TLBIMVAHIS, TLB Invalidate by VA, Hyp mode, Inner Shareable

The TLBIMVAHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIMVAHIS are UNDEFINED.

Attributes

TLBIMVAHIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVAHIS instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0011	0b001

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    AArch32.TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID_NONE, Shareability_ISH,
    TLBIlevel_Any, TLBI_AllAttr, R[t]);
elsif PSTATE.EL == EL3 then
    if !HaveEL(EL2) then
        UNDEFINED;
    else
        AArch32.TLBI_VA(SS_NonSecure, Regime_EL2, VMID[], Shareability_ISH, TLBIlevel_Any,
        TLBI_AllAttr, R[t]);

```

TLBIMVAIS, TLB Invalidate by VA, Inner Shareable

The TLBIMVAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIMVAIS are UNDEFINED.

Attributes

TLBIMVAIS is a 32-bit System instruction.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA												RES0				ASID															

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing the TLBIMVAIS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

TLBIMVAL, TLB Invalidate by VA, Last level

The TLBIMVAL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBIMVAL are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVAL is a 32-bit System instruction.

TLBTR, TLB Type Register

The TLBTR characteristics are:

Purpose

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

Configuration

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TLBTR are UNDEFINED.

Attributes

TLBTR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															nU

IMPLEMENTATION DEFINED, bits [31:1]

IMPLEMENTATION DEFINED.

nU, bit [0]

Not Unified TLB. Indicates whether the implementation has a unified TLB:

nU	Meaning
0b0	Unified TLB.
0b1	Separate Instruction and Data TLBs.

Accessing TLBTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configuration

AArch32 System register TPIDRPRW bits [31:0] are architecturally mapped to AArch64 System register [TPIDR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TPIDRPRW are UNDEFINED.

Note

The PE never updates this register.

Attributes

TPIDRPRW is a 32-bit register.

Field descriptions

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRPRW

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b100

```

TRFCR, Trace Filter Control Register

The TRFCR characteristics are:

Purpose

Provides EL1 controls for Trace.

Configuration

AArch32 System register TRFCR bits [31:0] are architecturally mapped to AArch64 System register [TRFCR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at EL0 and FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR are UNDEFINED.

Attributes

TRFCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								TS		RES0		E1TRE		E0TRE	

Bits [31:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

TS	Meaning	Applies when
0b01	Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF .	
0b10	Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2 : <ul style="list-style-type: none"> EL3 is implemented and is using AArch32. EL3 is implemented, using AArch64, and SCR_EL3.ECVEn == 0b0. EL2 is using AArch32. EL2 is using AArch64 and CNTHCTL_EL2.ECV == 0b0. 	When FEAT_ECV is implemented
0b11	Physical timestamp. The traced timestamp is the physical counter value.	

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- EL2 is implemented and [HTRFCR.TS](#) != 0b00.
- SelfHostedTraceEnabled() == FALSE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

E1TRE	Meaning
0b0	Tracing is prohibited in PL1 modes.
0b1	Tracing is allowed in PL1 modes.

This field is ignored if SelfHostedTraceEnabled() == FALSE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

E0TRE, bit [0]

EL0 Trace Enable.

E0TRE	Meaning
0b0	Tracing is prohibited at EL0.
0b1	Tracing is allowed at EL0.

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and enabled in the current security state and [HCR](#).TGE == 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing TRFCR

Accesses to this register use the following encodings in the System register encoding space:

        else
            TRFCR = R[t];

```

TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

Purpose

The control register for stage 1 of the PL1&0 translation regime. Its controls include:

- Where the VA range is split between addresses translated using [TTBR0](#) and addresses translated using [TTBR1](#).
- The translation table format used by this stage of translation.

From Armv8.2, when the value of TTBCR.{EAE, T2E} is {1, 1}, TTBCR is used with [TTBCR2](#).

Configuration

AArch32 System register TTBCR bits [31:0] are architecturally mapped to AArch64 System register [TCR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TTBCR are UNDEFINED.

The current translation table format determines which format of the register is used.

Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

Attributes

TTBCR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EAE		RES0																		PD1		PD0	RES0		N						

EAE, bit [31]

Extended Address Enable.

EAE	Meaning
0b0	Use the VMSAv8-32 translation system with the Short-descriptor translation table format.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Bits [30:6]

Reserved, RES0.

PD1, bit [5]

Translation table walk disable for translations using [TTBR1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1](#).

PD1	Meaning
0b0	Perform translation table walks using TTBR1 .
0b1	A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

PD0, bit [4]

Translation table walk disable for translations using [TTBR0](#). This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using [TTBR0](#).

PD0	Meaning
0b0	Perform translation table walks using TTBR0 .
0b1	A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Bit [3]

Reserved, RES0.

N, bits [2:0]

Indicate the width of the base address held in [TTBR0](#). In [TTBR0](#), the base address field is bits[31:14-N]. The value of N also determines:

- Whether [TTBR0](#) or [TTBR1](#) is used as the base address for translation table walks.
- The size of the translation table pointed to by [TTBR0](#).

N can take any value from 0 to 7, that is, from 0b000 to 0b111.

When N has its reset value of 0, the translation table base is compatible with Armv5 and Armv6.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

When TTBCR.EAE == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EAE	IMPLEMENTATION DEFINED	SH1	ORGN1	IRGN1	EPD1	A1	RES0	T1SZ	RES0	SH0	ORGN0	IRGN0	EPD0	T2E	RES0	T0SZ															

EAE, bit [31]

Extended Address Enable.

EAE	Meaning
0b1	Use the VMSAv8-32 translation system with the Long-descriptor translation table format.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

IMPLEMENTATION DEFINED, bit [30]

IMPLEMENTATION DEFINED.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1](#).

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1](#).

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1](#).

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

EPD1, bit [23]

Translation table walk disable for translations using [TTBR1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1](#).

EPD1	Meaning
0b0	Perform translation table walks using TTBR1 .
0b1	A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

A1, bit [22]

Selects whether [TTBR0](#) or [TTBR1](#) defines the ASID.

A1	Meaning
0b0	TTBR0 .ASID defines the ASID.
0b1	TTBR1 .ASID defines the ASID.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Bits [21:19]

Reserved, RES0.

T1SZ, bits [18:16]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using [TTBR0](#) and [TTBR1](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Bits [15:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0](#).

SH0	Meaning
0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0](#).

ORGNO	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

EPD0, bit [7]

Translation table walk disable for translations using [TTBR0](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0](#).

EPD0	Meaning
0b0	Perform translation table walks using TTBR0 .
0b1	A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

T2E, bit [6]

When FEAT_AA32HPD is implemented:

TTBCR2 Enable.

T2E	Meaning
0b0	TTBCR2 is disabled. The contents of TTBCR2 are treated as 0 for all purposes other than reading or writing the register.
0b1	TTBCR2 is enabled.

If TTBCR.EAE==0, then the behavior is as if the bit is 0.

Otherwise:

Reserved, RAZ/WI.

Bits [5:3]

Reserved, RES0.

T0SZ, bits [2:0]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using [TTBR0](#) and [TTBR1](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing TTBCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

TTBCR2, Translation Table Base Control Register 2

The TTBCR2 characteristics are:

Purpose

The second control register for stage 1 of the PL1&0 translation regime.

If FEAT_AA32HPD is not implemented then this register is not implemented and its encoding is UNDEFINED. Otherwise:

- When the value of [TTBCR](#).{EAE, T2E} is not {1, 1} the contents of TTBCR2 are treated as zero for all purposes other than reading or writing the register.
- When the value of [TTBCR](#).{EAE, T2E} is {1, 1} TTBCR2 is used with [TTBCR](#).

Configuration

AArch32 System register TTBCR2 bits [31:0] are architecturally mapped to AArch64 System register [TCR_EL1\[63:32\]](#).

This register is present only when AArch32 is supported at EL0 and FEAT_AA32HPD is implemented. Otherwise, direct accesses to TTBCR2 are UNDEFINED.

Attributes

TTBCR2 is a 32-bit register.

Field descriptions

31302928272625242322212019	18	17	16	15	14	13	12	11	10	9	87654
RES0	HWU162	HWU161	HWU160	HWU159	HWU062	HWU061	HWU060	HWU059	HPD1	HPD0	RE

Bits [31:19]

Reserved, RES0.

HWU162, bit [18]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

HWU162	Meaning
0b0	For translations using TTBR1 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR.T2E](#) is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU161, bit [17]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

HWU161	Meaning
0b0	For translations using TTBR1 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU160, bit [16]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

HWU160	Meaning
0b0	For translations using TTBR1 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU159, bit [15]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1](#).

HWU159	Meaning
0b0	For translations using TTBR1 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU062, bit [14]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

HWU062	Meaning
0b0	For translations using TTBR0 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU061, bit [13]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

HWU061	Meaning
0b0	For translations using TTBR0 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU060, bit [12]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

HWU060	Meaning
0b0	For translations using TTBR0 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU059, bit [11]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0](#).

HWU059	Meaning
0b0	For translations using TTBR0 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of [TTBCR](#).T2E is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HPD1, bit [10]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by [TTBR1](#).

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled if TTBCR .T2E == 1.

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of [TTBCR.T2E](#) is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPD0, bit [9]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by [TTBR0](#).

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled if TTBCR.T2E == 1.

When disabled, the permissions are treated is as if the bits are 0.

The Effective value of this field is 0 if the value of [TTBCR.T2E](#) is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:0]

Reserved, RES0.

Accessing TTBCR2

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0010	0b0000	0b011

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T2 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);

TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register TTBR0 bits [63:0] are architecturally mapped to AArch64 System register [TTBR0_EL1\[63:0\]](#).

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TTBR0 are UNDEFINED.

TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

[TTBCR](#).EAE determines which TTBR0 format is used:

- [TTBCR](#).EAE == 0b0: 32-bit format is used. TTBR0[63:32] are ignored.
- [TTBCR](#).EAE == 0b1: 64-bit format is used.

When EL3 is using AArch32, write access to TTBR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Used in conjunction with the [TTBCR](#). When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the [TTBCR](#), not in TTBR0.

Attributes

TTBR0 is a 64-bit register.

Field descriptions

When TTBCR.EAE == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																																			
TTB0																								IRGN[0]		NOS		RGN		IMP		S		IRGN[1]	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Bits [63:32]

Reserved, RES0.

TTB0, bits [31:7]

Translation table base address, bits[31:x], where x is 14-(TTBCR.N). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [0, 6]

Inner region bits. Bits [0,6] of this register together indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

IRGN	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Cacheable.
0b11	Normal memory, Inner Write-Back no Write-Allocate Cacheable.

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[0] is TTBR0[6].
- IRGN[1] is TTBR0[0].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR0.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

NOS	Meaning
0b0	Memory is Outer Shareable.
0b1	Memory is Inner Shareable.

This bit is ignored when the value of TTBR0.S is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

RGN	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Cacheable.
0b11	Normal memory, Outer Write-Back no Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Shareable:

S	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is Shareable. The TTBR0.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0								ASID								BADDR																
BADDR																															CnP	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The [TTBCR.A1](#) field selects either TTBR0.ASID or [TTBR1.ASID](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [TTBCR.T0SZ](#) as follows:

- If [TTBCR.T0SZ](#) is 0 or 1, $x = 5 - \text{TTBCR.T0SZ}$.
- If [TTBCR.T0SZ](#) is greater than 1, $x = 14 - \text{TTBCR.T0SZ}$.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. When [TTBCR.EAE](#) == 1, this bit indicates whether each entry that is pointed to by TTBR0 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1.

CnP	Meaning
0b0	<p>The translation table entries pointed to by this instance of TTBR0, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR0 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> • The value of TTBR0.CnP on those other PEs. • The value of TTBCR.EAE on those other PEs. • The value of the current ASID or, for the Non-secure instance of TTBR0, the value of the current VMID.
0b1	<p>The translation table entries pointed to by this instance of TTBR0 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1 for this instance of TTBR0 and all of the following apply:</p> <ul style="list-style-type: none"> • The translation table entries are pointed to by this instance of TTBR0. • The value of the applicable TTBCR.EAE field is 1. • The ASID is the same as the current ASID. • For the Non-secure instance of TTBR0, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0

Accesses to this register use the following encodings in the System register encoding space:

```

TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register TTBR1 bits [63:0] are architecturally mapped to AArch64 System register [TTBR1_EL1\[63:0\]](#).

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to TTBR1 are UNDEFINED.

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

[TTBCR](#).EAE determines which TTBR1 format is used:

- [TTBCR](#).EAE == 0b0: 32-bit format is used. TTBR1[63:32] are ignored.
- [TTBCR](#).EAE == 0b1: 64-bit format is used.

Used in conjunction with the [TTBCR](#). When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the [TTBCR](#), not in TTBR1.

Attributes

TTBR1 is a 64-bit register.

Field descriptions

When TTBCR.EAE == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																																
TTB1																								IRGN[1]		NOS	RGN		IMP	S	IRGN[0]	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:32]

Reserved, RES0.

TTB1, bits [31:7]

Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONstrained UNPREDICTABLE, and must be one of the following:

- Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [6, 0]

Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

IRGN	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Cacheable.
0b11	Normal memory, Inner Write-Back no Write-Allocate Cacheable.

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for Armv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[1] is TTBR1[6].
- IRGN[0] is TTBR1[0].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR1.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

NOS	Meaning
0b0	Memory is Outer Shareable.
0b1	Memory is Inner Shareable.

This bit is ignored when the value of TTBR1.S is 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

RGN	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Cacheable.
0b11	Normal memory, Outer Write-Back no Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Shareable:

S	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is Shareable. The TTBR1.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RES0								ASID								BADDR																
BADDR																															CnP	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The [TTBCR.A1](#) field selects either [TTBR0.ASID](#) or [TTBR1.ASID](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [TTBCR.T1SZ](#) as follows:

- If [TTBCR.T1SZ](#) is 0 or 1, $x = 5 - \text{TTBCR.T1SZ}$.
- If [TTBCR.T1SZ](#) is greater than 1, $x = 14 - \text{TTBCR.T1SZ}$.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. When [TTBCR.EAE](#) == 1, this bit indicates whether each entry that is pointed to by TTBR1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1.

CnP	Meaning
0b0	<p>The translation table entries pointed to by this instance of TTBR1, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR1 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> • The value of TTBR1.CnP on those other PEs. • The value of TTBCR.EAE on those other PEs. • The value of the current ASID or, for the Non-secure instance of TTBR1, the value of the current VMID.
0b1	<p>The translation table entries pointed to by this instance of TTBR1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1 for this instance of TTBR1 and all of the following apply:</p> <ul style="list-style-type: none"> • The translation table entries are pointed to by this instance of TTBR1. • The value of the applicable TTBCR.EAE field is 1. • The ASID is the same as the current ASID. • For the Non-secure instance of TTBR1, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR1

VBAR, Vector Base Address Register

The VBAR characteristics are:

Purpose

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

Configuration

AArch32 System register VBAR bits [31:0] are architecturally mapped to AArch64 System register [VBAR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to VBAR are UNDEFINED.

Attributes

VBAR is a 32-bit register.

Field descriptions

```

VDFSR, Virtual SError Exception Syndrome Register

The VDFSR characteristics are:

Purpose

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When the virtual SError interrupt injected using [HCR.VA](#) is taken to EL1 using AArch32, then the syndrome value is reported in [DFSR](#).{AET, ExT} and the remainder of [DFSR](#) is set as defined by VMSAv8-32. For more information, see The AArch32 Virtual Memory System Architecture.

If the virtual SError interrupt injected using [HCR.VA](#) is deferred by an ESB instruction, then the syndrome value is written to [VDISR](#).

Configuration

AArch32 System register VDFSR bits [31:0] are architecturally mapped to AArch64 System register [VSESR_EL2\[31:0\]](#) when the highest implemented Exception level is using AArch64.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDFSR are UNDEFINED.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when [SCR.NS](#) == 1.

Attributes

VDFSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																AET		RES0ExT		RES0											

Bits [31:16]

Reserved, RES0.

AET, bits [15:14]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[15:4] is set to VDFSR.AET.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR](#)[15:4] is set to VDFSR.AET.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[12] is set to VDFSR.ExT.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR](#)[12] is set to VDFSR.ExT.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing VDFSR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when [SCR.NS](#) == 1.

Accesses to this register use the following encodings in the System register encoding space:

VDISR, Virtual Deferred Interrupt Status Register

The VDISR characteristics are:

Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

Configuration

AArch32 System register VDISR bits [31:0] are architecturally mapped to AArch64 System register [VDISR_EL2\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDISR are UNDEFINED.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Attributes

VDISR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
A	RES0										AET	RES0	EXT	RES0	FS[4]	LPAE	RES0					FS[3:0]									

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from [VDFS.R.AET](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from [VDFS.R.ExT](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError interrupt.

FS	Meaning
0b10110	Asynchronous SError interrupt.

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR[10].
- FS[3:0] is VDISR[3:0].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to [TTBCR.EAE](#) when an ESB instruction defers a virtual SError interrupt.

LPAE	Meaning
0b0	Using the Short-descriptor translation table format.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
A	RES0										AET	RES0	EXT	RES0	LPAE	RES0	STATUS														

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from [VDEFSR.AET](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from [VDFSR.ExT](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

Set to [TTBCR.EAE](#) when an ESB instruction defers a virtual SError interrupt.

LPAE	Meaning
0b1	Using the Long-descriptor translation table format.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.

STATUS	Meaning
0b010001	Asynchronous SError interrupt.

All other values are reserved.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VDISR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

An indirect write to VDISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of [DISR](#) occurring in program order after the ESB instruction.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when [SCR.NS](#) == 1.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b0001	0b001

```

VMPIDR, Virtualization Multiprocessor ID Register

The VMPIDR characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of [MPIDR](#).

Configuration

AArch32 System register VMPIDR bits [31:0] are architecturally mapped to AArch64 System register [VMPIDR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to VMPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the [MPIDR](#).

Attributes

VMPIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
M	U	RES0					MT	Aff2								Aff1								Aff0							

M, bit [31]

Indicates whether this implementation includes the functionality introduced by the ARMv7 Multiprocessing Extensions. The possible values of this bit are:

M	Meaning
0b0	This implementation does not include the ARMv7 Multiprocessing Extensions functionality.
0b1	This implementation includes the ARMv7 Multiprocessing Extensions functionality.

From Armv8 this bit is RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system. The possible values of this bit are:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.U](#).

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels. The possible values of this bit are:

MT	Meaning
0b0	Performance of PEs at the lowest affinity level is largely independent.
0b1	Performance of PEs at the lowest affinity level is very interdependent.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.MT](#).

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff2](#).

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff1](#).

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or [MPIDR_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MPIDR.Aff0](#).

Accessing VMPIDR

Accesses to this register use the following encodings in the System register encoding space:

VPIDR, Virtualization Processor ID Register

The VPIDR characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of [MIDR](#).

Configuration

AArch32 System register VPIDR bits [31:0] are architecturally mapped to AArch64 System register [VPIDR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to VPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the [MIDR](#).

Attributes

VPIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Implementer								Variant				Architecture				PartNum								Revision							

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR](#).Implementer.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.Variant](#).

Architecture, bits [19:16]

Architecture version. Defined values are:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.Architecture](#).

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.PartNum](#).

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [MIDR.Revision](#).

Accessing VPIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

Purpose

The control register for stage 2 of the Non-secure PL1&0 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configuration

AArch32 System register VTCR bits [31:0] are architecturally mapped to AArch64 System register [VTCR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to VTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

VTCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES1	RES0	HWU62	HWU61	HWU60	HWU59	RES0					SH0	ORGN0	IRGN0	SLO	RES0	S	TOSZ														

Bit [31]

Reserved, RES1.

Bits [30:29]

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU61, bit [27]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU60, bit [26]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU59, bit [25]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [24:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [VTTBR](#).

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [VTTBR](#).

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [VTTBR](#).

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]

Starting level for translation table walks using [VTTBR](#).

SL0	Meaning
0b00	Start at level 2
0b01	Start at level 1

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of T0SZ, then a stage 2 level 1 Translation fault is generated.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

S, bit [4]

Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the stage 2 T0SZ value is treated as an UNKNOWN value

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [3:0]

The size offset of the memory region addressed by [VTTBR](#). The region size is $2^{(32-T0SZ)}$ bytes.

This field holds a four-bit signed integer value, meaning it supports values from -8 to 7.

Note

This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 1 Translation fault is generated.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VTCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0010	0b0001	0b010

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T2 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T2 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;

VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register VTTBR bits [63:0] are architecturally mapped to AArch64 System register [VTTBR_EL2\[63:0\]](#).

This register is present only when AArch32 is supported at EL0. Otherwise, direct accesses to VTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

VTTBR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								VMID								BADDR															
BADDR																															CnP
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:56]

Reserved, RES0.

VMID, bits [55:48]

The VMID for the translation table.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [VTCR.SL0](#) and [VTCR.T0SZ](#) as follows:

- If [VTCR.SL0](#) is 0b00, meaning that lookup starts at level 2, then x is 14 - [VTCR.T0SZ](#).
- If [VTCR.SL0](#) is 0b01, meaning that lookup starts at level 1, then x is 5 - [VTCR.T0SZ](#).
- If [VTCR.SL0](#) is either 0b10 or 0b11 then a stage 2 level 1 Translation fault is generated.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VTTBR are permitted to differ from the entries for VTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VTTBR are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1 and the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the VTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBRs do not point to the same translation table entries when the VMID value is the same as the current VMID, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behaviour of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

System Register index by functional group

Below are indexes for registers with the following main functional groups:

- [ID](#)
- [Memory](#)
- [Other](#)
- [Exception](#)
- [Special](#)
- [PSTATE](#)
- [Cache](#)
- [Address](#)
- [TLB](#)
- [PMU](#)
- [Reset](#)
- [Thread](#)
- [IMP DEF](#)
- [Timer](#)
- [Debug](#)
- [CTI](#)
- [Virt](#)
- [Secure](#)
- [Float](#)
- [Legacy](#)
- [Trace](#)
- [GIC](#)
- [GICD](#)
- [GICR](#)
- [GICC](#)
- [GICV](#)
- [GICH](#)
- [GITS](#)
- [RAS](#)
- [MPAM](#)
- [Pointer authentication](#)
- [AMU](#)
- [Root](#)
- [GIC ITS registers](#)

In the ID functional group:

Exec state	Name	Description
AArch32	CCSIDR	Current Cache Size ID Register
AArch32	CCSIDR2	Current Cache Size ID Register 2
AArch32	CLIDR	Cache Level ID Register
AArch32	CSSELR	Cache Size Selection Register
AArch32	CTR	Cache Type Register
AArch32	ID_AFR0	Auxiliary Feature Register 0
AArch32	ID_DFR0	Debug Feature Register 0
AArch32	ID_DFR1	Debug Feature Register 1
AArch32	ID_ISAR0	Instruction Set Attribute Register 0
AArch32	ID_ISAR1	Instruction Set Attribute Register 1
AArch32	ID_ISAR2	Instruction Set Attribute Register 2
AArch32	ID_ISAR3	Instruction Set Attribute Register 3
AArch32	ID_ISAR4	Instruction Set Attribute Register 4
AArch32	ID_ISAR5	Instruction Set Attribute Register 5
AArch32	ID_ISAR6	Instruction Set Attribute Register 6
AArch32	ID_MMFR0	Memory Model Feature Register 0
AArch32	ID_MMFR1	Memory Model Feature Register 1
AArch32	ID_MMFR2	Memory Model Feature Register 2
AArch32	ID_MMFR3	Memory Model Feature Register 3
AArch32	ID_MMFR4	Memory Model Feature Register 4
AArch32	ID_MMFR5	Memory Model Feature Register 5
AArch32	ID_PFR0	Processor Feature Register 0

Exec state	Name	Description
AArch32	ID_PFR1	Processor Feature Register 1
AArch32	ID_PFR2	Processor Feature Register 2
AArch32	MIDR	Main ID Register
AArch32	MPIDR	Multiprocessor Affinity Register
AArch32	REVIDR	Revision ID Register
AArch32	TCMTR	TCM Type Register
AArch32	TLBTR	TLB Type Register
AArch64	CCSIDR2_EL1	Current Cache Size ID Register 2
AArch64	CCSIDR_EL1	Current Cache Size ID Register
AArch64	CLIDR_EL1	Cache Level ID Register
AArch64	CSSELR_EL1	Cache Size Selection Register
AArch64	CTR_EL0	Cache Type Register
AArch64	DCZID_EL0	Data Cache Zero ID register
AArch64	GMID_EL1	Multiple tag transfer ID register
AArch64	ID_AA64AFR0_EL1	AArch64 Auxiliary Feature Register 0
AArch64	ID_AA64AFR1_EL1	AArch64 Auxiliary Feature Register 1
AArch64	ID_AA64DFR0_EL1	AArch64 Debug Feature Register 0
AArch64	ID_AA64DFR1_EL1	AArch64 Debug Feature Register 1
AArch64	ID_AA64ISAR0_EL1	AArch64 Instruction Set Attribute Register 0
AArch64	ID_AA64ISAR1_EL1	AArch64 Instruction Set Attribute Register 1
AArch64	ID_AA64ISAR2_EL1	AArch64 Instruction Set Attribute Register 2
AArch64	ID_AA64MMFR0_EL1	AArch64 Memory Model Feature Register 0
AArch64	ID_AA64MMFR1_EL1	AArch64 Memory Model Feature Register 1
AArch64	ID_AA64MMFR2_EL1	AArch64 Memory Model Feature Register 2
AArch64	ID_AA64PFR0_EL1	AArch64 Processor Feature Register 0
AArch64	ID_AA64PFR1_EL1	AArch64 Processor Feature Register 1
AArch64	ID_AA64SMFR0_EL1	SME Feature ID register 0
AArch64	ID_AA64ZFR0_EL1	SVE Feature ID register 0
AArch64	ID_AFR0_EL1	AArch32 Auxiliary Feature Register 0
AArch64	ID_DFR0_EL1	AArch32 Debug Feature Register 0
AArch64	ID_DFR1_EL1	Debug Feature Register 1
AArch64	ID_ISAR0_EL1	AArch32 Instruction Set Attribute Register 0
AArch64	ID_ISAR1_EL1	AArch32 Instruction Set Attribute Register 1
AArch64	ID_ISAR2_EL1	AArch32 Instruction Set Attribute Register 2
AArch64	ID_ISAR3_EL1	AArch32 Instruction Set Attribute Register 3
AArch64	ID_ISAR4_EL1	AArch32 Instruction Set Attribute Register 4
AArch64	ID_ISAR5_EL1	AArch32 Instruction Set Attribute Register 5
AArch64	ID_ISAR6_EL1	AArch32 Instruction Set Attribute Register 6
AArch64	ID_MMFR0_EL1	AArch32 Memory Model Feature Register 0
AArch64	ID_MMFR1_EL1	AArch32 Memory Model Feature Register 1
AArch64	ID_MMFR2_EL1	AArch32 Memory Model Feature Register 2
AArch64	ID_MMFR3_EL1	AArch32 Memory Model Feature Register 3
AArch64	ID_MMFR4_EL1	AArch32 Memory Model Feature Register 4
AArch64	ID_MMFR5_EL1	AArch32 Memory Model Feature Register 5
AArch64	ID_PFR0_EL1	AArch32 Processor Feature Register 0
AArch64	ID_PFR1_EL1	AArch32 Processor Feature Register 1
AArch64	ID_PFR2_EL1	AArch32 Processor Feature Register 2
AArch64	MIDR_EL1	Main ID Register
AArch64	MPAMIDR_EL1	MPAM ID Register (EL1)
AArch64	MPIDR_EL1	Multiprocessor Affinity Register
AArch64	REVIDR_EL1	Revision ID Register
AArch64	SMIDR_EL1	Streaming Mode Identification Register
External	EDAA32PFR	External Debug Auxiliary Processor Feature Register
External	EDDFR	External Debug Feature Register
External	EDPFR	External Debug Processor Feature Register
External	MIDR_EL1	Main ID Register

In the Memory functional group:

Exec state	Name	Description
AArch32	AMAIRO	Auxiliary Memory Attribute Indirection Register 0
AArch32	AMAIR1	Auxiliary Memory Attribute Indirection Register 1
AArch32	CONTEXTIDR	Context ID Register

Exec state	Name	Description
AArch32	DACR	Domain Access Control Register
AArch32	HAMAIR0	Hyp Auxiliary Memory Attribute Indirection Register 0
AArch32	HAMAIR1	Hyp Auxiliary Memory Attribute Indirection Register 1
AArch32	HMAIR0	Hyp Memory Attribute Indirection Register 0
AArch32	HMAIR1	Hyp Memory Attribute Indirection Register 1
AArch32	HTCR	Hyp Translation Control Register
AArch32	HTTBR	Hyp Translation Table Base Register
AArch32	MAIR0	Memory Attribute Indirection Register 0
AArch32	MAIR1	Memory Attribute Indirection Register 1
AArch32	NMRR	Normal Memory Remap Register
AArch32	PRRR	Primary Region Remap Register
AArch32	TTBCR	Translation Table Base Control Register
AArch32	TTBCR2	Translation Table Base Control Register 2
AArch32	TTBR0	Translation Table Base Register 0
AArch32	TTBR1	Translation Table Base Register 1
AArch32	VTCR	Virtualization Translation Control Register
AArch32	VTTBR	Virtualization Translation Table Base Register
AArch64	AMAIR_EL1	Auxiliary Memory Attribute Indirection Register (EL1)
AArch64	AMAIR_EL2	Auxiliary Memory Attribute Indirection Register (EL2)
AArch64	AMAIR_EL3	Auxiliary Memory Attribute Indirection Register (EL3)
AArch64	CONTEXTIDR_EL1	Context ID Register (EL1)
AArch64	CONTEXTIDR_EL2	Context ID Register (EL2)
AArch64	DACR32_EL2	Domain Access Control Register
AArch64	GPCCR_EL3	Granule Protection Check Control Register (EL3)
AArch64	GPTBR_EL3	Granule Protection Table Base Register
AArch64	LORC_EL1	LORegion Control (EL1)
AArch64	LOREA_EL1	LORegion End Address (EL1)
AArch64	LORID_EL1	LORegionID (EL1)
AArch64	LORN_EL1	LORegion Number (EL1)
AArch64	LORSA_EL1	LORegion Start Address (EL1)
AArch64	MAIR_EL1	Memory Attribute Indirection Register (EL1)
AArch64	MAIR_EL2	Memory Attribute Indirection Register (EL2)
AArch64	MAIR_EL3	Memory Attribute Indirection Register (EL3)
AArch64	TCR_EL1	Translation Control Register (EL1)
AArch64	TCR_EL2	Translation Control Register (EL2)
AArch64	TCR_EL3	Translation Control Register (EL3)
AArch64	TTBR0_EL1	Translation Table Base Register 0 (EL1)
AArch64	TTBR0_EL2	Translation Table Base Register 0 (EL2)
AArch64	TTBR0_EL3	Translation Table Base Register 0 (EL3)
AArch64	TTBR1_EL1	Translation Table Base Register 1 (EL1)
AArch64	TTBR1_EL2	Translation Table Base Register 1 (EL2)
AArch64	VTCR_EL2	Virtualization Translation Control Register
AArch64	VTTBR_EL2	Virtualization Translation Table Base Register

In the Other functional group:

Exec state	Name	Description
AArch32	CPACR	Architectural Feature Access Control Register
AArch32	SCTLR	System Control Register
AArch64	CPACR_EL1	Architectural Feature Access Control Register
AArch64	SCTLR_EL1	System Control Register (EL1)
AArch64	SCTLR_EL3	System Control Register (EL3)
AArch64	SMCR_EL1	SME Control Register (EL1)
AArch64	SMCR_EL2	SME Control Register (EL2)
AArch64	SMCR_EL3	SME Control Register (EL3)
AArch64	SMPRIMAP_EL2	Streaming Mode Priority Mapping Register
AArch64	SMPRI_EL1	Streaming Mode Priority Register
AArch64	ZCR_EL1	SVE Control Register (EL1)
AArch64	ZCR_EL2	SVE Control Register (EL2)
AArch64	ZCR_EL3	SVE Control Register (EL3)

In the Exception functional group:

Exec state	Name	Description
AArch32	ADFSR	Auxiliary Data Fault Status Register
AArch32	AIFSR	Auxiliary Instruction Fault Status Register
AArch32	DFAR	Data Fault Address Register
AArch32	DFSR	Data Fault Status Register
AArch32	HADFSR	Hyp Auxiliary Data Fault Status Register
AArch32	HAIFSR	Hyp Auxiliary Instruction Fault Status Register
AArch32	HDFAR	Hyp Data Fault Address Register
AArch32	HIFAR	Hyp Instruction Fault Address Register
AArch32	HPFAR	Hyp IPA Fault Address Register
AArch32	HSR	Hyp Syndrome Register
AArch32	HVBAR	Hyp Vector Base Address Register
AArch32	IFAR	Instruction Fault Address Register
AArch32	IFSR	Instruction Fault Status Register
AArch32	ISR	Interrupt Status Register
AArch32	MVBAR	Monitor Vector Base Address Register
AArch32	VBAR	Vector Base Address Register
AArch64	AFSR0_EL1	Auxiliary Fault Status Register 0 (EL1)
AArch64	AFSR0_EL2	Auxiliary Fault Status Register 0 (EL2)
AArch64	AFSR0_EL3	Auxiliary Fault Status Register 0 (EL3)
AArch64	AFSR1_EL1	Auxiliary Fault Status Register 1 (EL1)
AArch64	AFSR1_EL2	Auxiliary Fault Status Register 1 (EL2)
AArch64	AFSR1_EL3	Auxiliary Fault Status Register 1 (EL3)
AArch64	ESR_EL1	Exception Syndrome Register (EL1)
AArch64	ESR_EL2	Exception Syndrome Register (EL2)
AArch64	ESR_EL3	Exception Syndrome Register (EL3)
AArch64	FAR_EL1	Fault Address Register (EL1)
AArch64	FAR_EL2	Fault Address Register (EL2)
AArch64	FAR_EL3	Fault Address Register (EL3)
AArch64	HPFAR_EL2	Hypervisor IPA Fault Address Register
AArch64	IFSR32_EL2	Instruction Fault Status Register (EL2)
AArch64	ISR_EL1	Interrupt Status Register
AArch64	MFAR_EL3	PA Fault Address Register
AArch64	VBAR_EL1	Vector Base Address Register (EL1)
AArch64	VBAR_EL2	Vector Base Address Register (EL2)
AArch64	VBAR_EL3	Vector Base Address Register (EL3)

In the Special functional group:

Exec state	Name	Description
AArch32	DLR	Debug Link Register
AArch32	DSPSR	Debug Saved Program Status Register
AArch32	ELR_hyp	Exception Link Register (Hyp mode)
AArch32	SPSR	Saved Program Status Register
AArch32	SPSR_abt	Saved Program Status Register (Abort mode)
AArch32	SPSR_fiq	Saved Program Status Register (FIQ mode)
AArch32	SPSR_hyp	Saved Program Status Register (Hyp mode)
AArch32	SPSR_irq	Saved Program Status Register (IRQ mode)
AArch32	SPSR_mon	Saved Program Status Register (Monitor mode)
AArch32	SPSR_svc	Saved Program Status Register (Supervisor mode)
AArch32	SPSR_und	Saved Program Status Register (Undefined mode)
AArch64	ELR_EL1	Exception Link Register (EL1)
AArch64	ELR_EL2	Exception Link Register (EL2)
AArch64	ELR_EL3	Exception Link Register (EL3)
AArch64	SPSR_EL1	Saved Program Status Register (EL1)
AArch64	SPSR_EL2	Saved Program Status Register (EL2)
AArch64	SPSR_EL3	Saved Program Status Register (EL3)
AArch64	SPSR_abt	Saved Program Status Register (Abort mode)
AArch64	SPSR_fiq	Saved Program Status Register (FIQ mode)
AArch64	SPSR_irq	Saved Program Status Register (IRQ mode)
AArch64	SPSR_und	Saved Program Status Register (Undefined mode)
AArch64	SP_ELO	Stack Pointer (EL0)

Exec state	Name	Description
AArch64	SP_EL1	Stack Pointer (EL1)
AArch64	SP_EL2	Stack Pointer (EL2)
AArch64	SP_EL3	Stack Pointer (EL3)

In the PSTATE functional group:

Exec state	Name	Description
AArch32	APSR	Application Program Status Register
AArch32	CPSR	Current Program Status Register
AArch64	CurrentEL	Current Exception Level
AArch64	DAIF	Interrupt Mask Bits
AArch64	DIT	Data Independent Timing
AArch64	NZCV	Condition Flags
AArch64	PAN	Privileged Access Never
AArch64	SPSel	Stack Pointer Select
AArch64	SSBS	Speculative Store Bypass Safe
AArch64	SVCR	Streaming Vector Control Register
AArch64	TCO	Tag Check Override
AArch64	UAO	User Access Override

In the Cache functional group:

Exec state	Name	Description
AArch32	BPIALL	Branch Predictor Invalidate All
AArch32	BPIALLIS	Branch Predictor Invalidate All, Inner Shareable
AArch32	BPIMVA	Branch Predictor Invalidate by VA
AArch32	DCCIMVAC	Data Cache line Clean and Invalidate by VA to PoC
AArch32	DCCISW	Data Cache line Clean and Invalidate by Set/Way
AArch32	DCCMVAC	Data Cache line Clean by VA to PoC
AArch32	DCCMVAU	Data Cache line Clean by VA to PoU
AArch32	DCCSW	Data Cache line Clean by Set/Way
AArch32	DCIMVAC	Data Cache line Invalidate by VA to PoC
AArch32	DCISW	Data Cache line Invalidate by Set/Way
AArch32	ICIALLU	Instruction Cache Invalidate All to PoU
AArch32	ICIALLUIS	Instruction Cache Invalidate All to PoU, Inner Shareable
AArch32	ICIMVAU	Instruction Cache line Invalidate by VA to PoU
AArch64	DC CGDSW	Clean of Data and Allocation Tags by Set/Way
AArch64	DC CGDVAC	Clean of Data and Allocation Tags by VA to PoC
AArch64	DC CGDVADP	Clean of Data and Allocation Tags by VA to PoDP
AArch64	DC CGDVAP	Clean of Data and Allocation Tags by VA to PoP
AArch64	DC CGSW	Clean of Allocation Tags by Set/Way
AArch64	DC CGVAC	Clean of Allocation Tags by VA to PoC
AArch64	DC CGVADP	Clean of Allocation Tags by VA to PoDP
AArch64	DC CGVAP	Clean of Allocation Tags by VA to PoP
AArch64	DC CIGDPAPA	Clean and Invalidate of Data and Allocation Tags by PA to PoPA
AArch64	DC CIGDSW	Clean and Invalidate of Data and Allocation Tags by Set/Way
AArch64	DC CIGDVAC	Clean and Invalidate of Data and Allocation Tags by VA to PoC
AArch64	DC CIGSW	Clean and Invalidate of Allocation Tags by Set/Way
AArch64	DC CIGVAC	Clean and Invalidate of Allocation Tags by VA to PoC
AArch64	DC CIPAPA	Data or unified Cache line Clean and Invalidate by PA to PoPA
AArch64	DC CISW	Data or unified Cache line Clean and Invalidate by Set/Way
AArch64	DC CIVAC	Data or unified Cache line Clean and Invalidate by VA to PoC
AArch64	DC CSW	Data or unified Cache line Clean by Set/Way
AArch64	DC CVAC	Data or unified Cache line Clean by VA to PoC
AArch64	DC CVADP	Data or unified Cache line Clean by VA to PoDP
AArch64	DC CVAP	Data or unified Cache line Clean by VA to PoP
AArch64	DC CVAU	Data or unified Cache line Clean by VA to PoU
AArch64	DC GVA	Data Cache set Allocation Tag by VA
AArch64	DC GZVA	Data Cache set Allocation Tags and Zero by VA
AArch64	DC IGDWS	Invalidate of Data and Allocation Tags by Set/Way
AArch64	DC IGDVAC	Invalidate of Data and Allocation Tags by VA to PoC
AArch64	DC IGWS	Invalidate of Allocation Tags by Set/Way

Exec state	Name	Description
AArch64	DC IGVAC	Invalidate of Allocation Tags by VA to PoC
AArch64	DC ISW	Data or unified Cache line Invalidate by Set/Way
AArch64	DC IVAC	Data or unified Cache line Invalidate by VA to PoC
AArch64	DC ZVA	Data Cache Zero by VA
AArch64	IC IALLU	Instruction Cache Invalidate All to PoU
AArch64	IC IALLUIS	Instruction Cache Invalidate All to PoU, Inner Shareable
AArch64	IC IVAU	Instruction Cache line Invalidate by VA to PoU

In the Address functional group:

Exec state	Name	Description
AArch32	ATS12NSOPR	Address Translate Stages 1 and 2 Non-secure Only PL1 Read
AArch32	ATS12NSOPW	Address Translate Stages 1 and 2 Non-secure Only PL1 Write
AArch32	ATS12NSOUR	Address Translate Stages 1 and 2 Non-secure Only Unprivileged Read
AArch32	ATS12NSOUW	Address Translate Stages 1 and 2 Non-secure Only Unprivileged Write
AArch32	ATS1CPR	Address Translate Stage 1 Current state PL1 Read
AArch32	ATS1CPRP	Address Translate Stage 1 Current state PL1 Read PAN
AArch32	ATS1CPW	Address Translate Stage 1 Current state PL1 Write
AArch32	ATS1CPWP	Address Translate Stage 1 Current state PL1 Write PAN
AArch32	ATS1CUR	Address Translate Stage 1 Current state Unprivileged Read
AArch32	ATS1CUW	Address Translate Stage 1 Current state Unprivileged Write
AArch32	ATS1HR	Address Translate Stage 1 Hyp mode Read
AArch32	ATS1HW	Address Translate Stage 1 Hyp mode Write
AArch32	PAR	Physical Address Register
AArch64	AT S12E0R	Address Translate Stages 1 and 2 EL0 Read
AArch64	AT S12E0W	Address Translate Stages 1 and 2 EL0 Write
AArch64	AT S12E1R	Address Translate Stages 1 and 2 EL1 Read
AArch64	AT S12E1W	Address Translate Stages 1 and 2 EL1 Write
AArch64	AT S1E0R	Address Translate Stage 1 EL0 Read
AArch64	AT S1E0W	Address Translate Stage 1 EL0 Write
AArch64	AT S1E1R	Address Translate Stage 1 EL1 Read
AArch64	AT S1E1RP	Address Translate Stage 1 EL1 Read PAN
AArch64	AT S1E1W	Address Translate Stage 1 EL1 Write
AArch64	AT S1E1WP	Address Translate Stage 1 EL1 Write PAN
AArch64	AT S1E2R	Address Translate Stage 1 EL2 Read
AArch64	AT S1E2W	Address Translate Stage 1 EL2 Write
AArch64	AT S1E3R	Address Translate Stage 1 EL3 Read
AArch64	AT S1E3W	Address Translate Stage 1 EL3 Write
AArch64	PAR_EL1	Physical Address Register

In the TLB functional group:

Exec state	Name	Description
AArch32	CFPRCTX	Control Flow Prediction Restriction by Context
AArch32	CPRCTX	Cache Prefetch Prediction Restriction by Context
AArch32	DTLBIALL	Data TLB Invalidate All
AArch32	DTLBIASID	Data TLB Invalidate by ASID match
AArch32	DTLBIMVA	Data TLB Invalidate by VA
AArch32	DVPRCTX	Data Value Prediction Restriction by Context
AArch32	ITLBIALL	Instruction TLB Invalidate All
AArch32	ITLBIASID	Instruction TLB Invalidate by ASID match
AArch32	ITLBIMVA	Instruction TLB Invalidate by VA
AArch32	TLBIALL	TLB Invalidate All

Exec state	Name	Description
AArch32	ICC_AP0R<n>	Interrupt Controller Active Priorities Group 0 Registers
AArch32	ICC_AP1R<n>	Interrupt Controller Active Priorities Group 1 Registers
AArch32	ICC_ASGI1R	Interrupt Controller Alias Software Generated Interrupt Group 1 Register
AArch32	ICC_BPR0	Interrupt Controller Binary Point Register 0
AArch32	ICC_BPR1	Interrupt Controller Binary Point Register 1
AArch32	ICC_CTLR	Interrupt Controller Control Register
AArch32	ICC_DIR	Interrupt Controller Deactivate Interrupt Register
AArch32	ICC_EOIR0	Interrupt Controller End Of Interrupt Register 0
AArch32	ICC_EOIR1	Interrupt Controller End Of Interrupt Register 1
AArch32	ICC_HPIR0	Interrupt Controller Highest Priority Pending Interrupt Register 0
AArch32	ICC_HPIR1	Interrupt Controller Highest Priority Pending Interrupt Register 1
AArch32	ICC_HSRE	Interrupt Controller Hyp System Register Enable register
AArch32	ICC_IAR0	Interrupt Controller Interrupt Acknowledge Register 0
AArch32	ICC_IAR1	Interrupt Controller Interrupt Acknowledge Register 1
AArch32	ICC_IGRPEN0	Interrupt Controller Interrupt Group 0 Enable register
AArch32	ICC_IGRPEN1	Interrupt Controller Interrupt Group 1 Enable register
AArch32	ICC_MCTLR	Interrupt Controller Monitor Control Register
AArch32	ICC_MGRPEN1	Interrupt Controller Monitor Interrupt Group 1 Enable register
AArch32	ICC_MSRE	Interrupt Controller Monitor System Register Enable register
AArch32	ICC_PMR	Interrupt Controller Interrupt Priority Mask Register
AArch32	ICC_RPR	Interrupt Controller Running Priority Register
AArch32	ICC_SGI0R	Interrupt Controller Software Generated Interrupt Group 0 Register
AArch32	ICC_SGI1R	Interrupt Controller Software Generated Interrupt Group 1 Register
AArch32	ICC_SRE	Interrupt Controller System Register Enable register
AArch32	ICH_AP0R<n>	Interrupt Controller Hyp Active Priorities Group 0 Registers
AArch32	ICH_AP1R<n>	Interrupt Controller Hyp Active Priorities Group 1 Registers
AArch32	ICH_EISR	Interrupt Controller End of Interrupt Status Register
AArch32	ICH_ELRSR	Interrupt Controller Empty List Register Status Register
AArch32	ICH_HCR	Interrupt Controller Hyp Control Register
AArch32	ICH_LR<n>	Interrupt Controller List Registers
AArch32	ICH_LRC<n>	Interrupt Controller List Registers
AArch32	ICH_MISR	Interrupt Controller Maintenance Interrupt State Register
AArch32	ICH_VMCR	Interrupt Controller Virtual Machine Control Register
AArch32	ICH_VTR	Interrupt Controller VGIC Type Register
AArch32	ICV_AP0R<n>	Interrupt Controller Virtual Active Priorities Group 0 Registers
AArch32	ICV_AP1R<n>	Interrupt Controller Virtual Active Priorities Group 1 Registers
AArch32	ICV_BPR0	Interrupt Controller Virtual Binary Point Register 0
AArch32	ICV_BPR1	Interrupt Controller Virtual Binary Point Register 1
AArch32	ICV_CTLR	Interrupt Controller Virtual Control Register
AArch32	ICV_DIR	Interrupt Controller Deactivate Virtual Interrupt Register
AArch32	ICV_EOIR0	Interrupt Controller Virtual End Of Interrupt Register 0
AArch32	ICV_EOIR1	Interrupt Controller Virtual End Of Interrupt Register 1
AArch32	ICV_HPIR0	Interrupt Controller Virtual Highest Priority Pending Interrupt Register 0
AArch32	ICV_HPIR1	Interrupt Controller Virtual Highest Priority Pending Interrupt Register 1
AArch32	ICV_IAR0	Interrupt Controller Virtual Interrupt Acknowledge Register 0
AArch32	ICV_IAR1	Interrupt Controller Virtual Interrupt Acknowledge Register 1
AArch32	ICV_IGRPEN0	Interrupt Controller Virtual Interrupt Group 0 Enable register
AArch32	ICV_IGRPEN1	Interrupt Controller Virtual Interrupt Group 1 Enable register
AArch32	ICV_PMR	Interrupt Controller Virtual Interrupt Priority Mask Register
AArch32	ICV_RPR	Interrupt Controller Virtual Running Priority Register
AArch64	ICC_AP0R<n>_EL1	Interrupt Controller Active Priorities Group 0 Registers
AArch64	ICC_AP1R<n>_EL1	Interrupt Controller Active Priorities Group 1 Registers
AArch64	ICC_ASGI1R_EL1	Interrupt Controller Alias Software Generated Interrupt Group 1 Register
AArch64	ICC_BPR0_EL1	Interrupt Controller Binary Point Register 0
AArch64	ICC_BPR1_EL1	Interrupt Controller Binary Point Register 1
AArch64	ICC_CTLR_EL1	Interrupt Controller Control Register (EL1)
AArch64	ICC_CTLR_EL3	Interrupt Controller Control Register (EL3)
AArch64	ICC_DIR_EL1	Interrupt Controller Deactivate Interrupt Register
AArch64	ICC_EOIR0_EL1	Interrupt Controller End Of Interrupt Register 0
AArch64	ICC_EOIR1_EL1	Interrupt Controller End Of Interrupt Register 1
AArch64	ICC_HPIR0_EL1	Interrupt Controller Highest Priority Pending Interrupt Register 0
AArch64	ICC_HPIR1_EL1	Interrupt Controller Highest Priority Pending Interrupt Register 1

Exec state	Name	Description
AArch64	ICC_IAR0_EL1	Interrupt Controller Interrupt Acknowledge Register 0
AArch64	ICC_IAR1_EL1	Interrupt Controller Interrupt Acknowledge Register 1
AArch64	ICC_IGRPEN0_EL1	Interrupt Controller Interrupt Group 0 Enable register
AArch64	ICC_IGRPEN1_EL1	Interrupt Controller Interrupt Group 1 Enable register
AArch64	ICC_IGRPEN1_EL3	Interrupt Controller Interrupt Group 1 Enable register (EL3)
AArch64	ICC_PMR_EL1	Interrupt Controller Interrupt Priority Mask Register
AArch64	ICC_RPR_EL1	Interrupt Controller Running Priority Register
AArch64	ICC_SGI0R_EL1	Interrupt Controller Software Generated Interrupt Group 0 Register
AArch64	ICC_SGI1R_EL1	Interrupt Controller Software Generated Interrupt Group 1 Register
AArch64	ICC_SRE_EL1	Interrupt Controller System Register Enable register (EL1)
AArch64	ICC_SRE_EL2	Interrupt Controller System Register Enable register (EL2)
AArch64	ICC_SRE_EL3	Interrupt Controller System Register Enable register (EL3)
AArch64	ICH_AP0R<n>_EL2	Interrupt Controller Hyp Active Priorities Group 0 Registers
AArch64	ICH_AP1R<n>_EL2	Interrupt Controller Hyp Active Priorities Group 1 Registers
AArch64	ICH_EISR_EL2	Interrupt Controller End of Interrupt Status Register
AArch64	ICH_ELRSR_EL2	Interrupt Controller Empty List Register Status Register
AArch64	ICH_HCR_EL2	Interrupt Controller Hyp Control Register
AArch64	ICH_LR<n>_EL2	Interrupt Controller List Registers
AArch64	ICH_MISR_EL2	Interrupt Controller Maintenance Interrupt State Register
AArch64	ICH_VMCR_EL2	Interrupt Controller Virtual Machine Control Register
AArch64	ICH_VTR_EL2	Interrupt Controller VGIC Type Register
AArch64	ICV_AP0R<n>_EL1	Interrupt Controller Virtual Active Priorities Group 0 Registers
AArch64	ICV_AP1R<n>_EL1	Interrupt Controller Virtual Active Priorities Group 1 Registers
AArch64	ICV_BPR0_EL1	Interrupt Controller Virtual Binary Point Register 0
AArch64	ICV_BPR1_EL1	Interrupt Controller Virtual Binary Point Register 1
AArch64	ICV_CTLR_EL1	Interrupt Controller Virtual Control Register
AArch64	ICV_DIR_EL1	Interrupt Controller Deactivate Virtual Interrupt Register
AArch64	ICV_EOIR0_EL1	Interrupt Controller Virtual End Of Interrupt Register 0
AArch64	ICV_EOIR1_EL1	Interrupt Controller Virtual End Of Interrupt Register 1
AArch64	ICV_HPPIR0_EL1	Interrupt Controller Virtual Highest Priority Pending Interrupt Register 0
AArch64	ICV_HPPIR1_EL1	Interrupt Controller Virtual Highest Priority Pending Interrupt Register 1
AArch64	ICV_IAR0_EL1	Interrupt Controller Virtual Interrupt Acknowledge Register 0
AArch64	ICV_IAR1_EL1	Interrupt Controller Virtual Interrupt Acknowledge Register 1
AArch64	ICV_IGRPEN0_EL1	Interrupt Controller Virtual Interrupt Group 0 Enable register
AArch64	ICV_IGRPEN1_EL1	Interrupt Controller Virtual Interrupt Group 1 Enable register
AArch64	ICV_PMR_EL1	Interrupt Controller Virtual Interrupt Priority Mask Register
AArch64	ICV_RPR_EL1	Interrupt Controller Virtual Running Priority Register

In the GICD functional group:

Exec state	Name	Description
External	GICD_CLRSPI_NSR	Clear Non-secure SPI Pending Register
External	GICD_CLRSPI_SR	Clear Secure SPI Pending Register
External	GICD_CPENDSGIR<n>	SGI Clear-Pending Registers
External	GICD_CTLR	Distributor Control Register
External	GICD_ICACTIVER<n>	Interrupt Clear-Active Registers
External	GICD_ICACTIVER<n>E	Interrupt Clear-Active Registers (extended SPI range)
External	GICD_ICENABLER<n>	Interrupt Clear-Enable Registers
External	GICD_ICENABLER<n>E	Interrupt Clear-Enable Registers
External	GICD_ICFGR<n>	Interrupt Configuration Registers
External	GICD_ICFGR<n>E	Interrupt Configuration Registers (Extended SPI Range)
External	GICD_ICPENDR<n>	Interrupt Clear-Pending Registers
External	GICD_ICPENDR<n>E	Interrupt Clear-Pending Registers (extended SPI range)
External	GICD_IGROUPR<n>	Interrupt Group Registers
External	GICD_IGROUPR<n>E	Interrupt Group Registers (extended SPI range)
External	GICD_IGRPMODR<n>	Interrupt Group Modifier Registers
External	GICD_IGRPMODR<n>E	Interrupt Group Modifier Registers (extended SPI range)
External	GICD_IIDR	Distributor Implementer Identification Register
External	GICD_IPRIORITYR<n>	Interrupt Priority Registers
External	GICD_IPRIORITYR<n>E	Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.
External	GICD_IROUTER<n>	Interrupt Routing Registers
External	GICD_IROUTER<n>E	Interrupt Routing Registers (Extended SPI Range)

Exec state	Name	Description
External	GICD_ISACTIVER<n>	Interrupt Set-Active Registers
External	GICD_ISACTIVER<n>E	Interrupt Set-Active Registers (extended SPI range)
External	GICD_ISENBALER<n>	Interrupt Set-Enable Registers
External	GICD_ISENBALER<n>E	Interrupt Set-Enable Registers
External	GICD_ISPENDR<n>	Interrupt Set-Pending Registers
External	GICD_ISPENDR<n>E	Interrupt Set-Pending Registers (extended SPI range)
External	GICD_ITARGETSR<n>	Interrupt Processor Targets Registers
External	GICD_NSACR<n>	Non-secure Access Control Registers
External	GICD_NSACR<n>E	Non-secure Access Control Registers
External	GICD_SETSPI_NSR	Set Non-secure SPI Pending Register
External	GICD_SETSPI_SR	Set Secure SPI Pending Register
External	GICD_SGIR	Software Generated Interrupt Register
External	GICD_SPENDSGIR<n>	SIG Set-Pending Registers
External	GICD_STATUSR	Error Reporting Status Register
External	GICD_TYPER	Interrupt Controller Type Register
External	GICD_TYPER2	Interrupt Controller Type Register 2
External	GICM_CLRSPI_NSR	Clear Non-secure SPI Pending Register
External	GICM_CLRSPI_SR	Clear Secure SPI Pending Register
External	GICM_IIDR	Distributor Implementer Identification Register
External	GICM_SETSPI_NSR	Set Non-secure SPI Pending Register
External	GICM_SETSPI_SR	Set Secure SPI Pending Register
External	GICM_TYPER	Distributor MSI Type Register

In the GICR functional group:

Exec state	Name	Description
External	GICR_CLRLPIR	Clear LPI Pending Register
External	GICR_CTLR	Redistributor Control Register
External	GICR_ICACTIVER0	Interrupt Clear-Active Register 0
External	GICR_ICACTIVER<n>E	Interrupt Clear-Active Registers
External	GICR_ICENABLER0	Interrupt Clear-Enable Register 0
External	GICR_ICENABLER<n>E	Interrupt Clear-Enable Registers
External	GICR_ICFGR0	Interrupt Configuration Register 0
External	GICR_ICFGR1	Interrupt Configuration Register 1
External	GICR_ICFGR<n>E	Interrupt configuration registers
External	GICR_ICPENDR0	Interrupt Clear-Pending Register 0
External	GICR_ICPENDR<n>E	Interrupt Clear-Pending Registers
External	GICR_IGROUPR0	Interrupt Group Register 0
External	GICR_IGROUPR<n>E	Interrupt Group Registers
External	GICR_IGRPMODR0	Interrupt Group Modifier Register 0
External	GICR_IGRPMODR<n>E	Interrupt Group Modifier Registers
External	GICR_IIDR	Redistributor Implementer Identification Register
External	GICR_INVALLR	Redistributor Invalidate All Register
External	GICR_INVLPIR	Redistributor Invalidate LPI Register
External	GICR_IPRIORITYR<n>	Interrupt Priority Registers
External	GICR_IPRIORITYR<n>E	Interrupt Priority Registers (extended PPI range)
External	GICR_ISACTIVER0	Interrupt Set-Active Register 0
External	GICR_ISACTIVER<n>E	Interrupt Set-Active Registers
External	GICR_ISENBALER0	Interrupt Set-Enable Register 0
External	GICR_ISENBALER<n>E	Interrupt Set-Enable Registers
External	GICR_ISPENDR0	Interrupt Set-Pending Register 0
External	GICR_ISPENDR<n>E	Interrupt Set-Pending Registers
External	GICR_MPAMIDR	Report maximum PARTID and PMG Register
External	GICR_NSACR	Non-secure Access Control Register
External	GICR_PARTIDR	Set PARTID and PMG Register
External	GICR_PENDBASER	Redistributor LPI Pending Table Base Address Register
External	GICR_PROPBASER	Redistributor Properties Base Address Register
External	GICR_SETLPIR	Set LPI Pending Register
External	GICR_STATUSR	Error Reporting Status Register
External	GICR_SYNCRR	Redistributor Synchronize Register
External	GICR_TYPER	Redistributor Type Register
External	GICR_VPENDBASER	Virtual Redistributor LPI Pending Table Base Address Register

Exec state	Name	Description
External	GICR_VPROPBASER	Virtual Redistributor Properties Base Address Register
External	GICR_VSGIPENDR	Redistributor virtual SGI pending state register
External	GICR_VSGIR	Redistributor virtual SGI pending state request register
External	GICR_WAKER	Redistributor Wake Register

In the GICC functional group:

Exec state	Name	Description
External	GICC_ABPR	CPU Interface Aliased Binary Point Register
External	GICC_AEOIR	CPU Interface Aliased End Of Interrupt Register
External	GICC_AHPPIR	CPU Interface Aliased Highest Priority Pending Interrupt Register
External	GICC_AIAR	CPU Interface Aliased Interrupt Acknowledge Register
External	GICC_APR<n>	CPU Interface Active Priorities Registers
External	GICC_BPR	CPU Interface Binary Point Register
External	GICC_CTLR	CPU Interface Control Register
External	GICC_DIR	CPU Interface Deactivate Interrupt Register
External	GICC_EOIR	CPU Interface End Of Interrupt Register
External	GICC_HPPIR	CPU Interface Highest Priority Pending Interrupt Register
External	GICC_IAR	CPU Interface Interrupt Acknowledge Register
External	GICC_IIDR	CPU Interface Identification Register
External	GICC_NSAPR<n>	CPU Interface Non-secure Active Priorities Registers
External	GICC_PMR	CPU Interface Priority Mask Register
External	GICC_RPR	CPU Interface Running Priority Register
External	GICC_STATUSR	CPU Interface Status Register

In the GICV functional group:

Exec state	Name	Description
External	GICV_ABPR	Virtual Machine Aliased Binary Point Register
External	GICV_AEOIR	Virtual Machine Aliased End Of Interrupt Register
External	GICV_AHPPIR	Virtual Machine Aliased Highest Priority Pending Interrupt Register
External	GICV_AIAR	Virtual Machine Aliased Interrupt Acknowledge Register
External	GICV_APR<n>	Virtual Machine Active Priorities Registers
External	GICV_BPR	Virtual Machine Binary Point Register
External	GICV_CTLR	Virtual Machine Control Register
External	GICV_DIR	Virtual Machine Deactivate Interrupt Register
External	GICV_EOIR	Virtual Machine End Of Interrupt Register
External	GICV_HPPIR	Virtual Machine Highest Priority Pending Interrupt Register
External	GICV_IAR	Virtual Machine Interrupt Acknowledge Register
External	GICV_IIDR	Virtual Machine CPU Interface Identification Register
External	GICV_PMR	Virtual Machine Priority Mask Register
External	GICV_RPR	Virtual Machine Running Priority Register
External	GICV_STATUSR	Virtual Machine Error Reporting Status Register

In the GICH functional group:

Exec state	Name	Description
External	GICH_APR<n>	Active Priorities Registers
External	GICH_EISR	End Interrupt Status Register
External	GICH_ELSR	Empty List Register Status Register
External	GICH_HCSR	Hypervisor Control Register
External	GICH_LR<n>	List Registers
External	GICH_MISR	Maintenance Interrupt Status Register
External	GICH_VMCR	Virtual Machine Control Register
External	GICH_VTR	Virtual Type Register

In the GITS functional group:

Exec state	Name	Description
External	GITS_BASER<n>	ITS Translation Table Descriptors

Exec state	Name	Description
External	GITS_CBASER	ITS Command Queue Descriptor
External	GITS_CREADR	ITS Read Register
External	GITS_CTLR	ITS Control Register
External	GITS_CWRITER	ITS Write Register
External	GITS_IIDR	ITS Identification Register
External	GITS_MPAMIDR	Report maximum PARTID and PMG Register
External	GITS_MPIDR	Report ITS's affinity.
External	GITS_PARTIDR	Set PARTID and PMG Register
External	GITS_SGIR	ITS SGI Register
External	GITS_STATUSR	ITS Error Reporting Status Register
External	GITS_TRANSLATER	ITS Translation Register
External	GITS_TYPER	ITS Type Register
External	GITS_UMSIR	ITS Unmapped MSI register

In the RAS functional group:

Exec state	Name	Description
AArch32	DISR	Deferred Interrupt Status Register
AArch32	ERRIDR	Error Record ID Register
AArch32	ERRSELR	Error Record Select Register
AArch32	ERXADDR	Selected Error Record Address Register
AArch32	ERXADDR2	Selected Error Record Address Register 2
AArch32	ERXCTLR	Selected Error Record Control Register
AArch32	ERXCTLR2	Selected Error Record Control Register 2
AArch32	ERXFR	Selected Error Record Feature Register
AArch32	ERXFR2	Selected Error Record Feature Register 2
AArch32	ERXMISC0	Selected Error Record Miscellaneous Register 0
AArch32	ERXMISC1	Selected Error Record Miscellaneous Register 1
AArch32	ERXMISC2	Selected Error Record Miscellaneous Register 2

External register index by offset

Below are indexes for external registers in the following blocks:

- [GIC Distributor](#)
- [Debug](#)
- [GIC Virtual interface control](#)
- [PMU](#)
- [GIC Virtual CPU interface](#)
- [GIC Redistributor](#)
- [CTI](#)
- [GIC ITS control](#)
- [GIC CPU interface](#)
- [Timer](#)
- [GIC ITS translation](#)
- [AMU](#)
- [ETE](#)
- [MPAM](#)
- [RAS](#)

In the GIC Distributor block:

Frame	Offset	Name	Description
Dist_base	0x0000	GICD_CTLR	Distributor Control Register
Dist_base	0x0004	GICD_TYPER	Interrupt Controller Type Register
Dist_base	0x0008	GICD_IIDR	Distributor Implementer Identification Register
Dist_base	0x000C	GICD_TYPER2	Interrupt Controller Type Register 2
Dist_base	0x0010	GICD_STATUSR	Error Reporting Status Register
Dist_base	0x0010	GICD_STATUSR	Error Reporting Status Register
Dist_base	0x0040	GICD_SETSPI_NSR	Set Non-secure SPI Pending Register
Dist_base	0x0048	GICD_CLRSPI_NSR	Clear Non-secure SPI Pending Register
Dist_base	0x0050	GICD_SETSPI_SR	Set Secure SPI Pending Register
Dist_base	0x0058	GICD_CLRSPI_SR	Clear Secure SPI Pending Register
Dist_base	0x0080 + (4 * n)	GICD_IGROUPR<n>	Interrupt Group Registers
Dist_base	0x0100 + (4 * n)	GICD_ISENABLER<n>	Interrupt Set-Enable Registers
Dist_base	0x0180 + (4 * n)	GICD_ICENABLER<n>	Interrupt Clear-Enable Registers
Dist_base	0x0200 + (4 * n)	GICD_ISPENDR<n>	Interrupt Set-Pending Registers
Dist_base	0x0280 + (4 * n)	GICD_ICPENDR<n>	Interrupt Clear-Pending Registers
Dist_base	0x0300 + (4 * n)	GICD_ISACTIVER<n>	Interrupt Set-Active Registers

Dist_base	0x1000 + (4 * n)	GICD_IGROUPR<n>E	Interrupt Group Registers (extended SPI range)
Dist_base	0x1200 + (4 * n)	GICD_ISENABLER<n>E	Interrupt Set-Enable Registers
Dist_base	0x1400 + (4 * n)	GICD_ICENABLER<n>E	Interrupt Clear-Enable Registers

Frame	Offset	Name	Description
Dist_base	0x1600 + (4 * n)	GICD_ISPENDR<n>E	Interrupt Set-Pending Registers (extended SPI range)
Dist_base	0x1800 + (4 * n)	GICD_ICPENDR<n>E	Interrupt Clear-Pending Registers (extended SPI range)
Dist_base	0x1A00 + (4 * n)	GICD_ISACTIVER<n>E	Interrupt Set-Active Registers (extended SPI range)
Dist_base	0x1C00 + (4 * n)	GICD_ICACTIVER<n>E	Interrupt Clear-Active Registers (extended SPI range)
Dist_base	0x2000 + (4 * n)	GICD_IPRIORITYR<n>E	Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.
Dist_base	0x3000 + (4 * n)	GICD_ICFGR<n>E	Interrupt Configuration Registers (Extended SPI Range)
Dist_base	0x3400 + (4 * n)	GICD_IGRPMODR<n>E	Interrupt Group Modifier Registers (extended SPI range)
Dist_base	0x3600 + (4 * n)	GICD_NSACR<n>E	Non-secure Access Control Registers
Dist_base	0x6000 + (8 * n)	GICD_IROUTER<n>	Interrupt Routing Registers
Dist_base	0x8000 + (8 * n)	GICD_IROUTER<n>E	Interrupt Routing Registers (Extended SPI Range)
MSI_base	0x0004	GICM_TYPER	Distributor MSI Type Register
MSI_base	0x0040	GICM_SETSPI_NSR	Set Non-secure SPI Pending Register
MSI_base	0x0048	GICM_CLRSPI_NSR	Clear Non-secure SPI Pending Register
MSI_base	0x0050	GICM_SETSPI_SR	Set Secure SPI Pending Register
MSI_base	0x0058	GICM_CLRSPI_SR	Clear Secure SPI Pending Register
MSI_base	0x0FCC	GICM_IIDR	Distributor Implementer Identification Register

In the Debug block:

Offset	Name	Description
0x020	EDES	External Debug Event Status Register
0x024	EDECR	External Debug Execution Control Register
0x030	EDWAR[31:0]	External Debug Watchpoint Address Register
0x034	EDWAR[63:32]	External Debug Watchpoint Address Register
0x080	DBGDTRRX_EL0	Debug Data Transfer Register, Receive
0x084	EDITR	External Debug Instruction Transfer Register
0x088	EDSCR	External Debug Status and Control Register
0x08C	DBGDTRTX_EL0	Debug Data Transfer Register, Transmit
0x090	EDRCR	External Debug Reserve Control Register
0x094	EDACR	External Debug Auxiliary Control Register
0x098	EDECCR	External Debug Exception Catch Control Register
0x0A0	EDPCSR[31:0]	External Debug Program Counter Sample Register
0x0A4	EDCIDS	External Debug Context ID Sample Register
0x0A8	EDVIDSR	External Debug Virtual Context Sample Register
0x0AC	EDPCSR[63:32]	External Debug Program Counter Sample Register
0x300	OSLAR_EL1	OS Lock Access Register
0x310	EDPRCR	External Debug Power/Reset Control Register
0x314	EDPRSR	External Debug Processor Status Register
0x400 + (16 * n)	DBGBVR<n>_EL1[63:0]	Debug Breakpoint Value Registers
0x408 + (16 * n)	DBGBCR<n>_EL1	Debug Breakpoint Control Registers
0x800 + (16 * n)	DBGWVR<n>_EL1[63:0]	Debug Watchpoint Value Registers
0x808 + (16 * n)	DBGWCR<n>_EL1	Debug Watchpoint Control Registers

Offset	Name	Description
0xD00	MIDR_EL1	Main ID Register
0xD20	EDPFR[31:0]	External Debug Processor Feature Register
0xD24	EDPFR[63:32]	External Debug Processor Feature Register
0xD28	EDDFR[31:0]	External Debug Feature Register
0xD2C	EDDFR[63:32]	External Debug Feature Register
0xD60	EDAA32PFR	External Debug Auxiliary Processor Feature Register
0xF00	EDITCTRL	External Debug Integration mode Control register
0xFA0	DBGCLAIMSET_EL1	Debug CLAIM Tag Set register
0xFA4	DBGCLAIMCLR_EL1	Debug CLAIM Tag Clear register
0xFA8	EDDEVAFF0	External Debug Device Affinity register 0
0xFAC	EDDEVAFF1	External Debug Device Affinity register 1
0xFB0	EDLAR	External Debug Lock Access Register
0xFB4	EDLSR	External Debug Lock Status Register
0xFB8	DBGAUTHSTATUS_EL1	Debug Authentication Status register
0xFBC	EDDEVARCH	External Debug Device Architecture register
0xFC0	EDDEVID2	External Debug Device ID register 2
0xFC4	EDDEVID1	External Debug Device ID register 1
0xFC8	EDDEVID	External Debug Device ID register 0
0xFCC	EDDEVTYPE	External Debug Device Type register
0xFD0	EDPIDR4	External Debug Peripheral Identification Register 4
0xFE0	EDPIDR0	External Debug Peripheral Identification Register 0
0xFE4	EDPIDR1	External Debug Peripheral Identification Register 1
0xFE8	EDPIDR2	External Debug Peripheral Identification Register 2
0xFEC	EDPIDR3	External Debug Peripheral Identification Register 3
0xFF0	EDCIDR0	External Debug Component Identification Register 0
0xFF4	EDCIDR1	External Debug Component Identification Register 1
0xFF8	EDCIDR2	External Debug Component Identification Register 2
0xFFC	EDCIDR3	External Debug Component Identification Register 3

In the GIC Virtual interface control block:

Offset	Name	Description
0x0000	GICH_HCR	Hypervisor Control Register
0x0004	GICH_VTR	Virtual Type Register
0x0008	GICH_VMCR	Virtual Machine Control Register
0x0010	GICH_MISR	Maintenance Interrupt Status Register
0x0020	GICH_EISR	End Interrupt Status Register
0x0030	GICH_ELRSR	Empty List Register Status Register
0x00F0 + (4 * n)	GICH_APR<n>	Active Priorities Registers
0x0100 + (4 * n)	GICH_LR<n>	List Registers

In the PMU block:

Offset	Name	Description
0x000 + (8 * n)	PMEVCNTR<n>_EL0	Performance Monitors Event Count Registers
0x0F8	PMCCNTR_EL0[31:0]	Performance Monitors Cycle Counter
0x0FC	PMCCNTR_EL0[63:32]	Performance Monitors Cycle Counter
0x200	PMPCSR[31:0]	Program Counter Sample Register
0x204	PMPCSR[63:32]	Program Counter Sample Register

Offset	Name	Description
0x208	PMCID1SR	CONTEXTIDR_EL1 Sample Register
0x20C	PMVIDSR	VMID Sample Register
0x220	PMPCSR[31:0]	Program Counter Sample Register
0x224	PMPCSR[63:32]	Program Counter Sample Register
0x228	PMCID1SR	CONTEXTIDR_EL1 Sample Register
0x22C	PMCID2SR	CONTEXTIDR_EL2 Sample Register
0x400 + (4 * n)	PMEVTYPEPER<n>_EL0	Performance Monitors Event Type Registers
0x47C	PMCCFILTR_EL0	Performance Monitors Cycle Counter Filter Register
0xC00	PMCNTENSET_EL0	Performance Monitors Count Enable Set register
0xC20	PMCNTENCLR_EL0	Performance Monitors Count Enable Clear register
0xC40	PMINTENSET_EL1	Performance Monitors Interrupt Enable Set register
0xC60	PMINTENCLR_EL1	Performance Monitors Interrupt Enable Clear register
0xC80	PMOVSCLR_EL0	Performance Monitors Overflow Flag Status Clear register
0xCA0	PMSWINC_EL0	Performance Monitors Software Increment register
0xCC0	PMOVSSET_EL0	Performance Monitors Overflow Flag Status Set register
0xE00	PMCFGR	Performance Monitors Configuration Register
0xE04	PMCR_EL0	Performance Monitors Control Register
0xE20	PMCEID0	Performance Monitors Common Event Identification register 0
0xE24	PMCEID1	Performance Monitors Common Event Identification register 1
0xE28	PMCEID2	Performance Monitors Common Event Identification register 2
0xE2C	PMCEID3	Performance Monitors Common Event Identification register 3
0xE40	PMMIR	Performance Monitors Machine Identification Register
0xF00	PMITCTRL	Performance Monitors Integration mode Control register
0xFA8	PMDEVAFF0	Performance Monitors Device Affinity register 0
0xFAC	PMDEVAFF1	Performance Monitors Device Affinity register 1
0xFB0	PMLAR	Performance Monitors Lock Access Register
0xFB4	PMLSR	Performance Monitors Lock Status Register
0xFB8	PMAUTHSTATUS	Performance Monitors Authentication Status register
0xFBC	PMDEVARCH	Performance Monitors Device Architecture register
0xFC8	PMDEVID	Performance Monitors Device ID register
0xFCC	PMDEVTYPE	Performance Monitors Device Type register
0xFD0	PMPIDR4	Performance Monitors Peripheral Identification Register 4
0xFE0	PMPIDR0	Performance Monitors Peripheral Identification Register 0
0xFE4	PMPIDR1	Performance Monitors Peripheral Identification Register 1
0xFE8	PMPIDR2	Performance Monitors Peripheral Identification Register 2
0xFEC	PMPIDR3	Performance Monitors Peripheral Identification Register 3
0xFF0	PMCIDR0	Performance Monitors Component Identification Register 0
0xFF4	PMCIDR1	Performance Monitors Component Identification Register 1
0xFF8	PMCIDR2	Performance Monitors Component Identification Register 2
0xFFC	PMCIDR3	Performance Monitors Component Identification Register 3

In the GIC Virtual CPU interface block:

Offset	Name	Description
0x0000	GICV_CTLR	Virtual Machine Control Register
0x0004	GICV_PMR	Virtual Machine Priority Mask Register
0x0008	GICV_BPR	Virtual Machine Binary Point Register

Offset	Name	Description
0x000C	GICV_IAR	Virtual Machine Interrupt Acknowledge Register
0x0010	GICV_EOIR	Virtual Machine End Of Interrupt Register
0x0014	GICV_RPR	Virtual Machine Running Priority Register
0x0018	GICV_HPPIR	Virtual Machine Highest Priority Pending Interrupt Register
0x001C	GICV_ABPR	Virtual Machine Aliased Binary Point Register
0x0020	GICV_AIAR	Virtual Machine Aliased Interrupt Acknowledge Register
0x0024	GICV_AEOIR	Virtual Machine Aliased End Of Interrupt Register
0x0028	GICV_AHPPIR	Virtual Machine Aliased Highest Priority Pending Interrupt Register
0x002C	GICV_STATUSR	Virtual Machine Error Reporting Status Register
0x00D0 + (4 * n)	GICV_APR<n>	Virtual Machine Active Priorities Registers
0x00FC	GICV_IIDR	Virtual Machine CPU Interface Identification Register
0x1000	GICV_DIR	Virtual Machine Deactivate Interrupt Register

In the GIC Redistributor block:

Frame	Offset	Name	Description
RD_base	0x0000	GICR_CTLR	Redistributor Control Register
RD_base	0x0004	GICR_IIDR	Redistributor Implementer Identification Register
RD_base	0x0008	GICR_TYPER	Redistributor Type Register
RD_base	0x0010	GICR_STATUSR	Error Reporting Status Register
RD_base	0x0010	GICR_STATUSR	Error Reporting Status Register
RD_base	0x0014	GICR_WAKER	Redistributor Wake Register
RD_base	0x0018	GICR_MPAMIDR	Report maximum PARTID and PMG Register
RD_base	0x001C	GICR_PARTIDR	Set PARTID and PMG Register
RD_base	0x0040	GICR_SETLPIR	Set LPI Pending Register
RD_base	0x0048	GICR_CLRLPIR	Clear LPI Pending Register
RD_base	0x0070	GICR_PROPBASER	Redistributor Properties Base Address Register
RD_base	0x0078	GICR_PENDBASER	Redistributor LPI Pending Table Base Address Register
RD_base	0x00A0	GICR_INVLPIR	Redistributor Invalidate LPI Register
RD_base	0x00B0	GICR_INVALLR	Redistributor Invalidate All Register
RD_base	0x00C0	GICR_SYNCR	Redistributor Synchronize Register
SGI_base	0x0080	GICR_IGROUPR0	Interrupt Group Register 0
SGI_base	0x0080 + (4 * n)	GICR_IGROUPR<n>E	Interrupt Group Registers
SGI_base	0x0100	GICR_ISENBALER0	Interrupt Set-Enable Register 0
SGI_base	0x0100 + (4 * n)	GICR_ISENBALER<n>E	Interrupt Set-Enable Registers
SGI_base	0x0180	GICR_ICENABLER0	Interrupt Clear-Enable Register 0
SGI_base	0x0180 + (4 * n)	GICR_ICENABLER<n>E	Interrupt Clear-Enable Registers
SGI_base	0x0200	GICR_ISPENDR0	Interrupt Set-Pending Register 0
SGI_base	0x0200 + (4 * n)	GICR_ISPENDR<n>E	Interrupt Set-Pending Registers
SGI_base	0x0280	GICR_ICPENDR0	Interrupt Clear-Pending Register 0
SGI_base	0x0280 + (4 * n)	GICR_ICPENDR<n>E	Interrupt Clear-Pending Registers
SGI_base	0x0300	GICR_ISACTIVER0	Interrupt Set-Active Register 0
SGI_base	0x0300 + (4 * n)	GICR_ISACTIVER<n>E	Interrupt Set-Active Registers
SGI_base	0x0380	GICR_ICACTIVER0	Interrupt Clear-Active Register 0
SGI_base	0x0380 + (4 * n)	GICR_ICACTIVER<n>E	Interrupt Clear-Active Registers

Frame	Offset	Name	Description
SGI_base	0x0400 + (4 * n)	GICR_IPRIORITYR<n>E	Interrupt Priority Registers (extended PPI range)
SGI_base	0x0400 + (4 * n)	GICR_IPRIORITYR<n>	Interrupt Priority Registers
SGI_base	0x0C00	GICR_ICFGR0	Interrupt Configuration Register 0
SGI_base	0x0C00 + (4 * n)	GICR_ICFGR<n>E	Interrupt configuration registers
SGI_base	0x0C04	GICR_ICFGR1	Interrupt Configuration Register 1
SGI_base	0x0D00	GICR_IGRPMDR0	Interrupt Group Modifier Register 0
SGI_base	0x0D00 + (4 * n)	GICR_IGRPMDR<n>E	Interrupt Group Modifier Registers
SGI_base	0x0E00	GICR_NSACR	Non-secure Access Control Register
VLPI_base	0x0070	GICR_VPROPBASER	Virtual Redistributor Properties Base Address Register
VLPI_base	0x0078	GICR_VPENDBASER	Virtual Redistributor LPI Pending Table Base Address Register
VLPI_base	0x0080	GICR_VSGIR	Redistributor virtual SGI pending state request register
VLPI_base	0x0088	GICR_VSGIPENDR	Redistributor virtual SGI pending state register

In the CTI block:

Offset	Name	Description
0x000	CTICONTROL	CTI Control register
0x010	CTIINTACK	CTI Output Trigger Acknowledge register
0x014	CTIAPPSET	CTI Application Trigger Set register
0x018	CTIAPPCLEAR	CTI Application Trigger Clear register
0x01C	CTIAPPPULSE	CTI Application Pulse register
0x020 + (4 * n)	CTIINEN<n>	CTI Input Trigger to Output Channel Enable registers
0x0A0 + (4 * n)	CTIOUTEN<n>	CTI Input Channel to Output Trigger Enable registers
0x130	CTITRIGINSTATUS	CTI Trigger In Status register
0x134	CTITRIGOUTSTATUS	CTI Trigger Out Status register
0x138	CTICHINSTATUS	CTI Channel In Status register
0x13C	CTICHOUTSTATUS	CTI Channel Out Status register
0x140	CTIGATE	CTI Channel Gate Enable register
0x144	ASICCTL	CTI External Multiplexer Control register
0x150	CTIDEVCTL	CTI Device Control register
0xF00	CTIITCTRL	CTI Integration mode Control register
0xFA0	CTICLAIMSET	CTI CLAIM Tag Set register
0xFA4	CTICLAIMCLR	CTI CLAIM Tag Clear register
0xFA8	CTIDEVAFF0	CTI Device Affinity register 0
0xFAC	CTIDEVAFF1	CTI Device Affinity register 1
0xFB0	CTILAR	CTI Lock Access Register
0xFB4	CTILSR	CTI Lock Status Register
0xFB8	CTIAUTHSTATUS	CTI Authentication Status register
0xFBC	CTIDEVARCH	CTI Device Architecture register
0xFC0	CTIDEVID2	CTI Device ID register 2
0xFC4	CTIDEVID1	CTI Device ID register 1
0xFC8	CTIDEVID	CTI Device ID register 0
0xFCC	CTIDEVTYPE	CTI Device Type register
0xFD0	CTIPIDR4	CTI Peripheral Identification Register 4
0xFE0	CTIPIDR0	CTI Peripheral Identification Register 0
0xFE4	CTIPIDR1	CTI Peripheral Identification Register 1

Offset	Name	Description
0xFE8	CTIPIDR2	CTI Peripheral Identification Register 2
0xFEC	CTIPIDR3	CTI Peripheral Identification Register 3
0xFF0	CTICIDR0	CTI Component Identification Register 0
0xFF4	CTICIDR1	CTI Component Identification Register 1
0xFF8	CTICIDR2	CTI Component Identification Register 2
0xFFC	CTICIDR3	CTI Component Identification Register 3

In the GIC ITS control block:

Offset	Name	Description
0x0000	GITS_CTLR	ITS Control Register
0x0004	GITS_IIDR	ITS Identification Register
0x0008	GITS_TYPER	ITS Type Register
0x0010	GITS_MPAMIDR	Report maximum PARTID and PMG Register
0x0014	GITS_PARTIDR	Set PARTID and PMG Register
0x0018	GITS_MPIDR	Report ITS's affinity.
0x0040	GITS_STATUSR	ITS Error Reporting Status Register
0x0048	GITS_UMSIR	ITS Unmapped MSI register
0x0080	GITS_CBASER	ITS Command Queue Descriptor
0x0088	GITS_CWRITER	ITS Write Register
0x0090	GITS_CREADR	ITS Read Register
0x0100 + (8 * n)	GITS_BASER<n>	ITS Translation Table Descriptors
0x20020	GITS_SGIR	ITS SGI Register

In the GIC CPU interface block:

Offset	Name	Description
0x0000	GICC_CTLR	CPU Interface Control Register
0x0004	GICC_PMR	CPU Interface Priority Mask Register
0x0008	GICC_BPR	CPU Interface Binary Point Register
0x000C	GICC_IAR	CPU Interface Interrupt Acknowledge Register
0x0010	GICC_EOIR	CPU Interface End Of Interrupt Register
0x0014	GICC_RPR	CPU Interface Running Priority Register
0x0018	GICC_HPPIR	CPU Interface Highest Priority Pending Interrupt Register
0x001C	GICC_ABPR	CPU Interface Aliased Binary Point Register
0x0020	GICC_AIAR	CPU Interface Aliased Interrupt Acknowledge Register
0x0024	GICC_AEOIR	CPU Interface Aliased End Of Interrupt Register
0x0028	GICC_AHPPIR	CPU Interface Aliased Highest Priority Pending Interrupt Register
0x002C	GICC_STATUSR	CPU Interface Status Register
0x002C	GICC_STATUSR	CPU Interface Status Register
0x00D0 + (4 * n)	GICC_APR<n>	CPU Interface Active Priorities Registers
0x00E0 + (4 * n)	GICC_NSAPR<n>	CPU Interface Non-secure Active Priorities Registers
0x00FC	GICC_IIDR	CPU Interface Identification Register
0x1000	GICC_DIR	CPU Interface Deactivate Interrupt Register

In the Timer block:

Frame	Offset	Name	Description
CNTBaseN	0x000	CNTPCT[31:0]	Counter-timer Physical Count

Frame	Offset	Name	Description
CNTBaseN	0x004	CNTPCT[63:32]	Counter-timer Physical Count
CNTBaseN	0x008	CNTVCT[31:0]	Counter-timer Virtual Count
CNTBaseN	0x00C	CNTVCT[63:32]	Counter-timer Virtual Count
CNTBaseN	0x010	CNTFRQ	Counter-timer Frequency
CNTBaseN	0x014	CNTEL0ACR	Counter-timer EL0 Access Control Register
CNTBaseN	0x018	CNTVOFF[31:0]	Counter-timer Virtual Offset
CNTBaseN	0x01C	CNTVOFF[63:32]	Counter-timer Virtual Offset
CNTBaseN	0x020	CNTP_CVAL[31:0]	Counter-timer Physical Timer CompareValue
CNTBaseN	0x024	CNTP_CVAL[63:32]	Counter-timer Physical Timer CompareValue
CNTBaseN	0x028	CNTP_TVAL	Counter-timer Physical Timer TimerValue
CNTBaseN	0x02C	CNTP_CTL	Counter-timer Physical Timer Control
CNTBaseN	0x030	CNTV_CVAL[31:0]	Counter-timer Virtual Timer CompareValue
CNTBaseN	0x034	CNTV_CVAL[63:32]	Counter-timer Virtual Timer CompareValue
CNTBaseN	0x038	CNTV_TVAL	Counter-timer Virtual Timer TimerValue
CNTBaseN	0x03C	CNTV_CTL	Counter-timer Virtual Timer Control
CNTBaseN	0xFD0 + (4 * n)	CounterID<n>	Counter ID registers
CNTCTLBase	0x000	CNTFRQ	Counter-timer Frequency
CNTCTLBase	0x004	CNTNSAR	Counter-timer Non-secure Access Register
CNTCTLBase	0x008	CNTTIDR	Counter-timer Timer ID Register
CNTCTLBase	0x040 + (4 * n)	CNTACR<n>	Counter-timer Access Control Registers

AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

Configuration

External register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register [AMCFGR_EL0\[31:0\]](#).

