_EL2.{E2H, TGE}** is {1, 1}, the entry would be required to translate the specified VA using the **EL2&0** translation regime for the Security state indicated by the current value of **SCR_EL3.{NSE, NS}**.
- When **FEAT_RME** is not implemented, or when **EL2** is disabled, implemented and enabled in the current Security state, the described entry would be required to translate the specified current VA value using the **EL1&0** translation regime for the Security state of **SCR_EL3.NS**:
 - If **HCR_EL2.{E2H, TGE}** is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.NS**.
 - If **HCR_EL2.{E2H, TGE}** is {1, 1}, the entry would be required to translate the specified VA using the **EL2&0** translation regime for the Security state indicated by the current value of **SCR_EL3.NS**.
 - When **EL2** is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the **EL1&0** translation regime for the Security state indicated by the current value of **SCR_EL3.NS**.

When **FEAT_RME** is not implemented, or when **EL2** is disabled, implemented and enabled in the current Security state, the described entry would be required to translate the specified current VA value using the **EL1&0** translation regime for the Security state of **SCR_EL3.NS**.

The Security state is indicated by the value of **SCR_EL3.NS** if **FEAT_RME** is not implemented, or **SCR_EL3.{NSE, NS}** if **FEAT_RME** is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the **EL1&0** and **EL2&0** translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If **FEAT_XS** is implemented, the **nXS** variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the **nXS** qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the **nXS** qualifier is considered complete when the subset of these memory accesses with **XS** attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAALE1, TLBI VAALE1NXS is a 64-bit System instruction.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																TTL				VA[55:12]											
VA[55:12]																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