External register AMCFGR bits [31:0] are architecturally mapped to AArch32 System register [AMCFGR\[31:0\]](#).

The power domain of AMCFGR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are RES0.

Attributes

AMCFGR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NCG				RES0			HDBG	RAZ						SIZE				N													

NCG, bits [31:28]

Defines the number of counter groups.

The number of implemented counter groups is [AMCFGR.NCG + 1].

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

This feature must be supported, and so this bit is 0b1.

HDBG	Meaning
0b0	AMCR.HDBG is RES0.
0b1	AMCR.HDBG is read/write.

Access to this field is **RO**.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is [AMCFGR.SIZE + 1].

The counters are 64-bit.

Note

Software also uses this field to determine the spacing of counters in the memory-map. The counters are at doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is **RO**.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is [AMCFGR.N + 1].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMCFGR

AMCFGR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xE00	AMCFGR

Accesses on this interface are **RO**.

AMCGCR, Activity Monitors Counter Group Configuration Register

The AMCGCR characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configuration

External register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register [AMCGCR_EL0\[31:0\]](#).

External register AMCGCR bits [31:0] are architecturally mapped to AArch32 System register [AMCGCR\[31:0\]](#).

The power domain of AMCGCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are RES0.

Attributes

AMCGCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																CG1NC								CG0NC							

Bits [31:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is 0 to 16.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

Reads as 0x04.

Access to this field is **RO**.

Accessing AMCGCR

AMCGCR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
-----------	--------	----------

AMCGCR, Activity Monitors Counter Group Configuration Register

AMU	0xCE0	AMCGCR
-----	-------	--------

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

AMCIDR0, Activity Monitors Component Identification Register 0

The AMCIDR0 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

The power domain of AMCIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_0							

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is **RO**.

Accessing AMCIDR0

AMCIDR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFF0	AMCIDR0

Accesses on this interface are **RO**.

AMCIDR1, Activity Monitors Component Identification Register 1

The AMCIDR1 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

The power domain of AMCIDR1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												CLASS			PRMBL 1				

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

PRMBL_1, bits [3:0]

Preamble.

Reads as 0b0000.

Access to this field is **RO**.

Accessing AMCIDR1

AMCIDR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFF4	AMCIDR1

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMCIDR2, Activity Monitors Component Identification Register 2

The AMCIDR2 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

The power domain of AMCIDR2 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_2							

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is **RO**.

Accessing AMCIDR2

AMCIDR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFF8	AMCIDR2

Accesses on this interface are **RO**.

AMCIDR3, Activity Monitors Component Identification Register 3

The AMCIDR3 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

The power domain of AMCIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_3							

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is **RO**.

Accessing AMCIDR3

AMCIDR3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFFC	AMCIDR3

Accesses on this interface are **RO**.

AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

Purpose

Disable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

Configuration

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR0_ELO\[31:0\]](#).

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENCLR0\[31:0\]](#).

The power domain of AMCNTENCLR0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are RES0.

Attributes

AMCNTENCLR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																RAZ/WI										P3	P2	P1	P0		

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for [AMEVCNTR0<n>](#).

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR0<n> is disabled.
0b1	When read, means that AMEVCNTR0<n> is enabled.

The reset behaviour of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENCLR0

AMCNTENCLR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xC20	AMCNTENCLR0

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Configuration

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENCLR1_ELO\[31:0\]](#).

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENCLR1\[31:0\]](#).

The power domain of AMCNTENCLR1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are RES0.

Attributes

AMCNTENCLR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter disable bit for [AMEVCNTR1<n>](#).

When N is less than 16, bits [15:N] are RAZ, where N is the value in [AMCGCR.CG1NC](#).

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR1<n> is disabled.
0b1	When read, means that AMEVCNTR1<n> is enabled.

The reset behaviour of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENCLR1

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENCLR1 are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

The number of auxiliary activity monitor event counters implemented is zero exactly when [AMCFGR](#).NCG == 0b0000.

AMCNTENCLR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xC24	AMCNTENCLR1

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

Purpose

Enable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

Configuration

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENSET0_ELO\[31:0\]](#).

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENSET0\[31:0\]](#).

The power domain of AMCNTENSET0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are RES0.

Attributes

AMCNTENSET0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																RAZ/WI										P3	P2	P1	P0		

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter enable bit for [AMEVCNTR0<n>](#).

Note

[AMCGCR](#).CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR0<n> is disabled.
0b1	When read, means that AMEVCNTR0<n> is enabled.

The reset behaviour of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENSET0

AMCNTENSET0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xC00	AMCNTENSET0

Accesses on this interface are **RO**.

AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

Purpose

Enable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Configuration

External register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENSET1_ELO\[31:0\]](#).

External register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch32 System register [AMCNTENSET1\[31:0\]](#).

The power domain of AMCNTENSET1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are RES0.

Attributes

AMCNTENSET1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter enable bit for [AMEVCNTR1<n>](#).

When N is less than 16, bits [15:N] are RAZ, where N is the value in [AMCGCR.CG1NC](#).

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR1<n> is disabled.
0b1	When read, means that AMEVCNTR1<n> is enabled.

The reset behaviour of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENSET1

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENSET1 are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

The number of auxiliary activity monitor counters implemented is zero exactly when [AMCFGR](#).NCG == 0b0000.

AMCNTENSET1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xC04	AMCNTENSET1

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

AMCR, Activity Monitors Control Register

The AMCR characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

Configuration

External register AMCR bits [31:0] are architecturally mapped to AArch64 System register [AMCR_EL0\[31:0\]](#).

External register AMCR bits [31:0] are architecturally mapped to AArch32 System register [AMCR\[31:0\]](#).

The power domain of AMCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCR are RES0.

Attributes

AMCR is a 32-bit register.

Field descriptions

Bits [31:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

HDBG	Meaning
0b0	Activity monitors do not halt counting when the PE is halted in Debug state.
0b1	Activity monitors halt counting when the PE is halted in Debug state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing AMCR

AMCR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xE04	AMCR

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMDEVAFF0, Activity Monitors Device Affinity Register 0

The AMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Configuration

The power domain of AMDEVAFF0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVAFF0 is a 32-bit register.

Field descriptions

MPIDR_EL1lo, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing AMDEVAFF0

AMDEVAFF0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFA8	AMDEVAFF0

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMDEVAFF1, Activity Monitors Device Affinity Register 1

The AMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Configuration

- The power domain of AMDEVAFF1 is IMPLEMENTATION DEFINED.
- Implementation of this register is OPTIONAL.
- This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVAFF1 is a 32-bit register.

Field descriptions

MPIDR_EL1hi, bits [31:0]

- [MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing AMDEVAFF1

AMDEVAFF1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFAC	AMDEVAFF1

Accesses on this interface are **RO**.

AMDEVARCH, Activity Monitors Device Architecture Register

The AMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the AMU component.

Configuration

The power domain of AMDEVARCH is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVARCH is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARCHITECT											PRESENT	REVISION				ARCHID															

ARCHITECT, bits [31:21]

Defines the architecture of the component. For AMU, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is **RO**.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as 0b1.

Access to this field is **RO**.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

All other values are reserved.

Reads as 0b0000.

Access to this field is **RO**.

ARCHID, bits [15:0]

Defines this part to be an AMU component. For architectures defined by Arm this is further subdivided.

For AMU:

- Bits [15:12] are the architecture version, 0x0.
- Bits [11:0] are the architecture part number, 0xA66.

This corresponds to AMU architecture version AMUv1.

Reads as 0x0A66.

Access to this field is **RO**.

Accessing AMDEVARCH

AMDEVARCH can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFBC	AMDEVARCH

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMDEVTTYPE, Activity Monitors Device Type Register

The AMDEVTTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's performance monitor interface.

Configuration

The power domain of AMDEVTTYPE is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVTTYPE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												SUB			MAJOR				

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype.

Reads as 0b0001.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type.

Reads as 0b0110.

Access to this field is **RO**.

Accessing AMDEVTTYPE

AMDEVTTYPE can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFCC	AMDEVTTYPE

Accesses on this interface are **RO**.

AMEVCNTR0<n>, Activity Monitors Event Counter Registers 0, n = 0 - 3

The AMEVCNTR0<n> characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configuration

External register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch64 System register [AMEVCNTR0<n>_ELO\[63:0\]](#).

External register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch32 System register [AMEVCNTR0<n>\[63:0\]](#).

The power domain of AMEVCNTR0<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n> are RES0.

Attributes

AMEVCNTR0<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																ACNT															
																ACNT															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 3.

The reset behaviour of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMEVCNTR0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads of AMEVCNTR0<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters.

AMEVCNTR0<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance	Range
AMU	0x000 + (8 * n)	AMEVCNTR0<n>	31:0

Accesses on this interface are **RO**.

Component	Offset	Instance	Range
AMU	0x004 + (8 * n)	AMEVCNTR0<n>	63:32

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMEVCNTR1<n>, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Configuration

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch64 System register [AMEVCNTR1<n>_ELO\[63:0\]](#).

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch32 System register [AMEVCNTR1<n>\[63:0\]](#).

The power domain of AMEVCNTR1<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are RES0.

Attributes

AMEVCNTR1<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																ACNT															
																ACNT															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

The reset behaviour of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMEVCNTR1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVCNTR1<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

[AMCGCR.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

AMEVCNTR1<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance	Range
AMU	$0 \times 100 + (8 * n)$	AMEVCNTR1<n>	31:0

Accesses on this interface are **RO**.

Component	Offset	Instance	Range
AMU	$0 \times 104 + (8 * n)$	AMEVCNTR1<n>	63:32

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMEVTYPER0<n>, Activity Monitors Event Type Registers 0, n = 0 - 3

The AMEVTYPER0<n> characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter [AMEVCNTR0<n>](#) counts.

Configuration

External register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch64 System register [AMEVTYPER0<n>_EL0\[31:0\]](#).

External register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch32 System register [AMEVTYPER0<n>\[31:0\]](#).

The power domain of AMEVTYPER0<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n> are RES0.

Attributes

AMEVTYPER0<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																evtCount															

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter [AMEVCNTR0<n>](#). The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

evtCount	Meaning	Applies when
0x0011	Processor frequency cycles	When n == 0
0x4004	Constant frequency cycles	When n == 1
0x0008	Instructions retired	When n == 2
0x4005	Memory stall cycles	When n == 3

Accessing AMEVTYPER0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads of AMEVTYPER0<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters.

AMEVTYPER0<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	$0x400 + (4 * n)$	AMEVTYPER0<n>

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMEVTYPER1<n>, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n> characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter [AMEVCNTR1<n>](#) counts.

Configuration

External register AMEVTYPER1<n> bits [31:0] are architecturally mapped to AArch64 System register [AMEVTYPER1<n>_EL0\[31:0\]](#).

External register AMEVTYPER1<n> bits [31:0] are architecturally mapped to AArch32 System register [AMEVTYPER1<n>\[31:0\]](#).

The power domain of AMEVTYPER1<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n> are RES0.

Attributes

AMEVTYPER1<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																evtCount															

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter [AMEVCNTR1<n>](#).

It is IMPLEMENTATION DEFINED what values are supported by each counter.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMEVTYPER1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVTYPER1<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

[AMCGCR.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

AMEVTYPER1<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	$0 \times 480 + (4 * n)$	AMEVTYPER1<n>

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMIIDR, Activity Monitors Implementation Identification Register

The AMIIDR characteristics are:

Purpose

Defines the implementer and revisions of the AMU.

Configuration

The power domain of AMIIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMIIDR are RES0.

Attributes

AMIIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ProductID												Variant			Revision			Implementer													

ProductID, bits [31:20]

This field is an AMU part identifier.

If [AMPIDR0](#) is implemented, [AMPIDR0](#).PART_0 matches bits [27:20] of this field.

If [AMPIDR1](#) is implemented, [AMPIDR1](#).PART_1 matches bits [31:28] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [19:16]

This field distinguishes product variants or major revisions of the product.

If [AMPIDR2](#) is implemented, [AMPIDR2](#).REVISION matches AMIIDR.Variant.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

This field distinguishes minor revisions of the product.

If [AMPIDR3](#) is implemented, [AMPIDR3](#).REVAND matches AMIIDR.Revision.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the AMU.

For an Arm implementation, this field reads as 0x43B.

Bits [11:8] contain the JEP106 continuation code of the implementer.

Bit 7 is RES0

Bits [6:0] contain the JEP106 identity code of the implementer.

If [AMPIDR4](#) is implemented, [AMPIDR4](#).DES_2 matches bits [11:8] of this field.

If [AMPIDR2](#) is implemented, [AMPIDR2](#).DES_1 matches bits [6:4] of this field.

If [AMPIDR1](#) is implemented, [AMPIDR1](#).DES_0 matches bits [3:0] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMIIDR

AMIIDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xE08	AMIIDR

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMPIDR0, Activity Monitors Peripheral Identification Register 0

The AMPIDR0 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PART_0							

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMPIDR0

AMPIDR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFE0	AMPIDR0

Accesses on this interface are **RO**.

AMPIDR1, Activity Monitors Peripheral Identification Register 1

The AMPIDR1 characteristics are:

Purpose

Provides information to identify an activity monitors component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR1 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												DES_0				PART_1			

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code.
For Arm Limited, this field is 0b1011.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

Accessing AMPIDR1

AMPIDR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
-----------	--------	----------

AMU	0xFE4	AMPIDR1
-----	-------	---------

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMPIDR2, Activity Monitors Peripheral Identification Register 2

The AMPIDR2 characteristics are:

Purpose

Provides information to identify an activity monitors component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR2 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								REVISION				JEDEC		DES_1	

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.
Reads as 0b1.
Access to this field is **RO**.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code.
For Arm Limited, this field is 0b011.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

Accessing AMPIDR2

AMPIDR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFE8	AMPIDR2

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMPIDR3, Activity Monitors Peripheral Identification Register 3

The AMPIDR3 characteristics are:

Purpose

Provides information to identify an activity monitors component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR3 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								REVAND				CMOD			

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using [AMPIDR2](#).REVISION as an extension to the Part number must use this field as a major revision number.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

Accessing AMPIDR3

AMPIDR3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFEC	AMPIDR3

Accesses on this interface are **RO**.

AMPIDR4, Activity Monitors Peripheral Identification Register 4

The AMPIDR4 characteristics are:

Purpose

Provides information to identify an activity monitors component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR4 is IMPLEMENTATION DEFINED.
Implementation of this register is OPTIONAL.
This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR4 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SIZE			DES_2				

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.
Reads as 0b0000.
Access to this field is **RO**.

DES_2, bits [3:0]

Designer. JEP106 continuation code, least significant nibble.
For Arm Limited, this field is 0b0100.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

Accessing AMPIDR4

AMPIDR4 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFD0	AMPIDR4

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

Purpose

Can be used to provide IMPLEMENTATION DEFINED controls for the CTI. For example, the register might be used to control multiplexors for additional IMPLEMENTATION DEFINED triggers. The IMPLEMENTATION DEFINED controls provided by this register might modify the architecturally defined behavior of the CTI.

Note

The architecturally-defined triggers must not be multiplexed.

Configuration

It is IMPLEMENTATION DEFINED whether ASICCTL is implemented in the Core power domain or in the Debug power domain.

If it is implemented in the Core power domain then it is IMPLEMENTATION DEFINED whether it is in the Cold reset domain or the Warm reset domain.

This register must reset to a value that supports the architecturally-defined behavior of the CTI. Changing the value of the register from its reset value causes IMPLEMENTATION DEFINED behavior that might differ from the architecturally-defined behavior of the CTI.

Other than the requirements listed in this register description, all aspects of the reset behavior of the ASICCTL are IMPLEMENTATION DEFINED.

Attributes

ASICCTL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ASICCTL

ASICCTL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x144	ASICCTL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

Purpose

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- [CNTNSAR](#) controls whether CNTACR<n> is accessible by Non-secure accesses.
- If frame CNTEL0BaseN is implemented, the [CNTEL0ACR](#) in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

Configuration

The power domain of CNTACR<n> is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Implemented only if the value of [CNTTIDR](#).Frame<n> is 1.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

Attributes

CNTACR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0				RWPT		RWVT		RVOFF		RFRQ		RVCT		RPCT					

Bits [31:6]

Reserved, RES0.

RWPT, bit [5]

Read/write access to the EL1 Physical Timer registers [CNTP_CVAL](#), [CNTP_TVAL](#), and [CNTP_CTL](#), in frame <n>. The possible values of this bit are:

RWPT	Meaning
0b0	No access to the EL1 Physical Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the EL1 Physical Timer registers in frame <n>.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RWVT, bit [4]

Read/write access to the Virtual Timer register [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTV_CTL](#), in frame <n>. The possible values of this bit are:

RWVT	Meaning
0b0	No access to the Virtual Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the Virtual Timer registers in frame <n>.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVOFF, bit [3]

Read-only access to [CNTVOFF](#), in frame <n>. The possible values of this bit are:

RVOFF	Meaning
0b0	No access to CNTVOFF in frame <n>. The register is RES0.
0b1	Read-only access to CNTVOFF in frame <n>.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RFRQ, bit [2]

Read-only access to [CNTFRQ](#), in frame <n>. The possible values of this bit are:

RFRQ	Meaning
0b0	No access to CNTFRQ in frame <n>. The register is RES0.
0b1	Read-only access to CNTFRQ in frame <n>.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVCT, bit [1]

Read-only access to [CNTVCT](#), in frame <n>. The possible values of this bit are:

RVCT	Meaning
0b0	No access to CNTVCT in frame <n>. The register is RES0.
0b1	Read-only access to CNTVCT in frame <n>.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RPCT, bit [0]

Read-only access to [CNTPCT](#), in frame <n>. The possible values of this bit are:

RPCT	Meaning
0b0	No access to CNTPCT in frame <n>. The register is RES0.
0b1	Read-only access to CNTPCT in frame <n>.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTACR<n>

In a system that recognizes two Security states:

- CNTACR<n> is always accessible by Secure accesses.
- [CNTNSAR](#).NS<n> determines whether CNTACR<n> is accessible by Non-secure accesses.

CNTACR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x040 + (4 * n)	CNTACR<n>

Accesses on this interface are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTCR, Counter Control Register

The CNTCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Configuration

The power domain of CNTCR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0														FCREQ							RES0			SCEN	HDBG	EN					

Bits [31:18]

Reserved, RES0.

FCREQ, bits [17:8]

Frequency change request. Indicates the number of the entry in the Frequency modes table to select.

Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is IMPLEMENTATION DEFINED up to a maximum of 1004 entries, see 'The Frequency modes table'. An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

The reset behaviour of this field is:

- On a Timer reset, this field resets to 0.

Bits [7:3]

Reserved, RES0.

SCEN, bit [2]

When FEAT_CNTSC is implemented:

Scale Enable.

SCEN	Meaning
0b0	Scaling is not enabled. The counter value is incremented by 0x1.00000000 for each counter tick.
0b1	Scaling is enabled. The counter is incremented by CNTSCR.ScaleVal for each counter tick.

The SCEN bit can only be changed when the counter is disabled, when CNTCR.EN == 0.

If the value of CNTCR.SCEN changes when CNTCR.EN == 1 then:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

When the [CNTCV](#) register in the CNTControlBase frame of the memory mapped counter module is written to, the accumulated fraction information is reset to zero.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HDBG, bit [1]

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

HDBG	Meaning
0b0	System counter ignores Halt-on-debug.
0b1	Asserted Halt-on-debug signal halts system counter update.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enables the counter:

EN	Meaning
0b0	System counter disabled.
0b1	System counter enabled.

The reset behaviour of this field is:

- On a Timer reset, this field resets to 0.

Accessing CNTCR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x000	CNTCR

Accesses on this interface are **RW**.

CNTCV, Counter Count Value register

The CNTCV characteristics are:

Purpose

Indicates the current count value.

Configuration

The power domain of CNTCV is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTCV is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																CountValue															
																CountValue															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CountValue, bits [63:0]

Indicates the counter value.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTCV

Frame	Accessibility
CNTControlBase	RW
CNTReadBase	RO

A write to CNTCV must be visible in the [CNTPCT](#) register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, and therefore this register instance, is implemented only in the Secure memory map.
- If the counter is enabled, the effect of writing to the register is UNKNOWN.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

CNTCV can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTControlBase	0x008	CNTCV	63:0

Accesses on this interface are **RW**.

CNTCV, Counter Count Value register

Component	Frame	Offset	Instance	Range
Timer	CNTReadBase	0x000	CNTCV	63:0

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

CNTELOACR, Counter-timer EL0 Access Control Register

The CNTELOACR characteristics are:

Purpose

An implementation of CNTELOACR in the frame at CNTBaseN controls whether the [CNTPTCT](#), [CNTVCT](#), [CNTFRQ](#), EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTELOBaseN.

Configuration

The power domain of CNTELOACR is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTELOACR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0								
										RES0																													

Bits [31:10]

Reserved, RES0.

ELOPTEN, bit [9]

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the [CNTPT_CVAL](#), [CNTPT_TVAL](#), and [CNTPT_CTL](#) registers in the current CNTBaseN frame are also accessible in the corresponding CNTELOBaseN frame. The possible values of this bit are:

ELOPTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ELOVTEN, bit [8]

Second view read/write access control for the Virtual Timer registers. This bit controls whether the [CNTVT_CVAL](#), [CNTVT_TVAL](#), and [CNTVT_CTL](#) registers in the current CNTBaseN frame are also accessible in the corresponding CNTELOBaseN frame. The possible values of this bit are:

ELOVTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

ELOVCTEN, bit [1]

Second view read access control for [CNTVCT](#) and [CNTERQ](#). The possible values of this bit are:

ELOVCTEN	Meaning
0b0	CNTVCT is not visible in the second view. If ELOPCTEN is set to 0, CNTERQ is not visible in the second view.
0b1	Access permitted. If CNTVCT and CNTERQ are visible in the current frame then they are visible in the second view.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ELOPCTEN, bit [0]

Second view read access control for [CNTPCT](#) and [CNTERQ](#). The possible values of this bit are:

ELOPCTEN	Meaning
0b0	CNTPCT is not visible in the second view. If ELOVCTEN is set to 0, CNTERQ is not visible in the second view.
0b1	Access permitted. If CNTPCT and CNTERQ are visible in the current frame then they are visible in the second view.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTEL0ACR

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

- The register location in that frame is RAZ/WI.

- If the corresponding CNTEL0BaseN frame is implemented, the registers [CNTERQ](#), [CNTP_CTL](#), [CNTP_CVAL](#), [CNTP_TVAL](#), [CNTPCT](#), [CNTV_CTL](#), [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTVCT](#) are not visible in that frame.

CNTEL0ACR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x014	CNTEL0ACR

Accesses on this interface are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

Purpose

Indicates the base frequency of the system counter.

Configuration

The power domain of CNTFID0 is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information, see 'The Frequency modes table'.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID0 is a 32-bit register.

Field descriptions

Frequency, bits [31:0]

- The base frequency of the system counter, in Hz.
- The reset behaviour of this field is:
- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFID0

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTFID0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020	CNTFID0

Accesses on this interface are **RO or RW**.

CNTFID<n>, Counter Frequency IDs, n > 0, n = 1 - 1003

The CNTFID<n> characteristics are:

Purpose

Indicates alternative system counter update frequencies.

Configuration

The power domain of CNTFID<n> is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, [CNTFID0](#), see 'The Frequency modes table'.

The number of CNTFID<n> registers is IMPLEMENTATION DEFINED, and the only required CNTFID<n> register is [CNTFID0](#).

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED up to this limit. For an implementation that includes registers in the IMPLEMENTATION DEFINED register space 0x0C0-0x0FC, the maximum number of entries in the Frequency modes table is 40, including the zero-word end marker.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																Frequency															

Frequency, bits [31:0]

A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. Arm strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

increment = (base frequency) / (selected frequency)

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFID<n>

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes these registers, is implemented only in the Secure memory map.

CNTFID<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020 + (4 * n)	CNTFID<n>

Accesses on this interface are **RO or RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. The instance of the register in the CNTCTLBase frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configuration

The power domain of CNTFRQ is IMPLEMENTATION DEFINED.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTFRQ is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Clock frequency																															

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFRQ

CNTFRQ must be implemented as an RW register in the CNTCTLBase frame.

In a system that recognizes two Security states, the instance of the register in the CNTCTLBase frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTBaseN frame, and in the corresponding CNTELOBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTELOBaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTELOBaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTELOBaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RFRQ](#) is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

For an implemented CNTELOBaseN frame:

- CNTFRQ is accessible as a RO register in that frame if both:
 - CNTFRQ is accessible in the corresponding CNTBaseN frame.

- Either the value of [CNTELOACR.EL0VCTEN](#) is 1 or the value of [CNTELOACR.EL0PCTEN](#) is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

CNTFRQ can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x010	CNTFRQ

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTELOBaseN	0x010	CNTFRQ

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x000	CNTFRQ

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTID, Counter Identification Register

The CNTID characteristics are:

Purpose

Indicates whether counter scaling is implemented.

Configuration

The power domain of CNTID is IMPLEMENTATION DEFINED.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTID are RES0.

Attributes

CNTID is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																												CNTSC			

Bits [31:4]

Reserved, RES0.

CNTSC, bits [3:0]

Indicates whether Counter Scaling is implemented

CNTSC	Meaning
0b0000	Counter scaling is not implemented.
0b0001	Counter scaling is implemented.

All other values are reserved.

Accessing CNTID

In a system that supports Secure and Non-secure memory maps, the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTID can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x1C	CNTID

Accesses on this interface are **RO**.

CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

Purpose

Provides the highest-level control of whether frames CNTBaseN and CNTELOBaseN are accessible by Non-secure accesses.

Configuration

The power domain of CNTNSAR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTNSAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								NS7	NS6	NS5	NS4	NS3	NS2	NS1	NS0

Bits [31:8]

Reserved, RES0.

NS<n>, bit [n], for n = 7 to 0

Non-secure access to frame n. The possible values of this bit are:

NS<n>	Meaning
0b0	Secure access only. Behaves as RES0 to Non-secure accesses.
0b1	Secure and Non-secure accesses permitted.

This bit also determines whether, in the CNTCTLBase frame, [CNTACR<n>](#) and [CNTVOFF<n>](#) are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTNSAR

In a system that recognizes two Security states, this register is only accessible by Secure accesses.

CNTNSAR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x004	CNTNSAR

Accesses on this interface are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Configuration

The power domain of CNTP_CTL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_CTL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																											ISTATUS			IMASK	ENABLE

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CTL

CNTP_CTL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CTL is accessible in that frame if the value of [CNTACR<n>.RWPT](#) is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CTL is accessible in that frame if both:
 - CNTP_CTL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTEL0ACR.EL0PTEN](#) is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

CNTP_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x02C	CNTP_CTL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x02C	CNTP_CTL

Accesses on this interface are **RW**.

CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the EL1 physical timer.

Configuration

The power domain of CNTP_CVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_CVAL is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CompareValue																															

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTP_CTL.ISTATUS](#) is set to 1.
- An interrupt is generated if [CNTP_CTL.IMASK](#) is 0.

When [CNTP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL

CNTP_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CVAL is accessible in that frame if the value of [CNTACR<n>.RWPT](#) is 1.

- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CVAL is accessible in that frame if both:
 - CNTP_CVAL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTEL0ACR.EL0PTEN](#) is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

CNTP_CVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x020	CNTP_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x024	CNTP_CVAL	63:32

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x020	CNTP_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x024	CNTP_CVAL	63:32

Accesses on this interface are **RW**.

CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configuration

The power domain of CNTP_TVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_TVAL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TimerValue																															

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If [CNTP_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTP_CTL.ENABLE](#) is 1, the value returned is (CompareValue - [CNTPCT](#)).

On a write of this register, CompareValue is set to ([CNTPCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTP_CTL.ISTATUS](#) is set to 1.
- If [CNTP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_TVAL

CNTP_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_TVAL is accessible in that frame if the value of [CNTACR<n>.RWPT](#) is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_TVAL is accessible in that frame if both:
 - CNTP_TVAL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTEL0ACR.EL0PTEN](#) is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

CNTP_TVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x028	CNTP_TVAL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x028	CNTP_TVAL

Accesses on this interface are **RW**.

CNPCT, Counter-timer Physical Count

The CNPCT characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

The power domain of CNPCT is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNPCT is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Physical count value																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Physical count value.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNPCT

CNPCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNPCT is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RPCT](#) is 1.
- Otherwise, the CNPCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNPCT is accessible in that frame if both:
 - CNPCT is accessible in the corresponding CNTBaseN frame.
 - The value of [CNTEL0ACR.EL0PCTEN](#) is 1.
- Otherwise, the CNPCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

CNPCT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x000	CNPCT	31:0

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x004	CNPCT	63:32

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTELOBaseN	0x000	CNPCT	31:0

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTELOBaseN	0x004	CNPCT	63:32

Accesses on this interface are **RO**.

CNTSCR, Counter Scale Register

The CNTSCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Configuration

The power domain of CNTSCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTSCR are RES0.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTSCR is a 32-bit register.

Field descriptions

ScaleVal, bits [31:0]

Scale Value

When counter scaling is enabled, ScaleVal is the amount added to the counter value for every counter tick.

Counter tick is defined as one period of the current operating frequency of the Generic counter.

ScaleVal is expressed as an unsigned fixed point number with an 8-bit integer value and a 24-bit fractional value.

CNTSCR.ScaleVal can only be changed when [CNTCR.EN](#) == 0. If the value of this field is changed when [CNTCR.EN](#) == 1:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTSCR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x10	CNTSCR

Accesses on this interface are **RW**.

CNTR, Counter Status Register

The CNTR characteristics are:

Purpose

Provides counter frequency status information.

Configuration

The power domain of CNTR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FCACK																								RES0			DBGH		RES0		

FCACK, bits [31:8]

Frequency change acknowledge. Indicates the currently selected entry in the Frequency modes table, see 'The Frequency modes table'.

The reset behaviour of this field is:

- On a Timer reset, this field resets to 0.

Bits [7:2]

Reserved, RES0.

DBGH, bit [1]

Indicates whether the counter is halted because the Halt-on-debug signal is asserted:

DBGH	Meaning
0b0	Counter is not halted.
0b1	Counter is halted.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing CNTR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x004	CNTSR

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

Purpose

Indicates the implemented timers in the memory map, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTELOBaseN.
- Frame CNTBaseN has a virtual timer capability.

Configuration

The power domain of CNTTIDR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTTIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Frame7				Frame6				Frame5				Frame4				Frame3				Frame2				Frame1				Frame0			

Frame<n>, bits [4n+3:4n], for n = 7 to 0

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2], the FEL0 subfield, indicates whether frame CNTBase<n> has a second view, CNTELOBase<n>. The possible values of this bit are:

Bit[2]	Meaning
0b0	Frame<n> does not have a second view. The CNTELOACR register in the first view of the frame is RES0.
0b1	Frame<n> has a second view, CNTELOBase<n>.

If bit[0] is 0, bit[2] is RES0.

Bit[1], the FVI subfield, indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers [CNTV_CVAL](#), [CNTV_TVAL](#), and [CNTV_CTL](#).
- This CNTCTLBase frame implements the virtual timer offset register [CNTVOFF<n>](#).

The possible values of bit[1] are:

Bit[1]	Meaning
0b0	Frame<n> does not have virtual capability. The virtual time and offset registers are RES0.
0b1	Frame<n> has virtual capability. The virtual time and offset registers are implemented.

If bit[0] is 0, bit[1] is RES0.

Bit[0], the FI subfield, indicates whether frame CNTBase<n> is implemented. The possible values of this bit are:

Bit[0]	Meaning
0b0	Frame<n> is not implemented. All registers associated with the frame are RES0.
0b1	Frame<n> is implemented

Accessing CNTTIDR

In a system that recognizes two Security states this register is accessible by both Secure and Non-secure accesses.

CNTTIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x008	CNTTIDR

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Configuration

The power domain of CNTV_CTL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																ISTATUS		IMASK	ENABLE												

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTV_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CTL

CNTV_CTL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CTL is accessible in that frame if the value of [CNTACR<n>.RWVT](#) is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CTL is accessible in that frame if both:
 - CNTV_CTL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTEL0ACR.EL0VTEN](#) is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

CNTV_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x03C	CNTV_CTL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x03C	CNTV_CTL

Accesses on this interface are **RW**.

CNTV_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the virtual timer.

Configuration

The power domain of CNTV_CVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_CVAL is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CompareValue, bits [63:0]

Holds the virtual timer CompareValue.

When [CNTV_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTV_CTL.ISTATUS](#) is set to 1.
- An interrupt is generated if [CNTV_CTL.IMASK](#) is 0.

When [CNTV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CVAL

CNTV_CVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CVAL is accessible in that frame if the value of [CNTACR<n>.RWVT](#) is 1.

- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CVAL is accessible in that frame if both:
 - CNTV_CVAL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTEL0ACR.EL0VTEN](#) is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

CNTV_CVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x030	CNTV_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x034	CNTV_CVAL	63:32

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x030	CNTV_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x034	CNTV_CVAL	63:32

Accesses on this interface are **RW**.

CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configuration

The power domain of CNTV_TVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																TimerValue															

TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If [CNTV_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTV_CTL.ENABLE](#) is 1, the value returned is (CompareValue - [CNTVCT](#)).

On a write of this register, CompareValue is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTV_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTV_CTL.ISTATUS](#) is set to 1.
- If [CNTV_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_TVAL

CNTV_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_TVAL is accessible in that frame if the value of [CNTACR<n>](#).RWVT is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_TVAL is accessible in that frame if both:
 - CNTV_TVAL is accessible in the corresponding CNTBaseN frame:
 - The value of [CNTEL0ACR](#).EL0VTEN is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

CNTV_TVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x038	CNTV_TVAL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x038	CNTV_TVAL

Accesses on this interface are **RW**.

CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value.

Configuration

The power domain of CNTVCT is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVCT is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual count value																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Virtual count value.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCT

CNTVCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTVCT is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RVCT](#) is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTVCT is accessible in that frame if both:
 - CNTVCT is accessible in the corresponding CNTBaseN frame.
 - The value of [CNTEL0ACR.EL0VCTEN](#) is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTVCT register must be accessible as an atomic 64-bit value.

CNTVCT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x008	CNTVCT	31:0

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x00C	CNTVCT	63:32

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTELOBaseN	0x008	CNTVCT	31:0

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTELOBaseN	0x00C	CNTVCT	63:32

Accesses on this interface are **RO**.

CNTVOFF, Counter-timer Virtual Offset

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset for a CNTBaseN frame that has virtual timer capability. This is the offset between real time and virtual time.

Configuration

The power domain of CNTVOFF is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVOFF is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual offset																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Virtual offset																															

Bits [63:0]

Virtual offset.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF

CNTVOFF is implemented, as a RO register, in any implemented CNTBaseN frame that has virtual timer capability.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTVOFF is accessible in that frame, as a RO register, if the value of [CNTACR<n>.RVOFF](#) is 1.
- Otherwise, the CNTVOFF address in that frame is RAZ/WI.

Note

CNTVOFF is never visible in any CNTEL0BaseN frame. This means that the CNTVOFF address in any implemented CNTEL0BaseN frame is RAZ/WI.

In an implementation that supports 64-bit atomic accesses, a CNTVOFF{<n>} register must be accessible as an atomic 64-bit value.

CNTVOFF can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Range
Timer	CNTBaseN	0x018	31:0

Accesses on this interface are **RO**.

Component	Frame	Offset	Range
Timer	CNTBaseN	0x01C	63:32

Accesses on this interface are **RO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTVOFF<n>, Counter-timer Virtual Offsets, n = 0 - 7

The CNTVOFF<n> characteristics are:

Purpose

Holds the 64-bit virtual offset for frame CNTBase<n>. This is the offset between real time and virtual time.

Configuration

The power domain of CNTVOFF<n> is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVOFF<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Virtual offset																															
Virtual offset																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Virtual offset.

The reset behaviour of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF<n>

In the CNTCTLBase frame a CNTVOFF<n> register must be implemented, as a RW register, for each CNTBaseN frame that has virtual timer capability. For more information, see 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames'.

Note

The value of <n> in an instance of CNTVOFF<n> specifies the value of N for the associated CNTBaseN frame.

In a system that recognizes two Security states, for any CNTVOFF<n> register in the CNTCTLBase frame:

- CNTVOFF<n> is always accessible by Secure accesses.
- [CNTNSAR.NS<n>](#) determines whether CNTVOFF<n> is accessible by Non-secure accesses.

The register location of any unimplemented CNTVOFF<n> register in the CNTCTLBase frame is RAZ/WI.

The CNTVOFF<n> register is accessible in the CNTBaseN frame using [CNTVOFF](#).

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF<n> registers must be accessible as atomic 64-bit values.

CNTVOFF<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Range
Timer	CNTCTLBase	$0x080 + (8 * n)$	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Range
Timer	CNTCTLBase	$0x084 + (8 * n)$	63:32

Accesses on this interface are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CounterID<n>, Counter ID registers, n = 0 - 11

The CounterID<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

Configuration

The power domain of CounterID<n> is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

These registers are implemented independently in each of the implemented Generic Timer memory-mapped frames.

If the implementation of the Counter ID registers requires an architecture version, the value for this version of the Arm Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of 0xF.

Attributes

CounterID<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing CounterID<n>

These registers must be implemented, as RO registers, in every implemented Generic Timer memory-mapped frame.

For the CNTCTLBase frame, in a system that recognizes two Security states these registers are accessible by both Secure and Non-secure accesses.

For the CNTControlBase frame, in a system that supports Secure and Non-secure memory maps the frame is implemented only in the Secure memory map, meaning these registers are implemented only in the Secure memory map.

For the CNTBaseN frames, 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

CounterID<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
-----------	-------	--------	----------

Timer	CNTControlBase	0xFD0 + (4 * n)	CounterID<n>
-------	----------------	-----------------	--------------

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTReadBase	0xFD0 + (4 * n)	CounterID<n>

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTBaseN	0xFD0 + (4 * n)	CounterID<n>

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTELOBaseN	0xFD0 + (4 * n)	CounterID<n>

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0xFD0 + (4 * n)	CounterID<n>

Accesses on this interface are **RO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

Purpose

Clears bits of the Application Trigger register.

Configuration

CTIAPPCLEAR is in the Debug power domain.

Attributes

CTIAPPCLEAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23
APPCLEAR31	APPCLEAR30	APPCLEAR29	APPCLEAR28	APPCLEAR27	APPCLEAR26	APPCLEAR25	APPCLEAR24	APPCLEAR23

APPCLEAR<x>, bit [x], for x = 31 to 0

Application trigger <x> disable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

Writing to this bit has the following effect:

APPCLEAR<x>	Meaning
0b0	No effect.
0b1	Clear corresponding bit in CTIAPPTRIG to 0 and clear the corresponding channel event.

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use [CTIAPPULSE](#).

Accessing CTIAPPCLEAR

CTIAPPCLEAR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x018	CTIAPPCLEAR

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **WI**.
- When !SoftwareLockStatus() accesses to this register are **WO**.

CTIAPPPULSE, CTI Application Pulse register

The CTIAPPPULSE characteristics are:

Purpose

Causes event pulses to be generated on ECT channels.

Configuration

CTIAPPPULSE is in the Debug power domain.

Attributes

CTIAPPPULSE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23
APPPULSE31	APPPULSE30	APPPULSE29	APPPULSE28	APPPULSE27	APPPULSE26	APPPULSE25	APPPULSE24	APPPULSE23

APPPULSE<x>, bit [x], for x = 31 to 0

Generate event pulse on ECT channel <x>.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

Writing to this bit has the following effect:

APPPULSE<x>	Meaning
0b0	No effect.
0b1	Channel <x> event pulse generated.

Note

- The CTIAPPPULSE operation does not affect the state of the Application Trigger register, CTIAPPTRIG. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

Accessing CTIAPPPULSE

It is CONSTRAINED UNPREDICTABLE whether a write to CTIAPPPULSE generates an event on a channel if CTICONTROL.GLBEN is 0.

CTIAPPPULSE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x01C	CTIAPPPULSE

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **WI**.
- When !SoftwareLockStatus() accesses to this register are **WO**.

CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

Purpose

Sets bits of the Application Trigger register.

Configuration

CTIAPPSET is in the Debug power domain.

Attributes

CTIAPPSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
APPSET31	APPSET30	APPSET29	APPSET28	APPSET27	APPSET26	APPSET25	APPSET24	APPSET23	APPSET22	APPSET21	APPSET20	APPSET19	APPSET18	APPSET17	APPSET16	APPSET15	APPSET14	APPSET13	APPSET12	APPSET11	APPSET10	APPSET9	APPSET8	APPSET7	APPSET6	APPSET5	APPSET4	APPSET3	APPSET2	APPSET1	APPSET0

APPSET<x>, bit [x], for x = 31 to 0

Application trigger <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

APPSET<x>	Meaning
0b0	Reading this means the application trigger is inactive. Writing this has no effect.
0b1	Reading this means the application trigger is active. Writing this sets the corresponding bit in CTIAPPTRIG to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use [CTIAPPULSE](#).

The reset behaviour of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing CTIAPPSET

CTIAPPSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x014	CTIAPPSET

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

Configuration

CTIAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance.

Attributes

CTIAUTHSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [23:16]

Reserved, RES0.

Bits [15:12]

Reserved, RAZ.

Bits [11:8]

Reserved, RES0.

Bits [7:4]

Reserved, RAZ.

NSNID, bits [3:2]

If EL3 is implemented, this field holds the same value as [DBGAUTHSTATUS_EL1](#).NSNID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as [DBGAUTHSTATUS_EL1](#).SNID.

NSID, bits [1:0]

If EL3 is implemented, this field holds the same value as [DBGAUTHSTATUS_EL1](#).NSID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as [DBGAUTHSTATUS_EL1](#).SID.

Accessing CTIAUTHSTATUS

CTIAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFB8	CTIAUTHSTATUS

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

Purpose

Provides the raw status of the ECT channel inputs to the CTI.

Configuration

CTICHINSTATUS is in the Debug power domain.

Attributes

CTICHINSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17
CHIN31	CHIN30	CHIN29	CHIN28	CHIN27	CHIN26	CHIN25	CHIN24	CHIN23	CHIN22	CHIN21	CHIN20	CHIN19	CHIN18	CHIN17

CHIN<n>, bit [n], for n = 31 to 0

Input channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

CHIN<n>	Meaning
0b0	Input channel <n> is inactive.
0b1	Input channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

Accessing CTICHINSTATUS

CTICHINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x138	CTICHINSTATUS

Accesses on this interface are **RO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

Purpose

Provides the status of the ECT channel outputs from the CTI.

Configuration

CTICHOUTSTATUS is in the Debug power domain.

Attributes

CTICHOUTSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
CHOUT31	CHOUT30	CHOUT29	CHOUT28	CHOUT27	CHOUT26	CHOUT25	CHOUT24	CHOUT23	CHOUT22	CHOUT21	CHOUT20

CHOUT<n>, bit [n], for n = 31 to 0

Output channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

Possible values of this bit are:

CHOUT<n>	Meaning
0b0	Output channel <n> is inactive.
0b1	Output channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an output channel can be observed as active.

Note

The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see [CTIGATE](#).

Accessing CTICHOUTSTATUS

CTICHOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x13C	CTICHOUTSTATUS

Accesses on this interface are **RO**.

CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL 0							

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is **RO**.

Accessing CTICIDR0

CTICIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF0	CTICIDR0

Accesses on this interface are **RO**.

CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								CLASS				PRMBL_1			

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Reads as 0b0000.

Access to this field is **RO**.

Accessing CTICIDR1

CTICIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF4	CTICIDR1

Accesses on this interface are **RO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL 2							

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is **RO**.

Accessing CTICIDR2

CTICIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF8	CTICIDR2

Accesses on this interface are **RO**.

CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL 3							

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is **RO**.

Accessing CTICIDR3

CTICIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFFC	CTICIDR3

Accesses on this interface are **RO**.

CTICLAIMCLR, CTI CLAIM Tag Clear register

The CTICLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM bits, and to clear CLAIM tag bits to 0.

Configuration

CTICLAIMCLR is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMCLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19
CLAIM31	CLAIM30	CLAIM29	CLAIM28	CLAIM27	CLAIM26	CLAIM25	CLAIM24	CLAIM23	CLAIM22	CLAIM21	CLAIM20	CLAIM19

CLAIM<x>, bit [x], for x = 31 to 0

CLAIM tag clear bit.

Reads return the value of CLAIM<x>, writes have the following behavior:

CLAIM<x>	Meaning
0b0	No action.
0b1	Indirectly clear CLAIM<x> to 0.

A single write to CTICLAIMCLR can clear multiple tags to 0.

If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/WI.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing CTICLAIMCLR

CTICLAIMCLR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA4	CTICLAIMCLR

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

CTICLAIMSET, CTI CLAIM Tag Set register

The CTICLAIMSET characteristics are:

Purpose

Used by software to set CLAIM bits to 1.

Configuration

CTICLAIMSET is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19
CLAIM31	CLAIM30	CLAIM29	CLAIM28	CLAIM27	CLAIM26	CLAIM25	CLAIM24	CLAIM23	CLAIM22	CLAIM21	CLAIM20	CLAIM19

CLAIM<x>, bit [x], for x = 31 to 0

CLAIM tag set bit.

If x is less than the IMPLEMENTATION DEFINED number of CLAIM tags, this field is RAO and the behavior on writes is:

CLAIM<x>	Meaning
0b0	No action.
0b1	Indirectly set CLAIM<x> tag to 1.

A single write to CTICLAIMSET can set multiple tags to 1.

If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/WI.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing CTICLAIMSET

CTICLAIMSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA0	CTICLAIMSET

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

Purpose

Controls whether the CTI is enabled.

Configuration

CTICONTROL is in the Debug power domain.

Attributes

CTICONTROL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

GLBEN, bit [0]

Enables or disables the CTI mapping functions. Possible values of this field are:

GLBEN	Meaning
0b0	CTI mapping functions and application trigger disabled.
0b1	CTI mapping functions and application trigger enabled.

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it is CONstrained UNPREDICTABLE which of the following occurs:

- The output trigger remains asserted after the mapping functions are disabled.
- The output trigger is deasserted after the mapping functions are disabled.

All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behaviour of this field is:

- On an External debug reset, this field resets to 0.

Accessing CTICONTROL

CTICONTROL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x000	CTICONTROL

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF0 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then [CTIDEVAFF1](#) must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MPIDR_EL1lo																															

MPIDR_EL1lo, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIDEVAFF0

CTIDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA8	CTIDEVAFF0

Accesses on this interface are **RO**.

CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF1 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then [CTIDEVAFF0](#) must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																MPIDR_EL1hi															

MPIDR_EL1hi, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIDEVAFF1

CTIDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFAC	CTIDEVAFF1

Accesses on this interface are **RO**.

CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the CTI component.

Configuration

CTIDEVARCH is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is not implemented, [CTIDEVAFF0](#) and [CTIDEVAFF1](#) are also not implemented.

Attributes

CTIDEVARCH is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARCHITECT											PRESENT	REVISION				ARCHID															

ARCHITECT, bits [31:21]

Defines the architecture of the component. For CTI, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is **RO**.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as 0b1.

Access to this field is **RO**.

REVISION, bits [19:16]

When FEAT_DoPD is implemented:

Revision.

Defines the architecture revision of the component.

REVISION	Meaning
0b0000	First revision.
0b0001	As 0b0000, and also adds support for CTIDEVCTL .

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Revision.

Defines the architecture revision of the component.

All other values are reserved.

Reads as 0b0000.

Access to this field is **RO**.

ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, 0x1.
- Bits [11:0] are the architecture part number, 0xA14.

This corresponds to CTI architecture version CTIv2.

Reads as 0x1A14.

Access to this field is **RO**.

Accessing CTIDEVARCH

CTIDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFBC	CTIDEVARCH

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVCTL, CTI Device Control register

The CTIDEVCTL characteristics are:

Purpose

Provides target-specific device controls

Configuration

CTIDEVCTL is in the Debug power domain.

This register is present only when FEAT_DoPD is implemented. Otherwise, direct accesses to CTIDEVCTL are RES0.

Attributes

CTIDEVCTL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																RCE												OSUCE			

Bits [31:2]

Reserved, RES0.

RCE, bit [1]

Reset Catch Enable.

RCE	Meaning
0b0	Reset Catch debug event disabled.
0b1	Reset Catch debug event enabled.

The reset behaviour of this field is:

- On an External debug reset, this field resets to 0.

OSUCE, bit [0]

OS Unlock Catch Enable

OSUCE	Meaning
0b0	OS Unlock Catch debug event disabled.
0b1	OS Unlock Catch debug event enabled.

The reset behaviour of this field is:

- On an External debug reset, this field resets to 0.

Accessing CTIDEVCTL

CTIDEVCTL can be accessed through the external debug interface:

Component	Offset	Instance
-----------	--------	----------

CTI	0x150	CTIDEVCTL
-----	-------	-----------

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

Purpose

Describes the CTI component to the debugger.

Configuration

CTIDEVID is in the Debug power domain.

Attributes

CTIDEVID is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0						INOUT	RES0				NUMCHAN				RES0	NUMTRIG				RES0	EXTMUXNUM										

Bits [31:26]

Reserved, RES0.

INOUT, bits [25:24]

Input/output options. Indicates presence of the input gate. If the CTM is not implemented or CTIv2 is not implemented, this field is RAZ.

INOUT	Meaning
0b00	CTIGATE does not mask propagation of input events from external channels.
0b01	CTIGATE masks propagation of input events from external channels.

All other values are reserved.

Bits [23:22]

Reserved, RES0.

NUMCHAN, bits [21:16]

Number of ECT channels implemented. For Armv8, valid values are:

- 0b000011 3 channels (0..2) implemented.
- 0b000100 4 channels (0..3) implemented.
- 0b000101 5 channels (0..4) implemented.
- 0b000110 6 channels (0..5) implemented.

and so on up to 0b100000, 32 channels (0..31) implemented.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [15:14]

Reserved, RES0.

NUMTRIG, bits [13:8]

Number of triggers implemented. This is one more than the index of the largest trigger, rather than the actual number of triggers. For Armv8, valid values are:

- 0b000011 Up to 3 triggers (0..2) implemented.
- 0b001000 Up to 8 triggers (0..7) implemented.
- 0b001001 Up to 9 triggers (0..8) implemented.
- 0b001010 Up to 10 triggers (0..9) implemented.

and so on up to 0b100000, 32 triggers (0..31) implemented.

All other values are reserved. If the PE contains a Trace extension, this field must be at least 0b001000. There is no guarantee that any of the implemented triggers, including the highest numbered, are connected to any components.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [7:5]

Reserved, RES0.

EXTMUXNUM, bits [4:0]

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, [ASICCTL](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIDEVID

CTIDEVID can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC8	CTIDEVID

Accesses on this interface are **RO**.

CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

Configuration

CTIDEVID1 is in the Debug power domain.

Attributes

CTIDEVID1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																RES0															

Bits [31:0]

Reserved, RES0.

Accessing CTIDEVID1

CTIDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC4	CTIDEVID1

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

Configuration

CTIDEVID2 is in the Debug power domain.

Attributes

CTIDEVID2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																RES0															

Bits [31:0]

Reserved, RES0.

Accessing CTIDEVID2

CTIDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC0	CTIDEVID2

Accesses on this interface are **RO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PEs cross-trigger interface.

Configuration

CTIDEVTYPE is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIDEVTYPE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SUB				MAJOR			

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as 0b0001.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type. Indicates this is a cross-trigger component.

Reads as 0b0100.

Access to this field is **RO**.

Accessing CTIDEVTYPE

CTIDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFCC	CTIDEVTYPE

Accesses on this interface are **RO**.

CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

Purpose

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

Configuration

CTIGATE is in the Debug power domain.

Attributes

CTIGATE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
GATE31	GATE30	GATE29	GATE28	GATE27	GATE26	GATE25	GATE24	GATE23	GATE22	GATE21	GATE20	GATE19	GATE18	GATE17	GATE16	GATE15	GATE14	GATE13	GATE12	GATE11	GATE10	GATE9	GATE8	GATE7	GATE6	GATE5	GATE4	GATE3	GATE2	GATE1	GATE0

GATE<x>, bit [x], for x = 31 to 0

Channel <x> gate enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

GATE<x>	Meaning
0b0	Disable output and, if CTIDEVID .INOUT == 0b01, input channel <x> propagation.
0b1	Enable output and, if CTIDEVID .INOUT == 0b01, input channel <x> propagation.

If GATE<x> is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behaviour of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing CTIGATE

CTIGATE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x140	CTIGATE

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

Purpose

Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

Configuration

CTIINEN<n> is in the Debug power domain.

If input trigger n is not connected, the behavior of CTIINEN<n> is IMPLEMENTATION DEFINED.

Attributes

CTIINEN<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17
INEN31	INEN30	INEN29	INEN28	INEN27	INEN26	INEN25	INEN24	INEN23	INEN22	INEN21	INEN20	INEN19	INEN18	INEN17

INEN<x>, bit [x], for x = 31 to 0

Input trigger <n> to output channel <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

INEN<x>	Meaning
0b0	Input trigger <n> will not generate an event on output channel <x>.
0b1	Input trigger <n> will generate an event on output channel <x>.

The reset behaviour of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing CTIINEN<n>

CTIINEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x020 + (4 * n)	CTIINEN<n>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

Purpose

Can be used to deactivate the output triggers.

Configuration

CTIINTACK is in the Debug power domain.

Attributes

CTIINTACK is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15
ACK31	ACK30	ACK29	ACK28	ACK27	ACK26	ACK25	ACK24	ACK23	ACK22	ACK21	ACK20	ACK19	ACK18	ACK17	ACK16	ACK15

ACK<n>, bit [n], for n = 31 to 0

Acknowledge for output trigger <n>.

Bits [31:N] are RAZ/WI. N is the number of CTI triggers implemented as defined by the [CTIDEVID](#).NUMTRIG field.

If any of the following is true, writes to ACK<n> are ignored:

- n >= [CTIDEVID](#).NUMTRIG, the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by [CTIOUTEN<n>](#), is still active.

Otherwise, if any of the following are true, it is IMPLEMENTATION DEFINED whether writes to ACK<n> are ignored:

- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

ACK<n>	Meaning
0b0	No effect
0b1	Deactivate the trigger.

Accessing CTIINTACK

A debugger must read [CTITRIGOUTSTATUS](#) to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPPULSE to activate another trigger.

CTIINTACK can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x010	CTIINTACK

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **WI**.
- When !SoftwareLockStatus() accesses to this register are **WO**.

CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

Purpose

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

It is IMPLEMENTATION DEFINED whether CTIITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIITCTRL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

The following resets apply:

- If the register is implemented in the Core power domain:
 - On a Cold reset, this field resets to 0.
 - On an External debug reset, the value of this field is unchanged.
 - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
 - On a Cold reset, the value of this field is unchanged.
 - On an External debug reset, this field resets to 0.
 - On a Warm reset, the value of this field is unchanged.

Accessing CTIITCTRL

CTIITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xF00	CTIITCTRL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

Purpose

Allows or disallows access to the CTI registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILAR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and [CTILSR](#) to check the current status of the lock.

Attributes

CTILAR is a 32-bit register.

Field descriptions

When Software Lock is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																KEY															

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																RES0															

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing CTILAR

CTILAR can be accessed through a memory-mapped access to the external debug interface:

Component	Offset	Instance
-----------	--------	----------

CTILAR, CTI Lock Access Register

CTI	0xFB0	CTILAR
-----	-------	--------

Accesses on this interface are **WO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

Purpose

Indicates the current status of the Software Lock for CTI registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILSR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses [CTILAR](#) to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																													nTT	SLK	SLI

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

When Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behaviour of this field is:

- On an External debug reset, this field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Accessing CTILSR

CTILSR can be accessed through a memory-mapped access to the external debug interface:

Component	Offset	Instance
CTI	0xFB4	CTILSR

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

Purpose

Defines which input channels generate output trigger n.

Configuration

CTIOUTEN<n> is in the Debug power domain.

If output trigger n is not connected, the behavior of CTIOUTEN<n> is IMPLEMENTATION DEFINED.

Attributes

CTIOUTEN<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
OUTEN31	OUTEN30	OUTEN29	OUTEN28	OUTEN27	OUTEN26	OUTEN25	OUTEN24	OUTEN23	OUTEN22	OUTEN21	OUTEN20

OUTEN<x>, bit [x], for x = 31 to 0

Input channel <x> to output trigger <n> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the [CTIDEVID](#).NUMCHAN field.

Possible values of this bit are:

OUTEN<x>	Meaning
0b0	An event on input channel <x> will not cause output trigger <n> to be asserted.
0b1	An event on input channel <x> will cause output trigger <n> to be asserted.

The reset behaviour of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing CTIOUTEN<n>

CTIOUTEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x0A0 + (4 * n)	CTIOUTEN<n>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PART 0							

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR0

CTIPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE0	CTIPIDR0

Accesses on this interface are **RO**.

CTIPIDR1, CTI Peripheral Identification Register 1

The CTIPIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								DES_0				PART_1			

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR1

CTIPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE4	CTIPIDR1

Accesses on this interface are **RO**.

CTIPIDR2, CTI Peripheral Identification Register 2

The CTIPIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																REVISION				JEDEC		DES_1									

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as 0b1.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR2

CTIPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE8	CTIPIDR2

Accesses on this interface are **RO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																REVAND				CMOD											

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using [CTIPIDR2](#).REVISION as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR3

CTIPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFEC	CTIPIDR3

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR4 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR4 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SIZE			DES_2				

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR4

CTIPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFD0	CTIPIDR4

Accesses on this interface are **RO**.

CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

Purpose

Provides the status of the trigger inputs.

Configuration

CTITRIGINSTATUS is in the Debug power domain.

Attributes

CTITRIGINSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TRIN31	TRIN30	TRIN29	TRIN28	TRIN27	TRIN26	TRIN25	TRIN24	TRIN23	TRIN22	TRIN21	TRIN20	TRIN19	TRIN18	TRIN17	TRIN16

TRIN<n>, bit [n], for n = 31 to 0

Trigger input <n> status.

Bits [31:N] are RAZ. N is the number of CTI triggers implemented as defined by the [CTIDEVID](#).NUMTRIG field.

TRIN<n>	Meaning
0b0	Input trigger n is inactive.
0b1	Input trigger n is active.

Not implemented and not-connected input triggers are always inactive.

It is IMPLEMENTATION DEFINED whether an input trigger that does not support multicycle events can be observed as active.

Accessing CTITRIGINSTATUS

CTITRIGINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x130	CTITRIGINSTATUS

Accesses on this interface are **RO**.

CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

Purpose

Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicycle channel events.

Configuration

CTITRIGOUTSTATUS is in the Debug power domain.

Attributes

CTITRIGOUTSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
TROUT31	TROUT30	TROUT29	TROUT28	TROUT27	TROUT26	TROUT25	TROUT24	TROUT23	TROUT22	TROUT21	TROUT20

TROUT<n>, bit [n], for n = 31 to 0

Trigger output <n> status.

Bits [31:N] are RAZ. N is the value in [CTIDEVID.NUMTRIG](#).

If $n < N$, and output trigger <n> is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicycle channel events, then permitted values for TROUT<n> are:

TROUT<n>	Meaning
0b0	Output trigger n is inactive.
0b1	Output trigger n is active.

Otherwise when $n < N$ it is IMPLEMENTATION DEFINED whether TROUT<n> behaves as described here or is RAZ.

Accessing CTITRIGOUTSTATUS

CTITRIGOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x134	CTITRIGOUTSTATUS

Accesses on this interface are **RO**.

DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configuration

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGAUTHSTATUS_EL1\[31:0\]](#).

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGAUTHSTATUS\[31:0\]](#).

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

DBGAUTHSTATUS_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				RTNID		RTID		RES0								RLNID		RLID		RES0				SNID		SID		NSNID		NSID	

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.
0b10	Implemented and disabled. ExternalRootInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalRootInvasiveDebugEnabled() == TRUE.

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is 00.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLID.

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.
0b10	Implemented and disabled. ExternalRealmInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalRealmInvasiveDebugEnabled() == TRUE.

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is 00.

Bits [11:8]

Reserved, RES0.

SNID, bits [7:6]

When FEAT_Debugv8p4 is implemented:

Secure non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

Secure non-invasive debug.

SNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.
0b10	Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

SID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.
0b10	Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSNID, bits [3:2]**When FEAT_Debugv8p4 is implemented:**

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

If the Effective value of [SCR_EL3.NS](#) is 1, or if EL3 is implemented and EL2 is not implemented, this field reads as 0b11.

All other values are reserved.

Otherwise:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b10	Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

NSID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b10	Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

Accessing DBGAUTHSTATUS_EL1**DBGAUTHSTATUS_EL1 can be accessed through the external debug interface:**

Component	Offset	Instance
Debug	0xFB8	DBGAUTHSTATUS_EL1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>_EL1](#).

Configuration

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGBCR<n>_EL1\[31:0\]](#).

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBCR<n>\[31:0\]](#).

DBGBCR<n>_EL1 is in the Core power domain.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBCR<n>_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								BT				LBN				SSC		HMC	RES0				BAS			RES0	PMC	E			

When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

BT	Meaning
0b0000	Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.
0b0001	As 0b0000 but linked to a Context matching breakpoint.
0b0010	Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value.
0b0011	As 0b0010, with linking enabled.
0b0100	Unlinked instruction address mismatch. DBGBVR<n>_EL1 is the address of an instruction to be stepped.
0b0101	As 0b0100, with linking enabled.
0b0110	Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1 .
0b0111	As 0b0110, with linking enabled.
0b1000	Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID .
0b1001	As 0b1000, with linking enabled.
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1 , and DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID .
0b1011	As 0b1010, with linking enabled.
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBVR<n>_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2 .
0b1101	As 0b1100, with linking enabled.
0b1110	Unlinked Full Context ID match. DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1 , and DBGBVR<n>_EL1.ContextID2 is compared against CONTEXTIDR_EL2 .
0b1111	As 0b1110, with linking enabled.

Constraints on breakpoint programming mean some values are reserved under certain conditions.

For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved DBGBCR<n>_EL1.BT values'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>_EL1.E is 0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values'.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see [DBGBCR<n>_EL1](#).SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When AArch32 is supported at EL0:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions

All other values are reserved.

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint
0b0011	DBGBVR<n>_EL1	Use for stepping T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for stepping T32 instructions
0b1111	DBGBVR<n>_EL1	Use for stepping A64 and A32 instructions

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the [DBGBCR<n>_EL1.SSC](#) description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint [DBGBVR<n>_EL1](#). Possible values are:

E	Meaning
0b0	Breakpoint disabled.
0b1	Breakpoint enabled.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGBCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x408 + (16 * n)	DBGBCR<n>_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register [DBGBCR<n>_EL1](#).

Configuration

External register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register [DBGBVR<n>_EL1\[63:0\]](#).

External register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGBVR<n>\[31:0\]](#).

External register DBGBVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register [DBGBXVR<n>\[31:0\]](#).

DBGBVR<n>_EL1 is in the Core power domain.

How this register is interpreted depends on the value of [DBGBCR<n>_EL1](#).BT.

- When [DBGBCR<n>_EL1](#).BT is 0b0x0x, this register holds a virtual address.
- When [DBGBCR<n>_EL1](#).BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When [DBGBCR<n>_EL1](#).BT is 0b100x, this register holds a VMID.
- When [DBGBCR<n>_EL1](#).BT is 0b101x, this register holds a VMID and a Context ID.
- When [DBGBCR<n>_EL1](#).BT is 0b111x, this register holds two Context ID values.

For other values of [DBGBCR<n>_EL1](#).BT, this register is RES0.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBVR<n>_EL1 is a 64-bit register.

Field descriptions

When DBGBCR<n>_EL1.BT == 0b0x0x:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32					
RESS[14:4]											Bits[52:49]				VA[48:2]																					
VA[48:2]																															RES0					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					

RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

VA[52:49], bits [52:49]

When FEAT_LVA is implemented:

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Extension to RESS[14:4]. For more information, see RESS[14:4].

VA[48:2], bits [48:2]

If the address is being matched in an AArch64 stage 1 translation regime:

- This field contains bits[48:2] of the address for comparison.
- When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b001x:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32						
																RES0																					
																ContextID																					
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0						

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR_EL2](#) when (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented), EL2 is using AArch64, [HCR_EL2.E2H](#) is 1, and either:

- The PE is executing at EL2.
- [HCR_EL2.TGE](#) is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against the following:

- [CONTEXTIDR](#) when the PE is executing at AArch32.
- [CONTEXTIDR_EL1](#) when the PE is executing at AArch64.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b011x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																ContextID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b100x and EL2 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																VMID[15:8]								VMID[7:0]							
RES0																RES0															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VHE is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. For more information, see DBGVVR<n>_EL1.VMID[7:0].

If EL2 is using AArch32, this field is RES0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCR_EL2.VS](#) is 0.
- FEAT_VMID16 is not implemented.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b101x and EL2 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																VMID[15:8]								VMID[7:0]							
ContextID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. For more information, see DBGBVR<n>_EL1.VMID[7:0].

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b110x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ContextID2

ContextID2, bits [63:32]

Context ID value for comparison against [CONTEXTIDR_EL2](#).

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b111x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ContextID2, bits [63:32]

Context ID value for comparison against [CONTEXTIDR_EL2](#).

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR_EL1](#).

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBVR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGBVR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x400 + (16 * n)	DBGBVR<n>_EL1	63:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET_EL1](#) register.

Configuration

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGCLAIMCLR_EL1\[31:0\]](#).

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMCLR\[31:0\]](#).

DBGCLAIMCLR_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RAZ/WI																								CLAIM							

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing DBGCLAIMCLR_EL1

DBGCLAIMCLR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA4	DBGCLAIMCLR_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

DBGCLAIMSET_EL1, Debug CLAIM Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMCLR_EL1](#) register.

Configuration

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register [DBGCLAIMSET_EL1\[31:0\]](#).

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGCLAIMSET\[31:0\]](#).

DBGCLAIMSET_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMSET_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RAZ/WI																								CLAIM							

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Set CLAIM tag bits.

This field is RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

Accessing DBGCLAIMSET_EL1

DBGCLAIMSET_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA0	DBGCLAIMSET_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communications Channel.

Configuration

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch64 System register [DBGDTRRX_EL0\[31:0\]](#).

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRRXint\[31:0\]](#).

DBGDTRRX_EL0 is in the Core power domain.

Attributes

DBGDTRRX_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Update DTRRX																															

Bits [31:0]

Update DTRRX.

Writes to this register:

- If RXfull is set to 1, set DTRRX to UNKNOWN.
- If RXfull is set to 0, update the value in DTRRX.

After the write, RXfull is set to 1.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRX_EL0

If [EDSCR](#).ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONstrained UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRRX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x080	DBGDTRRX_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communication Channel.

Configuration

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch64 System register [DBGDTRTX_EL0\[31:0\]](#).

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRTXint\[31:0\]](#).

DBGDTRTX_EL0 is in the Core power domain.

Attributes

DBGDTRTX_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Return DTRTX																															

Bits [31:0]

Return DTRTX.

Reads of this register:

- If TXfull is set to 1, return the last value written to DTRTX.
- If TXfull is set to 0, return an UNKNOWN value.

After the read, TXfull is cleared to 0.

Writes to this register:

- If TXfull is set to 1, set DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTX_EL0

If [EDSCR](#).ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRTX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x08C	DBGDTRTX_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Purpose

Configuration

Attributes

Field descriptions

Page 3935

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>_EL1](#) is being watched.

BAS	Description
xxxxxx1	Match byte at DBGWVR<n>_EL1
xxxxxx1x	Match byte at DBGWVR<n>_EL1 + 1
xxxxx1xx	Match byte at DBGWVR<n>_EL1 + 2
xxxx1xxx	Match byte at DBGWVR<n>_EL1 + 3

In cases where [DBGWVR<n>_EL1](#) addresses a double-word:

BAS	Description, if DBGWVR<n>_EL1[2] == 0
xxx1xxxx	Match byte at DBGWVR<n>_EL1 + 4
xx1xxxxx	Match byte at DBGWVR<n>_EL1 + 5
x1xxxxxx	Match byte at DBGWVR<n>_EL1 + 6
1xxxxxxx	Match byte at DBGWVR<n>_EL1 + 7

If [DBGWVR<n>_EL1\[2\]](#) == 1, only BAS[3:0] is used. Arm deprecates setting [DBGWVR<n>_EL1\[2\]](#) == 1.

The valid values for BAS are non-zero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>.BAS values'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n. Possible values are:

E	Meaning
0b0	Watchpoint disabled.
0b1	Watchpoint enabled.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGWCR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGWCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x808 + (16 * n)	DBGWCR<n>_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>_EL1](#).

Configuration

External register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register [DBGWVR<n>_EL1\[63:0\]](#).

External register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGWVR<n>\[31:0\]](#).

DBGWVR<n>_EL1 is in the Core power domain.

If watchpoint n is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RESS[14:4]											Bits[52:49]			VA[48:2]																		
VA[48:2]																															RES0	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

RESS[14:4], bits [63:53]

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

VA[52:49], bits [52:49]

When FEAT_LVA is implemented:

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Extension to RESS[14:4]. For more information, see RESS[14:4].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

Arm deprecates setting [DBGWVR<n>_EL1\[2\] == 1](#).

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGWVR<n>_EL1**Note**

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGWVR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x800 + (16 * n)	DBGWVR<n>_EL1	63:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

EDAA32PFR, External Debug Auxiliary Processor Feature Register

The EDAA32PFR characteristics are:

Purpose

Provides information about implemented PE features.

Note

The register mnemonic, EDAA32PFR, is derived from previous definitions of this register that defined this register only when AArch64 was not supported.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

It is IMPLEMENTATION DEFINED whether EDAA32PFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDAA32PFR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																																			
RES0																MSA_frac				EL3				EL2				PMSA				VMSA			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Bits [63:20]

Reserved, RES0.

MSA_frac, bits [19:16]

When EDAA32PFR.PMSA == 0b0000 and EDAA32PFR.VMSA == 0b1111:

Memory System Architecture fractional field. This holds the information on additional Memory System Architectures supported. Defined values are:

MSA_frac	Meaning
0b0001	PMSAv8-64 supported in all translation regimes. VMSAv8-64 not supported.
0b0010	PMSAv8-64 supported in all translation regimes. In addition to PMSAv8-64, stage 1 EL1&0 translation regime also supports VMSAv8-64.

All other values are reserved.

Otherwise:

Reserved, RES0.

EL3, bits [15:12]**When EDPFR.EL3 == 0b0000:**

AArch32 EL3 Exception level handling. Defined values are:

EL3	Meaning
0b0000	EL3 is not implemented or can be executed in AArch64 state.
0b0001	EL3 can be executed in AArch32 state only.

All other values are reserved.

Note

[EDPFR](#).{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Otherwise:

Reserved, RAZ.

EL2, bits [11:8]**When EDPFR.EL2 == 0b0000:**

AArch32 EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented or can be executed in AArch64 state.
0b0001	EL2 can be executed in AArch32 state only.

All other values are reserved.

Note

[EDPFR](#).{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Otherwise:

Reserved, RAZ.

PMSA, bits [7:4]

Indicates support for a 32-bit PMSA. Defined values are:

PMSA	Meaning
0b0000	PMSA-32 not supported.
0b0100	PMSAv8-32 supported.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

VMSA, bits [3:0]**When EDAA32PFR.PMSA != 0b0000:**

Indicates support for a VMSA in addition to a 32-bit PMSA. Defined values are:

VMSA	Meaning
0b0000	VMSA not supported.

All other values are reserved.

When EDAA32PFR.PMSA == 0b0000:

Defined values are:

VMSA	Meaning
0b0000	VMSAv8-64 supported.
0b1111	Memory system architecture described by EDAA32PFR.MSA_frac.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Otherwise:

Reserved, RAZ.

Accessing EDAA32PFR

EDAA32PFR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD60	EDAA32PFR

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

Purpose

Allows implementations to support IMPLEMENTATION DEFINED controls.

Configuration

It is IMPLEMENTATION DEFINED whether EDACR is implemented in the Core power domain or in the Debug power domain.

If FEAT_DoPD is implemented, this register is implemented in the Core power domain.

If FEAT_DoPD is not implemented, the power domain that this register is implemented in is IMPLEMENTATION DEFINED.

Changing this register from its reset value causes IMPLEMENTATION DEFINED behavior, including possible deviation from the architecturally-defined behavior.

If the EDACR contains any control bits that must be preserved over power down, then these bits must be accessible by the external debug interface when the OS Lock is locked, [OSLSR_EL1](#).OSLK == 1, and when the Core is powered off.

Attributes

EDACR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The following resets apply:

- If the register is implemented in the Core power domain:
 - On a Cold reset, this field resets to an architecturally UNKNOWN value.
 - On an External debug reset, the value of this field is unchanged.
 - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
 - On a Cold reset, the value of this field is unchanged.
 - On an External debug reset, this field resets to an architecturally UNKNOWN value.
 - On a Warm reset, the value of this field is unchanged.

Accessing EDACR

EDACR can be accessed through the external debug interface:

Component	Offset	Instance
-----------	--------	----------

Debug	0x094	EDACR
-------	-------	-------

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_0							

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is **RO**.

Accessing EDCIDR0

EDCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF0	EDCIDR0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												CLASS			PRMBL_1				

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

PRMBL_1, bits [3:0]

Preamble.

Reads as 0b0000.

Access to this field is **RO**.

Accessing EDCIDR1

EDCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF4	EDCIDR1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_2							

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is **RO**.

Accessing EDCIDR2

EDCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF8	EDCIDR2

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDCIDR3, External Debug Component Identification Register 3

The EDCIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_3							

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is **RO**.

Accessing EDCIDR3

EDCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFFC	EDCIDR3

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDCIDSR, External Debug Context ID Sample Register

The EDCIDSR characteristics are:

Purpose

Contains the sampled value of the Context ID, captured on reading [EDPCSR](#)[31:0].

Configuration

EDCIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDCIDSR are RES0.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDCIDSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CONTEXTIDR																															

CONTEXTIDR, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent [EDPCSR](#) sample. When the most recent [EDPCSR](#) sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from [CONTEXTIDR_EL1](#).
- If EL1 is using AArch32, then the Context ID is sampled from [CONTEXTIDR](#).
- If EL3 is implemented and is using AArch32, then [CONTEXTIDR](#) is a banked register, and EDCIDSR samples the current banked copy of [CONTEXTIDR](#) for the Security state that is associated with the most recent [EDPCSR](#) sample.

Because the value written to EDCIDSR is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether EDCIDSR is set to the original or new value if [EDPCSR](#) samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDCIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

EDCIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A4	EDCIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVAFF0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MPIDR_EL1lo																															

MPIDR_EL1lo, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing EDDEVAFF0

EDDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA8	EDDEVAFF0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVAFF1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																MPIDR_EL1hi															

MPIDR_EL1hi, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing EDDEVAFF1

EDDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFAC	EDDEVAFF1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the external debug component.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVARCH is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARCHITECT											PRESENT	REVISION				ARCHVER				ARCHPART											

ARCHITECT, bits [31:21]

Defines the architecture of the component. For debug, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is **RO**.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as 0b1.

Access to this field is **RO**.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For debug, the revision defined by Armv8-A is 0x0.

All other values are reserved.

Reads as 0b0000.

Access to this field is **RO**.

ARCHVER, bits [15:12]

Defines the architecture version of the component. This is the same value as [ID_AA64DFR0_EL1](#).DebugVer and [DBGDIDR](#).Version. The defined values of this field are:

ARCHVER	Meaning
0b0110	Armv8.0 Debug architecture.
0b0111	Armv8.0 Debug architecture with Virtualization Host Extensions.
0b1000	Armv8.2 Debug architecture.
0b1001	Armv8.4 Debug architecture.

FEAT_Debugv8p4 adds the functionality indicated by the value 0b1001. FEAT_Debugv8p2 adds the functionality indicated by the value 0b1000. If FEAT_VHE is not implemented, the only permitted value is 0b0110.

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHVER is ARCHID[15:12].

ARCHPART, bits [11:0]

The part number of the Armv8-A debug component.

The fields ARCHVER and ARCHPART together form the field ARCHID, so that ARCHPART is ARCHID[11:0].

Reads as 0xA15.

Access to this field is **RO**.

Accessing EDDEVARCH

EDDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFBC	EDDEVARCH

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				AuxRegs				RES0								DebugPower				PCSample											

Bits [31:28]

Reserved, RES0.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Defined values are:

AuxRegs	Meaning
0b0000	None supported.
0b0001	Support for External Debug Auxiliary Control Register, EDACR .

All other values are reserved.

Bits [23:8]

Reserved, RES0.

DebugPower, bits [7:4]

Indicates support for the FEAT_DoPD feature. Defined values are:

DebugPower	Meaning
0b0000	FEAT_DoPD not implemented. Registers in the external debug interface register map are implemented in a mix of the Debug and Core power domains.
0b0001	FEAT_DoPD implemented. All registers in the external debug interface register map are implemented in the Core power domain.

FEAT_DoPD implements the functionality added by the value 0b0001.

All other values are reserved.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Defined values are:

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the external debug registers space.
0b0010	Only EDPCSR and EDCIDS are implemented. This option is only permitted if EL3 and EL2 are not implemented.
0b0011	EDPCSR , EDCIDS , and EDVIDSR are implemented.

All other values are reserved.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMDEVID.PCSample](#).

Accessing EDDEVID

EDDEVID can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC8	EDDEVID

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDDEVID1, External Debug Device ID register 1

The EDDEVID1 characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																												PCSROffset			

Bits [31:4]

Reserved, RES0.

PCSROffset, bits [3:0]

This field indicates the offset applied to PC samples returned by reads of [EDPCSR](#). Permitted values of this field in Armv8 are:

PCSROffset	Meaning
0b0000	EDPCSR not implemented.
0b0010	EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMDEVID](#).PCSample.

Accessing EDDEVID1

EDDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC4	EDDEVID1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

Purpose

Reserved for future descriptions of features of the debug implementation.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing EDDEVID2

EDDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC0	EDDEVID2

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDDEVTYPER, External Debug Device Type register

The EDDEVTYPER characteristics are:

Purpose

Indicates to a debugger that this component is part of a PEs debug logic.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVTYPER is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SUB				MAJOR			

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as 0b0001.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type. Indicates this is a debug logic component.

Reads as 0b0101.

Access to this field is **RO**.

Accessing EDDEVTYPER

EDDEVTYPER can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFCC	EDDEVTYPER

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDDFR, External Debug Feature Register

The EDDFR characteristics are:

Purpose

Provides top level information about the debug system.

Note

Debuggers must use [EDDEVARCH](#) to determine the Debug architecture version.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

It is IMPLEMENTATION DEFINED whether EDDFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDDFR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0												TraceFilt								UNKNOWN											
CTX_CMPs				RES0				WRPs				RES0				BRPs				PMUVer				TraceVer				UNKNOWN			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:44]

Reserved, RES0.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension is not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension is implemented.

All other values are reserved.

FEAT_TRF implements the functionality added by 0b0001.

From Armv8.4, the permitted values are 0b0000 and 0b0001.

Bits [39:32]

Reserved, UNKNOWN.

CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64DFR0_EL1](#).CTX_CMPs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64DFR0_EL1](#).WRPs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64DFR0_EL1](#).BRPs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and also includes support for: <ul style="list-style-type: none"> Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. If EL2 is implemented, the MDCR_EL2.HPMD control bit.
0b0101	PMUv3 for Armv8.4. As 0b0100, and also includes support for the PMMIR_EL1 register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and also includes support for: <ul style="list-style-type: none"> 64-bit event counters. If EL2 is implemented, the MDCR_EL2.HCCD control bit. If EL3 is implemented, the MDCR_EL3.SCCD control bit.
0b0111	PMUv3 for Armv8.7. As 0b0110, and also includes support for: <ul style="list-style-type: none"> The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO control bits. If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} control bits.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

TraceVer	Meaning
0b0000	PE trace unit System registers not implemented.
0b0001	PE trace unit System registers implemented.

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64DFR0_EL1](#).TraceVer.

Bits [3:0]

Reserved, UNKNOWN.

Accessing EDDFR

EDDFR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD28	EDDFR	31:0

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

Component	Offset	Instance	Range
Debug	0xD2C	EDDFR	63:32

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

Purpose

Controls Exception Catch debug events. For more information, see 'Summary of Exception Catch debug event control'.

Configuration

External register EDECCR bits [31:0] are architecturally mapped to AArch64 System register [OSECCR_EL1\[31:0\]](#).

External register EDECCR bits [31:0] are architecturally mapped to AArch32 System register [DBGOSECCR\[31:0\]](#).

EDECCR is in the Core power domain.

Attributes

EDECCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	
									RES0	RLR2	RLR1	RLR0	RES0	RLE2	RLE1	RLE0	NSR3	NSR2	NSR1	NSR0	SR3	SR2	SR1	SR0	NSE3	NSE2	NSE1	NSE0

Bits [31:23]

Reserved, RES0.

RLR2, bit [22]

When FEAT_RME is implemented:

Controls exception catch on exception return to Realm EL2 in conjunction with EDECCR.RLE2.

RLR2	Meaning
0b0	If EDECCR.RLE2 is 0, then Exception Catch debug events are disabled for Realm EL2. If EDECCR.RLE2 is 1, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL2.
0b1	If EDECCR.RLE2 is 0, then Exception Catch debug events are enabled for exception returns to Realm EL2. If EDECCR.RLE2 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL2.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RLR1, bit [21]**When FEAT_RME is implemented:**

Controls exception catch on exception return to Realm EL1 in conjunction with EDECCR.RLE1.

RLR1	Meaning
0b0	If EDECCR.RLE1 is 0, then Exception Catch debug events are disabled for Realm EL1. If EDECCR.RLE1 is 1, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL1.
0b1	If EDECCR.RLE1 is 0, then Exception Catch debug events are enabled for exception returns to Realm EL1. If EDECCR.RLE1 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RLR0, bit [20]**When FEAT_RME is implemented:**

Controls exception catch on exception return to Realm EL0.

RLR0	Meaning
0b0	Exception Catch debug events are disabled for Realm EL0.
0b1	Exception Catch debug events are enabled for exception returns to Realm EL0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [19]

Reserved, RES0.

RLE2, bit [18]**When FEAT_RME is implemented:**

Controls exception catch on exception entry to Realm EL2. Also controls exception catch on exception return to Realm EL2 in conjunction with EDECCR.RLR2.

RLE2	Meaning
0b0	If EDECCR.RLR2 is 0, then Exception Catch debug events are disabled for Realm EL2. If EDECCR.RLR2 is 1, then Exception Catch debug events are enabled for exception returns to Realm EL2.
0b1	If EDECCR.RLR2 is 0, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL2. If EDECCR.RLR2 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL2.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RLE1, bit [17]

When FEAT_RME is implemented:

Controls exception catch on exception entry to Realm EL1. Also controls exception catch on exception return to Realm EL1 in conjunction with EDECCR.RLR1.

RLE1	Meaning
0b0	If EDECCR.RLR1 is 0, then Exception Catch debug events are disabled for Realm EL1.
	If EDECCR.RLR1 is 1, then Exception Catch debug events are enabled for exception returns to Realm EL1.
0b1	If EDECCR.RLR1 is 0, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL1.
	If EDECCR.RLR1 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RLE0, bit [16]

Access to this field is **RES0**.

NSR3, bit [15]

Access to this field is **RES0**.

NSR2, bit [14]

When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:

Controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSE2.

NSR2	Meaning
0b0	If EDECCR.NSE2 is 0, then Exception Catch debug events are disabled for Non-secure EL2.
	If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2.
0b1	If EDECCR.NSE2 is 0, then Exception Catch debug events are enabled for exception returns to Non-secure EL2.
	If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL2.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSR1, bit [13]

When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:

Controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSE1.

NSR1	Meaning
0b0	If EDECCR.NSE1 is 0, then Exception Catch debug events are disabled for Non-secure EL1. If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1.
0b1	If EDECCR.NSE1 is 0, then Exception Catch debug events are enabled for exception returns to Non-secure EL1. If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSR0, bit [12]

When FEAT_Debugv8p2 is implemented and Non-secure EL0 is implemented:

Controls exception catch on exception return to Non-secure EL0.

NSR0	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL0.
0b1	Exception Catch debug events are enabled for exception returns to Non-secure EL0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR3, bit [11]

When FEAT_Debugv8p2 is implemented and EL3 is implemented:

Controls exception catch on exception return to EL3 in conjunction with EDECCR.SE3.

SR3	Meaning
0b0	If EDECCR.SE3 is 0, then Exception Catch debug events are disabled for EL3. If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3.
0b1	If EDECCR.SE3 is 0, then Exception Catch debug events are enabled for exception returns to EL3. If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR2, bit [10]

When FEAT_Debugv8p2 is implemented and FEAT_SEL2 is implemented:

Controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SE2.

SR2	Meaning
0b0	If EDECCR.SE2 is 0, then Exception Catch debug events are disabled for Secure EL2. If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2.
0b1	If EDECCR.SE2 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL2. If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR1, bit [9]

When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

Controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SE1.

SR1	Meaning
0b0	If EDECCR.SE1 is 0, then Exception Catch debug events are disabled for Secure EL1. If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1.
0b1	If EDECCR.SE1 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL1. If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR0, bit [8]

When FEAT_Debugv8p2 is implemented and Secure EL0 is implemented:

Controls exception catch on exception return to Secure EL0.

SR0	Meaning
0b0	Exception Catch debug events are disabled for Secure EL0.
0b1	Exception Catch debug events are enabled for exception returns to Secure EL0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSE3, bit [7]

Access to this field is **RES0**.

NSE2, bit [6]

When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:

Controls exception catch on exception entry to Non-secure EL2. Also controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSR2.

NSE2	Meaning
0b0	If EDECCR.NSR2 is 0, then Exception Catch debug events are disabled for Non-secure EL2. If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL2.
0b1	If EDECCR.NSR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2. If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL2.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

When Non-secure EL2 is implemented:

Coarse-grained exception catch for Non-secure EL2. Controls Exception Catch debug events for Non-secure EL2.

NSE2	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL2.
0b1	Exception Catch debug events are enabled for Non-secure EL2.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSE1, bit [5]

When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:

Controls exception catch on exception entry to Non-secure EL1. Also controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSR1.

NSE1	Meaning
0b0	If EDECCR.NSR1 is 0, then Exception Catch debug events are disabled for Non-secure EL1. If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL1.
0b1	If EDECCR.NSR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1. If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

When Non-secure EL1 is implemented:

Coarse-grained exception catch for Non-secure EL1. Controls Exception Catch debug events for Non-secure EL1.

NSE1	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL1.
0b1	Exception Catch debug events are enabled for Non-secure EL1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSE0, bit [4]

Access to this field is **RES0**.

SE3, bit [3]

When FEAT_Debugv8p2 is implemented and EL3 is implemented:

Controls exception catch on exception entry to EL3. Also controls exception catch on exception return to EL3 in conjunction with EDECCR.SR3.

SE3	Meaning
0b0	If EDECCR.SR3 is 0, then Exception Catch debug events are disabled for EL3. If EDECCR.SR3 is 1, then Exception Catch debug events are enabled for exception returns to EL3.
0b1	If EDECCR.SR3 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3. If EDECCR.SR3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

When FEAT_Debugv8p2 is not implemented and EL3 is implemented:

Coarse-grained exception catch for EL3. Controls Exception Catch debug events for EL3.

SE3	Meaning
0b0	Exception Catch debug events are disabled for EL3.
0b1	Exception Catch debug events are enabled for EL3.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SE2, bit [2]

When FEAT_Debugv8p2 is implemented and FEAT_SEL2 is implemented:

Controls exception catch on exception entry to Secure EL2. Also controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SR2.

SE2	Meaning
0b0	If EDECCR.SR2 is 0, then Exception Catch debug events are disabled for Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL2.
0b1	If EDECCR.SR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SE1, bit [1]

When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

Controls exception catch on exception entry to Secure EL1. Also controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SR1.

SE1	Meaning
0b0	If EDECCR.SR1 is 0, then Exception Catch debug events are disabled for Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL1.
0b1	If EDECCR.SR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

When Secure EL1 is implemented:

Coarse-grained exception catch for Secure EL1. Controls Exception Catch debug events for Secure EL1.

SE1	Meaning
0b0	Exception Catch debug events are disabled for Secure EL1.
0b1	Exception Catch debug events are enabled for Secure EL1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SE0, bit [0]

Access to this field is **RES0**.

Accessing EDECCR

EDECCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x098	EDECCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

EDECR, External Debug Execution Control Register

The EDECR characteristics are:

Purpose

Controls Halting debug events.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDECR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																												SS	RCE	OS	UCE

Bits [31:3]

Reserved, RES0.

SS, bit [2]

Halting step enable. Possible values of this field are:

SS	Meaning
0b0	Halting step debug event disabled.
0b1	Halting step debug event enabled.

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is CONSTRAINED UNPREDICTABLE as described in 'Changing the value of EDECR.SS when not in Debug state'.

The reset behaviour of this field is:

- On a Cold reset, when FEAT_DoPD is implemented, this field resets to 0.
- On an External debug reset, when FEAT_DoPD is not implemented, this field resets to 0.

RCE, bit [1]

When FEAT_DoPD is not implemented:

Reset Catch Enable.

RCE	Meaning
0b0	Reset Catch debug event disabled.
0b1	Reset Catch debug event enabled.

The reset behaviour of this field is:

- On an External debug reset, this field resets to 0.

Otherwise:

Reserved, RES0.

OSUCE, bit [0]**When FEAT_DoPD is not implemented:**

OS Unlock Catch Enable.

OSUCE	Meaning
0b0	OS Unlock Catch debug event disabled.
0b1	OS Unlock Catch debug event enabled.

The reset behaviour of this field is:

- On an External debug reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Accessing EDECR

EDECR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x024	EDECR

This interface is accessible as follows:

- When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are **RO**.
- When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDES, External Debug Event Status Register

The EDES characteristics are:

Purpose

Indicates the status of internally pending Halting debug events.

Configuration

EDES is in the Core power domain.

Attributes

EDES is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																													SS	RC	OSUC

Bits [31:3]

Reserved, RES0.

SS, bit [2]

When FEAT_DoPD is implemented:

Halting step debug event pending. Possible values of this field are:

SS	Meaning
0b0	Reading this means that a Halting step debug event is not pending. Writing this means no action.
0b1	Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Halting step debug event pending. Possible values of this field are:

SS	Meaning
0b0	Reading this means that a Halting step debug event is not pending. Writing this means no action.
0b1	Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

The reset behaviour of this field is:

- On a Warm reset, this field resets to the value in [EDEC.R.SS](#).

RC, bit [1]

Reset Catch debug event pending. Possible values of this field are:

RC	Meaning
0b0	Reading this means that a Reset Catch debug event is not pending. Writing this means no action.
0b1	Reading this means that a Reset Catch debug event is pending. Writing this clears the pending Reset Catch debug event.

The reset behaviour of this field is:

- On a Warm reset:
 - When FEAT_DoPD is implemented, this field resets to the value in [CTIDEVCTL.RCE](#).
 - When FEAT_DoPD is not implemented, this field resets to the value in [EDECR.RCE](#).

OSUC, bit [0]

OS Unlock Catch debug event pending. Possible values of this field are:

OSUC	Meaning
0b0	Reading this means that an OS Unlock Catch debug event is not pending. Writing this means no action.
0b1	Reading this means that an OS Unlock Catch debug event is pending. Writing this clears the pending OS Unlock Catch debug event.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing EDES

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is **CONSTRAINED UNPREDICTABLE** whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it might become pending again when the Core is powered back on and Cold reset.

EDES can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x020	EDES

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

EDITCTRL, External Debug Integration mode Control register

The EDITCTRL characteristics are:

Purpose

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

It is IMPLEMENTATION DEFINED whether EDITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

EDITCTRL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																IME															

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

The following resets apply:

- Whichever power domain the register is implemented in, this field resets to 0.
- Otherwise, the value of this field is unchanged.

Accessing EDITCTRL

EDITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xF00	EDITCTRL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

Purpose

Used in Debug state for passing instructions to the PE for execution.

Configuration

EDITR is in the Core power domain.

Attributes

EDITR is a 32-bit register.

Field descriptions

When AArch32 is supported at EL0 and in AArch32 state:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
T32Second																T32First															

T32Second, bits [31:16]

Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information, see 'Behavior in Debug state'.

T32First, bits [15:0]

First halfword of the T32 instruction to be executed on the PE.

When AArch64 is supported at the highest implemented Exception level and in AArch64 state:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
A64 instruction to be executed on the PE																															

Bits [31:0]

A64 instruction to be executed on the PE.

Accessing EDITR

If [EDSCR](#).ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

EDITR ignores writes if the PE is in Non-debug state.

EDITR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x084	EDITR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

Purpose

Allows or disallows access to the external debug registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses EDLAR to set or clear the lock, and [EDLSR](#) to check the current status of the lock.

Attributes

EDLAR is a 32-bit register.

Field descriptions

When Software Lock is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																KEY															

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																RES0															

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing EDLAR

EDLAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
Debug	0xFB0	EDLAR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

Purpose

Indicates the current status of the software lock for external debug registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses [EDLAR](#) to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																												nTT	SLK	SLI	

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

When Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behaviour of this field is:

- On a Cold reset, when FEAT_DoPD is implemented, this field resets to 1.
- On an External debug reset, when FEAT_DoPD is not implemented, this field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Accessing EDLSR

EDLSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
Debug	0xFB4	EDLSR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configuration

EDPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDPCSR are RES0.

EDPCSR[63:32] and EDPCSR[31:0] are accessed at 32-bit memory mapped addresses that are not contiguous.

If FEAT_VHE is implemented, the format of this register differs depending on the value of [EDSCR.SC2](#).

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDPCSR is a 64-bit register.

Field descriptions

When FEAT_VHE is not implemented or EDSCR.SC2 == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
PC Sample high word, EDPCSRhi																															
PC Sample low word																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

PC Sample high word, EDPCSRhi. If [EDVIDSR.HV](#) == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from [EDVIDSR.{NS,E2,E3}](#).

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#) to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#). The translation regime that EDPCSR samples can be determined from [EDVIDSR](#).{NS,E2,E3}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, [EDCIDSR](#), and [EDVIDSR](#) are unchanged.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_VHE is implemented and EDSCR.SC2 == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
NS	EL	RES0						PC Sample high word, EDPCSRhi																								
PC Sample low word																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

EL	Meaning
0b00	Sample is from EL0.
0b01	Sample is from EL1.
0b10	Sample is from EL2.
0b11	Sample is from EL3.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [60:56]

Reserved, RES0.

Bits [55:32]

PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, [EDCIDS](#)R, and [EDVIDS](#)R to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, [EDCIDS](#)R, and [EDVIDS](#)R. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, [EDCIDS](#)R, and [EDVIDS](#)R are unchanged.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'

EDPCSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance	Range
Debug	0x0A0	EDPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
Debug	0x0AC	EDPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

Purpose

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

It is IMPLEMENTATION DEFINED whether EDPFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDPFR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN				UNKNOWN				RES0				UNKNOWN				AMU				UNKNOWN				SEL2				SVE			
UNKNOWN				GIC				AdvSIMD				FP				EL3				EL2				EL1				EL0			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:60]

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

Bits [59:56]

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

Bits [55:52]

Reserved, RES0.

Bits [51:48]

From Armv8.4:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

Bits [43:40]**From Armv8.2:**

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

SEL2, bits [39:36]

Secure EL2. Defined values are:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

All other values are reserved.

SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

SVE	Meaning
0b0000	SVE is not implemented.
0b0001	SVE is implemented.

All other values are reserved.

Bits [31:28]**From Armv8.2:**

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

GIC, bits [27:24]

System register GIC interface support. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1](#).GIC.

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following Sisd and SIMD operations: <ul style="list-style-type: none"> Integer byte, halfword, word and doubleword element operations. Single-precision and double-precision floating-point arithmetic. Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support, that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support, that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1](#).AdvSIMD.

FP, bits [19:16]

Floating-point. Defined values are:

FP	Meaning
0b0000	Floating-point is implemented, and includes support for: <ul style="list-style-type: none"> Single-precision and double-precision floating-point types. Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support, that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with floating-point support, that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without floating-point support.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1](#).FP.

EL3, bits [15:12]

AArch64 EL3 Exception level handling. Defined values are:

EL3	Meaning
0b0000	EL3 is not implemented or cannot be executed in AArch64 state.
0b0001	EL3 can be executed in AArch64 state only.
0b0010	EL3 can be executed in both Execution states.

When the value of [EDAA32PFR](#).EL3 is non-zero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1](#).EL3.

EL2, bits [11:8]

AArch64 EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented or cannot be executed in AArch64 state.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in both Execution states.

When the value of [EDAA32PFR](#).EL2 is non-zero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1](#).EL2.

EL1, bits [7:4]

AArch64 EL1 Exception level handling. Defined values are:

EL1	Meaning
0b0000	EL1 cannot be executed in AArch64 state.
	EL1 can be executed in AArch32 state only.
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1](#).EL1.

EL0, bits [3:0]

AArch64 EL0 Exception level handling. Defined values are:

EL0	Meaning
0b0000	EL0 cannot be executed in AArch64 state.
	EL0 can be executed in AArch32 state only.
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of [ID_AA64PFR0_EL1](#).EL0.

Accessing EDPFR

EDPFR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0xD20	EDPFR	31:0

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

Component	Offset	Instance	Range
Debug	0xD24	EDPFR	63:32

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

EDPIDR0, External Debug Peripheral Identification Register 0

The EDPIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PART_0							

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR0

EDPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE0	EDPIDR0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDPIDR1, External Debug Peripheral Identification Register 1

The EDPIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												DES_0				PART_1			

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR1

EDPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE4	EDPIDR1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																REVISION				JEDEC		DES_1									

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as 0b1.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR2

EDPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE8	EDPIDR2

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								REVAND				CMOD			

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using [EDPIDR2](#).REVISION as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR3

EDPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
-----------	--------	----------

EDPIDR3, External Debug Peripheral Identification Register 3

Debug	0xFEC	EDPIDR3
-------	-------	---------

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR4 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SIZE				DES_2			

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR4

EDPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
-----------	--------	----------

Debug	0xFD0	EDPIDR4
-------	-------	---------

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

Purpose

Controls the PE functionality related to powerup, reset, and powerdown.

Configuration

EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT_DoPD is implemented then all fields in this register are in the Core power domain.

CORENPDRQ is the only field that is mapped between the EDPRCR and DBGPRCR and DBGPRCR_EL1.

Attributes

EDPRCR is a 32-bit register.

Field descriptions

When FEAT_DoPD is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																												CWRR	CORENPDRQ		

Bits [31:2]

Reserved, RES0.

CWRR, bit [1]

When FEAT_RME is implemented:

The PE ignores all writes to this bit.

Otherwise:

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

CWRR	Meaning
0b0	No action.
0b1	Request Warm reset.

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- **RAZ/WI** if any of the following are true:
 - OSLockStatus()
 - SoftwareLockStatus()
- Otherwise, access to this field is **WO/RAZ**.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the [DBGPRCR.CORENPDRQ](#) and [DBGPRCR_EL1.CORENPDRQ](#) fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Accessing this field has the following behavior:

- When OSLockStatus(), access to this field is **UNKNOWN/WI**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																COREPURQ		RES0	CWRR	CORENPDRQ											

Bits [31:4]

Reserved, RES0.

COREPURQ, bit [3]

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain, and that the power controller emulates powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

COREPURQ	Meaning
0b0	Do not request power up of the Core power domain.
0b1	Request power up of the Core power domain, and emulation of powerdown.

In an implementation that includes the recommended external debug interface, this bit drives the DBGPWRUPREQ signal.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behaviour of this field is:

- On an External debug reset, this field resets to 0.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Bit [2]

Reserved, RES0.

CWRR, bit [1]

When FEAT_RME is implemented:

The PE ignores all writes to this bit.

Otherwise:

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

CWRR	Meaning
0b0	No action.
0b1	Request Warm reset.

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- **RAZ/WI** if any of the following are true:
 - !IsCorePowered()
 - DoubleLockStatus()
 - OSLockStatus()
 - SoftwareLockStatus()
- Otherwise, access to this field is **WO/RAZ**.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the [DBGPRCR](#).CORENPDRQ and [DBGPRCR_EL1](#).CORENPDRQ fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR](#).COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behaviour of this field is:

- On a Cold reset, this field resets to the value in [EDPRCR](#).COREPURQ.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - !IsCorePowered()
 - DoubleLockStatus()
 - OSLockStatus()
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Accessing EDPRCR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

EDPRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x310	EDPRCR

This interface is accessible as follows:

- When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are **RO**.
- When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

Purpose

Holds information about the reset and powerdown state of the PE.

Configuration

EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT_DoPD is implemented then all fields in this register are in the Core power domain.

Attributes

EDPRSR is a 32-bit register.

Bits [31:17]

Reserved, RES0.

EPMAD, bit [16]

When FEAT_RME is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Access Disable Extended Status. Together with EDPRSR.EPMAD, reports whether access to Performance Monitor registers by an external debugger is permitted.

For a description of the values derived by evaluating EPMAD and EPMAD together, see EDPRSR.EPMAD.

Otherwise:

Reserved, RES0.

ETADE, bit [15]

When FEAT_RME is implemented, external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable Extended Status. Together with EDPRSR.ETAD, reports whether access to PE Trace Unit registers by an external debugger is permitted.

For a description of the values derived by evaluating ETAD and ETAD together, see EDPRSR.ETAD.

Otherwise:

Reserved, RES0.

EDADE, bit [14]**When FEAT_RME is implemented:**

External Debug Access Disable Extended Status. Together with EDPRSR.EDAD, reports whether access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) by an external debugger is permitted.

For a description of the values derived by evaluating EDAD and EDADE together, see EDPRSR.EDAD.

Otherwise:

Reserved, RES0.

STAD, bit [13]**When external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:**

Sticky ETAD error. Set to 1 when a Non-secure external debug interface access to an external trace register returns an error because AllowExternalTraceAccess() == FALSE for the access.

STAD	Meaning
0b0	Since EDPRSR was last read, no external accesses to the PE Trace Unit registers have failed because AllowExternalTraceAccess() was FALSE for the access.
0b1	Since EDPRSR was last read, at least one external access to the PE Trace Unit registers has failed because AllowExternalTraceAccess() was FALSE for the access.

If IsCorePowered() == TRUE, the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE then this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE then it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This bit is in the Core power domain.

Note

If FEAT_DoPD is implemented, FEAT_DoubleLock is not implemented.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - DoubleLockStatus()
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - EDPRSR.R == 1
- Otherwise, access to this field is **RC/WI**.

Otherwise:

Reserved, RES0.

ETAD, bit [12]**When FEAT_RME is implemented, external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:**

External Trace Access Disable Status. Together with EDPRSR.ETADE, reports whether access to PE Trace Unit registers by an external debugger is permitted.

ETADE	ETAD	Meaning
0b0	0b0	Access to PE Trace Unit registers by an external debugger is permitted.
0b0	0b1	Root and Secure access to PE Trace Unit registers by an external debugger is permitted. Realm and Non-secure access to PE Trace Unit registers by an external debugger is not permitted.
0b1	0b0	Root and Realm access to PE Trace Unit registers by an external debugger is permitted. Secure and Non-secure access to PE Trace Unit registers by an external debugger is not permitted.
0b1	0b1	Root access to PE Trace Unit registers by an external debugger is permitted. Secure, Non-secure, and Realm access to PE Trace Unit registers by an external debugger is not permitted.

When external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable status.

ETAD	Meaning
0b0	External Non-secure PE Trace Unit accesses enabled. AllowExternalTraceAccess() == TRUE for a Non-secure access.
0b1	External Non-secure PE Trace Unit accesses disabled. AllowExternalTraceAccess() == FALSE for a Non-secure access.

This bit is in the Core power domain.

Note

If FEAT_DoPD is implemented, FEAT_DoubleLock is not implemented.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - DoubleLockStatus()
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

SDR, bit [11]

Sticky Debug Restart. Set to 1 when the PE exits Debug state.

Permitted values are:

SDR	Meaning
0b0	The PE has not restarted since EDPRSR was last read.
0b1	The PE has restarted since EDPRSR was last read.

Note

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is UNKNOWN on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If The Core power domain is powered up, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

SPMAD, bit [10]

When FEAT_Debugv8p4 is implemented:

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because AllowExternalPMUAccess() == FALSE.

Permitted values are:

SPMAD	Meaning
0b0	No Non-secure external debug interface accesses to the external Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read.
0b1	At least one Non-secure external debug interface access to the external Performance Monitors register has failed and returned an error because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

Otherwise:

Sticky EPMAD error.

SPMAD	Meaning
0b0	No external debug interface accesses to the Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.
0b1	At least one external debug interface access to the Performance Monitors registers has failed and returned an error because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - OSLockStatus()
 - DoubleLockStatus()
 - EDPRSR.R == 1
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

EPMAD, bit [9]

When FEAT_RME is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Access Disable Status. Together with EDPRSR.EPMADE, reports whether access to Performance Monitor registers by an external debugger is permitted.

EPMADE	EPMAD	Meaning
0b0	0b0	Access to Performance Monitor registers by an external debugger is permitted.
0b0	0b1	Root and Secure access to Performance Monitor registers by an external debugger is permitted. Realm and Non-secure access to Performance Monitor registers by an external debugger is not permitted.
0b1	0b0	Root and Realm access to Performance Monitor registers by an external debugger is permitted. Secure and Non-secure access to Performance Monitor registers by an external debugger is not permitted.
0b1	0b1	Root access to Performance Monitor registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Performance Monitor registers by an external debugger is not permitted.

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Non-secure Access Disable status.

EPMAD	Meaning
0b0	External Non-secure Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE for a Non-secure access.
0b1	External Non-secure Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

When FEAT_PMUv3 is implemented:

External Performance Monitors access disable status.

EPMAD	Meaning
0b0	External Performance Monitors access enabled. AllowExternalPMUAccess() == TRUE.
0b1	External Performance Monitors access disabled. AllowExternalPMUAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - OSLockStatus()
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

SDAD, bit [8]

When FEAT_Debugv8p4 is implemented:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

SDAD	Meaning
0b0	No Non-secure external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.
0b1	At least one Non-secure external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

Otherwise:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

SDAD	Meaning
0b0	No external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.
0b1	At least one external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This bit is UNKNOWN on reads if OSLockStatus() == TRUE and external debug writes to [OSLAR_EL1](#) do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

EDAD, bit [7]

When FEAT_RME is implemented:

External Debug Access Disable Status. Together with EDPRSR.EDADE, reports whether access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) by an external debugger is permitted.

EDADE	EDAD	Meaning
0b0	0b0	Access to Debug registers by an external debugger is permitted.
0b0	0b1	Root and Secure access to Debug registers by an external debugger is permitted. Realm and Non-secure access to Debug registers by an external debugger is not permitted.
0b1	0b0	Root and Realm access to Debug registers by an external debugger is permitted. Secure and Non-secure access to Debug registers by an external debugger is not permitted.
0b1	0b1	Root access to Debug registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Debug registers by an external debugger is not permitted.

When FEAT_Debugv8p4 is implemented:

External Debug Access Disable status.

EDAD	Meaning
0b0	External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE for a Non-secure access.
0b1	External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable status.

EDAD	Meaning
0b0	External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE.
0b1	External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. AllowExternalDebugAccess() == FALSE.

This bit is not valid and reads UNKNOWN if OSLockStatus() == TRUE and external debug writes to [OSLAR_EL1](#) do not return an error when AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

Otherwise:

External Debug Access Disable status.

EDAD	Meaning
0b0	External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. AllowExternalDebugAccess() == TRUE.
0b1	External access to breakpoint registers, watchpoint registers disabled. It is IMPLEMENTATION DEFINED whether accesses to OSLAR_EL1 are enabled or disabled. AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

DLK, bit [6]

When FEAT_Debugv8p4 is implemented:

This field is RES0.

When FEAT_Debugv8p2 is implemented and FEAT_DoubleLock is implemented:

Double Lock.

From Armv8.2, this field is deprecated.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **RAZ/WI** if all of the following are true:
 - IsCorePowered()
 - !DoubleLockStatus()
- Otherwise, access to this field is **UNKNOWN/WI**.

When FEAT_DoubleLock is implemented:

Double Lock.

This field returns the result of the pseudocode function DoubleLockStatus().

If the Core power domain is powered up and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether:

- EDPRSR.PU reads as 1, EDPRSR.DLK reads as 1, and EDPRSR.SPD is UNKNOWN.
- EDPRSR.PU reads as 0, EDPRSR.DLK is UNKNOWN, and EDPRSR.SPD reads as 0.

This field is in the Core power domain.

DLK	Meaning
0b0	DoubleLockStatus() returns FALSE.
0b1	DoubleLockStatus() returns TRUE and the Core power domain is powered up.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:

- FEAT_DoPD is not implemented
- !IsCorePowered()
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

OSLK, bit [5]

OS Lock status bit.

A read of this bit returns the value of [OSLSR_EL1.OSLK](#).

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
 - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

HALTED, bit [4]

Halted status bit.

HALTED	Meaning
0b0	PE is in Non-debug state.
0b1	PE is in Debug state.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - FEAT_DoPD is not implemented
 - !IsCorePowered()
- Otherwise, access to this field is **RO**.

SR, bit [3]

Sticky core Reset status bit.

Permitted values are:

SR	Meaning
0b0	The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read.
0b1	The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read.

If EDPRSR.PU reads as 1 and EDPRSR.R reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 1.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

R, bit [2]

PE Reset status bit.

Permitted values are:

R	Meaning
0b0	The non-debug logic of the PE is not in reset state.
0b1	The non-debug logic of the PE is in reset state.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - (FEAT_DoPD is not implemented and !IsCorePowered())
 - DoubleLockStatus()
- Otherwise, access to this field is **RO**.

SPD, bit [1]

Sticky core Powerdown status bit.

If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, then:

- If FEAT_Debugv8p2 is implemented, this bit reads as 0.
- If FEAT_Debugv8p2 is not implemented, this bit might read as 0 or 1.

For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

SPD	Meaning
0b0	If EDPRSR.PU is 0, it is not known whether the state of the debug registers in the Core power domain is lost. If EDPRSR.PU is 1, the state of the debug registers in the Core power domain has not been lost.
0b1	The state of the debug registers in the Core power domain has been lost.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

When FEAT_DoPD is not implemented and the Core power domain is in either retention or powerdown state, the value of EDPRSR.SPD is IMPLEMENTATION DEFINED. For more information, see 'EDPRSR.SPD when the Core domain is in either retention or powerdown state'.

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

This field is in the Core power domain.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 1.

Accessing this field has the following behavior:

- **RAZ/WI** if all of the following are true:
 - FEAT_DoPD is not implemented
 - !IsCorePowered()
- **UNKNOWN/WI** if all of the following are true:
 - IsCorePowered()
 - DoubleLockStatus()
- Otherwise, access to this field is **RO**.

PU, bit [0]

When FEAT_DoPD is implemented:

Core powerup status bit.

Access to this field is **RAO/WI**.

When FEAT_Debugv8p2 is implemented:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

PU	Meaning
0b0	Either the Core power domain is in a low-power or powerdown state, or FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, meaning the debug registers in the Core power domain cannot be accessed.
0b1	The Core power domain is in a powerup state, and either FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, meaning the debug registers in the Core power domain can be accessed.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'

Access to this field is **RO**.

Otherwise:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

When the Core power domain is powered-up and DoubleLockStatus() == TRUE, then the value of EDPRSR.PU is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.

Otherwise, permitted values are:

PU	Meaning
0b0	Core power domain is in a low-power or powerdown state where the debug registers in the Core power domain cannot be accessed.
0b1	Core power domain is in a powerup state where the debug registers in the Core power domain can be accessed.

If FEAT_DoubleLock is implemented, the Core power domain is powered up, and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

Access to this field is **RO**.

Accessing EDPRSR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, then:
 - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
 - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If FEAT_DoPD is not implemented and the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

EDPRSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x314	EDPRSR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDRCR, External Debug Reserve Control Register

The EDRCR characteristics are:

Purpose

This register is used to allow imprecise entry to Debug state and clear sticky bits in [EDSCR](#).

Configuration

EDRCR is in the Core power domain.

Attributes

EDRCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																			CBRR0		CSPA		CSE		RES0						

Bits [31:5]

Reserved, RES0.

CBRRQ, bit [4]

Allow imprecise entry to Debug state. The actions on writing to this bit are:

CBRRQ	Meaning
0b0	No action.
0b1	Allow imprecise entry to Debug state, for example by canceling pending bus accesses.

Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1.

This feature is optional. If this feature is not implemented, writes to this bit are ignored.

CSPA, bit [3]

Clear Sticky Pipeline Advance. This bit is used to clear the [EDSCR](#).PipeAdv bit to 0. The actions on writing to this bit are:

CSPA	Meaning
0b0	No action.
0b1	Clear the EDSCR .PipeAdv bit to 0.

CSE, bit [2]

Clear Sticky Error. Used to clear the [EDSCR](#) cumulative error bits to 0. The actions on writing to this bit are:

CSE	Meaning
0b0	No action.
0b1	Clear the EDSCR .{TXU, RXO, ERR} bits, and, if the PE is in Debug state, the EDSCR .ITO bit, to 0.

Bits [1:0]

Reserved, RES0.

Accessing EDCR

EDRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x090	EDRCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

External register EDSCR bits [30:29] are architecturally mapped to AArch64 System register [MDCCSR_EL0\[30:29\]](#).

EDSCR is in the Core power domain.

Attributes

EDSCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

TFO, bit [31]

When [FEAT_TRF](#) is implemented:

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

TFO	Meaning
0b0	Trace Filter controls are not affected.
0b1	Trace Filter controls in TRFCR_EL1 and TRFCR_EL2 are ignored. Trace Filter controls TRFCR and HTRFCR are ignored.

When [OSLSR_EL1](#).OSLK == 1, this bit can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRExt](#) System registers.

This bit is ignored by the PE when `ExternalSecureNoninvasiveDebugEnabled() == FALSE` and the Effective value of [MDCR_EL3](#).STE == 1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

DTRRX full.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

TXfull, bit [29]

DTRTX full.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

ITO, bit [28]

ITR overrun.

If the PE is in Non-debug state, this bit is UNKNOWN. ITO is set to 0 on entry to Debug state.

Access to this field is **RO**.

RXO, bit [27]

DTRRX overrun.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

TXU, bit [26]

DTRTX underrun.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

PipeAdv, bit [25]

Pipeline advance. Set to 1 every time the PE pipeline retires one or more instructions. Cleared to 0 by a write to [EDRCR.CSPA](#).

The architecture does not define precisely when this bit is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing.

Access to this field is **RO**.

ITE, bit [24]

ITR empty.

If the PE is in Non-debug state, this bit is UNKNOWN. It is always valid in Debug state.

Access to this field is **RO**.

INTdis, bits [23:22]

When FEAT_RME is implemented:

Interrupt disable. Disables taking interrupts in Non-debug state.

INTdis	Meaning
0b00	This bit has no effect on the masking of interrupts.
0b01	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked. If ExternalRootInvasiveDebugEnabled() is TRUE, then all interrupts taken to Root state are masked. If ExternalRealmInvasiveDebugEnabled() is TRUE, then all interrupts taken to Realm state are masked.

Note

All interrupts includes virtual and SError interrupts.

When [OSLSR_EL1](#).OSLK is 1, this field can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRext](#) System registers.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_RME is implemented, bit[23] of this register is RES0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

When FEAT_Debugv8p4 is implemented:

Interrupt disable. Disables taking interrupts in Non-debug state.

INTdis	Meaning
0b00	Masking of interrupts is controlled by PSTATE and interrupt routing controls.
0b01	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked.

Note

All interrupts includes virtual and SError interrupts.

When [OSLSR_EL1](#).OSLK is 1, this field can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRext](#) System registers.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_Debugv8p4 is implemented, bit[23] of this register is RES0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Interrupt disable. Disables taking interrupts in Non-debug state.

INTdis	Meaning
0b00	Masking of interrupts is controlled by PSTATE and interrupt routing controls.
0b01	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure EL1 are masked.
0b10	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure EL1 are masked.
0b11	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked.

Note

All interrupts includes virtual and SError interrupts.

When [OSLSR_EL1](#).OSLK is 1, this field can be indirectly read and written through the [MDSCR_EL1](#) and [DBGDSCRext](#) System registers.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

Support for the values 0b01 and 0b10 is IMPLEMENTATION DEFINED. If these values are not supported, they are reserved. If programmed with a reserved value, the PE behaves as if INTdis has been programmed with a defined value, other than for a direct read of EDSCR, and the value returned by a read of EDSCR.INTdis is UNKNOWN.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

TDA, bit [21]

Traps accesses to the following debug System registers:

- AArch64: [DBGBCR<n>_EL1](#), [DBGBVR<n>_EL1](#), [DBGWCR<n>_EL1](#), [DBGWVR<n>_EL1](#).
- AArch32: [DBGBCR<n>](#), [DBGBVR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#).

The possible values of this field are:

TDA	Meaning
0b0	Accesses to debug System registers do not generate a Software Access Debug event.
0b1	Accesses to debug System registers generate a Software Access Debug event, if OSLSR_EL1 .OSLK is 0 and if halting is allowed.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

MA, bit [20]

Memory access mode. Controls the use of memory-access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

MA	Meaning
0b0	Normal access mode.
0b1	Memory access mode.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and FEAT_PCSRv8p2 is not implemented:

Sample [CONTEXTIDR_EL2](#). Controls whether the PC Sample-based Profiling Extension samples [CONTEXTIDR_EL2](#) or [VTTBR_EL2](#).VMID.

SC2	Meaning
0b0	Sample VTTBR_EL2 .VMID.
0b1	Sample CONTEXTIDR_EL2 .

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NS, bit [18]

When FEAT_RME is implemented:

Non-secure status. Together with the NSE field, gives the current Security state:

NSE	NS	Meaning
0b0	0b0	Secure.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

In Non-debug state, this bit is UNKNOWN.

Access to this field is **RO**.

Otherwise:

Non-secure status. When in Debug state, gives the current Security state:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

In Non-debug state, this bit is UNKNOWN.

Access to this field is **RO**.

Bit [17]

Reserved, RES0.

SDD, bit [16]

When FEAT_RME is implemented:

Secure debug disabled.

Reports the inverse of ExternalRootInvasiveDebugEnabled().

Access to this field is **RO**.

Otherwise:

Secure debug disabled.

On entry to Debug state:

- If entering in Secure state, SDD is set to 0.
- If entering in Non-secure state, SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled().

In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

In Non-debug state:

- SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(). If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, a context synchronization event is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

Access to this field is **RO**.

NSE, bit [15]**When FEAT_RME is implemented:**

Together with the NS field, this field gives the current Security state.

For a description of the values derived by evaluating NS and NSE together, see EDSCR.NS.

In Non-debug state, this bit is UNKNOWN.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

HDE, bit [14]

Halting debug enable. The possible values of this field are:

HDE	Meaning
0b0	Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.
0b1	Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

RW, bits [13:10]

Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level.

RW	Meaning	Applies when
0b1111	Any of the following: <ul style="list-style-type: none"> The PE is in Non-debug state. The PE is at EL0 using AArch64. The PE is not at EL0, and EL1, EL2, and EL3 are using AArch64. 	
0b1110	The PE is in Debug state at EL0. EL0 is using AArch32. EL1, EL2, and EL3 are using AArch64.	When AArch32 is supported at EL0
0b110x	The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is enabled in the current Security state and is using AArch64. If implemented, EL3 is using AArch64.	When AArch32 is supported at EL0 and EL2 is implemented
0b10xx	The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is not implemented, disabled in the current Security state, or using AArch32. EL3 is using AArch64.	When AArch32 is supported at EL0 and EL3 is implemented
0b0xxx	The PE is in Debug state. All Exception levels are using AArch32.	When AArch32 is supported at EL0

In Non-debug state, this field is RAO.

Access to this field is **RO**.

EL, bits [9:8]

Exception level. In Debug state, this gives the current Exception level of the PE.

In Non-debug state, this field is RAZ.

Access to this field is **RO**.

A, bit [7]

SError interrupt pending. In Debug state, indicates whether an SError interrupt is pending:

- If [HCR_EL2](#).{AMO, TGE} = {1, 0}, EL2 is enabled in the current Security state, and the PE is executing at EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

A	Meaning
0b0	No SError interrupt pending.
0b1	SError interrupt pending.

A debugger can read EDSCR to check whether an SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

UNKNOWN in Non-debug state.

Access to this field is **RO**.

ERR, bit [6]

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **RO**.

STATUS, bits [5:0]

Debug status flags.

STATUS	Meaning
0b000001	PE is restarting, exiting Debug state.
0b000010	PE is in Non-debug state.
0b000111	Breakpoint.
0b010011	External debug request.
0b011011	Halting step, normal.
0b011111	Halting step, exclusive.
0b100011	OS Unlock Catch.
0b100111	Reset Catch.
0b101011	Watchpoint.
0b101111	HLT instruction.
0b110011	Software access to debug register.
0b110111	Exception Catch.
0b111011	Halting step, no syndrome.

All other values of STATUS are reserved.

Access to this field is **RO**.

Accessing EDSCR

EDSCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x088	EDSCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

Purpose

Contains sampled values captured on reading [EDPCSR](#)[31:0].

Configuration

EDVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDVIDSR are RES0.

If FEAT_VHE is implemented, the format of this register differs depending on the value of [EDSCR](#).SC2.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

When the PC Sample-based Profiling Extension is implemented in the external debug registers space, if EL2 is not implemented and EL3 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDVIDSR is a 32-bit register.

Field descriptions

When FEAT_VHE is not implemented or EDSCR.SC2 == 0:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NS	E2	E3	HV	RES0												VMID[15:8]						VMID									

This format applies in all Armv8.0 implementations.

NS, bit [31]

Non-secure state sample. Indicates the Security state associated with the most recent [EDPCSR](#) sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E2, bit [30]**When EL2 is implemented:**

Exception level 2 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL2.

E2	Meaning
0b0	Sample is not from EL2.
0b1	Sample is from EL2.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [29]**When EL3 is implemented and AArch64 is supported at the highest implemented Exception level:**

Exception level 3 status sample. Indicates whether the most recent [EDPCSR](#) sample was associated with EL3 using AArch64.

E3	Meaning
0b0	Sample is not from EL3 using AArch64.
0b1	Sample is from EL3 using AArch64.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HV, bit [28]

EDPCSRhi ([EDPCSR](#)[63:32]) valid. Indicates whether bits [63:32] of the most recent [EDPCSR](#) sample might be nonzero:

HV	Meaning
0b0	Bits[63:32] of the most recent EDPCSR sample are zero.
0b1	Bits[63:32] of the most recent EDPCSR sample might be nonzero.

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi ([EDPCSR](#)[63:32]) does not need to be read.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [27:16]

Reserved, RES0.

VMID[15:8], bits [15:8]**When FEAT_VMID16 is implemented and EL2 is implemented:**

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]**When EL2 is implemented:**

VMID sample. The VMID associated with the most recent EDPCSRlo ([EDPCSR](#)[31:0]) sample. When the most recent [EDPCSR](#) sample was generated:

- This field is RES0 if any of the following apply:
 - The PE is executing in Secure state.
 - The PE is executing at EL2.
- Otherwise:
 - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or [VTCR_EL2](#).VS is 1, this field is set to [VTTBR_EL2](#).VMID.
 - If EL2 is using AArch64, FEAT_VMID16 is implemented, and [VTCR_EL2](#).VS is 0, PMVIDSR.VMID[7:0] is set to [VTTBR_EL2](#).VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
 - If EL2 is using AArch32, this field is set to [VTTBR](#).VMID.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and EDSCR.SC2 == 1:**CONTEXTIDR_EL2, bits [31:0]**

Context ID. The value of [CONTEXTIDR_EL2](#) that is associated with the most recent [EDPCSR](#) sample. When the most recent [EDPCSR](#) sample was generated:

- If EL2 was using AArch64 and the PE was executing in Non-secure state, then this field is set to the Context ID sampled from [CONTEXTIDR_EL2](#).
- If EL2 was using AArch32 or the PE was executing in Secure state, then this field is set to an UNKNOWN value.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

EDVIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A8	EDVIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

Purpose

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

Configuration

EDWAR is in the Core power domain.

Attributes

EDWAR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Watchpoint address																															
Watchpoint address																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the [DC ZVA](#) block size.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The value of EDWAR[63:32] is UNKNOWN if Debug state was entered for a Watchpoint debug event taken from AArch32 state.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See 'Determining the memory location that caused a Watchpoint exception'.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDWAR

EDWAR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x030	EDWAR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
Debug	0x034	EDWAR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

ERRCIDR0, Component Identification Register 0

The ERRCIDR0 characteristics are:

Purpose

Provides discovery information about the component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.
ERRCIDR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																PRMBL_0															

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Component identification preamble, segment 0.
Reads as 0x0D.
Access to this field is **RO**.

Accessing ERRCIDR0

ERRCIDR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFF0	ERRCIDR0

Accesses on this interface are **RO**.

ERRCIDR1, Component Identification Register 1

The ERRCIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRCIDR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								CLASS			PRMBL_1				

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1111	Generic peripheral with IMPLEMENTATION DEFINED register layout.

Other values are defined by the CoreSight Architecture.

This field reads as 0xF.

PRMBL_1, bits [3:0]

Component identification preamble, segment 1.

Reads as 0b0000.

Access to this field is **RO**.

Accessing ERRCIDR1

ERRCIDR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFF4	ERRCIDR1

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRCIDR2, Component Identification Register 2

The ERRCIDR2 characteristics are:

Purpose

Provides discovery information about the component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.
ERRCIDR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				
RES0																								PRMBL_2											

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Component identification preamble, segment 2.
Reads as 0x05.
Access to this field is **RO**.

Accessing ERRCIDR2

ERRCIDR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFF8	ERRCIDR2

Accesses on this interface are **RO**.

ERRCIDR3, Component Identification Register 3

The ERRCIDR3 characteristics are:

Purpose

Provides discovery information about the component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.
ERRCIDR3 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																PRMBL_3															

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Component identification preamble, segment 3.
Reads as 0xB1.
Access to this field is **RO**.

Accessing ERRCIDR3

ERRCIDR3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFFC	ERRCIDR3

Accesses on this interface are **RO**.

ERRCRICR0, Critical Error Interrupt Configuration Register 0

The ERRCRICR0 characteristics are:

Purpose

Critical Error Interrupt configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR0 are RES0.

ERRCRICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR0 is a 64-bit register.

Field descriptions

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0								ADDR																								
ADDR																															RES0	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRCRICR0.ADDR << 2) is the address that the component writes to when signaling the Critical Error Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED

ERRCRICR1, Critical Error Interrupt Configuration Register 1

The ERRCRICR1 characteristics are:

Purpose

Critical Error Interrupt configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR1 are RES0.

ERRCRICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR1 is a 32-bit register.

Field descriptions

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRCRICR1

ERRCRICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEA8	ERRCRICR1

Accesses on this interface are **RW**.

ERRCRICR2, Critical Error Interrupt Configuration Register 2

The ERRCRICR2 characteristics are:

Purpose

Critical Error Interrupt control and configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR2 are RES0.

ERRCRICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR2 is a 32-bit register.

Field descriptions

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
											RES0												IRQEN		NSMSI		SH		MemAttr		

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRCRICR2:

Security attribute. Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Secure.
0b1	Non-secure.

The reset behaviour of this field is:

- On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRCRICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Not shared.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when ERRCRICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

MemAttr	Meaning
0b0000	Device-nGnRnE memory.
0b0001	Device-nGnRE memory.
0b0010	Device-nGRE memory.
0b0011	Device-GRE memory.
0b0101	Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111	Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001	Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010	Normal memory, Inner Write-Through, Outer Write-Through.
0b1011	Normal memory, Inner Write-Back, Outer Write-Through.
0b1101	Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110	Normal memory, Inner Write-Through, Outer Write-Back.
0b1111	Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRCRICR2

ERRCRICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEAC	ERRCRICR2

Accesses on this interface are **RW**.

ERRDEVAFF, Device Affinity Register

The ERRDEVAFF characteristics are:

Purpose

For a group of error records that has affinity with a single PE or a group of PEs, ERRDEVAFF is a copy of [MPIDR_EL1](#) or part of [MPIDR_EL1](#):

- If the group of error records has affinity with a single PE, the affinity level is 0, ERRDEVAFF reads the same value as [MPIDR_EL1](#), and ERRDEVAFF.F0V reads-as-one to indicate affinity level 0.
- If the group of error records has affinity with a group of PEs, the affinity level is 1, 2, or 3, parts of ERRDEVAFF reads the same value as parts of [MPIDR_EL1](#), and the rest of ERRDEVAFF indicates the level.

For example, if the group of PEs is a subset of the PEs at affinity level 1 then all of the following are true:

- All the PEs in the group have the same values in [MPIDR_EL1](#).{Aff3,Aff2}, and these values are equal to ERRDEVAFF.{Aff3,Aff2}.
- ERRDEVAFF.Aff1 is nonzero and not 0x80, and ERRDEVAFF.{Aff0,F0V} read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the group of error records has affinity with is indicated by the least-significant set bit in ERRDEVAFF.Aff1. In this example, if ERRDEVAFF.Aff1[2:0] is 0b100, then the group of error records has affinity with the up-to 8 PEs that have [MPIDR_EL1](#).Aff1[7:3] == ERRDEVAFF.Aff1[7:3].

If RAS System Architecture v1.1 is not implemented, ERRDEVAFF can only describe a group of error records that is affine with a single PE or all the PEs at an affinity level.

Configuration

This register is present only when the group of error records has affinity with a PE or cluster of PEs. Otherwise, direct accesses to ERRDEVAFF are RES0.

ERRDEVAFF is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVAFF is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32			
RES0																								Aff3										
F0V	U	RES0								MT	Aff2								Aff1								Aff0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

PE affinity level 3. The [MPIDR_EL1](#).Aff3 field, viewed from the highest Exception level of the associated PE or PEs.

F0V, bit [31]

Indicates that the ERRDEVAFF.Aff0 field is valid.

F0V	Meaning
0b0	ERRDEVAFF.Aff0 is not valid, and the PE affinity is above level 0 or a subset of level 0.
0b1	ERRDEVAFF.Aff0 is valid, and the PE affinity is at level 0.

U, bit [30]

When **ERRDEVAFF.F0V == 1**:

Uniprocessor. The [MPIDR_EL1](#).U field, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

When **ERRDEVAFF.F0V == 1**:

Multithreaded. The [MPIDR_EL1](#).MT field, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Aff2, bits [23:16]

When affine with a PE or PEs at affinity level 2 or below:

PE affinity level 2. The [MPIDR_EL1](#).Aff2 field, viewed from the highest Exception level of the associated PE or PEs.

When affine with a sub-set of PEs at affinity level 2:

PE affinity level 2. Defines part of the [MPIDR_EL1](#).Aff2 field, viewed from the highest Exception level of the associated PEs.

Aff2	Meaning
0bxxxxxxx1	ERRDEVAFF.Aff2[7:1] is the value of MPIDR_EL1 .Aff2[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	ERRDEVAFF.Aff2[7:2] is the value of MPIDR_EL1 .Aff2[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	ERRDEVAFF.Aff2[7:3] is the value of MPIDR_EL1 .Aff2[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	ERRDEVAFF.Aff2[7:4] is the value of MPIDR_EL1 .Aff2[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	ERRDEVAFF.Aff2[7:5] is the value of MPIDR_EL1 .Aff2[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	ERRDEVAFF.Aff2[7:6] is the value of MPIDR_EL1 .Aff2[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	ERRDEVAFF.Aff2[7] is the value of MPIDR_EL1 .Aff2[7], viewed from the highest Exception level of the associated PEs.

Otherwise:

PE affinity level 2. Indicates whether the PE affinity is at level 3.

Aff2	Meaning
0x80	PE affinity is at level 3.

All other values are reserved.

Aff1, bits [15:8]**When affine with a PE or PEs at affinity level 1 or below:**

PE affinity level 1. The [MPIDR_EL1](#).Aff1 field, viewed from the highest Exception level of the associated PE or PEs.

When affine with a sub-set of PEs at affinity level 1:

PE affinity level 1. Defines part of the [MPIDR_EL1](#).Aff1 field, viewed from the highest Exception level of the associated PEs.

Aff1	Meaning
0bxxxxxxx1	ERRDEVAFF.Aff1[7:1] is the value of MPIDR_EL1 .Aff1[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	ERRDEVAFF.Aff1[7:2] is the value of MPIDR_EL1 .Aff1[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	ERRDEVAFF.Aff1[7:3] is the value of MPIDR_EL1 .Aff1[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	ERRDEVAFF.Aff1[7:4] is the value of MPIDR_EL1 .Aff1[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	ERRDEVAFF.Aff1[7:5] is the value of MPIDR_EL1 .Aff1[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	ERRDEVAFF.Aff1[7:6] is the value of MPIDR_EL1 .Aff1[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	ERRDEVAFF.Aff1[7] is the value of MPIDR_EL1 .Aff1[7], viewed from the highest Exception level of the associated PEs.

Otherwise:

PE affinity level 1. Indicates whether the PE affinity is at level 2.

Aff1	Meaning
0x00	PE affinity is above level 2 or a subset of level 2.
0x80	PE affinity is at level 2.

Aff0, bits [7:0]**When affine with a PE at affinity level 0:**

PE affinity level 0. The [MPIDR_EL1](#).Aff0 field, viewed from the highest Exception level of the associated PE.

When affine with a sub-set of PEs at affinity level 0:

PE affinity level 0. Defines part of the [MPIDR_EL1](#).Aff0 field, viewed from the highest Exception level of the associated PEs.

Aff0	Meaning
0bxxxxxxx1	ERRDEVAFF.Aff0[7:1] is the value of MPIDR_EL1 .Aff0[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	ERRDEVAFF.Aff0[7:2] is the value of MPIDR_EL1 .Aff0[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	ERRDEVAFF.Aff0[7:3] is the value of MPIDR_EL1 .Aff0[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	ERRDEVAFF.Aff0[7:4] is the value of MPIDR_EL1 .Aff0[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	ERRDEVAFF.Aff0[7:5] is the value of MPIDR_EL1 .Aff0[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	ERRDEVAFF.Aff0[7:6] is the value of MPIDR_EL1 .Aff0[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	ERRDEVAFF.Aff0[7] is the value of MPIDR_EL1 .Aff0[7], viewed from the highest Exception level of the associated PEs.

Otherwise:

PE affinity level 0. Indicates whether the PE affinity is at level 1.

Aff0	Meaning
0x00	PE affinity is above level 1 or a subset of level 1.
0x80	PE affinity is at level 1.

Accessing ERRDEVAFF

ERRDEVAFF can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFA8	ERRDEVAFF

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

ERRDEVARCH, Device Architecture Register

The ERRDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

Configuration

ERRDEVARCH is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVARCH is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARCHITECT											PRESENT	REVISION				ARCHVER				ARCHPART											

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

ARCHITECT	Meaning
0b01000111011	JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

PRESENT, bit [20]

DEVARCH Present. Defines that the DEVARCH register is present.

PRESENT	Meaning
0b0	Device Architecture information not present.
0b1	Device Architecture information present.

This field reads as 1.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

REVISION	Meaning
0b0000	RAS System Architecture v1.0.
0b0001	RAS System Architecture v1.1. As 0b0000 and also: <ul style="list-style-type: none"> • Simplifies ERR<n>STATUS. • Adds support for additional ERR<n>MISC<m> registers. • Adds support for the optional RAS Timestamp Extension. • Adds support for the optional Common Fault Injection Model Extension.

All other values are reserved.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0000	RAS System Architecture v1.

All other values are reserved.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0b0000.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA00	RAS System Architecture.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA00.

Accessing ERRDEVARCH

ERRDEVARCH can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFBC	ERRDEVARCH

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRDEVID, Device Configuration Register

The ERRDEVID characteristics are:

Purpose

Provides discovery information for the component.

Configuration

ERRDEVID is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVID is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

NUM, bits [15:0]

Highest numbered index of the error records in this group, plus one. Each implemented record is owned by a node. A node might own multiple records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRDEVID

ERRDEVID can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFC8	ERRDEVID

Accesses on this interface are **RO**.

ERRERICR0, Error Recovery Interrupt Configuration Register 0

The ERRERICR0 characteristics are:

Purpose

Error Recovery Interrupt configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR0 are RES0.

ERRERICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR0 is a 64-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0								ADDR																								
ADDR																															RES0	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRERICR0.ADDR << 2) is the address that the component writes to when signaling the Error Recovery Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																															
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR0

ERRERICR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE90	ERRERICR0

Accesses on this interface are **RW**.

ERRERICR1, Error Recovery Interrupt Configuration Register 1

The ERRERICR1 characteristics are:

Purpose

Error Recovery Interrupt configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR1 are RES0.

ERRERICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR1 is a 32-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR1

ERRERICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE98	ERRERICR1

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRERICR2, Error Recovery Interrupt Configuration Register 2

The ERRERICR2 characteristics are:

Purpose

Error Recovery Interrupt control and configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR2 are RES0.

ERRERICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR2 is a 32-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
											RES0												IRQEN		NSMSI		SH	MemAttr			

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRERICR2:

Security attribute. Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Secure.
0b1	Non-secure.

The reset behaviour of this field is:

- On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRERICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Not shared.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when ERRERICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

MemAttr	Meaning
0b0000	Device-nGnRnE memory.
0b0001	Device-nGnRE memory.
0b0010	Device-nGRE memory.
0b0011	Device-GRE memory.
0b0101	Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111	Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001	Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010	Normal memory, Inner Write-Through, Outer Write-Through.
0b1011	Normal memory, Inner Write-Back, Outer Write-Through.
0b1101	Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110	Normal memory, Inner Write-Through, Outer Write-Back.
0b1111	Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR2

ERRERICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE9C	ERRERICR2

Accesses on this interface are **RW**.

ERRFHICR0, Fault Handling Interrupt Configuration Register 0

The ERRFHICR0 characteristics are:

Purpose

Fault Handling Interrupt configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR0 are RES0.

ERRFHICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR0 is a 64-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0								ADDR																							
ADDR																															RES0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRFHICR0.ADDR << 2) is the address that the component writes to when signaling the Fault Handling Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																															
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR0

ERRFHICR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE80	ERRFHICR0

Accesses on this interface are **RW**.

ERRFHICR1, Fault Handling Interrupt Configuration Register 1

The ERRFHICR1 characteristics are:

Purpose

Fault Handling Interrupt configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR1 are RES0.

ERRFHICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR1 is a 32-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR1

ERRFHICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE88	ERRFHICR1

Accesses on this interface are **RW**.

ERRFHICR2, Fault Handling Interrupt Configuration Register 2

The ERRFHICR2 characteristics are:

Purpose

Fault Handling Interrupt control and configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR2 are RES0.

ERRFHICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR2 is a 32-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
											RES0												IRQEN		NSMSI		SH		MemAttr		

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRFHICR2:

Security attribute. Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Secure.
0b1	Non-secure.

The reset behaviour of this field is:

- On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRFHICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Not shared.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when ERRFHICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

MemAttr	Meaning
0b0000	Device-nGnRnE memory.
0b0001	Device-nGnRE memory.
0b0010	Device-nGRE memory.
0b0011	Device-GRE memory.
0b0101	Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111	Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001	Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010	Normal memory, Inner Write-Through, Outer Write-Through.
0b1011	Normal memory, Inner Write-Back, Outer Write-Through.
0b1101	Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110	Normal memory, Inner Write-Through, Outer Write-Back.
0b1111	Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR2

ERRFHICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE8C	ERRFHICR2

Accesses on this interface are **RW**.

ERRGSR, Error Group Status Register

The ERRGSR characteristics are:

Purpose

Shows the status for the records in the group.

Configuration

ERRGSR is implemented only as part of a memory-mapped group of error records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

Attributes

ERRGSR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35
RES0								S55	S54	S53	S52	S51	S50	S49	S48	S47	S46	S45	S44	S43	S42	S41	S40	S39	S38	S37	S36	S35
S31	S30	S29	S28	S27	S26	S25	S24	S23	S22	S21	S20	S19	S18	S17	S16	S15	S14	S13	S12	S11	S10	S9	S8	S7	S6	S5	S4	S3
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3

Bits [63:56]

Reserved, RES0.

S<m>, bit [m], for m = 55 to 0

When error record <m> is implemented and error record <m> supports this type of reporting:

The status for error record <m>. A read-only copy of [ERR<m>STATUS.V](#).

S<m>	Meaning
0b0	No error.
0b1	One or more errors.

If the Common Fault Injection Model is implemented, up-to 24 records can be implemented meaning bits [55:24] are RES0.

Otherwise:

Reserved, RES0.

Accessing ERRGSR

ERRGSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE00	ERRGSR

Accesses on this interface are **RO**.

ERRIIDR, Implementation Identification Register

The ERRIIDR characteristics are:

Purpose

Defines the implementer of the component.

Configuration

Implementation of this register is OPTIONAL.

This register is present only when RAS System Architecture v1.1 is implemented.

Attributes

ERRIIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ProductID												Variant				Revision				Implementer											

ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

If [ERRPIDR0](#) and [ERRPIDR1](#) are implemented, [ERRPIDR0](#).PART_0 matches bits [7:0] of ERRIIDR.ProductID and [ERRPIDR1](#).PART_1 matches bits [11:8] of ERRIIDR.ProductID.

Variant, bits [19:16]

Component major revision.

This field distinguishes product variants or major revisions of the product.

If [ERRPIDR2](#) is implemented, [ERRPIDR2](#).REVISION matches ERRIIDR.Variant.

Revision, bits [15:12]

Component minor revision.

This field distinguishes minor revisions of the product.

If [ERRPIDR3](#) is implemented, [ERRPIDR3](#).REVAND matches ERRIIDR.Revision.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the RAS component. For an Arm implementation, this field has the value 0x43B.

Bits [11:8] contain the JEP106 continuation code of the implementer, and bits [6:0] contain the JEP106 identity code of the implementer. Bit 7 is RES0.

If [ERRPIDR4](#) is implemented, [ERRPIDR2](#) is implemented, and [ERRPIDR1](#) is implemented, [ERRPIDR4](#).DES_2 matches bits [11:8] of ERRIIDR.Implementer, [ERRPIDR2](#).DES_1 matches bits [6:4] of ERRIIDR.Implementer, and [ERRPIDR1](#).DES_0 matches bits [3:0] of ERRIIDR.Implementer.

Accessing ERRIIDR

ERRIIDR can be accessed through the memory-mapped interfaces:

Component	Offset
RAS	0xE10

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

ERRIMPDEF<n>, IMPLEMENTATION DEFINED Register <n>, n = 0 - 191

The ERRIMPDEF<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED RAS extensions.

Configuration

This register is present only when the Common Fault Injection Model Extension is not implemented, ERRDEVID.NUM <= 32 and an implementation implements ERRIMPDEF<n>. Otherwise, direct accesses to ERRIMPDEF<n> are RES0.

Attributes

ERRIMPDEF<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ERRIRQCR<n>, Generic Error Interrupt Configuration Register, n = 0 - 15

The ERRIRQCR<n> characteristics are:

Purpose

The ERRIRQCR<n> registers are reserved for IMPLEMENTATION DEFINED interrupt configuration registers.

The architecture provides a recommended layout for the ERRIRQCR<n> registers. These registers are named:

- [ERRFHICR0](#), [ERRFHICR1](#), and [ERRFHICR2](#) for the fault handling interrupt controls.
- [ERRERICR0](#), [ERRERICR1](#), and [ERRERICR2](#) for the error recovery interrupt controls.
- [ERRCRICR0](#), [ERRCRICR1](#), and [ERRCRICR2](#) for the critical error interrupt controls.
- [ERRIRQSR](#) for the status register.

This section describes the generic, IMPLEMENTATION DEFINED, format.

Configuration

This register is present only when the interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQCR<n> are RES0.

ERRIRQCR<n> is implemented only as part of a memory-mapped group of error records.

Attributes

ERRIRQCR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																															
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED controls. The content of these registers is IMPLEMENTATION DEFINED.

Accessing ERRIRQCR<n>

ERRIRQCR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE80 + (8 * n)	ERRIRQCR<n>

Accesses on this interface are **RW**.

ERRIRQSR, Error Interrupt Status Register

The ERRIRQSR characteristics are:

Purpose

Interrupt status register.

Configuration

This register is present only when interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQSR are RES0.

ERRIRQSR is implemented only as part of a memory-mapped group of error records.

Attributes

ERRIRQSR is a 64-bit register.

Field descriptions

When the implementation uses the recommended layout for the ERRIRQCR<n> registers:

Bits [63:6]

Reserved, RES0.

CRIERR, bit [5]

When the Critical Error Interrupt is implemented:

Critical Error Interrupt Error.

CRIERR	Meaning
0b0	Critical Error Interrupt write has not returned an error since this field was last cleared to zero.
0b1	Critical Error Interrupt write has returned an error since this field was last cleared to zero.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CRI, bit [4]**When the Critical Error Interrupt is implemented:**

Critical Error Interrupt write in progress.

CRI	Meaning
0b0	Critical Error Interrupt write not in progress.
0b1	Critical Error Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual [ERR<n>STATUS](#) registers.

Access to this field is **RO**.**Otherwise:**

Reserved, RES0.

ERIERR, bit [3]**When the Error Recovery Interrupt is implemented:**

Error Recovery Interrupt Error.

ERIERR	Meaning
0b0	Error Recovery Interrupt write has not returned an error since this field was last cleared to zero.
0b1	Error Recovery Interrupt write has returned an error since this field was last cleared to zero.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1C**.**Otherwise:**

Reserved, RES0.

ERI, bit [2]**When the Error Recovery Interrupt is implemented:**

Error Recovery Interrupt write in progress.

ERI	Meaning
0b0	Error Recovery Interrupt write not in progress.
0b1	Error Recovery Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual [ERR<n>STATUS](#) registers.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

FHIERR, bit [1]

When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt Error.

FHIERR	Meaning
0b0	Fault Handling Interrupt write has not returned an error since this field was last cleared to zero.
0b1	Fault Handling Interrupt write has returned an error since this field was last cleared to zero.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

FHI, bit [0]

When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt write in progress.

FHI	Meaning
0b0	Fault Handling Interrupt write not in progress.
0b1	Fault Handling Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual [ERR<n>STATUS](#) registers.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRIRQSR

ERRIRQSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEF8	ERRIRQSR

Accesses on this interface are **RW**.

ERR<n>ADDR, Error Record Address Register, n = 0 - 65534

The ERR<n>ADDR characteristics are:

Purpose

If an address is associated with a detected error, then it is written to ERR<n>ADDR when the error is recorded. It is IMPLEMENTATION DEFINED how the recorded address maps to the software-visible physical address. Software might have to reconstruct the actual physical addresses using the identity of the node and knowledge of the system.

Configuration

This register is present only when error record <n> is implemented and error record <n> includes an address associated with an error. Otherwise, direct accesses to ERR<n>ADDR are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

Attributes

ERR<n>ADDR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NS	SI	AI	VA	NSE	RES0		PADDR																								
PADDR																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NS, bit [63]

When FEAT_RME is implemented:

Non-secure attribute. With ERR<n>ADDR.NSE, indicates the physical address space of the recorded location.

NS	Meaning
0b0	When ERR<n>ADDR.NSE == 0: ERR<n>ADDR.PADDR is a Secure address. When ERR<n>ADDR.NSE == 1: ERR<n>ADDR.PADDR is a Root address.
0b1	When ERR<n>ADDR.NSE == 0: ERR<n>ADDR.PADDR is a Non-secure address. When ERR<n>ADDR.NSE == 1: ERR<n>ADDR.PADDR is a Realm address.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RME is not implemented:

Non-secure attribute.

NS	Meaning
0b0	ERR<n>ADDR.PADDR is a Secure address.
0b1	ERR<n>ADDR.PADDR is a Non-secure address.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SI, bit [62]

When FEAT_RME is implemented:

Secure Incorrect. Indicates whether ERR<n>ADDR.{NS, NSE} are valid.

SI	Meaning
0b0	ERR<n>ADDR.{NS, NSE} are correct. That is, they match the programmers' view of the physical address space for the recorded location.
0b1	ERR<n>ADDR.{NS, NSE} might not be correct, and might not match the programmers' view of the physical address space for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RME is not implemented:

Secure Incorrect. Indicates whether ERR<n>ADDR.NS is valid.

SI	Meaning
0b0	ERR<n>ADDR.NS is correct. That is, it matches the programmers' view of the Non-secure attribute for the recorded location.
0b1	ERR<n>ADDR.NS might not be correct, and might not match the programmers' view of the Non-secure attribute for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AI, bit [61]

Address Incorrect. Indicates whether ERR<n>ADDR.PADDR is a valid physical address that is known to match the programmers' view of the physical address for the recorded location.

AI	Meaning
0b0	ERR<n>ADDR.PADDR is a valid physical address. That is, it matches the programmers' view of the physical address for the recorded location.
0b1	ERR<n>ADDR.PADDR might not be a valid physical address, and might not match the programmers' view of the physical address for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

VA, bit [60]

Virtual Address. Indicates whether ERR<n>ADDR.PADDR field is a virtual address.

VA	Meaning
0b0	ERR<n>ADDR.PADDR is not a virtual address.
0b1	ERR<n>ADDR.PADDR is a virtual address.

No context information is provided for the virtual address. When ERR<n>ADDR.VA is 1, ERR<n>ADDR.{NS, SI, AI} read as {0, 1, 1}.

Support for this field is optional. If this field is not implemented and ERR<n>ADDR.PADDR field is a virtual address, then ERR<n>ADDR.{NS, SI, AI} read as {0, 1, 1}.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [59]

When FEAT_RME is implemented:

Physical Address Space. Together with ERR<n>ADDR.NS, indicates the address space for ERR<n>ADDR.PADDR.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [58:56]

Reserved, RES0.

PADDR, bits [55:0]

Physical Address. Address of the recorded location. If the physical address size implemented by this component is smaller than the size of this field, then high-order bits are unimplemented and either RES0 or have a fixed read-only IMPLEMENTATION DEFINED value. Low-order address bits might also be unimplemented and RES0, for example, if the physical address is always aligned to the size of a protection granule.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing ERR<n>ADDR

ERR<n>ADDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x018 + (64 * n)	ERR<n>ADDR

This interface is accessible as follows:

- When the Common Fault Injection Model Extension is implemented by the node that owns this error record, ERR<q>PFGF.AV == 0 and ERR<n>STATUS.AV == 1 accesses to this register are **RO**.
- When the Common Fault Injection Model Extension is not implemented by the node that owns this error record and ERR<n>STATUS.AV == 1 accesses to this register are **RO**.
- Otherwise accesses to this register are **RW**.

ERR<n>CTLR, Error Record Control Register, n = 0 - 65534

The ERR<n>CTLR characteristics are:

Purpose

The error control register contains enable bits for the node that writes to this record:

- Enabling error detection and correction.
- Enabling the critical error, error recovery, and fault handling interrupts.
- Enabling in-band error response for uncorrected errors.

For each bit, if the node does not support the feature, then the bit is RES0. The definition of each record is IMPLEMENTATION DEFINED.

Configuration

This register is present only when error record <n> is implemented and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>CTLR are RES0.

[ERR<n>FR](#) describes the features implemented by the node.

Attributes

ERR<n>CTLR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33							
IMPLEMENTATION DEFINED																																					
RES0																			CI	RES0	WDUI	Bit[10]	WCFL	Bit[8]	WUE	WFI	WUI	Bit[4]	Bit[3]	Bit[2]	IMPLEMENTATION DEFINED						
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1							

IMPLEMENTATION DEFINED, bits [63:32]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

Bits [31:14]

Reserved, RES0.

CI, bit [13]

When ERR<n>FR.CI == 0b10:

Critical error interrupt enable. When enabled, the critical error interrupt is generated for a critical error condition.

CI	Meaning
0b0	Critical error interrupt not generated for critical errors. Critical errors are treated as Uncontained errors.
0b1	Critical error interrupt generated for critical errors.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [12]

Reserved, RES0.

WDUI, bit [11]

When **ERR<n>FR.DUI == 0b11:**

Error recovery interrupt for Deferred errors on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on writes.

WDUI	Meaning
0b0	Error recovery interrupt not generated for Deferred errors on writes.
0b1	Error recovery interrupt generated for Deferred errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DUI, bit [10]

When **ERR<n>FR.DUI == 0b10:**

Error recovery interrupt for Deferred errors enable.

When [ERR<n>FR.DUI == 0b10](#), this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Deferred error.

DUI	Meaning
0b0	Error recovery interrupt not generated for Deferred errors.
0b1	Error recovery interrupt generated for Deferred errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When **ERR<n>FR.DUI == 0b11:**

Error recovery interrupt for Deferred errors on reads enable.

When [ERR<n>FR.DUI == 0b11](#), this field is named RDUI.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on reads.

RDUI	Meaning
0b0	Error recovery interrupt not generated for Deferred errors on reads.
0b1	Error recovery interrupt generated for Deferred errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WCFI, bit [9]

When **ERR<n>FR.CFI == 0b11**:

Fault handling interrupt for Corrected errors on writes enable.

When enabled:

- If the node implements Corrected error counters for writes, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see [ERR<n>MISC0](#).
- Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on writes.

WCFI	Meaning
0b0	Fault handling interrupt not generated for Corrected errors on writes.
0b1	Fault handling interrupt generated for Corrected errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CFI, bit [8]

When **ERR<n>FR.CFI == 0b10**:

Fault handling interrupt for Corrected errors enable.

When [ERR<n>FR.CFI == 0b10](#), this control applies to errors arising from both reads and writes.

When enabled:

- If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see [ERR<n>MISC0](#).
- Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error.

CFI	Meaning
0b0	Fault handling interrupt not generated for Corrected errors.
0b1	Fault handling interrupt generated for Corrected errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.CFI == 0b11:

Fault handling interrupt for Corrected errors on reads enable.

When [ERR<n>FR.CFI](#) == 0b11, this field is named RCFI.

When enabled:

- If the node implements Corrected error counters for reads, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see [ERR<n>MISC0](#).
- Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on reads.

RCFI	Meaning
0b0	Fault handling interrupt not generated for Corrected errors on reads.
0b1	Fault handling interrupt generated for Corrected errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUE, bit [7]

When ERR<n>FR.UE == 0b11:

In-band error response on writes enable.

When enabled, responses to writes that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

WUE	Meaning
0b0	In-band error response for uncorrected errors on writes disabled.
0b1	In-band error response for uncorrected errors on writes enabled.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WFI, bit [6]

When ERR<n>FR.FI == 0b11:

Fault handling interrupt on writes enable.

When enabled:

- The fault handling interrupt is generated for errors recorded as either Deferred error or Uncorrected error on writes.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
 - If the node implements Corrected error counters for writes, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
 - Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on writes.

WFI	Meaning
0b0	Fault handling interrupt on writes disabled.
0b1	Fault handling interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUI, bit [5]

When **ERR<n>FR.UI == 0b11**:

Uncorrected error recovery interrupt on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on writes.

WUI	Meaning
0b0	Error recovery interrupt on writes disabled.
0b1	Error recovery interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UE, bit [4]

When **ERR<n>FR.UE == 0b10**:

In-band error response enable.

When [ERR<n>FR.UE == 0b10](#), this control applies to errors arising from both reads and writes.

When enabled, responses to transactions that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

UE	Meaning
0b0	In-band error response for uncorrected errors disabled.
0b1	In-band error response for uncorrected errors enabled.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.UE == 0b11:

In-band error response on reads enable.

When [ERR<n>FR.UE](#) == 0b11, this field is named RUE.

When enabled, responses to reads that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

RUE	Meaning
0b0	In-band error response for uncorrected errors on reads disabled.
0b1	In-band error response for uncorrected errors on reads enabled.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FI, bit [3]**When ERR<n>FR.FI == 0b10:**

Fault handling interrupt enable.

When [ERR<n>FR.FI](#) == 0b10, this control applies to errors arising from both reads and writes.

When enabled:

- The fault handling interrupt is generated for all errors recorded as either Deferred error or Uncorrected error.
- If the fault handling interrupt for Corrected errors control is not implemented:
 - If the node implements Corrected error counters, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
 - Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error.

FI	Meaning
0b0	Fault handling interrupt disabled.
0b1	Fault handling interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.FI == 0b11:

Fault handling interrupt on reads enable.

When [ERR<n>FR.FI](#) == 0b11, this field is named RFI.

When enabled:

- The fault handling interrupt is generated for errors recorded as either Deferred error or Uncorrected error on reads.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
 - If the node implements Corrected error counters for reads, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
 - Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on reads.

RFI	Meaning
0b0	Fault handling interrupt on reads disabled.
0b1	Fault handling interrupt on reads enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UI, bit [2]

When **ERR<n>FR.UI == 0b10:**

Uncorrected error recovery interrupt enable.

When **ERR<n>FR.UI == 0b10**, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Uncorrected error.

UI	Meaning
0b0	Error recovery interrupt disabled.
0b1	Error recovery interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When **ERR<n>FR.UI == 0b11:**

Uncorrected error recovery interrupt on reads enable.

When **ERR<n>FR.UI == 0b11**, this field is named RUI.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on reads.

RUI	Meaning
0b0	Error recovery interrupt on reads disabled.
0b1	Error recovery interrupt on reads enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMPLEMENTATION DEFINED, bit [1]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

ED, bit [0]

When ERR<n>FR.ED == 0b10:

Error reporting and logging enable. When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an IMPLEMENTATION DEFINED control for error injection.

ED	Meaning
0b0	Error reporting disabled.
0b1	Error reporting enabled.

It is IMPLEMENTATION DEFINED whether the node fully disables error detection and correction when reporting is disabled. That is, even with error reporting disabled, the node might continue to silently correct errors. Uncorrected errors might result in corrupt data being silently propagated by the node.

Note

If this node requires initialization after Cold reset to prevent signaling false errors, then Arm recommends this field is set to 0 on Cold reset, meaning errors are not reported from Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error reporting after the node is initialized. Otherwise, the Cold reset value is IMPLEMENTATION DEFINED. If the Cold reset value is 1, the reset values of other controls in this register are also IMPLEMENTATION DEFINED and should not be UNKNOWN.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

Accessing ERR<n>CTLR

ERR<n>CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	$0 \times 008 + (64 * n)$	ERR<n>CTLR

Accesses on this interface are **RW**.

ERR<n>FR, Error Record Feature Register, n = 0 - 65534

The ERR<n>FR characteristics are:

Purpose

Defines whether <n> is the first record owned by a node:

- If <n> is the first error record owned by a node, then ERR<n>FR.ED is not 0b00.
- If <n> is not the first error record owned by a node, then ERR<n>FR.ED is 0b00.

If <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.

Attributes

ERR<n>FR is a 64-bit register.

Field descriptions

When error record <n> is not the first error record owned by the node:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:2]

Reserved, RES0.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is not the first error record owned the node.

ED	Meaning
0b00	Error record <n> is not the first error record owned by the node.

This field reads as 0b00.

When error record <n> is the first error record owned by the node:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED										CE	DE	UE	OU	ER	UE	UC	IMPLEMENTATION DEFINED														
FRX	RES0					TS	CI	INJ	CEO				DUI	RP	CEC	CFI	UE	FI	UI	IMPLEMENTATION DEFINED					ED						
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IMPLEMENTATION DEFINED, bits [63:55]**When ERR<n>FR.FRX != 1:**

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

CE, bits [54:53]**When ERR<n>FR.FRX == 1:**

Corrected Error recording. Describes the types of Corrected errors the node can record, if any.

CE	Meaning
0b00	Does not record Corrected errors.
0b01	Records only transient or persistent Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to either 0b01 or 0b11.
0b10	Records only non-specific Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to 0b10.
0b11	Records all types of Corrected error.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

DE, bit [52]**When ERR<n>FR.FRX == 1:**

Deferred Error recording. Describes whether the node supports recording Deferred errors.

DE	Meaning
0b0	Does not record Deferred errors.
0b1	Records Deferred errors.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UEO, bit [51]**When ERR<n>FR.FRX == 1:**

Latent or Restartable Error recording. Describes whether the node supports recording Latent or Restartable errors.

UEO	Meaning
0b0	Does not record Latent or Restartable errors.
0b1	Records Latent or Restartable errors.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UER, bit [50]**When ERR<n>FR.FRX == 1:**

Signaled or Recoverable Error recording. Describes whether the node supports recording Signaled or Recoverable errors.

UER	Meaning
0b0	Does not record Signaled or Recoverable errors.
0b1	Records Signaled or Recoverable errors.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UEU, bit [49]**When ERR<n>FR.FRX == 1:**

Unrecoverable Error recording. Describes whether the node supports recording Unrecoverable errors.

UEU	Meaning
0b0	Does not record Unrecoverable errors.
0b1	Records Unrecoverable errors.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UC, bit [48]**When ERR<n>FR.FRX == 1:**

Uncontainable Error recording. Describes whether the node supports recording Uncontainable errors.

UC	Meaning
0b0	Does not record Uncontainable errors.
0b1	Records Uncontainable errors.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

IMPLEMENTATION DEFINED, bits [47:32]

Reserved for identifying IMPLEMENTATION DEFINED controls.

FRX, bit [31]**When RAS System Architecture v1.1 is implemented:**

Feature Register extension. Defines whether ERR<n>FR[63:48] are architecturally defined.

FRX	Meaning
0b0	ERR<n>FR[63:48] are IMPLEMENTATION DEFINED.
0b1	ERR<n>FR[63:48] are defined by the architecture.

Otherwise:

Reserved, RES0.

Bits [30:26]

Reserved, RES0.

TS, bits [25:24]

Timestamp Extension. Indicates whether, for each error record <m> owned by this node, [ERR<m>MISC3](#) is used as the timestamp register, and, if it is, the timebase used by the timestamp.

TS	Meaning
0b00	Does not support a timestamp register.
0b01	Implements a timestamp register in ERR<n>MISC3 for each error record <m> owned by the node. The timestamp uses the same timebase as the system Generic Timer.
Note For an error record that has an affinity to a PE, this is the same timer that is visible through CNTPCT_ELO at the highest Exception level on that PE.	
0b10	Implements a timestamp register in ERR<m>MISC3 for each error record <m> owned by the node. The timestamp uses an IMPLEMENTATION DEFINED timebase.

All other values are reserved.

CI, bits [23:22]

Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented by the node.

CI	Meaning
0b00	Does not support the critical error interrupt. ERR<n>CTLR.CI is RES0.
0b01	Critical error interrupt is supported and always enabled. ERR<n>CTLR.CI is RES0.
0b10	Critical error interrupt is supported and controllable using ERR<n>CTLR.CI .

All other values are reserved.

INJ, bits [21:20]

Fault Injection Extension. Indicates whether the Common Fault Injection Model Extension is implemented by the node.

INJ	Meaning
0b00	Does not support the Common Fault Injection Model Extension.
0b01	Supports the Common Fault Injection Model Extension. See ERR<n>PFGF for more information.

All other values are reserved.

CEO, bits [19:18]When [ERR<n>FR.CEC](#) != 0b000:

Corrected Error overwrite. Indicates the behavior of the node when a second or subsequent Corrected error is recorded and a first Corrected error has previously been recorded by an error record <m> owned by the node.

CEO	Meaning
0b00	Keeps the previous error syndrome.
0b01	If ERR<m>STATUS.OF is 1 before the Corrected error is counted, then the error record keeps the previous syndrome. Otherwise the previous syndrome is overwritten.

All other values are reserved.

The second or subsequent Corrected error is counted by the Corrected error counter, regardless of the value of this field. If counting the error causes unsigned overflow of the counter, then [ERR<m>STATUS.OF](#) is set to 1.

This means that, if no other error is subsequently recorded that overwrites the syndrome:

- If ERR<n>FR.CEO is 0b00, the error record holds the syndrome for the first recorded Corrected error.
- If ERR<n>FR.CEO is 0b01, the error record holds the syndrome for the most recently recorded Corrected error before the counter overflows.

Otherwise:

Reserved, RES0.

DUI, bits [17:16]

When ERR<n>FR.UI != 0b00:

Error recovery interrupt for deferred errors control. Indicates whether the enabling and disabling of error recovery interrupts on deferred errors is supported by the node.

DUI	Meaning
0b00	Does not support the enabling and disabling of error recovery interrupts on deferred errors. ERR<n>CTLR.DUI is RES0.
0b10	Enabling and disabling of error recovery interrupts on deferred errors is supported and controllable using ERR<n>CTLR.DUI .
0b11	Enabling and disabling of error recovery interrupts on deferred errors is supported, and controllable using ERR<n>CTLR.WDUI for writes and ERR<n>CTLR.RDUI for reads.

All other values are reserved.

Otherwise:

Reserved, RES0.

RP, bit [15]

When ERR<n>FR.CEC != 0b000:

Repeat counter. Indicates whether the node implements a second Corrected error counter in [ERR<m>MISC0](#) for each error record <m> owned by the node that can record countable errors.

RP	Meaning
0b0	Implements a single Corrected error counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.
0b1	Implements a first (repeat) counter and a second (other) counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors. The repeat counter is the same size as the primary error counter.

Otherwise:

Reserved, RES0.

CEC, bits [14:12]

Corrected Error Counter. Indicates whether the node implements the standard Corrected error counter mechanisms in [ERR<m>MISC0](#) for each error record <m> owned by the node that can record countable errors.

CEC	Meaning
0b000	Does not implement the standard Corrected error counter model.
0b010	Implements an 8-bit Corrected error counter in ERR<m>MISC0 [39:32] for each error record <m> owned by the node that can record countable errors.
0b100	Implements a 16-bit Corrected error counter in ERR<m>MISC0 [47:32] for each error record <m> owned by the node that can record countable errors.

All other values are reserved.

Note

Implementations might include other error counter models, or might include the standard model and not indicate this in ERR<n>FR.

CFI, bits [11:10]

When ERR<n>FR.FI != 0b00:

Fault handling interrupt for corrected errors control. Indicates whether the enabling and disabling of fault handling interrupts on corrected errors is supported by the node.

CFI	Meaning
0b00	Does not support the enabling and disabling of fault handling interrupts on corrected errors. ERR<n>CTLR .CFI is RES0.
0b10	Enabling and disabling of fault handling interrupts on corrected errors is supported and controllable using ERR<n>CTLR .CFI.
0b11	Enabling and disabling of fault handling interrupts on corrected errors is supported, and controllable using ERR<n>CTLR .WCFI for writes and ERR<n>CTLR .RCFI for reads.

All other values are reserved.

Otherwise:

Reserved, RES0.

UE, bits [9:8]

In-band error response (External Abort). Indicates whether the in-band error response and associated controls are implemented by the node.

UE	Meaning
0b00	Does not support the in-band error response. ERR<n>CTLR .UE is RES0.
0b01	In-band error response is supported and always enabled. ERR<n>CTLR .UE is RES0.
0b10	In-band error response is supported and controllable using ERR<n>CTLR .UE.
0b11	In-band error response is supported, and controllable using ERR<n>CTLR .WUE for writes and ERR<n>CTLR .RUE for reads.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

FI, bits [7:6]

Fault handling interrupt. Indicates whether the fault handling interrupt and associated controls are implemented by the node.

FI	Meaning
0b00	Does not support the fault handling interrupt. ERR<n>CTLR.FI is RES0.
0b01	Fault handling interrupt is supported and always enabled. ERR<n>CTLR.FI is RES0.
0b10	Fault handling interrupt is supported and controllable using ERR<n>CTLR.FI .
0b11	Fault handling interrupt is supported, and controllable using ERR<n>CTLR.WFI for writes and ERR<n>CTLR.RFI for reads.

UI, bits [5:4]

Error recovery interrupt for uncorrected errors. Indicates whether the error handling interrupt and associated controls are implemented by the node.

UI	Meaning
0b00	Does not support the error handling interrupt. ERR<n>CTLR.UI is RES0.
0b01	Error handling interrupt is supported and always enabled. ERR<n>CTLR.UI is RES0.
0b10	Error handling interrupt is supported and controllable using ERR<n>CTLR.UI .
0b11	Error handling interrupt is supported, and controllable using ERR<n>CTLR.WUI for writes and ERR<n>CTLR.RUI for reads.

IMPLEMENTATION DEFINED, bits [3:2]

IMPLEMENTATION DEFINED.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is the first record owned the node, and whether the node implements the controls for enabling and disabling error reporting and logging.

ED	Meaning
0b01	Error reporting and logging always enabled. ERR<n>CTLR.ED is RES0.
0b10	Error reporting and logging is controllable using ERR<n>CTLR.ED .

All other values are reserved.

Accessing ERR<n>FR

ERR<n>FR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x000 + (64 * n)	ERR<n>FR

Accesses on this interface are **RO**.

ERR<n>MISC0, Error Record Miscellaneous Register 0, n = 0 - 65534

The ERR<n>MISC0 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record <n> implements architecturally-defined Corrected error counters ([ERR<q>FR.CEC](#) != 0b000), and error record <n> can record countable errors, then ERR<n>MISC0 implements the architecturally-defined Corrected error counter or counters.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC0 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC0, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>MISC0 is a 64-bit register.

Field descriptions

When ERR<q>FR.CEC == 0b000:

OFO, bit [63]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

OFO	Meaning
0b0	Other counter has not overflowed.
0b1	Other counter has overflowed.

A direct write that modifies this field might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [62:48]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [47]

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

OFR	Meaning
0b0	Repeat counter has not overflowed.
0b1	Repeat counter has overflowed.

A direct write that modifies this field might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [46:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b010 and ERR<q>FR.RP == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OFO, bit [47]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

OFO	Meaning
0b0	Other counter has not overflowed.
0b1	Other counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [46:40]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [39]

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

OFR	Meaning
0b0	Repeat counter has not overflowed.
0b1	Repeat counter has overflowed.

A direct write that modifies this field might indirectly set [ERR<n>STATUS.OF](#) to an UNKNOWN value and a direct write to [ERR<n>STATUS.OF](#) that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [38:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC0

Reads from ERR<n>MISC0 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and [ERR<q>PFGF.MV](#) is 1, then some parts of this register are read/write when [ERR<n>STATUS.MV](#) is 1. See [ERR<n>PFGF.MV](#) for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When [ERR<n>STATUS.MV](#) is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x020 + (64 * n)	ERR<n>MISC0

Accesses on this interface are **RW**.

ERR<n>MISC1, Error Record Miscellaneous Register 1, n = 0 - 65534

The ERR<n>MISC1 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC1 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC1, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>MISC1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ERR<n>MISC2, Error Record Miscellaneous Register 2, n = 0 - 65534

The ERR<n>MISC2 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configuration

This register is present only when (an implementation implements ERR<n>MISC2 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC2 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC2, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<n>MISC2 does not require zeroing to return the record to a quiescent state.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>MISC2 is a 64-bit register.

ERR<n>MISC3, Error Record Miscellaneous Register 3, n = 0 - 65534

The ERR<n>MISC3 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record n supports the RAS Timestamp Extension ([ERR<q>FR.TS](#) != 0b00), then ERR<n>MISC3 contains the timestamp value for error record n when the error was detected. Otherwise the contents of ERR<n>MISC3 are IMPLEMENTATION DEFINED.

Configuration

This register is present only when (an implementation implements ERR<n>MISC3 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC3 are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC3, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<n>MISC3 does not require zeroing to return the record to a quiescent state.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>MISC3 is a 64-bit register.

Field descriptions

When ERR<q>FR.TS != 0b00:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

TS, bits [63:0]

Timestamp. Timestamp value recorded when the error was detected. Valid only if [ERR<n>STATUS.V](#) == 1.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO** or **RW**.

When ERR<q>FR.TS == 0b00:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC3

Reads from ERR<n>MISC3 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and [ERR<q>PFGF.MV](#) is 1, then some parts of this register are read/write when [ERR<n>STATUS.MV](#) is 1. See [ERR<n>PFGF.MV](#) for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When [ERR<n>STATUS.MV](#) is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x038 + (64 * n)	ERR<n>MISC3

Accesses on this interface are **RW**.

ERR<n>PFGCDN, Pseudo-fault Generation Countdown Register, n = 0 - 65534

The ERR<n>PFGCDN characteristics are:

Purpose

Generates one of the errors enabled in the corresponding [ERR<n>PFGCTL](#) register.

Configuration

This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCDN are RES0.

[ERR<n>FR](#) describes the features implemented by the node.

Attributes

ERR<n>PFGCDN is a 64-bit register.

Field descriptions

Countdown value.

This field is copied to Error Generation Counter when either:

- Software writes [ERR<n>PFGCTL](#).CDNEN with 1.
- The Error Generation Counter decrements to zero and [ERR<n>PFGCTL](#).R == 1.

While [ERR<n>PFGCTL](#).CDNEN == 1 and the Error Generation Counter is nonzero, the counter decrements by 1 for each cycle at an IMPLEMENTATION DEFINED clock rate. When the counter reaches 0, one of the errors enabled in the [ERR<n>PFGCTL](#) register is generated.

Note

The current Error Generation Counter value is not visible to software.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing ERR<n>PFGCDN

ERR<n>PFGCDN can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	$0x810 + (64 * n)$	ERR<n>PFGCDN

Accesses on this interface are **RW**.

ERR<n>PFGCTL, Pseudo-fault Generation Control Register, n = 0 - 65534

The ERR<n>PFGCTL characteristics are:

Purpose

Enables controlled fault generation.

Configuration

This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCTL are RES0.

[ERR<n>FR](#) describes the features implemented by the node.

Attributes

ERR<n>PFGCTL is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0

Bits [63:32]

Reserved, RES0.

CDNEN, bit [31]

Countdown Enable. Controls transfers of the value held in [ERR<n>PFGCDN](#) to the Error Generation Counter and enables this counter.

CDNEN	Meaning
0b0	The Error Generation Counter is disabled.
0b1	The Error Generation Counter is enabled. On a write of 1 to this field, the Error Generation Counter is set to ERR<n>PFGCDN.CDN .

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

R, bit [30]

When the node supports this control:

Restart. Controls whether the Error Generation Counter restarts or stops counting on reaching zero.

R	Meaning
0b0	On reaching zero, the Error Generation Counter will stop counting.
0b1	On reaching zero, the Error Generation Counter is set to ERR<n>PFGCDN.CDN .

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:13]

Reserved, RES0.

Bit [12]

When the node always sets [ERR<n>STATUS.MV](#) to 0b1 when an injected error is recorded:

Reserved, RAO/WI.

When the node supports this control:

Miscellaneous syndrome. The value written to [ERR<n>STATUS.MV](#) when an injected error is recorded.

MV	Meaning
0b0	ERR<n>STATUS.MV is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.MV is set to 1 when an injected error is recorded.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

When the node always sets [ERR<n>STATUS.AV](#) to 0b1 when an injected error is recorded:

Reserved, RAO/WI.

When the node supports this control:

Address syndrome. The value written to [ERR<n>STATUS.AV](#) when an injected error is recorded.

AV	Meaning
0b0	ERR<n>STATUS.AV is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.AV is set to 1 when an injected error is recorded.

The reset behaviour of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PN, bit [10]**When the node supports this control:**

Poison flag. The value written to [ERR<n>STATUS](#).PN when an injected error is recorded.

PN	Meaning
0b0	ERR<n>STATUS .PN is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS .PN is set to 1 when an injected error is recorded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ER, bit [9]**When the node supports this control:**

Error Reported flag. The value written to [ERR<n>STATUS](#).ER when an injected error is recorded.

ER	Meaning
0b0	ERR<n>STATUS .ER is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS .ER is set to 1 when an injected error is recorded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CI, bit [8]**When the node supports this control:**

Critical Error flag. The value written to [ERR<n>STATUS](#).CI when an injected error is recorded.

CI	Meaning
0b0	ERR<n>STATUS .CI is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS .CI is set to 1 when an injected error is recorded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CE, bits [7:6]**When the node supports this control:**

Corrected Error generation enable. Controls the type of injected Corrected error generated by the fault injection feature of the node.

CE	Meaning
0b00	An injected Corrected error will not be generated by the fault injection feature of the node.
0b01	An injected non-specific Corrected error is generated in the fault injection state. ERR<n>STATUS .CE is set to 0b10 when the injected error is recorded.
0b10	An injected transient Corrected error is generated in the fault injection state. ERR<n>STATUS .CE is set to 0b01 when the injected error is recorded.
0b11	An injected persistent Corrected error is generated in the fault injection state. ERR<n>STATUS .CE is set to 0b11 when the injected error is recorded.

The set of permitted values for this field is defined by [ERR<n>PFGF](#).CE.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DE, bit [5]**When the node supports this control:**

Deferred Error generation enable. Controls whether an injected Deferred error is generated by the fault injection feature of the node.

DE	Meaning
0b0	An injected Deferred error will not be generated by the fault generation feature of the node.
0b1	An injected Deferred error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEO, bit [4]**When the node supports this control:**

Latent or Restartable Error generation enable. Controls whether an injected Latent or Restartable error is generated by the fault injection feature of the node.

UEO	Meaning
0b0	An injected Latent or Restartable error will not be generated by the fault generation feature of the node.
0b1	An injected Latent or Restartable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UER, bit [3]

When the node supports this control:

Signaled or Recoverable Error generation enable. Controls whether an injected Signaled or Recoverable error is generated by the fault injection feature of the node.

UER	Meaning
0b0	An injected Signaled or Recoverable error will not be generated by the fault generation feature of the node.
0b1	An injected Signaled or Recoverable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEU, bit [2]

When the node supports this control:

Unrecoverable Error generation enable. Controls whether an injected Unrecoverable error is generated by the fault injection feature of the node.

UEU	Meaning
0b0	An injected Unrecoverable error will not be generated by the fault generation feature of the node.
0b1	An injected Unrecoverable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UC, bit [1]**When the node supports this control:**

Uncontainable Error generation enable. Controls whether an injected Uncontainable error is generated by the fault injection feature of the node.

UC	Meaning
0b0	An injected Uncontainable error will not be generated by the fault generation feature of the node.
0b1	An injected Uncontainable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OF, bit [0]**When the node supports this control:**

Overflow flag. The value written to [ERR<n>STATUS](#).OF when an injected error is recorded.

OF	Meaning
0b0	ERR<n>STATUS .OF is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS .OF is set to 1 when an injected error is recorded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing ERR<n>PFGCTL**ERR<n>PFGCTL can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
RAS	0x808 + (64 * n)	ERR<n>PFGCTL

Accesses on this interface are **RW**.

ERR<n>PFGF, Pseudo-fault Generation Feature Register, n = 0 - 65534

The ERR<n>PFGF characteristics are:

Purpose

Defines which common architecturally-defined fault generation features are implemented.

Configuration

This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGF are RES0.

[ERR<n>FR](#) describes the features implemented by the node.

Attributes

ERR<n>PFGF is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																																	
RES0	R	SYN	NA	RES0														MV	AV	PN	ER	CI	CE	DE	UE	O	UE	R	UE	U	C	O	F
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

Bits [63:31]

Reserved, RES0.

R, bit [30]

Restartable. Support for Error Generation Counter restart mode.

R	Meaning
0b0	The node does not support this feature. ERR<n>PFGCTL.R is RES0.
0b1	Error Generation Counter restart mode is implemented and is controlled by ERR<n>PFGCTL.R . ERR<n>PFGCTL.R is a read/write field.

SYN, bit [29]

Syndrome. Fault syndrome injection.

SYN	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS .{IERR, SERR} to IMPLEMENTATION DEFINED values. ERR<n>STATUS .{IERR, SERR} are UNKNOWN when ERR<n>STATUS.V is 0.
0b1	When an injected error is recorded, the node does not update the ERR<n>STATUS .{IERR, SERR} fields. ERR<n>STATUS .{IERR, SERR} are writable when ERR<n>STATUS.V is 0.

Note

If ERR<n>PFGF.SYN is 1, software can write specific values into the [ERR<n>STATUS](#).{IERR, SERR} fields when setting up a fault injection event. The sets of values that can be written to these fields is IMPLEMENTATION DEFINED.

NA, bit [28]

No access required. Defines whether this component fakes detection of the error on an access to the component or spontaneously in the fault injection state.

NA	Meaning
0b0	The component fakes detection of the error on an access to the component.
0b1	The component fakes detection of the error spontaneously in the fault injection state.

Bits [27:13]

Reserved, RES0.

MV, bit [12]

Miscellaneous syndrome.

Additional syndrome injection. Defines whether software can control all or part of the syndrome recorded in the ERR<n>MISC<m> registers when an injected error is recorded.

MV	Meaning
0b0	When an injected error is recorded, the node might update ERR<n>MISC<m>. If any syndrome is recorded by the node in ERR<n>MISC<m>, then ERR<n>STATUS .MV is set to 1. ERR<n>PFGCTL .MV is RES0.
0b1	When an injected error is recorded, the node might update some, but not all ERR<n>MISC<m> syndrome fields, and updates ERR<n>STATUS .MV as follows: <ul style="list-style-type: none"> If any syndrome is recorded by the node in ERR<n>MISC<m>, then ERR<n>STATUS.MV is set to 1. Otherwise, ERR<n>STATUS.MV is set to ERR<n>PFGCTL.MV. <p>It is IMPLEMENTATION DEFINED which ERR<n>MISC<m> syndrome fields, if any, are updated. Some syndrome fields might always be updated by the node when an error is recorded. For example, a corrected error counter might always be updated when any countable error, including a countable injected error, is recorded. Other ERR<n>MISC<m> syndrome fields are not updated by the node and are writable when ERR<n>STATUS.MV is 0.</p> <p>If the node always sets ERR<n>STATUS.MV to 1 when recording an injected error then ERR<n>PFGCTL.MV is RAO/WI, otherwise ERR<n>PFGCTL.MV is a read/write field.</p>

Note

If ERR<n>PFGF.MV is 1, software can write specific additional syndrome values into the ERR<n>MISC<m> registers when setting up a fault injection event. The values that can be written to these registers are IMPLEMENTATION DEFINED.

AV, bit [11]

Address syndrome. Address syndrome injection.

AV	Meaning
0b0	When an injected error is recorded, the node either sets ERR<n>ADDR and ERR<n>STATUS .AV for the access, or leaves these unchanged. ERR<n>PFGCTL .AV is RES0.
0b1	When an injected error is recorded, the node does not update ERR<n>ADDR and does one of: <ul style="list-style-type: none"> Sets ERR<n>STATUS.AV to ERR<n>PFGCTL.AV. ERR<n>PFGCTL.AV is a read/write field. Sets ERR<n>STATUS.AV to 1. ERR<n>PFGCTL.AV is RAO/WI. ERR<n>ADDR is writable when ERR<n>STATUS .AV is 0.

Note

If ERR<n>PFGF.AV is 1, software can write a specific address value into [ERR<n>ADDR](#) when setting up a fault injection event.

PN, bit [10]

When the node supports this flag:

Poison flag. Describes how the fault generation feature of the node sets the [ERR<n>STATUS](#).PN status flag.

PN	Meaning
0b0	When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS .PN to 1. ERR<n>PFGCTL .PN is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS .PN is set to ERR<n>PFGCTL .PN. ERR<n>PFGCTL .PN is a read/write field.

This behavior replaces the architecture-defined rules for setting the [ERR<n>STATUS](#).PN bit.

Otherwise:

Reserved, RAZ.

ER, bit [9]

When the node supports this flag:

Error Reported flag. Describes how the fault generation feature of the node sets the [ERR<n>STATUS](#).ER status flag.

ER	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS .ER according to the architecture-defined rules for setting the ER field. ERR<n>PFGCTL .ER is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS .ER is set to ERR<n>PFGCTL .ER. This behavior replaces the architecture-defined rules for setting the ER bit. ERR<n>PFGCTL .ER is a read/write field.

Otherwise:

Reserved, RAZ.

CI, bit [8]

When the node supports this flag:

Critical Error flag. Describes how the fault generation feature of the node sets the [ERR<n>STATUS](#).CI status flag.

CI	Meaning
0b0	When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.CI to 1. ERR<n>PFGCTL.CI is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.CI is set to ERR<n>PFGCTL.CI . ERR<n>PFGCTL.CI is a read/write field.

This behavior replaces the architecture-defined rules for setting the [ERR<n>STATUS.CI](#) bit.

Otherwise:

Reserved, RAZ.

CE, bits [7:6]

When the node supports this type of error:

Corrected Error generation. Describes the types of Corrected error that the fault generation feature of the node can generate.

CE	Meaning
0b00	The fault generation feature of the node does not generate Corrected errors. ERR<n>PFGCTL.CE is RES0.
0b01	The fault generation feature of the node allows generation of a non-specific Corrected error, that is, a Corrected error that is recorded by setting ERR<n>STATUS.CE to 0b10. ERR<n>PFGCTL.CE is a read/write field. The values 0b10 and 0b11 in ERR<n>PFGCTL.CE are reserved.
0b11	The fault generation feature of the node allows generation of transient or persistent Corrected errors, that is, Corrected errors that are recorded by setting ERR<n>STATUS.CE to 0b01 or 0b11 respectively. ERR<n>PFGCTL.CE is a read/write field. The value 0b01 in ERR<n>PFGCTL.CE is reserved.

All other values are reserved.

If [ERR<n>FR.FRX](#) is 1, then [ERR<n>FR.CE](#) indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

DE, bit [5]

When the node supports this type of error:

Deferred Error generation. Describes whether the fault generation feature of the node can generate Deferred errors.

DE	Meaning
0b0	The fault generation feature of the node does not generate Deferred errors. ERR<n>PFGCTL.DE is RES0.
0b1	The fault generation feature of the node allows generation of Deferred errors. ERR<n>PFGCTL.DE is a read/write field.

If [ERR<n>FR.FRX](#) is 1, then [ERR<n>FR.DE](#) indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UEO, bit [4]**When the node supports this type of error:**

Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate Latent or Restartable errors.

UEO	Meaning
0b0	The fault generation feature of the node does not generate Latent or Restartable errors. ERR<n>PFGCTL .UEO is RES0.
0b1	The fault generation feature of the node allows generation of Latent or Restartable errors. ERR<n>PFGCTL .UEO is a read/write field.

If [ERR<n>FR](#).FRX is 1, then [ERR<n>FR](#).UEO indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UER, bit [3]**When the node supports this type of error:**

Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate Signaled or Recoverable errors.

UER	Meaning
0b0	The fault generation feature of the node does not generate Signaled or Recoverable errors. ERR<n>PFGCTL .UER is RES0.
0b1	The fault generation feature of the node allows generation of Signaled or Recoverable errors. ERR<n>PFGCTL .UER is a read/write field.

If [ERR<n>FR](#).FRX is 1, then [ERR<n>FR](#).UER indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UEU, bit [2]**When the node supports this type of error:**

Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate Unrecoverable errors.

UEU	Meaning
0b0	The fault generation feature of the node does not generate Unrecoverable errors. ERR<n>PFGCTL .UEU is RES0.
0b1	The fault generation feature of the node allows generation of Unrecoverable errors. ERR<n>PFGCTL .UEU is a read/write field.

If [ERR<n>FR](#).FRX is 1, then [ERR<n>FR](#).UEU indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UC, bit [1]**When the node supports this type of error:**

Uncontainable Error generation. Describes whether the fault generation feature of the node can generate Uncontainable errors.

UC	Meaning
0b0	The fault generation feature of the node does not generate Uncontainable errors. ERR<n>PFGCTL .UC is RES0.
0b1	The fault generation feature of the node allows generation of Uncontainable errors. ERR<n>PFGCTL .UC is a read/write field.

If [ERR<n>FR](#).FRX is 1, then [ERR<n>FR](#).UC indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

OF, bit [0]**When the node supports this flag:**

Overflow flag. Describes how the fault generation feature of the node sets the [ERR<n>STATUS](#).OF status flag.

OF	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS .OF according to the architecture-defined rules for setting the OF field. ERR<n>PFGCTL .OF is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS .OF is set to ERR<n>PFGCTL .OF. This behavior replaces the architecture-defined rules for setting the OF bit. ERR<n>PFGCTL .OF is a read/write field.

Otherwise:

Reserved, RAZ.

Accessing ERR<n>PFGF**ERR<n>PFGF can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
RAS	0x800 + (64 * n)	ERR<n>PFGF

Accesses on this interface are **RO**.

ERR<n>STATUS, Error Record Primary Status Register, n = 0 - 65534

The ERR<n>STATUS characteristics are:

Purpose

Contains status information for error record <n>, including:

- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a Requester.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An IMPLEMENTATION DEFINED extended error code.

Within this register:

- ERR<n>STATUS.{AV, V, MV} are valid bits that define whether error record <n> registers are valid.
- ERR<n>STATUS.{UE, OF, CE, DE, UET} encode the types of error or errors recorded.
- ERR<n>STATUS.{CI, ER, PN, IERR, SERR} are syndrome fields.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>STATUS are RES0.

[ERR<q>FR](#) describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>STATUS, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in [ERR<q>CTLR](#).

Attributes

ERR<n>STATUS is a 64-bit register.

Field descriptions

When RAS System Architecture v1.1 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
AV	V	UE	ER	OF	MV	CE	DE	PN	UET	CI	RES0	IERR										SERR									
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record <n> includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **W1C**.

UE, bit [29]

Uncorrected Error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

ER, bit [28]

Error Reported.

ER	Meaning
0b0	No in-band error response (External Abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: <ul style="list-style-type: none"> • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is implemented and was 1 when an error was detected and not corrected. • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is not implemented and the component always reports errors.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0.

Note

An in-band error response signaled by the component might be masked and not generate any exception.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE == 0
 - this field can be set to 0b1 by a Deferred error
- **UNKNOWN/WI** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - this field is never set to 0b1 by a Deferred error
- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- A Corrected error counter is implemented, an error is counted, and the counter overflows.
- ERR<n>STATUS.V was previously 1, a Corrected error counter is not implemented, and a Corrected error is recorded.
- ERR<n>STATUS.V was previously 1, and a type of error other than a Corrected error is recorded.

Otherwise, this field is unchanged when an error is recorded.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.

- A direct write to this field that clears this field to zero might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
0b0	Since this field was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed.
0b1	Since this field was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

MV, bit [26]

When error record <n> includes an additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC<m> not valid.
0b1	The IMPLEMENTATION DEFINED contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

DE, bit [23]

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - ERR<n>STATUS.V == 0
 - (ERR<n>STATUS.DE == 0 and ERR<n>STATUS.UE == 0)
- Otherwise, access to this field is **W1C**.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

Note

Software might use the information in the error record registers to determine what recovery is necessary.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - ERR<n>STATUS.V == 0
 - ERR<n>STATUS.UE == 0
- Otherwise, access to this field is **W1C**.

CI, bit [19]

Critical Error. Indicates whether a critical error condition has been recorded.

CI	Meaning
0b0	No critical error condition.
0b1	Critical error condition.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

Bits [18:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - the Common Fault Injection Model Extension is not implemented by the node that owns this error record

- ERR<n>STATUS.V == 0
- **UNKNOWN/WI** if all of the following are true:
 - ERR<q>PFGF.SYN == 0
 - ERR<n>STATUS.V == 0
- Otherwise, access to this field is **RW**.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, nSEI pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.
0x11	Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another component.
0x14	Internal timeout. For example, timeout on interface within the component.
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.
0x1A	Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI** if all of the following are true:
 - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
 - ERR<n>STATUS.V == 0
- UNKNOWN/WI** if all of the following are true:
 - ERR<q>PFGF.SYN == 0
 - ERR<n>STATUS.V == 0
- Otherwise, access to this field is **RW**.

When RAS System Architecture v1.0 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
AV	V	UE	ER	OF	MV	CE	DE	PN	UET	RES0						IERR						SERR									
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record <n> includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **RO** if all of the following are true:
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

UE, bit [29]

Uncorrected Error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
 - ERR<n>STATUS.OF == 1
 - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

ER, bit [28]

Error Reported.

ER	Meaning
0b0	No in-band error response (External Abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: <ul style="list-style-type: none"> • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is implemented and was 1 when an error was detected and not corrected. • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is not implemented and the component always reports errors.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0.

Note

An in-band error response signaled by the component might be masked and not generate any exception.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0, if this field is never set to 1 by a Deferred error.
- Clearing ERR<n>STATUS.{UE,DE} to {0,0}, if this field can be set to 1 by a Deferred error.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE == 0
 - this field can be set to 0b1 by a Deferred error
- **UNKNOWN/WI** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - this field is never set to 0b1 by a Deferred error
- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 1.
- A Deferred error is detected, ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE != 0b00. ERR<n>STATUS.CE might be updated for the new Corrected error.
- A Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is set to 1 when one of the following occurs:

- A Deferred error is detected and ERR<n>STATUS.UE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, and ERR<n>STATUS.{UE, DE} != {0, 0}.
- A Corrected error counter is implemented, ERR<n>STATUS.{UE, DE} != {0, 0}, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is cleared to 0 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 0.
- A Deferred error is detected, ERR<n>STATUS.UE == 0, and ERR<n>STATUS.DE == 0.
- A Corrected error is detected, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE == 0b00.

The IMPLEMENTATION DEFINED clearing of this field might also depend on the value of the other error status fields.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.
- A direct write to this field that clears this field to 0 might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
0b0	<p>If ERR<n>STATUS.UE == 1, then no error syndrome for an Uncorrected error has been discarded.</p> <p>If ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1, then no error syndrome for a Deferred error has been discarded.</p> <p>If ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and a Corrected error counter is implemented, then the counter has not overflowed.</p> <p>If ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, ERR<n>STATUS.CE != 0b00, and no Corrected error counter is implemented, then no error syndrome for a Corrected error has been discarded.</p>
	<p>Note</p> <p>This field might have been set to 1 when an error syndrome was discarded and later cleared to 0 when a higher priority syndrome was recorded.</p>
0b1	At least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

MV, bit [26]

When error record <n> includes an additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC<m> not valid.
0b1	The IMPLEMENTATION DEFINED contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behaviour of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0

- ERR<n>STATUS.CE != 0b00
- ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
 - ERR<n>STATUS.OF == 1
 - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

DE, bit [23]

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
 - ERR<n>STATUS.OF == 1
 - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write

- Otherwise, access to this field is **W1C**.

PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing both ERR<n>STATUS.{DE, UE} to 0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- UNKNOWN/WI** if any of the following are true:
 - ERR<n>STATUS.V == 0
 - (ERR<n>STATUS.DE == 0 and ERR<n>STATUS.UE == 0)
- RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

Note

Software might use the information in the error record registers to determine what recovery is necessary.

If this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
 - ERR<n>STATUS.V == 0
 - ERR<n>STATUS.UE == 0
- **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Bits [19:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
 - ERR<n>STATUS.V == 0
- **UNKNOWN/WI** if all of the following are true:
 - ERR<q>PFGF.SYN == 0
 - ERR<n>STATUS.V == 0
- **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **RW**.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, nSEI pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.
0x11	Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another component.
0x14	Internal timeout. For example, timeout on interface within the component.
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.
0x1A	Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
 - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
 - ERR<n>STATUS.V == 0
- **UNKNOWN/WI** if all of the following are true:
 - ERR<q>PFGF.SYN == 0
 - ERR<n>STATUS.V == 0
- **RO** if all of the following are true:
 - ERR<n>STATUS.DE == 0
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.CE != 0b00
 - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE == 0
 - ERR<n>STATUS.DE != 0
 - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
 - ERR<n>STATUS.UE != 0
 - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **RW**.

Accessing ERR<n>STATUS

ERR<n>STATUS.{AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI} are write-one-to-clear (W1C) fields, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero. ERR<n>STATUS.{IERR, SERR} are read/write (RW) fields, although the set of implemented valid values is IMPLEMENTATION DEFINED. See also [ERR<n>PFGF.SYN](#).

After reading ERR<n>STATUS, software must clear the valid fields in the register to allow new errors to be recorded. However, between reading the register and clearing the valid fields, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

- Writes to ERR<n>STATUS.{UE, DE, CE} are ignored if ERR<n>STATUS.OF is 1 and is not being cleared to 0.
- Writes to ERR<n>STATUS.V are ignored if any of ERR<n>STATUS.{UE, DE, CE} are nonzero and are not being cleared to zero.
- Writes to ERR<n>STATUS.{AV, MV} and the ERR<n>STATUS.{ER, PN, UET, IERR, SERR} syndrome fields are ignored if the highest priority nonzero error status field is not being cleared to zero. The error status fields in priority order from highest to lowest, are ERR<n>STATUS.UE, ERR<n>STATUS.DE, and ERR<n>STATUS.CE.

When RAS System Architecture v1.1 is implemented, a write to the register is ignored if all of:

- Any of ERR<n>STATUS.{V, UE, OF, CE, DE} are nonzero before the write.
- The write does not clear the nonzero ERR<n>STATUS.{V, UE, OF, CE, DE} fields to zero by writing ones to the applicable field or fields.

Some of the fields in ERR<n>STATUS are also defined as UNKNOWN where certain combinations of ERR<n>STATUS.{V, DE, UE} are zero. The rules for writes to ERR<n>STATUS allow a node to implement such a field as a fixed read-only value.

For example, when RAS System Architecture v1.1 is implemented, a write to ERR<n>STATUS when ERR<n>STATUS.V is 1 results in either ERR<n>STATUS.V field being cleared to zero, or ERR<n>STATUS.V not changing. Since all fields in ERR<n>STATUS, other than ERR<n>STATUS.{AV, V, MV}, usually read as UNKNOWN values when ERR<n>STATUS.V is zero, this means those fields can be implemented as read-only if applicable.

To ensure correct and portable operation, when software is clearing the valid fields in the register to allow new errors to be recorded, Arm recommends that software:

- Read ERR<n>STATUS and determine which fields need to be cleared to zero.
- Write ones to all the W1C fields that are nonzero in the read value.

- Write zero to all the W1C fields that are zero in the read value.
- Write zero to all the RW fields.

Otherwise, these fields might not have the correct value when a new fault is recorded.

An exception is when the node supports writing to these fields as part of fault injection. See also [ERR<n>PFGF.SYN](#).

ERR<n>STATUS can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	$0 \times 010 + (64 * n)$	ERR<n>STATUS

This interface is accessible as follows:

- When ERR<n>STATUS.V != 0, ERR<n>STATUS.V is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When ERR<n>STATUS.UE != 0, ERR<n>STATUS.UE is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When ERR<n>STATUS.OF != 0, ERR<n>STATUS.OF is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When ERR<n>STATUS.CE != 0b00, ERR<n>STATUS.CE is not being cleared to 0b00 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When ERR<n>STATUS.DE != 0, ERR<n>STATUS.DE is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- Otherwise accesses to this register are **RW**.

ERRPIDR0, Peripheral Identification Register 0

The ERRPIDR0 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PART_0							

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, bits [7:0].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in [ERRPIDR1](#).PART_1 and ERRPIDR0.PART_0. There are 8 bits, [ERRPIDR2](#).REVISION and [ERRPIDR3](#).REVAND, available to define the revision of the component.
- If a 16-bit part number is used, it is stored in [ERRPIDR2](#).PART_2, [ERRPIDR1](#).PART_1 and ERRPIDR0.PART_0. There are 4 bits, [ERRPIDR3](#).REVISION, available to define the revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR0

ERRPIDR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFE0	ERRPIDR0

Accesses on this interface are **RO**.

ERRPIDR1, Peripheral Identification Register 1

The ERRPIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								DES_0				PART_1			

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0]. ERRPIDR1.DES_0 and [ERRPIDR2.DES_1](#) together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, bits [11:8].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in ERRPIDR1.PART_1 and [ERRPIDR0.PART_0](#). There are 8 bits, [ERRPIDR2.REVISION](#) and [ERRPIDR3.REVAND](#), available to define the revision of the component.

- If a 16-bit part number is used, it is stored in [ERRPIDR2](#).PART_2, ERRPIDR1.PART_1 and [ERRPIDR0](#).PART_0. There are 4 bits, [ERRPIDR3](#).REVISION, available to define the revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR1

ERRPIDR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFE4	ERRPIDR1

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

ERRPIDR2, Peripheral Identification Register 2

The ERRPIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR2 is a 32-bit register.

Field descriptions

When the component uses a 12-bit part number:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																REVISION				JEDEC		DES 1									

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Component major revision. ERRPIDR2.REVISION and [ERRPIDR3.REVAND](#) together form the revision number of the component, with ERRPIDR2.REVISION being the most significant part and [ERRPIDR3.REVAND](#) the least significant part. When a component is changed, ERRPIDR2.REVISION or [ERRPIDR3.REVAND](#) are increased to ensure that software can differentiate the different revisions of the component. [ERRPIDR3.REVAND](#) should be set to 0b0000 when ERRPIDR2.REVISION is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4]. [ERRPIDR1.DES_0](#) and ERRPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the

implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

When the component uses a 16-bit part number:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																PART_2				JEDEC		DES_1									

Bits [31:8]

Reserved, RES0.

PART_2, bits [7:4]

Part number, bits [15:12].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in [ERRPIDR1.PART_1](#) and [ERRPIDR0.PART_0](#). There are 8 bits, [ERRPIDR2.REVISION](#) and [ERRPIDR3.REVAND](#), available to define the revision of the component.
- If a 16-bit part number is used, it is stored in [ERRPIDR2.PART_2](#), [ERRPIDR1.PART_1](#) and [ERRPIDR0.PART_0](#). There are 4 bits, [ERRPIDR3.REVISION](#), available to define the revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4]. [ERRPIDR1.DES_0](#) and [ERRPIDR2.DES_1](#) together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR2

ERRPIDR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFE8	ERRPIDR2

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRPIDR3, Peripheral Identification Register 3

The ERRPIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR3 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR3 is a 32-bit register.

Field descriptions

When the component uses a 12-bit part number:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																REVAND				CMOD											

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Component minor revision. [ERRPIDR2.REVISION](#) and ERRPIDR3.REVAND together form the revision number of the component, with [ERRPIDR2.REVISION](#) being the most significant part and ERRPIDR3.REVAND the least significant part. When a component is changed, [ERRPIDR2.REVISION](#) or ERRPIDR3.REVAND are increased to ensure that software can differentiate the different revisions of the component. ERRPIDR3.REVAND should be set to 0b0000 when [ERRPIDR2.REVISION](#) is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer Modified.

Indicates the component has been modified.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.

- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

When the component uses a 16-bit part number:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																REVISION				CMOD											

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Component revision. When a component is changed, ERRPIDR3.REVISION is increased to ensure that software can differentiate the different revisions of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer Modified.

Indicates the component has been modified.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR3

ERRPIDR3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFEC	ERRPIDR3

Accesses on this interface are **RO**.

ERRPIDR4, Peripheral Identification Register 4

The ERRPIDR4 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR4 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR4 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SIZE				DES_2			

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component.

The distance from the start of the address space used by this component to the end of the component identification registers.

A value of 0b0000 means one of the following is true:

- The component uses a single 4KB block.
- The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.

Any other value means the component occupies $2^{\text{ERRPIDR4.SIZE}}$ 4KB blocks.

Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 bank is 5, meaning this field has the value 0x4.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR4

ERRPIDR4 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFD0	ERRPIDR4

Accesses on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_ABPR, CPU Interface Aliased Binary Point Register

The GICC_ABPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_ABPR are RES0.

In systems that support two Security states:

- This register is an alias of the Non-secure copy of [GICC_BPR](#).
- Non-secure accesses to this register return a shifted value of the binary point.
- If [ICC_CTLR_EL3](#).CBPR_EL1NS == 1, Secure accesses to this register access [ICC_BPR0_EL1](#).

Attributes

GICC_ABPR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																		Binary Point													

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- 'Secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when [GICC_CTLR](#).CBPR == 0.
- 'Non-secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for all other cases.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICC_ABPR

This register is used only when System register access is not enabled. When System register access is enabled, the System registers [ICC_BPR0_EL1](#) and [ICC_BPR1_EL1](#) provide equivalent functionality.

GICC_ABPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x001C	GICC_ABPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICC_AEOIR, CPU Interface Aliased End Of Interrupt Register

The GICC_AEOIR characteristics are:

Purpose

A write to this register performs priority drop for the specified Group 1 interrupt and, if the appropriate [GICC_CTLR.EOImodeS](#) or [GICC_CTLR.EOImodeNS](#) field == 0, also deactivates the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_AEOIR are RES0.

When [GICD_CTLR.DS](#)==0, this register is an alias of the Non-secure view of [GICC_EOIR](#). A Secure access to this register is identical to a Non-secure access to [GICC_EOIR](#).

Attributes

GICC_AEOIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								INTID																							

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_AEOIR

A write to this register must correspond to the most recently acknowledged Group 1 interrupt. If a value other than the last value read from [GICC_AIAR](#) is written to this register, the effect is UNPREDICTABLE.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_EOIR1](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_EOIR1_EL1](#) provides equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_AEOIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0024	GICC_AEOIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_AHPPIR, CPU Interface Aliased Highest Priority Pending Interrupt Register

The GICC_AHPPIR characteristics are:

Purpose

If the highest priority pending interrupt is in Group 1, this register provides the INTID of the highest priority pending interrupt on the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_AHPPIR are RES0.

If [GICD_CTLR.DS](#)=0, this register is an alias of the Non-secure view of [GICC_HPPIR](#). A Secure access to this register is identical to a Non-secure access to [GICC_HPPIR](#).

Attributes

GICC_AHPPIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								INTID																							

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_AHPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_HPPIR1](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_HPPIR1_EL1](#) provides equivalent functionality.

If the highest priority pending interrupt is in Group 0, a read of this register returns the special INTID 1023.

Interrupt identifiers corresponding to an interrupt group that is not enabled are ignored.

If the highest priority pending interrupt is a direct interrupt that is both individually enabled in the Distributor and part of an interrupt group that is enabled in the Distributor, and the interrupt group is disabled in the CPU interface for this PE, this register returns the special INTID 1023.

For more information about pending interrupts that are not considered when determining the highest priority pending interrupt, see 'Preemption' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_AHPPIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0028	GICC_AHPPIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICC_AIAR, CPU Interface Aliased Interrupt Acknowledge Register

The GICC_AIAR characteristics are:

Purpose

Provides the INTID of the signaled Group 1 interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_AIAR are RES0.

When [GICD_CTLR.DS](#)==0, this register is an alias of the Non-secure view of [GICC_IAR](#). A Secure access to this register is identical to a Non-secure access to [GICC_IAR](#).

Attributes

GICC_AIAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								INTID																							

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_AIAR

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_AIAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
-----------	--------	----------

GIC CPU interface	0x0020	GICC_AIAR
----------------------	--------	-----------

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICC_APR<n>, CPU Interface Active Priorities Registers, n = 0 - 3

The GICC_APR<n> characteristics are:

Purpose

Provides information about interrupt active priorities.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_APR<n> are RES0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

When [GICD_CTLR.DS](#) == 0, these registers are Banked, and Non-secure accesses do not affect Secure operation. The Secure copies of these registers hold active priorities for Group 0 interrupts, and the Non-secure copies provide a Non-secure view of the active priorities for Group 1 interrupts.

GICC_APR1 is only implemented in implementations that support 6 or more bits of priority. GICC_APR2 and GICC_APR3 are only implemented in implementations that support 7 bits of priority.

When [GICD_CTLR.DS](#) == 1, these registers hold the active priorities for Group 0 interrupts, and the active priorities for Group 1 interrupts are held by the [GICC_NSAPR<n>](#) registers.

Attributes

GICC_APR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing GICC_APR<n>

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- In AArch64:
 - For Group 0, [ICC_AP0R<n>_EL1](#).
 - For Group 1, [ICC_AP1R<n>_EL1](#).
- In AArch32:
 - For Group 0, [ICC_AP0R<n>](#).
 - For Group 1, [ICC_AP1R<n>](#).

GICC_APR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	$0 \times 00D0 + (4 * n)$	GICC_APR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_BPR, CPU Interface Binary Point Register

The GICC_BPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_BPR are RES0.

In systems that support two Security states:

- This register is Banked.
- The Secure instance of this register determines Group 0 interrupt preemption.
- The Non-secure instance of this register determines Group 1 interrupt preemption.

In systems that support only one Security state, when [GICC_CTLR](#).CBPR == 0, this register determines only Group 0 interrupt preemption.

When [GICC_CTLR](#).CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

Attributes

GICC_BPR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																	Binary Point														

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- 'Secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when [GICC_CTLR](#).CBPR == 0.
- 'Non-secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for all other cases.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Note

Aliasing the Non-secure GICC_BPR as [GICC_ABPR](#) in a multiprocessor system permits a PE that can make only Secure accesses to configure the preemption setting for Group 1 interrupts by accessing [GICC_ABPR](#).

Accessing GICC_BPR

This register is used only when System register access is not enabled. When System register access is enabled this register is RAZ/WI, and the System registers [ICC_BPR0_EL1](#) and [ICC_BPR1_EL1](#) provide equivalent functionality.

GICC_BPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0008	GICC_BPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICC_CTLR, CPU Interface Control Register

The GICC_CTLR characteristics are:

Purpose

Controls the CPU interface, including enabling of interrupt groups, interrupt signal bypass, binary point registers used, and separation of priority drop and interrupt deactivation.

Note

If the GIC implementation supports two Security states, independent EOI controls are provided for accesses from each Security state. Secure accesses handle both Group 0 and Group 1 interrupts, and Non-secure accesses handle Group 1 interrupts only.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_CTLR are RES0.

In a GIC implementation that supports two Security states:

- This register is Banked.
- The register bit assignments are different in the Secure and Non-secure copies.

Attributes

GICC_CTLR is a 32-bit register.

Field descriptions

When GICD_CTLR.DS==0, Non-secure access:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										EOImodeNS		RES0		IRQBypDisGrp1		FIQBypDisGrp1		RES0		EnableGrp1											

Bits [31:10]

Reserved, RES0.

EOImodeNS, bit [9]

Controls the behavior of Non-secure accesses to [GICC_EOIR](#), [GICC_AEOIR](#), and [GICC_DIR](#).

EOImodeNS	Meaning
0b0	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
0b1	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Bits [8:7]

Reserved, RES0.

IRQBypDisGrp1, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC_SRE_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

FIQBypDisGrp1, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQBypDisGrp1	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC_SRE_EL3.DFB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Bits [4:1]

Reserved, RES0.

EnableGrp1, bit [0]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
0b0	Group 1 interrupt signaling is disabled.
0b1	Group 1 interrupt signaling is enabled.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

When GICD_CTLR.DS==0, Secure access:

313029282726252423222120191817161514131211	10	9	8	7	6
RES0	EOImodeNS	EOImodeS	IRQBypDisGrp1	FIQBypDisGrp1	IRQBypDisGrp0

Bits [31:11]

Reserved, RES0.

EOImodeNS, bit [10]

Controls the behavior of Non-secure accesses to [GICC_EOIR](#), [GICC_AEOIR](#), and [GICC_DIR](#).

EOImodeNS	Meaning
0b0	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
0b1	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

EOImodeS, bit [9]

Controls the behavior of Secure accesses to [GICC_EOIR](#), [GICC_AEOIR](#), and [GICC_DIR](#).

EOImodeS	Meaning
0b0	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
0b1	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

This field shares state with [GICC_CTLR](#).EOImode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

IRQBypDisGrp1, bit [8]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC_SRE_EL3](#).DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

FIQByDisGrp1, bit [7]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQByDisGrp1	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC_SRE_EL3.DFB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

IRQByDisGrp0, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:

IRQByDisGrp0	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC_SRE_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

FIQByDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

FIQByDisGrp0	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC_SRE_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

CBPR, bit [4]

Controls whether [GICC_BPR](#) provides common control of preemption to Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	GICC_BPR determines preemption for Group 0 interrupts only.
0b1	GICC_ABPR determines preemption for Group 1 interrupts. GICC_BPR determines preemption for both Group 0 and Group 1 interrupts.

This field is an alias of [ICC_CTLR_EL3.CBPR_EL1NS](#).

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of [GICC_BPR](#) returns the value of Secure [GICC_BPR](#).Binary_Point, incremented by 1, and saturated to 0b111.
- Non-secure writes of [GICC_BPR](#) are ignored.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

FIQEn, bit [3]

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

FIQEn	Meaning
0b0	Group 0 interrupts are signaled using the IRQ signal.
0b1	Group 0 interrupts are signaled using the FIQ signal.

Group 1 interrupts are signaled using the IRQ signal only.

If an implementation supports two Security states, this bit is permitted to be RAO/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Bit [2]

Reserved, RES0.

EnableGrp1, bit [1]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
0b0	Group 1 interrupt signaling is disabled.
0b1	Group 1 interrupt signaling is enabled.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

EnableGrp0, bit [0]

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

EnableGrp0	Meaning
0b0	Group 0 interrupt signaling is disabled.
0b1	Group 0 interrupt signaling is enabled.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

When GICD_CTLR.DS == 1:

31302928272625242322212019181716151413121110	9	8	7	6	5
RES0	EOImode	IRQBypDisGrp1	FIQBypDisGrp1	IRQBypDisGrp0	FIQBypDisGrp0

Bits [31:10]

Reserved, RES0.

EOImode, bit [9]

Controls the behavior of accesses to [GICC_EOIR](#), [GICC_AEOIR](#), and [GICC_DIR](#).

EOImode	Meaning
0b0	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
0b1	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

This field shares state with [GICC_CTLR.EOImodeS](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

IRQBypDisGrp1, bit [8]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC_SRE_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

FIQByDisGrp1, bit [7]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQByDisGrp1	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC_SRE_EL3.DFB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

IRQByDisGrp0, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:

IRQByDisGrp0	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC_SRE_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

FIQByDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

FIQByDisGrp0	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and [ICC_SRE_EL3.DIB](#) == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

CBPR, bit [4]

Controls whether [GICC_BPR](#) provides common control of preemption to Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	GICC_BPR determines preemption for Group 0 interrupts only.
0b1	GICC_ABPR determines preemption for Group 1 interrupts. GICC_BPR determines preemption for both Group 0 and Group 1 interrupts.

This field is an alias of [ICC_CTLR_EL3.CBPR_EL1NS](#).

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of [GICC_BPR](#) returns the value of Secure [GICC_BPR](#).Binary_Point, incremented by 1, and saturated to 0b111.
- Non-secure writes of [GICC_BPR](#) are ignored.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

FIQEn, bit [3]

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

FIQEn	Meaning
0b0	Group 0 interrupts are signaled using the IRQ signal.
0b1	Group 0 interrupts are signaled using the FIQ signal.

Group 1 interrupts are signaled using the IRQ signal only.

If an implementation supports two Security states, this bit is permitted to be RAO/WI.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Bit [2]

Reserved, RES0.

EnableGrp1, bit [1]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
0b0	Group 1 interrupt signaling is disabled.
0b1	Group 1 interrupt signaling is enabled.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

EnableGrp0, bit [0]

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

EnableGrp0	Meaning
0b0	Group 0 interrupt signaling is disabled.
0b1	Group 0 interrupt signaling is enabled.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing GICC_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_CTLR](#) and [ICC_MCTLR](#) provide equivalent functionality.
- For AArch64 implementations, [ICC_CTLR_EL1](#) and [ICC_CTLR_EL3](#) provide equivalent functionality.

GICC_CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0000	GICC_CTLR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_DIR, CPU Interface Deactivate Interrupt Register

The GICC_DIR characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_DIR are RES0.

Attributes

GICC_DIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								INTID																							

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_DIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_DIR](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_DIR_EL1](#) provides equivalent functionality.

Writes to this register have an effect only in the following cases:

- When [GICD_CTLR](#).DS == 1, if [GICC_CTLR](#).EOImode == 1.
- In GIC implementations that support two Security states:
 - If the access is Secure and [GICC_CTLR](#).EOImodeS == 1.
 - If the access is Non-secure and [GICC_CTLR](#).EOImodeNS == 1.

The following writes must be ignored:

- Writes to this register when the corresponding EOImode field in [GICC_CTLR](#) == 0. In systems that support system error generation, an implementation might generate a system error.
- Writes to this register when the corresponding EOImode field in [GICC_CTLR](#) == 0 and the corresponding interrupt is not active. In systems that support system error generation, an implementation might generate a system error. In implementations using the GIC Stream Protocol Interface, these writes correspond to a Deactivate packet for an interrupt that is not active. For more information, see 'Deactivate (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If the corresponding EOImode field in [GICC_CTLR](#) is 1 and this register is written to without a corresponding write to [GICC_EOIR](#) or [GICC_AEOIR](#), the interrupt is deactivated but the bit corresponding to it in the active priorities registers remains set.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_DIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x1000	GICC_DIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_EOIR, CPU Interface End Of Interrupt Register

The GICC_EOIR characteristics are:

Purpose

A write to this register performs priority drop for the specified interrupt and, if the appropriate [GICC_CTLR.EOImodeS](#) or [GICC_CTLR.EOImodeNS](#) field == 0, also deactivates the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_EOIR are RES0.

If [GICD_CTLR.DS](#)==0:

- This register is Common.
- [GICC_AEOIR](#) is an alias of the Non-secure view of this register.

For Secure writes when [GICD_CTLR.DS](#)==0, or for Secure and Non-secure writes when [GICD_CTLR.DS](#)==1, the register provides functionality for Group 0 interrupts.

For Non-secure writes when [GICD_CTLR.DS](#)==1, the register provides functionality for Group 1 interrupts.

Attributes

GICC_EOIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								INTID																							

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

For every read of a valid INTID from [GICC_IAR](#), the connected PE must perform a matching write to GICC_EOIR. The value written to GICC_EOIR must be the INTID from [GICC_IAR](#). Reads of INTIDs 1020-1023 do not require matching writes.

Note

Arm recommends that software preserves the entire register value read from [GICC_IAR](#), and writes that value back to GICC_EOIR on completion of interrupt processing.

For nested interrupts, the order of writes to this register must be the reverse of the order of interrupt acknowledgement. Behavior is UNPREDICTABLE if:

- This ordering constraint is not maintained.
- The value written to this register does not match an active interrupt, or the ID of a spurious interrupt.
- The value written to this register does not match the last valid interrupt value read from [GICC_IAR](#).

For general information about the effect of writes to end of interrupt registers, and about the possible separation of the priority drop and interrupt deactivate operations, see 'Interrupt lifecycle' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If [GICD_CTLR.DS](#)==0:

- [GICC_CTLR.EOImodeS](#) controls the behavior of Secure accesses to GICC_EOIR and [GICC_AEOIR](#).
- [GICC_CTLR.EOImodeNS](#) controls the behavior of Non-secure accesses to GICC_EOIR and [GICC_AEOIR](#).

Accessing GICC_EOIR

The following writes must be ignored:

- Writes of INTIDs 1020-1023.
- Secure writes corresponding to Group 1 interrupts. In systems that support system error generation, an implementation might generate a system error. In this case, GIC behavior is predictable, and the highest Secure active priority (in the Secure copy of [GICC_APR<n>](#)) will be reset if the highest active priority is Secure. System behavior is UNPREDICTABLE.
- Non-secure writes corresponding to Group 0 interrupts when [GICC_CTLR.EOImodeS](#) == 1. In systems that support system error generation, an implementation might generate a system error. In this case, GIC behavior is predictable, and the highest Non-secure active priority (in the Non-secure copy of [GICC_APR<n>](#)) will be reset if the highest active priority is Non-secure. System behavior is UNPREDICTABLE.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_EOIR0](#) and [ICC_EOIR1](#) provide equivalent functionality.
- For AArch64 implementations, [ICC_EOIR0_EL1](#) and [ICC_EOIR1_EL1](#) provide equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_EOIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0010	GICC_EOIR

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

GICC_HPPIR, CPU Interface Highest Priority Pending Interrupt Register

The GICC_HPPIR characteristics are:

Purpose

Provides the INTID of the highest priority pending interrupt on the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_HPPIR are RES0.

If [GICD_CTLR.DS](#)==0:

- This register is Common.
- [GICC_AHPPIR](#) is an alias of the Non-secure view of this register.

Attributes

GICC_HPPIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								INTID																							

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_HPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_HPPIR0](#) and [ICC_HPPIR1](#) provide equivalent functionality.
- For AArch64 implementations, [ICC_HPPIR0_EL1](#) and [ICC_HPPIR1_EL1](#) provide equivalent functionality.

If the highest priority pending interrupt is in Group 0, a Non-secure read of this register returns the special INTID 1023.

For Secure reads when [GICD_CTLR.DS==0](#), or for Secure and Non-secure reads when [GICD_CTLR.DS==1](#), returns the special INTID 1022 if the highest priority pending interrupt is in Group 1.

If no interrupts are in the pending state, a read of this register returns the special INTID 1023.

Interrupt identifiers corresponding to an interrupt group that is not enabled are ignored.

If the highest priority pending interrupt is a direct interrupt that is both individually enabled in the Distributor and part of an interrupt group that is enabled in the Distributor, and the interrupt group is disabled in the CPU interface for this PE, this register returns the special INTID 1023.

For more information about pending interrupts that are not considered when determining the highest priority pending interrupt, see 'Preemption' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_HPPIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0018	GICC_HPPIR

This interface is accessible as follows:

- When [GICD_CTLR.DS == 0](#) accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_IAR, CPU Interface Interrupt Acknowledge Register

The GICC_IAR characteristics are:

Purpose

Provides the INTID of the signaled interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_IAR are RES0.

This register is available in all configurations of the GIC. If [GICD_CTLR.DS](#)=0:

- This register is Common.
- [GICC_AIAR](#) is an alias of the Non-secure view of this register.

The format of the INTID is governed by whether affinity routing is enabled for a Security state.

Attributes

GICC_IAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								INTID																							

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A read of this register returns the INTID of the highest priority pending interrupt for the CPU interface. The read returns a spurious INTID of 1023 if any of the following apply:

- Forwarding of interrupts by the Distributor to the CPU interface is disabled.
- Signaling of interrupts by the CPU interface to the connected PE is disabled.
- There are no pending interrupts on the CPU interface with sufficient priority for the interface to signal it to the PE.

When the GIC returns a valid INTID to a read of this register it treats the read as an acknowledge of that interrupt. In addition, it changes the interrupt status from pending to active, or to active and pending if the pending state of the interrupt persists. Normally, the pending state of an interrupt persists only if the interrupt is level-sensitive and remains asserted.

For every read of a valid INTID from GICC_IAR, the connected PE must perform a matching write to [GICC_EOIR](#).

Note

- Arm recommends that software preserves the entire register value read from this register, and writes that value back to [GICC_EOIR](#) on completion of interrupt processing.
 - For SPIs, although multiple target PEs might attempt to read this register at any time, only one PE can obtain a valid INTID. For more information, see 'Activation' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).
-

Accessing GICC_IAR

When [GICD_CTLR.DS](#)==1, if the highest priority pending interrupt is in Group 1, the special INTID 1022 is returned.

In GIC implementations that support two Security states, if the highest priority pending interrupt is in Group 0, Non-secure reads return the special INTID 1023.

In GIC implementations that support two Security states, if the highest priority pending interrupt is in Group 1, Secure reads return the special INTID 1022.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_IAR0](#) and [ICC_IAR1](#) provide equivalent functionality.
- For AArch64 implementations, [ICC_IAR0_EL1](#) and [ICC_IAR1_EL1](#) provide equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_IAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x000C	GICC_IAR

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

GICC_IIDR, CPU Interface Identification Register

The GICC_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_IIDR are RES0.

Attributes

GICC_IIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ProductID												Architecture_version				Revision				Implementer											

ProductID, bits [31:20]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture_version, bits [19:16]

The version of the GIC architecture that is implemented.

Architecture_version	Meaning
0b0001	GICv1.
0b0010	GICv2.
0b0011	FEAT_GICv3 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.
0b0100	FEAT_GICv4 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.

Other values are reserved.

Revision, bits [15:12]

Revision number for the CPU interface.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the CPU interface.

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

Accessing GICC_IIDR

GICC_IIDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x00FC	GICC_IIDR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_NSAPR<n>, CPU Interface Non-secure Active Priorities Registers, n = 0 - 3

The GICC_NSAPR<n> characteristics are:

Purpose

Provides information about Group 1 interrupt active priorities.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_NSAPR<n> are RES0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

When [GICD_CTLR.DS](#)==0, these registers are RAZ/WI to Non-secure accesses.

GICC_NSAPR1 is only implemented in implementations that support 6 or more bits of priority. GICC_NSAPR2 and GICC_NSAPR3 are only implemented in implementations that support 7 bits of priority.

Attributes

GICC_NSAPR<n> is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing GICC_NSAPR<n>

GICC_NSAPR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x00E0 + (4 * n)	GICC_NSAPR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICC_PMR, CPU Interface Priority Mask Register

The GICC_PMR characteristics are:

Purpose

This register provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Note

Higher interrupt priority corresponds to a lower value of the Priority field.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_PMR are RES0.

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

Attributes

GICC_PMR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								Priority							

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = 0b0.
- For 64 supported levels, bits [1:0] = 0b00.
- For 32 supported levels, bits [2:0] = 0b000.
- For 16 supported levels, bits [3:0] = 0b0000.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICC_PMR

If the GIC implementation supports two Security states:

- Non-secure accesses to this register can only read or write values corresponding to the lower half of the priority range.
- If a Secure write has programmed the register with a value that corresponds to a value in the upper half of the priority range then:
 - Any Non-secure read of the register returns 0x00, regardless of the value held in the register.
 - Non-secure writes are ignored.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

GICC_PMR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0004	GICC_PMR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_RPR, CPU Interface Running Priority Register

The GICC_RPR characteristics are:

Purpose

This register indicates the running priority of the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_RPR are RES0.

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

Attributes

GICC_RPR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								Priority							

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR was set to the minimum value.

Accessing GICC_RPR

If there is no active interrupt on the CPU interface, the idle priority value is returned.

If the GIC implementation supports two Security states, a Non-secure read of the Priority field returns:

- 0x00 if the field value is less than 0x80.
- The Non-secure view of the Priority value if the field value is 0x80 or more.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Software cannot determine the number of implemented priority bits from this register.

GICC_RPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0014	GICC_RPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICC_STATUSR, CPU Interface Status Register

The GICC_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_STATUSR are RES0.

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

This register is used only when System register access is not enabled. If System register access is enabled, this register is not updated. Equivalent functionality might be provided by appropriate traps and exceptions.

Attributes

GICC_STATUSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																			ASV		WROD		RWOD		WRD		RRD				

Bits [31:5]

Reserved, RES0.

ASV, bit [4]

Attempted security violation.

ASV	Meaning
0b0	Normal operation.
0b1	A Non-secure access to a Secure register has been detected.

Note

This bit is not set to 1 for registers where any of the fields are Non-secure.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICC_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

If this register is implemented, [GICV_STATUSR](#) must also be implemented.

GICC_STATUSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x002C	GICC_STATUSR (S)

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.

Component	Offset	Instance
GIC CPU interface	0x002C	GICC_STATUSR (NS)

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_CLRSPI_NSR, Clear Non-secure SPI Pending Register

The GICD_CLRSPI_NSR characteristics are:

Purpose

Removes the pending state from a valid SPI if permitted by the Security state of the access and the [GICD_NSACR<n>](#) value for that SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

If [GICD_TYPER](#).MBIS == 0, this register is reserved.

When [GICD_CTLR](#).DS == 1, this register provides functionality for all SPIs.

Attributes

GICD_CLRSPI_NSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																			INTID												

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to [GICD_SETSPI_NSR](#) or [GICD_SETSPI_SR](#) adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to [GICD_CLRSPI_NSR](#), [GICD_CLRSPI_SR](#), or [GICD_ICPENDR<n>](#).
- For a level-sensitive interrupt, a write to [GICD_SETSPI_NSR](#) or [GICD_SETSPI_SR](#) adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to [GICD_CLRSPI_NSR](#) or [GICD_CLRSPI_SR](#). If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_CLRSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding [GICD_NSACR<n>](#) register is less than 0b10.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can clear the pending state of any valid SPI.

GICD_CLRSPI_NSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0048	GICD_CLRSPI_NSR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICD_CLRSPI_SR, Clear Secure SPI Pending Register

The GICD_CLRSPI_SR characteristics are:

Purpose

Removes the pending state from a valid SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

If [GICD_TYPER](#).MBIS == 0, this register is reserved.

When [GICD_CTLR](#).DS == 1, this register is WI.

Attributes

GICD_CLRSPI_SR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																			INTID												

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to [GICD_SETSPI_NSR](#) or [GICD_SETSPI_SR](#) adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to [GICD_CLRSPI_NSR](#), [GICD_CLRSPI_SR](#), or [GICD_ICPENDR<n>](#).
- For a level-sensitive interrupt, a write to [GICD_SETSPI_NSR](#) or [GICD_SETSPI_SR](#) adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to [GICD_CLRSPI_NSR](#) or [GICD_CLRSPI_SR](#). If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_CLRSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICD_CLRSPI_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0058	GICD_CLRSPI_SR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WI**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WI**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_CPENDSGIR<n>, SGI Clear-Pending Registers, n = 0 - 3

The GICD_CPENDSGIR<n> characteristics are:

Purpose

Removes the pending state from an SGI.

A write to this register changes the state of a pending SGI to inactive, and the state of an active and pending SGI to active.

Configuration

Four SGI clear-pending registers are implemented. Each register contains eight clear-pending bits for each of four SGIs, for a total of 16 possible SGIs.

In multiprocessor implementations, each PE has a copy of these registers.

Attributes

GICD_CPENDSGIR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SGI_clear_pending_bits3								SGI_clear_pending_bits2								SGI_clear_pending_bits1								SGI_clear_pending_bits0							

SGI_clear_pending_bits<x>, bits [8x+7:8x], for x = 3 to 0

Removes the pending state from SGI number $4n + x$ for the PE corresponding to the bit number written to.

Reads and writes have the following behavior:

SGI_clear_pending_bits<x>	Meaning
0x00	If read, indicates that the SGI from the corresponding PE is not pending and is not active and pending. If written, has no effect.
0x01	If read, indicates that the SGI from the corresponding PE is pending or is active and pending. If written, removes the pending state from the SGI for the corresponding PE.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For SGI ID m, generated by processing element C writing to the corresponding [GICD_SGIR](#) field, where DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_CPENDSGIR<n> number is given by $n = m \text{ DIV } 4$.
- The offset of the required register is $(0xF10 + (4n))$.
- The offset of the required field within the register GICD_CPENDSGIR<n> is given by $m \text{ MOD } 4$.
- The required bit in the 8-bit SGI clear-pending field m is bit C.

Accessing GICD_CPENDSGIR<n>

These registers are used only when affinity routing is not enabled. When affinity routing is enabled, this register is RES0. An implementation is permitted to make the register RAZ/WI in this case.

A register bit that corresponds to an unimplemented SGI is RAZ/WI.

These registers are byte-accessible.

If the GIC implementation supports two Security states:

- A register bit that corresponds to a Group 0 interrupt is RAZ/WI to Non-secure accesses.
- Register bits corresponding to unimplemented PEs are RAZ/WI.

GICD_CPENDSGIR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0F10 + (4 * n)	GICD_CPENDSGIR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICD_CTLR, Distributor Control Register

The GICD_CTLR characteristics are:

Purpose

Enables interrupts and affinity routing.

Configuration

The format of this register depends on the Security state of the access and the number of Security states supported, which is specified by GICD_CTLR.DS.

Attributes

GICD_CTLR is a 32-bit register.

Field descriptions

When access is Secure, in a system that supports two Security states:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RWP																								E1NWF	DS	ARE_NS	ARE_S	RES0	EnableGrp1S	EnableGrp1NS	EnableGrp1NS

RWP, bit [31]

Register Write Pending. Read only. Indicates whether a register write is in progress or not:

RWP	Meaning
0b0	No register write in progress. The effects of previous register writes to the affected register fields are visible to all logical components of the GIC architecture, including the CPU interfaces.
0b1	Register write in progress. The effects of previous register writes to the affected register fields are not guaranteed to be visible to all logical components of the GIC architecture, including the CPU interfaces, as the effects of the changes are still being propagated.

This field tracks writes to:

- GICD_CTLR[2:0], the Group Enables, for transitions from 1 to 0 only.
- GICD_CTLR[7:4], the ARE bits, E1NWF bit and DS bit.
- GICD_ICENABLER<n>.

Updates to other register fields are not tracked by this field.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:8]

Reserved, RES0.

E1NWF, bit [7]

Enable 1 of N Wakeup Functionality.

It is IMPLEMENTATION DEFINED whether this bit is programmable, or RAZ/WI.

If it is implemented, then it has the following behavior:

E1NWF	Meaning
0b0	A PE that is asleep cannot be picked for 1 of N interrupts.
0b1	A PE that is asleep can be picked for 1 of N interrupts as determined by IMPLEMENTATION DEFINED controls.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

DS, bit [6]

Disable Security.

DS	Meaning
0b0	Non-secure accesses are not permitted to access and modify registers that control Group 0 interrupts.
0b1	Non-secure accesses are permitted to access and modify registers that control Group 0 interrupts.

If DS is written from 0 to 1 when GICD_CTLR.ARE_S == 1, then GICD_CTLR.ARE for the single Security state is RAO/WI.

If the Distributor only supports a single Security state, this bit is RAO/WI.

If the Distributor supports two Security states, it IMPLEMENTATION DEFINED whether this bit is programmable or implemented as RAZ/WI.

When this field is set to 1, all accesses to GICD_CTLR access the single Security state view, and all bits are accessible.

When set to 1, this field can only be cleared by a hardware reset.

Writing this bit from 0 to 1 is UNPREDICTABLE if any of the following is true:

- [GICD_CTLR.EnableGrp0](#)==1.
- [GICD_CTLR.EnableGrp1S](#)==1.
- [GICD_CTLR.EnableGrp1NS](#)==1.
- One or more INTID is in the Active or Active and Pending state.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

ARE_NS, bit [5]

Affinity Routing Enable, Non-secure state.

ARE_NS	Meaning
0b0	Affinity routing disabled for Non-secure state.
0b1	Affinity routing enabled for Non-secure state.

When affinity routing is enabled for the Secure state, this field is RAO/WI.

Changing the ARE_NS settings from 0 to 1 is UNPREDICTABLE except when GICD_CTLR.EnableGrp1 Non-secure == 0.

Changing the ARE_NS settings from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility for Non-secure state is not implemented, this field is RAO/WI.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

ARE_S, bit [4]

Affinity Routing Enable, Secure state.

ARE_S	Meaning
0b0	Affinity routing disabled for Secure state.
0b1	Affinity routing enabled for Secure state.

Changing the ARE_S setting from 0 to 1 is UNPREDICTABLE except when all of the following apply:

- GICD_CTLR.EnableGrp0==0.
- GICD_CTLR.EnableGrp1S==0.
- GICD_CTLR.EnableGrp1NS==0.

Changing the ARE_S settings from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility for Secure state is not implemented, this field is RAO/WI.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Bit [3]

Reserved, RES0.

EnableGrp1S, bit [2]

Enable Secure Group 1 interrupts.

EnableGrp1S	Meaning
0b0	Secure Group 1 interrupts are disabled.
0b1	Secure Group 1 interrupts are enabled.

If GICD_CTLR.ARE_S == 0, this field is RES0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

EnableGrp1NS, bit [1]

Enable Non-secure Group 1 interrupts.

EnableGrp1NS	Meaning
0b0	Non-secure Group 1 interrupts are disabled.
0b1	Non-secure Group 1 interrupts are enabled.

Note

This field also controls whether LPIs are forwarded to the PE.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enable Group 0 interrupts.

EnableGrp0	Meaning
0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

When access is Non-secure, in a system that supports two Security states:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RWP	RES0														ARE_NS		RES0	EnableGrp1A		EnableGrp1											

RWP, bit [31]

This bit is a read-only alias of the Secure GICD_CTLR.RWP bit.

Bits [30:5]

Reserved, RES0.

ARE_NS, bit [4]

This bit is a read-write alias of the Secure GICD_CTLR.ARE_NS bit.

If GICv2 backwards compatibility for Non-secure state is not implemented, this field is RAO/WI.

Bits [3:2]

Reserved, RES0.

EnableGrp1A, bit [1]

If ARE_NS == 1, then this bit is a read-write alias of the Secure GICD_CTLR.EnableGrp1NS bit.

If ARE_NS == 0, then this bit is RES0.

EnableGrp1, bit [0]

If ARE_NS == 0, then this bit is a read-write alias of the Secure GICD_CTLR.EnableGrp1NS bit.

If ARE_NS == 1, then this bit is RES0.

When in a system that supports only a single Security state:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RWP	RES0														nASSGReq		E1NWF	DS	RES0	ARE	RES0	EnableGrp1		EnableGrp0							

RWP, bit [31]

Register Write Pending. Read only. Indicates whether a register write is in progress or not:

RWP	Meaning
0b0	No register write in progress. The effects of previous register writes to the affected register fields are visible to all logical components of the GIC architecture, including the CPU interfaces.
0b1	Register write in progress. The effects of previous register writes to the affected register fields are not guaranteed to be visible to all logical components of the GIC architecture, including the CPU interfaces, as the effects of the changes are still being propagated.

This field tracks updates to:

- GICD_CTLR[2:0], the Group Enables, for transitions from 1 to 0 only.
- GICD_CTLR[7:4], the ARE bits, E1NWF bit and DS bit.

- GICD_ICENABLER<n>, the bits that allow disabling of SPIs.

Updates to other register fields are not tracked by this field.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:9]

Reserved, RES0.

nASSGReq, bit [8]

When FEAT_GICv4p1 is implemented:

Controls whether SGIs have an active state.

This bit is RES0 if [GICD_TYPER2](#).GICD_TYPER2.nASSGReq is 0.

This bit is WI when any of GICD_CTLR.{EnableGrp0,EnableGrp1} is 1.

nASSGReq	Meaning
0b0	SGIs have an active state and must be deactivated.
0b1	SGIs do not have an active state and do not require deactivation.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Otherwise:

Reserved, RES0.

E1NWF, bit [7]

Enable 1 of N Wakeup Functionality.

It is IMPLEMENTATION DEFINED whether this bit is programmable, or RAZ/WI.

If it is implemented, then it has the following behavior:

E1NWF	Meaning
0b0	A PE that is asleep cannot be picked for 1 of N interrupts.
0b1	A PE that is asleep can be picked for 1 of N interrupts as determined by IMPLEMENTATION DEFINED controls.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

DS, bit [6]

Disable Security. This field is RAO/WI.

Bit [5]

Reserved, RES0.

ARE, bit [4]

Affinity Routing Enable.

ARE	Meaning
0b0	Affinity routing disabled.
0b1	Affinity routing enabled.

Changing the ARE settings from 0 to 1 is UNPREDICTABLE except when all of the following apply:

- GICD_CTLR.EnableGrp1==0.
- GICD_CTLR.EnableGrp0==0.

Changing ARE from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility is not implemented, this field is RAO/WI.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Bits [3:2]

Reserved, RES0.

EnableGrp1, bit [1]

Enable Group 1 interrupts.

EnableGrp1	Meaning
0b0	Group 1 interrupts disabled.
0b1	Group 1 interrupts enabled.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enable Group 0 interrupts.

EnableGrp0	Meaning
0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICD_CTLR

If an interrupt is pending within a CPU interface when the corresponding GICD_CTLR.EnableGrpX bit is written from 1 to 0 the interrupt must be retrieved from the CPU interface.

Note

This might have no effect on the forwarded interrupt if it has already been activated. When a write changes the value of ARE for a Security state or the value of the DS bit, the format used for interpreting the remaining bits provided in the write data is the format that applied before the write takes effect.

GICD_CTLR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0000	GICD_CTLR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICD_ICACTIVER<n>, Interrupt Clear-Active Registers, n = 0 - 31

The GICD_ICACTIVER<n> characteristics are:

Purpose

Deactivates the corresponding interrupt. These registers are used when saving and restoring GIC state.

Configuration

These registers are available in all GIC configurations. If [GICD_CTLR.DS](#)==0, these registers are Common.

The number of implemented GICD_ICACTIVER<n> registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_ICACTIVER0 is Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_ICACTIVER0 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ICACTIVER<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	
Clear_active_bit31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27	Clear_active_bit26	Clear_active_bit25

Clear_active_bit<x>, bit [x], for x = 31 to 0

Removes the active state from interrupt number 32n + x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICACTIVER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ICACTIVER is (0x380 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Accessing GICD_ICTIVER<n>

When affinity routing is enabled for the Security state of an interrupt, the bits corresponding to SGIs and PPIs in that Security state are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by [GICR_ICTIVER0](#).

Bits corresponding to unimplemented interrupts are RAZ/WI.

If [GICD_CTLR.DS](#)==0, unless the [GICD_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

GICD_ICTIVER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0380 + (4 * n)	GICD_ICTIVER<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICD_ICACTIVER<n>E, Interrupt Clear-Active Registers (extended SPI range), n = 0 - 31

The GICD_ICACTIVER<n>E characteristics are:

Purpose

Removes the active state from the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICACTIVER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICACTIVER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ICACTIVER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	
Clear_active_bit31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27	Clear_active_bit26	Clear_active_bit25

Clear_active_bit<x>, bit [x], for x = 31 to 0

For the extended SPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICACTIVER<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.
- The offset of the required GICD_ICACTIVER<n>E is $(0 \times 1C00 + (4 \times n))$.
- The bit number of the required group modifier bit in this register is $(m-4096) \text{ MOD } 32$.

Accessing GICD_ICACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICACTIVER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x1C00 + (4 * n)	GICD_ICACTIVER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICD_ICENABLER<n>, Interrupt Clear-Enable Registers, n = 0 - 31

The GICD_ICENABLER<n> characteristics are:

Purpose

Disables forwarding of the corresponding interrupt to the CPU interfaces.

Configuration

These registers are available in all GIC configurations. If [GICD_CTLR.DS](#)=0, these registers are Common.

The number of implemented [GICD_ICENABLER<n>](#) registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_ICENABLER0 is Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_ICENABLER0 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ICENABLER<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_enable_bit31	Clear_enable_bit30	Clear_enable_bit29	Clear_enable_bit28	Clear_enable_bit27	Clear_enable_bit26

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, controls the forwarding of interrupt number $32n + x$ to the CPU interfaces. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICENABLER<n> number, n, is given by $n = m \text{ DIV } 32$.
- The offset of the required GICD_ICENABLER is $(0 \times 180 + (4 \times n))$.
- The bit number of the required group modifier bit in this register is $m \text{ MOD } 32$.

Note

Writing a 1 to a GICD_ICENABLER<n> bit only disables the forwarding of the corresponding interrupt from the Distributor to any CPU interface. It does not prevent the interrupt from changing state, for example becoming pending or active and pending if it is already active.

Accessing GICD_ICENABLER<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICENABLER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When [GICD_CTLR.DS](#)==0, bits corresponding to Group 0 and Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to [GICD_ISENABLER<n>](#) and [GICD_ICENABLER<n>](#) where n=0.

Completion of a write to this register does not guarantee that the effects of the write are visible throughout the affinity hierarchy. To ensure an enable has been cleared, software must write to the register with bits set to 1 to clear the required enables. Software must then poll [GICD_CTLR.RWP](#) until it has the value zero.

GICD_ICENABLER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0180 + (4 * n)	GICD_ICENABLER<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICD_ICENABLER<n>E, Interrupt Clear-Enable Registers, n = 0 - 31

The GICD_ICENABLER<n>E characteristics are:

Purpose

Disables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICENABLER<n>E are RES0.

When [GICD_TYPER.ESPI](#)==0, these registers are RES0.

When [GICD_TYPER.ESPI](#)==1, the number of implemented [GICD_ICENABLER<n>E](#) registers is ([GICD_TYPER.ESPI_range](#)+1). Registers are numbered from 0.

Attributes

GICD_ICENABLER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_enable_bit31	Clear_enable_bit30	Clear_enable_bit29	Clear_enable_bit28	Clear_enable_bit27	Clear_enable_bit26

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For the extended SPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICENABLER<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.
- The offset of the required GICD_ICENABLER<n>E is $(0x1400 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-4096) \text{ MOD } 32$.

Accessing GICD_ICENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICENABLER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS==0](#), bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x1400 + (4 * n)	GICD_ICENABLER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICD_ICFGR<n>, Interrupt Configuration Registers, n = 0 - 63

The GICD_ICFGR<n> characteristics are:

Purpose

Determines whether the corresponding interrupt is edge-triggered or level-sensitive.

Configuration

These registers are available in all GIC configurations. If the GIC implementation supports two Security states, these registers are Common.

GICD_ICFGR1 is Banked for each connected PE with [GICR_TYPER](#).Processor_Number < 8.

Accessing GICD_ICFGR1 from a PE with [GICR_TYPER](#).Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICFGR<n>

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

For SGIs, Int_config fields are RO, meaning that GICD_ICFGR0 is RO.

Changing Int_config when the interrupt is individually enabled is UNPREDICTABLE.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

Fields corresponding to unimplemented interrupts are RAZ/WI.

Attributes

GICD_ICFGR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13
Int_config15	Int_config14	Int_config13	Int_config12	Int_config11	Int_config10	Int_config9	Int_config8	Int_config7	Int_config6	Int_config5	Int_config4	Int_config3	Int_config2	Int_config1	Int_config0	Int_config0	Int_config0	Int_config0

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b10	Corresponding interrupt is edge-triggered.

Int_config[0] (bit [2x]) is RES0.

For SGIs, this field always indicates edge-triggered.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICD_ICFGR<n>

For SPIs and PPIs, when [GICD_CTLR.DS](#)==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICD_ICFGR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0C00 + (4 * n)	GICD_ICFGR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_ICFGR<n>E, Interrupt Configuration Registers (Extended SPI Range), n = 0 - 63

The GICD_ICFGR<n>E characteristics are:

Purpose

Determines whether the corresponding SPI in the extended SPI range is edge-triggered or level-sensitive.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICFGR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICFGR<n>E registers is ((GICD_TYPER.ESPI_range+1)*2). Registers are numbered from 0.

Attributes

GICD_ICFGR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13
Int_config15	Int_config14	Int_config13	Int_config12	Int_config11	Int_config10	Int_config9	Int_config8	Int_config7	Int_config6	Int_config5	Int_config4	Int_config3	Int_config2	Int_config1	Int_config0	Int_config0	Int_config0	Int_config0

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

Int_config[0] (bit[2x]) is RES0.

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b10	Corresponding interrupt is edge-triggered.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICD_ICFGR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICFGR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICFGR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
-----------	-------	--------	----------

GIC Distributor	Dist_base	0x3000 + (4 * n)	GICD_ICFGR<n>E
--------------------	-----------	---------------------	----------------

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICD_ICPENDR<n>, Interrupt Clear-Pending Registers, n = 0 - 31

The GICD_ICPENDR<n> characteristics are:

Purpose

Removes the pending state from the corresponding interrupt.

Configuration

These registers are available in all GIC configurations. If [GICD_CTLR.DS](#)==0, these registers are Common.

The number of implemented [GICD_ICPENDR<n>](#) registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_ICPENDR0 is Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_ICPENDR0 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ICPENDR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_pending_bit31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_pending_bit27	Clear_pending_bit26

Clear_pending_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, removes the pending state from interrupt number 32n + x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on any PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending: <ul style="list-style-type: none"> On this PE if the interrupt is an SGI or PPI. On at least one PE if the interrupt is an SPI. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: <ul style="list-style-type: none"> If the interrupt is an SGI. In this case, the write is ignored. The pending state of an SGI can be cleared using GICD_CPENDDSGIR<n>. If the interrupt is not pending and is not active and pending. If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICPENDR<n> number, n, is given by $n = m \text{ DIV } 32$.
- The offset of the required GICD_ICPENDR is $(0x200 + (4*n))$.
- The bit number of the required group modifier bit in this register is $m \text{ MOD } 32$.

Accessing GICD_ICPENDR<n>

Clear-pending bits for SGIs are RO/WI.

When affinity routing is enabled for the Security state of an interrupt:

- Bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by [GICR_ICPENDR0](#).
- Bits corresponding to Group 0 and Group 1 Secure interrupts can only be cleared by Secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If [GICD_CTLR.DS](#)==0, unless the [GICD_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

GICD_ICPENDR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0280 + (4 * n)	GICD_ICPENDR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_ICPENDR<n>E, Interrupt Clear-Pending Registers (extended SPI range), n = 0 - 31

The GICD_ICPENDR<n>E characteristics are:

Purpose

Removes the pending state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICPENDR<n>E are RES0.

When [GICD_TYPER.ESPI](#)==0, these registers are RES0.

When [GICD_TYPER.ESPI](#)==1, the number of implemented GICD_ICPENDR<n>E registers is ([GICD_TYPER.ESPI_range](#)+1). Registers are numbered from 0.

Attributes

GICD_ICPENDR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_pending_bit31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_pending_bit27	Clear_pending_bit26

Clear_pending_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the pending state to interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: <ul style="list-style-type: none">If the interrupt is not pending and is not active and pending.If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ICPENDR<n>E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICPENDR<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.
- The offset of the required GICD_ICPENDR<n>E is $(0 \times 1800 + (4 * n))$.
- The bit number of the required group modifier bit in this register is $(m-4096) \text{ MOD } 32$.

Accessing GICD_ICPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICPENDR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	$0 \times 1800 + (4 * n)$	GICD_ICPENDR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_IGROUPR<n>, Interrupt Group Registers, n = 0 - 31

The GICD_IGROUPR<n> characteristics are:

Purpose

Controls whether the corresponding interrupt is in Group 0 or Group 1.

Configuration

These registers are available in all GIC configurations. If [GICD_CTLR.DS](#)==0, these registers are Secure.

The number of implemented GICD_IGROUPR<n> registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_IGROUPR0 is Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_IGROUPR0 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_IGROUPR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Group_status_bit31	Group_status_bit30	Group_status_bit29	Group_status_bit28	Group_status_bit27	Group_status_bit26

Group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit.

Group_status_bit<x>	Meaning
0b0	When GICD_CTLR.DS ==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS ==0, the corresponding interrupt is Secure.
0b1	When GICD_CTLR.DS ==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS ==0, the corresponding interrupt is Non-secure Group 1.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICD_IGRPMODR<n>](#) to form a 2-bit field that defines an interrupt group. The encoding of this field is described in [GICD_IGRPMODR<n>](#).

If affinity routing is disabled for the Security state of an interrupt, then:

- The corresponding [GICD_IGRPMODR<n>](#) bit is RES0.
- For Secure interrupts, the interrupt is Secure Group 0.
- For Non-secure interrupts, the interrupt is Non-secure Group 1.

The reset behaviour of this field is:

- On a GIC reset:

- When n == 0, this field resets to an UNKNOWN value.
- When n > 0, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGROUPR<n> number, n, is given by $n = m \text{ DIV } 32$.
- The offset of the required GICD_IGROUP is $(0x080 + (4*n))$.
- The bit number of the required group modifier bit in this register is $m \text{ MOD } 32$.

Accessing GICD_IGROUPR<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_IGROUPR0.

When [GICD_CTLR.DS](#)==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Accesses to GICD_IGROUPR0 when affinity routing is not enabled for a Security state access the same state as [GICR_IGROUPR0](#), and must update Redistributor state associated with the PE performing the accesses. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IGROUPR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	$0x0080 + (4 * n)$	GICD_IGROUPR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.

GICD_IGROUPR<n>E, Interrupt Group Registers (extended SPI range), n = 0 - 31

The GICD_IGROUPR<n>E characteristics are:

Purpose

Controls whether the corresponding SPI in the extended SPI range is in Group 0 or Group 1.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IGROUPR<n>E are RES0.

When [GICD_TYPER.ESPI](#)==0, these registers are RES0.

When [GICD_TYPER.ESPI](#)==1:

- The number of implemented GICD_IGROUPR<n>E registers is ([GICD_TYPER.ESPI_range](#)+1). Registers are numbered from 0.
- When [GICD_CTLR.DS](#)==0, this register is Secure.

Attributes

GICD_IGROUPR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Group_status_bit31	Group_status_bit30	Group_status_bit29	Group_status_bit28	Group_status_bit27	Group_status_bit26

Group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit.

Group_status_bit<x>	Meaning
0b0	When GICD_CTLR.DS ==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS ==0, the corresponding interrupt is Secure.
0b1	When GICD_CTLR.DS ==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS ==0, the corresponding interrupt is Non-secure Group 1.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICD_IGRPMODR<n>E](#) to form a 2-bit field that defines an interrupt group. The encoding of this field is described in [GICD_IGRPMODR<n>E](#).

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0:

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGROUPR<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.
- The offset of the required GICD_IGROUPR<n>E is $(0 \times 1000 + (4 \times n))$.

- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_IGROUPR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGROUPR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IGROUPR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x1000 + (4 * n)	GICD_IGROUPR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_IGRPMODR<n>, Interrupt Group Modifier Registers, n = 0 - 31

The GICD_IGRPMODR<n> characteristics are:

Purpose

When [GICD_CTLR.DS==0](#), this register together with the [GICD_IGROUPR<n>](#) registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- Secure Group 1.

Configuration

When [GICD_CTLR.DS==0](#), these registers are Secure.

The number of implemented [GICD_IGROUPR<n>](#) registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

When [GICD_CTLR.ARE_S==0](#) or [GICD_CTLR.DS==1](#), the GICD_IGRPMODR<n> registers are RES0. An implementation can make these registers RAZ/WI in this case.

Attributes

GICD_IGRPMODR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	
Group_modifier_bit31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28	Group_modifier_bit27	Group...

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. When affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICD_IGROUPR<n>](#) to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGRPMODR<n> number, n, is given by $n = m \text{ DIV } 32$.
- The offset of the required GICD_IGRPMODR is $(0 \times 080 + (4 * n))$.
- The bit number of the required group modifier bit in this register is $m \text{ MOD } 32$.

See [GICD_IGROUPR<n>](#) for information about the GICD_IGRPMODR0 reset value.

Accessing GICD_IGRPMODR<n>

When affinity routing is enabled for Secure state, GICD_IGRPMODR0 is RES0 and equivalent functionality is proved by [GICR_IGRPMODR0](#).

When [GICD_CTLR](#).DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IGRPMODR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0D00 + (4 * n)	GICD_IGRPMODR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_IGRPMODR<n>E, Interrupt Group Modifier Registers (extended SPI range), n = 0 - 31

The GICD_IGRPMODR<n>E characteristics are:

Purpose

When [GICD_CTLR.DS](#)==0, this register together with the [GICD_IGROUPR<n>E](#) registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IGRPMODR<n>E are RES0.

GICD_IGRPMODR<n>E resets to 0x00000000.

When [GICD_TYPER.ESPI](#)==0, these registers are RES0.

When [GICD_TYPER.ESPI](#)==1:

- The number of implemented GICD_IGRPMODR<n>E registers is ([GICD_TYPER.ESPI_range](#)+1). Registers are numbered from 0.
- When [GICD_CTLR.DS](#)==0, this register is Secure.

Attributes

GICD_IGRPMODR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	
Group_modifier_bit31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28	Group_modifier_bit27	Group_modifier_bit26

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICD_IGROUPR<n>E](#) to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGRPMODR<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.
- The offset of the required GICD_IGRPMODR<n>E is $(0x3400 + (4*n))$.

- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_IGRPMODR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGRPMODR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS==0](#), bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IGRPMODR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x3400 + (4 * n)	GICD_IGRPMODR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_IIDR, Distributor Implementer Identification Register

The GICD_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the Distributor.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GICD_IIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ProductID								RES0				Variant				Revision				Implementer											

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the Distributor:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

Accessing GICD_IIDR

GICD_IIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0008	GICD_IIDR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_IPRIORITYR<n>, Interrupt Priority Registers, n = 0 - 254

The GICD_IPRIORITYR<n> characteristics are:

Purpose

Holds the priority of the corresponding interrupt.

Configuration

These registers are available in all configurations of the GIC. When [GICD_CTLR.DS](#)=0, these registers are Common.

The number of implemented GICD_IPRIORITYR<n> registers is 8*([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_IPRIORITYR0 to GICD_IPRIORITYR7 are Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_IPRIORITYR0 to GICD_IPRIORITYR7 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_IPRIORITYR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Priority_offset_3B								Priority_offset_2B								Priority_offset_1B								Priority_offset_0B							

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IPRIORITYR<n> number, n, is given by $n = m \text{ DIV } 4$.
- The offset of the required GICD_IPRIORITYR<n> register is $(0x400 + (4*n))$.
- The byte offset of the required Priority field in this register is $m \text{ MOD } 4$, where:
 - Byte offset 0 refers to register bits [7:0].
 - Byte offset 1 refers to register bits [15:8].
 - Byte offset 2 refers to register bits [23:16].
 - Byte offset 3 refers to register bits [31:24].

Accessing GICD_IPRIORITYR<n>

These registers are always used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt:

- [GICR_IPRIORITYR<n>](#) is used instead of GICD_IPRIORITYR<n> where n = 0 to 7 (that is, for SGIs and PPIs).
- GICD_IPRIORITYR<n> is RAZ/WI where n = 0 to 7.

These registers are byte-accessible.

A register field corresponding to an unimplemented interrupt is RAZ/WI.

A GIC might implement fewer than eight priority bits, but must implement at least bits [7:4] of each field. In each field, unimplemented bits are RAZ/WI, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When [GICD_CTLR.DS](#)==0:

- A register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in 'Software accesses of interrupt priority' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

It is IMPLEMENTATION DEFINED whether changing the value of a priority field changes the priority of an active interrupt.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IPRIORITYR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0400 + (4 * n)	GICD_IPRIORITYR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_IPRIORITYR<n>E, Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC., n = 0 - 255

The GICD_IPRIORITYR<n>E characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IPRIORITYR<n>E are RES0.

When [GICD_TYPER](#).ESPI==0, these registers are RES0.

When [GICD_TYPER](#).ESPI==1, the number of implemented GICD_IPRIORITYR<n>E registers is (([GICD_TYPER](#).ESPI_range+1)*8). Registers are numbered from 0.

Attributes

GICD_IPRIORITYR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Priority_offset_3B								Priority_offset_2B								Priority_offset_1B								Priority_offset_0B							

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

GICD_IPRIORITYR<n>E, Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.,
n = 0 - 255

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IPRIORITYR<n> number, n, is given by $n = (m-4096) \text{ DIV } 4$.
- The offset of the required GICD_IPRIORITYR<n>E register is $(0x2000 + (4*n))$.
- The byte offset of the required Priority field in this register is $m \text{ MOD } 4$, where:
 - Byte offset 0 refers to register bits [7:0].
 - Byte offset 1 refers to register bits [15:8].
 - Byte offset 2 refers to register bits [23:16].
 - Byte offset 3 refers to register bits [31:24].

Accessing GICD_IPRIORITYR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISACTIVER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS==0](#):

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

GICD_IPRIORITYR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x2000 + (4 * n)	GICD_IPRIORITYR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_IROUTER<n>, Interrupt Routing Registers, n = 32 - 1019

The GICD_IROUTER<n> characteristics are:

Purpose

When affinity routing is enabled, provides routing information for the SPI with INTID n.

Configuration

These registers are available in all configurations of the GIC. If the GIC implementation supports two Security states, these registers are Common.

The maximum value of n is given by $(32 * (\text{GICD_TYPER.ITLinesNumber} + 1) - 1)$. [GICD_IROUTER<n>](#) registers where n=0 to 31 are reserved.

Attributes

GICD_IROUTER<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																								Aff3								
Interrupt_Routing_Mode	RES0								Aff2								Aff1								Aff0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Interrupt_Routing_Mode, bit [31]

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

Interrupt_Routing_Mode	Meaning
0b0	Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.
0b1	Interrupts routed to any PE defined as a participating node.

If `GICD_IROUTER<n>.IRM == 0` and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending behavior is `CONSTRAINED UNPREDICTABLE`:

- The interrupt is not forwarded to any PE, direct reads return the written value

- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the UNKNOWN implemented PE
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the written value

In implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI.

When this bit is set to 1, GICD_IROUTER<n>.{Aff3, Aff2, Aff1, Aff0} are UNKNOWN.

Note

An implementation might choose to make the Aff<n> fields RO when this field is 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:24]

Reserved, RES0.

Aff2, bits [23:16]

Affinity level 2.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For an SPI with INTID m:

- The corresponding GICD_IROUTER<n> register number, n, is given by $n = m$.
- The offset of the GICD_IROUTER<n> register is $0x6000 + 8n$.

Accessing GICD_IROUTER<n>

These registers are used only when affinity routing is enabled. When affinity routing is not enabled:

- These registers are RES0. An implementation is permitted to make the register RAZ/WI in this case.
- The [GICD_ITARGETSR<n>](#) registers provide interrupt routing information.

Note

When affinity routing becomes enabled for a Security state (for example, following a reset or following a write to [GICD_CTLR](#)) the value of all writeable fields in this register is UNKNOWN for that Security state. When the group of an

interrupt changes so the ARE setting for the interrupt changes to 1, the value of this register is UNKNOWN for that interrupt.

If [GICD_CTLR.DS](#)==0, unless the [GICD_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any GICD_IROUTER<n> registers that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

Note

For each interrupt, a GIC implementation might support fewer than 256 values for an affinity level. In this case, some bits of the corresponding affinity level field might be RO. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IROUTER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x6000 + (8 * n)	GICD_IROUTER<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICD_IROUTER<n>E, Interrupt Routing Registers (Extended SPI Range), n = 0 - 1023

The GICD_IROUTER<n>E characteristics are:

Purpose

When affinity routing is enabled, provides routing information for the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IROUTER<n>E are RES0.

When [GICD_TYPER.ESPI](#)==0, these registers are RES0.

When [GICD_TYPER.ESPI](#)==1, the number of implemented GICD_IROUTER<n>E registers is ((([GICD_TYPER.ESPI_range](#)+1)*32)-1). Registers are numbered from 0.

Attributes

GICD_IROUTER<n>E is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32				
RES0																								Aff3											
Interrupt_Routing_Mode				RES0								Aff2								Aff1								Aff0							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0				

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Interrupt_Routing_Mode, bit [31]

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

Interrupt_Routing_Mode	Meaning
0b0	Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.
0b1	Interrupts routed to any PE defined as a participating node.

If GICD_IROUTER<n>E.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending behavior is CONSTRAINED UNPREDICTABLE:

GICD_IROUTER<n>E, Interrupt Routing Registers (Extended SPI Range), n = 0 - 1023

- The interrupt is not forwarded to any PE, direct reads return the written value
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the UNKNOWN implemented PE
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the written value

In implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI.

When this bit is set to 1, GICD_IROUTER<n>E.{Aff3, Aff2, Aff1, Aff0} are UNKNOWN.

Note

An implementation might choose to make the Aff<n> fields RO when this field is 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:24]

Reserved, RES0.

Aff2, bits [23:16]

Affinity level 2.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For an SPI with INTID m:

- The corresponding GICD_IROUTER<n>E register number, n, is given by $n = m$.
- The offset of the GICD_IROUTER<n>E register is $0x6000 + 8n$.

Accessing GICD_IROUTER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IROUTER<n>E, the register is RES0.

When [GICD_CTLR.DS=0](#), a register that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IROUTER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x8000 + (8 * n)	GICD_IROUTER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_ISACTIVER<n>, Interrupt Set-Active Registers, n = 0 - 31

The GICD_ISACTIVER<n> characteristics are:

Purpose

Activates the corresponding interrupt. These registers are used when saving and restoring GIC state.

Configuration

These registers are available in all GIC configurations. If [GICD_CTLR.DS](#)==0, these registers are Common.

The number of implemented [GICD_ISACTIVER<n>](#) registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_ISACTIVER0 is Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_ISACTIVER0 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ISACTIVER<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_active_bit31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_bit26	Set_active_bit25

Set_active_bit<x>, bit [x], for x = 31 to 0

Adds the active state to interrupt number 32n + x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISACTIVER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ISACTIVER is (0x300 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Accessing GICD_ISACTIVER<n>

When affinity routing is enabled for the Security state of an interrupt, bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by [GICR_ISACTIVER0](#).

Bits corresponding to unimplemented interrupts are RAZ/WI.

If [GICD_CTLR.DS](#) == 0, unless the [GICD_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

The bit reads as one if the status of the interrupt is active or active and pending. [GICD_ISPENDR<n>](#) and [GICD_ICPENDR<n>](#) provide the pending status of the interrupt.

GICD_ISACTIVER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0300 + (4 * n)	GICD_ISACTIVER<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_ISACTIVER<n>E, Interrupt Set-Active Registers (extended SPI range), n = 0 - 31

The GICD_ISACTIVER<n>E characteristics are:

Purpose

Adds the active state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ISACTIVER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISACTIVER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ISACTIVER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_active_bit31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_bit26	Set_active_bit25

Set_active_bit<x>, bit [x], for x = 31 to 0

For the extended SPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISACTIVER<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.
- The offset of the required GICD_ISACTIVER<n>E is $(0x1A00 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-4096) \text{ MOD } 32$.

Accessing GICD_ISACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISACTIVER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x1A00 + (4 * n)	GICD_ISACTIVER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICD_ISENABLER<n>, Interrupt Set-Enable Registers, n = 0 - 31

The GICD_ISENABLER<n> characteristics are:

Purpose

Enables forwarding of the corresponding interrupt to the CPU interfaces.

Configuration

These registers are available in all GIC configurations. If [GICD_CTLR.DS](#)==0, these registers are Common.

The number of implemented GICD_ISENABLER<n> registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_ISENABLER0 is Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_ISENABLER0 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ISENABLER<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_enable_bit31	Set_enable_bit30	Set_enable_bit29	Set_enable_bit28	Set_enable_bit27	Set_enable_bit26	Set_enable_bit25

Set_enable_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, controls the forwarding of interrupt number 32n + x to the CPU interfaces. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISENABLER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ISENABLER is (0x100 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

At start-up, and after a reset, a PE can use this register to discover which peripheral INTIDs the GIC supports. If [GICD_CTLR.DS](#)==0 in a system that supports EL3, the PE must do this for the Secure view of the available interrupts, and Non-secure software running on the PE must do this discovery after the Secure software has configured interrupts as Group 0/Secure Group 1 and Non-secure Group 1.

Accessing GICD_ISENABLER<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ISENABLER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When [GICD_CTLR.DS](#)==0, bits corresponding to Group 0 or Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to [GICD_ISENABLER<n>](#) and [GICD_ICENABLER<n>](#) where n=0.

For SPIs and PPIs, each bit controls the forwarding of the corresponding interrupt from the Distributor to the CPU interfaces.

GICD_ISENABLER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0100 + (4 * n)	GICD_ISENABLER<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_ISENABLER<n>E, Interrupt Set-Enable Registers, n = 0 - 31

The GICD_ISENABLER<n>E characteristics are:

Purpose

Enables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ISENABLER<n>E are RES0.

When [GICD_TYPER.ESPI](#)==0, these registers are RES0.

When [GICD_TYPER.ESPI](#)==1, the number of implemented [GICD_ISENABLER<n>E](#) registers is ([GICD_TYPER.ESPI_range](#)+1). Registers are numbered from 0.

Attributes

GICD_ISENABLER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_enable_bit31	Set_enable_bit30	Set_enable_bit29	Set_enable_bit28	Set_enable_bit27	Set_enable_bit26	Set_enable_bit25

Set_enable_bit<x>, bit [x], for x = 31 to 0

For the extended SPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISENABLER<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.
- The offset of the required GICD_ISENABLER<n>E is $(0x1200 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-4096) \text{ MOD } 32$.

Accessing GICD_ISENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISENABLER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS==0](#), bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x1200 + (4 * n)	GICD_ISENABLER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_ISPENDR<n>, Interrupt Set-Pending Registers, n = 0 - 31

The GICD_ISPENDR<n> characteristics are:

Purpose

Adds the pending state to the corresponding interrupt.

Configuration

These registers are available in all GIC configurations. If [GICD_CTLR.DS](#)=0, these registers are Common.

The number of implemented [GICD_ISPENDR<n>](#) registers is ([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_ISPENDR0 is Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_ISPENDR0 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ISPENDR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	
Set_pending_bit31	Set_pending_bit30	Set_pending_bit29	Set_pending_bit28	Set_pending_bit27	Set_pending_bit26	Set_pending_bit25

Set_pending_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, adds the pending state to interrupt number 32n + x. Reads and writes have the following behavior:

Set pending bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on any PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending: <ul style="list-style-type: none"> On this PE if the interrupt is an SGI or PPI. On at least one PE if the interrupt is an SPI. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: <ul style="list-style-type: none"> If the interrupt is an SGI. The pending state of an SGI can be set using GICD_SPENDSGIR<n>. If the interrupt is not inactive and is not active. If the interrupt is already pending because of a write to GICD_ISPENDR<n>. If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Accessing GICD_ISPENDR<n>

Set-pending bits for SGIs are read-only and ignore writes. The Set-pending bits for SGIs are provided as [GICD_SPENDSGIR<n>](#).

When affinity routing is enabled for the Security state of an interrupt:

- Bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ISPENDR0.
- Bits corresponding to Group 0 and Group 1 Secure interrupts can only be set by Secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If [GICD_CTLR.DS](#)==0, unless the [GICD_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

GICD_ISPENDR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0200 + (4 * n)	GICD_ISPENDR<n>

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_ISPENDR<n>E, Interrupt Set-Pending Registers (extended SPI range), n = 0 - 31

The GICD_ISPENDR<n>E characteristics are:

Purpose

Adds the pending state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ISPENDR<n>E are RES0.

When [GICD_TYPER](#).ESPI==0, these registers are RES0.

When [GICD_TYPER](#).ESPI==1, the number of implemented GICD_ISPENDR<n>E registers is ([GICD_TYPER](#).ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ISPENDR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	Se
Set_pending_bit31	Set_pending_bit30	Set_pending_bit29	Set_pending_bit28	Set_pending_bit27	Set_pending_bit26	Se

Set_pending_bit<x>, bit [x], for x = 31 to 0

For the extended SPIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: <ul style="list-style-type: none">• If the interrupt is already pending because of a write to GICD_ISPENDR<n>E.• If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISPENDR<n>E number, n, is given by $n = (m-4096) \text{ DIV } 32$.

- The offset of the required GICD_ISPENDR<n>E is $(0 \times 1600 + (4 * n))$.
- The bit number of the required group modifier bit in this register is $(m - 4096) \text{ MOD } 32$.

Accessing GICD_ISPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISPENDR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	$0 \times 1600 + (4 * n)$	GICD_ISPENDR<n>E

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_ITARGETSR<n>, Interrupt Processor Targets Registers, n = 0 - 254

The GICD_ITARGETSR<n> characteristics are:

Purpose

When affinity routing is not enabled, holds the list of target PEs for the interrupt. That is, it holds the list of CPU interfaces to which the Distributor forwards the interrupt if it is asserted and has sufficient priority.

Configuration

These registers are available in all configurations of the GIC. When [GICD_CTLR.DS](#)==0, these registers are Common.

The number of implemented GICD_ITARGETSR<n> registers is 8*([GICD_TYPER.ITLinesNumber](#)+1). Registers are numbered from 0.

GICD_ITARGETSR0 to GICD_ITARGETSR7 are Banked for each connected PE with [GICR_TYPER.Processor_Number](#) < 8.

Accessing GICD_ITARGETSR0 to GICD_ITARGETSR7 from a PE with [GICR_TYPER.Processor_Number](#) > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ITARGETSR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CPU_targets_offset_3B								CPU_targets_offset_2B								CPU_targets_offset_1B								CPU_targets_offset_0B							

PEs in the system number from 0, and each bit in a PE targets field refers to the corresponding PE. For example, a value of 0x3 means that the Pending interrupt is sent to PEs 0 and 1. For GICD_ITARGETSR0-GICD_ITARGETSR7, a read of any targets field returns the number of the PE performing the read.

CPU_targets_offset_3B, bits [31:24]

PE targets for an interrupt, at byte offset 3.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

CPU_targets_offset_2B, bits [23:16]

PE targets for an interrupt, at byte offset 2.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

CPU_targets_offset_1B, bits [15:8]

PE targets for an interrupt, at byte offset 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

CPU_targets_offset_0B, bits [7:0]

PE targets for an interrupt, at byte offset 0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

The bits that are set to 1 in the PE targets field determine which PEs are targeted:

Value of PE targets field	Interrupt targets
0bxxxxxx1	CPU interface 0
0bxxxxxx1x	CPU interface 1
0bxxxxxx1xx	CPU interface 2
0bxxxx1xxx	CPU interface 3
0bxxx1xxxx	CPU interface 4
0bxx1xxxxx	CPU interface 5
0bx1xxxxxx	CPU interface 6
0b1xxxxxxx	CPU interface 7

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ITARGETSR<n> number, n, is given by $n = m \text{ DIV } 4$.
- The offset of the required GICD_ITARGETSR<n> register is $(0x800 + (4*n))$.
- The byte offset of the required Priority field in this register is $m \text{ MOD } 4$, where:
 - Byte offset 0 refers to register bits [7:0].
 - Byte offset 1 refers to register bits [15:8].
 - Byte offset 2 refers to register bits [23:16].
 - Byte offset 3 refers to register bits [31:24].

Software can write to these registers at any time. Any change to a targets field value:

- Has no effect on any active interrupt. This means that removing a CPU interface from a targets list does not cancel an active state for interrupts on that CPU interface. There is no effect on interrupts that are active and pending until the active status is cleared, at which time it is treated as a pending interrupt.
- Has an effect on any pending interrupts. This means:
 - Enables the CPU interface to be chosen as a target for the pending interrupt using an IMPLEMENTATION DEFINED mechanism.
 - Removing a CPU interface from the target list of a pending interrupt removes the pending state of the interrupt on that CPU interface.

Accessing GICD_ITARGETSR<n>

These registers are used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt, the target PEs for an interrupt are defined by [GICD_IROUTER<n>](#) and the associated byte in GICD_ITARGETSR<n> is RES0. An implementation is permitted to make the byte RAZ/WI in this case.

- These registers are byte-accessible.
- A register field corresponding to an unimplemented interrupt is RAZ/WI.
- A field bit corresponding to an unimplemented CPU interface is RAZ/WI.
- GICD_ITARGETSR0-GICD_ITARGETSR7 are read-only. Each field returns a value that corresponds only to the PE reading the register.
- It is IMPLEMENTATION DEFINED which, if any, SPIs are statically configured in hardware. The field for such an SPI is read-only, and returns a value that indicates the PE targets for the interrupt.
- If [GICD_CTLR.DS](#)==0, unless the [GICD_NSACR<n>](#) registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

In a single connected PE implementation, all interrupts target one PE, and these registers are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_ITARGETSR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0800 + (4 * n)	GICD_ITARGETSR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICD_NSACR<n>, Non-secure Access Control Registers, n = 0 - 63

The GICD_NSACR<n> characteristics are:

Purpose

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

Configuration

The concept of selective enabling of Non-secure access to Group 0 and Secure Group 1 interrupts applies to SGIs and SPIs.

GICD_NSACR0 is a Banked register used for SGIs. A copy is provided for every PE that has a CPU interface and that supports this feature.

Attributes

GICD_NSACR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
NS_access15	NS_access14	NS_access13	NS_access12	NS_access11	NS_access10	NS_access9	NS_access8	NS_access7									

NS_access<x>, bits [2x+1:2x], for x = 15 to 0

Controls Non-secure access of the interrupt with ID 16n + x.

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:

NS_access<x>	Meaning
0b00	No Non-secure access is permitted to fields associated with the corresponding interrupt.
0b01	Non-secure read and write access is permitted to set-pending bits in GICD_ISPENDR<n> associated with the corresponding interrupt. A Non-secure write access to GICD_SETSPI_NSR is permitted to set the pending state of the corresponding interrupt. A Non-secure write access to GICD_SGIR is permitted to generate a Secure SGI for the corresponding interrupt. An implementation might also provide read access to clear-pending bits in GICD_ICPENDR<n> associated with the corresponding interrupt.
0b10	As 0b01, but adds Non-secure read and write access permission to fields associated with the corresponding interrupt in the GICD_ICPENDR<n> registers. A Non-secure write access to GICD_CLRSPI_NSR is permitted to clear the pending state of the corresponding interrupt. Also adds Non-secure read access permission to fields associated with the corresponding interrupt in the GICD_ISACTIVER<n> and GICD_ICACTIVER<n> registers.
0b11	For GICD_NSACR0 this encoding is reserved and treated as 10. For all other GICD_NSACR<n> registers this encoding is treated as 0b10, but adds Non-secure read and write access permission to GICD_ITARGETSR<n> and GICD_IROUTER<n> fields associated with the corresponding interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_NSACR<n> number, n, is given by $n = m \text{ DIV } 16$.
- The offset of the required GICD_NSACR<n> register is $(0xE00 + (4*n))$.

Note

Because each field in this register comprises two bits, GICD_NSACR0 controls access rights to SGI registers, GICD_NSACR1 controls access to PPI registers (and is always RAZ/WI), and all other GICD_NSACR<n> registers control access to SPI registers.

For compatibility with GICv2, writes to GICD_NSACR0 for a particular PE must be coordinated within the Distributor and must update [GICR_NSACR](#) for the Redistributor associated with that PE.

Accessing GICD_NSACR<n>

These registers are always used when affinity routing is not enabled. When affinity routing is enabled for the Secure state, GICD_NSACR0 is RES0 and [GICR_NSACR](#) provides equivalent functionality for SGIs.

These registers do not support PPIs, therefore GICD_NSACR1 is RAZ/WI.

GICD_NSACR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	$0xE00 + (4 * n)$	GICD_NSACR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **RAZ/WI**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RAZ/WI**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_NSACR<n>E, Non-secure Access Control Registers, n = 0 - 63

The GICD_NSACR<n>E characteristics are:

Purpose

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_NSACR<n>E are RES0.

When [GICD_TYPER.ESPI](#)==0, these registers are RES0.

When [GICD_TYPER.ESPI](#)==1, the number of implemented GICD_ICFGR<n>E registers is (([GICD_TYPER.ESPI_range](#)+1)*2). Registers are numbered from 0.

Attributes

GICD_NSACR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
NS_access15	NS_access14	NS_access13	NS_access12	NS_access11	NS_access10	NS_access9	NS_access8	NS_access7									

NS_access<x>, bits [2x+1:2x], for x = 15 to 0

Controls Non-secure access of the interrupt with ID 16n + x.

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:

NS_access<x>	Meaning
0b00	No Non-secure access is permitted to fields associated with the corresponding interrupt.
0b01	Non-secure read and write access is permitted to set-pending bits in GICD_ISPENDR<n>E associated with the corresponding interrupt. A Non-secure write access to GICD_SETSPI_NSR is permitted to set the pending state of the corresponding interrupt.
0b10	As 0b01, but adds Non-secure read and write access permission to fields associated with the corresponding interrupt in the GICD_ICPENDR<n>E registers. A Non-secure write access to GICD_CLRSPI_NSR is permitted to clear the pending state of the corresponding interrupt. Also adds Non-secure read access permission to fields associated with the corresponding interrupt in the GICD_ISACTIVER<n>E and GICD_ICACTIVER<n>E registers.
0b11	This encoding is treated as 0b10, but adds Non-secure read and write access permission to GICD_IROUTER<n>E fields associated with the corresponding interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_NSACR<n>E number, n, is given by $n = (m - 4096) \text{ DIV } 16$.
- The offset of the required GICD_NSACR<n>E register is $(0 \times 3600 + (4 * n))$.

Accessing GICD_NSACR<n>E

GICD_NSACR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	$0 \times 3600 + (4 * n)$	GICD_NSACR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **RAZ/WI**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RAZ/WI**.

GICD_SETSPI_NSR, Set Non-secure SPI Pending Register

The GICD_SETSPI_NSR characteristics are:

Purpose

Adds the pending state to a valid SPI if permitted by the Security state of the access and the [GICD_NSACR<n>](#) value for that SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

If [GICD_TYPER](#).MBIS == 0, this register is reserved.

When [GICD_CTLR](#).DS == 1, this register provides functionality for all SPIs.

Attributes

GICD_SETSPI_NSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																			INTID												

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or [GICD_SETSPI_SR](#) adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to [GICD_CLRSPI_NSR](#), [GICD_CLRSPI_SR](#), or [GICD_ICPENDR<n>](#).
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or [GICD_SETSPI_SR](#) adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to [GICD_CLRSPI_NSR](#) or [GICD_CLRSPI_SR](#). If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_SETSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding [GICD_NSACR<n>](#) register is 0.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can set the pending state of any valid SPI.

GICD_SETSPI_NSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0040	GICD_SETSPI_NSR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_SETSPI_SR, Set Secure SPI Pending Register

The GICD_SETSPI_SR characteristics are:

Purpose

Adds the pending state to a valid SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

If [GICD_TYPER](#).MBIS == 0, this register is reserved.

When [GICD_CTLR](#).DS == 1, this register is WI.

Attributes

GICD_SETSPI_SR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																			INTID												

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to [GICD_SETSPI_NSR](#) or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to [GICD_CLRSPI_NSR](#), [GICD_CLRSPI_SR](#), or [GICD_ICPENDR<n>](#).
- For a level-sensitive interrupt, a write to [GICD_SETSPI_NSR](#) or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to [GICD_CLRSPI_NSR](#) or [GICD_CLRSPI_SR](#). If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_SETSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICD_SETSPI_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0050	GICD_SETSPI_SR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WI**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WI**.

GICD_SGIR, Software Generated Interrupt Register

The GICD_SGIR characteristics are:

Purpose

Controls the generation of SGIs.

Configuration

This register is available in all configurations of the GIC. If the GIC supports two Security states this register is Common.

Attributes

GICD_SGIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0						TargetListFilter				CPUTargetList						NSATT	RES0						INTID								

Bits [31:26]

Reserved, RES0.

TargetListFilter, bits [25:24]

Determines how the Distributor processes the requested SGI.

TargetListFilter	Meaning
0b00	Forward the interrupt to the CPU interfaces specified by GICD_SGIR.CPUTargetList.
0b01	Forward the interrupt to all CPU interfaces except that of the PE that requested the interrupt.
0b10	Forward the interrupt only to the CPU interface of the PE that requested the interrupt.
0b11	Reserved.

CPUTargetList, bits [23:16]

When GICD_SGIR.TargetListFilter is 0b00, this field defines the CPU interfaces to which the Distributor must forward the interrupt.

Each bit of the field refers to the corresponding CPU interface. For example, CPUTargetList[0] corresponds to interface 0. Setting a bit to 1 indicates that the interrupt must be forwarded to the corresponding interface.

If this field is 0b00000000 when GICD_SGIR.TargetListFilter is 0b00, the Distributor does not forward the interrupt to any CPU interface.

NSATT, bit [15]

Specifies the required group of the SGI.

NSATT	Meaning
0b0	Forward the SGI specified in the INTID field to a specified CPU interface only if the SGI is configured as Group 0 on that interface.
0b1	Forward the SGI specified in the INTID field to a specified CPU interface only if the SGI is configured as Group 1 on that interface.

This field is writable only by a Secure access. Non-secure accesses can also generate Group 0 interrupts, if allowed to do so by GICD_NSACR0. Otherwise, Non-secure writes to GICD_SGIR generate an SGI only if the specified SGI is programmed as Group 1, regardless of the value of bit [15] of the write.

Bits [14:4]

Reserved, RES0.

INTID, bits [3:0]

The INTID of the SGI to forward to the specified CPU interfaces.

Accessing GICD_SGIR

This register is used only when affinity routing is not enabled. When affinity routing is enabled, this register is RES0.

It is IMPLEMENTATION DEFINED whether this register has any effect when the forwarding of interrupts by the Distributor is disabled by [GICD_CTLR](#).

GICD_SGIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0F00	GICD_SGIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_SPENDSGIR<n>, SGI Set-Pending Registers, n = 0 - 3

The GICD_SPENDSGIR<n> characteristics are:

Purpose

Adds the pending state to an SGI.

A write to this register changes the state of an inactive SGI to pending, and the state of an active SGI to active and pending.

Configuration

Four SGI set-pending registers are implemented. Each register contains eight set-pending bits for each of four SGIs, for a total of 16 possible SGIs.

In multiprocessor implementations, each PE has a copy of these registers.

Attributes

GICD_SPENDSGIR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SGI_set_pending_bits3								SGI_set_pending_bits2								SGI_set_pending_bits1								SGI_set_pending_bits0							

SGI_set_pending_bits<x>, bits [8x+7:8x], for x = 3 to 0

Adds the pending state to SGI number $4n + x$ for the PE corresponding to the bit number written to.

Reads and writes have the following behavior:

SGI_set_pending_bits<x>	Meaning
0x00	If read, indicates that the SGI from the corresponding PE is not pending and is not active and pending. If written, has no effect.
0x01	If read, indicates that the SGI from the corresponding PE is pending or is active and pending. If written, adds the pending state to the SGI for the corresponding PE.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For SGI ID m, generated by processing element C writing to the corresponding [GICD_SGIR](#) field, where DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_SPENDSGIR<n> number is given by $n = m \text{ DIV } 4$.
- The offset of the required register is $(0xF20 + (4n))$.
- The offset of the required field within the register GICD_SPENDSGIR<n> is given by $m \text{ MOD } 4$.
- The required bit in the 8-bit SGI set-pending field m is bit C.

Accessing GICD_SPENDSGIR<n>

These registers are used only when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt then the bit associated with SGI in that Security state is RES0. An implementation is permitted to make the register RAZ/WI in this case.

A register bit that corresponds to an unimplemented SGI is RAZ/WI.

These registers are byte-accessible.

If the GIC implementation supports two Security states:

- A register bit that corresponds to a Group 0 interrupt is RAZ/WI to Non-secure accesses.
- Register bits corresponding to unimplemented PEs are RAZ/WI.

GICD_SPENDSGIR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0F20 + (4 * n)	GICD_SPENDSGIR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_STATUSR, Error Reporting Status Register

The GICD_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

Attributes

GICD_STATUSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																WROD		RWOD		WRD		RRD									

Bits [31:4]

Reserved, RES0.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICD_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

GICD_STATUSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0010	GICD_STATUSR (S)

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0010	GICD_STATUSR (NS)

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICD_TYPER, Interrupt Controller Type Register

The GICD_TYPER characteristics are:

Purpose

Provides information about what features the GIC implementation supports. It indicates:

- Whether the GIC implementation supports two Security states.
- The maximum number of INTIDs that the GIC implementation supports.
- The number of PEs that can be used as interrupt targets.

Configuration

This register is available in all configurations of the GIC. When [GICD_CTLR.DS](#)==0, this register is Common.

Attributes

GICD_TYPER is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ESPI_range	RSS	No1N	A3V	IDbits	DVIS	LPIS	MBIS	num_LPis	SecurityExtn	RES0	ESPI	CPUNumber	ITLinesNumber																		

ESPI_range, bits [31:27]

When GICD_TYPER.ESPI == 1:

Indicates the maximum INTID in the Extended SPI range.

Maximum Extended SPI INTID is $(32 * (\text{ESPI_range} + 1) + 4095)$.

The ESPI_range field only indicates the maximum number of SPIs that the GIC implementation might support. This value determines the number of instances of the following interrupt registers:

- [GICD_IGROUPR<n>E](#).
- [GICD_ISENBALER<n>E](#).
- [GICD_ICENABLER<n>E](#).
- [GICD_ISPENDR<n>E](#).
- [GICD_ICPENDR<n>E](#).
- [GICD_ISACTIVER<n>E](#).
- [GICD_ICACTIVER<n>E](#).
- [GICD_IPRIORITYR<n>E](#).
- [GICD_ICFGR<n>E](#).
- [GICD_IROUTER<n>E](#).
- [GICD_IGRPMODR<n>E](#).

The GIC architecture does not require a GIC implementation to support a continuous range of SPI interrupt IDs. Software must check which SPI INTIDs are supported, up to the maximum value indicated by GICD_TYPER.ESPI_range.

Otherwise:

Reserved, RES0.

RSS, bit [26]

Range Selector Support.

RSS	Meaning
0b0	The IRI supports targeted SGIs with affinity level 0 values of 0 - 15.
0b1	The IRI supports targeted SGIs with affinity level 0 values of 0 - 255.

No1N, bit [25]

Indicates whether 1 of N SPI interrupts are supported.

No1N	Meaning
0b0	1 of N SPI interrupts are supported.
0b1	1 of N SPI interrupts are not supported.

A3V, bit [24]

Affinity 3 valid. Indicates whether the Distributor supports nonzero values of Affinity level 3.

A3V	Meaning
0b0	The Distributor only supports zero values of Affinity level 3.
0b1	The Distributor supports nonzero values of Affinity level 3.

IDbits, bits [23:19]

The number of interrupt identifier bits supported, minus one.

DVIS, bit [18]

When FEAT_GICv4 is implemented:

Indicates whether the implementation supports Direct Virtual LPI injection.

DVIS	Meaning
0b0	The implementation does not support Direct Virtual LPI injection.
0b1	The implementation supports Direct Virtual LPI injection.

Otherwise:

Reserved, RES0.

LPIS, bit [17]

Indicates whether the implementation supports LPIS.

LPIS	Meaning
0b0	The implementation does not support LPIS.
0b1	The implementation supports LPIS.

MBIS, bit [16]

Indicates whether the implementation supports message-based interrupts by writing to Distributor registers.

MBIS	Meaning
0b0	The implementation does not support message-based interrupts by writing to Distributor registers. The GICD_CLRSPI_NSR , GICD_SETSPI_NSR , GICD_CLRSPI_SR , and GICD_SETSPI_SR registers are reserved.
0b1	The implementation supports message-based interrupts by writing to the GICD_CLRSPI_NSR , GICD_SETSPI_NSR , GICD_CLRSPI_SR , or GICD_SETSPI_SR registers.

num_LPIs, bits [15:11]

Number of supported LPIs.

- 0b00000 Number of LPIs as indicated by GICD_TYPER.IDbits.
- All other values Number of LPIs supported is $2^{(\text{num_LPIs}+1)}$.
 - Available LPI INTIDs are $8192..(8192 + 2^{(\text{num_LPIs}+1)} - 1)$.
 - This field cannot indicate a maximum LPI INTID greater than that indicated by GICD_TYPER.IDbits.

When the supported INTID width is less than 14 bits, this field is RES0 and no LPIs are supported.

SecurityExtn, bit [10]

Indicates whether the GIC implementation supports two Security states:

When [GICD_CTLR.DS](#) == 1, this field is RAZ.

SecurityExtn	Meaning
0b0	The GIC implementation supports only a single Security state.
0b1	The GIC implementation supports two Security states.

Bit [9]

Reserved, RES0.

ESPI, bit [8]

Extended SPI

ESPI	Meaning
0b0	Extended SPI range not implemented.
0b1	Extended SPI range implemented.

CPUNumber, bits [7:5]

Reports the number of PEs that can be used when affinity routing is not enabled, minus 1.

These PEs must be numbered contiguously from zero, but the relationship between this number and the affinity hierarchy from MPIDR is IMPLEMENTATION DEFINED. If the implementation does not support ARE being zero, this field is 000.

ITLinesNumber, bits [4:0]

For the INTID range 32 to 1019, indicates the maximum SPI supported.

If the value of this field is N, the maximum SPI INTID is $32(N+1)$ minus 1. For example, 00011 specifies that the maximum SPI INTID is 127.

Regardless of the range of INTIDs defined by this field, interrupt IDs 1020-1023 are reserved for special purposes.

A value of 0 indicates no SPIs are support.

The ITLinesNumber field only indicates the maximum number of SPIs that the GIC implementation might support. This value determines the number of instances of the following interrupt registers:

- [GICD_IGROUPR<n>](#).
- [GICD_ISENABLER<n>](#).
- [GICD_ICENABLER<n>](#).
- [GICD_ISPENDR<n>](#).

- [GICD_ICPENDR<n>](#).
- [GICD_ISACTIVER<n>](#).
- [GICD_ICACTIVER<n>](#).
- [GICD_IPRIORITYR<n>](#).
- [GICD_ITARGETSR<n>](#).
- [GICD_ICFGR<n>](#).
- [GICD_IROUTER<n>](#).
- [GICD_IGRPMODR<n>](#).

The GIC architecture does not require a GIC implementation to support a continuous range of SPI interrupt IDs. Software must check which SPI INTIDs are supported, up to the maximum value indicated by GICD_TYPER.ITLinesNumber.

Accessing GICD_TYPER

GICD_TYPER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0004	GICD_TYPER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICD_TYPER2, Interrupt Controller Type Register 2

The GICD_TYPER2 characteristics are:

Purpose

Provides information about which features the GIC implementation supports.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GICD_TYPER2 are RES0.

When [GICD_CTLR.DS](#) == 0, this register is Common.

Attributes

GICD_TYPER2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
RES0																							nASSGICap		VIL		RES0		VID			

Bits [31:9]

Reserved, RES0.

nASSGICap, bit [8]

Indicates whether SGIs can be configured to not have an active state.

nASSGICap	Meaning
0b0	SGIs have an active state.
0b1	SGIs can be globally configured not to have an active state.

This bit is RES0 on implementations that support two Security states.

VIL, bit [7]

Indicates whether 16 bits of vPEID are implemented.

VIL	Meaning
0b0	GIC supports 16-bit vPEID.
0b1	GIC supports GICD_TYPER2.VID + 1 bits of vPEID.

Bits [6:5]

Reserved, RES0.

VID, bits [4:0]

When GICD_TYPER2.VIL == 1, the number of bits is equal to the bits of vPEID minus one.

When GICD_TYPER2.VIL == 0, this field is RES0.

Accessing GICD_TYPER2

GICD_TYPER2 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x000C	GICD_TYPER2

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICH_APR<n>, Active Priorities Registers, n = 0 - 3

The GICH_APR<n> characteristics are:

Purpose

These registers track which preemption levels are active in the virtual CPU interface, and indicate the current active priority. Corresponding bits are set to 1 in this register when an interrupt is acknowledged, based on [GICH_LR<n>](#). Priority, and the least significant bit set is cleared on EOI.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_APR<n> are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

The number of registers required depends on how many bits are implemented in [GICH_LR<n>](#). Priority:

- When 5 priority bits are implemented, 1 register is required (GICH_APR0).
- When 6 priority bits are implemented, 2 registers are required (GICH_APR0, GICH_APR1).
- When 7 priority bits are implemented, 4 registers are required (GICH_APR0, GICH_APR1, GICH_APR2, GICH_APR3).

Unimplemented registers are RAZ/WI.

Attributes

GICH_APR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

P<x>, bit [x], for x = 31 to 0

Active priorities. Possible values of each bit are:

P<x>	Meaning
0b0	There is no interrupt active at the priority corresponding to that bit.
0b1	There is an interrupt active at the priority corresponding to that bit.

The correspondence between priorities and bits depends on the number of bits of priority that are implemented.

If 5 bits of priority are implemented (bits [7:3] of priority), then there are 32 priority groups, and the active state of these priorities are held in GICH_APR0 in the bits corresponding to Priority[7:3].

If 6 bits of priority are implemented (bits [7:2] of priority), then there are 64 priority groups, and:

- The active state of priorities 0 - 124 are held in GICH_APR0 in the bits corresponding to 0:Priority[6:2].
- The active state of priorities 128 - 252 are held in GICH_APR1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of priority are implemented (bits [7:1] of priority), then there are 128 priority groups, and:

- The active state of priorities 0 - 62 are held in GICH_APR0 in the bits corresponding to 00:Priority[5:1].
- The active state of priorities 64 - 126 are held in GICH_APR1 in the bits corresponding to 01:Priority[5:1].
- The active state of priorities 128 - 190 are held in GICH_APR2 in the bits corresponding to 10:Priority[5:1].
- The active state of priorities 192 - 254 are held in GICH_APR3 in the bits corresponding to 11:Priority[5:1].

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing GICH_APR<n>

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- In AArch64:
 - For Group 0, [ICH_AP0R<n>_EL2](#).
 - For Group 1, [ICH_AP1R<n>_EL2](#).
- In AArch32:
 - For Group 0, [ICH_AP0R<n>](#).
 - For Group 1, [ICH_AP1R<n>](#).

GICH_APR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	$0 \times 00F0 + (4 * n)$	GICH_APR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICH_EISR, End Interrupt Status Register

The GICH_EISR characteristics are:

Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_EISR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_EISR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																Status15	Status14	Status13	Status12	Status11	Status10	Status9	Status8	Status7	Status6	Status5	Status4	Status3	Status2	Status1	Status0

Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

EOI maintenance interrupt status for List register <n>:

Status<n>	Meaning
0b0	GICH_LR<n> does not have an EOI maintenance interrupt.
0b1	GICH_LR<n> has an EOI maintenance interrupt that has not been handled.

For any [GICH_LR<n>](#) register, the corresponding status bit is set to 1 if all of the following are true:

- [GICH_LR<n>](#).State is 0b00.
- [GICH_LR<n>](#).HW == 0.
- [GICH_LR<n>](#).EOI == 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICH_EISR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICH_EISR](#) provides equivalent functionality.
- For AArch64 implementations, [ICH_EISR_EL2](#) provides equivalent functionality.

Bits corresponding to unimplemented List registers are RAZ.

GICH_EISR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0020	GICH_EISR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICH_ELRSR, Empty List Register Status Register

The GICH_ELRSR characteristics are:

Purpose

Indicates which List registers contain valid interrupts.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_ELRSR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_ELRSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																Status15	Status14	Status13	Status12	Status11	Status10	Status9	Status8	Status7	Status6	Status5	Status4	Status3	Status2	Status1	Status0

Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>:

Status<n>	Meaning
0b0	GICH_LR<n> , if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.
0b1	GICH_LR<n> does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.

For any [GICH_LR<n>](#) register, the corresponding status bit is set to 1 if [GICH_LR<n>](#).State is 0b00 and either:

- [GICH_LR<n>](#).HW == 1.
- [GICH_LR<n>](#).EOI == 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 1.

Accessing GICH_ELRSR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICH_ELRSR](#) provides equivalent functionality.
- For AArch64 implementations, [ICH_ELRSR_EL2](#) provides equivalent functionality.

Bits corresponding to unimplemented List registers are RES0.

GICH_ELRSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0030	GICH_ELRSR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICH_HCR, Hypervisor Control Register

The GICH_HCR characteristics are:

Purpose

Controls the virtual CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_HCR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_HCR is a 32-bit register.

Field descriptions

3130292827262524232221201918171615141312111098		7	6	5	4	3	2	1	0		
EOICount	RES0			VGrp1DIE	VGrp1EIE	VGrp0DIE	VGrp0EIE	NPIE	LRENPIE	UIE	En

EOICount, bits [31:27]

Counts the number of EOIs received that do not have a corresponding entry in the List registers. The virtual CPU interface increments this field automatically when a matching EOI is received. EOIs that do not clear a bit in [GICH_APR<n>](#) do not cause an increment. If an EOI occurs when the value of this field is 31, then the field wraps to 0.

The maintenance interrupt is asserted whenever this field is nonzero and GICH_HCR.LRENPIE == 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [26:8]

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is disabled:

VGrp1DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp1 == 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is enabled:

VGrp1EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp1 == 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is disabled:

VGrp0DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp0 == 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is enabled:

VGrp0EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp0 == 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NPIE, bit [3]

No Pending Interrupt Enable.

Enables the signaling of a maintenance interrupt while no pending interrupts are present in the List registers:

NPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable.

Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register for an EOI request:

LRENPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while GICH_HCR.EOICount is not 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UIE, bit [1]

Underflow Interrupt Enable.

Enables the signaling of a maintenance interrupt when the List registers are either empty or hold only one valid entry.

UIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	A maintenance interrupt is signaled if zero or one of the List register entries are marked as a valid interrupt.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

En, bit [0]

Enable.

Global enable bit for the virtual CPU interface.

En	Meaning
0b0	Virtual CPU interface operation is disabled.
0b1	Virtual CPU interface operation is enabled.

When this field is 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of [GICV_IAR](#) or [GICV_AIAR](#) returns a spurious interrupt ID.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The VGrp1DIE, VGrp1EIE, VGrp0DIE, and VGrp0EIE fields permit the hypervisor to track the virtual CPU interfaces that are enabled. The hypervisor can then route interrupts that have multiple targets correctly and efficiently, without having to read the virtual CPU interface status.

See 'Maintenance interrupts' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069) and [GICH_MISR](#) for more information.

Accessing GICH_HCR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICH_HCR](#) provides equivalent functionality.
- For AArch64 implementations, [ICH_HCR_EL2](#) provides equivalent functionality.

GICH_HCR.En must be set to 1 for any virtual or maintenance interrupt to be asserted.

GICH_HCR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0000	GICH_HCR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICH_LR<n>, List Registers, n = 0 - 15

The GICH_LR<n> characteristics are:

Purpose

These registers provide context information for the virtual CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_LR<n> are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

A maximum of 16 List registers can be provided. [GICH_VTR.ListRegs](#) defines the number implemented. Unimplemented List registers are RAZ/WI.

Attributes

GICH_LR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HWGroup		State	Priority				RES0		pINTID										vINTID												

HW, bit [31]

Indicates whether this virtual interrupt is a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt corresponding to the INTID:

HW	Meaning
0b0	This interrupt is triggered entirely in software. No notification is sent to the Distributor when the virtual interrupt is deactivated.
0b1	A hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using GICH_LR<n>.pINTID to indicate the physical interrupt identifier. If GICV_CTLR.EOImode == 0, this request corresponds to a write to GICV_EOIR or GICV_AEOIR , otherwise it corresponds to a write to GICV_DIR .

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Group, bit [30]

Indicates whether the interrupt is Group 0 or Group 1:

Group	Meaning
0b0	Group 0 virtual interrupt. GICV_CTLR.FIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and GICV_CTLR.EnableGrp0 enables signaling of this interrupt to the virtual machine.
0b1	Group 1 virtual interrupt, signaled as a virtual IRQ. GICV_CTLR.EnableGrp1 enables signaling of this interrupt to the virtual machine.

Note

[GICV_CTLR.CBPR](#) controls whether [GICV_BPR](#) or [GICV_ABPR](#) determines if a pending Group 1 interrupt has sufficient priority to preempt current execution.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

State, bits [29:28]

The state of the interrupt. This field has one of the following values:

State	Meaning
0b00	Inactive
0b01	Pending
0b10	Active
0b11	Active and pending

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the inactive state are ignored, except for the purpose of generating virtual maintenance interrupts.

Note

For hardware interrupts, the active and pending state is held in the Distributor rather than the virtual CPU interface. A hypervisor must only use the active and pending state for software originated interrupts, which are typically associated with virtual devices, or for SGIs.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Priority, bits [27:23]

The priority of this interrupt.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:20]

Reserved, RES0.

pINTID, bits [19:10]

The function of this field depends on the value of GICH_LR<n>.HW.

When GICH_LR<n>.HW == 0:

- Bit [19] indicates whether the interrupt triggers an EOI maintenance interrupt. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits [18:13] are reserved, SBZ.

- If the vINTID field value corresponds to an SGI (that is, 0-15), bits [12:10] contain the number of the requesting PE. This appears in the corresponding field of [GICV_IAR](#) or [GICV_AIAR](#). If the vINTID field value is not 0-15, this field must be cleared to 0.

When GICH_LR<n>.HW == 1:

- This field indicates the pINTID that the hypervisor forwards to the Distributor. This field is only required to implement enough bits to hold a valid value for the ID configuration. Any unused higher order bits are RAZ/WI.
- If the value of pINTID is 0-15 or 1020-1023, behavior is UNPREDICTABLE. If the value of pINTID is 16-31, this field applies to the PPI associated with this same PE as the virtual CPU interface requesting the deactivation.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

vINTID, bits [9:0]

This INTID is returned to the VM when the interrupt is acknowledged through [GICV_IAR](#). Each valid interrupt stored in the List registers must have a unique vINTID for that virtual CPU interface. If the value of vINTID is 1020-1023, behavior is UNPREDICTABLE.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICH_LR<n>

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICH_LR<n>](#) provides equivalent functionality.
- For AArch64 implementations, [ICH_LR<n>_EL2](#) provides equivalent functionality.

GICH_LR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	$0 \times 0100 + (4 * n)$	GICH_LR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICH_MISR, Maintenance Interrupt Status Register

The GICH_MISR characteristics are:

Purpose

Indicates which maintenance interrupts are asserted.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_MISR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_MISR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								VGrp1D		VGrp1E		VGrp0D		VGrp0E		NPL		REN		U		EOI									

Bits [31:8]

Reserved, RES0.

VGrp1D, bit [7]

vPE Group 1 Disabled.

VGrp1D	Meaning
0b0	vPE Group 1 Disabled maintenance interrupt not asserted.
0b1	vPE Group 1 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [GICH_HCR.VGrp1DIE](#) == 1 and [GICH_VMCR.VENG1](#) == 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

VGrp1E, bit [6]

vPE Group 1 Enabled.

VGrp1E	Meaning
0b0	vPE Group 1 Enabled maintenance interrupt not asserted.
0b1	vPE Group 1 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [GICH_HCR.VGrp1EIE](#) == 1 and [GICH_VMCR.VENG1](#) == 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

VGrp0D, bit [5]

vPE Group 0 Disabled.

VGrp0D	Meaning
0b0	vPE Group 0 Disabled maintenance interrupt not asserted.
0b1	vPE Group 0 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [GICH_HCR.VGrp0DIE](#) == 1 and [GICH_VMCR.VENG0](#) == 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

VGrp0E, bit [4]

vPE Group 0 Enabled.

VGrp0E	Meaning
0b0	vPE Group 0 Enabled maintenance interrupt not asserted.
0b1	vPE Group 0 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when [GICH_HCR.VGrp0EIE](#) == 1 and [GICH_VMCR.VENG0](#) == 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

NP, bit [3]

No Pending.

NP	Meaning
0b0	No Pending maintenance interrupt not asserted.
0b1	No Pending maintenance interrupt asserted.

This maintenance interrupt is asserted when [GICH_HCR.NPIE](#) == 1 and no List register is in the pending state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

LREN, bit [2]

List Register Entry Not Present.

LREN	Meaning
0b0	List Register Entry Not Present maintenance interrupt not asserted.
0b1	List Register Entry Not Present maintenance interrupt asserted.

This maintenance interrupt is asserted when [GICH_HCR.LRENPIE](#) == 1 and [GICH_HCR.EOICount](#) is nonzero.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

U, bit [1]

Underflow.

U	Meaning
0b0	Underflow maintenance interrupt not asserted.
0b1	Underflow maintenance interrupt asserted.

This maintenance interrupt is asserted when [GICH_HCR](#).UIE == 1 and zero or one of the List register entries are marked as a valid interrupt.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

EOI, bit [0]

End Of Interrupt.

EOI	Meaning
0b0	End Of Interrupt maintenance interrupt not asserted.
0b1	End Of Interrupt maintenance interrupt asserted.

This maintenance interrupt is asserted when at least one bit in [GICH_EISR](#) == 1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Note

A List register is in the pending state only if the corresponding [GICH_LR<n>](#) value is 0b01, that is, pending. The active and pending state is not included.

Accessing GICH_MISR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICH_MISR](#) provides equivalent functionality.
- For AArch64 implementations, [ICH_MISR_EL2](#) provides equivalent functionality.

A maintenance interrupt is asserted only if at least one bit is set to 1 in this register and if [GICH_HCR](#).En == 1.

GICH_MISR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0010	GICH_MISR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

GICH_VMCR, Virtual Machine Control Register

The GICH_VMCR characteristics are:

Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state. This register is updated when a virtual machine updates the virtual CPU interface registers.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_VMCR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_VMCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VPMR								VBPR0		VBPR1		RES0				VEOIM		RES0		VCBPR		VFIQEn		VAcKtI		VENG1		VENG0			

VPMR, bits [31:24]

Virtual priority mask. The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

This alias field is updated when a VM updates [GICV_PMR](#).Priority.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 1.

This alias field is updated when a VM updates [GICV_BPR](#).Binary_Point.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 0.

This alias field is updated when a VM updates [GICV_ABPR](#).Binary_Point.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [17:10]

Reserved, RES0.

VEOIM, bit [9]

Virtual EOImode. Possible values of this bit are:

VEOIM	Meaning
0b0	A write of an INTID to GICV_EOIR or GICV_AEOIR drops the priority of the interrupt with that INTID, and also deactivates that interrupt.
0b1	A write of an INTID to GICV_EOIR or GICV_AEOIR only drops the priority of the interrupt with that INTID. Software must write to GICV_DIR to deactivate the interrupt.

This alias field is updated when a VM updates [GICV_CTLR](#).EOImode.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

VCBPR	Meaning
0b0	GICV_ABPR determines the preemption group for Group 1 interrupts.
0b1	GICV_BPR determines the preemption group for Group 1 interrupts.

This alias field is updated when a VM updates [GICV_CTLR](#).CBPR.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

VFIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

This alias field is updated when a VM updates [GICV_CTLR](#).FIQEn.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

VAckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.

This alias field is updated when a VM updates [GICV_CTLR.AckCtl](#).

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VENG1, bit [1]

Virtual interrupt enable, Group 1. Possible values of this bit are:

VENG1	Meaning
0b0	Group 1 virtual interrupts are disabled.
0b1	Group 1 virtual interrupts are enabled.

This alias field is updated when a VM updates [GICV_CTLR.EnableGrp1](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VENG0, bit [0]

Virtual interrupt enable, Group 0. Possible values of this bit are:

VENG0	Meaning
0b0	Group 0 virtual interrupts are disabled.
0b1	Group 0 virtual interrupts are enabled.

This alias field is updated when a VM updates [GICV_CTLR.EnableGrp0](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Note

A List register is in the pending state only if the corresponding [GICH_LR<n>](#) value is 0b01, that is, pending. The active and pending state is not included.

Accessing GICH_VMCR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICH_VMCR](#) provides equivalent functionality.
- For AArch64 implementations, [ICH_VMCR_EL2](#) provides equivalent functionality.

GICH_VMCR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0008	GICH_VMCR

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **RW**.

- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICH_VTR, Virtual Type Register

The GICH_VTR characteristics are:

Purpose

Indicates the number of implemented virtual priority bits and List registers.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_VTR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_VTR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PRIbits			PREbits			IDbits			SEIS		A3V	RES0															ListRegs				

PRIbits, bits [31:29]

The number of virtual priority bits implemented, minus one.
An implementation must implement at least 32 levels of virtual priority (5 priority bits).

PREbits, bits [28:26]

The number of virtual preemption bits implemented, minus one.
An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).
The value of this field must be less than or equal to the value of GICH_VTR.PRIbits.

IDbits, bits [25:23]

The number of virtual interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

SEIS, bit [22]

SEI support. Indicates whether the virtual CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support generation of SEIs.
0b1	The virtual CPU interface logic supports generation of SEIs.

A3V, bit [21]

Affinity 3 valid. Possible values are:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of the Aff3 field in ICC_SGI0R_EL1 , ICC_SGI1R_EL1 , and ICC_ASGI1R_EL1 .
0b1	The virtual CPU interface logic supports nonzero values of the Aff3 field in ICC_SGI0R_EL1 , ICC_SGI1R_EL1 , and ICC_ASGI1R_EL1 .

Bits [20:5]

Reserved, RES0.

ListRegs, bits [4:0]

The number of implemented List registers, minus one.

Accessing GICH_VTR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICH_VTR](#) provides equivalent functionality.
- For AArch64 implementations, [ICH_VTR_EL2](#) provides equivalent functionality.

GICH_VTR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0004	GICH_VTR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

GICM_CLRSPI_NSR, Clear Non-secure SPI Pending Register

The GICM_CLRSPI_NSR characteristics are:

Purpose

Removes the pending state from a valid SPI if permitted by the Security state of the access and the [GICD_NSACR<n>](#) value for that SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

This register is present only when GICM_TYPER.CLR == 1. Otherwise, direct accesses to GICM_CLRSPI_NSR are RES0.

When [GICD_CTLR.DS](#) == 1, this register provides functionality for all SPIs.

Attributes

GICM_CLRSPI_NSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																INTID															

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of [GICD_CLRSPI_NSR](#).

Accessing GICM_CLRSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding [GICD_NSACR<n>](#) register is less than 0b10.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can clear the pending state of any valid SPI.

GICM_CLRSPI_NSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	0x0048	GICM_CLRSPI_NSR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICM_CLRSPI_SR, Clear Secure SPI Pending Register

The GICM_CLRSPI_SR characteristics are:

Purpose

Removes the pending state from a valid SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

This register is present only when GICM_TYPER.SR == 1 and GICM_TYPER.CLR == 1. Otherwise, direct accesses to GICM_CLRSPI_SR are RES0.

When [GICD_CTLR.DS](#) == 1, this register is **WI**.

Attributes

GICM_CLRSPI_SR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																INTID															

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of [GICD_CLRSPI_SR](#).

Accessing GICM_CLRSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICM_CLRSPI_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	0x0058	GICD_CLRSPI_SR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WI**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WI**.

GICM_IIDR, Distributor Implementer Identification Register

The GICM_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the Distributor.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GICM_IIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ProductID								RES0				Variant				Revision				Implementer											

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the Distributor:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

Accessing GICM_IIDR

GICM_IIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	0x0FCC	GICM_IIDR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICM_SETSPI_NSR, Set Non-secure SPI Pending Register

The GICM_SETSPI_NSR characteristics are:

Purpose

Adds the pending state to a valid SPI if permitted by the Security state of the access and the [GICD_NSACR<n>](#) value for that SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

When [GICD_CTLR.DS](#)==1, this register provides functionality for all SPIs.

Attributes

GICM_SETSPI_NSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																INTID															

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of [GICD_SETSPI_NSR](#).

Accessing GICM_SETSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding [GICD_NSACR<n>](#) register is 0.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can set the pending state of any valid SPI.

GICM_SETSPI_NSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	0x0040	GICM_SETSPI_NSR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICM_SETSPI_SR, Set Secure SPI Pending Register

The GICM_SETSPI_SR characteristics are:

Purpose

Adds the pending state to a valid SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

This register is present only when GICM_TYPER.SR == 1. Otherwise, direct accesses to GICM_SETSPI_SR are RES0.

When [GICD_CTLR.DS](#)==1, this register is WI.

Attributes

GICM_SETSPI_SR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																INTID															

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of [GICD_SETSPI_SR](#).

Accessing GICM_SETSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICM_SETSPI_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	0x0050	GICM_SETSPI_SR

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **WI**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WI**.

GICM_TYPER, Distributor MSI Type Register

The GICM_TYPER characteristics are:

Purpose

Provides information about what features the GIC implementation supports.

Configuration

This register is available in all configurations of the GIC. When [GICD_CTLR.DS](#)=0, this register is Common.

Attributes

GICM_TYPER is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Valid	CLR	SR	INTID													RES0					NumSPIs										

Valid, bit [31]

Reports whether GICM_TYPER content is valid.

Valid	Meaning
0b0	GICM_TYPER reports no information on the capabilities of the GICM frame, all other fields are RES0.
0b1	GICM_TYPER reports information on capabilities of GICM frame.

CLR, bit [30]

Reports whether MSI clear registers are supported.

CLR	Meaning
0b0	MSI clear registers not implemented.
0b1	MSI clear registers implemented.

SR, bit [29]

Reports whether Secure aliases of MSI registers are supported.

SR	Meaning
0b0	Secure aliases of MSI registers not implemented.
0b1	Secure aliases of MSI registers implemented.

INTID, bits [28:16]

INTID of the first SPI assigned to this GICM frame.

Bits [15:11]

Reserved, RES0.

NumSPIs, bits [10:0]

Number of SPIs assigned to this GICM frame.

Accessing GICM_TYPER

GICM_TYPER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	0x0004	GICM_TYPER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICR_CLRLPIR, Clear LPI Pending Register

The GICR_CLRLPIR characteristics are:

Purpose

Clears the pending state of the specified LPI.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_CLRLPIR is a 64-bit register.

Field descriptions

When GICR_TYPER.DirectLPI == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																pINTID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

pINTID, bits [31:0]

The INTID of the physical LPI.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER.IDbits](#) field. Unimplemented bits are RES0.

When GICR_TYPER.DirectLPI == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																IMPLEMENTATION DEFINED															
																IMPLEMENTATION DEFINED															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing GICR_CLRLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPis and does not include an ITS. The functionality of this register is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if any of the following apply:

- [GICR_CTLR](#).EnableLPis == 0.
- The pINTID value specifies an unimplemented LPI.
- The pINTID value specifies an LPI that is not pending.

GICR_CLRLPIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0048	GICR_CLRLPIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICR_CTLR, Redistributor Control Register

The GICR_CTLR characteristics are:

Purpose

Controls the operation of a Redistributor, and enables the signaling of LPIs by the Redistributor to the connected PE.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_CTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
UWP	RES0	DPG1S	DPG1NS	DPG0																											

UWP, bit [31]

Upstream Write Pending. Read-only. Indicates whether all upstream writes have been communicated to the Distributor.

UWP	Meaning
0b0	The effects of all upstream writes have been communicated to the Distributor, including any Generate SGI packets. For more information, see 'Generate SGI (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).
0b1	Not all the effects of upstream writes, including any Generate SGI packets, have been communicated to the Distributor. For more information, see 'Generate SGI (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Bits [30:27]

Reserved, RES0.

DPG1S, bit [26]

Disable Processor selection for Group 1 Secure interrupts. When [GICR_TYPER.DPGS](#) == 1:

DPG1S	Meaning
0b0	A Group 1 Secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Secure Group 1 interrupts are enabled.
0b1	A Group 1 Secure SPI configured to use the 1 of N distribution model cannot select this PE.

When [GICR_TYPER.DPGS](#) == 0 this bit is RAZ/WI.

When [GICD_CTLR.DS](#)==1, this field is RAZ/WI. In GIC implementations that support two Security states, this field is only accessible by Secure accesses, and is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when [GICD_CTLR.ARE_S](#)==0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

DPG1NS, bit [25]

Disable Processor selection for Group 1 Non-secure interrupts. When [GICR_TYPER.DPGS](#) == 1:

DPG1NS	Meaning
0b0	A Group 1 Non-secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Non-secure Group 1 interrupts are enabled.
0b1	A Group 1 Non-secure SPI configured to use the 1 of N distribution model cannot select this PE.

When [GICR_TYPER.DPGS](#) == 0 this bit is RAZ/WI.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when [GICD_CTLR.ARE_NS](#)==0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

DPG0, bit [24]

Disable Processor selection for Group 0 interrupts. When [GICR_TYPER.DPGS](#) == 1:

DPG0	Meaning
0b0	A Group 0 SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Group 0 interrupts are enabled.
0b1	A Group 0 SPI configured to use the 1 of N distribution model cannot select this PE.

When [GICR_TYPER.DPGS](#) == 0 this bit is RAZ/WI.

When [GICD_CTLR.DS](#) == 1, this field is always accessible. In GIC implementations that support two Security states, this field is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when [GICD_CTLR.ARE_S](#) == 0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Bits [23:4]

Reserved, RES0.

RWP, bit [3]

Register Write Pending. This bit indicates whether a register write for the current Security state is in progress or not.

RWP	Meaning
0b0	The effect of all previous writes to the following registers are visible to all agents in the system: <ul style="list-style-type: none"> GICR_ICENABLER0 GICR_CTLR.DPG1S GICR_CTLR.DPG1NS GICR_CTLR.DPG0 GICR_CTLR, which clears EnableLPIs from 1 to 0. In FEAT_GICv4p1, GICR_VPROPBASER, which clears Valid from 1 to 0.
0b1	The effect of all previous writes to the following registers are not guaranteed by the architecture to be visible to all agents in the system while the changes are still being propagated: <ul style="list-style-type: none"> GICR_ICENABLER0 GICR_CTLR.DPG1S GICR_CTLR.DPG1NS GICR_CTLR.DPG0 GICR_CTLR, which clears EnableLPIs from 1 to 0. In FEAT_GICv4p1, GICR_VPROPBASER, which clears Valid from 1 to 0.

IR, bit [2]

LPI invalidate registers supported.

This bit is read-only.

IR	Meaning
0b0	This bit does not indicate whether the GICR_INVLPIR, GICR_INVALLR and GICR_SYNCRR are implemented or not.
0b1	GICR_INVLPIR, GICR_INVALLR and GICR_SYNCRR are implemented.

If [GICR_TYPER.DirectLPI](#) is 1 or [GICR_TYPER.RVPEI](#) is 1, [GICR_INVLPIR](#), [GICR_INVALLR](#), and [GICR_SYNCRR](#) are always implemented.

Arm recommends that implementations report GICR_CTLR.IR as 1 in these cases.

CES, bit [1]

Clear Enable Supported.

This bit is read-only.

CES	Meaning
0b0	The IRI does not indicate whether GICR_CTLR.EnableLPIs is RES1 once set.
0b1	GICR_CTLR.EnableLPIs is not RES1 once set.

Implementing GICR_CTLR.EnableLPIs as programmable and not reporting GICR_CTLR.CES == 1 is deprecated.

Implementing GICR_CTLR.EnableLPIs as RES1 once set is deprecated.

When GICR_CTLR.CES == 0, software cannot assume that GICR_CTLR.EnableLPIs is programmable without observing the bit being cleared.

EnableLPIs, bit [0]

In implementations where affinity routing is enabled for the Security state:

EnableLPIs	Meaning
0b0	LPI support is disabled. Any doorbell interrupt generated as a result of a write to a virtual LPI register must be discarded, and any ITS translation requests or commands involving LPIs in this Redistributor are ignored.
0b1	LPI support is enabled.

Note

If [GICR_TYPER](#).PLPIS == 0, this field is RES0. If [GICD_CTLR](#).ARE_NS is written from 1 to 0 when this bit is 1, behavior is an IMPLEMENTATION DEFINED choice between clearing GICR_CTLR.EnableLPis to 0 or maintaining its current value.

When affinity routing is not enabled for the Non-secure state, this bit is RES0.

When written from 0 to 1, the Redistributor loads the LPI Pending table from memory to check for any pending interrupts.

After it has been written to 1, it is IMPLEMENTATION DEFINED whether the bit becomes RES1 or can be cleared by to 0.

Where the bit remains programmable:

- Software must observe GICR_CTLR.RWP==0 after clearing GICR_CTLR.EnableLPis from 1 to 0 before writing [GICR_PENDBASER](#) or [GICR_PROPBASER](#), otherwise behavior is UNPREDICTABLE.
- Software must observe GICR_CTLR.RWP==0 after clearing GICR_CTLR.EnableLPis from 1 to 0 before setting GICR_CTLR.EnableLPis to 1, otherwise behavior is UNPREDICTABLE.

Note

If one or more ITS is implemented, Arm strongly recommends that all LPis are mapped to another Redistributor before GICR_CTLR.EnableLPis is cleared to 0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

The participation of a PE in the 1 of N distribution model for a given interrupt group is governed by the concatenation of [GICR_WAKER](#).ProcessorSleep, the appropriate [GICR_CTLR](#).DPG{1, 0} bit, and the PE interrupt group enable. The behavior options are:

PS	DPG{1S, 1NS, 0}	Enable	PE Behavior
0b0	0b0	0b0	The PE cannot be selected.
0b0	0b0	0b1	The PE can be selected.
0b0	0b1	*	The PE cannot be selected.
0b1	*	*	The PE cannot be selected when GICD_CTLR .E1NWF == 0. When GICD_CTLR .E1NWF == 1, the mechanism by which PEs are selected is IMPLEMENTATION DEFINED.

If an SPI using the 1 of N distribution model has been forwarded to the PE, and a write to GICR_CTLR occurs that changes the DPG bit for the interrupt group of the SPI, the IRI must attempt to select a different target PE for the SPI. This might have no effect on the forwarded SPI if it has already been activated.

Accessing GICR_CTLR

GICR_CTLR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0000	GICR_CTLR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_ICACTIVER0, Interrupt Clear-Active Register 0

The GICR_ICACTIVER0 characteristics are:

Purpose

Deactivates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICACTIVER0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	Cle
Clear_active_bit31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27	Clear_active_bit26	Clear_active_bit25

Clear_active_bit<x>, bit [x], for x = 31 to 0

Removes the active state from interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICACTIVER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD_ICACTIVER<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD_ICACTIVER<n>](#).

When [GICD_CTLR](#).DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ICACTIVER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0380	GICR_ICACTIVER0

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_ICACTIVER<n>E, Interrupt Clear-Active Registers, n = 1 - 2

The GICR_ICACTIVER<n>E characteristics are:

Purpose

Removes the active state from the corresponding PPI.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICACTIVER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICACTIVER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	Cle
Clear_active_bit31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27	Clear_active_bit26	

Clear_active_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICACTIVER<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_ICACTIVER<n>E is $(0x200 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_ICACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICACTIVER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0380 + (4 * n)	GICR_ICACTIVER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_ICENABLER0, Interrupt Clear-Enable Register 0

The GICR_ICENABLER0 characteristics are:

Purpose

Disables forwarding of the corresponding SGI or PPI to the CPU interfaces.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICENABLER0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_enable_bit31	Clear_enable_bit30	Clear_enable_bit29	Clear_enable_bit28	Clear_enable_bit27	Clear_enable_bit26

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For PPIs and SGIs, controls the forwarding of interrupt number x to the CPU interfaces. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICENABLER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICENABLER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD_ICENABLER<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD_ICENABLER<n>](#).

When [GICD_CTLR](#).DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ICENABLER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0180	GICR_ICENABLER0

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ICENABLER<n>E, Interrupt Clear-Enable Registers, n = 1 - 2

The GICR_ICENABLER<n>E characteristics are:

Purpose

Disables forwarding of the corresponding PPI to the CPU interfaces.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICENABLER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICENABLER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_enable_bit31	Clear_enable_bit30	Clear_enable_bit29	Clear_enable_bit28	Clear_enable_bit27	Clear_enable_bit26

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For the extended PPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICENABLER<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_ICENABLER<n>E is $(0x180 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_ICENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICENABLER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0180 + (4 * n)	GICR_ICENABLER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ICFGR0, Interrupt Configuration Register 0

The GICR_ICFGR0 characteristics are:

Purpose

Determines whether the corresponding SGI is edge-triggered or level-sensitive.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICFGR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13
Int_config15	Int_config14	Int_config13	Int_config12	Int_config11	Int_config10	Int_config9	Int_config8	Int_config7	Int_config6	Int_config5	Int_config4	Int_config3	Int_config2	Int_config1	Int_config0	Int_config0	Int_config0	Int_config0

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the is level-sensitive or edge-triggered.

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b10	Corresponding interrupt is edge-triggered.

For SGIs, this field always indicates edge-triggered.

A read of this bit always returns the correct value to indicate the interrupt triggering method.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICFGR0

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=0.

When [GICD_CTLR.DS](#)==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICR_ICFGR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0C00	GICR_ICFGR0

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **RW**.

- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ICFGR1, Interrupt Configuration Register 1

The GICR_ICFGR1 characteristics are:

Purpose

Determines whether the corresponding PPI is edge-triggered or level-sensitive.

Configuration

A copy of this register is provided for each Redistributor.

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

Changing Int_config when the interrupt is individually enabled is UNPREDICTABLE.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

Attributes

GICR_ICFGR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13
Int_config15	Int_config14	Int_config13	Int_config12	Int_config11	Int_config10	Int_config9	Int_config8	Int_config7	Int_config6	Int_config5	Int_config4	Int_config3	Int_config2	Int_config1	Int_config0	RES0	RES0	RES0

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b10	Corresponding interrupt is edge-triggered.

Int_config[0] (bit [2x]) is RES0.

A read of this bit always returns the correct value to indicate the interrupt triggering method.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICFGR1

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=1 .

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICR_ICFGR1 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0C04	GICR_ICFGR1

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICR_ICFGR<n>E, Interrupt configuration registers, n = 2 - 5

The GICR_ICFGR<n>E characteristics are:

Purpose

Determines whether the corresponding PPI in the extended PPI range is edge-triggered or level-sensitive.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICFGR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICFGR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13
Int_config15	Int_config14	Int_config13	Int_config12	Int_config11	Int_config10	Int_config9	Int_config8	Int_config7	Int_config6	Int_config5	Int_config4	Int_config3	Int_config2	Int_config1	Int_config0	Int_config0	Int_config0	Int_config0

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

Int_config[0] (bit [2x]) is RES0.

Int_config<x>	Meaning
0b00	The corresponding interrupt is level-sensitive.
0b10	The corresponding interrupt is edge-triggered.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For each supported extended PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

Accessing GICR_ICFGR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICFGR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICFGR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
-----------	-------	--------	----------

GIC Redistributor	SGI_base	0x0C00 + (4 * n)	GICR_ICFGR<n>E
----------------------	----------	---------------------	----------------

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICR_ICPENDR0, Interrupt Clear-Pending Register 0

The GICR_ICPENDR0 characteristics are:

Purpose

Removes the pending state from the corresponding SGI or PPI.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICPENDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_pending_bit31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_pending_bit27	Clear_pending_bit26

Clear_pending_bit<x>, bit [x], for x = 31 to 0

Removes the pending state from interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: <ul style="list-style-type: none"> If the interrupt is not pending and is not active and pending. If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICPENDR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD_ICPENDR<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD_ICENABLER<n>](#).

When [GICD_CTLR.DS](#) == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ICPENDR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0280	GICR_ICPENDR0

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICR_ICPENDR<n>E, Interrupt Clear-Pending Registers, n = 1 - 2

The GICR_ICPENDR<n>E characteristics are:

Purpose

Removes the pending state from the corresponding PPI.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICPENDR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICPENDR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_pending_bit31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_pending_bit27	Clear_pending_bit26

Clear_pending_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the pending state to interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: <ul style="list-style-type: none">• If the interrupt is not pending and is not active and pending.• If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICR_ICPENDR<n>E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICPENDR<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_ICPENDR<n>E is $(0x200 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_ICPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICPENDR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	$0x0280 + (4 * n)$	GICR_ICPENDR<n>E

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_IGROUPR0, Interrupt Group Register 0

The GICR_IGROUPR0 characteristics are:

Purpose

Controls whether the corresponding SGI or PPI is in Group 0 or Group 1.

Configuration

This register is available in all GIC configurations. If the GIC implementation supports two Security states, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGROUPR0 is a 32-bit register.

Field descriptions

31	30	29	
Redistributor_group_status_bit31	Redistributor_group_status_bit30	Redistributor_group_status_bit29	Redistributor_group_status_bit28

Redistributor_group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit. In this register:

- Bits [31:16] are group status bits for PPIs.
- Bits [15:0] are group status bits for SGIs.

Redistributor_group_status_bit<x>	Meaning
0b0	When GICD_CTLR.DS ==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS ==0, the corresponding interrupt is Secure.
0b1	When GICD_CTLR.DS ==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS ==0, the corresponding interrupt is Non-secure Group 1.

When [GICD_CTLR.DS](#) == 0, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICR_IGRPMODR0](#) to form a 2-bit field that defines an interrupt group. The encoding of this field is at [GICR_IGRPMODR0](#).

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

The considerations for the reset value of this register are the same as those for [GICD_IGROUPR<n>](#) with n=0.

Accessing GICR_IGROUPR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGROUPR0, the corresponding bit is RES0 and equivalent functionality is provided by [GICD_IGROUPR<n>](#) with n=0.

When `GICD_CTLR.DS == 0`, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IGROUPR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0080	GICR_IGROUPR0

This interface is accessible as follows:

- When `GICD_CTLR.DS == 0` accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_IGROUPR<n>E, Interrupt Group Registers, n = 1 - 2

The GICR_IGROUPR<n>E characteristics are:

Purpose

Controls whether the corresponding PPI is in Group 0 or Group 1.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_IGROUPR<n>E are RES0.

When [GICD_CTLR.DS](#)==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGROUPR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Group_status_bit31	Group_status_bit30	Group_status_bit29	Group_status_bit28	Group_status_bit27	Group_status_bit26

Group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit.

Group_status_bit<x>	Meaning
0b0	When GICD_CTLR.DS ==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS ==0, the corresponding interrupt is Secure.
0b1	When GICD_CTLR.DS ==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS ==0, the corresponding interrupt is Non-secure Group 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGRPMODR<n>E to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICR_IGRPMODR<n>E.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGROUPR<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_IGROUPR<n>E is $(0 \times 080 + (4 * n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_IGROUPR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGROUPR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_IGROUPR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0080 + (4 * n)	GICR_IGROUPR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_IGRPMODR0, Interrupt Group Modifier Register 0

The GICR_IGRPMODR0 characteristics are:

Purpose

When [GICD_CTLR.DS](#)==0, this register together with the [GICR_IGROUPR0](#) register, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

When [GICD_CTLR.DS](#)==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGRPMODR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	
Group_modifier_bit31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28	Group_modifier_bit27	Group_modifier_bit26

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICR_IGROUPR0](#) to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_IGRPMODR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR0, the corresponding bit is RES0 and equivalent functionality is provided by [GICD_IGRPMODR<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD_IGRPMODR<n>](#).

When [GICD_CTLR.ARE_S](#) == 0 or [GICD_CTLR.DS](#) == 1, GICR_IGRPMODR0 is RES0. An implementation can make this register RAZ/WI in this case.

When [GICD_CTLR.DS](#)==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IGRPMODR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0D00	GICR_IGRPMODR0

This interface is accessible as follows:

- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_IGRPMODR<n>E, Interrupt Group Modifier Registers, n = 1 - 2

The GICR_IGRPMODR<n>E characteristics are:

Purpose

When [GICD_CTLR.DS](#)==0, this register together with the GICR_IGROUPR<n>E registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_IGRPMODR<n>E are RES0.

When [GICD_CTLR.DS](#)==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGRPMODR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	
Group_modifier_bit31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28	Group_modifier_bit27	Group...

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICR_IGROUPR<n>E](#) to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGRPMODR<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_IGRPMODR<n>E is $(0x000 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_IGRPMODR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_IGRPMODR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0D00 + (4 * n)	GICR_IGRPMODR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_IIDR, Redistributor Implementer Identification Register

The GICR_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the Redistributor.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GICR_IIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ProductID								RES0				Variant				Revision				Implementer											

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the Redistributor:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

Accessing GICR_IIDR

GICR_IIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0004	GICR_IIDR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_INVALLR, Redistributor Invalidate All Register

The GICR_INVALLR characteristics are:

Purpose

Invalidates any cached configuration data of all physical LPIs, causing the GIC to reload the interrupt configuration from the physical LPI Configuration table at the address specified by [GICR_PROPBASER](#).

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_INVALLR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
V	RES0															vPEID															
RES0																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

V, bit [63]

When FEAT_GICv4p1 is implemented:

Indicates whether the INTID is virtual or physical.

V	Meaning
0b0	Invalidate is for a physical INTID.
0b1	Invalidate is for a virtual INTID.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

vPEID, bits [47:32]

When FEAT_GICv4p1 is implemented:

When GICR_INVLPIR.V == 0, this field is RES0

When GICR_INVLPIR.V == 1, this field is the target vPEID of the invalidate.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER2.VIL](#) and [GICD_TYPER2.VID](#) fields. Unimplemented bits are RES0.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

Note

If any LPI has been forwarded to the PE and a valid write to GICR_INVALLR is received, the Redistributor must ensure it reloads its properties from memory. This has no effect on the forwarded LPI if it has already been activated.

Accessing GICR_INVALLR

This register is mandatory when any of the following are true:

- [GICR_TYPER](#).Direct is 1.
- [GICR_CTLR](#).IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

Writes to this register have no effect if no physical LPIs are currently stored in the local Redistributor cache.

GICR_INVALLR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x00B0	GICR_INVALLR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_INVLPIR, Redistributor Invalidate LPI Register

The GICR_INVLPIR characteristics are:

Purpose

Invalidates the cached configuration data of a specified LPI, causing the GIC to reload the interrupt configuration from the physical LPI Configuration table at the address specified by [GICR_PROPBASER](#).

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_INVLPIR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
V	RES0															vPEID															
INTID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

V, bit [63]
When FEAT_GICv4p1 is implemented:

Indicates whether the INTID is virtual or physical.

V	Meaning
0b0	Invalidate is for a physical INTID.
0b1	Invalidate is for a virtual INTID.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

vPEID, bits [47:32]
When FEAT_GICv4p1 is implemented:

When GICR_INVLPIR.V == 0, this field is RES0

When GICR_INVLPIR.V == 1, this field is the target vPEID of the invalidate.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER2.VIL](#) and [GICD_TYPER2.VID](#) fields. Unimplemented bits are RES0.

Otherwise:

Reserved, RES0.

INTID, bits [31:0]

The INTID of the physical LPI to be cleaned.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER](#).IDbits field. Unimplemented bits are RES0.

Note

If any LPI has been forwarded to the PE and a valid write to GICR_INVLPIR is received, the Redistributor must ensure it reloads its properties from memory and apply any changes by retrieving and reforwarding the LPI as required. This has no effect on the forwarded LPI if it has already been activated.

Accessing GICR_INVLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory when any of the following are true:

- [GICR_TYPER](#).Direct is 1.
- [GICR_CTLR](#).IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

Writes to this register have no effect if either:

- The specified LPI is not currently stored in the local Redistributor.
- The pINTID field corresponds to an unimplemented LPI.

GICR_INVLPIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x00A0	GICR_INVLPIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

GICR_IPRIORITYR<n>, Interrupt Priority Registers, n = 0 - 7

The GICR_IPRIORITYR<n> characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each SGI and PPI supported by the GIC.

Configuration

A copy of these registers is provided for each Redistributor.

These registers are configured as follows:

- GICR_IPRIORITYR0-GICR_IPRIORITYR3 store the priority of SGIs.
- GICR_IPRIORITYR4-GICR_IPRIORITYR7 store the priority of PPIs.

Attributes

GICR_IPRIORITYR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Priority_offset_3B								Priority_offset_2B								Priority_offset_1B								Priority_offset_0B							

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_IPRIORITYR<n>

These registers are used when affinity routing is enabled for the Security state of the interrupt. When affinity routing is not enabled the bits corresponding to the interrupt are RAZ/WI and [GICD_IPRIORITYR<n>](#) provides equivalent functionality.

These registers are used for SGIs and PPIs only. Equivalent functionality for SPIs is provided by [GICD_IPRIORITYR<n>](#).

These registers are byte-accessible.

When [GICD_CTLR.DS](#) == 0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in 'Software accesses of interrupt priority' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IPRIORITYR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0400 + (4 * n)	GICR_IPRIORITYR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_IPRIORITYR<n>E, Interrupt Priority Registers (extended PPI range), n = 8 - 23

The GICR_IPRIORITYR<n>E characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each extended PPI supported by the GIC.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_IPRIORITYR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IPRIORITYR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Priority_offset_3B								Priority_offset_2B								Priority_offset_1B								Priority_offset_0B							

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IPRIORITYR<n>E number, n, is given by $n = (m-1024) \text{ DIV } 4$.
- The offset of the required GICR_IPRIORITYR<n>E register is $(0x400 + (4*n))$.
- The byte offset of the required Priority field in this register is $m \text{ MOD } 4$, where:
 - Byte offset 0 refers to register bits [7:0].
 - Byte offset 1 refers to register bits [15:8].
 - Byte offset 2 refers to register bits [23:16].
 - Byte offset 3 refers to register bits [31:24].

Accessing GICR_IPRIORITYR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

GICR_IPRIORITYR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	$0x0400 + (4 * n)$	GICR_IPRIORITYR<n>E

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_ISACTIVER0, Interrupt Set-Active Register 0

The GICR_ISACTIVER0 characteristics are:

Purpose

Activates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISACTIVER0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_active_bit31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_bit26	Set_active_bit25

Set_active_bit<x>, bit [x], for x = 31 to 0

Adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ISACTIVER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD_ISACTIVER<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD_ISACTIVER<n>](#).

When [GICD_CTLR](#).DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISACTIVER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
-----------	-------	--------	----------

GIC Redistributor	SGI_base	0x0300	GICR_ISACTIVER0
----------------------	----------	--------	-----------------

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_ISACTIVER<n>E, Interrupt Set-Active Registers, n = 1 - 2

The GICR_ISACTIVER<n>E characteristics are:

Purpose

Adds the active state to the corresponding PPI.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ISACTIVER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISACTIVER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_active_bit31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_bit26	Set_active_bit25

Set_active_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISACTIVER<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_ISACTIVER<n>E is $(0x200 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_ISACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ISACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0300 + (4 * n)	GICR_ISACTIVER<n>E

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_ISENABLER0, Interrupt Set-Enable Register 0

The GICR_ISENABLER0 characteristics are:

Purpose

Enables forwarding of the corresponding SGI or PPI to the CPU interfaces.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISENABLER0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_enable_bit31	Set_enable_bit30	Set_enable_bit29	Set_enable_bit28	Set_enable_bit27	Set_enable_bit26	Set_enable_bit25

Set_enable_bit<x>, bit [x], for x = 31 to 0

For PPIs and SGIs, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Accessing GICR_ISENABLER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISENABLER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD_ISENABLER<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD_ISENABLER<n>](#).

When [GICD_CTLR](#).DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISENABLER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0100	GICR_ISENABLER0

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_ISENABLER<n>E, Interrupt Set-Enable Registers, n = 1 - 2

The GICR_ISENABLER<n>E characteristics are:

Purpose

Enables forwarding of the corresponding PPI to the CPU interfaces.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ISENABLER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISENABLER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_enable_bit31	Set_enable_bit30	Set_enable_bit29	Set_enable_bit28	Set_enable_bit27	Set_enable_bit26	Set_enable_bit25

Set_enable_bit<x>, bit [x], for x = 31 to 0

For the extended PPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISENABLER<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_ISENABLER<n>E is $(0 \times 100 + (4 \times n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_ISENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISENABLER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ISENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SIG_base	0x0100 + (4 * n)	GICR_ISENABLER<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_ISPENDR0, Interrupt Set-Pending Register 0

The GICR_ISPENDR0 characteristics are:

Purpose

Adds the pending state to the corresponding SGI or PPI.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISPENDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	Se
Set_pending_bit31	Set_pending_bit30	Set_pending_bit29	Set_pending_bit28	Set_pending_bit27	Set_pending_bit26	Se

Set_pending_bit<x>, bit [x], for x = 31 to 0

For PPIs and SGIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: <ul style="list-style-type: none">• If the interrupt is already pending because of a write to GICR_ISPENDR0.• If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ISPENDR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD_ISPENDR<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD_ISPENDR<n>](#).

When [GICD_CTLR](#).DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISPENDR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0200	GICR_ISPENDR0

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_ISPENDR<n>E, Interrupt Set-Pending Registers, n = 1 - 2

The GICR_ISPENDR<n>E characteristics are:

Purpose

Adds the pending state to the corresponding PPI.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ISPENDR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISPENDR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Set_pending_bit31	Set_pending_bit30	Set_pending_bit29	Set_pending_bit28	Set_pending_bit27	Set_pending_bit26	Set_pending_bit25	Set_pending_bit24	Set_pending_bit23	Set_pending_bit22	Set_pending_bit21	Set_pending_bit20	Set_pending_bit19	Set_pending_bit18	Set_pending_bit17	Set_pending_bit16	Set_pending_bit15	Set_pending_bit14	Set_pending_bit13	Set_pending_bit12	Set_pending_bit11	Set_pending_bit10	Set_pending_bit9	Set_pending_bit8	Set_pending_bit7	Set_pending_bit6	Set_pending_bit5	Set_pending_bit4	Set_pending_bit3	Set_pending_bit2	Set_pending_bit1	Set_pending_bit0

Set_pending_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: <ul style="list-style-type: none"> If the interrupt is already pending because of a write to GICR_ISPENDR<n>E. If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISPENDR<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_ISPENDR<n>E is $(0 \times 200 + (4 \times n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_ISPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISPENDR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ISPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0200 + (4 * n)	GICR_ISPENDR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_MPAMIDR, Report maximum PARTID and PMG Register

The GICR_MPAMIDR characteristics are:

Purpose

Reports the maximum support PARTID and PMG values.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_MPAMIDR are RES0.

A copy of this register is provided for each Redistributor.

When [GICR_TYPER](#).MPAM==0, this register is RES0.

Attributes

GICR_MPAMIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMGmax								PARTIDmax															

Bits [31:24]

Reserved, RES0.

PMGmax, bits [23:16]

Maximum PMG value supported.

PARTIDmax, bits [15:0]

Maximum PARTID value supported.

Accessing GICR_MPAMIDR

GICR_MPAMIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0018	GICR_MPAMIDR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_NSACR, Non-secure Access Control Register

The GICR_NSACR characteristics are:

Purpose

Enables Secure software to permit Non-secure software to create SGIs targeting the PE connected to this Redistributor by writing to [ICC_SGI1R_EL1](#), [ICC_ASGI1R_EL1](#) or [ICC_SGI0R_EL1](#).

For more information, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Configuration

For a description on when a write to [ICC_SGI0R_EL1](#), [ICC_SGI1R_EL1](#) or [ICC_ASGI1R_EL1](#) is permitted to generate an interrupt, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

GICR_NSACR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
NS_access15	NS_access14	NS_access13	NS_access12	NS_access11	NS_access10	NS_access9	NS_access8	NS_access7									

NS_access<x>, bits [2x+1:2x], for x = 15 to 0

Configures the level of Non-secure access permitted when the SGI is in Secure Group 0 or Secure Group 1, as defined from [GICR_IGROUPRO](#) and [GICR_IGRPMODR0](#). A field is provided for each SGI. The possible values of each 2-bit field are:

NS_access<x>	Meaning
0b00	Non-secure writes are not permitted to generate Secure Group 0 SGIs or Secure Group 1 SGIs.
0b01	Non-secure writes are permitted to generate a Secure Group 0 SGI.
0b10	As 0b01, but additionally Non-secure writes to are permitted to generate a Secure Group 1 SGI.
0b11	Reserved. If the field is programmed to the reserved value, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the valid values. However, to maintain the principle that as the value increases additional accesses are permitted Arm strongly recommends that implementations treat this value as 0b10. It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the valid value chosen.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_NSACR

When [GICD_CTLR](#).DS == 1, this register is RAZ/WI.

When [GICD_CTLR.DS](#) == 0, this register is Secure, and is RAZ/WI to Non-secure accesses.

This register is used when affinity routing is enabled. When affinity routing is not enabled for the Security state of the interrupt, [GICD_NSACR<n>](#) with n=0 provides equivalent functionality.

This register does not support PPIs.

GICR_NSACR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0E00	GICR_NSACR

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_PARTIDR, Set PARTID and PMG Register

The GICR_PARTIDR characteristics are:

Purpose

Sets the PARTID and PMG values used for memory accesses by the Redistributor.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_PARTIDR are RES0.

A copy of this register is provided for each Redistributor.

When [GICR_TYPER](#).MPAM==0, this register is RES0.

Attributes

GICR_PARTIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMG								PARTID															

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

PMG value used when Redistributor accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PMG values in the range 0 to PMG_MAX are stateful or RES0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

PARTID, bits [15:0]

PARTID value used when Redistributor accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PARTID values in the range 0 to PARTID_MAX are stateful or RES0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Accessing GICR_PARTIDR

GICR_PARTIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x001C	GICR_PARTIDR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICR_PENDBASER, Redistributor LPI Pending Table Base Address Register

The GICR_PENDBASER characteristics are:

Purpose

Specifies the base address of the LPI Pending table, and the Shareability and Cacheability of accesses to the LPI Pending table.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_PENDBASER is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0		PTZ		RES0		OuterCache		RES0		Physical_Address																						
Physical_Address																RES0		Shareability		InnerCache		RES0										
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bit [63]

Reserved, RES0.

PTZ, bit [62]

Pending Table Zero. Indicates to the Redistributor whether the LPI Pending table is zero when [GICR_CTLR.EnableLPIs](#) == 1.

This field is WO, and reads as 0.

PTZ	Meaning
0b0	The LPI Pending table is not zero, and contains live data.
0b1	The LPI Pending table is zero. Software must ensure the LPI Pending table is zero before this value is written.

Bits [61:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Pending table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:16]

Bits [51:16] of the physical address containing the LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Pending table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Pending table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:0]

Reserved, RES0.

Accessing GICR_PENDBASER

Having the GICR_PENDBASER OuterCache, Shareability or InnerCache fields programmed to different values on different Redistributors with [GICR_CTLR.EnableLPIs == 1](#) in the system is UNPREDICTABLE.

Changing GICR_PENDBASER with [GICR_CTLR.EnableLPIs == 1](#) is UNPREDICTABLE.

GICR_PENDBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0078	GICR_PENDBASER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICR_PROPBASER, Redistributor Properties Base Address Register

The GICR_PROPBASER characteristics are:

Purpose

Specifies the base address of the LPI Configuration table, and the Shareability and Cacheability of accesses to the LPI Configuration table.

Configuration

A copy of this register is provided for each Redistributor.

An implementation might make this register RO, for example to correspond to an LPI Configuration table in read-only memory.

Attributes

GICR_PROPBASER is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0				OuterCache				RES0				Physical_Address																			
Physical_Address																Shareability				InnerCache				RES0				IDbits			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IDbits, bits [4:0]

The number of bits of LPI INTID supported, minus one, by the LPI Configuration table starting at Physical_Address.

If the value of this field is larger than the value of [GICD_TYPER.IDbits](#), the [GICD_TYPER.IDbits](#) value applies.

If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all physical LPIs are out of range.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_PROPBASER

It is IMPLEMENTATION DEFINED whether GICR_PROPBASER can be set to different values on different Redistributors. [GICR_TYPER.CommonLPIAff](#) identifies the Redistributors that must have GICR_PROPBASER set to the same values whenever [GICR_CTLR.EnableLPIs](#) == 1.

Setting different values in different copies of GICR_PROPBASER on Redistributors that are required to use a common LPI Configuration table when [GICR_CTLR.EnableLPIs](#) == 1 leads to UNPREDICTABLE behavior.

Other restrictions apply when a Redistributor caches information from GICR_PROPBASER. For more information, see 'LPI Configuration tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

GICR_PROPBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0070	GICR_PROPBASER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_SETLPIR, Set LPI Pending Register

The GICR_SETLPIR characteristics are:

Purpose

Generates an LPI by setting the pending state of the specified LPI.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_SETLPIR is a 64-bit register.

Field descriptions

When GICR_TYPER.DirectLPI == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																RES0															
																pINTID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

pINTID, bits [31:0]

The INTID of the physical LPI to be generated.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER.IDbits](#) field. Unimplemented bits are RES0.

When GICR_TYPER.DirectLPI == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																IMPLEMENTATION DEFINED															
																IMPLEMENTATION DEFINED															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing GICR_SETLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPis and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if either:

- The pINTID field corresponds to an LPI that is already pending.
- The pINTID field corresponds to an unimplemented LPI.
- [GICR_CTLR](#).EnableLPis == 0.

GICR_SETLPIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0040	GICR_SETLPIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_STATUSR, Error Reporting Status Register

The GICR_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

A copy of this register is provided for each Redistributor.

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

Attributes

GICR_STATUSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																WROD				RWOD		WRD		RRD							

Bits [31:4]

Reserved, RES0.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICR_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

GICR_STATUSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0010	GICR_STATUSR (S)

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0010	GICR_STATUSR (NS)

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_SYNCR, Redistributor Synchronize Register

The GICR_SYNCR characteristics are:

Purpose

Indicates completion of register based invalidate operations.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_SYNCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															Busy

Bits [31:1]

Reserved, RES0.

Busy, bit [0]

Indicates completion of invalidation operations

Busy	Meaning
0b0	No operations are in progress.
0b1	A write is in progress to one or more of the following registers: <ul style="list-style-type: none"> GICR_INVLPIR. GICR_INVALLR. GICv3, GICR_CLRLPIR.

This field tracks operations initiated on the same Redistributor.

Accessing GICR_SYNCR

When this register is accessed, it is optional that an implementation might wait until all operations are complete before returning a value, in which case GICR_SYNCR.Busy is always 0.

This register is mandatory when any of the following are true:

- [GICR_TYPER](#).Direct is 1.
- [GICR_CTLR](#).IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

GICR_SYNCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
-----------	-------	--------	----------

GIC Redistributor	RD_base	0x00C0	GICR_SYNCR
----------------------	---------	--------	------------

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_TYPER, Redistributor Type Register

The GICR_TYPER characteristics are:

Purpose

Provides information about the configuration of this Redistributor.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_TYPER is a 64-bit register.

Field descriptions

6362616059	58	57	56	55545352515049484746454443424140	39	38	37	36	35	34	33	32								
Affinity_Value																				
PPI	num	VSGI	Common	LPI	Aff	Processor Number					RV	PEID	MPAM	DPGS	Last	Direct	LPI	Dirty	VLPIS	PLPIS
3130292827	26	25	24	2322212019181716151413121110	9	8	7	6	5	4	3	2	1	0						

Affinity_Value, bits [63:32]

- The identity of the PE associated with this Redistributor.
- Bits [63:56] provide Aff3, the Affinity level 3 value for the Redistributor.
- Bits [55:48] provide Aff2, the Affinity level 2 value for the Redistributor.
- Bits [47:40] provide Aff1, the Affinity level 1 value for the Redistributor.
- Bits [39:32] provide Aff0, the Affinity level 0 value for the Redistributor.

PPInum, bits [31:27] When FEAT_GICv3p1 is implemented:

The value derived from this field specifies the maximum PPI INTID that a GIC implementation can support. An implementation might not implement all PPIs up to this maximum.

PPInum	Meaning
0b00000	Maximum PPI INTID is 31.
0b00001	Maximum PPI INTID is 1087.
0b00010	Maximum PPI INTID is 1119.

All other values are reserved.

Otherwise:

Reserved, RES0.

VSGI, bit [26] When FEAT_GICv4p1 is implemented:

Indicates whether vSGIs are supported.

VSGI	Meaning
0b0	Direct injection of SGIs not supported.
0b1	Direct injection of SGIs supported.

Otherwise:

Reserved, RES0.

CommonLPIAff, bits [25:24]

The affinity level at which Redistributors share an LPI Configuration table.

CommonLPIAff	Meaning
0b00	All Redistributors must share an LPI Configuration table.
0b01	All Redistributors with the same Aff3 value must share an LPI Configuration table.
0b10	All Redistributors with the same Aff3.Aff2 value must share an LPI Configuration table.
0b11	All Redistributors with the same Aff3.Aff2.Aff1 value must share an LPI Configuration table.

Processor_Number, bits [23:8]

A unique identifier for the PE. When [GITS_TYPER](#).PTA == 0, an ITS uses this field to identify the interrupt target.

When affinity routing is disabled for a Security state, this field indicates which [GICD_ITARGETSR<n>](#) corresponds to this Redistributor.

RVPEID, bit [7]

When FEAT_GICv4p1 is implemented:

Indicates how the resident vPE is specified.

RVPEID	Meaning
0b0	GICR_VPENDBASER records the address of the vPE's Virtual Pending Table.
0b1	GICR_VPENDBASER records vPEID.

Otherwise:

Reserved, RES0.

MPAM, bit [6]

When FEAT_GICv3p1 is implemented:

MPAM

MPAM	Meaning
0b0	MPAM not supported.
0b1	MPAM supported.

Otherwise:

Reserved, RES0.

DPGS, bit [5]

Sets support for [GICR_CTLR](#).DPG* bits.

DPGS	Meaning
0b0	GICR_CTLR.DPG* bits are not supported.
0b1	GICR_CTLR.DPG* bits are supported.

Last, bit [4]

Indicates whether this Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

Last	Meaning
0b0	This Redistributor is not the highest-numbered Redistributor in a series of contiguous Redistributor pages.
0b1	This Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

DirectLPI, bit [3]

Indicates whether this Redistributor supports direct injection of LPIs.

DirectLPI	Meaning
0b0	This Redistributor does not support direct injection of LPIs. The GICR_SETLPIR , GICR_CLRLPIR , GICR_INVLPIR , GICR_INVALLR , and GICR_SYNCRR registers are either not implemented, or have an IMPLEMENTATION DEFINED purpose.
0b1	This Redistributor supports direct injection of LPIs. The GICR_SETLPIR , GICR_CLRLPIR , GICR_INVLPIR , GICR_INVALLR , and GICR_SYNCRR registers are implemented.

Dirty, bit [2]

Controls the functionality of [GICR_VPENDBASER](#). Dirty.

Dirty	Meaning
0b0	GICR_VPENDBASER .Dirty is UNKNOWN when GICR_VPENDBASER .Valid == 1.
0b1	GICR_VPENDBASER .Dirty indicates when the Virtual Pending Table has been parsed when GICR_VPENDBASER .Valid is written from 0 to 1.

When [GICR_TYPER.VLPIS](#) == 0, this field is RES0.

Note

In GICv4p1 implementations this field is RES1.

VLPIS, bit [1]

Indicates whether the GIC implementation supports virtual LPIs and the direct injection of virtual LPIs.

VLPIS	Meaning
0b0	The implementation does not support virtual LPIs or the direct injection of virtual LPIs.
0b1	The implementation supports virtual LPIs and the direct injection of virtual LPIs.

Note

In GICv3 implementations this field is RES0.

PLPIS, bit [0]

Indicates whether the GIC implementation supports physical LPis.

PLPIS	Meaning
0b0	The implementation does not support physical LPis.
0b1	The implementation supports physical LPis.

Accessing GICR_TYPER

GICR_TYPER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0008	GICR_TYPER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICR_VPENDBASER, Virtual Redistributor LPI Pending Table Base Address Register

The GICR_VPENDBASER characteristics are:

Purpose

Specifies the base address of the memory that holds the virtual LPI Pending table for the currently scheduled virtual machine.

Configuration

Attributes

GICR_VPENDBASER is a 64-bit register.

Field descriptions

When FEAT_GICv4 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Valid	IDAI	PendingLast	Dirty	RES0	OuterCache	RES0	Physical Address																								
Physical Address															RES0	Shareability	InnerCache	RES0													
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Valid, bit [63]

This bit controls whether the virtual LPI Pending table is valid.

Valid	Meaning
0b0	The virtual LPI Pending table is not valid. No vPE is scheduled.
0b1	The virtual LPI Pending table is valid. A vPE is scheduled.

Setting GICR_VPENDBASER.Valid == 1 when the associated CPU interface does not implement FEAT_GICv4 is UNPREDICTABLE.

Note

Software can determine whether a PE supports FEAT_GICv3 or FEAT_GICv4 by reading ID_AA64PFR0_EL1.

Writing a new value to any bit of GICR_VPENDBASER, other than GICR_VPENDBASER.Valid, when GICR_VPENDBASER.Valid==1 is UNPREDICTABLE.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

IDAI, bit [62]

Implementation Defined Area Invalid. Indicates whether the IMPLEMENTATION DEFINED area in the virtual LPI Pending table is valid.

IDAI	Meaning
0b0	The IMPLEMENTATION DEFINED area is valid.
0b1	The IMPLEMENTATION DEFINED area is invalid and all pending interrupt information is held in the architecturally defined part of the virtual LPI Pending table.

For more information, see 'LPI Pending tables' and 'Virtual LPI Configuration tables and virtual LPI Pending tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

PendingLast, bit [61]

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR_VPENDBASER.Valid has been written from 1 to 0 and is otherwise UNKNOWN.

PendingLast	Meaning
0b0	There are no pending and enabled interrupts for the last scheduled vPE.
0b1	There is at least one pending interrupt for the last scheduled vPE. It is IMPLEMENTATION DEFINED whether this bit is set when the only pending interrupts for the last scheduled vPE are not enabled. Arm deprecates setting PendingLast to 1 when the only pending interrupts for the last scheduled virtual machine are not enabled.

When the GICR_VPENDBASER.Valid bit is written from 0 to 1, this bit is RES1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Dirty, bit [60]

When GICR_VPENDBASER.Valid == 0:

Indicates whether a de-scheduling operation is in progress.

This field is read-only.

Dirty	Meaning
0b0	No de-scheduling operation in process.
0b1	De-scheduling operation in process.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty==1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

When GICR_VPENDBASER.Valid == 1 and GICR_TYPER.Dirty == 1:

This field is read-only. Reports whether the Virtual Pending table has been parsed.

Dirty	Meaning
0b0	Parsing of the Virtual Pending Table has completed.
0b1	Parsing of the Virtual Pending Table has not completed.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Otherwise:

This field is read-only. This field is UNKNOWN.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Bit [59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to virtual LPI Pending tables of vPEs targeting this Redistributor.

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the OuterCacheability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:16]

Bits [51:16] of the physical address containing the virtual LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the virtual LPI Pending table.

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the Shareability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the virtual LPI Pending table.

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the InnerCacheability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:0]

Reserved, RES0.

When FEAT_GICv4p1 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Valid	Doorbell	PendingLast	Dirty	VGrp0En	VGrp1En	RES0																									
RES0																	vPEID														
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Valid, bit [63]

This bit controls whether a vPE is scheduled:

Valid	Meaning
0b0	The virtual LPI Pending table is not valid. No vPE is scheduled.
0b1	The virtual LPI Pending table is valid. A vPE is scheduled.

Setting GICR_VPENDBASER.Valid == 1 when the associated CPU interface does not implement FEAT_GICv4 is UNPREDICTABLE.

Note

Software can determine whether a PE supports FEAT_GICv3 or FEAT_GICv4 by reading ID_AA64PFR0_EL1.

Writing a new value to any bit of GICR_VPENDBASER, other than GICR_VPENDBASER.Valid, when GICR_VPENDBASER.Valid==1 is UNPREDICTABLE.

Setting GICR_VPENDBASER.Valid to 1 is UNPREDICTABLE if [GICR_VPROPBASER](#).Valid == 0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Doorbell, bit [62]

When GICR_VPENDBASER.Valid is written from 1 to 0, this bit controls whether a default doorbell interrupt is requested for the descheduled vPE.

Doorbell	Meaning
0b0	No default doorbell requested.
0b1	Default doorbell requested.

When GICR_VPENDBASER.Valid is written from 1 to 0, if there are outstanding enabled pending interrupts then this bit is treated as 0.

When GICR_VPENDBASER.Valid is written from 1 to 0, if GICR_VPENDBASER.PendingLast is written as 1 then this bit is treated as 0.

When GICR_VPENDBASER.Valid == 1, reads return an UNKNOWN value.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

PendingLast, bit [61]

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR_VPENDBASER.Valid is written from 1 to 0 and is otherwise UNKNOWN.

PendingLast	Meaning
0b0	There are no pending and enabled interrupts for the last scheduled vPE.
0b1	There is at least one pending and enabled interrupt for the last scheduled vPE.

When the GICR_VPENDBASER.Valid bit is written from 0 to 1, this bit is RES1.

When GICR_VPENDBASER.Valid is written from 1 to 0, if GICR_VPENDBASER.PendingLast is written as 1, then this bit is set to an UNKNOWN value.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Dirty, bit [60]**When GICR_VPENDBASER.Valid == 0:**

Read-only. Indicates whether a de-scheduling operation is in progress.

Dirty	Meaning
0b0	No de-scheduling operation in progress.
0b1	De-scheduling operation in progress.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Otherwise:

Read-only. Reports whether the Virtual Pending table has been parsed.

Dirty	Meaning
0b0	Parsing of the Virtual Pending Table is complete.
0b1	Parsing of the Virtual Pending Table has not completed.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

VGrp0En, bit [59]

Enable virtual Group 0 interrupts.

VGrp0En	Meaning
0b0	Forwarding of virtual Group 0 interrupts disabled.
0b1	Forwarding of virtual Group 0 interrupts enabled.

Writing a new value to VGrp0En while [GICR_VPENDBASER.Valid==1](#) is CONSTRAINED UNPREDICTABLE:

- The update is ignored.
- The update is ignored for all purposes other than a direct read of the register.
- The virtual group enable is updated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

VGrp1En, bit [58]

Enable virtual Group 1 interrupts.

VGrp1En	Meaning
0b0	Forwarding of virtual Group 1 interrupts disabled.
0b1	Forwarding of virtual Group 1 interrupts enabled.

Writing a new value to VGrp1En while [GICR_VPENDBASER.Valid==1](#) is CONSTRAINED UNPREDICTABLE:

- The update is ignored.
- The update is ignored for all purposes other than a direct read of the register.
- The virtual group enable is updated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [57:16]

Reserved, RES0.

vPEID, bits [15:0]

When GICR_VPENDBASER.Valid == 1, ID of scheduled vPE.

When GICR_VPENDBASER.Valid == 1, if GICR_VPENDBASER.vPEID is set to a value greater than the configured vPEID width, the behavior of this field is CONSTRAINED UNPREDICTABLE:

- GICR_VPENDBASER.vPEID is treated as having an UNKNOWN valid value for all purposes other than a direct read of the register.
- GICR_VPENDBASER.Valid is treated as being set to 0 for all purposes other than a direct read of the register.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER2.VIL](#) and [GICD_TYPER2.VID](#) fields, unimplemented bits are RES0.

Accessing GICR_VPENDBASER

The effect of a write to this register is not guaranteed to be visible throughout the affinity hierarchy, as indicated by [GICR_CTLR.RWP](#) == 0.

GICR_VPENDBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	VLPI_base	0x0078	GICR_VPENDBASER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_VPROPBASER, Virtual Redistributor Properties Base Address Register

The GICR_VPROPBASER characteristics are:

Purpose

Specifies the base address of the memory that holds the virtual LPI Configuration table for the currently scheduled virtual machine.

Configuration

This register is provided in FEAT_GICv4 implementations only.

Attributes

GICR_VPROPBASER is a 64-bit register.

Field descriptions

When FEAT_GICv4 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0				OuterCache				RES0				Physical_Address																			
Physical_Address												Shareability				InnerCache				RES0				IDbits							
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the virtual LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IDbits, bits [4:0]

The number of bits of virtual LPI INTID supported, minus one.

If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all virtual LPIs are out of range.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

When FEAT_GICv4p1 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Valid	RES0	Entry_Size			OuterCache			Indirect	Page_Size			Z	Physical_Address																		
Physical_Address											Shareability		InnerCache			Size															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Valid, bit [63]

This bit controls whether the vPE Configuration Table is valid.

Valid	Meaning
0b0	The vPE Configuration table is not valid.
0b1	The vPE Configuration table is valid.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Bit [62]

Reserved, RES0.

Entry_Size, bits [61:59]

Specifies the number 64-bit doublewords per table entry, minus one.

This bit is read-only.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Indirect, bit [55]

This field indicates whether GICR_VPROPBASER specifies a single, flat table or a two-level table where the first level contains a list of descriptors.

Indirect	Meaning
0b0	Single Level. The Size field indicates the number of pages used to store data associated with each table entry.
0b1	Two Level. The Size field indicates the number of pages that contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used.

This field is RES0 for GIC implementations that only support flat tables.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Page_Size, bits [54:53]

The following values indicate the size of page that the translation table uses:

Page_Size	Meaning
0b00	4KB.
0b01	16KB.
0b10	64KB.
0b11	Reserved. Treated as 0b10.

Note

If the GIC implementation supports only a single, fixed page size, this field might be RO.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Z, bit [52]

When GICR_VPROPBASER.Valid is written from 0 to 1, GICR_VPROPBASER.Z indicates whether the vPE Configuration table is known to contain all zeros.

Z	Meaning
0b0	The vPE Configuration table is not zero, and contains live data.
0b1	The vPE Configuration table is zero.

Setting GICR_VPROPBASER.Z to 0 causes the IRI to reload configuration from memory

When GICR_VPROPBASER.Valid is written from 0 to 1, if GICR_VPROPBASER.Z==1 behavior is UNPREDICTABLE if the allocated memory does not contain all zeros.

This field is WO, and reads as 0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Size, bits [6:0]

The number of pages of physical memory allocated to the table, minus one.

[GICR_VPROPBASER](#).Page_Size specifies the size of each page.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing GICR_VPROPBASER

GICR_VPROPBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	VLPI_base	0x0070	GICR_VPROPBASER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICR_VSGIPENDR, Redistributor virtual SGI pending state register

The GICR_VSGIPENDR characteristics are:

Purpose

Requests the pending state of virtual SGIs for a specified vPE.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GICR_VSGIPENDR are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_VSGIPENDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Busy	RES0															Pending															

Busy, bit [31]

ID of target vPEID

Busy	Meaning
0b0	Query of virtual SGI state not in progress.
0b1	Query of virtual SGI state in progress.

Bits [30:16]

Reserved, RES0.

Pending, bits [15:0]

Pending state of virtual SGIs for requested vPEID.

This field is UNKNOWN when [GICR_VSGIPENDR](#).Busy == 1

Accessing GICR_VSGIPENDR

64-bit access only.

GICR_VSGIPENDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	VLPI_base	0x0088	GICR_VSGIPENDR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICR_VSGIR, Redistributor virtual SGI pending state request register

The GICR_VSGIR characteristics are:

Purpose

Requests the pending state of virtual SGIs for a specified vPE.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GICR_VSGIR are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_VSGIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																vPEID															

Bits [31:16]

Reserved, RES0.

vPEID, bits [15:0]

ID of target vPE

Writing this field is CONSTRAINED UNPREDICTABLE when [GICR_VSGIPENDR](#).Busy == 1, with either the write ignored or a new query started.

Writing a value greater than the configured vPEID width behaviour is CONSTRAINED UNPREDICTABLE:

- GICR_VPENDBASER.vPEID is treated as having an UNKNOWN valid value for all purposes other than a direct read of the register.
- GICR_VPENDBASER.Valid is treated as being set to 0 for all purposes other than a direct read of the register.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER2](#).VIL and [GICD_TYPER2](#).VID fields. Unimplemented bits are RES0.

Accessing GICR_VSGIR

64-bit access only.

GICR_VSGIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
-----------	-------	--------	----------

GIC Redistributor	VLPI_base	0x0080	GICR_VSGIR
----------------------	-----------	--------	------------

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICR_WAKER, Redistributor Wake Register

The GICR_WAKER characteristics are:

Purpose

Permits software to control the behavior of the WakeRequest power management signal corresponding to the Redistributor. Power management operations follow the rules in 'Power management' in in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_WAKER is a 32-bit register.

Field descriptions

31	3029282726252423222120191817161514131211109876543	2	1	0
IMPLEMENTATION DEFINED	RES0	ChildrenAsleep	ProcessorSleep	IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bit [31]

IMPLEMENTATION DEFINED.

Bits [30:3]

Reserved, RES0.

ChildrenAsleep, bit [2]

Read-only. Indicates whether the connected PE is quiescent:

ChildrenAsleep	Meaning
0b0	An interface to the connected PE might be active.
0b1	All interfaces to the connected PE are quiescent.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 1.

ProcessorSleep, bit [1]

Indicates whether the Redistributor can assert the **WakeRequest** signal:

ProcessorSleep	Meaning
0b0	This PE is not in, and is not entering, a low power state.
0b1	<p>The PE is either in, or is in the process of entering, a low power state.</p> <p>All interrupts that arrive at the Redistributor:</p> <ul style="list-style-type: none"> • Assert a WakeRequest signal. • Are held in the pending state at the Redistributor, and are not communicated to the CPU interface.

Note

When ProcessorSleep == 1, the Redistributor must ensure that any interrupts that are pending on the CPU interface are released.

For an implementation that is using the GIC Stream Protocol Interface:

- A Quiesce command puts the interface between the Redistributor and the CPU interface in a quiescent state. For more information, see 'Quiesce (IRI)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).
- A Release command releases any interrupts that are pending on the CPU interface. For more information, see 'Release (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Before powering down a PE, software must set this bit to 1 and wait until ChildrenAsleep == 1. After powering up a PE, or following a failed powerdown, software must set this bit to 0 and wait until ChildrenAsleep == 0.

Changing ProcessorSleep from 1 to 0 when ChildrenAsleep is not 1 results in UNPREDICTABLE behavior.

Changing ProcessorSleep from 0 to 1 when the Enable for each interrupt group in the associated CPU interface is not 0 results in UNPREDICTABLE behavior.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 1.

IMPLEMENTATION DEFINED, bit [0]

IMPLEMENTATION DEFINED.

Accessing GICR_WAKER

When [GICD_CTLR.DS==1](#), this register is always accessible.

When [GICD_CTLR.DS==0](#), this is a Secure register. This register is RAZ/WI to Non-secure accesses.

To ensure a Redistributor is quiescent, software must write to GICR_WAKER with ProcessorSleep == 1, then poll the register until ChildrenAsleep == 1.

Resetting the connected PE when GICR_WAKER.ProcessorSleep==0 or GICR_WAKER.ChildrenAsleep==0, can lead to UNPREDICTABLE behaviour in the IRI.

Resetting the IRI when GICR_WAKER.ProcessorSleep==0 or GICR_WAKER.ChildrenAsleep==0 can lead to UNPREDICTABLE behaviour in the connected PE.

GICR_WAKER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0014	GICR_WAKER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_ABPR, Virtual Machine Aliased Binary Point Register

The GICV_ABPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

This register corresponds to [GICC_ABPR](#) in the physical CPU interface.

Note

[GICH_LR<n>](#).Group determines whether a virtual interrupt is Group 0 or Group 1.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_ABPR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_ABPR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																		Binary_Point													

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

The Binary_Point field of this register is aliased to [GICH_VMCR.VBPR1](#).

Accessing GICV_ABPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_BPR1](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_BPR1_EL1](#) provides equivalent functionality.

The value contained in this register is one greater than the actual applied binary point value, as described in 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This register is used for Group 1 interrupts when [GICV_CTLR](#).CBPR == 0. [GICV_BPR](#) provides equivalent functionality for Group 0 interrupts, and for Group 1 interrupts when [GICV_CTLR](#).CBPR == 1.

GICV_ABPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x001C	GICV_ABPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_AEOIR, Virtual Machine Aliased End Of Interrupt Register

The GICV_AEOIR characteristics are:

Purpose

A write to this register performs a priority drop for the specified Group 1 virtual interrupt and, if [GICV_CTLR.EOImode](#) == 0, also deactivates the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_AEOIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_AEOIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0							INTID																								

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A successful EOI request means that:

- The highest priority bit in [GICH_APR<n>](#) is cleared, causing the running priority to drop.
- If the appropriate [GICV_CTLR.EOImode](#) bit == 0, the interrupt is deactivated in the corresponding List register. If the INTID corresponds to a hardware interrupt, the interrupt is also deactivated in the Distributor.

Note

Only Group 1 interrupts can target the hypervisor, and therefore only Group 1 interrupts are deactivated in the Distributor.

A write to this register is UNPREDICTABLE if the INTID corresponds to a Group 0 interrupt. In addition, the following GICv2 UNPREDICTABLE cases require specific actions:

- If highest active priority is Group 0 and the identified interrupt is in the List Registers and it matches the highest active priority. When EL2 is using System registers and [ICH_VTR_EL2](#).SEIS is 1, an IMPLEMENTATION DEFINED SEI might be generated, otherwise GICv3 implementations must ignore such writes.
- If the identified interrupt is in the List Registers, and the HW bit is 1, and the interrupt to be deactivated is an SGI (that is, the value of Physical_ID is between 0 and 15). GICv3 implementations must perform the deactivate operation. This means that a GICv3 implementation in legacy operation must ensure only a single SGI is active for a PE.
- If the identified interrupt is in the List Registers, and the HW bit is 1, and the corresponding pINTID field value is between 1020 and 1023, indicating a special purpose INTID. GICv3 implementations must not perform a deactivate operation but must still change the state of the List register as appropriate. When EL2 is using System registers and [ICH_VTR_EL2](#).SEIS is 1, an implementation might generate a system error.

Accessing GICV_AEOIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_EOIR1](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_EOIR1_EL1](#) provides equivalent functionality.

This register is used for Group 1 interrupts only. [GICV_EOIR](#) provides equivalent functionality for Group 0 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_AEOIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0024	GICV_AEOIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_AHPPIR, Virtual Machine Aliased Highest Priority Pending Interrupt Register

The GICV_AHPPIR characteristics are:

Purpose

Provides the INTID of the highest priority pending Group 1 virtual interrupt in the List registers.

This register corresponds to the physical CPU interface register [GICC_AHPPIR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_AHPPIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_AHPPIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0							INTID																								

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A read of this register returns the spurious INTID 1023 if any of the following are true:

- There are no pending interrupts of sufficiently high priority value to be signaled to the PE.
- The highest priority pending interrupt is in Group 0.

Accessing GICV_AHPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_HPPIR1](#) provides equivalent functionality.

- For AArch64 implementations, [ICC_HPPIR1_EL1](#) provides equivalent functionality.

This register is used for Group 1 interrupts only. [GICV_HPPIR](#) provides equivalent functionality for Group 0 interrupts.

The register does not return the INTID of an interrupt that is active and pending.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_AHPPIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0028	GICV_AHPPIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_AIAR, Virtual Machine Aliased Interrupt Acknowledge Register

The GICV_AIAR characteristics are:

Purpose

Provides the INTID of the signaled Group 1 virtual interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

This register corresponds to the physical CPU interface register [GICC_AIAR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_AIAR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_AIAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0							INTID																								

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

The operation of this register is similar to the operation of [GICV_IAR](#). When a vPE reads this register, the corresponding [GICH_LR<n>](#).Group field is checked to determine whether the interrupt is in Group 0 or Group 1:

- If the interrupt is Group 0, the spurious INTID 1023 is returned and the interrupt is not acknowledged.
- If the interrupt is Group 1, the INTID is returned. The List register entry is updated to active state, and the appropriate bit in [GICH_APR<n>](#) is set to 1.

A read of this register returns the spurious INTID 1023 if any of the following are true:

- When the virtual CPU interface is enabled and [GICH_HCR](#).En == 1:

- There are no pending interrupts of sufficiently high priority value to be signaled to the PE.
- The highest priority pending interrupt is in Group 0.
- Interrupt signaling by the virtual CPU interface is disabled.

Accessing GICV_AIAR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_IAR1](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_IAR1_EL1](#) provides equivalent functionality.

This register is used for Group 1 interrupts only. [GICV_IAR](#) provides equivalent functionality for Group 0 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_AIAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0020	GICV_AIAR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_APR<n>, Virtual Machine Active Priorities Registers, n = 0 - 3

The GICV_APR<n> characteristics are:

Purpose

Provides information about interrupt active priorities.

These registers correspond to the physical CPU interface registers [GICC_APR<n>](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_APR<n> are RES0.

When System register access is disabled for EL2, these registers access [GICH_APR<n>](#), and all active priorities for virtual machines are held in [GICH_APR<n>](#) regardless of interrupt group.

When System register access is enabled for EL2, these registers access [ICH_AP1R<n>_EL2](#), and all active priorities for virtual machines are held in [ICH_AP1R<n>_EL2](#) regardless of interrupt group.

Attributes

GICV_APR<n> is a 32-bit register.

Field descriptions

P<x>, bit [x], for x = 31 to 0

Provides information about active priorities for the virtual machine.

See [GICH_APR<n>](#) and [ICH_AP1R<n>_EL2](#) for the correspondence between priorities and bits.

Accessing GICV_APR<n>

If System register access is not enabled for EL2, these registers access [GICH_APR<n>](#). If System register access is enabled for EL2, these registers access [ICH_AP1R<n>_EL2](#). All active priority mapped guests are held in the accessed registers, regardless of interrupt group.

GICV_APR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x00D0 + (4 * n)	GICV_APR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICV_BPR, Virtual Machine Binary Point Register

The GICV_BPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

This register corresponds to [GICC_BPR](#) in the physical CPU interface.

Note

[GICH_LR<n>](#).Group determines whether a virtual interrupt is Group 0 or Group 1.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_BPR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

When [GICV_CTLR](#).CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

Attributes

GICV_BPR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																	Binary Point														

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see 'ICC_BPR0_EL1 Binary Point for Group 1 interrupts when CBPR == 1, or for Group 0 interrupts' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The Binary_Point field of this register is aliased to [GICH_VMCR](#).VBPR0.

Accessing GICV_BPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_BPR0](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_BPR0_EL1](#) provides equivalent functionality.

GICV_BPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0008	GICV_BPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_CTLR, Virtual Machine Control Register

The GICV_CTLR characteristics are:

Purpose

Controls the behavior of virtual interrupts.

This register corresponds to the physical CPU interface register [GICC_CTLR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_CTLR are RES0.

This register is available when a GIC implementation supports interrupt virtualization.

Attributes

GICV_CTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																						EOImode	RES0	CBPR	FIQEn	AckCtl	EnableGrp1	EnableGrp0			

Bits [31:10]

Reserved, RES0.

EOImode, bit [9]

Controls the behavior associated with the [GICV_EOIR](#), [GICV_AEOIR](#), and [GICV_DIR](#) registers:

EOImode	Meaning
0b0	Writes to GICV_EOIR and GICV_AEOIR perform priority drop and deactivate interrupt operations simultaneously. Behavior on a write to GICV_DIR is unpredictable. When it has completed processing the interrupt, the virtual machine writes to GICV_EOIR or GICV_AEOIR to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the physical Distributor.
0b1	Writes to GICV_EOIR and GICV_AEOIR perform priority drop operation only. Writes to GICV_DIR perform deactivate interrupt operation only. When it has completed processing the interrupt, the virtual machine writes to GICV_DIR to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the Distributor.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

CBPR, bit [4]

Controls whether [GICV_BPR](#) affects both Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	GICV_BPR affects Group 0 virtual interrupts only. GICV_ABPR affects Group 1 virtual interrupts only.
0b1	GICV_BPR affects both Group 0 and Group 1 virtual interrupts.

For more information, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIQEn, bit [3]

FIQ Enable. Controls whether Group 0 virtual interrupts are presented as virtual FIQs:

FIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AckCtl, bit [2]

Arm deprecates use of this bit. Arm strongly recommends that software is written to operate with this bit always cleared to 0.

Acknowledge control. When the highest priority interrupt is Group 1, determines whether [GICV_IAR](#) causes the CPU interface to acknowledge the interrupt or returns the spurious identifier 1022, and whether [GICV_HPPIR](#) returns the interrupt ID or the special identifier 1022.

AckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an interrupt ID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the interrupt ID of the corresponding interrupt.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EnableGrp1, bit [1]

Enables the signaling of Group 1 virtual interrupts by the virtual CPU interface to the virtual machine:

EnableGrp1	Meaning
0b0	Signaling of Group 1 interrupts is disabled.
0b1	Signaling of Group 1 interrupts is enabled.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enables the signaling of Group 0 virtual interrupts by the virtual CPU interface to the virtual machine:

EnableGrp0	Meaning
0b0	Signaling of Group 0 interrupts is disabled.
0b1	Signaling of Group 0 interrupts is enabled.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICV_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_CTLR](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_CTLR_EL1](#) provides equivalent functionality.

GICV_CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0000	GICV_CTLR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICV_DIR, Virtual Machine Deactivate Interrupt Register

The GICV_DIR characteristics are:

Purpose

Deactivates a specified virtual interrupt in the [GICH_LR<n>](#) List registers.

This register corresponds to the physical CPU interface register [GICC_DIR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_DIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_DIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0							INTID																								

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

When the virtual machine writes to this register, the specified interrupt in the List registers is changed from active to inactive, or from active and pending to pending. If the specified interrupt is present in the List registers but is not in either the active or active and pending states, the effect is UNPREDICTABLE. If the specified interrupt is not present in the List registers, [GICH_HCR](#).EOICount is incremented, potentially generating a maintenance interrupt.

Note

If the specified interrupt is not present in the List registers, the virtual machine cannot recover the INTID. Therefore, the hypervisor must ensure that, when [GICV_CTLR](#).EOImode == 1, no more than one active interrupt is

transferred from the List registers into a software list. If more than one active interrupt that is not stored in the List registers exists, the hypervisor must handle accesses to GICV_DIR in software, typically by trapping these accesses.

If the corresponding [GICH_LR<n>.HW == 1](#), indicating a hardware interrupt, then a deactivate request is sent to the physical Distributor, identifying the physical INTID from the corresponding field in the List register. This effect is identical to a Non-secure write to [GICC_DIR](#) from the PE having that physical INTID. This means that if the corresponding physical interrupt is marked as Group 0, the request is ignored.

Note

Interrupt deactivation using this register is based on the provided INTID, with no requirement to deactivate interrupts in any particular order. A single register is therefore used to deactivate both Group 0 and Group 1 interrupts.

Accessing GICV_DIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_DIR](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_DIR_EL1](#) provides equivalent functionality.

Writes to this register are valid only when [GICV_CTLR.EOImode == 1](#). Writes to this register are otherwise UNPREDICTABLE.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_DIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x1000	GICV_DIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_EOIR, Virtual Machine End Of Interrupt Register

The GICV_EOIR characteristics are:

Purpose

A write to this register performs a priority drop for the specified Group 0 virtual interrupt and, if [GICV_CTLR.EOImode](#) == 0, also deactivates the interrupt.

This register corresponds to the physical CPU interface register [GICC_EOIR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_EOIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_EOIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0							INTID																								

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

The behavior of this register depends on the setting of [GICV_CTLR.EOImode](#):

GICV_CTLR.EOImode	Behavior
0b0	Both the priority drop and the deactivate interrupt effects occur
0b1	Only the priority drop effect occurs.

A successful EOI request means that:

- The highest priority bit in [GICH_APR<n>](#) is cleared, causing the running priority to drop.
- If the appropriate [GICV_CTLR.EOImode](#) bit == 0, the interrupt is deactivated in the corresponding List register [GICH_LR<n>](#). If [GICH_LR<n>.HW](#) == 1, indicating the INTID corresponds to a hardware interrupt,

a deactivate request is also sent to the physical Distributor, identifying the physical INTID from the corresponding field in the List register. This effect is identical to a Non-secure write to [GICC_DIR](#) from the PE having that physical INTID. This means that if the corresponding physical interrupt is marked as Group 0, and [GICD_CTLR.DS](#) == 0, the deactivation request is ignored. See [GICC_EOIR](#) for more information.

Note

Only Group 1 interrupts can target the hypervisor, and therefore only Group 1 interrupts are deactivated in the Distributor.

Accessing GICV_EOIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_EOIR0](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_EOIR0_EL1](#) provides equivalent functionality.

This register is used for Group 0 interrupts only. [GICV_AEOIR](#) provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_EOIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0010	GICV_EOIR

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_HPPIR, Virtual Machine Highest Priority Pending Interrupt Register

The GICV_HPPIR characteristics are:

Purpose

Provides the INTID of the highest priority pending Group 0 virtual interrupt in the List registers.

This register corresponds to the physical CPU interface register [GICC_HPPIR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_HPPIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_HPPIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0							INTID																								

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Reads of the GICC_HPPIR that do not return a valid INTID return a spurious INTID, 1022 or 1023. See 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Highest priority pending interrupt Group	GICV_HPPIR read	GICV_CTLR.AckCtl	Returned INTID
1	Non-secure	x	ID of Group 1 interrupt 1022
1	Secure	0	ID of Group 1 interrupt 1023
1	Secure	1	ID of Group 0 interrupt 1023
0	Non-secure	x	ID of Group 0 interrupt 1023
0	Secure	x	ID of Group 0 interrupt 1023
No pending interrupts	x	x	1023

If the CPU interface supports only a single Security state, the entries that apply to Secure reads describe the behavior.

Accessing GICV_HPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_HPPIR0](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_HPPIR0_EL1](#) provides equivalent functionality.

This register is used for Group 0 interrupts only. [GICV_AHPPIR](#) provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_HPPIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0018	GICV_HPPIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

GICV_IAR, Virtual Machine Interrupt Acknowledge Register

The GICV_IAR characteristics are:

Purpose

Provides the INTID of the signaled Group 0 virtual interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

This register corresponds to the physical CPU interface register [GICC_IAR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_IAR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_IAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0							INTID																								

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

When the virtual machine writes to this register, the virtual CPU interface acknowledges the highest priority pending virtual interrupt and sets the state in the corresponding List register to active. The appropriate bit in the active priorities register [GICH_APR<n>](#) is set to 1.

If [GICH_LR<n>](#).HW == 0, indicating that the interrupt is software-triggered, then bits [12:10] of [GICH_LR<n>](#) are returned in bits [12:10] of GICV_IAR. Otherwise bits [12:10] are RES0.

A read of this register returns the spurious INTID 1023 if either of the following is true:

- There are no pending interrupts of sufficiently high priority value to be signaled to the PE with the virtual CPU interface enabled and [GICH_HCR.En](#) == 1.
- Interrupt signaling by the virtual CPU interface is disabled.

A read of this register returns the spurious INTID 1022 if the highest priority pending interrupt is Group 1 and [GICV_CTLR.AckCtl](#) == 0.

Accessing GICV_IAR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_IAR0](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_IAR0_EL1](#) provides equivalent functionality.

This register is used for Group 0 interrupts only. [GICV_AIAR](#) provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_IAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x000C	GICV_IAR

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_IIDR, Virtual Machine CPU Interface Identification Register

The GICV_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the virtual CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_IIDR are RES0.

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

Attributes

GICV_IIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ProductID												Architecture_version				Revision				Implementer											

ProductID, bits [31:20]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture_version, bits [19:16]

The version of the GIC architecture that is implemented.

Architecture_version	Meaning
0b0001	GICv1.
0b0010	GICv2.
0b0011	GICv3 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.
0b0100	GICv4 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.

Other values are reserved.

Revision, bits [15:12]

Revision number for the CPU interface.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the CPU interface.

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

Accessing GICV_IIDR

GICV_IIDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x00FC	GICV_IIDR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_PMR, Virtual Machine Priority Mask Register

The GICV_PMR characteristics are:

Purpose

This register provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

Note

Higher interrupt priority corresponds to a lower value of the Priority field.

This register corresponds to the physical CPU interface register [GICC_PMR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_PMR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

The Priority field of this register is aliased to [GICH_VMCR.VMPR](#), to enable state to be switched easily between virtual machines during context-switching.

Attributes

GICV_PMR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								Priority							

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = 0b0.
- For 64 supported levels, bits [1:0] = 0b00.
- For 32 supported levels, bits [2:0] = 0b000.
- For 16 supported levels, bits [3:0] = 0b0000.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICV_PMR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_PMR](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_PMR_EL1](#) provides equivalent functionality.

GICV_PMR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0004	GICV_PMR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GICV_RPR, Virtual Machine Running Priority Register

The GICV_RPR characteristics are:

Purpose

This register indicates the running priority of the virtual CPU interface.

This register corresponds to the physical CPU interface register [GICC_RPR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_RPR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_RPR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								Priority							

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the virtual CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR was set to the minimum value.

Accessing GICV_RPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_RPR](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_RPR_EL1](#) provides equivalent functionality.

Depending on the implementation, if no bits are set to 1 in [GICH_APR<n>](#), indicating no active virtual interrupts in the virtual CPU interface, the priority reads as 0xFF or 0xF8 to reflect the number of supported interrupt priority bits defined by [GICH_VTR](#).PRIbits.

GICV_RPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0014	GICV_RPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_STATUSR, Virtual Machine Error Reporting Status Register

The GICV_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_STATUSR are RES0.

In systems where this register is implemented, Arm expects that when a virtual machine is scheduled, the hypervisor ensures that this register is cleared to 0. The hypervisor might check for illegal accesses when the virtual machine is unscheduled.

Attributes

GICV_STATUSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																												WROD	RWOD	WRD	RRD

Bits [31:4]

Reserved, RES0.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICV_STATUSR

This is an optional register. If the register is implemented, [GICC_STATUSR](#) must also be implemented. If the register is not implemented, the location is RAZ/WI.

This register is used only when System register access is not enabled. If System register access is enabled, this register is not updated. Equivalent function might be provided by appropriate traps and exceptions.

GICV_STATUSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x002C	GICV_STATUSR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GITS_BASER<n>, ITS Translation Table Descriptors, n = 0 - 7

The GITS_BASER<n> characteristics are:

Purpose

Specifies the base address and size of the ITS translation tables.

Configuration

A copy of this register is provided for each ITS translation table.

Bits [63:32] and bits [31:0] are accessible independently.

A maximum of 8 GITS_BASER<n> registers can be provided. Unimplemented registers are RES0.

When [GITS_CTLR.Enabled](#) == 1 or [GITS_CTLR.Quiescent](#) == 0, writing this register is UNPREDICTABLE.

Attributes

GITS_BASER<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Valid	Indirect	Inner	Cache	Type	Outer	Cache	Entry_Size	Physical_Address																							
Physical_Address																	Shareability		Page_Size		Size										
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Valid, bit [63]

Indicates whether software has allocated memory for the translation table:

Valid	Meaning
0b0	No memory is allocated for the translation table. The ITS discards any writes to the interrupt translation page when either: <ul style="list-style-type: none"> GITS_BASER<n>.Type specifies any valid table entry type other than interrupt collections, that is, any value other than 0b100. GITS_BASER<n>.Type specifies an interrupt collection and GITS_TYPER.HCC == 0.
0b1	Memory is allocated to the translation table.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Indirect, bit [62]

This field indicates whether an implemented register specifies a single, flat table or a two-level table where the first level contains a list of descriptors.

Indirect	Meaning
0b0	Single Level. The Size field indicates the number of pages used by the ITS to store data associated with each table entry.
0b1	Two Level. The Size field indicates the number of pages which contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used.

For more information, see 'The ITS tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field is RAZ/WI for GIC implementations that only support flat tables. If the maximum width of the scaling factor that is identified by GITS_BASER<n>.Type and the smallest page size that is supported result in a single level table that requires multiple pages, then implementing this bit as RAZ/WI is DEPRECATED.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [61:59]

Indicates the Inner Cacheability attributes of accesses to the table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Type, bits [58:56]

Read only. Specifies the type of entity that requires entries in the corresponding translation table. The possible values of the field are:

Type	Meaning
0b000	Unimplemented. This register does not correspond to a translation table.
0b001	Devices. This register corresponds to a translation table that scales with the width of the DeviceID. Only a single GITS_BASER<n> register reports this type.
0b010	vPEs. FEAT_GICv4 only. This register corresponds to a translation table that scales with the number of vPEs in the system. The translation table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of vPEs in the system. Only a single GITS_BASER<n> register reports this type.
0b100	Interrupt collections. This register corresponds to a translation table that scales with the number of interrupt collections in the system. The translation table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of interrupt collections. Not more than one GITS_BASER<n> register will report this type.

Other values are reserved.

For FEAT_GICv4p1, the registers are allocated as follows:

- GITS_BASER0.Type is 0b001 (Device).
- GITS_BASER1.Type is either 0b100 (Collection Table) or 0b000 (Unimplemented).
- GITS_BASER2.Type is either 0b010 (vPE) or 0b000 (Unimplemented).
- GITS_BASER<n>.Type, where 'n' is in the range 3 to 7, is 0b000 (Unimplemented).

For FEAT_GICv3, FEAT_GICv3p1, and FEAT_GICv4, Arm recommends that the GITS_BASER<n> use the same allocations.

Other allocations of Type values are deprecated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

OuterCache, bits [55:53]

Indicates the Outer Cacheability attributes of accesses to the table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Entry_Size, bits [52:48]

Read-only. Specifies the number of bytes per translation table entry, minus one.

Physical_Address, bits [47:12]

Physical Address. When Page_Size is 4KB or 16KB:

- Bits [51:48] of the base physical address are zero.
- This field provides bits[47:12] of the base physical address of the table.
- Bits[11:0] of the base physical address are zero.
- The address must be aligned to the size specified in the Page Size field. Otherwise the effect is CONSTRAINED UNPREDICTABLE, and can be one of the following:
 - Bits[X:12], where X is derived from the page size, are treated as zero.
 - The value of bits[X:12] are used when calculating the address of a table access.

When Page_Size is 64KB:

- Bits[47:16] of the register provide bits[47:16] of the base physical address of the table.
- Bits[15:12] of the register provide bits[51:48] of the base physical address of the table.
- Bits[15:0] of the base physical address are 0.

In implementations that support fewer than 52 bits of physical address, any unimplemented upper bits might be RAZ/WI.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Page_Size, bits [9:8]

The size of page that the translation table uses:

Page_Size	Meaning
0b00	4KB.
0b01	16KB.
0b10	64KB.
0b11	Reserved. Treated as 0b10.

Note

If the GIC implementation supports only a single, fixed page size, this field might be RO.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Size, bits [7:0]

The number of pages of physical memory allocated to the table, minus one. GITS_BASER<n>.Page_Size specifies the size of each page.

If GITS_BASER<n>.Type == 0, this field is RAZ/WI.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GITS_BASER<n>

GITS_BASER<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0100 + (8 * n)	GITS_BASER<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GITS_CBASER, ITS Command Queue Descriptor

The GITS_CBASER characteristics are:

Purpose

Specifies the base address and size of the ITS command queue.

Configuration

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CBASER is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Valid	RES0	InnerCache			RES0	OuterCache			RES0	Physical_Address																					
Physical_Address																Shareability		RES0	Size												
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Valid, bit [63]

Indicates whether software has allocated memory for the command queue:

Valid	Meaning
0b0	No memory is allocated for the command queue.
0b1	Memory is allocated to the command queue.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Bit [62]

Reserved, RES0.

InnerCache, bits [61:59]

Indicates the Inner Cacheability attributes of accesses to the command queue. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [58:56]

Reserved, RES0.

OuterCache, bits [55:53]

Indicates the Outer Cacheability attributes of accesses to the command queue. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bit [52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the base physical address of the command queue. Bits [11:0] of the base address are 0.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

If bits [15:12] are not all zeros, behavior is a CONSTRAINED UNPREDICTABLE choice:

- Bits [15:12] are treated as if all the bits are zero. The value read back from those bits is either the value written or zero.
- The result of the calculation of an address for a command queue read can be corrupted.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the command queue. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [9:8]

Reserved, RES0.

Size, bits [7:0]

The number of 4KB pages of physical memory allocated to the command queue, minus one.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

The command queue is a circular buffer and wraps at Physical Address [47:0] + (4096 * (Size + 1)).

Note

When this register is successfully written, the value of [GITS_CREADR](#) is set to zero.

Accessing GITS_CBASER

When [GITS_CTLR.Enabled](#) == 1 or [GITS_CTLR.Quiescent](#) == 0, writing this register is UNPREDICTABLE.

GITS_CBASER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0080	GITS_CBASER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GITS_CREADR, ITS Read Register

The GITS_CREADR characteristics are:

Purpose

Specifies the offset from [GITS_CBASER](#) where the ITS reads the next ITS command.

Configuration

This register is cleared to 0 when a value is written to [GITS_CBASER](#).

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CREADR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																																
RES0												Offset																RES0				Stalled
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:20]

Reserved, RES0.

Offset, bits [19:5]

Bits [19:5] of the offset from [GITS_CBASER](#). Bits [4:0] of the offset are zero.

Bits [4:1]

Reserved, RES0.

Stalled, bit [0]

Reports whether the processing of commands is stalled because of a command error.

Stalled	Meaning
0b0	ITS command queue is not stalled because of a command error.
0b1	ITS command queue is stalled because of a command error.

For more information, see 'The ITS command interface' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accessing GITS_CREADR

GITS_CREADR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
-----------	--------	----------

GIC ITS control	0x0090	GITS_CREADR
-----------------	--------	-------------

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GITS_CTLR, ITS Control Register

The GITS_CTLR characteristics are:

Purpose

Controls the operation of an ITS.

Configuration

The ITS_Number (bits [7:4]) and bit [1] fields apply only in FEAT_GICv4 implementations, and are RES0 in FEAT_GICv3 implementations.

Attributes

GITS_CTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Quiescent		RES0																UMSIRQ		ITS Number				RES0		ImDe		Enabled			

Quiescent, bit [31]

Read-only. Indicates completion of all ITS operations when GITS_CTLR.Enabled == 0.

Quiescent	Meaning
0b0	The ITS is not quiescent and cannot be powered down.
0b1	The ITS is quiescent and can be powered down.

For the ITS to be considered inactive, there must be no transactions in progress. In addition, all operations required to ensure that mapping data is consistent with external memory must be complete.

Note

In distributed GIC implementations, this bit is set to 1 only after the ITS forwards any operations that have not yet been completed to the Redistributors and receives confirmation that all such operations have reached the appropriate Redistributor.

In FEAT_GICv3, FEAT_GICv3p1, and FEAT_GICv4, when GITS_CTLR.Enabled == 1, the value of GITS_CTLR.Quiescent is UNKNOWN.

In FEAT_GICv4p1, when GITS_CTLR.Enabled == 1, the value of GITS_CTLR.Quiescent reads as 1 until the write to Enabled has taken effect and then reads as 0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 1.

Bits [30:9]

Reserved, RES0.

UMSIRQ, bit [8]

Unmapped MSI reporting interrupt enable.

UMSIirq	Meaning
0b0	The ITS does not assert an interrupt signal when GITS_STATUSR.UMSI is 1.
0b1	The ITS asserts an interrupt signal when GITS_STATUSR.UMSI is 1.

If [GITS_TYPER.UMSIirq](#) is 0, this field is RES0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

ITS_Number, bits [7:4]

In FEAT_GICv3 implementations this field is RES0.

In FEAT_GICv4 implementations with more than one ITS instance, this field indicates the ITS number for use with 'VMOVP GICv4.0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

It is IMPLEMENTATION DEFINED whether this field is programmable or RO.

If this field is programmable, changing this field when [GITS_CTLR.Quiescent](#) == 0 or [GITS_CTLR.Enabled](#) == 1 is UNPREDICTABLE.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [3:2]

Reserved, RES0.

ImDe, bit [1]

In GICv3 implementations, this bit is RES0.

In GICv4 implementations, this bit is IMPLEMENTATION DEFINED.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Enabled, bit [0]

Controls whether the ITS is enabled:

Enabled	Meaning
0b0	The ITS is not enabled. Writes to GITS_TRANSLATER are ignored and no further command queue entries are processed.
0b1	The ITS is enabled. Writes to GITS_TRANSLATER result in interrupt translations and the command queue is processed.

If a write to this register changes this field from 1 to 0, the ITS must ensure that both:

- Any caches containing mapping data are made consistent with external memory.
- [GITS_CTLR.Quiescent](#) == 0 until all caches are consistent with external memory.

Changing [GITS_CTLR.Enabled](#) from 0 to 1 when [GITS_CTLR.Quiescent](#) is 0 results in UNPREDICTABLE behavior.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Accessing GITS_CTLR

GITS_CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0000	GITS_CTLR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_CWRITER, ITS Write Register

The GITS_CWRITER characteristics are:

Purpose

Specifies the offset from [GITS_CBASER](#) where software writes the next ITS command.

Configuration

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CWRITER is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
RES0																																
RES0												Offset																RES0				Retry
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

Bits [63:20]

Reserved, RES0.

Offset, bits [19:5]

Bits [19:5] of the offset from [GITS CBASER](#). Bits [4:0] of the offset are zero.

The reset behaviour of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [4:1]

Reserved, RES0.

Retry, bit [0]

Writing this bit has the following effects:

Retry	Meaning
0b0	No effect on the processing commands by the ITS.
0b1	Restarts the processing of commands by the ITS if it stalled because of a command error.

Note

If the processing of commands is not stalled because of a command error, writing 1 to this bit has no effect.

When read, this bit is RES0.

For more information, see 'The ITS command interface' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If GITS_CWRITER is written with a value outside of the valid range specified by [GITS_CBASER.Physical_Address](#) and [GITS_CBASER.Size](#), behavior is a CONSTRAINED UNPREDICTABLE choice, as follows:

- The command queue is considered invalid, and no further commands are processed until GITS_CWRITER is written with a value that is in the valid range.
- The value is treated as a valid UNKNOWN value.

An implementation might choose to report a system error in an IMPLEMENTATION DEFINED manner.

Accessing GITS_CWRITER

GITS_CWRITER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0088	GITS_CWRITER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_IIDR, ITS Identification Register

The GITS_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the ITS.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GITS_IIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ProductID								RES0				Variant				Revision				Implementer											

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the ITS:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.

- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

Accessing GITS_IIDR

GITS_IIDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0004	GITS_IIDR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

GITS_MPAMIDR, Report maximum PARTID and PMG Register

The GITS_MPAMIDR characteristics are:

Purpose

Reports the maximum support PARTID and PMG values.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GITS_MPAMIDR are RES0.

A copy of this register is provided for each ITS.

When [GITS_TYPER](#).MPAM==0, this register is RES0.

Attributes

GITS_MPAMIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMGmax								PARTIDmax															

Bits [31:24]

Reserved, RES0.

PMGmax, bits [23:16]

Maximum PMG value supported.

PARTIDmax, bits [15:0]

Maximum PARTID value supported.

Accessing GITS_MPAMIDR

GITS_MPAMIDR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x0010

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

GITS_MPIDR, Report ITS's affinity.

The GITS_MPIDR characteristics are:

Purpose

Reports ITS's affinity when the vPE Table is shared with Redistributors.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GITS_MPIDR are RES0.

A copy of this register is provided for each ITS.

When [GITS_TYPER](#).SVPET==0, this register is RES0.

Attributes

GITS_MPIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Aff3								Aff2								Aff1								RES0							

Aff3, bits [31:24]

The Affinity level 3 value for the ITS.

Aff2, bits [23:16]

The Affinity level 2 value for the ITS.

Aff1, bits [15:8]

The Affinity level 1 value for the ITS.

Bits [7:0]

Reserved, RES0.

Accessing GITS_MPIDR

GITS_MPIDR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x0018

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

GITS_PARTIDR, Set PARTID and PMG Register

The GITS_PARTIDR characteristics are:

Purpose

Sets the PARTID and PMG values used for memory accesses by the ITS.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GITS_PARTIDR are RES0.

A copy of this register is provided for each ITS.

When [GITS_TYPER](#).MPAM==0, this register is RES0.

Attributes

GITS_PARTIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMG								PARTID															

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

PMG value used when ITS accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PMG values in the range 0 to PMG_MAX are stateful or RES0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

PARTID, bits [15:0]

PARTID value used when ITS accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PARTID values in the range 0 to PARTID_MAX are stateful or RES0.

The reset behaviour of this field is:

- On a GIC reset, this field resets to 0.

Accessing GITS_PARTIDR

GITS_PARTIDR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x0014

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GITS_SGIR, ITS SGI Register

The GITS_SGIR characteristics are:

Purpose

Written by software to signal a virtual SGI for translation by the ITS.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GITS_SGIR are RES0.

This register is provided only in FEAT_GICv4p1 implementations.

Attributes

GITS_SGIR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																vPEID															
																RES0															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																vINTID															

Bits [63:48]

Reserved, RES0.

vPEID, bits [47:32]

ID of target vPEID.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER2.VIL](#) and [GICD_TYPER2.VID](#) fields. Unimplemented bits are RES0.

Bits [31:4]

Reserved, RES0.

vINTID, bits [3:0]

INTID of virtual SGI.

Accessing GITS_SGIR

64-bit access only.

GITS_SGIR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x20020

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_STATUSR, ITS Error Reporting Status Register

The GITS_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.
- Unmapped MSIs.

Configuration

Attributes

GITS_STATUSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												Snyndrome				Overflow		UMSI	WROD	RWOD	WRD	RRD									

Bits [31:10]

Reserved, RES0.

Snyndrome, bits [9:6]

Syndrone for the MSI that set GITS_STATUSR.UMSI to 1.

Snyndrome	Meaning
0b0000	Unknown reason.
0b0010	DeviceID out of range.
0b0011	DeviceID unmapped.
0b0100	EventID out of range.
0b0101	EventID unmapped.
0b0111	Collection unmapped.
0b1001	vPEID unmapped.

An implementation might not support reporting all syndromes, and might report 0b0000 for any cause.

This field is UNKNOWN when GITS_STATUSR.UMSI is 0.

Overflow, bit [5]

Reports whether an unmapped MSI has been received while GITS_STATUSR.UMSI is 1.

Overflow	Meaning
0b0	No unmapped MSIs have been received since GITS_STATUSR.UMSI set to 1.
0b1	At least one unmapped MSIs have been received since GITS_STATUSR.UMSI set to 1.

A software write of 1 to the bit clears it. A write of any other value is ignored.

If [GITS_TYPER](#).UMSI is 0, this field is RES0.

UMSI, bit [4]

Reports whether an unmapped MSI has been received

An unmapped MSI is defined as an MSI arriving at [GITS_TRANSLATER](#) for which there is insufficient mapping information for it to be forwarded to a Redistributor.

It is IMPLEMENTATION DEFINED whether an INT command can be reported as an unmapped MSI.

UMSI	Meaning
0b0	No unmapped MSIs have been received.
0b1	Unmapped MSI received.

A software write of 1 to the bit clears it. A write of any other value is ignored.

If [GITS_TYPER](#).UMSI is 0, this field is RES0.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GITS_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

GITS_STATUSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0040	GITS_STATUSR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_TRANSLATER, ITS Translation Register

The GITS_TRANSLATER characteristics are:

Purpose

Written by a requesting Device to signal an interrupt for translation by the ITS.

Configuration

This register is at the same offset as [GICD_SETSPI_NSR](#) in the Distributor, and is at the same offset as [GICR_SETLPIR](#) in the Redistributor.

Attributes

GITS_TRANSLATER is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EventID																															

EventID, bits [31:0]

An identifier corresponding to the interrupt to be translated.

Note

The size of the EventID is DeviceID specific, and set when the DeviceID is mapped to an ITT (using MAPD).

The number of EventID bits implemented is reported by [GITS_TYPER.ID_bits](#). If a write specifies non-zero identifiers bits outside this range behavior is a CONSTRAINED UNPREDICTABLE choice between:

- Non-zero identifier bits outside the supported range are ignored.
- The write is ignored.

The DeviceID presented to an ITS is used to index a device table. The device table maps the DeviceID to an interrupt translation table for that device.

Accessing GITS_TRANSLATER

16-bit access to bits [15:0] of this register must be supported. When this register is written by a 16-bit transaction, bits [31:16] are written as zero.

Implementations must ensure that:

- A unique DeviceID is provided for each requesting device, and the DeviceID is presented to the ITS when a write to this register occurs in a manner that cannot be spoofed by any agent capable of performing writes.
- The DeviceID presented corresponds to the DeviceID field in the ITS commands.

Writes to this register are ignored if any of the following are true:

- [GITS_CTLR.Enabled](#) == 0.
- The presented DeviceID is not mapped to an Interrupt Translation Table.
- The DeviceID is larger than the supported size.
- The DeviceID is mapped to an Interrupt Translation Table, but the EventID is outside the range specified by MAPD.

- The EventID is mapped to an Interrupt Translation Table and the EventID is within the range specified by MAPD, but the EventID is unmapped.

Translation requests that result from writes to this register are subject to certain ordering rules. For more information, see 'Ordering of translations with the output to ITS commands' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

GITS_TRANSLATER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS translation	0x0040	GITS_TRANSLATER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_TYPER, ITS Type Register

The GITS_TYPER characteristics are:

Purpose

Specifies the features that an ITS supports.

Configuration

Attributes

GITS_TYPER is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																INV	UMSI	irq	UMSI	nID	SV	PET	VMAPP	VSGI	MPAM	VMOV	PCIL	IMPLEMENTATION DEFINED										CIDb																									
HCC				RES0				PTASEIS				Devbits				ID_bits				ITT_entry_size				IMPLEMENTATION DEFINED				C																																			

Bits [63:47]

Reserved, RES0.

INV, bit [46]

ITS cache invalidation behavior on disable.

INV	Meaning
0b0	It is IMPLEMENTATION DEFINED whether ITS caches are invalidated on clearing GITS_CTLR .Enabled and GITS_BASER<n> .Valid.
0b1	ITS caches are invalidated on clearing GITS_CTLR .Enabled and GITS_BASER<n> .Valid.

If GITS_TYPER.INV is 1, after the following sequence:

- [GITS_CTLR](#).Enabled written to 0.
- A read of [GITS_CTLR](#).Quiescent returns 1.
- [GITS_BASER<n>](#).Valid written to 0.

There is no cached information from the ITS memory structure pointed to by [GITS_BASER<n>](#).

UMSIirq, bit [45]

Indicates support for generating an interrupt on receiving unmapped MSI.

UMSIirq	Meaning
0b0	Interrupt on unmapped MSI not supported.
0b1	Interrupt on unmapped MSI is supported.

If GITS_TYPER.UMSI is 0, this field is RES0.

UMSI, bit [44]

Indicates support for reporting receipt of unmapped MSIs.

UMSI	Meaning
0b0	Reporting of unmapped MSIs is not supported.
0b1	Reporting of unmapped MSIs is supported.

nID, bit [43]

When FEAT_GICv4p1 is implemented:

nID

nID	Meaning
0b0	Individual doorbell interrupt supported.
0b1	Individual doorbell interrupt not supported.

Otherwise:

Reserved, RES0.

SVPET, bits [42:41]

When FEAT_GICv4p1 is implemented:

SVPET

SVPET	Meaning
0b00	vPE Table is not shared with Redistributors.
0b01	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR.Aff3.
0b10	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3 and Aff2.
0b11	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3, Aff2 and Aff1.

Otherwise:

Reserved, RES0.

VMAPP, bit [40]

When FEAT_GICv4p1 is implemented:

VMAPP

VMAPP	Meaning
0b0	FEAT_GICv4 VMAPP command layout.
0b1	FEAT_GICv4p1 VMAPP command layout.

Otherwise:

Reserved, RES0.

VSGI, bit [39]

When FEAT_GICv4p1 is implemented:

VSGI

VSGI	Meaning
0b0	Direct injection of SGIs is not supported.
0b1	Direct injection of SGIs is supported.

Otherwise:

Reserved, RES0.

MPAM, bit [38]

When FEAT_GICv3p1 is implemented:

MPAM

MPAM	Meaning
0b0	MPAM is not supported.
0b1	MPAM is supported.

Otherwise:

Reserved, RES0.

VMOVP, bit [37]

Indicates the form of the VMOVP command.

VMOVP	Meaning
0b0	When moving a vPE, software must issue a VMOVP on all ITSs that have mappings for that vPE. The ITSList and Sequence Number fields in the VMOVP command must ensure synchronization, otherwise behavior is UNPREDICTABLE.
0b1	When moving a vPE, software must only issue a VMOVP on one of the ITSs that has a mapping for that vPE. The ITSList and Sequence Number fields in the VMOVP command are RES0.

CIL, bit [36]

Collection ID Limit.

CIL	Meaning
0b0	ITS supports 16-bit Collection ID, GITS_TYPER.CIDbits is RES0.
0b1	GITS_TYPER.CIDbits indicates supported Collection ID size

In implementations that do not support Collections in external memory, this bit is RES0 and the number of Collections supported is reported by [GITS_TYPER.HCC](#).

CIDbits, bits [35:32]

Number of Collection ID bits.

- The number of bits of Collection ID minus one.
- When [GITS_TYPER.CIL](#) == 0, this field is RES0.

HCC, bits [31:24]

Hardware Collection Count. The number of interrupt collections supported by the ITS without provisioning of external memory.

Note

Collections held in hardware are unmapped at reset.

Bits [23:20]

Reserved, RES0.

PTA, bit [19]

Physical Target Addresses. Indicates the format of the target address:

PTA	Meaning
0b0	The target address corresponds to the PE number specified by GICR_TYPER.Processor_Number .
0b1	The target address corresponds to the base physical address of the required Redistributor.

For more information, see 'RDbase' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

SEIS, bit [18]

SEI support. Indicates whether the virtual CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The ITS does not support local generation of SEIs.
0b1	The ITS supports local generation of SEIs.

Devbits, bits [17:13]

The number of DeviceID bits implemented, minus one.

ID_bits, bits [12:8]

The number of EventID bits implemented, minus one.

ITT_entry_size, bits [7:4]

Read-only. Indicates the number of bytes per translation table entry, minus one.

For more information about the ITS command 'MAPD', see MAPD.

IMPLEMENTATION DEFINED, bit [3]

IMPLEMENTATION DEFINED.

CCT, bit [2]

Cumulative Collection Tables.

CCT	Meaning
0b0	The total number of supported collections is determined by the number of collections held in memory only.
0b1	The total number of supported collections is determined by number of collections that are held in memory and the number indicated by GITS_TYPER.HCC.

If GITS_TYPER.HCC == 0, or if memory backed collections are not supported (all [GITS_BASER<n>.Type](#) != 100), this bit is RES0.

Virtual, bit [1]**When FEAT_GICv4 is implemented:**

Indicates whether the ITS supports virtual LPIs and direct injection of virtual LPIs:

Virtual	Meaning
0b0	The ITS does not support virtual LPIs or direct injection of virtual LPIs.
0b1	The ITS supports virtual LPIs and direct injection of virtual LPIs.

Otherwise:

Reserved, RES0.

Physical, bit [0]

Indicates whether the ITS supports physical LPIs:

Physical	Meaning
0b0	The ITS does not support physical LPIs.
0b1	The ITS supports physical LPIs.

This field is RES1, indicating that the ITS supports physical LPIs.

Accessing GITS_TYPER**GITS_TYPER can be accessed through the memory-mapped interfaces:**

Component	Offset	Instance
GIC ITS control	0x0008	GITS_TYPER

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

GITS_UMSIR, ITS Unmapped MSI register

The GITS_UMSIR characteristics are:

Purpose

Provides the DeviceID and EventID of the unmapped MSI that set [GITS_STATUSR](#).UMSI.

Configuration

This register is present only when GITS_TYPER.UMSI == 1. Otherwise, direct accesses to GITS_UMSIR are RES0.

Attributes

GITS_UMSIR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
DeviceID																															
EventID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

DeviceID, bits [63:32]

DeviceID of MSI that set [GITS_STATUSR](#).UMSI to 1.

If [GITS_STATUSR](#).UMSI is 0, this field is UNKNOWN.

EventID, bits [31:0]

EventID of MSI that set [GITS_STATUSR](#).UMSI to 1.

If [GITS_STATUSR](#).UMSI is 0, this field is UNKNOWN.

Accessing GITS_UMSIR

GITS_UMSIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0048	GITS_UMSIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [MIDR_EL1\[31:0\]](#).

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MIDR\[31:0\]](#).

It is IMPLEMENTATION DEFINED whether MIDR_EL1 is implemented in the Core power domain or in the Debug power domain.

Attributes

MIDR_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Implementer								Variant				Architecture				PartNum								Revision							

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is **RO**.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture, bits [19:16]

Architecture version. Defined values are:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID * registers.

All other values are reserved.

Access to this field is **RO**.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing MIDR_EL1

MIDR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD00	MIDR_EL1

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

MPAMCFG_CMAX, MPAM Cache Maximum Capacity Partition Configuration Register

The MPAMCFG_CMAX characteristics are:

Purpose

The MPAMCFG_CMAX is a 32-bit read/write register that controls the maximum fraction of the cache capacity that the PARTID selected by [MPAMCFG_PART_SEL](#) is permitted to allocate.

MPAMCFG_CMAX_s controls the cache maximum capacity for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CMAX_ns controls the cache maximum capacity for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CMAX_rt controls the cache maximum capacity for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CMAX_rl controls the cache maximum capacity for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_CMAX is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CCAP_PART == 1. Otherwise, direct accesses to MPAMCFG_CMAX are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_CMAX is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																CMAX															

Bits [31:16]

Reserved, RES0.

CMAX, bits [15:0]

Maximum cache capacity usage in fixed-point fraction format by the partition selected by [MPAMCFG_PART_SEL](#). The fraction represents the portion of the total cache capacity that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in [MPAMF_CCAP_IDR.CMAX_WD](#). Unimplemented bits within the field are RAZ/WI. The implemented bits of the CMAX field are always the most significant bits of the field.

The fixed-point fraction CMAX is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the cache that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_CMAX

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_CMAX_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_CMAX_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_CMAX_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_CMAX_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_CMAX_s, MPAMCFG_CMAX_ns, MPAMCFG_CMAX_rt, and MPAMCFG_CMAX_rl must be separate registers.

- The Secure instance (MPAMCFG_CMAX_s) accesses the cache capacity partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_CMAX_ns) accesses the cache capacity partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_CMAX_rt) accesses the cache capacity partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_CMAX_rl) accesses the cache capacity partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the cache resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_CMAX can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0108	MPAMCFG_CMAX_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0108	MPAMCFG_CMAX_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0108	MPAMCFG_CMAX_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0108	MPAMCFG_CMAX_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_CPBM<n>, MPAM Cache Portion Bitmap Partition Configuration Register, n = 0 - 1023

The MPAMCFG_CPBM<n> characteristics are:

Purpose

The MPAMCFG_CPBM<n> register array gives access to the cache portion bitmap. Each register in the array is a read/write register that configures the cache portions numbered from <n * 32> to <31 + (n * 32)> that a PARTID is allowed to allocate.

After setting [MPAMCFG_PART_SEL](#) with a PARTID, software writes to the MPAMCFG_CPBM<n> register to configure which cache portions the PARTID is allowed to allocate.

The MPAMCFG_CPBM<n> register that contains the bitmap bit corresponding to cache portion p has n equal to p[15:5]. The field, P<x>, of that MPAMCFG_CPBM<n> register that contains the bitmap bit corresponding to cache portion p has x equal to p[4:0].

MPAMCFG_CPBM<n>_s controls cache portions for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CPBM<n>_ns controls the cache portions for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CPBM<n>_rt controls cache portions for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CPBM<n>_rl controls the cache portions for the Realm PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_CPBM<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CPOR_PART == 1. Otherwise, direct accesses to MPAMCFG_CPBM<n> are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_CPBM<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
P<32 * n + 31>	P<32 * n + 30>	P<32 * n + 29>	P<32 * n + 28>	P<32 * n + 27>	P<32 * n + 26>	P<32 * n + 25>

P<x + (n * 32)>, bit [x], for x = 31 to 0

Portion allocation control bit. Each cache portion allocation control bit, MPAMCFG_CPBM<n>.P<x>, grants permission to the PARTID selected by [MPAMCFG_PART_SEL](#) to allocate cache lines within cache portion <x + (n * 32)>.

P<x + (n * 32)>	Meaning
0b0	The PARTID is not permitted to allocate into cache portion <x + (n * 32)>.
0b1	The PARTID is permitted to allocate within cache portion <x + (n * 32)>.

The number of bits in the cache portion partitioning bit map of this component is given in [MPAMF_CPOR_IDR.CPBM_WD](#). CPBM_WD contains a value from 1 to 2^{15} , inclusive. Values of CPBM_WD greater than 32 require an array of 32-bit [MPAMCFG_CPBM<n>](#) registers to access the cache portion bitmap, up to 1024 registers.

Bits MPAMCFG_CPBM<n>.P<x + (n * 32)>, where <x + (n * 32)> is greater than or equal to CPBM_WD, are RES0:

- If $n > \text{MPAMF_CPOR_IDR.CPBM_WD}[15:5]$, the entire 32 P<x> are RES0.
- If $n == \text{MPAMF_CPOR_IDR.CPBM_WD}[15:5]$, bits [31: CPBM_WD[4:0]] are RES0 and the remaining bits are valid.
- If $n < \text{MPAMF_CPOR_IDR.CPBM_WD}[15:5]$, the entire 32 P<x> are valid.

Accessing MPAMCFG_CPBM<n>

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_CPBM<n>_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_CPBM<n>_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_CPBM<n>_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_CPBM<n>_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_CPBM<n>_s, MPAMCFG_CPBM<n>_ns, MPAMCFG_CPBM<n>_rt, and MPAMCFG_CPBM<n>_rl must be separate registers.

- The Secure instance (MPAMCFG_CPBM<n>_s) accesses the cache portion bitmap used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_CPBM<n>_ns) accesses the cache portion bitmap used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_CPBM<n>_rt) accesses the cache portion bitmap used for Root PARTIDs.
- The Realm instance (MPAMCFG_CPBM<n>_rl) accesses the cache portion bitmap used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the cache resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_CPBM<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x1000 + (4 * n)	MPAMCFG_CPBM<n>_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x1000 + (4 * n)	MPAMCFG_CPBM<n>_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x1000 + (4 * n)	MPAMCFG_CPBM<n>_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x1000 + (4 * n)	MPAMCFG_CPBM<n>_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_INTPARTID, MPAM Internal PARTID Narrowing Configuration Register

The MPAMCFG_INTPARTID characteristics are:

Purpose

MPAMCFG_INTPARTID is a 32-bit read/write register that controls the mapping of the PARTID selected by [MPAMCFG_PART_SEL](#) into a narrower internal PARTID (intPARTID).

MPAMCFG_INTPARTID_s controls the mapping for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_INTPARTID_ns controls the mapping for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_INTPARTID_rt controls the mapping for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_INTPARTID_rl controls the mapping for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

The MPAMCFG_INTPARTID register associates the request PARTID (reqPARTID) in the [MPAMCFG_PART_SEL](#) register with an internal PARTID (intPARTID) in this register. To set that association, store reqPARTID into the [MPAMCFG_PART_SEL](#) register and then store the intPARTID into the MPAMCFG_INTPARTID register. To read the association, store reqPARTID into the MPAMCFG_PART_SEL register and then read MPAMCFG_INTPARTID.

If the intPARTID stored into MPAMCFG_INTPARTID is out-of-range or does not have the INTERNAL bit set, the association of reqPARTID to intPARTID is not written and [MPAMF_ESR](#) is set to indicate an intPARTID_Range error.

If [MPAMCFG_PART_SEL](#).INTERNAL is 1 when MPAMCFG_INTPARTID is read or written, [MPAMF_ESR](#) is set to indicate an Unexpected_INTERNAL error.

Configuration

The power domain of MPAMCFG_INTPARTID is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PARTID_NRW == 1. Otherwise, direct accesses to MPAMCFG_INTPARTID are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_INTPARTID is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																INTERNAL		INTPARTID													

Bits [31:17]

Reserved, RES0.

INTERNAL, bit [16]

Internal PARTID flag.

This bit must be 1 when written to the register. If written as 0, the write will not update the reqPARTID to intPARTID association.

On a read of this register, the bit will always read the value last written.

INTPARTID, bits [15:0]

This field contains the intPARTID mapped to the reqPARTID in [MPAMCFG_PART_SEL](#).

The maximum intPARTID supported is [MPAMF_PARTID_NRW_IDR](#).INTPARTID_MAX.

Accessing MPAMCFG_INTPARTID

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_INTPARTID_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_INTPARTID_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_INTPARTID_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_INTPARTID_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_INTPARTID_s, MPAMCFG_INTPARTID_ns, MPAMCFG_INTPARTID_rt, and MPAMCFG_INTPARTID_rl must be separate registers.

- The Secure instance (MPAMCFG_INTPARTID_s) accesses the PARTID narrowing used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_INTPARTID_ns) accesses the PARTID narrowing used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_INTPARTID_rt) accesses the PARTID narrowing used for Root PARTIDs.
- The Realm instance (MPAMCFG_INTPARTID_rl) accesses the PARTID narrowing used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_INTPARTID access the PARTID narrowing configuration settings without being affected by [MPAMCFG_PART_SEL](#).RIS.

Loads and stores to MPAMCFG_INTPARTID access the PARTID narrowing configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_INTPARTID can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0600	MPAMCFG_INTPARTID_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0600	MPAMCFG_INTPARTID_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0600	MPAMCFG_INTPARTID_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0600	MPAMCFG_INTPARTID_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_MBW_MAX, MPAM Memory Bandwidth Maximum Partition Configuration Register

The MPAMCFG MBW MAX characteristics are:

Purpose

MPAMCFG_MBW_MAX is a 32-bit read/write register that controls the maximum fraction of memory bandwidth that the PARTID selected by [MPAMCFG_PART_SEL](#) is permitted to use.

MPAMCFG_MBW_MAX_s controls maximum bandwidth for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MAX_ns controls the maximum bandwidth for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MAX_rt controls the maximum bandwidth for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MAX_rl controls the maximum bandwidth for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

A PARTID that has used more than MAX is given no access to additional bandwidth if HARDLIM == 1 or is given additional bandwidth only if there are no requests from PARTIDs that have not exceeded their MAX if HARDLIM == 0.

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG MBW MAX is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_MAX == 1. Otherwise, direct accesses to MPAMCFG_MBW_MAX are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG MBW MAX is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HARDLIM				RES0												MAX															

HARDLIM, bit [31]

Hard bandwidth limiting.

HARDLIM	Meaning
0b0	When MAX bandwidth is exceeded, the partition contends with a low preference for downstream bandwidth beyond MAX.
0b1	When MAX bandwidth is exceeded, the partition does not use any more bandwidth until the memory bandwidth measurement for the partition falls below MAX.

Bits [30:16]

Reserved, RES0.

MAX, bits [15:0]

Memory maximum bandwidth allocated to the partition selected by [MPAMCFG_PART_SEL](#). MAX is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in [MPAMF_MBW_IDR.BWA_WD](#). Unimplemented bits are RAZ/WI. The implemented bits of the MAX field are always to the left of the field. For example, if BWA_WD = 3, the implemented bits are MPAMCFG_MBW_MAX[15:13] and MPAMCFG_MBW_MAX[12:0] are unimplemented.

The fixed-point fraction MAX is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the bandwidth that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_MBW_MAX

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_MBW_MAX_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_MAX_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_MAX_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_MAX_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_MAX_s, MPAMCFG_MBW_MAX_ns, MPAMCFG_MBW_MAX_rt, and MPAMCFG_MBW_MAX_rl must be separate registers.

- The Secure instance (MPAMCFG_MBW_MAX_s) accesses the memory maximum bandwidth partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_MAX_ns) accesses the memory maximum bandwidth partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_MAX_rt) accesses the memory maximum bandwidth partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_MAX_rl) accesses the memory maximum bandwidth partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_MBW_MAX can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0208	MPAMCFG_MBW_MAX_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0208	MPAMCFG_MBW_MAX_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
-----------	-------	--------	----------

MPAM	MPAMF_BASE_rt	0x0208	MPAMCFG_MBW_MAX_rt
------	---------------	--------	--------------------

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0208	MPAMCFG_MBW_MAX_rl

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

MPAMCFG_MBW_MIN, MPAM Memory Bandwidth Minimum Partition Configuration Register

The MPAMCFG_MBW_MIN characteristics are:

Purpose

MPAMCFG_MBW_MIN is a 32-bit read/write register that controls the minimum fraction of memory bandwidth that the PARTID selected by [MPAMCFG_PART_SEL](#) is permitted to use.

MPAMCFG_MBW_MIN_s controls the minimum bandwidth for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MIN_ns controls the minimum bandwidth for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MIN_rt controls the minimum bandwidth for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MIN_rl controls the minimum bandwidth for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

A PARTID that has used less than MIN is given preferential access to bandwidth.

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_MBW_MIN is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_MIN == 1. Otherwise, direct accesses to MPAMCFG_MBW_MIN are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_MIN is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																MIN															

Bits [31:16]

Reserved, RES0.

MIN, bits [15:0]

Memory minimum bandwidth allocated to the partition selected by [MPAMCFG_PART_SEL](#). MIN is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in [MPAMF_MBW_IDR.BWA_WD](#). Unimplemented bits are RAZ/WI. The implemented bits of the MIN field are always to the left of the field. For example, if BWA_WD = 4, the implemented bits are MPAMCFG_MBW_MIN[15:12] and MPAMCFG_MBW_MIN[11:0] are unimplemented.

The fixed-point fraction MIN is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the bandwidth that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_MBW_MIN

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_MBW_MIN_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_MIN_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_MIN_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_MIN_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_MIN_s, MPAMCFG_MBW_MIN_ns, MPAMCFG_MBW_MIN_rt, and MPAMCFG_MBW_MIN_rl must be separate registers.

- The Secure instance (MPAMCFG_MBW_MIN_s) accesses the memory minimum bandwidth partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_MIN_ns) accesses the memory minimum bandwidth partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_MIN_rt) accesses the memory minimum bandwidth partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_MIN_rl) accesses the memory minimum bandwidth partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_MBW_MIN can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0200	MPAMCFG_MBW_MIN_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0200	MPAMCFG_MBW_MIN_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0200	MPAMCFG_MBW_MIN_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0200	MPAMCFG_MBW_MIN_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_MBW_PBM<n>, MPAM Bandwidth Portion Bitmap Partition Configuration Register, n = 0 - 127

The MPAMCFG_MBW_PBM<n> characteristics are:

Purpose

The MPAMCFG_MBW_PBM<n> register array gives access to the memory bandwidth portion bitmap. Each register in the array is a read/write register that configures the bandwidth portions <32 * n> to <(32 * n) + 31> that a PARTID is allowed to allocate.

After setting [MPAMCFG_PART_SEL](#) with a PARTID, software writes to one or more of the MPAMCFG_MBW_PBM<n> registers to configure which bandwidth portions the PARTID is allowed to allocate.

The MPAMCFG_MBW_PBM<n> register that contains the bitmap bit corresponding to memory bandwidth portion p has n equal to $p[11:5]$. The field, $P<x + (32 * n)>$ of that MPAMCFG_MBW_PBM<n> register that contains the bitmap bit corresponding to memory bandwidth portion p has x equal to $p[4:0]$.

The MPAMCFG_MBW_PBM<n>_s registers control the bandwidth portion bitmap for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). The MPAMCFG_MBW_PBM<n>_ns registers control the bandwidth portion bitmap for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). The MPAMCFG_MBW_PBM<n>_rt registers control the bandwidth portion bitmap for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). The MPAMCFG_MBW_PBM<n>_rl registers control the bandwidth portion bitmap for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_MBW_PBM<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_PBM == 1. Otherwise, direct accesses to MPAMCFG_MBW_PBM<n> are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_PBM<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
P<32 * n + 31>	P<32 * n + 30>	P<32 * n + 29>	P<32 * n + 28>	P<32 * n + 27>	P<32 * n + 26>	P<32 * n + 25>

P<x + (32 * n)>, bit [x], for x = 31 to 0

Portion allocation control bit. Each bandwidth portion allocation control bit MPAMCFG_MBW_PBM<n>.P<x + (32 * n)> grants permission to the PARTID selected by [MPAMCFG_PART_SEL](#) to allocate bandwidth within bandwidth portion <x + (32 * n)>.

P<x + (32 * n)>	Meaning
0b0	The PARTID is not permitted to allocate into bandwidth portion <x + (32 * n)>.
0b1	The PARTID is permitted to allocate within bandwidth portion <x + (32 * n)>.

MPAMCFG_MBW_PBM<n>, MPAM Bandwidth Portion Bitmap Partition Configuration Register, n = 0 - 127

The number of bits in the bandwidth portion partitioning bit map of this component is given in [MPAMF_MBW_IDR.BWPBM_WD](#). BWPBM_WD contains a value from 1 to 2^{12} , inclusive. Values of BWPBM_WD greater than 32 require a group of 32-bit registers to access the bandwidth portion bitmap, up to 128 32-bit registers.

Bits MPAMCFG_MBW_PBM<n>.P<x + (32 * n)>>, where <x + (32 * n)> is greater than or equal to BWPBM_WD are RES0:

- If $n > \text{MPAMF_MBW_IDR.BWPBM_WD}[11:5]$, the entire 32 P<x> are RES0.
- If $n == \text{MPAMF_MBW_IDR.BWPBM_WD}[11:5]$, bits [31: BWPBM_WD[4:0]] are RES0 and the remaining bits are valid.
- If $n < \text{MPAMF_MBW_IDR.BWPBM_WD}[11:5]$, the entire 32 P<x> are valid.

Accessing MPAMCFG_MBW_PBM<n>

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_MBW_PBM<n>_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_PBM<n>_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_PBM<n>_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_PBM<n>_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_PBM<n>_s, MPAMCFG_MBW_PBM<n>_ns, MPAMCFG_MBW_PBM<n>_rt, and MPAMCFG_MBW_PBM<n>_rl must be separate registers.

- The Secure instance (MPAMCFG_MBW_PBM<n>_s) accesses the memory bandwidth portion bitmap used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_PBM<n>_ns) accesses the memory bandwidth portion bitmap used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_PBM<n>_rt) accesses the memory bandwidth portion bitmap used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_PBM<n>_rl) accesses the memory bandwidth portion bitmap used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

When RIS is not implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#), and [MPAMCFG_PART_SEL.INTERNAL](#) must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#), and [MPAMCFG_PART_SEL.INTERNAL](#) must be 0.

MPAMCFG_MBW_PBM<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_MBW_PROP, MPAM Memory Bandwidth Proportional Stride Partition Configuration Register

The MPAMCFG_MBW_PROP characteristics are:

Purpose

Controls the proportional stride of memory bandwidth that the PARTID selected by [MPAMCFG_PART_SEL](#) uses.

MPAMCFG_MBW_PROP_s controls the bandwidth proportional stride for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_PROP_ns controls the bandwidth proportional stride for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_PROP_rt controls the bandwidth proportional stride for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_PROP_rl controls the bandwidth proportional stride for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

Proportional stride is a relative cost of bandwidth requested by one PARTID in relation to the costs of the bandwidths requested by each other PARTID also competing to use the bandwidth.

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_MBW_PROP is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_PROP == 1. Otherwise, direct accesses to MPAMCFG_MBW_PROP are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_PROP is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EN	RES0															STRIDEM1															

EN, bit [31]

Enable proportional stride bandwidth partitioning.

EN	Meaning
0b0	The selected partition is not regulated by proportional stride bandwidth partitioning.
0b1	The selected partition has bandwidth usage regulated by proportional stride bandwidth partitioning as controlled by STRIDEM1.

Bits [30:16]

Reserved, RES0.

STRIDEM1, bits [15:0]

Memory bandwidth stride minus 1 allocated to the partition selected by [MPAMCFG_PART_SEL](#). STRIDEM1 represents the normalized cost of bandwidth consumption by the partition.

The proportional stride partitioning control parameter is an unsigned integer representing the normalized cost to a partition for consuming bandwidth. Larger values have a larger cost and correspond to a lesser allocation of bandwidth while smaller values indicate a lesser cost and therefore a higher allocation of bandwidth.

The implemented width of STRIDEM1 is given in MPAMF_MBW_IDR.BWA_WD.

Accessing MPAMCFG_MBW_PROP

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_MBW_PROP_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_PROP_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_PROP_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_PROP_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_PROP_s, MPAMCFG_MBW_PROP_ns, MPAMCFG_MBW_PROP_rt, and MPAMCFG_MBW_PROP_rl must be separate registers.

- The Secure instance (MPAMCFG_MBW_PROP_s) accesses the memory proportional stride bandwidth partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_PROP_ns) accesses the memory proportional stride bandwidth partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_PROP_rt) accesses the memory proportional stride bandwidth partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_PROP_rl) accesses the memory proportional stride bandwidth partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_MBW_PROP can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0500	MPAMCFG_MBW_PROP_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0500	MPAMCFG_MBW_PROP_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0500	MPAMCFG_MBW_PROP_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x0500	MPAMCFG_MBW_PROP_r1

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

MPAMCFG_MBW_WINWD, MPAM Memory Bandwidth Partitioning Window Width Configuration Register

The MPAMCFG_MBW_WINWD characteristics are:

Purpose

MPAMCFG_MBW_WINWD is a 32-bit register that shows and sets the value of the window width for the PARTID in [MPAMCFG_PART_SEL](#).

MPAMCFG_MBW_WINWD_s reads and controls the bandwidth control window width for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_WINWD_ns reads and controls the bandwidth control window width for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_WINWD_rt reads and controls the bandwidth control window width for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_WINWD_rl reads and controls the bandwidth control window width for the Real PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

MPAMCFG_MBW_WINWD is read-only if [MPAMF_MBW_IDR](#).WINDWR == 0, and the window width is set by the hardware, even if variable.

MPAMCFG_MBW_WINWD is read/write if [MPAMF_MBW_IDR](#).WINDWR == 1, permitting configuration of the window width for each PARTID independently on hardware that supports this functionality.

If [MPAMF_IDR](#).HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_WINWD is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_MBW_PART == 1. Otherwise, direct accesses to MPAMCFG_MBW_WINWD are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_WINWD is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								US_INT								US_FRAC															

Bits [31:24]

Reserved, RES0.

US_INT, bits [23:8]

Window width, integer microseconds.

This field reads (and sets) the integer part of the window width in microseconds for the PARTID selected by [MPAMCFG_PART_SEL](#).

US_FRAC, bits [7:0]

Window width, fractional microseconds.

This field reads (and sets) the fractional part of the window width in microseconds for the PARTID selected by [MPAMCFG_PART_SEL](#).

Accessing MPAMCFG_MBW_WINWD

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_MBW_WINWD_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_WINWD_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_WINWD_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_WINWD_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_WINWD_s, MPAMCFG_MBW_WINWD_ns, MPAMCFG_MBW_WINWD_rt, and MPAMCFG_MBW_WINWD_rl must be separate registers.

- The Secure instance (MPAMCFG_MBW_WINWD_s) accesses the window width used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_WINWD_ns) accesses the window width used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_WINWD_rt) accesses the window width used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_WINWD_rl) accesses the window width used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_MBW_WINWD can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0220	MPAMCFG_MBW_WINWD_s

This interface is accessible as follows:

- When MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are **RO**.
- When MPAMF_MBW_IDR.WINDWR == 1 accesses to this register are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0220	MPAMCFG_MBW_WINWD_ns

This interface is accessible as follows:

- When MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are **RO**.
- When MPAMF_MBW_IDR.WINDWR == 1 accesses to this register are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0220	MPAMCFG_MBW_WINWD_rt

This interface is accessible as follows:

- When FEAT_RME is implemented and MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are **RO**.
- When FEAT_RME is implemented and MPAMF_MBW_IDR.WINDWR == 1 accesses to this register are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0220	MPAMCFG_MBW_WINWD_rl

This interface is accessible as follows:

- When FEAT_RME is implemented and MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are **RO**.
- When FEAT_RME is implemented and MPAMF_MBW_IDR.WINDWR == 1 accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

MPAMCFG_PART_SEL, MPAM Partition Configuration Selection Register

The MPAMCFG_PART_SEL characteristics are:

Purpose

Selects a partition ID to configure.

MPAMCFG_PART_SEL_s selects a Secure PARTID to configure. MPAMCFG_PART_SEL_ns selects a Non-secure PARTID to configure. MPAMCFG_PART_SEL_rt selects a Root PARTID to configure. MPAMCFG_PART_SEL_rl selects a Realm PARTID to configure.

After setting this register with a PARTID, software (usually a hypervisor) can perform a series of accesses to MPAMCFG registers to configure parameters for MPAM resource controls to use when requests have that PARTID.

Configuration

The power domain of MPAMCFG_PART_SEL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and (MPAMF_IDR.HAS_CCAP_PART == 1, or MPAMF_IDR.HAS_CPOR_PART == 1, or MPAMF_IDR.HAS_MBW_PART == 1, or MPAMF_IDR.HAS_PRI_PART == 1, or MPAMF_IDR.HAS_PARTID_NRW == 1, or (MPAMF_IDR.EXT == 0 and MPAMF_IDR.HAS_IMPL_IDR == 1) or (MPAMF_IDR.EXT == 1, MPAMF_IDR.HAS_IMPL_IDR == 1 and MPAMF_IDR.NO_IMPL_PART == 0)). Otherwise, direct accesses to MPAMCFG_PART_SEL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_PART_SEL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				RIS				RES0				INTERNAL				PARTID_SEL															

Bits [31:28]

Reserved, RES0.

RIS, bits [27:24]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MPAMCFG registers and describe with MPAMF ID registers.

Otherwise:

Reserved, RES0.

Bits [23:17]

Reserved, RES0.

INTERNAL, bit [16]

Internal PARTID.

If [MPAMF_IDR.HAS_PARTID_NRW](#) = 0, this field is RAZ/WI.

If [MPAMF_IDR.HAS_PARTID_NRW](#) = 1:

INTERNAL	Meaning
0b0	PARTID_SEL is interpreted as a request PARTID and ignored except for use with MPAMCFG_INTPARTID register access.
0b1	PARTID_SEL is interpreted as an internal PARTID and used for access to MPAMCFG control settings except for MPAMCFG_INTPARTID .

If PARTID narrowing is implemented as indicated by [MPAMF_IDR.HAS_PARTID_NRW](#) = 1, when accessing other MPAMCFG registers the value of the MPAMCFG_PART_SEL.INTERNAL bit is checked for these conditions:

- When the [MPAMCFG_INTPARTID](#) register is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 0, an Unexpected_INTERNAL error is set in [MPAMF_ESR](#).
- When an MPAMCFG register other than [MPAMCFG_INTPARTID](#) is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 1, [MPAMF_ESR](#) is set to indicate an intPARTID_Range error.

In either error case listed here, the value returned by a read operation is UNPREDICTABLE, and the control settings are not affected by a write.

PARTID_SEL, bits [15:0]

Selects the partition ID to configure.

Reads and writes to other MPAMCFG registers are indexed by PARTID_SEL and by the NS bit used to access MPAMCFG_PART_SEL to access the configuration for a single partition.

Accessing MPAMCFG_PART_SEL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_PART_SEL_s must be accessible from the Secure MPAM feature page. MPAMCFG_PART_SEL_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_PART_SEL_s and MPAMCFG_PART_SEL_ns must be separate registers. The Secure instance (MPAMCFG_PART_SEL_s) accesses the PARTID selector used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_PART_SEL_ns) accesses the PARTID selector used for Non-secure PARTIDs.

MPAMCFG_PART_SEL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0100	MPAMCFG_PART_SEL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0100	MPAMCFG_PART_SEL_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0100	MPAMCFG_PART_SEL_rt

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_PART_SEL, MPAM Partition Configuration Selection Register

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x0100	MPAMCFG_PART_SEL_r1

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_PRI, MPAM Priority Partition Configuration Register

The MPAMCFG_PRI characteristics are:

Purpose

Controls the internal and downstream priority of requests attributed to the PARTID selected by [MPAMCFG_PART_SEL](#).

MPAMCFG_PRI_s controls the priorities for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_PRI_ns controls the priorities for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_PRI_rt controls the priorities for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_PRI_rl controls the priorities for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_PRI is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PRI_PART == 1. Otherwise, direct accesses to MPAMCFG_PRI are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_PRI is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DSPRI																INTPRI															

DSPRI, bits [31:16]

Downstream priority.

If [MPAMF_PRI_IDR.HAS_DSPRI](#) == 0, bits of this field are RES0 as this field is not used.

If [MPAMF_PRI_IDR.HAS_DSPRI](#) == 1, this field is a priority value applied to downstream communications from this MSC for transactions of the partition selected by [MPAMCFG_PART_SEL](#).

The implemented width of this field is [MPAMF_PRI_IDR.DSPRI_WD](#) bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of [MPAMF_PRI_IDR.DSPRI_0_IS_LOW](#).

INTPRI, bits [15:0]

Internal priority.

If [MPAMF_PRI_IDR.HAS_INTPRI](#) == 0, bits of this field are RES0 as this field is not used.

If [MPAMF_PRI_IDR.HAS_INTPRI](#) == 1, this field is a priority value applied internally inside this MSC for transactions of the partition selected by [MPAMCFG_PART_SEL](#).

The implemented width of this field is [MPAMF_PRI_IDR.INTPRI_WD](#) bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of [MPAMF_PRI_IDR.INTPRI_0_IS_LOW](#).

Accessing MPAMCFG_PRI

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMCFG_PRI_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_PRI_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_PRI_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_PRI_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_PRI_s, MPAMCFG_PRI_ns, MPAMCFG_PRI_rt, and MPAMCFG_PRI_rl must be separate registers.

- The Secure instance (MPAMCFG_PRI_s) accesses the priority partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_PRI_ns) accesses the priority partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_PRI_rt) accesses the priority partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_PRI_rl) accesses the priority partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the priority resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_PRI can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0400	MPAMCFG_PRI_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0400	MPAMCFG_PRI_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0400	MPAMCFG_PRI_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0400	MPAMCFG_PRI_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_AIDR, MPAM Architecture Identification Register

The MPAMF_AIDR characteristics are:

Purpose

Identifies the version of the MPAM architecture that this MSC implements.

Note: The following values are defined for bits [7:0]:

- 0x01 == MPAM architecture v0.1
- 0x10 == MPAM architecture v1.0
- 0x11 == MPAM architecture v1.1

Configuration

The power domain of MPAMF_AIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_AIDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_AIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												ArchMajorRev				ArchMinorRev			

Bits [31:8]

Reserved, RES0.

ArchMajorRev, bits [7:4]

Major revision of the MPAM architecture implemented by the MSC.

This table shows the only valid combinations of MPAM version numbers in an MSC. FORCE_NS functionality is only available in MPAM v0.1.

ArchMajorRev	ArchMinorRev	MPAMv	Available
0	0		None.
0	1	v0.1	MPAMv1.0 + MPAMv1.1 + FORCE_NS
1	0	v1.0	MPAMv1.0
1	1	v1.1	MPAMv1.0 + MPAMv1.1 - FORCE_NS

Use of MPAMv0.1 in MSCs is restricted to limited circumstances. The MSC must be able to initiate requests in the Secure address space which have MPAM PARTID forced to the Non-secure space with that forcing not controllable or observable by the software that configures the device for Secure requests. Please contact Arm before setting MPAMF_AIDR to report MPAMv0.1.

ArchMinorRev, bits [3:0]

Minor revision of the MPAM architecture implemented by the MSC.

See the table in the description of the ArchMajorRev field in this register.

Accessing MPAMF_AIDR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_AIDR is read-only.

MPAMF_AIDR must be readable from the Secure, Non-secure, Root, and Realm MPAM feature pages.

MPAMF_AIDR must have the same contents in the Secure, Non-secure, Root, and Realm MPAM feature pages.

MPAMF_AIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0020	MPAMF_AIDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0020	MPAMF_AIDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0020	MPAMF_AIDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0020	MPAMF_AIDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_CCAP_IDR, MPAM Features Cache Capacity Partitioning ID register

The MPAMF_CCAP_IDR characteristics are:

Purpose

Indicates the number of fractional bits in [MPAMCFG_CMAX](#).CMAX.

MPAMF_CCAP_IDR_s indicates the number of fractional bits in the Secure instance of [MPAMCFG_CMAX](#).
MPAMF_CCAP_IDR_ns indicates the number of fractional bits in the Non-secure instance of [MPAMCFG_CMAX](#).
MPAMF_CCAP_IDR_rt indicates the number of fractional bits in the Root cache capacity control settings register field, [MPAMCFG_CMAX](#).CMAX. MPAMF_CCAP_IDR_rl indicates the number of fractional bits in the Realm cache capacity control settings register field, [MPAMCFG_CMAX](#).CMAX.

When [MPAMF_IDR.HAS_RIS](#) is 1, some fields in this register give information for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. The description of every field that is affected by [MPAMCFG_PART_SEL](#).RIS has information within the field description.

Configuration

The power domain of MPAMF_CCAP_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CCAP_PART == 1. Otherwise, direct accesses to MPAMF_CCAP_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_CCAP_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																										CMAX_WD					

Bits [31:6]

Reserved, RES0.

CMAX_WD, bits [5:0]

Number of fractional bits implemented in the cache capacity partitioning control, [MPAMCFG_CMAX](#).CMAX, of this device. See [MPAMCFG_CMAX](#).

This field must contain a value from 1 to 16, inclusive.

If RIS is implemented, this field indicates the number of fractional bits in the cache capacity partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_CCAP_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_CCAP_IDR is read-only.

MPAMF_CCAP_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_CCAP_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_CCAP_IDR_s is permitted to have either the same or different contents to MPAMF_CCAP_IDR_ns, MPAMF_CCAP_IDR_rt, or MPAMF_CCAP_IDR_rl.
- MPAMF_CCAP_IDR_ns is permitted to have either the same or different contents to MPAMF_CCAP_IDR_rt or MPAMF_CCAP_IDR_rl.
- MPAMF_CCAP_IDR_rt is permitted to have either the same or different contents to MPAMF_CCAP_IDR_rl.

There must be separate registers in the Secure (MPAMF_CCAP_IDR_s), Non-secure (MPAMF_CCAP_IDR_ns), Root (MPAMF_CCAP_IDR_rt), and Realm (MPAMF_CCAP_IDR_rl) MPAM feature pages.

When [MPAMF_IDR.HAS_RIS](#) is 1, MPAMF_CCAP_IDR shows the configuration of cache capacity partitioning for the cache resource instance selected by [MPAMCFG_PART_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_CCAP_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0038	MPAMF_CCAP_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0038	MPAMF_CCAP_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0038	MPAMF_CCAP_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0038	MPAMF_CCAP_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_CPOR_IDR, MPAM Features Cache Portion Partitioning ID register

The MPAMF_CPOR_IDR characteristics are:

Purpose

Indicates the number of bits in [MPAMCFG_CPBM<n>](#).

MPAMF_CPOR_IDR_s indicates the number of bits in the Secure instance of [MPAMCFG_CPBM<n>](#).

MPAMF_CPOR_IDR_ns indicates the number of bits in the Non-secure instance of [MPAMCFG_CPBM<n>](#).

MPAMF_CPOR_IDR_rt indicates the number of bits in the Root instance of [MPAMCFG_CPBM<n>](#).

MPAMF_CPOR_IDR_rl indicates the number of bits in the Realm instance of [MPAMCFG_CPBM<n>](#).

When [MPAMF_IDR.HAS_RIS](#) is 1, some fields in this register give information for the resource instance selector, [MPAMCFG_PART_SEL](#).RIS. The description of every field that is affected by [MPAMCFG_PART_SEL](#).RIS has information within the field description.

Configuration

The power domain of MPAMF_CPOR_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CPOR_PART == 1. Otherwise, direct accesses to MPAMF_CPOR_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_CPOR_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																CPBM_WD															

Bits [31:16]

Reserved, RES0.

CPBM_WD, bits [15:0]

Number of bits in the cache portion partitioning bit map of this device. See [MPAMCFG_CPBM<n>](#).

This field must contain a value from 1 to 32768, inclusive. Values greater than 32 require a group of 32-bit registers to access the CPBM, up to 1024 if CPBM_WD is the largest value.

If RIS is implemented, this field indicates the number bits in the cache portion bitmap for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_CPOR_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_CPOR_IDR is read-only.

MPAMF_CPOR_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_CPOR_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_CPOR_IDR_s is permitted to have either the same or different contents to MPAMF_CPOR_IDR_ns, MPAMF_CPOR_IDR_rt, or MPAMF_CPOR_IDR_rl.
- MPAMF_CPOR_IDR_ns is permitted to have either the same or different contents to MPAMF_CPOR_IDR_rt or MPAMF_CPOR_IDR_rl.
- MPAMF_CPOR_IDR_rt is permitted to have either the same or different contents to MPAMF_CPOR_IDR_rl.

There must be separate registers in the Secure (MPAMF_CPOR_IDR_s), Non-secure (MPAMF_CPOR_IDR_ns), Root (MPAMF_CPOR_IDR_rt), and Realm (MPAMF_CPOR_IDR_rl) MPAM feature pages.

When [MPAMF_IDR.HAS_RIS](#) is 1, MPAMF_CPOR_IDR shows the configuration of cache portion partitioning for the cache resource instance selected by [MPAMCFG_PART_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_CPOR_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0030	MPAMF_CPOR_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0030	MPAMF_CPOR_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0030	MPAMF_CPOR_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0030	MPAMF_CPOR_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_CSUMON_IDR, MPAM Features Cache Storage Usage Monitoring ID register

The MPAMF_CSUMON_IDR characteristics are:

Purpose

Indicates the number of cache storage usage monitor instances and other properties of the CSU monitoring.

MPAMF_CSUMON_IDR_s indicates the number and properties of Secure cache storage usage monitoring.

MPAMF_CSUMON_IDR_ns indicates the number and properties of Non-secure cache storage usage monitoring.

MPAMF_CSUMON_IDR_rt indicates the number and properties of Root cache storage usage monitoring.

MPAMF_CSUMON_IDR_rl indicates the number and properties of Realm cache storage usage monitoring.

If [MPAMF_IDR.HAS_RIS](#) is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#). Fields that do not mention RIS are constant across all resource instances.

Configuration

The power domain of MPAMF_CSUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MPAMF_CSUMON_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_CSUMON_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HAS_CAPTURE	CSU_RO	RES0	HAS_OFSR	RES0												NUM_MON															

HAS_CAPTURE, bit [31]

The implementation supports copying an [MSMON_CSU](#) to the corresponding [MSMON_CSU_CAPTURE](#) on a capture event.

HAS_CAPTURE	Meaning
0b0	MSMON_CSU_CAPTURE is not implemented and there is no support for capture events in the CSU monitor.
0b1	The MSMON_CSU_CAPTURE register is implemented and the CSU monitor supports the capture event behavior.

If RIS is implemented, this field indicates that CSU monitor capture is implemented for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#).

CSU_RO, bit [30]

The implementation of [MSMON_CSU](#) is read-only.

CSU_RO	Meaning
0b0	MSMON_CSU is read/write.
0b1	MSMON_CSU is read-only.

If RIS is implemented, this field indicates that the [MSMON_CSU](#) monitor register is read-only for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [29:27]

Reserved, RES0.

HAS_OFSR, bit [26]

When **FEAT_MPAMv0p1** is implemented or **FEAT_MPAMv1p1** is implemented:

The CSU monitor overflow status bitmap register, [MSMON_CSU_OFSR](#), is implemented.

HAS_OFSR	Meaning
0b0	MSMON_CSU_OFSR register is not implemented.
0b1	MSMON_CSU_OFSR register is implemented.

If RIS is implemented, this field indicates that CSU monitor overflow status bitmap register is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

Bits [25:16]

Reserved, RES0.

NUM_MON, bits [15:0]

The number of cache storage usage monitor instances implemented.

The largest [MSMON_CFG_MON_SEL](#).MON_SEL value is NUM_MON minus 1.

If RIS is implemented, this field indicates the number of CSU monitor instances implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_CSUMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_CSUMON_IDR is read-only.

MPAMF_CSUMON_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_CSUMON_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_CSUMON_IDR_s is permitted to have either the same or different contents to MPAMF_CSUMON_IDR_ns, MPAMF_CSUMON_IDR_rt, or MPAMF_CSUMON_IDR_rl.
- MPAMF_CSUMON_IDR_ns is permitted to have either the same or different contents to MPAMF_CSUMON_IDR_rt or MPAMF_CSUMON_IDR_rl.
- MPAMF_CSUMON_IDR_rt is permitted to have either the same or different contents to MPAMF_CSUMON_IDR_rl.

There must be separate registers in the Secure (MPAMF_CSUMON_IDR_s), Non-secure (MPAMF_CSUMON_IDR_ns), Root (MPAMF_CSUMON_IDR_rt), and Realm (MPAMF_CSUMON_IDR_rl) MPAM feature pages.

When [MPAMF_IDR](#).HAS_RIS is 1, MPAMF_CSUMON_IDR shows the configuration of cache storage usage monitoring for the cache resource instance selected by [MPAMCFG_PART_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF_CSUMON_IDR is not affected by [MSMON_CFG_MON_SEL](#).RIS.

MPAMF_CSUMON_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0088	MPAMF_CSUMON_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0088	MPAMF_CSUMON_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0088	MPAMF_CSUMON_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0088	MPAMF_CSUMON_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_ECR, MPAM Error Control Register

The MPAMF_ECR characteristics are:

Purpose

MPAMF_ECR is a 32-bit read/write register that controls MPAM error interrupts for this MSC.

MPAMF_ECR_s controls Secure MPAM error handling. MPAMF_ECR_ns controls Non-secure MPAM error handling. MPAMF_ECR_rt controls Root MPAM error handling. MPAMF_ECR_rl controls Realm MPAM error handling.

Configuration

The power domain of MPAMF_ECR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_ECR are RES0.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the [MPAMF_ESR](#) and MPAMF_ECR must be RAZ/WI.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ECR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															INTEN

Bits [31:1]

Reserved, RES0.

INTEN, bit [0]

Interrupt Enable.

INTEN	Meaning
0b0	MPAM error interrupts are not signaled.
0b1	MPAM error interrupts are signaled.

Accessing MPAMF_ECR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMF_ECR_s must be accessible from the Secure MPAM feature page.
- MPAMF_ECR_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ECR_rt must be accessible from the Root MPAM feature page.
- MPAMF_ECR_rl must be accessible from the Realm MPAM feature page.

MPAMF_ECR_s, MPAMF_ECR_ns, MPAMF_ECR_rt, and MPAMF_ECR_rl must be separate registers.

- The Secure instance (MPAMF_ECR_s) accesses the error interrupt controls used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ECR_ns) accesses the error interrupt controls used for Non-secure PARTIDs.
- The Root instance (MPAMF_ECR_rt) accesses the error interrupt controls used for Root PARTIDs.
- The Realm instance (MPAMF_ECR_rl) accesses the error interrupt controls used for Realm PARTIDs.

MPAMF_ECR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00F0	MPAMF_ECR_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00F0	MPAMF_ECR_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00F0	MPAMF_ECR_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00F0	MPAMF_ECR_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_ERR_MSI_ADDR_H, MPAM Error MSI High-part Address Register

The MPAMF_ERR_MSI_ADDR_H characteristics are:

Purpose

MPAMF_ERR_MSI_ADDR_H is a 32-bit read/write register for the high part of the MPAM error MSI address.

MPAMF_ERR_MSI_ADDR_H_s is the high part of the MSI write address for error interrupts related to Secure PARTIDs. MPAMF_ERR_MSI_ADDR_H_ns is the high part of the MSI write address for error interrupts related to Non-secure PARTIDs. MPAMF_ERR_MSI_ADDR_H_rt is the high part of the MSI write address for error interrupts related to Root PARTIDs. MPAMF_ERR_MSI_ADDR_H_rl is the high part of the MSI write address for error interrupts related to Realm PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_ADDR_H is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_ADDR_H are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ADDR_H is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												MSI_ADDR_H																			

Bits [31:20]

Reserved, RES0.

MSI_ADDR_H, bits [19:0]

MSI write address bits[51:32].

Accessing MPAMF_ERR_MSI_ADDR_H

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMF_ERR_MSI_ADDR_H_s must be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_ADDR_H_s, MPAMF_ERR_MSI_ADDR_H_ns, MPAMF_ERR_MSI_ADDR_H_rt, and MPAMF_ERR_MSI_ADDR_H_rl must be separate registers.

- The Secure instance (MPAMF_ERR_MSI_ADDR_H_s) accesses the high part of the memory address for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ADDR_H_ns) accesses the high part of the memory address for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ADDR_H_rt) accesses the high part of the memory address for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ADDR_H_rl) accesses the high part of the memory address for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_ADDR_H can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00E4	MPAMF_ERR_MSI_ADDR_H_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00E4	MPAMF_ERR_MSI_ADDR_H_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00E4	MPAMF_ERR_MSI_ADDR_H_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00E4	MPAMF_ERR_MSI_ADDR_H_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_ERR_MSI_ADDR_L, MPAM Error MSI Low-part Address Register

The MPAMF_ERR_MSI_ADDR_L characteristics are:

Purpose

MPAMF_ERR_MSI_ADDR_L is a 32-bit read/write register for the low part of the MPAM error MSI address.

MPAMF_ERR_MSI_ADDR_L_s is the low part of the MSI write address for error interrupts related to Secure PARTIDs. MPAMF_ERR_MSI_ADDR_L_ns is the low part of the MSI write address for error interrupts related to Non-secure PARTIDs. MPAMF_ERR_MSI_ADDR_L_rt is the low part of the MSI write address for error interrupts related to Root PARTIDs. MPAMF_ERR_MSI_ADDR_L_rl is the low part of the MSI write address for error interrupts related to Realm PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_ADDR_L is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_ADDR_L are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ADDR_L is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MSI_ADDR_L																		Bits[1:0]													

MSI_ADDR_L, bits [31:2]

MSI write address bits[31:2].

Bits [1:0]

Reads as 0b00.

Access to this field is **RO**.

Accessing MPAMF_ERR_MSI_ADDR_L

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMF_ERR_MSI_ADDR_L_s must be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_L_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_L_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_ADDR_L_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_ADDR_L_s, MPAMF_ERR_MSI_ADDR_L_ns, MPAMF_ERR_MSI_ADDR_L_rt, and MPAMF_ERR_MSI_ADDR_L_rl must be separate registers.

- The Secure instance (MPAMF_ERR_MSI_ADDR_L_s) accesses the low part of the memory address for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ADDR_L_ns) accesses the low part of the memory address for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ADDR_L_rt) accesses the low part of the memory address for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ADDR_L_rl) accesses the low part of the memory address for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_ADDR_L can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00E0	MPAMF_ERR_MSI_ADDR_L_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00E0	MPAMF_ERR_MSI_ADDR_L_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00E0	MPAMF_ERR_MSI_ADDR_L_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00E0	MPAMF_ERR_MSI_ADDR_L_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_ERR_MSI_ATTR, MPAM Error MSI Write Attributes Register

The MPAMF_ERR_MSI_ATTR characteristics are:

Purpose

MPAMF_ERR_MSI_ATTR is a 32-bit read/write register that controls MPAM error MSI write attributes for MPAM errors in this MSC.

MPAMF_ERR_MSI_ATTR_s controls the attributes of Secure MPAM error MSI writes. MPAMF_ERR_MSI_ATTR_ns controls the attributes of Non-secure MPAM error MSI writes. MPAMF_ERR_MSI_ATTR_rt controls the attributes of Root MPAM error MSI writes. MPAMF_ERR_MSI_ATTR_rl controls the attributes of Realm MPAM error MSI writes.

Configuration

The power domain of MPAMF_ERR_MSI_ATTR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_ATTR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ATTR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	MSI_SH	MSI_MEMATTR	RES0																												MSIEN

Bits [31:30]

Reserved, RES0.

MSI_SH, bits [29:28]

Sharability attribute of MSI writes.

MSI_SH	Meaning
0b00	Non-shareable.
0b01	Reserved, CONSTRAINED UNPREDICTABLE.
0b10	Outer Shareable.
0b11	Inner Shareable.

When MPAMF_ERR_MSI_ATTR.MSI_MEMATTR specifies a Device memory type, the contents of this field are IGNORED and Shareability is effectively Outer Shareable.

MSI_MEMATTR, bits [27:24]

Memory attributes of MSI writes.

Note: This encoding matches the VMSAv8-64 stage 2 MemAttr[3:0] field as described in the Arm ARM, except that the following encodings are Reserved (not UNPREDICTABLE) and behave as DEvice-nGnRnE: 0b0100, 0b1000, and 0b1100.

MSI_MEMATTR	Meaning
0b0000	Device-nGnRnE.
0b0001	Device-nGnRE.
0b0010	Device-nGRE.
0b0011	Device-GRE.
0b0100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b0101	Normal Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal Inner Write-Through Cacheable, Outer Non-cacheable.
0b0111	Normal Inner Write-Back Cacheable, Outer Non-cacheable.
0b1000	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1001	Normal Inner Non-Cachable, Outer Write-Through Cacheable.
0b1010	Normal Inner Write-Through Cacheable, Outer Write-Through Cacheable.
0b1011	Normal Inner Write-Back Cacheable, Outer Write-Through Cacheable.
0b1100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1101	Normal Inner Non-cacheable, Outer Write-Back Cacheable.
0b1110	Normal Inner Write-Through Cacheable, Outer Write-Back Cacheable.
0b1111	Normal Inner Write-Back Cacheable, Outer Write-Back Cacheable.

When this field specifies a Device memory type, the contents of MPAMF_ERR_MSI_ATTR.MSI_SH are IGNORED and Shareability is effectively Outer Shareable.

Device types may be implemented as any Device type with more than 'n' characters. For example, if this field is set to 0b0010, an implementation may treat the MSI write as the specified type, Device-nGRE, or as Device-nGnRE or as Device-nGnRnE.

Reserved encodings 0b0100, 0b1000, and 0b1100 must be implemented to behave the same as the 0b0000 encoding.

Bits [23:1]

Reserved, RES0.

MSIEN, bit [0]

Error interrupt MSI Enable.

MSIEN	Meaning
0b0	MPAM error MSI writes are not generated to signal enabled MPAM error interrupts. When error MSI writes are disabled, hardwired error interrupts could be generated.
0b1	MPAM error MSI writes are generated to signal enabled MPAM error interrupts. When error MSI writes are enabled, hardwired error interrupts are not generated.

The value of this field affects whether hardwired error interrupts are generated.

The reset behaviour of this field is:

- On a MSC reset, this field resets to 0.

Accessing MPAMF_ERR_MSI_ATTR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMF_ERR_MSI_ATTR_s must be accessible from the Secure MPAM feature page.

- MPAMF_ERR_MSI_ATTR_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_ATTR_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_ATTR_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_ATTR_s, MPAMF_ERR_MSI_ATTR_ns, MPAMF_ERR_MSI_ATTR_rt, and MPAMF_ERR_MSI_ATTR_rl must be separate registers.

- The Secure instance (MPAMF_ERR_MSI_ATTR_s) accesses the memory access attributes for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ATTR_ns) accesses the memory access attributes for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ATTR_rt) accesses the memory access attributes for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ATTR_rl) accesses the memory access attributes for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_ATTR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00EC	MPAMF_ERR_MSI_ATTR_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00EC	MPAMF_ERR_MSI_ATTR_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00EC	MPAMF_ERR_MSI_ATTR_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00EC	MPAMF_ERR_MSI_ATTR_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_ERR_MSI_DATA, MPAM Error MSI Data Register

The MPAMF_ERR_MSI_DATA characteristics are:

Purpose

MPAMF_ERR_MSI_DATA is a 32-bit read/write register for the MPAM error MSI data.

MPAMF_ERR_MSI_DATA_s is the data for the MSI write for error interrupts related to Secure PARTIDs.

MPAMF_ERR_MSI_DATA_ns is the data for the MSI write for error interrupts related to Non-secure PARTIDs.

MPAMF_ERR_MSI_DATA_rt is the data for the MSI write for error interrupts related to Root PARTIDs.

MPAMF_ERR_MSI_DATA_rl is the data for the MSI write for error interrupts related to Realm PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_DATA is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_DATA are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_DATA is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																MSI_DATA															

MSI_DATA, bits [31:0]

MSI data to be written to ITS to signal an MSI.

Accessing MPAMF_ERR_MSI_DATA

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMF_ERR_MSI_DATA_s must be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_DATA_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_DATA_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_DATA_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_DATA_s, MPAMF_ERR_MSI_DATA_ns, MPAMF_ERR_MSI_DATA_rt, and MPAMF_ERR_MSI_DATA_rl must be separate registers.

- The Secure instance (MPAMF_ERR_MSI_DATA_s) accesses the data for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_DATA_ns) accesses the data for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_DATA_rt) accesses the data for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_DATA_rl) accesses the data for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_DATA can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00E8	MPAMF_ERR_MSI_DATA_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00E8	MPAMF_ERR_MSI_DATA_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00E8	MPAMF_ERR_MSI_DATA_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00E8	MPAMF_ERR_MSI_DATA_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_ERR_MSI_MPAM, MPAM Error MSI Write MPAM Information Register

The MPAMF_ERR_MSI_MPAM characteristics are:

Purpose

MPAMF_ERR_MSI_MPAM is a 32-bit read/write register that sets the MPAM information for error MSI write attributes for MPAM errors in this MSC.

MPAMF_ERR_MSI_MPAM_s controls MPAM information labeling of Secure MPAM error MSI writes.

MPAMF_ERR_MSI_MPAM_ns controls MPAM information labeling of Non-secure MPAM error MSI writes.

MPAMF_ERR_MSI_MPAM_rt controls MPAM information labeling of Root MPAM error MSI writes.

MPAMF_ERR_MSI_MPAM_rl controls MPAM information labeling of Realm MPAM error MSI writes.

Configuration

The power domain of MPAMF_ERR_MSI_MPAM is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_MPAM are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_MPAM is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMG								PARTID															

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group property for PARTID MSC error interrupt write.

The reset behaviour of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition ID for MSC error interrupt write.

The PARTID in this register is in the Secure PARTID space in the MPAMF_ERR_MSI_MPAM_s instance and in the Non-secure PARTID space in the MPAMF_ERR_MSI_MPAM_ns instance of this register.

The reset behaviour of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMF_ERR_MSI_MPAM

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMF_ERR_MSI_MPAM_s must be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_MPAM_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_MPAM_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_MPAM_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_MPAM_s, MPAMF_ERR_MSI_MPAM_ns, MPAMF_ERR_MSI_MPAM_rt, and MPAMF_ERR_MSI_MPAM_rl must be separate registers.

- The Secure instance (MPAMF_ERR_MSI_MPAM_s) accesses the MPAM information for MSI write request to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_MPAM_ns) accesses the MPAM information for MSI write request to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_MPAM_rt) accesses the MPAM information for MSI write request to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_MPAM_rl) accesses the MPAM information for MSI write request to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_MPAM can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00DC	MPAMF_ERR_MSI_MPAM_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00DC	MPAMF_ERR_MSI_MPAM_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00DC	MPAMF_ERR_MSI_MPAM_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00DC	MPAMF_ERR_MSI_MPAM_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_ESR, MPAM Error Status Register

The MPAMF_ESR characteristics are:

Purpose

Indicates MPAM error status for this MSC.

MPAMF_ESR_s reports Secure MPAM errors. MPAMF_ESR_ns reports Non-secure MPAM errors. MPAMF_ESR_rt reports Root MPAM errors. MPAMF_ESR_rl reports Realm MPAM errors.

Software should write this register after reading the status of an error to reset ERRCODE to 0x0000 and OVRWR to 0 so that future errors are not reported with OVRWR set.

Configuration

The power domain of MPAMF_ESR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_ESR are RES0.

MPAMF_ESR is 64-bit register when MPAM v0.1 or v1.1 is implemented and MPAMF_IDR.HAS_EXTD_ESR == 1.

Otherwise, MPAMF_ESR is a 32-bit register.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the MPAMF_ESR and [MPAMF_ECR](#) must be RAZ/WI.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ESR is a:

- 64-bit register when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_EXTD_ESR == 1
- 32-bit register otherwise

Field descriptions

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_EXTD_ESR == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32		
RES0																																RIS	
OVRWR	RES0		ERRCODE			PMG										PARTID_MON																	
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		

Bits [63:36]

Reserved, RES0.

RIS, bits [35:32]

When MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. Where applicable to the ERRCODE, captures the RIS value for the error.

Otherwise:

Reserved, RES0.

OVRWR, bit [31]

Overwritten.

If 0 and ERRCODE == 0b0000, no errors have occurred.

If 0 and ERRCODE is non-zero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is non-zero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is zero must not be produced by hardware and is only reached when software writes this combination into this register.

Bits [30:28]

Reserved, RES0.

ERRCODE, bits [27:24]

Error code.

ERRCODE	Meaning
0b0000	No error.
0b0001	PARTID_SEL_Range.
0b0010	Req_PARTID_Range.
0b0011	MSMONCFG_ID_RANGE.
0b0100	Req_PMG_Range.
0b0101	Monitor_Range.
0b0110	intPARTID_Range.
0b0111	Unexpected_INTERNAL.
0b1000	Undefined_RIS_PART_SEL.
0b1001	RIS_No_Control.
0b1010	Undefined_RIS_MON_SEL.
0b1011	RIS_No_Monitor.
0b1100	Reserved.
0b1101	Reserved.
0b1110	Reserved.
0b1111	Reserved.

PMG, bits [23:16]

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to 0x00 on an error that does not capture PMG.

PARTID_MON, bits [15:0]

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OVRWR	RES0			ERRCODE				PMG								PARTID MON															

OVRWR, bit [31]

Overwritten.

If 0 and ERRCODE == 0b0000, no errors have occurred.

If 0 and ERRCODE is non-zero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is non-zero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is 0 must not be produced by hardware and is only reached when software writes this combination into this register.

Bits [30:28]

Reserved, RES0.

ERRCODE, bits [27:24]

Error code.

ERRCODE	Meaning
0b0000	No error.
0b0001	PARTID_SEL_Range.
0b0010	Req_PARTID_Range.
0b0011	MSMONCFG_ID_RANGE.
0b0100	Req_PMG_Range.
0b0101	Monitor_Range.
0b0110	intPARTID_Range.
0b0111	Unexpected_INTERNAL.
0b1000	Reserved.
0b1001	Reserved.
0b1010	Reserved.
0b1011	Reserved.
0b1100	Reserved.
0b1101	Reserved.
0b1110	Reserved.
0b1111	Reserved.

PMG, bits [23:16]

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to 0x00 on an error that does not capture PMG.

PARTID_MON, bits [15:0]

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0x0000.

Accessing MPAMF_ESR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MPAMF_ESR_s must be accessible from the Secure MPAM feature page.
- MPAMF_ESR_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ESR_rt must be accessible from the Root MPAM feature page.

- MPAMF_ESR_rl must be accessible from the Realm MPAM feature page.

MPAMF_ESR_s, MPAMF_ESR_ns, MPAMF_ESR_rt, and MPAMF_ESR_rl must be separate registers.

- The Secure instance (MPAMF_ESR_s) accesses the error status used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ESR_ns) accesses the error status used for Non-secure PARTIDs.
- The Root instance (MPAMF_ESR_rt) accesses the error status used for Root PARTIDs.
- The Realm instance (MPAMF_ESR_rl) accesses the error status used for Realm PARTIDs.

MPAMF_ESR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00F8	MPAMF_ESR_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00F8	MPAMF_ESR_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00F8	MPAMF_ESR_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00F8	MPAMF_ESR_rl

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_IDR, MPAM Features Identification Register

The MPAMF_IDR characteristics are:

Purpose

Indicates which memory partitioning and monitoring features are present on this MSC.

MPAMF_IDR_s indicates the MPAM features accessed from the Secure MPAM feature page. MPAMF_IDR_ns indicates the MPAM features accessed from the Non-secure MPAM feature page. MPAMF_IDR_rt indicates the MPAM features accessed from the Root MPAM feature page. MPAMF_IDR_rl indicates the MPAM features accessed from the Realm MPAM feature page.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. The description of every field that is affected by [MPAMCFG_PART_SEL](#).RIS has that information within the field description.

Configuration

The power domain of MPAMF_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_IDR are RES0.

MPAMF_IDR is 64-bit register when MPAM v0.1 or v1.1 is implemented.

Otherwise, MPAMF_IDR is a 32-bit register.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_IDR is a:

- 64-bit register when FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented
- 32-bit register otherwise

Field descriptions

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

63	62	61	60	59	58	57	56	55
RES0				RIS_MAX				
HAS_PARTID_NRW	HAS_MSMON	HAS_IMPL_IDR_EXT	HAS_PRI_PART	HAS_MBW_PART	HAS_CPOR_PART	HAS_CCAP_PART		
31	30	29	28	27	26	25	24	23

Bits [63:60]

Reserved, RES0.

RIS_MAX, bits [59:56]

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Maximum RIS value supported in [MPAMCFG_PART_SEL](#). Must be 0b0000 if [MPAMF_IDR](#).HAS_RIS == 0.

Otherwise:

Reserved, RES0.

Bits [55:42]

Reserved, RES0.

SP4, bit [41]

When **FEAT_RME** is implemented:

Indicates whether this MSC supports 4 PARTID spaces.

SP4	Meaning
0b0	This MSC supports two PARTID spaces.
0b1	This MSC supports four PARTID spaces.

This field must read the same in each instance of this register and for any value in [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

HAS_ERR_MSI, bit [40]

When **MPAMF_IDR.EXT** == 1:

Has support for MSI writes to signal MPAM error interrupts. These registers are implemented: [MPAMF_ERR_MSI_ADDR_L](#), [MPAMF_ERR_MSI_ADDR_H](#), [MPAMF_ERR_MSI_ATTR](#), [MPAMF_ERR_MSI_DATA](#), and [MPAMF_ERR_MSI_MPAM](#).

HAS_ERR_MSI	Meaning
0b0	MPAMF_ERR_MSI_ADDR_L , MPAMF_ERR_MSI_ADDR_H , MPAMF_ERR_MSI_ATTR , MPAMF_ERR_MSI_DATA , and MPAMF_ERR_MSI_MPAM registers are not implemented.
0b1	MPAMF_ERR_MSI_ADDR_L , MPAMF_ERR_MSI_ADDR_H , MPAMF_ERR_MSI_ATTR , MPAMF_ERR_MSI_DATA , and MPAMF_ERR_MSI_MPAM are implemented and can be used to generate writes to signal error interrupts.

If [MPAMF_IDR.HAS_ESR](#) is 0, this bit must also be 0.

Otherwise:

Reserved, RES0.

HAS_ESR, bit [39]

When **MPAMF_IDR.EXT** == 1:

[MPAMF_ESR](#) is implemented.

HAS_ESR	Meaning
0b0	MPAMF_ESR , MPAMF_ECR , and MPAM error handling are not implemented.
0b1	MPAMF_ESR , MPAMF_ECR , and MPAM error handling are implemented.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the [MPAMF_ESR](#) and [MPAMF_ECR](#) must be RAZ/WI.

Otherwise:

Reserved, RES0.

HAS_EXTD_ESR, bit [38]

When MPAMF_IDR.EXT == 1:

[MPAMF_ESR](#) is 64 bits.

HAS_EXTD_ESR	Meaning
0b0	MPAMF_ESR is 32 bits.
0b1	MPAMF_ESR is 64 bits.

When [MPAMF_IDR](#).HAS_RIS and [MPAMF_IDR](#).HAS_ESR, this field must be 1.

Otherwise:

Reserved, RES0.

NO_IMPL_MSMON, bit [37]

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_IMPL_IDR == 1:

[MPAMF_IMPL_IDR](#) defines no IMPLEMENTATION DEFINED resource monitors.

NO_IMPL_MSMON	Meaning
0b0	MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource monitor.
0b1	MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource monitors.

If RIS is implemented, this field indicates the presence of IMPLEMENTATION DEFINED resource monitors described in [MPAMF_IMPL_IDR](#) for the selected resource instance.

Otherwise:

Reserved, RES0.

NO_IMPL_PART, bit [36]

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_IMPL_IDR == 1:

[MPAMF_IMPL_IDR](#) defines no IMPLEMENTATION DEFINED resource controls.

NO_IMPL_PART	Meaning
0b0	MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource control.
0b1	MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource controls.

If RIS is implemented, this field indicates the presence of IMPLEMENTATION DEFINED resource controls described in [MPAMF_IMPL_IDR](#) for the selected resource instance.

Otherwise:

Reserved, RES0.

Bits [35:33]

Reserved, RES0.

HAS_RIS, bit [32]

When MPAMF_IDR.EXT == 1:

Has resource instance selector. Indicates that [MPAMCFG_PART_SEL](#) contains the RIS field that selects a resource instance to control.

HAS_RIS	Meaning
0b0	MPAMCFG_PART_SEL does not implement the MPAMCFG_PART_SEL .RIS field or multiple resource instance support.
0b1	MPAMCFG_PART_SEL implements the MPAMCFG_PART_SEL .RIS field and MPAM resource instance numbers up to and including MPAMF_IDR.RIS_MAX.

Otherwise:

Reserved, RES0.

HAS_PARTID_NRW, bit [31]

Has PARTID narrowing.

HAS_PARTID_NRW	Meaning
0b0	Does not have MPAMF_PARTID_NRW_IDR , MPAMCFG_INTPARTID , or intPARTID mapping support.
0b1	Supports the MPAMF_PARTID_NRW_IDR , MPAMCFG_INTPARTID registers.

HAS_MSMON, bit [30]

Has resource monitors. Indicates whether this MSC has MPAM resource monitors.

HAS_MSMON	Meaning
0b0	Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR .
0b1	Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR .

HAS_IMPL_IDR, bit [29]

Has [MPAMF_IMPL_IDR](#). Indicates whether this MSC has the IMPLEMENTATION SPECIFIC MPAM features register, [MPAMF_IMPL_IDR](#).

HAS_IMPL_IDR	Meaning
0b0	Does not have MPAMF_IMPL_IDR .
0b1	Has MPAMF_IMPL_IDR .

EXT, bit [28]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Extended MPAMF_IDR.

EXT	Meaning
0b0	MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits.
0b1	MPAMF_IDR has bits defined in [63:32]. The register is 64-bits.

Otherwise:

Reserved, RES0.

HAS_PRI_PART, bit [27]

Has priority partitioning. Indicates that MPAM priority partitioning is implemented and [MPAMF_PRI_IDR](#) exists.

HAS_PRI_PART	Meaning
0b0	Does not support priority partitioning or have MPAMF_PRI_IDR .
0b1	Has priority partitioning and MPAMF_PRI_IDR .

If RIS is implemented, this field indicates the presence of priority partitioning resource controls as described in [MPAMF_PRI_IDR](#) for the selected resource instance.

HAS_MBW_PART, bit [26]

Has memory bandwidth partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and [MPAMF_MBW_IDR](#).

HAS_MBW_PART	Meaning
0b0	Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register.
0b1	Has MPAMF_MBW_IDR register.

If RIS is implemented, this field indicates the presence of memory bandwidth partitioning resource controls as described in [MPAMF_MBW_IDR](#) for the selected resource instance.

HAS_CPOR_PART, bit [25]

Has cache portion partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and [MPAMF_CPOR_IDR](#).

HAS_CPOR_PART	Meaning
0b0	Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPBM<n> registers.
0b1	Has MPAMF_CPOR_IDR and MPAMCFG_CPBM<n> registers.

If RIS is implemented, this field indicates the presence of cache portion partitioning resource controls as described in [MPAMF_CPOR_IDR](#) for the selected resource instance.

HAS_CCAP_PART, bit [24]

Has cache capacity partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the [MPAMF_CCAP_IDR](#) and [MPAMCFG_CMAX](#) registers.

HAS_CCAP_PART	Meaning
0b0	Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.
0b1	Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

If RIS is implemented, this field indicates the presence of cache capacity partitioning resource controls as described in [MPAMF_CPOR_IDR](#) for the selected resource instance.

PMG_MAX, bits [23:16]

Maximum value of Non-secure PMG supported by this component.

PARTID_MAX, bits [15:0]

Maximum value of Non-secure PARTID supported by this component.

Otherwise:

31	30	29	28	27	26	25	24	23
HAS_PARTID_NRW	HAS_MSMON	HAS_IMPL_IDR	EXT	HAS_PRI_PART	HAS_MBW_PART	HAS_CPOR_PART	HAS_CCAP_PART	HAS_CCAP_PART

HAS_PARTID_NRW, bit [31]

Has PARTID narrowing.

HAS_PARTID_NRW	Meaning
0b0	Does not have MPAMF_PARTID_NRW_IDR , MPAMCFG_INTPARTID , or intPARTID mapping support.
0b1	Supports the MPAMF_PARTID_NRW_IDR , MPAMCFG_INTPARTID registers.

HAS_MSMON, bit [30]

Has resource monitors. Indicates whether this MSC has MPAM resource monitors.

HAS_MSMON	Meaning
0b0	Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR .
0b1	Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR .

HAS_IMPL_IDR, bit [29]

Has [MPAMF_IMPL_IDR](#). Indicates whether this MSC has the IMPLEMENTATION SPECIFIC MPAM features register, [MPAMF_IMPL_IDR](#).

HAS_IMPL_IDR	Meaning
0b0	Does not have MPAMF_IMPL_IDR .
0b1	Has MPAMF_IMPL_IDR .

EXT, bit [28]

When **FEAT_MPAMv0p1** is implemented or **FEAT_MPAMv1p1** is implemented:

Extended MPAMF_IDR.

EXT	Meaning
0b0	MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits.
0b1	MPAMF_IDR has bits defined in [63:32]. The register is 64-bits.

Otherwise:

Reserved, RES0.

HAS_PRI_PART, bit [27]

Has priority partitioning. Indicates whether this MSC implements MPAM priority partitioning and [MPAMF_PRI_IDR](#).

HAS_PRI_PART	Meaning
0b0	Does not support priority partitioning or have MPAMF_PRI_IDR .
0b1	Has MPAMF_PRI_IDR .

HAS_MBW_PART, bit [26]

Has memory bandwidth partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and [MPAMF_MBW_IDR](#).

HAS_MBW_PART	Meaning
0b0	Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register.
0b1	Has MPAMF_MBW_IDR register.

HAS_CPOR_PART, bit [25]

Has cache portion partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and [MPAMF_CPOR_IDR](#).

HAS_CPOR_PART	Meaning
0b0	Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPBm<n> registers.
0b1	Has MPAMF_CPOR_IDR and MPAMCFG_CPBm<n> registers.

HAS_CCAP_PART, bit [24]

Has cache capacity partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the [MPAMF_CCAP_IDR](#) and [MPAMCFG_CMAX](#) registers.

HAS_CCAP_PART	Meaning
0b0	Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.
0b1	Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

PMG_MAX, bits [23:16]

Maximum value of Non-secure PMG supported by this component.

PARTID_MAX, bits [15:0]

Maximum value of Non-secure PARTID supported by this component.

Accessing MPAMF_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

[MPAMF_IDR](#) is read-only.

[MPAMF_IDR](#) must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

[MPAMF_IDR](#) is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- [MPAMF_IDR_s](#) is permitted to have either the same or different contents to [MPAMF_IDR_ns](#), [MPAMF_IDR_rt](#), or [MPAMF_IDR_rl](#).
- [MPAMF_IDR_ns](#) is permitted to have either the same or different contents to [MPAMF_IDR_rt](#) or [MPAMF_IDR_rl](#).
- [MPAMF_IDR_rt](#) is permitted to have either the same or different contents to [MPAMF_IDR_rl](#).

There must be separate registers in the Secure (MPAMF_IDR_s), Non-secure (MPAMF_IDR_ns), Root (MPAMF_IDR_rt), and Realm (MPAMF_IDR_rl) MPAM feature pages.

When [MPAMF_IDR](#).HAS_RIS is 1, MPAMF_IDR shows the configuration of MSC MPAM for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0000	MPAMF_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0000	MPAMF_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0000	MPAMF_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0000	MPAMF_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_IIDR, MPAM Implementation Identification Register

The MPAMF_IIDR characteristics are:

Purpose

Uniquely identifies the MSC implementation by the combination of implementer, product ID, variant, and revision.

Configuration

The power domain of MPAMF_IIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_IIDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_IIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ProductID												Variant				Revision				Implementer											

ProductID, bits [31:20]

The MSC implementer as identified in the MPAMF_IIDR.Implementer field must assure each product has a unique ProductID from any other with the same Implementer value.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [19:16]

This field distinguishes product variants or major revisions of the product.

Note

Implementations of ProductID with differing software interfaces are expected to have different values in the MPAMF_IIDR.Variant field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

This field distinguishes minor revisions of the product.

Note

This field is intended to differentiate product revisions that are minor changes and are largely software compatible with previous revisions.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the MPAM MSC.

[11:8] must contain the JEP106 continuation code of the implementer.

[7] must always be 0.

[6:0] must contain the JEP106 identity code of the implementer.

For an Arm implementation, bits[11:0] are 0x43B.

Accessing MPAMF_IIDR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_IIDR is read-only.

MPAMF_IIDR must be readable from the Secure, Non-secure, Root, and Realm MPAM feature pages.

MPAMF_IIDR must have the same contents in the Secure, Non-secure, Root, and Realm MPAM feature pages.

MPAMF_IIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0018	MPAMF_IIDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0018	MPAMF_IIDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0018	MPAMF_IIDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0018	MPAMF_IIDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_IMPL_IDR, MPAM Implementation-Specific Partitioning Feature Identification Register

The MPAMF_IMPL_IDR characteristics are:

Purpose

Indicates the implementation-defined partitioning and monitoring features and parameters of the MSC.

MPAMF_IMPL_IDR_s indicates IMPLEMENTATION DEFINED partitioning and monitoring features accessed from the Secure MPAM feature page. MPAMF_IMPL_IDR_ns indicates those accessed from the Non-secure MPAM feature page. MPAMF_IMPL_IDR_rt indicates IMPLEMENTATION DEFINED partitioning and monitoring features accessed from the Root MPAM feature page. MPAMF_IMPL_IDR_rl indicates those accessed from the Realm MPAM feature page.

If [MPAMF_IDR.HAS_RIS](#) is 1, this register gives the implementation-specific features and parameters of the resource instance selected by [MPAMCFG_PART_SEL.RIS](#) for any features that are specific to the resource.

Configuration

The power domain of MPAMF_IMPL_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_IMPL_IDR == 1. Otherwise, direct accesses to MPAMF_IMPL_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_IMPL_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																IMPLFEAT															

IMPLFEAT, bits [31:0]

All 32 bits of this register are available to be used as the implementer sees fit to indicate the presence of IMPLEMENTATION DEFINED MPAM features in this MSC and to give additional implementation-specific read-only information about the parameters of implementation-specific MPAM features to software.

If RIS is implemented, this register indicates the implementation-specific features and parameters of the resource instance selected by [MPAMCFG_PART_SEL.RIS](#).

Accessing MPAMF_IMPL_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_IMPL_IDR is read-only.

MPAMF_IMPL_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_IMPL_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_IMPL_IDR_s is permitted to have either the same or different contents to MPAMF_IMPL_IDR_ns, MPAMF_IMPL_IDR_rt, or MPAMF_IMPL_IDR_rl.

- MPAMF_IMPL_IDR_ns is permitted to have either the same or different contents to MPAMF_IMPL_IDR_rt or MPAMF_IMPL_IDR_rl.
- MPAMF_IMPL_IDR_rt is permitted to have either the same or different contents to MPAMF_IMPL_IDR_rl.

There must be separate registers in the Secure (MPAMF_IMPL_IDR_s), Non-secure (MPAMF_IMPL_IDR_ns), Root (MPAMF_IMPL_IDR_rt), and Realm (MPAMF_IMPL_IDR_rl) MPAM feature pages.

When [MPAMF_IDR.HAS_RIS](#) is 1, MPAMF_IMPL_IDR shows the configuration of implementation-specific features for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_IMPL_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0028	MPAMF_IMPL_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0028	MPAMF_IMPL_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0028	MPAMF_IMPL_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0028	MPAMF_IMPL_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_MBW_IDR, MPAM Memory Bandwidth Partitioning Identification Register

The MPAMF_MBW_IDR characteristics are:

Purpose

Indicates which MPAM bandwidth partitioning features are present on this MSC.

MPAMF_MBW_IDR_s indicates bandwidth partitioning features accessed from the Secure MPAM feature page.
 MPAMF_MBW_IDR_ns indicates bandwidth partitioning features accessed from the Non-secure MPAM feature page.
 MPAMF_MBW_IDR_rt indicates bandwidth partitioning features accessed from the Root MPAM feature page.
 MPAMF_MBW_IDR_rl indicates bandwidth partitioning features accessed from the Realm MPAM feature page.

When [MPAMF_IDR.HAS_RIS](#) is 1, some fields in this register give information for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#). The description of every field that is affected by [MPAMCFG_PART_SEL.RIS](#) has that information within the field description.

Configuration

The power domain of MPAMF_MBW_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_MBW_PART == 1. Otherwise, direct accesses to MPAMF_MBW_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MBW_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [31:29]

Reserved, RES0.

BWPBM_WD, bits [28:16]

Bandwidth portion bitmap width.

The number of bandwidth portion bits in the [MPAMCFG_MBW_PBM<n>](#) register array.

If MPAMF_MBW_IDR.HAS_PBM is 1, this field must contain a value from 1 to 4096, inclusive. Values greater than 32 require a group of 32-bit registers to access the BWPBM, up to 128 if BWPBM_WD is the largest value.

If MPAMF_MBW_IDR.HAS_PBM is 0, this field must be ignored by software.

If RIS is implemented, this field indicates the width of the memory bandwidth portion bitmap partitioning control for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#).

Bit [15]

Reserved, RES0.

WINDWR, bit [14]

Indicates the bandwidth accounting period register is writable.

WINDWR	Meaning
0b0	The bandwidth accounting period is readable from MPAMCFG_MBW_WINWD which might be fixed or vary due to clock rate reconfiguration of the memory channel or memory controller.
0b1	The bandwidth accounting width is readable and writable per partition in MPAMCFG_MBW_WINWD .

HAS_PROP, bit [13]

Indicates that this MSC implements proportional stride bandwidth partitioning and the [MPAMCFG_MBW_PROP](#) register can be accessed.

HAS_PROP	Meaning
0b0	There is no memory bandwidth proportional stride control and the MPAMCFG_MBW_PROP register is RES0.
0b1	The proportional stride memory bandwidth partitioning scheme is supported and the MPAMCFG_MBW_PROP register can be accessed.

If RIS is implemented, this field indicates the presence of the memory bandwidth proportional stride partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_PBM, bit [12]

Indicates that bandwidth portion partitioning is implemented and the [MPAMCFG_MBW_PBM<n>](#) register array can be accessed.

HAS_PBM	Meaning
0b0	There is no memory bandwidth portion control and the MPAMCFG_MBW_PBM<n> is RES0.
0b1	The memory bandwidth portion allocation scheme exists and the MPAMCFG_MBW_PBM<n> register can be accessed.

If RIS is implemented, this field indicates the presence of the memory bandwidth portion partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_MAX, bit [11]

Indicates that this MSC implements maximum bandwidth partitioning and the [MPAMCFG_MBW_MAX](#) register can be accessed.

HAS_MAX	Meaning
0b0	There is no maximum memory bandwidth control and the MPAMCFG_MBW_MAX register is RES0.
0b1	The maximum memory bandwidth allocation scheme is supported and the MPAMCFG_MBW_MAX register can be accessed.

If RIS is implemented, this field indicates the presence of the maximum bandwidth partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_MIN, bit [10]

Indicates that this MSC implements minimum bandwidth partitioning and the [MPAMCFG_MBW_MIN](#) register can be accessed.

HAS_MIN	Meaning
0b0	There is no minimum memory bandwidth control and the MPAMCFG_MBW_MIN register is RES0.
0b1	The minimum memory bandwidth allocation scheme is supported and the MPAMCFG_MBW_MIN register can be accessed.

If RIS is implemented, this field indicates the presence of the minimum bandwidth partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [9:6]

Reserved, RES0.

BWA_WD, bits [5:0]

Number of implemented bits in the bandwidth allocation fields: MIN, MAX, and STRIDE. See [MPAMCFG_MBW_MIN](#), [MPAMCFG_MBW_MAX](#), and [MPAMCFG_MBW_PROP](#).

In any of these bandwidth allocation fields exist, this field must have a value from 1 to 16, inclusive. Otherwise, it is permitted to be 0.

If RIS is implemented, this field indicates the number of implemented bits in the bandwidth allocation control fields for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_MBW_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_MBW_IDR is read-only.

MPAMF_MBW_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_MBW_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_MBW_IDR_s is permitted to have either the same or different contents to MPAMF_MBW_IDR_ns, MPAMF_MBW_IDR_rt, or MPAMF_MBW_IDR_rl.
- MPAMF_MBW_IDR_ns is permitted to have either the same or different contents to MPAMF_MBW_IDR_rt or MPAMF_MBW_IDR_rl.
- MPAMF_MBW_IDR_rt is permitted to have either the same or different contents to MPAMF_MBW_IDR_rl.

There must be separate registers in the Secure (MPAMF_MBW_IDR_s), Non-secure (MPAMF_MBW_IDR_ns), Root (MPAMF_MBW_IDR_rt), and Realm (MPAMF_MBW_IDR_rl) MPAM feature pages.

When [MPAMF_IDR](#).HAS_RIS is 1, MPAMF_MBW_IDR shows the configuration of memory bandwidth partitioning for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_MBW_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0040	MPAMF_MBW_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0040	MPAMF_MBW_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
-----------	-------	--------	----------

MPAM	MPAMF_BASE_rt	0x0040	MPAMF_MBW_IDR_rt
------	---------------	--------	------------------

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0040	MPAMF_MBW_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

MPAMF_MBWUMON_IDR, MPAM Features Memory Bandwidth Usage Monitoring ID register

The MPAMF_MBWUMON_IDR characteristics are:

Purpose

Indicates the number of memory bandwidth usage monitor instances implemented. This register also indicates several properties of MBWU monitoring, including whether the implementation supports capture, scaling, or long counters.

MPAMF_MBWUMON_IDR_s indicates the number of Secure memory bandwidth usage monitor instances.

MPAMF_MBWUMON_IDR_ns indicates the number of Non-secure memory bandwidth usage monitor instances.

MPAMF_MBWUMON_IDR_rt indicates the number of Root memory bandwidth usage monitor instances.

MPAMF_MBWUMON_IDR_rl indicates the number of Realm memory bandwidth usage monitor instances.

If [MPAMF_IDR.HAS_RIS](#) is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#). Fields that do not mention RIS are constant across all resource instances.

Configuration

The power domain of MPAMF_MBWUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MPAMF_MBWUMON_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MBWUMON_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HAS_CAPTURE	HAS_LONG	LWD	HAS_RWBW	RES0	HAS_OFSR	RES0	SCALE	NUM_MON																							

HAS_CAPTURE, bit [31]

The implementation supports copying an [MSMON_MBWU](#) to the corresponding [MSMON_MBWU_CAPTURE](#) on a capture event.

HAS_CAPTURE	Meaning
0b0	MSMON_MBWU_CAPTURE is not implemented and there is no support for capture events in the MBWU monitor.
0b1	The MSMON_MBWU_CAPTURE register is implemented and the MBWU monitor supports the capture event behavior.

If RIS is implemented, this field indicates that MBWU monitor capture is implemented for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#).

If MPAMF_MBWUMON_IDR.HAS_LONG is 1, this also indicates that [MSMON_MBWU_L_CAPTURE](#) is implemented.

HAS_LONG, bit [30]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Indicates whether [MSMON_MBWU_L](#) is implemented.

If HAS_CAPTURE is 1, indicates whether [MSMON_MBWU_L_CAPTURE](#) is implemented.

HAS_LONG	Meaning
0b0	Does not implement MSMON_MBWU_L or MSMON_MBWU_L_CAPTURE .
0b1	Implements MSMON_MBWU_L . If HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE is also implemented.

If RIS is implemented, this field indicates that the long MBWU monitor is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

If MPAMF_MBWUMON_IDR.HAS_CAPTURE is 1, this also indicates that [MSMON_MBWU_L_CAPTURE](#) is implemented.

Otherwise:

Reserved, RES0.

LWD, bit [29]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Long register VALUE width.

If [MPAMF_MBWUMON_IDR](#).HAS_LONG is 0, [MPAMF_MBWUMON_IDR](#).LWD must also be 0.

LWD	Meaning
0b0	If MPAMF_MBWUMON_IDR .HAS_LONG is 1, MSMON_MBWU_L has 44-bit VALUE field in bits [43:0]. Bits [62:44] are RES0. If HAS_LONG is 1 and MPAMF_MBWUMON_IDR .HAS_CAPTURE is 1, MSMON_MBWU_L_CAPTURE also has 44-bit VALUE field in bits [43:0].
0b1	MSMON_MBWU_L has 63-bit VALUE field in bits [62:0]. If MPAMF_MBWUMON_IDR .HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE also has 63-bit VALUE field in bits [62:0].

If RIS is implemented, this field indicates the length of the [MSMON_MBWU_L](#).VALUE field implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

HAS_RWBW, bit [28]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Read/write bandwidth selection is implemented in [MSMON_CFG_MBWU_FLT](#).

HAS_RWBW	Meaning
0b0	Read/write bandwidth selection is not implemented.
0b1	Read/write bandwidth selection is implemented.

If RIS is implemented, this field indicates whether read/write bandwidth collection selection is available in [MSMON_CFG_MBWU_FLT](#) for resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

Bit [27]

Reserved, RES0.

HAS_OFSR, bit [26]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

The MBWU monitor overflow status bitmap register, [MSMON_MBWU_OFSR](#), is implemented.

HAS_OFSR	Meaning
0b0	MSMON_MBWU_OFSR register is not implemented.
0b1	MSMON_MBWU_OFSR register is implemented.

If RIS is implemented, this field indicates that MBWU monitor overflow status bitmap register is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

Bits [25:21]

Reserved, RES0.

SCALE, bits [20:16]

Scaling of [MSMON_MBWU](#).VALUE in bits. If scaling is enabled by [MSMON_CFG_MBWU_CTL](#).SCLEN, the byte count in the VALUE field has been shifted by SCALE bits to the right.

SCALE	Meaning
0b00000	Scaling is not implemented.
0bxxxxx	Other values are right shift count when scaling is enabled.

If RIS is implemented, this field indicates the scale value for [MSMON_MBWU](#).VALUE field for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

NUM_MON, bits [15:0]

The number of memory bandwidth usage monitor instances implemented. The largest monitor instance selector, [MSMON_CFG_MON_SEL](#).MON_SEL, is NUM_MON minus 1.

If RIS is implemented, this field indicates the number of MBWU monitor instances for [MSMON_MBWU](#).VALUE field for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_MBWUMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_MBWUMON_IDR is read-only.

MPAMF_MBWUMON_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_MBWUMON_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_MBWUMON_IDR_s is permitted to have either the same or different contents to MPAMF_MBWUMON_IDR_ns, MPAMF_MBWUMON_IDR_rt, or MPAMF_MBWUMON_IDR_rl.
- MPAMF_MBWUMON_IDR_ns is permitted to have either the same or different contents to MPAMF_MBWUMON_IDR_rt or MPAMF_MBWUMON_IDR_rl.
- MPAMF_MBWUMON_IDR_rt is permitted to have either the same or different contents to MPAMF_MBWUMON_IDR_rl.

There must be separate registers in the Secure (MPAMF_MBWUMON_IDR_s), Non-secure (MPAMF_MBWUMON_IDR_ns), Root (MPAMF_MBWUMON_IDR_rt), and Realm (MPAMF_MBWUMON_IDR_rl) MPAM feature pages.

When [MPAMF_IDR.HAS_RIS](#) is 1, MPAMF_MBWUMON_IDR shows the configuration of memory bandwidth monitoring for the bandwidth resource instance selected by [MPAMCFG_PART_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF_MBWUMON_IDR is not affected by [MSMON_CFG_MON_SEL.RIS](#).

MPAMF_MBWUMON_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0090	MPAMF_MBWUMON_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0090	MPAMF_MBWUMON_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0090	MPAMF_MBWUMON_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0090	MPAMF_MBWUMON_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_MSMON_IDR, MPAM Resource Monitoring Identification Register

The MPAMF_MSMON_IDR characteristics are:

Purpose

Indicates which MPAM monitoring features are present on this MSC.

MPAMF_MSMON_IDR_s indicates Secure monitoring features. MPAMF_MSMON_IDR_ns indicates Non-secure monitoring features. MPAMF_MSMON_IDR_rt indicates Root monitoring features. MPAMF_MSMON_IDR_rl indicates Realm monitoring features.

If [MPAMF_IDR.HAS_RIS](#) is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#). Fields that do not mention RIS are constant across all resource instances.

Configuration

The power domain of MPAMF_MSMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_MSMON == 1. Otherwise, direct accesses to MPAMF_MSMON_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MSMON_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17
HAS_LOCAL_CAPT_EVNT	NO_HW_OFLW_INTR	HAS_OFLW_MS	HAS_OFLOW_SR	RES0						MSMON_MBWUM				

HAS_LOCAL_CAPT_EVNT, bit [31]

Has local capture event generator. Indicates whether this MSC has the MPAM local capture event generator and the [MSMON_CAPT_EVNT](#) register.

HAS_LOCAL_CAPT_EVNT	Meaning
0b0	Does not support MPAM local capture event generator or MSMON_CAPT_EVNT .
0b1	Supports the MPAM local capture event generator and the MSMON_CAPT_EVNT register.

NO_HW_OFLW_INTR, bit [30]

When FEAT_MPAMv1p1 is implemented:

Does not have hardwired MPAM monitor overflow interrupt.

NO_HW_OFLW_INTR	Meaning
0b0	Supports generating a hardwired interrupt to signal MPAM monitor overflow.
0b1	No support for a hardwired interrupt to signal MPAM monitor overflow.

If this field is 0, the MSC supports generating a hardwired interrupt for monitor overflow events.

If this field is 0 and the HAS_OFLW_MSI field in this register is 1, the MSC supports generating both hardwired interrupts and MSI writes to signal interrupts.

Otherwise:

Reserved, RES0.

HAS_OFLW_MSI, bit [29]

When FEAT_MPAMv1p1 is implemented:

Has support for MSI writes to signal MPAM monitor overflow interrupts. These registers are implemented: [MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#) and [MSMON_OFLOW_MSI_MPAM](#).

HAS_OFLW_MSI	Meaning
0b0	MSMON_OFLOW_MSI_ADDR_L , MSMON_OFLOW_MSI_ADDR_H , MSMON_OFLOW_MSI_ATTR , MSMON_OFLOW_MSI_DATA and MSMON_OFLOW_MSI_MPAM registers are not implemented.
0b1	MSMON_OFLOW_MSI_ADDR_L , MSMON_OFLOW_MSI_ADDR_H , MSMON_OFLOW_MSI_ATTR , MSMON_OFLOW_MSI_DATA and MSMON_OFLOW_MSI_ATTR are implemented and can be used to generate writes to signal MPAM monitor overflow interrupts.

If [MPAMF_MSMON_IDR.NO_HW_OFLW_INTR](#) is 1 and this bit is 0, this MSC does not support monitor overflow interrupts.

Otherwise:

Reserved, RES0.

HAS_OFLOW_SR, bit [28]

When FEAT_MPAMv1p1 is implemented:

Has MPAM monitor overflow status register [MSMON_OFLOW_SR](#).

HAS_OFLOW_SR	Meaning
0b0	Does not have MSMON_OFLOW_SR .
0b1	Supports MSMON_OFLOW_SR .

Otherwise:

Reserved, RES0.

Bits [27:18]

Reserved, RES0.

MSMON_MBWU, bit [17]

Memory bandwidth usage monitoring. Indicates whether MPAM monitoring for Memory Bandwidth Usage by PARTID and PMG is implemented and whether the following bandwidth usage registers are accessible:

- [MPAMF_MBWUMON_IDR](#), [MSMON_CFG_MBWU_CTL](#), [MSMON_CFG_MBWU_FLT](#), [MSMON_MBWU](#).
- The optional [MSMON_MBWU_CAPTURE](#).
- If MPAM v0.1 or MPAM v1.1 is implemented, the optional [MSMON_MBWU_L](#) and the optional [MSMON_MBWU_L_CAPTURE](#).

MSMON_MBWU	Meaning
0b0	Does not have monitoring for memory bandwidth usage and does not use the bandwidth usage registers.
0b1	Has monitoring of memory bandwidth usage and uses the bandwidth usage registers.

If RIS is implemented, this field indicates that memory bandwidth usage monitoring is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS as described in [MPAMF_MBWUMON_IDR](#).

MSMON_CSU, bit [16]

Cache storage usage monitoring. Indicates whether MPAM monitoring of cache storage usage by PARTID and PMG is implemented and the following registers are accessible:

- [MPAMF_CSUMON_IDR](#), [MSMON_CFG_CSU_CTL](#), [MSMON_CFG_CSU_FLT](#), [MSMON_CSU](#).
- The optional [MSMON_CSU_CAPTURE](#).

MSMON_CSU	Meaning
0b0	Does not have monitoring for cache storage usage or the MPAMF_CSUMON_IDR , MSMON_CFG_CSU_CTL , MSMON_CFG_CSU_FLT , MSMON_CSU or MSMON_CSU_CAPTURE registers.
0b1	Has monitoring of cache storage usage and the MPAMF_CSUMON_IDR , MSMON_CFG_CSU_CTL , MSMON_CFG_CSU_FLT , MSMON_CSU and optional MSMON_CSU_CAPTURE registers.

If RIS is implemented, this field indicates that cache storage usage monitoring is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS as described in [MPAMF_CSUMON_IDR](#).

Bits [15:0]

Reserved, RES0.

Accessing MPAMF_MSMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_MSMON_IDR is read-only.

MPAMF_MSMON_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_MSMON_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_MSMON_IDR_s is permitted to have either the same or different contents to MPAMF_MSMON_IDR_ns, MPAMF_MSMON_IDR_rt, or MPAMF_MSMON_IDR_rl.
- MPAMF_MSMON_IDR_ns is permitted to have either the same or different contents to MPAMF_MSMON_IDR_rt or MPAMF_MSMON_IDR_rl.
- MPAMF_MSMON_IDR_rt is permitted to have either the same or different contents to MPAMF_MSMON_IDR_rl.

There must be separate registers in the Secure (MPAMF_MSMON_IDR_s), Non-secure (MPAMF_MSMON_IDR_ns), Root (MPAMF_MSMON_IDR_rt), and Realm (MPAMF_MSMON_IDR_rl) MPAM feature pages.

When [MPAMF_IDR](#).HAS_RIS is 1, MPAMF_MSMON_IDR shows the configuration of memory system monitoring for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF_MSMON_IDR is not affected by [MSMON_CFG_MON_SEL](#).RIS.

MPAMF_MSMON_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0080	MPAMF_MSMON_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0080	MPAMF_MSMON_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0080	MPAMF_MSMON_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0080	MPAMF_MSMON_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_PARTID_NRW_IDR, MPAM PARTID Narrowing ID register

The MPAMF_PARTID_NRW_IDR characteristics are:

Purpose

Indicates the largest internal PARTID for this MSC.

MPAMF_PARTID_NRW_IDR_s indicates the largest Secure internal PARTID. MPAMF_PARTID_NRW_IDR_ns indicates the largest Non-secure internal PARTID.

When FEAT_RME is implemented: MPAMF_PARTID_NRW_rt indicates the largest Root internal PARTID. MPAMF_PARTID_NRW_rl indicates the largest Realm internal PARTID.

PARTID narrowing is global to the MSC and does not vary by resource instance.

Configuration

The power domain of MPAMF_PARTID_NRW_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PARTID_NRW == 1. Otherwise, direct accesses to MPAMF_PARTID_NRW_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_PARTID_NRW_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																INTPARTID_MAX															

Bits [31:16]

Reserved, RES0.

INTPARTID_MAX, bits [15:0]

The largest intPARTID supported in this MSC.

Accessing MPAMF_PARTID_NRW_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_PARTID_NRW_IDR is read-only.

MPAMF_PARTID_NRW_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_PARTID_NRW_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_PARTID_NRW_IDR_s is permitted to have either the same or different contents to MPAMF_PARTID_NRW_IDR_ns, MPAMF_PARTID_NRW_IDR_rt, or MPAMF_PARTID_NRW_IDR_rl.

- MPAMF_PARTID_NRW_IDR_ns is permitted to have either the same or different contents to MPAMF_PARTID_NRW_IDR_rt or MPAMF_PARTID_NRW_IDR_rl.
- MPAMF_PARTID_NRW_IDR_rt is permitted to have either the same or different contents to MPAMF_PARTID_NRW_IDR_rl.

There must be separate registers in the Secure (MPAMF_PARTID_NRW_IDR_s), Non-secure (MPAMF_PARTID_NRW_IDR_ns), Root (MPAMF_PARTID_NRW_IDR_rt), and Realm (MPAMF_PARTID_NRW_IDR_rl) MPAM feature pages.

MPAMF_PARTID_NRW_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0050	MPAMF_PARTID_NRW_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0050	MPAMF_PARTID_NRW_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0050	MPAMF_PARTID_NRW_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0050	MPAMF_PARTID_NRW_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_PRI_IDR, MPAM Priority Partitioning Identification Register

The MPAMF_PRI_IDR characteristics are:

Purpose

Indicates which MPAM priority partitioning features are present on this MSC.

MPAMF_PRI_IDR_s indicates priority partitioning features accessed from the Secure MPAM feature page.

MPAMF_PRI_IDR_ns indicates priority partitioning features accessed from the Non-secure MPAM feature page.

MPAMF_PRI_IDR_rt indicates priority partitioning features accessed from the Root MPAM feature page.

MPAMF_PRI_IDR_rl indicates priority partitioning features accessed from the Realm MPAM feature page.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. The description of every field that is affected by [MPAMCFG_PART_SEL](#).RIS has that information within the field description.

Configuration

The power domain of MPAMF_PRI_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PRI_PART == 1. Otherwise, direct accesses to MPAMF_PRI_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_PRI_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	DSPRI_WD	RES0	DSPRI_0_IS_LOW	HAS_DSPRI	RES0	INTPRI_WD	RES0	INTPRI_0_IS_LOW	HAS_INTPRI	RES0	INTPRI_0_IS_LOW	HAS_INTPRI	RES0	INTPRI_0_IS_LOW	HAS_INTPRI	RES0	INTPRI_0_IS_LOW	HAS_INTPRI	RES0	INTPRI_0_IS_LOW	HAS_INTPRI	RES0	INTPRI_0_IS_LOW	HAS_INTPRI	RES0	INTPRI_0_IS_LOW	HAS_INTPRI	RES0	INTPRI_0_IS_LOW	HAS_INTPRI	RES0

Bits [31:26]

Reserved, RES0.

DSPRI_WD, bits [25:20]

Number of implemented bits in the downstream priority field (DSPRI) of [MPAMCFG_PRI](#).

If HAS_DSPRI == 1, this field must contain a value from 1 to 16, inclusive.

If HAS_DSPRI == 0, this field must be 0.

If RIS is implemented, this field indicates the number of downstream priority bits for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [19:18]

Reserved, RES0.

DSPRI_0_IS_LOW, bit [17]

Indicates whether 0 in [MPAMCFG_PRI](#).DSPRI is the lowest or the highest downstream priority.

DSPRI_0_IS_LOW	Meaning
0b0	In the MPAMCFG_PRI .DSPRI field, a value of 0 means the highest priority.
0b1	In the MPAMCFG_PRI .DSPRI field, a value of 0 means the lowest priority.

If RIS is implemented, this field indicates that 0 is the lowest downstream priority for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_DSPRI, bit [16]

Indicates that the [MPAMCFG_PRI](#) register implements the DSPRI field.

HAS_DSPRI	Meaning
0b0	This MSC supports priority partitioning, but does not implement a downstream priority (DSPRI) field in the MPAMCFG_PRI register.
0b1	This MSC supports downstream priority partitioning and implements the downstream priority (DSPRI) field in the MPAMCFG_PRI register.

If RIS is implemented, this field indicates that downstream priority is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [15:10]

Reserved, RES0.

INTPRI_WD, bits [9:4]

Number of implemented bits in the internal priority field (INTPRI) in the [MPAMCFG_PRI](#) register.

If HAS_INTPRI == 1, this field must contain a value from 1 to 16, inclusive.

If HAS_INTPRI == 0, this field must be 0.

If RIS is implemented, this field indicates the number of internal priority bits for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [3:2]

Reserved, RES0.

INTPRI_0_IS_LOW, bit [1]

Indicates whether 0 in [MPAMCFG_PRI](#).INTPRI is the lowest or the highest internal priority.

INTPRI_0_IS_LOW	Meaning
0b0	In the MPAMCFG_PRI .INTPRI field, a value of 0 means the highest priority.
0b1	In the MPAMCFG_PRI .INTPRI field, a value of 0 means the lowest priority.

If RIS is implemented, this field indicates that 0 is the lowest internal priority for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_INTPRI, bit [0]

Indicates that this MSC implements the INTPRI field in the [MPAMCFG_PRI](#) register.

HAS_INTPRI	Meaning
0b0	This MSC supports priority partitioning, but does not implement the internal priority (INTPRI) field in the MPAMCFG_PRI register.
0b1	This MSC supports internal priority partitioning and implements the internal priority (INTPRI) field in the MPAMCFG_PRI register.

If RIS is implemented, this field indicates that internal priority is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_PRI_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_PRI_IDR is read-only.

MPAMF_PRI_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_PRI_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_PRI_IDR_s is permitted to have either the same or different contents to MPAMF_PRI_IDR_ns, MPAMF_PRI_IDR_rt, or MPAMF_PRI_IDR_rl.
- MPAMF_PRI_IDR_ns is permitted to have either the same or different contents to MPAMF_PRI_IDR_rt or MPAMF_PRI_IDR_rl.
- MPAMF_PRI_IDR_rt is permitted to have either the same or different contents to MPAMF_PRI_IDR_rl.

There must be separate registers in the Secure (MPAMF_PRI_IDR_s), Non-secure (MPAMF_PRI_IDR_ns), Root (MPAMF_PRI_IDR_rt), and Realm (MPAMF_PRI_IDR_rl) MPAM feature pages.

When [MPAMF_IDR](#).HAS_RIS is 1, MPAMF_PRI_IDR shows the configuration of priority partitioning for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_PRI_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0048	MPAMF_PRI_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0048	MPAMF_PRI_IDR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0048	MPAMF_PRI_IDR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0048	MPAMF_PRI_IDR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_SIDR, MPAM Features Secure Identification Register

The MPAMF_SIDR characteristics are:

Purpose

The MPAMF_SIDR is a 32-bit read-only register that indicates the maximum Secure PARTID and Secure PMG on this MSC.

Configuration

The power domain of MPAMF_SIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_SIDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_SIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								S_PMG_MAX								S_PARTID_MAX															

Bits [31:24]

Reserved, RES0.

S_PMG_MAX, bits [23:16]

Maximum value of Secure PMG supported by this component.

S_PARTID_MAX, bits [15:0]

Maximum value of Secure PARTID supported by this component.

Accessing MPAMF_SIDR

This register is only within the Secure MPAM feature page memory frame.

MPAMF_SIDR is read-only.

MPAMF_SIDR must only be readable from the Secure MPAM feature page. If the system or the MSC does not support the Secure address map, this register must not be accessible.

MPAMF_SIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0008	MPAMF_SIDR_s

Accesses on this interface are **RO**.

MSMON_CAPT_EVNT, MPAM Capture Event Generation Register

The MSMON_CAPT_EVNT characteristics are:

Purpose

Generates a local capture event when written with bit[0] as 1.

MSMON_CAPT_EVNT_s generates local capture events for Secure monitor instances only or for Secure and Non-secure monitor instances. MSMON_CAPT_EVNT_ns generates local capture events for Non-secure monitor instances only. MSMON_CAPT_EVNT_rt generates local capture events for Root monitor instances only or for Root, Secure, Realm, and Non-secure monitor instances. MSMON_CAPT_EVNT_rl generates local capture events for Realm monitor instances or for for Realm monitor instances or Realm and Non-secure monitor instances.

Configuration

The power domain of MSMON_CAPT_EVNT is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.HAS_LOCAL_CAPT_EVNT == 1. Otherwise, direct accesses to MSMON_CAPT_EVNT are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CAPT_EVNT is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																ALL		NOW													

Bits [31:2]

Reserved, RES0.

ALL, bit [1]

In the Secure instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Secure and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.
- If ALL is written as 0 and NOW is written as 1, signal a capture event to Secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.

In the Non-secure instance of this register, this bit is RAZ/WI.

In the Root instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Root, Realm, Secure, and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.
- If ALL is written as 0 and NOW is written as 1, signal a capture event to Root monitor instances within this MSC that are configured with CAPT_EVNT = 7.

In the Realm instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Realm and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.

- If ALL is written as 0 and NOW is written as 1, signal a capture event to Realm monitor instances within this MSC that are configured with CAPT_EVNT = 7.

This bit always reads as zero.

ALL	Meaning
0b0	Send capture event only to monitor instances in the same MPAM feature page as this register.
0b1	Send capture event to monitor instances in certain MPAM feature pages as described in the ALL field of this register.

NOW, bit [0]

When written as 1, this bit causes an event to those monitor instances described in the ALL field that have CAPT_EVNT set to the value of 7.

When this bit is written as 0, no event is signaled.

This bit always reads as zero.

Accessing MSMON_CAPT_EVNT

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CAPT_EVNT_s must be accessible from the Secure MPAM feature page. MSMON_CAPT_EVNT_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CAPT_EVNT_s and MSMON_CAPT_EVNT_ns must be separate registers. The Secure instance (MSMON_CAPT_EVNT_s) can generate local capture events for Secure monitor instances only or for Secure and Non-secure monitor instances, and the Non-secure instance (MSMON_CAPT_EVNT_ns) can generate local capture events for Non-secure monitor instances only.

MSMON_CAPT_EVNT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0808	MSMON_CAPT_EVNT_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0808	MSMON_CAPT_EVNT_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0808	MSMON_CAPT_EVNT_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0808	MSMON_CAPT_EVNT_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CFG_CSU_CTL, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Control Register

The MSMON_CFG_CSU_CTL characteristics are:

Purpose

Controls the CSU monitor selected by [MSMON_CFG_MON_SEL](#).

MSMON_CFG_CSU_CTL_s controls the Secure cache storage usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_CTL_ns controls Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_CTL_rt controls the monitor configuration for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_CTL_rl controls the monitor configuration for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance configuration accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL](#).RIS and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

Configuration

The power domain of MSMON_CFG_CSU_CTL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CFG_CSU_CTL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_CSU_CTL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
EN	CAPT_EVNT	CAPT_EVNT	CAPT_EVNT	CAPT_RESET	OFLOW_STATUS	OFLOW_INTR	OFLOW_FRZ	SUBTYPE	RES0	MATCH_PMG	MATCH_PARTID						

EN, bit [31]

Enabled.

EN	Meaning
0b0	The monitor instance is disabled and must not collect any information.
0b1	The monitor instance is enabled to collect information according to the configuration of the instance.

CAPT_EVNT, bits [30:28]

Capture event selector.

Select the event that triggers capture from the following:

CAPT_EVNT	Meaning
0b000	No capture event is triggered.
0b001	External capture event 1 (optional but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

If capture is not implemented for the CSU monitor type as indicated by [MPAMF_CSUMON_IDR.HAS_CAPTURE](#) = 0, this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset after capture.

Controls whether the value of [MSMON_CSU](#) is reset to zero immediately after being copied to [MSMON_CSU_CAPTURE](#).

CAPT_RESET	Meaning
0b0	Monitor is not reset on capture.
0b1	Monitor is reset on capture.

If capture is not implemented for the CSU monitor type as indicated by [MPAMF_CSUMON_IDR.HAS_CAPTURE](#) = 0, this field is RAZ/WI.

Because the CSU monitor type produces a measurement rather than a count, it might not make sense to ever reset the value after a capture. If there is no reason to ever reset a CSU monitor, this field is RAZ/WI.

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of [MSMON_CSU](#) has overflowed.

OFLOW_STATUS	Meaning
0b0	No overflow has occurred.
0b1	At least one overflow has occurred since this bit was last written to zero.

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

OFLOW_INTR, bit [25]

Overflow Interrupt.

Controls whether an overflow interrupt is generated when the value of [MSMON_CSU](#) has overflowed.

OFLOW_INTR	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_CSU .
0b1	On overflow, an implementation-specific interrupt is signaled.

If OFLOW_INTR is not supported by the implementation, this field is RAZ/WI.

OFLOW_FRZ, bit [24]

Freeze Monitor on Overflow.

Controls whether the value of [MSMON_CSU](#) freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	Monitor count wraps on overflow.
0b1	Monitor count freezes on overflow. The frozen value might be 0 or another value if the monitor overflowed with an increment larger than 1.

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

SUBTYPE, bits [23:20]

Subtype. Type of cache storage usage counted by this monitor.

This field is not currently used for CSU monitors, but reserved for future use.

This field is RAZ/WI.

Bits [19:18]

Reserved, RES0.

MATCH_PMG, bit [17]

Match PMG.

Controls whether the monitor measures only storage used with PMG matching [MSMON_CFG_CSU_FLT](#).PMG.

MATCH_PMG	Meaning
0b0	The monitor measures storage used with any PMG value.
0b1	The monitor only measures storage used with the PMG value matching MSMON_CFG_CSU_FLT .PMG.

If MATCH_PMG == 1 and MATCH_PARTID == 0, it is CONSTRAINED UNPREDICTABLE whether the monitor instance:

- Measures the storage used with matching PMG and with any PARTID.
- Measures no storage usage, that is, [MSMON_CSU](#).VALUE is zero.
- Measures the storage used with matching PMG and PARTID, that is, treats MATCH_PARTID as == 1.

MATCH_PARTID, bit [16]

Match PARTID.

Controls whether the monitor measures only storage used with PARTID matching [MSMON_CFG_CSU_FLT](#).PARTID.

MATCH_PARTID	Meaning
0b0	The monitor measures storage used with any PARTID value.
0b1	The monitor only measures storage used with the PARTID value matching MSMON_CFG_CSU_FLT .PARTID.

Bits [15:8]

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code. The CSU monitor is TYPE = 0x43.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x43.

Access to this field is **RO**.

Accessing MSMON_CFG_CSU_CTL

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_CFG_CSU_CTL_s must be accessible from the Secure MPAM feature page.
- MSMON_CFG_CSU_CTL_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_CSU_CTL_rt must be accessible from the Root MPAM feature page.
- MSMON_CFG_CSU_CTL_rl must be accessible from the Realm MPAM feature page.

MSMON_CFG_CSU_CTL_s, MSMON_CFG_CSU_CTL_ns, MSMON_CFG_CSU_CTL_rt, and MSMON_CFG_CSU_CTL_rl must be separate registers.

- The Secure instance (MSMON_CFG_CSU_CTL_s) accesses the cache storage usage monitor controls used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_CSU_CTL_ns) accesses the cache storage usage monitor controls used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_CSU_CTL_rt) accesses the cache storage usage monitor controls used for Root PARTIDs.
- The Realm instance (MSMON_CFG_CSU_CTL_rl) accesses the cache storage usage monitor controls used for Realm PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache resource instance selected by [MSMON_CFG_MON_SEL](#). RIS and the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CFG_CSU_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0818	MSMON_CFG_CSU_CTL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0818	MSMON_CFG_CSU_CTL_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0818	MSMON_CFG_CSU_CTL_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0818	MSMON_CFG_CSU_CTL_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CFG_CSU_FLT, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Filter Register

The MSMON_CFG_CSU_FLT characteristics are:

Purpose

Configures PARTID and PMG to measure or count in the CSU monitor selected by [MSMON_CFG_MON_SEL](#).

MSMON_CFG_CSU_FLT_s sets filter conditions for the Secure cache storage usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_CTL_ns sets filter conditions for the Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_FLT_rt sets the filter conditions for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_FLT_rl sets the filter conditions for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_CFG_CSU_FLT is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CFG_CSU_FLT are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_CSU_FLT is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMG								PARTID															

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter cache storage usage monitoring.

If [MSMON_CFG_CSU_CTL.MATCH_PMG](#) == 0, this field is not used to match cache storage to a PMG and the contents of this field is ignored.

If [MSMON_CFG_CSU_CTL.MATCH_PMG](#) == 1 and [MSMON_CFG_CSU_CTL.MATCH_PARTID](#) == 1, the monitor instance selected by [MSMON_CFG_MON_SEL](#) measures or counts cache storage labeled with PMG equal to this field and PARTID equal to the PARTID field.

If [MSMON_CFG_CSU_CTL.MATCH_PMG](#) == 1 and [MSMON_CFG_CSU_CTL.MATCH_PARTID](#) == 0, the behavior of the monitor instance selected by [MSMON_CFG_MON_SEL](#) is CONSTRAINED UNPREDICTABLE. See [MSMON_CFG_CSU_CTL.MATCH_PMG](#) for more information.

PARTID, bits [15:0]

Partition ID to filter cache storage usage monitoring.

If [MSMON_CFG_CSU_CTL.MATCH_PARTID](#) == 0 and [MSMON_CFG_CSU_CTL.MATCH_PMG](#) == 0, the monitor measures all allocated cache storage.

If [MSMON_CFG_CSU_CTL.MATCH_PARTID](#) == 0 and [MSMON_CFG_CSU_CTL.MATCH_PMG](#) == 1, the behavior of the monitor is CONSTRAINED UNPREDICTABLE. See the description of [MSMON_CFG_CSU_CTL.MATCH_PMG](#).

If [MSMON_CFG_CSU_CTL.MATCH_PARTID](#) == 1 and [MSMON_CFG_CSU_CTL.MATCH_PMG](#) == 0, the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts cache storage labeled with PARTID equal to this field.

If [MSMON_CFG_CSU_CTL.MATCH_PARTID](#) == 1 and [MSMON_CFG_CSU_CTL.MATCH_PMG](#) == 1, the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts cache storage labeled with PARTID equal to this field and PMG equal to the PMG field.

Accessing MSMON_CFG_CSU_FLT

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- [MSMON_CFG_CSU_FLT_s](#) must be accessible from the Secure MPAM feature page.
- [MSMON_CFG_CSU_FLT_ns](#) must be accessible from the Non-secure MPAM feature page.
- [MSMON_CFG_CSU_FLT_rt](#) must be accessible from the Root MPAM feature page.
- [MSMON_CFG_CSU_FLT_rl](#) must be accessible from the Realm MPAM feature page.

[MSMON_CFG_CSU_FLT_s](#), [MSMON_CFG_CSU_FLT_ns](#), [MSMON_CFG_CSU_FLT_rt](#), and [MSMON_CFG_CSU_FLT_rl](#) must be separate registers.

- The Secure instance ([MSMON_CFG_CSU_FLT_s](#)) accesses the PARTID and PMG matching for a cache storage usage monitor used for Secure PARTIDs.
- The Non-secure instance ([MSMON_CFG_CSU_FLT_ns](#)) accesses the PARTID and PMG matching for a cache storage usage monitor used for Non-secure PARTIDs.
- The Root instance ([MSMON_CFG_CSU_FLT_rt](#)) accesses the PARTID and PMG matching for a cache storage usage monitor used for Root PARTIDs.
- The Realm instance ([MSMON_CFG_CSU_FLT_rl](#)) accesses the PARTID and PMG matching for a cache storage usage monitor used for Realm PARTIDs.

When RIS is implemented, loads and stores to [MSMON_CFG_CSU_FLT](#) access the monitor configuration settings for the resource instance selected by [MSMON_CFG_MON_SEL.RIS](#) and the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

When RIS is not implemented, loads and stores to [MSMON_CFG_CSU_FLT](#) access the monitor configuration settings for the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

MSMON_CFG_CSU_FLT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0810	MSMON_CFG_CSU_FLT_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0810	MSMON_CFG_CSU_FLT_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0810	MSMON_CFG_CSU_FLT_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_r1	0x0810	MSMON_CFG_CSU_FLT_r1

When FEAT_RME is implemented access on this interface are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

MSMON_CFG_MBWU_CTL, MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Control Register

The MSMON_CFG_MBWU_CTL characteristics are:

Purpose

Controls the MBWU monitor selected by [MSMON_CFG_MON_SEL](#).

MSMON_CFG_MBWU_CTL_s controls the Secure memory bandwidth usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_MBWU_CTL_ns controls Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_MBWU_CTL_rt controls the monitor configuration for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_MBWU_CTL_rl controls the monitor configuration for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance configuration accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL](#).RIS and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

Configuration

The power domain of MSMON_CFG_MBWU_CTL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_CFG_MBWU_CTL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MBWU_CTL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EN	CAPT_EVNT	CAPT_RESET	OFLOW_STATUS	OFLOW_INTR	OFLOW_FRZ	SUBTYPE	SCLEN	RES0	MATCH_PMG	MATCH_PART					

EN, bit [31]

Enabled.

EN	Meaning
0b0	The monitor instance is disabled and must not collect any information.
0b1	The monitor instance is enabled to collect information according to the configuration of the instance.

CAPT_EVNT, bits [30:28]

Capture event selector.

When the selected capture event occurs, [MSMON_MBWU](#) of the monitor instance is copied to [MSMON_MBWU_CAPTURE](#) of the same instance. If the long counter is also implemented, [MSMON_MBWU_L](#) is also copied to [MSMON_MBWU_L_CAPTURE](#).

Select the event that triggers capture from the following:

CAPT_EVNT	Meaning
0b000	No capture event is triggered.
0b001	External capture event 1 (optional but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

If capture is not implemented for the MBWU monitor type as indicated by [MPAMF_MBWUMON_IDR](#).HAS_CAPTURE = 0, this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset [MSMON_MBWU](#).VALUE after capture.

Controls whether the VALUE field of the monitor instance is reset to zero immediately after being copied to the corresponding capture register.

CAPT_RESET	Meaning
0b0	MSMON_MBWU .VALUE field of the monitor instance is not reset on capture.
0b1	MSMON_MBWU .VALUE field of the monitor instance is reset on capture.

If capture is not implemented for the MBWU monitor type as indicated by [MPAMF_MBWUMON_IDR](#).HAS_CAPTURE = 0, this field is RAZ/WI.

This control bit affects both [MSMON_MBWU](#) and [MSMON_MBWU_L](#) in implementations that include [MSMON_MBWU_L](#).

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of [MSMON_MBWU](#) has overflowed.

OFLOW_STATUS	Meaning
0b0	MSMON_MBWU .VALUE has not overflowed.
0b1	MSMON_MBWU .VALUE has overflowed at least once since this bit was last written to zero.

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

Overflow status for [MSMON_MBWU_L](#).VALUE is reported in [MSMON_CFG_MBWU_CTL](#).OFLOW_STATUS_L.

OFLOW_INTR, bit [25]

Enable interrupt on overflow of [MSMON_MBWU](#).VALUE.

OFLOW_INTR	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_MBWU .VALUE.
0b1	An implementation-specific interrupt is signaled on an overflow of MSMON_MBWU .VALUE.

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

If overflow interrupt is not supported by the MSC implementation, this field is RAZ/WI.

Interrupt enable for overflow of [MSMON_MBWU_L.VALUE](#) is controlled by [MSMON_CFG_MBWU_CTL.OFLOW_INTR_L](#).

OFLOW_FRZ, bit [24]

Freeze monitor instance on overflow.

Controls whether [MSMON_MBWU.VALUE](#) field of the monitor instance freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	MSMON_MBWU.VALUE field of the monitor instance wraps on overflow.
0b1	MSMON_MBWU.VALUE field of the monitor instance freezes on overflow. If the increment that caused the overflow was 1, the frozen value is the post-increment value of 0. If the increment that caused the overflow was larger than 1, the frozen value of the monitor might be 0 or a larger value less than the final increment.

If overflow is not possible for the instance of the MBWU monitor in the implementation, this field is RAZ/WI.

This control bit affects both [MSMON_MBWU](#) and [MSMON_MBWU_L](#) in implementations that include [MSMON_MBWU_L](#).

SUBTYPE, bits [23:20]

Subtype. Type of bandwidth counted by this monitor.

This field is not currently used for MBWU monitors, but reserved for future use.

This field is RAZ/WI.

SCLEN, bit [19]

[MSMON_MBWU.VALUE](#) Scaling Enable.

Enables scaling of [MSMON_MBWU.VALUE](#) by [MPAMF_MBWUMON_IDR.SCALE](#).

SCLEN	Meaning
0b0	MSMON_MBWU.VALUE has bytes counted by the monitor instance.
0b1	MSMON_MBWU.VALUE has bytes counted by the monitor instance, shifted right by MPAMF_MBWUMON_IDR.SCALE .

Bit [18]

Reserved, RES0.

MATCH_PMG, bit [17]

Match PMG.

Controls whether the monitor instance only counts data transferred with PMG matching [MSMON_CFG_MBWU_FLT.PMG](#).

MATCH_PMG	Meaning
0b0	The monitor instance counts data transferred with any PMG value.
0b1	The monitor instance only counts data transferred with the PMG value matching MSMON_CFG_MBWU_FLT.PMG .

MATCH_PARTID, bit [16]

Match PARTID.

Controls whether the monitor instance counts only data transferred with PARTID matching [MSMON_CFG_MBWU_FLT](#).PARTID.

MATCH_PARTID	Meaning
0b0	The monitor instance counts data transferred with any PARTID value.
0b1	The monitor instance only counts data transferred with the PARTID value matching MSMON_CFG_MBWU_FLT .PARTID.

OFLOW_STATUS_L, bit [15]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Overflow Status of [MSMON_MBWU_L](#).VALUE of the monitor instance.

Indicates whether [MSMON_MBWU_L](#).VALUE has overflowed.

OFLOW_STATUS_L	Meaning
0b0	MSMON_MBWU_L .VALUE has not overflowed.
0b1	MSMON_MBWU_L .VALUE has overflowed at least once since this bit was last written to zero.

If [MPAMF_MBWUMON_IDR](#).HAS_LONG == 0, this bit is RES0.

Overflow status of [MSMON_MBWU](#).VALUE is reported in [MSMON_CFG_MBWU_CTL](#).OFLOW_STATUS.

Otherwise:

Reserved, RES0.

OFLOW_INTR_L, bit [14]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Overflow Interrupt for [MSMON_MBWU_L](#).

Controls whether an MPAM overflow interrupt is generated when [MSMON_MBWU_L](#).VALUE overflows.

OFLOW_INTR_L	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_MBWU_L .VALUE.
0b1	An implementation-specific interrupt is signaled on overflow of MSMON_MBWU_L .VALUE.

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

If the overflow interrupt is not supported by the MSC implementation, this field is RAZ/WI.

If [MPAMF_MBWUMON_IDR](#).HAS_LONG == 0, this bit is RES0.

Otherwise:

Reserved, RES0.

Bits [13:8]

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code. The MBWU monitor is TYPE = 0x42.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x42.

Access to this field is **RO**.

Accessing MSMON_CFG_MBWU_CTL

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_CFG_MBWU_CTL_s must be accessible from the Secure MPAM feature page.
- MSMON_CFG_MBWU_CTL_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_MBWU_CTL_rt must be accessible from the Root MPAM feature page.
- MSMON_CFG_MBWU_CTL_rl must be accessible from the Realm MPAM feature page.

MSMON_CFG_MBWU_CTL_s, MSMON_CFG_MBWU_CTL_ns, MSMON_CFG_MBWU_CTL_rt, and MSMON_CFG_MBWU_CTL_rl must be separate registers.

- The Secure instance (MSMON_CFG_MBWU_CTL_s) accesses the memory bandwidth usage monitor controls used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_MBWU_CTL_ns) accesses the memory bandwidth usage monitor controls used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_MBWU_CTL_rt) accesses the memory bandwidth usage monitor controls used for Root PARTIDs.
- The Realm instance (MSMON_CFG_MBWU_CTL_rl) accesses the memory bandwidth usage monitor controls used for Realm PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_MBWU_CTL access the monitor configuration settings for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_MBWU_CTL access the monitor configuration settings for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CFG_MBWU_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0828	MSMON_CFG_MBWU_CTL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0828	MSMON_CFG_MBWU_CTL_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0828	MSMON_CFG_MBWU_CTL_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0828	MSMON_CFG_MBWU_CTL_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CFG_MBWU_FLT, MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Filter Register

The MSMON_CFG_MBWU_FLT characteristics are:

Purpose

Controls PARTID and PMG to measure or count in the MBWU monitor selected by [MSMON_CFG_MON_SEL](#).

MSMON_CFG_MBWU_FLT_s sets filter conditions for the Secure memory bandwidth usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_MBWU_CTL_ns sets filter conditions for the Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_FLT_rt sets the filter conditions for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_FLT_rl sets the filter conditions for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_CFG_MBWU_FLT is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_CFG_MBWU_FLT are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MBWU_FLT is a 32-bit register.

Field descriptions

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RWBW				RES0								PMG				PARTID															

RW filtering.

RWBW, bits [31:30]
When MPAMF_MBWUMON_IDR.HAS_RWBW == 1:

Read/write bandwidth filter. Configures the selected monitor instance to count all bandwidth, only read bandwidth or only write bandwidth.

RWBW	Meaning
0b00	Monitor instance counts read bandwidth and write bandwidth.
0b01	Monitor instance counts write bandwidth only.
0b10	Monitor instance counts read bandwidth only.
0b11	Reserved.

Otherwise:

Reserved, RES0.

Bits [29:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If [MSMON_CFG_MBWU_CTL.MATCH_PMG](#) == 0, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If [MSMON_CFG_MBWU_CTL.MATCH_PMG](#) == 1, the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts memory bandwidth labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If [MSMON_CFG_MBWU_CTL.MATCH_PARTID](#) == 0, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If [MSMON_CFG_MBWU_CTL.MATCH_PARTID](#) == 1, the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts memory bandwidth labeled with PARTID equal to this field.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMG								PARTID															

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If [MSMON_CFG_MBWU_CTL.MATCH_PMG](#) == 0, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If [MSMON_CFG_MBWU_CTL.MATCH_PMG](#) == 1, the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts memory bandwidth labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If [MSMON_CFG_MBWU_CTL.MATCH_PARTID](#) == 0, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If [MSMON_CFG_MBWU_CTL.MATCH_PARTID](#) == 1, the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts memory bandwidth labeled with PARTID equal to this field.

Accessing MSMON_CFG_MBWU_FLT

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_CFG_MBWU_FLT_s must be accessible from the Secure MPAM feature page.
- MSMON_CFG_MBWU_FLT_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_MBWU_FLT_rt must be accessible from the Root MPAM feature page.
- MSMON_CFG_MBWU_FLT_rl must be accessible from the Realm MPAM feature page.

MSMON_CFG_MBWU_FLT_s, MSMON_CFG_MBWU_FLT_ns, MSMON_CFG_MBWU_FLT_rt, and MSMON_CFG_MBWU_FLT_rl must be separate registers.

- The Secure instance (MSMON_CFG_MBWU_FLT_s) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_MBWU_FLT_ns) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_MBWU_FLT_rt) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_CFG_MBWU_FLT_rl) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_MBWU_FLT access the monitor configuration settings for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_MBWU_FLT access the monitor configuration settings for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CFG_MBWU_FLT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0820	MSMON_CFG_MBWU_FLT_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0820	MSMON_CFG_MBWU_FLT_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0820	MSMON_CFG_MBWU_FLT_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0820	MSMON_CFG_MBWU_FLT_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CFG_MON_SEL, MPAM Monitor Instance Selection Register

The MSMON_CFG_MON_SEL characteristics are:

Purpose

Selects a monitor instance to access through the MSMON configuration and counter registers.

MSMON_CFG_MON_SEL_s selects a Secure monitor instance to access via the Secure MPAM feature page.
 MSMON_CFG_MON_SEL_ns selects a Non-secure monitor instance to access via the Non-secure MPAM feature page.
 MSMON_CFG_MON_SEL_rt selects a Root monitor instance to access via the Root MPAM feature page.
 MSMON_CFG_MON_SEL_rl selects a Realm monitor instance to access via the Realm MPAM feature page.

Note

Different performance monitoring features within an MSC could have different numbers of monitor instances. See the NUM_MON field in the corresponding ID register. This means that a monitor out-of-bounds error might be signaled when an MSMON_CFG register is accessed because the value in MSMON_CFG_MON_SEL.MON_SEL is too large for the particular monitoring feature.

To configure a monitor, set MON_SEL in this register to the index of the monitor instance to configure, then write to the MSMON_CFG_x register to set the configuration of the monitor. At a later time, read the monitor register (for example, MSMON_MBWU) to get the value of the monitor.

Configuration

The power domain of MSMON_CFG_MON_SEL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and (MPAMF_IDR.HAS_MSMON == 1, or (MPAMF_IDR.HAS_IMPL_IDR == 1 and MPAMF_IDR.EXT == 0) or (MPAMF_IDR.HAS_IMPL_IDR == 1, MPAMF_IDR.EXT == 1 and MPAMF_IDR.NO_IMPL_MSMON == 0)). Otherwise, direct accesses to MSMON_CFG_MON_SEL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MON_SEL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				RIS				RES0								MON_SEL															

Bits [31:28]

Reserved, RES0.

RIS, bits [27:24]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MSMON_CFG registers.

Otherwise:

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

MON_SEL, bits [15:0]

Selects the monitor instance to configure or read.

Reads and writes to other MSMON registers are indexed by MON_SEL and by the NS bit used to access MSMON_CFG_MON_SEL to access the configuration for a single monitor.

Accessing MSMON_CFG_MON_SEL

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_CFG_MON_SEL_s must be accessible from the Secure MPAM feature page.
- MSMON_CFG_MON_SEL_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_MON_SEL_rt must be accessible from the Root MPAM feature page.
- MSMON_CFG_MON_SEL_rl must be accessible from the Realm MPAM feature page.

MSMON_CFG_MON_SEL_s, MSMON_CFG_MON_SEL_ns, MSMON_CFG_MON_SEL_rt, and MSMON_CFG_MON_SEL_rl must be separate registers.

- The Secure instance (MSMON_CFG_MON_SEL_s) accesses the monitor instance selector used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_MON_SEL_ns) accesses the monitor instance selector used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_MON_SEL_rt) accesses the monitor instance selector used for Root PARTIDs.
- The Realm instance (MSMON_CFG_MON_SEL_rl) accesses the monitor instance selector used for Realm PARTIDs.

MSMON_CFG_MON_SEL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0800	MSMON_CFG_MON_SEL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0800	MSMON_CFG_MON_SEL_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0800	MSMON_CFG_MON_SEL_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0800	MSMON_CFG_MON_SEL_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CSU, MPAM Cache Storage Usage Monitor Register

The MSMON_CSU characteristics are:

Purpose

Accesses the CSU monitor instance selected by [MSMON_CFG_MON_SEL](#).

MSMON_CSU_s is a Secure cache storage usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CSU_ns is a Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CSU_rt is a Root cache storage usage monitor instance selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CSU_rl is a Realm cache storage usage monitor instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_CSU is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, [MPAMF_IDR.HAS_MSMON](#) == 1 and [MPAMF_MSMON_IDR.MSMON_CSU](#) == 1. Otherwise, direct accesses to MSMON_CSU are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NRDY																VALUE															

NRDY, bit [31]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_CSU.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_CSU.VALUE field might be inaccurate or otherwise not represent the actual cache storage usage.

VALUE, bits [30:0]

Cache storage usage measurement value if MSMON_CSU.NRDY is 0. Invalid if MSMON_CSU.NRDY is 1.

VALUE is the cache storage usage measured in bytes meeting the criteria set in [MSMON_CFG_CSU_FLT](#) and [MSMON_CFG_CSU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

Accessing MSMON_CSU

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_CSU_s must be accessible from the Secure MPAM feature page.
- MSMON_CSU_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CSU_rt must be accessible from the Root MPAM feature page.
- MSMON_CSU_rl must be accessible from the Realm MPAM feature page.

MSMON_CSU_s, MSMON_CSU_ns, MSMON_CSU_rt, and MSMON_CSU_rl must be separate registers.

- The Secure instance (MSMON_CSU_s) accesses the cache storage usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSU_ns) accesses the cache storage usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CSU_rt) accesses the cache storage usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_CSU_rl) accesses the cache storage usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to MSMON_CSU access the cache storage usage monitor monitor instance for the cache resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to MSMON_CSU access the cache storage usage monitor monitor instance for the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CSU can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0840	MSMON_CSU_s

This interface is accessible as follows:

- When MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are **RW**.
- When MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0840	MSMON_CSU_ns

This interface is accessible as follows:

- When MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are **RW**.
- When MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0840	MSMON_CSU_rt

This interface is accessible as follows:

- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are **RW**.
- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0840	MSMON_CSU_rl

This interface is accessible as follows:

- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are **RW**.
- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are **RO**.

MSMON_CSU_CAPTURE, MPAM Cache Storage Usage Monitor Capture Register

The MSMON_CSU_CAPTURE characteristics are:

Purpose

MSMON_CSU_CAPTURE is a 32-bit read-write register that accesses the captured [MSMON_CSU](#) monitor instance selected by [MSMON_CFG_MON_SEL](#).

MSMON_CSU_CAPTURE_s is the Secure cache storage usage monitor capture instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CSU_CAPTURE_ns is the Non-secure cache storage usage monitor capture instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CSU_CAPTURE_rt is a Root cache storage usage monitor capture instance selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CSU_CAPTURE_rl is a Realm cache storage usage monitor capture instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance capture register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_CSU_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_CSU == 1 and MPAMF_CSUMON_IDR.HAS_CAPTURE == 1. Otherwise, direct accesses to MSMON_CSU_CAPTURE are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU_CAPTURE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NRDY																VALUE															

NRDY, bit [31]

Not Ready. Indicates whether the captured monitor value has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_CSU_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_CSU_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual cache storage usage.

VALUE, bits [30:0]

Captured cache storage usage measurement if MSMON_CSU_CAPTURE.NRDY is 0. Invalid if MSMON_CSU_CAPTURE.NRDY is 1.

VALUE is the captured cache storage usage measurement in bytes meeting the criteria set in [MSMON_CFG_CSU_FLT](#) and [MSMON_CFG_CSU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

Accessing MSMON_CSU_CAPTURE

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- `MSMON_CSU_CAPTURE_s` must be accessible from the Secure MPAM feature page.
- `MSMON_CSU_CAPTURE_ns` must be accessible from the Non-secure MPAM feature page.
- `MSMON_CSU_CAPTURE_rt` must be accessible from the Root MPAM feature page.
- `MSMON_CSU_CAPTURE_rl` must be accessible from the Realm MPAM feature page.

`MSMON_CSU_CAPTURE_s`, `MSMON_CSU_CAPTURE_ns`, `MSMON_CSU_CAPTURE_rt`, and `MSMON_CSU_CAPTURE_rl` must be separate registers.

- The Secure instance (`MSMON_CSU_CAPTURE_s`) accesses the captured cache storage usage monitor used for Secure PARTIDs.
- The Non-secure instance (`MSMON_CSU_CAPTURE_ns`) accesses the captured cache storage usage monitor used for Non-secure PARTIDs.
- The Root instance (`MSMON_CSU_CAPTURE_rt`) accesses the captured cache storage usage monitor used for Root PARTIDs.
- The Realm instance (`MSMON_CSU_CAPTURE_rl`) accesses the captured cache storage usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to `MSMON_CSU_CAPTURE` access the monitor instance for the cache resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to `MSMON_CSU_CAPTURE` access the monitor instance for the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CSU_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0848	MSMON_CSU_CAPTURE_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0848	MSMON_CSU_CAPTURE_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0848	MSMON_CSU_CAPTURE_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0848	MSMON_CSU_CAPTURE_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CSU_OFSR, MPAM CSU Monitor Overflow Status Register

The MSMON_CSU_OFSR characteristics are:

Purpose

MSMON_CSU_OFSR is a 32-bit read-only register that shows bitmap of CSU monitor instance overflow status for a contiguous group of 32 monitor instances.

MSMON_CSU_OFSR_s gives a bitmap of pending CSU overflow status for 32 Secure CSU monitor instances.
 MSMON_CSU_OFSR_ns gives a bitmap of pending CSU overflow status for 32 Non-secure CSU monitor instances.
 MSMON_CSU_OFSR_rt gives a bitmap of pending CSU overflow status for 32 Root CSU monitor instances.
 MSMON_CSU_OFSR_rl gives a bitmap of pending CSU overflow status for 32 Realm CSU monitor instances.

Configuration

The power domain of MSMON_CSU_OFSR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_CSUMON_IDR.HAS_OFSR == 1. Otherwise, direct accesses to MSMON_CSU_OFSR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU_OFSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
OFPND31	OFPND30	OFPND29	OFPND28	OFPND27	OFPND26	OFPND25	OFPND24	OFPND23	OFPND22	OFPND21	OFPND20

OFPND<i>, bit [i], for i = 31 to 0

Overflow status bitmap for CSU monitor instances. The RIS and the contiguous range of CSU monitor instances are set in [MSMON_CFG_MON_SEL](#). i of 0 corresponds to the CSU monitor instance [MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0](#).

OFPND<i>	Meaning
0b0	CSU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) does not have a pending overflow.
0b1	CSU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) has a pending overflow.

After reading [MSMON_OFLOW_SR](#) to determine that a CSU monitor instance has a pending overflow and which RIS values have pending overflows, an interrupt service routine could poll groups of 32 monitor instances in a RIS for pending monitors by reading this bitmap and incrementing [MSMON_CFG_MON_SEL.MON_SEL](#) by 32.

Accessing MSMON_CSU_OFSR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_CSU_OFSR_s must be accessible from the Secure MPAM feature page.
- MSMON_CSU_OFSR_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CSU_OFSR_rt must be accessible from the Root MPAM feature page.
- MSMON_CSU_OFSR_rl must be accessible from the Realm MPAM feature page.

MSMON_CSU_OFSR_s, MSMON_CSU_OFSR_ns, MSMON_CSU_OFSR_rt, and MSMON_CSU_OFSR_rl must be separate registers.

- The Secure instance (MSMON_CSU_OFSR_s) accesses the CSU monitor overflow status bitmap used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSU_OFSR_ns) accesses the CSU monitor overflow status bitmap used for Non-secure PARTIDs.
- The Root instance (MSMON_CSU_OFSR_rt) accesses the CSU monitor overflow status bitmap used for Root PARTIDs.
- The Realm instance (MSMON_CSU_OFSR_rl) accesses the CSU monitor overflow status bitmap used for Realm PARTIDs.

MSMON_CSU_OFSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0858	MSMON_CSU_OFSR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0858	MSMON_CSU_OFSR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0858	MSMON_CSU_OFSR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0858	MSMON_CSU_OFSR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MSMON_MBWU, MPAM Memory Bandwidth Usage Monitor Register

The MSMON_MBWU characteristics are:

Purpose

Accesses the monitor instance selected by [MSMON_CFG_MON_SEL](#).

MSMON_MBWU_s is the Secure memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_s. MSMON_MBWU_ns is the Non-secure memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_ns. MSMON_MBWU_rt is the Root memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_rt. MSMON_MBWU_rl is the Realm memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_rl.

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_MBWU is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_MBWU are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NRDY																VALUE															

NRDY, bit [31]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_MBWU.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_MBWU.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [30:0]

Memory bandwidth usage counter value if MSMON_MBWU.NRDY is 0. Invalid if MSMON_MBWU.NRDY is 1.

VALUE is the scaled count of bytes transferred since the monitor was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

If [MSMON_CFG_MBWU_CTL.SCLEN](#) enables scaling, the count in VALUE is the number of bytes shifted right by [MPAMF_MBWUMON_IDR.SCALE](#) bit positions and rounded.

Accessing MSMON_MBWU

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_MBWU_s must be accessible from the Secure MPAM feature page.
- MSMON_MBWU_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_rt must be accessible from the Root MPAM feature page.
- MSMON_MBWU_rl must be accessible from the Realm MPAM feature page.

MSMON_MBWU_s, MSMON_MBWU_ns, MSMON_MBWU_rt, and MSMON_MBWU_rl must be separate registers.

- The Secure instance (MSMON_MBWU_s) accesses the memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_ns) accesses the memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_rt) accesses the memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_rl) accesses the memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU access the memory bandwidth usage monitor instance for the resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU access the memory bandwidth usage monitor instance for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_MBWU can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0860	MSMON_MBWU_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0860	MSMON_MBWU_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0860	MSMON_MBWU_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0860	MSMON_MBWU_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_MBWU_CAPTURE, MPAM Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU_CAPTURE characteristics are:

Purpose

Accesses the captured MSMON_MBWU monitor instance selected by [MSMON_CFG_MON_SEL](#).

MSMON_MBWU_CAPTURE_s is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_MBWU_CAPTURE_ns is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#).

MSMON_MBWU_CAPTURE_rt is the Root memory bandwidth usage monitor capture instance selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_MBWU_CAPTURE_rl is the Realm memory bandwidth usage monitor capture instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance capture register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_MBWU_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1 and MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1. Otherwise, direct accesses to MSMON_MBWU_CAPTURE are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_CAPTURE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NRDY																VALUE															

NRDY, bit [31]

Not Ready. The captured NRDY bit from the corresponding instance of [MSMON_MBWU](#). This bit indicates whether the captured monitor value has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_MBWU_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_MBWU_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [30:0]

Captured memory bandwidth usage counter value if MSMON_MBWU_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_CAPTURE.NRDY is 1.

VALUE is the captured VALUE field from the corresponding instance of [MSMON_MBWU](#), the count of bytes transferred since the monitor was last reset that meet the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

VALUE captures the [MSMON_MBWU](#).VALUE and preserves any scaling that had been performed on the VALUE field in that register.

Accessing MSMON_MBWU_CAPTURE

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- [MSMON_MBWU_CAPTURE_s](#) must be accessible from the Secure MPAM feature page.
- [MSMON_MBWU_CAPTURE_ns](#) must be accessible from the Non-secure MPAM feature page.
- [MSMON_MBWU_CAPTURE_rt](#) must be accessible from the Root MPAM feature page.
- [MSMON_MBWU_CAPTURE_rl](#) must be accessible from the Realm MPAM feature page.

[MSMON_MBWU_CAPTURE_s](#), [MSMON_MBWU_CAPTURE_ns](#), [MSMON_MBWU_CAPTURE_rt](#), and [MSMON_MBWU_CAPTURE_rl](#) must be separate registers.

- The Secure instance ([MSMON_MBWU_CAPTURE_s](#)) accesses the captured memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance ([MSMON_MBWU_CAPTURE_ns](#)) accesses the captured memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance ([MSMON_MBWU_CAPTURE_rt](#)) accesses the captured memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance ([MSMON_MBWU_CAPTURE_rl](#)) accesses the captured memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to [MSMON_MBWU_CAPTURE](#) access the monitor instance for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to [MSMON_MBWU_CAPTURE](#) access the monitor instance for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_MBWU_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0868	MSMON_MBWU_CAPTURE_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0868	MSMON_MBWU_CAPTURE_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0868	MSMON_MBWU_CAPTURE_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0868	MSMON_MBWU_CAPTURE_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_MBWU_L, MPAM Long Memory Bandwidth Usage Monitor Register

The MSMON_MBWU_L characteristics are:

Purpose

Accesses the monitor instance selected by [MSMON_CFG_MON_SEL](#).

MSMON_MBWU_L_s is the Secure long memory bandwidth usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_MBWU_L_ns is the Non-secure long memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_MBWU_L_rt is the Root long memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#)_rt. MSMON_MBWU_L_rl is the Realm long memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#)_rl.

If [MPAMF_IDR](#).HAS_RIS is 1, the monitor instance long monitor register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL](#).RIS and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

Configuration

The power domain of MSMON_MBWU_L is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1 and MPAMF_MBWUMON_IDR.HAS_LONG == 1. Otherwise, direct accesses to MSMON_MBWU_L are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_L is a 64-bit register.

Field descriptions

When MPAMF_MBWUMON_IDR.LWD == 0:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NRDY	RES0																VALUE														
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NRDY, bit [63]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_MBWU_L.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_MBWU_L.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

Bits [62:44]

Reserved, RES0.

VALUE, bits [43:0]

Long (44-bit) memory bandwidth usage counter value if MSMON_MBWU_L.NRDY is 0. Invalid if MSMON_MBWU_L.NRDY is 1.

VALUE is the long count of bytes transferred since the monitor was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

When MPAMF_MBWUMON_IDR.LWD == 1:**NRDY, bit [63]**

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_MBWU_L.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_MBWU_L.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [62:0]

Long (63-bit) memory bandwidth usage counter value if MSMON_MBWU_L.NRDY is 0. Invalid if MSMON_MBWU_L.NRDY is 1.

VALUE is the long count of bytes transferred since the monitor instance was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

Accessing MSMON_MBWU_L

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_MBWU_L_s must be accessible from the Secure MPAM feature page.
- MSMON_MBWU_L_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_L_rt must be accessible from the Root MPAM feature page.
- MSMON_MBWU_L_rl must be accessible from the Realm MPAM feature page.

MSMON_MBWU_L_s, MSMON_MBWU_L_ns, MSMON_MBWU_L_rt, and MSMON_MBWU_L_rl must be separate registers.

- The Secure instance (MSMON_MBWU_L_s) accesses the long memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_L_ns) accesses the long memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_L_rt) accesses the long memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_L_rl) accesses the long memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU_L access the long memory bandwidth usage monitor instance for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU_L access the long memory bandwidth usage monitor instance for the monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_MBWU_L can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0880	MSMON_MBWU_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0880	MSMON_MBWU_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0880	MSMON_MBWU_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0880	MSMON_MBWU_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_MBWU_L_CAPTURE, MPAM Long Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU_L_CAPTURE characteristics are:

Purpose

Accesses the captured [MSMON_MBWU_L](#) monitor instance selected by [MSMON_CFG_MON_SEL](#).

MSMON_MBWU_L_CAPTURE_s is the Secure long memory bandwidth usage monitor capture instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_MBWU_L_CAPTURE_ns is the Non-secure long memory bandwidth usage monitor capture instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_MBWU_L_CAPTURE_rt is the Root long memory bandwidth usage monitor capture instance selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_MBWU_L_CAPTURE_rl is the Realm long memory bandwidth usage monitor capture instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance long capture register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_MBWU_L_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1, MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1 and MPAMF_MBWUMON_IDR.HAS_LONG == 1. Otherwise, direct accesses to MSMON_MBWU_L_CAPTURE are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_L_CAPTURE is a 64-bit register.

Field descriptions

When MPAMF_MBWUMON_IDR.LWD == 0:

VALUE																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_MBWU_L_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

Bits [62:44]

Reserved, RES0.

VALUE, bits [43:0]

Captured long memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY is 1.

VALUE is the captured 44-bit count of bytes transferred since the monitor instance was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

When MPAMF_MBWUMON_IDR.LWD == 1:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
NRDY		VALUE																													
VALUE																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_MBWU_L_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [62:0]

The captured long memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY is 1.

VALUE is the captured 63-bit count of bytes transferred since the monitor instance was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

Accessing MSMON_MBWU_L_CAPTURE

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_MBWU_L_CAPTURE_s must be accessible from the Secure MPAM feature page.
- MSMON_MBWU_L_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_L_CAPTURE_rt must be accessible from the Root MPAM feature page.
- MSMON_MBWU_L_CAPTURE_rl must be accessible from the Realm MPAM feature page.

MSMON_MBWU_L_CAPTURE_s, MSMON_MBWU_L_CAPTURE_ns, MSMON_MBWU_L_CAPTURE_rt, and MSMON_MBWU_L_CAPTURE_rl must be separate registers.

- The Secure instance (MSMON_MBWU_L_CAPTURE_s) accesses the captured long memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_L_CAPTURE_ns) accesses the captured long memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_L_CAPTURE_rt) accesses the captured long memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_L_CAPTURE_rl) accesses the captured long memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU_L_CAPTURE access the monitor instance for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU_L_CAPTURE access the monitor instance for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_MBWU_L_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0890	MSMON_MBWU_CAPTURE_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0890	MSMON_MBWU_CAPTURE_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0890	MSMON_MBWU_CAPTURE_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0890	MSMON_MBWU_CAPTURE_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_MBWU_OFSR, MPAM MBWU Monitor Overflow Status Register

The MSMON_MBWU_OFSR characteristics are:

Purpose

MSMON_MBWU_OFSR is a 32-bit read-only register that shows bitmap of MBWU monitor instance overflow status for a contiguous group of 32 monitor instances.

MSMON_MBWU_OFSR_s gives a bitmap of pending MBWU overflow status for 32 Secure MBWU monitor instances. MSMON_MBWU_OFSR_ns gives a bitmap of pending MBWU overflow status for 32 Non-secure MBWU monitor instances. MSMON_MBWU_OFSR_rt gives a bitmap of pending MBWU overflow status for 32 Root MBWU monitor instances. MSMON_MBWU_OFSR_rl gives a bitmap of pending MBWU overflow status for 32 Realm MBWU monitor instances.

Configuration

The power domain of MSMON_MBWU_OFSR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_MBWUMON_IDR.HAS_OFSR == 1. Otherwise, direct accesses to MSMON_MBWU_OFSR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_OFSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
OFPND31	OFPND30	OFPND29	OFPND28	OFPND27	OFPND26	OFPND25	OFPND24	OFPND23	OFPND22	OFPND21	OFPND20

OFPND<i>, bit [i], for i = 31 to 0

Overflow status bitmap for MBWU monitor instances. The RIS and the contiguous range of MBWU monitor instances are set in [MSMON_CFG_MON_SEL](#). i of 0 corresponds to the MBWU monitor instance [MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0](#).

OFPND<i>	Meaning
0b0	MBWU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) does not have a pending overflow.
0b1	MBWU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) has a pending overflow.

After reading [MSMON_OFLOW_SR](#) to determine that an MBWU monitor instance has a pending overflow and which RIS values have pending overflows, an interrupt service routine could poll groups of 32 monitor instances in a RIS for pending monitors by reading this bitmap and incrementing [MSMON_CFG_MON_SEL.MON_SEL](#) by 32.

A pending overflow may be in either the [MSMON_CFG_MBWU_CTL.OFLOW_STATUS](#) or [MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L](#) field.

Accessing MSMON_MBWU_OFSR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_MBWU_OFSR_s must be accessible from the Secure MPAM feature page.
- MSMON_MBWU_OFSR_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_OFSR_rt must be accessible from the Root MPAM feature page.
- MSMON_MBWU_OFSR_rl must be accessible from the Realm MPAM feature page.

MSMON_MBWU_OFSR_s, MSMON_MBWU_OFSR_ns, MSMON_MBWU_OFSR_rt, and MSMON_MBWU_OFSR_rl must be separate registers.

- The Secure instance (MSMON_MBWU_OFSR_s) accesses the MBWU monitor overflow status bitmap used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_OFSR_ns) accesses the MBWU monitor overflow status bitmap used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_OFSR_rt) accesses the MBWU monitor overflow status bitmap used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_OFSR_rl) accesses the MBWU monitor overflow status bitmap used for Realm PARTIDs.

MSMON_MBWU_OFSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0898	MSMON_MBWU_OFSR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0898	MSMON_MBWU_OFSR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0898	MSMON_MBWU_OFSR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0898	MSMON_MBWU_OFSR_rl

When FEAT_RME is implemented access on this interface are **RO**.

MSMON_OFLOW_MSI_ADDR_H, MPAM Monitor Overflow MSI Write High-part Address Register

The MSMON_OFLOW_MSI_ADDR_H characteristics are:

Purpose

MSMON_OFLOW_MSI_ADDR_H is a 32-bit read/write register for the high part of the MPAM monitor overflow MSI address.

MSMON_OFLOW_MSI_ADDR_H_s is the high part of the MSI write address for monitor overflow interrupts from Secure monitor instances. MSMON_OFLOW_MSI_ADDR_H_ns is the high part of the MSI write address for monitor overflow interrupts from Non-secure monitor instances. MSMON_OFLOW_MSI_ADDR_H_rt is the high part of the MSI write address for monitor overflow interrupts from Root monitor instances. MSMON_OFLOW_MSI_ADDR_H_rl is the high part of the MSI write address for monitor overflow interrupts from Realm monitor instances.

Configuration

The power domain of MSMON_OFLOW_MSI_ADDR_H is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_ADDR_H are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_ADDR_H is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												MSI_ADDR_H																			

Bits [31:20]

Reserved, RES0.

MSI_ADDR_H, bits [19:0]

MSI write address bits[51:32].

Accessing MSMON_OFLOW_MSI_ADDR_H

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_OFLOW_MSI_ADDR_H_s must be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_ADDR_H_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_ADDR_H_rt must be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_ADDR_H_rl must be accessible from the Realm MPAM feature page.

MSMON_OFLW_MSI_ADDR_H_s, MSMON_OFLW_MSI_ADDR_H_ns, MSMON_OFLW_MSI_ADDR_H_rt, and MSMON_OFLW_MSI_ADDR_H_rl must be separate registers.

- The Secure instance (MSMON_OFLW_MSI_ADDR_H_s) accesses the high part of the monitor overflow MSI write address of Secure monitors.
- The Non-secure instance (MSMON_OFLW_MSI_ADDR_H_ns) accesses the high part of the monitor overflow MSI write address of Non-secure monitors.
- The Root instance (MSMON_OFLW_MSI_ADDR_H_rt) accesses the high part of the monitor overflow MSI write address of Root monitors.
- The Realm instance (MSMON_OFLW_MSI_ADDR_H_rl) accesses the high part of the monitor overflow MSI write address of Realm monitors.

MSMON_OFLOW_MSI_ADDR_H can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08E4	MSMON_OFLW_MSI_ADDR_H_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08E4	MSMON_OFLW_MSI_ADDR_H_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08E4	MSMON_OFLW_MSI_ADDR_H_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08E4	MSMON_OFLW_MSI_ADDR_H_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_OFLOW_MSI_ADDR_L, MPAM Monitor Overflow MSI Low-part Address Register

The MSMON_OFLOW_MSI_ADDR_L characteristics are:

Purpose

MSMON_OFLOW_MSI_ADDR_L is a 32-bit read/write register for the low part of the MPAM monitor MSI address.

MSMON_OFLOW_MSI_ADDR_L_s is the low part of the MSI write address for overflow interrupts from Secure monitor instances. MSMON_OFLOW_MSI_ADDR_L_ns is the low part of the MSI write address for overflow interrupts from Non-secure monitor instances. MSMON_OFLOW_MSI_ADDR_L_rt is the low part of the MSI write address for overflow interrupts from Root monitor instances. MSMON_OFLOW_MSI_ADDR_L_rl is the low part of the MSI write address for overflow interrupts from Realm monitor instances.

Configuration

The power domain of MSMON_OFLOW_MSI_ADDR_L is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_ADDR_L are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_ADDR_L is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MSI_ADDR_L																		Bits[1:0]													

MSI_ADDR_L, bits [31:2]

MSI write address bits[31:2].

Bits [1:0]

Reads as 0b00.

Access to this field is **RO**.

Accessing MSMON_OFLOW_MSI_ADDR_L

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_OFLOW_MSI_ADDR_L_s must be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_ADDR_L_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_ADDR_L_rt must be accessible from the Root MPAM feature page.

- MSMON_OFLOW_MSI_ADDR_L_rl must be accessible from the Realm MPAM feature page.

MSMON_OFLOW_MSI_ADDR_L_s, MSMON_OFLOW_MSI_ADDR_L_ns, MSMON_OFLOW_MSI_ADDR_L_rt, and MSMON_OFLOW_MSI_ADDR_L_rl must be separate registers.

- The Secure instance (MSMON_OFLOW_MSI_ADDR_L_s) accesses the low part of the overflow MSI write address used for Secure PARTIDs.
- The Non-secure instance (MSMON_OFLOW_MSI_ADDR_L_ns) accesses the low part of the overflow MSI write address used for Non-secure PARTIDs.
- The Root instance (MSMON_OFLOW_MSI_ADDR_L_rt) accesses the low part of the overflow MSI write address used for Root PARTIDs.
- The Realm instance (MSMON_OFLOW_MSI_ADDR_L_rl) accesses the low part of the overflow MSI write address used for Realm PARTIDs.

MSMON_OFLOW_MSI_ADDR_L can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08E0	MSMON_OFLOW_MSI_ADDR_L_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08E0	MSMON_OFLOW_MSI_ADDR_L_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08E0	MSMON_OFLOW_MSI_ADDR_L_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08E0	MSMON_OFLOW_MSI_ADDR_L_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_OFLOW_MSI_ATTR, MPAM Monitor Overflow MSI Write Attributes Register

The MSMON_OFLOW_MSI_ATTR characteristics are:

Purpose

MSMON_OFLOW_MSI_ATTR is a 32-bit read/write register that controls MPAM monitor overflow MSI write attributes for MPAM monitor overflows in this MSC.

MSMON_OFLOW_MSI_ATTR_s controls Secure MPAM monitor overflow MSI writes. MSMON_OFLOW_MSI_ATTR_ns controls Non-secure MPAM monitor overflow MSI writes. MSMON_OFLOW_MSI_ATTR_rt controls Root MPAM monitor overflow MSI writes. MSMON_OFLOW_MSI_ATTR_rl controls Realm MPAM monitor overflow MSI writes.

Configuration

The power domain of MSMON_OFLOW_MSI_ATTR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_ATTR are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_ATTR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0		MSI_SH		MSI_MEMATTR		RES0																MSIEN									

Bits [31:30]

Reserved, RES0.

MSI_SH, bits [29:28]

Sharability attribute of MSI writes.

MSI_SH	Meaning
0b00	Non-shareable.
0b01	Reserved, CONSTRAINED UNPREDICTABLE.
0b10	Outer Shareable.
0b11	Inner Shareable.

When MSMON_OFLOW_MSI_ATTR.MSI_MEMATTR specifies a Device memory type, the contents of this field are IGNORED and Shareability is effectively Outer Shareable.

MSI_MEMATTR, bits [27:24]

Memory attributes of MSI writes.

Note: This encoding matches the VMSAv8-64 stage 2 MemAttr[3:0] field as described in the Arm ARM, except that the following encodings are Reserved (not UNPREDICTABLE) and behave as Device-nGnRnE: 0b0100, 0b1000, and 0b1100.

MSI_MEMATTR	Meaning
0b0000	Device-nGnRnE.
0b0001	Device-nGnRE.
0b0010	Device-nGRE.
0b0011	Device-GRE.
0b0100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b0101	Normal Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal Inner Write-Through Cacheable, Outer Non-cacheable.
0b0111	Normal Inner Write-Back Cacheable, Outer Non-cacheable.
0b1000	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1001	Normal Inner Non-Cachable, Outer Write-Through Cacheable.
0b1010	Normal Inner Write-Through Cacheable, Outer Write-Through Cachable.
0b1011	Normal Inner Write-Back Cacheable, Outer Write-Through Cachable.
0b1100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1101	Normal Inner Non-cacheable, Outer Write-Back Cacheable.
0b1110	Normal Inner Write-Through Cacheable, Outer Write-Back Cacheable.
0b1111	Normal Inner Write-Back Cacheable, Outer Write-Back Cacheable.

When this field specifies a Device memory type, the contents of MSMON_OFLOW_MSI_ATTR.MSI_SH are IGNORED and Shareability is effectively Outer Shareable.

Device types may be implemented as any Device type with more n characters. For example, if this field is set to 0b0010, an implementation may treat the MSI write as the specified type, Device-nGRE, or as Device-nGnRE or as Device-nGnRnE.

Reserved encodings 0b0100, 0b1000, and 0b1100 must be implemented to behave the same as the 0b0000 encoding.

Bits [23:1]

Reserved, RES0.

MSIEN, bit [0]

Monitor overflow MSI write enable.

MSIEN	Meaning
0b0	MPAM monitor overflow MSI writes are not generated to signal enabled MPAM monitor overflow interrupts. When monitor overflow MSI writes are disabled, hardwired monitor overflow interrupt could be generated if hardwired monitor overflow interrupt is implemented.
0b1	MPAM monitor overflow MSI writes are generated to signal enabled MPAM monitor overflow interrupts. When monitor overflow MSI writes are enabled, hardwired monitor overflow interrupts are not generated.

This enable affects whether a hardwired overflow interrupt is generated.

The reset behaviour of this field is:

- On a MSC reset, this field resets to 0.

Accessing MSMON_OFLOW_MSI_ATTR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_OFLOW_MSI_ATTR_s must be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_ATTR_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_ATTR_rt must be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_ATTR_rl must be accessible from the Realm MPAM feature page.

MSMON_OFLOW_MSI_ATTR_s, MSMON_OFLOW_MSI_ATTR_ns, MSMON_OFLOW_MSI_ATTR_rt, and MSMON_OFLOW_MSI_ATTR_rl must be separate registers.

- The Secure instance (MSMON_OFLOW_MSI_ATTR_s) accesses the monitor overflow MSI write attributes of Secure monitors.
- The Non-secure instance (MSMON_OFLOW_MSI_ATTR_ns) accesses the monitor overflow MSI write attributes of Non-secure monitors.
- The Root instance (MSMON_OFLOW_MSI_ATTR_rt) accesses the monitor overflow MSI write attributes of Root monitors.
- The Realm instance (MSMON_OFLOW_MSI_ATTR_rl) accesses the monitor overflow MSI write attributes of Realm monitors.

MSMON_OFLOW_MSI_ATTR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08EC	MSMON_OFLOW_MSI_ATTR_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08EC	MSMON_OFLOW_MSI_ATTR_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08EC	MSMON_OFLOW_MSI_ATTR_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08EC	MSMON_OFLOW_MSI_ATTR_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_OFLOW_MSI_DATA, MPAM Monitor Overflow MSI Write Data Register

The MSMON_OFLOW_MSI_DATA characteristics are:

Purpose

MSMON_OFLOW_MSI_DATA is a 32-bit read/write register for the MPAM monitor overflow MSI data.

MSMON_OFLOW_MSI_DATA_s is the data for the MSI write for monitor overflow from Secure monitor instances. MSMON_OFLOW_MSI_DATA_ns is the data for the MSI writes for monitor overflow interrupts from Non-secure monitor instances. MSMON_OFLOW_MSI_DATA_rt is the data for the MSI write for monitor overflow from Root monitor instances. MSMON_OFLOW_MSI_DATA_rl is the data for the MSI writes for monitor overflow interrupts from Realm monitor instances.

Configuration

The power domain of MSMON_OFLOW_MSI_DATA is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_DATA are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_DATA is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MSI_DATA																															

MSI_DATA, bits [31:0]

MSI write data word.

Accessing MSMON_OFLOW_MSI_DATA

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_OFLOW_MSI_DATA_s must be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_DATA_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_DATA_rt must be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_DATA_rl must be accessible from the Realm MPAM feature page.

MSMON_OFLOW_MSI_DATA_s, MSMON_OFLOW_MSI_DATA_ns, MSMON_OFLOW_MSI_DATA_rt, and MSMON_OFLOW_MSI_DATA_rl must be separate registers.

- The Secure instance (MSMON_OFLOW_MSI_DATA_s) accesses the monitor overflow MSI write data of Secure monitors.

- The Non-secure instance (MSMON_OFLOW_MSI_DATA_ns) accesses the monitor overflow MSI write data of Non-secure monitors.
- The Root instance (MSMON_OFLOW_MSI_DATA_rt) accesses the monitor overflow MSI write data of Root monitors.
- The Realm instance (MSMON_OFLOW_MSI_DATA_rl) accesses the monitor overflow MSI write data of Realm monitors.

MSMON_OFLOW_MSI_DATA can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08E8	MSMON_OFLOW_MSI_DATA_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08E8	MSMON_OFLOW_MSI_DATA_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08E8	MSMON_OFLOW_MSI_DATA_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08E8	MSMON_OFLOW_MSI_DATA_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_OFLOW_MSI_MPAM, MPAM Monitor Overflow MSI Write MPAM Information Register

The MSMON_OFLOW_MSI_MPAM characteristics are:

Purpose

MSMON_OFLOW_MSI_MPAM is a 32-bit read/write register that sets the MPAM information for a monitor overflow MSI write.

MSMON_OFLOW_MSI_MPAM_s controls MPAM information labeling of Secure monitor overflow MSI writes.
 MSMON_OFLOW_MSI_MPAM_ns controls MPAM information labeling of Non-secure monitor overflow MSI writes.
 MSMON_OFLOW_MSI_MPAM_rt controls MPAM information labeling of Root monitor overflow MSI writes.
 MSMON_OFLOW_MSI_MPAM_rl controls MPAM information labeling of Realm monitor overflow MSI writes.

Configuration

The power domain of MSMON_OFLOW_MSI_MPAM is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_MPAM are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_MPAM is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								PMG								PARTID															

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group property for an MSC monitor overflow MSI write.

The reset behaviour of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition ID for an MSC monitor overflow MSI write.

The PARTID in this field is in the Secure PARTID space in the MSMON_OFLOW_MSI_MPAM_s instance and in the Non-secure PARTID space in the MSMON_OFLOW_MSI_MPAM_ns instance of this register.

The reset behaviour of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

Accessing MSMON_OFLOW_MSI_MPAM

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- MSMON_OFLOW_MSI_MPAM_s must be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_MPAM_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_MPAM_rt must be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_MPAM_rl must be accessible from the Realm MPAM feature page.

MSMON_OFLOW_MSI_MPAM_s, MSMON_OFLOW_MSI_MPAM_ns, MSMON_OFLOW_MSI_MPAM_rt, and MSMON_OFLOW_MSI_MPAM_rl must be separate registers.

- The Secure instance (MSMON_OFLOW_MSI_MPAM_s) accesses the monitor overflow MSI MPAM information of Secure monitors.
- The Non-secure instance (MSMON_OFLOW_MSI_MPAM_ns) accesses the monitor overflow MSI MPAM information of Non-secure monitors.
- The Root instance (MSMON_OFLOW_MSI_MPAM_rt) accesses the monitor overflow MSI MPAM information of Root monitors.
- The Realm instance (MSMON_OFLOW_MSI_MPAM_rl) accesses the monitor overflow MSI MPAM information of Realm monitors.

MSMON_OFLOW_MSI_MPAM can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08DC	MSMON_OFLOW_MSI_MPAM_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08DC	MSMON_OFLOW_MSI_MPAM_ns

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08DC	MSMON_OFLOW_MSI_MPAM_rt

When FEAT_RME is implemented access on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08DC	MSMON_OFLOW_MSI_MPAM_rl

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_OFLOW_SR, MPAM Monitor Overflow Status Register

The MSMON_OFLOW_SR characteristics are:

Purpose

MSMON_OFLOW_SR is a 32-bit read-only register that shows MPAM monitor overflow status for this MSC.

MSMON_OFLOW_SR_s gives the status of overflows of Secure MPAM monitors. MSMON_OFLOW_SR_ns gives the status of overflows of Non-secure MPAM monitors. MSMON_OFLOW_SR_rt gives the status of overflows of Root MPAM monitors. MSMON_OFLOW_SR_rl gives the status of overflows of Realm MPAM monitors.

Configuration

The power domain of MSMON_OFLOW_SR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_MSMON_IDR.HAS_OFLOW_SR == 1. Otherwise, direct accesses to MSMON_OFLOW_SR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_SR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CSU_OFLOW_PND	MBWU_OFLOW_PND	RES0														RIS_PND15	RIS_PND14	RIS_PND13	RIS_PND12	RIS_PND11	RIS_PND10	RIS_PND9	RIS_PND8	RIS_PND7	RIS_PND6	RIS_PND5	RIS_PND4	RIS_PND3	RIS_PND2	RIS_PND1	RIS_PND0

CSU_OFLOW_PND, bit [31]

At least one cache storage usage monitor has OFLOW_STATUS of 1 in [MSMON_CFG_CSU_CTL](#).

CSU_OFLOW_PND	Meaning
0b0	There are no cache storage usage monitor instances where MSMON_CFG_CSU_CTL .OFLOW_STATUS is 1.
0b1	MSMON_CFG_CSU_CTL for at least one of the cache storage usage monitor instances has OFLOW_STATUS set to 1.

This field clears when [MSMON_CFG_CSU_CTL](#).OFLOW_STATUS has been reset to 0 for all CSU monitor instances in this MSC.

MBWU_OFLOW_PND, bit [30]

At least one memory bandwidth usage monitor instance has OFLOW_STATUS or OFLOW_STATUS_L of 1 in [MSMON_CFG_MBWU_CTL](#).

MBWU_OFLOW_PND	Meaning
0b0	There are no memory bandwidth usage monitor instances where MSMON_CFG_MBWU_CTL.OFLOW_STATUS is 1.
0b1	MSMON_CFG_MBWU_CTL for at least one of the memory bandwidth usage monitor instances has either OFLOW_STATUS or OFLOW_STATUS_L set to 1.

This field clears when [MSMON_CFG_MBWU_CTL.OFLOW_STATUS](#) and [MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L](#) have been reset to 0 for all MBWU monitor instances in this MSC.

Bits [29:16]

Reserved, RES0.

RIS_PND<r>, bit [r], for r = 15 to 0

Overflow status by RIS.

RIS_PND<r>	Meaning
0b0	RIS r has no unread overflows of any type of monitor.
0b1	RIS r has at least one unread overflow in at least one of the monitor types.

Combined with the CSU_OFLOW_PND and MBWU_OFLOW_PND flags in this register, an interrupt service routine could poll only the monitor types indicated in monitors for the resource instances flagged in this field.

Bit r is set when any monitor instance of any type in resource instance r has [OFLOW_STATUS](#) or [OFLOW_STATUS_L](#) set to 1.

Accessing MSMON_OFLOW_SR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

- [MSMON_OFLOW_SR_s](#) must be accessible from the Secure MPAM feature page.
- [MSMON_OFLOW_SR_ns](#) must be accessible from the Non-secure MPAM feature page.
- [MSMON_OFLOW_SR_rt](#) must be accessible from the Root MPAM feature page.
- [MSMON_OFLOW_SR_rl](#) must be accessible from the Realm MPAM feature page.

[MSMON_OFLOW_SR_s](#), [MSMON_OFLOW_SR_ns](#), [MSMON_OFLOW_SR_rt](#), and [MSMON_OFLOW_SR_rl](#) must be separate registers.

- The Secure instance ([MSMON_OFLOW_SR_s](#)) accesses the monitor overflow status summary of Secure monitors.
- The Non-secure instance ([MSMON_OFLOW_SR_ns](#)) accesses the monitor overflow status summary of Non-secure monitors.
- The Root instance ([MSMON_OFLOW_SR_rt](#)) accesses the monitor overflow status summary of Root monitors.
- The Realm instance ([MSMON_OFLOW_SR_rl](#)) accesses the monitor overflow status summary of Realm monitors.

MSMON_OFLOW_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08F0	MSMON_OFLOW_SR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08F0	MSMON_OFLOW_SR_ns

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08F0	MSMON_OFLOW_SR_rt

When FEAT_RME is implemented access on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08F0	MSMON_OFLOW_SR_rl

When FEAT_RME is implemented access on this interface are **RO**.

OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS Lock.

Configuration

External register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [OSLAR_EL1\[31:0\]](#).

OSLAR_EL1 is in the Core power domain.

The OS Lock can also be locked or unlocked using [DBGOSLAR](#).

If FEAT_Debugv8p2 is not implemented, it is IMPLEMENTATION DEFINED whether external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

If FEAT_Debugv8p2 is implemented, external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

Attributes

OSLAR_EL1 is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use [EDPRSR.OSLK](#) to check the current status of the lock.

Accessing OSLAR_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

OSLAR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x300	OSLAR_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **WO**.
- When IsCorePowered(), !DoubleLockStatus(), !AllowExternalDebugAccess() and FEAT_Debugv8p2 is not implemented accesses to this register are **IMPDEF**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. Arm recommends that this register is implemented.

Attributes

PMAUTHSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0				RTNID	RTID	RES0				RLNID		RLID	RES0				SNID	SID	NSNID	NSID											

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTNID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLNID.

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.

Bits [11:8]

Reserved, RES0.

SNID, bits [7:6]

Holds the same value as [DBGAUTHSTATUS_EL1](#).SNID.

SID, bits [5:4]

Secure invasive debug. Possible values of this field are:

SID	Meaning
0b00	Not implemented.

All other values are reserved.

NSNID, bits [3:2]

Holds the same value as [DBGAUTHSTATUS_EL1](#).NSNID.

NSID, bits [1:0]

Non-secure invasive debug. Possible values of this field are:

NSID	Meaning
0b00	Not implemented.

All other values are reserved.

Accessing PMAUTHSTATUS

PMAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFB8	PMAUTHSTATUS

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR_EL0](#), increments.

Configuration

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMCCFILTR_EL0\[31:0\]](#).

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCCFILTR\[31:0\]](#).

PMCCFILTR_EL0 is in the Core power domain.

On a Warm or Cold reset, RW fields in this register reset to:

- Architecturally UNKNOWN values if the reset is to an Exception level that is using AArch64.
- 0 if the reset is to an Exception level that is using AArch32.

The register is not affected by an External debug reset.

Attributes

PMCCFILTR_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P	U	NSK	NSU	NSH	M	RES0	SH	RES0	RLK	RLU	RLH	RES0																			

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMCCFILTR_EL0.RLK bit.

P	Meaning
0b0	Count cycles in EL1.
0b1	Do not count cycles in EL1.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMCCFILTR_EL0.RLU bit.

U	Meaning
0b0	Count cycles in EL0.
0b1	Do not count cycles in EL0.

NSK, bit [29]**When EL3 is implemented:**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

Otherwise:

Reserved, RES0.

NSU, bit [28]**When EL3 is implemented:**

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

Otherwise:

Reserved, RES0.

NSH, bit [27]**When EL2 is implemented:**

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMCCFILTR_EL0.RLH bit.

NSH	Meaning
0b0	Do not count cycles in EL2.
0b1	Count cycles in EL2.

Otherwise:

Reserved, RES0.

M, bit [26]**When EL3 is implemented:**

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

Note

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]

When FEAT_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is disabled, this field is RES0.

Note

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

RLK, bit [22]

When FEAT_RME is implemented:

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Realm EL1 are counted.

Otherwise, cycles in Realm EL1 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Realm EL0 are counted.

Otherwise, cycles in Realm EL0 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]**When FEAT_RME is implemented:**

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Realm EL2 are counted.

Otherwise, cycles in Realm EL2 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCFILTR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x47C	PMCCFILTR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. For more information, see 'Time as measured by the Performance Monitors cycle counter'.

[PMCCFILTR_EL0](#) determines the modes and states in which the PMCCNTR_EL0 can increment.

Configuration

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register [PMCCNTR_EL0\[63:0\]](#).

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register [PMCCNTR\[63:0\]](#).

PMCCNTR_EL0 is in the Core power domain.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																CCNT															
																CCNT															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CCNT, bits [63:0]

Cycle count. Depending on the values of [PMCR_EL0](#).{LC,D}, the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR_EL0](#).C sets this field to 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCNTR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance	Range
-----------	--------	----------	-------

PMU	0x0F8	PMCCNTR_EL0	31:0
-----	-------	-------------	------

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x0FC	PMCCNTR_EL0	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F

For more information about the common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Note

This view of the register was previously called PMCEID0_EL0.

Configuration

External register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID0_EL0\[31:0\]](#).

External register PMCEID0 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID0\[31:0\]](#).

PMCEID0 is in the Core power domain.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID7

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to common event n.

For each bit:

ID<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

Note

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID0

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE20	PMCEID0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x020 to 0x03F.

For more information about the common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Note

This view of the register was previously called PMCEID1_EL0.

Configuration

External register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID1_EL0\[31:0\]](#).

External register PMCEID1 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID1\[31:0\]](#).

PMCEID1 is in the Core power domain.

Attributes

PMCEID1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID7

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to common event (0x0020 + n).

For each bit:

ID<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

Note

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID1

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE24	PMCEID1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

For more information about the common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Configuration

External register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID0_EL0\[63:32\]](#).

External register PMCEID2 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID2\[31:0\]](#).

PMCEID2 is in the Core power domain.

This register is present only when FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are RES0.

Attributes

PMCEID2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15
IDhi31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16	IDhi15

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to common event (0x4000 + n).

For each bit:

IDhi<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

Note

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU

features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID2

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID2 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE28	PMCEID2

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

Purpose

Defines which common architectural events and common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

For more information about the common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Configuration

External register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID1_EL0\[63:32\]](#).

External register PMCEID3 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID3\[31:0\]](#).

PMCEID3 is in the Core power domain.

This register is present only when FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are RES0.

Attributes

PMCEID3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15
IDhi31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16	IDhi15

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to common event (0x4020 + n).

For each bit:

IDhi<n>	Meaning
0b0	The common event is not implemented, or not counted.
0b1	The common event is implemented.

When the value of a bit in the field is 1, the corresponding common event is implemented and counted.

Note

Arm recommends that if a common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU

features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID3

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID3 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE2C	PMCEID3

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

Purpose

Contains PMU-specific configuration data.

Configuration

PMCFGR is in the Core power domain.

Attributes

PMCFGR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NCG				RES0				FZO				RES0	UEN	WT	NA	EX	CCD	CC	SIZE				N								

NCG, bits [31:28]

This feature is not supported, so this field is RAZ.

Bits [27:22]

Reserved, RES0.

FZO, bit [21]

Freeze-on-overflow supported. Defined values are:

FZO	Meaning
0b0	Freeze-on-overflow mechanism is not supported. PMCR_ELO .FZO is RES0.
0b1	Freeze-on-overflow mechanism is supported. PMCR_ELO .FZO is RW.

FEAT_PMUv3p7 implements the functionality added by the value 0b1.

From Armv8.7, if FEAT_PMUv3 is implemented, the only permitted value is 0b1.

Bit [20]

Reserved, RES0.

UEN, bit [19]

User-mode Enable Register supported. [PMUSERENR_ELO](#) is not visible in the external debug interface, so this bit is RAZ.

WT, bit [18]

This feature is not supported, so this bit is RAZ.

NA, bit [17]

This feature is not supported, so this bit is RAZ.

EX, bit [16]

Export supported. Value is IMPLEMENTATION DEFINED.

EX	Meaning
0b0	PMCR_ELO .X is RES0.
0b1	PMCR_ELO .X is read/write.

Access to this field is **RO**.

CCD, bit [15]

Cycle counter has prescale.

This is RES1 if AArch32 is supported, and RAZ otherwise.

CCD	Meaning
0b0	PMCR_ELO .D is RES0.
0b1	PMCR_ELO .D is read/write.

CC, bit [14]

Dedicated cycle counter (counter 31) supported. This bit is RAO.

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8, the largest counter is 64-bits, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8, the counters are a doubleword-aligned addresses.

N, bits [7:0]

Number of counters implemented in addition to the cycle counter, [PMCCNTR_ELO](#). The maximum number of event counters is 31.

N	Meaning
0x00	Only PMCCNTR_ELO implemented.
0x01	PMCCNTR_ELO plus one event counter implemented.

and so on up to 0b00011111, which indicates [PMCCNTR_ELO](#) and 31 event counters implemented.

Accessing PMCFGR

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCFGR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE00	PMCFGR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCID1SR, CONTEXTIDR_EL1 Sample Register

The PMCID1SR characteristics are:

Purpose

Contains the sampled value of [CONTEXTIDR_EL1](#), captured on reading [PMPCSR](#)[31:0].

Configuration

PMCID1SR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMCID1SR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID](#).PCSample.

Attributes

PMCID1SR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CONTEXTIDR_EL1																															

CONTEXTIDR_EL1, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent [PMPCSR](#) sample. When the most recent [PMPCSR](#) sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from [CONTEXTIDR_EL1](#).
- If EL1 is using AArch32, then the Context ID is sampled from [CONTEXTIDR](#).
- If EL3 is implemented and is using AArch32, then [CONTEXTIDR](#) is a banked register and PMCID1SR samples the current banked copy of [CONTEXTIDR](#) for the Security state that is associated with the most recent [PMPCSR](#) sample.

Because the value written to PMCID1SR is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether PMCID1SR is set to the original or new value if [PMPCSR](#) samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCID1SR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

PMCID1SR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x208	PMCID1SR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance
PMU	0x228	PMCID1SR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCID2SR, CONTEXTIDR_EL2 Sample Register

The PMCID2SR characteristics are:

Purpose

Contains the sampled value of [CONTEXTIDR_EL2](#), captured on reading [PMPCSR](#)[31:0].

Configuration

PMCID2SR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMCID2SR are RES0.

Note

If FEAT_PCSRv8p2 is not implemented, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID](#).PCSample.

Attributes

PMCID2SR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CONTEXTIDR_EL2																															

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of [CONTEXTIDR_EL2](#) that is associated with the most recent [PMPCSR](#) sample. When the most recent [PMPCSR](#) sample was generated:

- If EL2 is using AArch64, then this field is set to the Context ID sampled from [CONTEXTIDR_EL2](#).
- If EL2 is using AArch32, then this field is set to an UNKNOWN value.

Because the value written to PMCID2SR is an indirect read of [CONTEXTIDR_EL2](#), it is CONSTRAINED UNPREDICTABLE whether PMCID2SR is set to the original or new value if [PMPCSR](#) samples:

- An instruction that writes to [CONTEXTIDR_EL2](#).
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCID2SR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

PMCID2SR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x22C	PMCID2SR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_0							

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is **RO**.

Accessing PMCIDR0

PMCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFF0	PMCIDR0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMCIDR1, Performance Monitors Component Identification Register 1

The PMCIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												CLASS			PRMBL_1				

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Reads as 0b0000.

Access to this field is **RO**.

Accessing PMCIDR1

PMCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFF4	PMCIDR1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

PMCIDR2, Performance Monitors Component Identification Register 2

The PMCIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_2							

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is **RO**.

Accessing PMCIDR2

PMCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFF8	PMCIDR2

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMCIDR3, Performance Monitors Component Identification Register 3

The PMCIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_3							

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is **RO**.

Accessing PMCIDR3

PMCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFFC	PMCIDR3

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

Purpose

Disables the Cycle Count Register, [PMCCNTR_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

Configuration

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENCLR_EL0\[31:0\]](#).

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENCLR\[31:0\]](#).

PMCNTENCLR_EL0 is in the Core power domain.

Attributes

PMCNTENCLR_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

[PMCCNTR_EL0](#) disable bit. Disables the cycle counter register. Possible values are:

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, disables the cycle counter.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
0b1	When read, means that PMEVCNTR<n>_EL0 is enabled. When written, disables PMEVCNTR<n>_EL0 .

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENCLR_ELO

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENCLR_ELO can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC20	PMCNTENCLR_ELO

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

Purpose

Enables the Cycle Count Register, [PMCCNTR_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

Configuration

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENSET_EL0\[31:0\]](#).

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENSET\[31:0\]](#).

PMCNTENSET_EL0 is in the Core power domain.

Attributes

PMCNTENSET_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

[PMCCNTR_EL0](#) enable bit. Enables the cycle counter register. Possible values are:

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, enables the cycle counter.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter enable bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
0b1	When read, means that PMEVCNTR<n>_EL0 event counter is enabled. When written, enables PMEVCNTR<n>_EL0 .

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENSET_ELO

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENSET_ELO can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC00	PMCNTENSET_ELO

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch32 System register [PMCR\[7:0\]](#).

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch64 System register [PMCR_EL0\[7:0\]](#).

PMCR_EL0 is in the Core power domain.

This register is only partially mapped to the internal [PMCR](#) System register. An external agent must use other means to discover the information held in [PMCR\[31:11\]](#), such as accessing [PMCFGR](#) and the ID registers.

Attributes

PMCR_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0					
RAZ/WI																					RES0	FZORES0	LP	LC	DP	X	D	C	P	E						

Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

FZO	Meaning
0b0	Do not freeze on overflow.
0b1	Event counters do not count when PMOVSLR_EL0[(N-1):0] is nonzero, where N is the value of MDCR_EL2.HPMN if EL2 is implemented, and PMCR_EL0.N otherwise.

If EL2 is implemented, then:

- This bit affects the operation of event counters in the range [0 .. ([MDCR_EL2.HPMN](#)-1)].
- If [MDCR_EL2.HPMN](#) is less than [PMCR_EL0.N](#):
 - This bit does not affect the operation of event counters in the range [[MDCR_EL2.HPMN](#) .. ([PMCR_EL0.N](#)-1)].

- The operation of this bit ignores the values of [PMOVSCLR_EL0](#)[(PMCR_EL0.N-1):[MDCR_EL2](#).HPMN].
- This applies even when EL2 is disabled in the current Security state.

This bit does not affect the operation of [PMCCNTR_EL0](#).

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [63:0].

If EL2 is implemented and [MDCR_EL2](#).HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [[MDCR_EL2](#).HPMN:(PMCR_EL0.N-1)].

If EL2 is implemented and [HDCR](#).HPMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [[HDCR](#).HPMN..(PMCR_EL0.N-1)].

Note

The effect of [MDCR_EL2](#).HPMN or [HDCR](#).HPMN on the operation of this bit always applies if EL2 is implemented, at all Exception levels including EL2 and EL3, and regardless of whether EL2 is enabled in the current Security state. For more information, see the description of [MDCR_EL2](#).HPMN or [HDCR](#).HPMN.

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

Otherwise:

Reserved, RES0.

LC, bit [6]

When AArch32 is supported at EL0:

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0 [31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0 [63:0].

Arm deprecates use of [PMCR_EL0](#).LC = 0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

DP	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this bit.
0b1	When event counting for counters in the range [0..(MDCR_EL2 .HPMN-1)] is prohibited, cycle counting by PMCCNTR_EL0 is disabled.

For more information, see 'Prohibiting event counting'.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

When AArch32 is supported at EL0:

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR_EL0 counts every clock cycle.
0b1	When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR_EL0 to zero.

Note

Resetting [PMCCNTR_EL0](#) does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is **WO/RAZ**.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

P	Meaning
0b0	No action.
0b1	Reset all event counters, not including PMCCNTR_EL0 , to zero.

Note

Resetting the event counters does not change the event counter overflow bits. If FEAT_PMUv3p5 is implemented, the value of [MDCR_EL2.HLP](#), or PMCR_EL0.LP is ignored and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

E, bit [0]

Enable.

E	Meaning
0b0	All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0 , are disabled.
0b1	All event counters in the range [0..(PMN-1)] and PMCCNTR_EL0 , are enabled by PMCNTENSET_EL0 .

If EL2 is implemented then:

- If EL2 is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If PMN is less than PMCR_EL0.N, this bit does not affect the operation of event counters in the range [PMN..(PMCR_EL0.N-1)].

If EL2 is not implemented, PMN is PMCR_EL0.N.

Note

The effect of the following fields on the operation of this bit applies if EL2 is implemented regardless of whether EL2 is enabled in the current Security state:

- [HDCR](#).HPMN. See the description of [HDCR](#).HPMN for more information.
 - [MDCR_EL2](#).HPMN. See the description of [MDCR_EL2](#).HPMN for more information.
-

The reset behaviour of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMCR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE04	PMCR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																MPIDR_EL1 lo															

MPIDR_EL1lo, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing PMDEVAFF0

PMDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFA8	PMDEVAFF0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																MPIDR_EL1hi															

MPIDR_EL1hi, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing PMDEVAFF1

PMDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFAC	PMDEVAFF1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the Performance Monitor component.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVARCH is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARCHITECT											PRESENT	REVISION				ARCHID															

ARCHITECT, bits [31:21]

Defines the architecture of the component. For Performance Monitors, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

PRESENT, bit [20]

When set to 1, indicates that the DEVARCH is present.

This field is 1 in Armv8.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For Performance Monitors, the revision defined by Armv8 is 0x0.

All other values are reserved.

ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For Performance Monitors:

- Bits [15:12] are the architecture version, 0x2.
- Bits [11:0] are the architecture part number, 0xA16.

This corresponds to Performance Monitors architecture version PMUv3.

Note

The PMUv3 memory-mapped programmers' model can be used by devices other than Armv8 processors. Software must determine whether the PMU is attached to an Armv8 processor by using the [PMDEVAFF0](#) and [PMDEVAFF1](#) registers to discover the affinity of the PMU to any Armv8 processors.

Accessing PMDEVARCH

PMDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFBC	PMDEVARCH

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMDEVID, Performance Monitors Device ID register

The PMDEVID characteristics are:

Purpose

Provides information about features of the Performance Monitors implementation.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required from Armv8.2 and in any implementation that includes FEAT_PCSRv8p2. Otherwise, its location is RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID.PCSample](#).

Attributes

PMDEVID is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																		PCSample													

Bits [31:4]

Reserved, RES0.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using Performance Monitors registers.

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the Performance Monitors register space.
0b0001	PC Sample-based Profiling Extension is implemented in the Performance Monitors register space.

All other values are reserved.

FEAT_PCSRv8p2 implements the functionality identified by the value 0b0001.

Accessing PMDEVID

PMDEVID can be accessed through the external debug interface:

Component	Offset	Instance
-----------	--------	----------

PMU	0xFC8	PMDEVID
-----	-------	---------

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's performance monitor interface.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVTYPE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												SUB			MAJOR				

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Must read as 0x1 to indicate this is a component within a PE.

MAJOR, bits [3:0]

Major type. Must read as 0x6 to indicate this is a performance monitor component.

Accessing PMDEVTYPE

PMDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFCC	PMDEVTYPE

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMEVCNTR<n>_EL0\[31:0\]](#).

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVCNTR<n>\[31:0\]](#).

PMEVCNTR<n>_EL0 is in the Core power domain.

Attributes

PMEVCNTR<n>_EL0 is a:

- 64-bit register when FEAT_PMUv3p5 is implemented
- 32-bit register otherwise

Field descriptions

When FEAT_PMUv3p5 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Event counter n																															
Event counter n																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If the highest implemented Exception level is using AArch32, the optional external interface to the performance monitors is implemented, and the [PMCR.LP](#) and [HDCR.HLP](#) bits are RAZ/WI, then locations in the external interface to the performance monitors that map to PMEVCNTR<n>_EL0[63:32] return UNKNOWN values on reads.

If the implementation does not support AArch64, bits [63:32] of the event counters are not required to be implemented.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Event counter n																															

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>_EL0

External accesses to the performance monitors ignore [PMUSERENR_EL0](#) and, if implemented, [MDCR_EL2](#).{TPM, TPMCR, HPMN} and [MDCR_EL3](#).TPM. This means that all counters are accessible regardless of the current Exception level or privilege of the access.

If FEAT_PMuV3p5 is not implemented, when IsCorePowered(), DoubleLockStatus(), OSLockStatus() or !AllowExternalPMUAccess(), 32-bit accesses to 0x004+8×n have a CONSTRAINED UNPREDICTABLE behavior.

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVCNTR<n>_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x000 + (8 * n)	PMEVCNTR<n>_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMEVTYPER<n>_EL0\[31:0\]](#).

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVTYPER<n>\[31:0\]](#).

PMEVTYPER<n>_EL0 is in the Core power domain.

If event counter n is not implemented:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess(), accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

Attributes

PMEVTYPER<n>_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P	U	NSK	NSU	NSH	M	MT	SH	T	RLK	RLU	RLH	RES0				evtCount[15:10]						evtCount[9:0]									

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMEVTYPER<n>_EL0.RLK bit.

P	Meaning
0b0	Count events in EL1.
0b1	Do not count events in EL1.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMEVTYPER<n>_EL0.RLU bit.

U	Meaning
0b0	Count events in EL0.
0b1	Do not count events in EL0.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMEVTYPER<n>_EL0.RLH bit.

NSH	Meaning
0b0	Do not count events in EL2.
0b1	Count events in EL2.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

EL3 filtering bit.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in EL3 are counted.

Otherwise, events in EL3 are not counted.

Most applications can ignore this field and set its value to 0b0.

Note

This field is not visible in the AArch32 [PMEVTYPER<n>](#) System register.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]

When (FEAT_MTPMU is implemented and enabled) or an IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

Note

- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]**When FEAT_SEL2 is implemented and EL3 is implemented:**

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

Note

This field is not visible in the AArch32 [PMEVTYPER<n>](#) System register.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

T, bit [23]**When FEAT_TME is implemented:**

Transactional state filtering bit. Controls counting in Transactional state.

T	Meaning
0b0	This bit has no effect on the filtering of events.
0b1	Do not count events in Transactional state.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]**When FEAT_RME is implemented:**

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Realm EL1 are counted.

Otherwise, events in Realm EL1 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]**When FEAT_RME is implemented:**

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Realm EL0 are counted.

Otherwise, events in Realm EL0 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]

When FEAT_RME is implemented:

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Realm EL2 are counted.

Otherwise, events in Realm EL2 are not counted.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter [PMEVCNTR<n>_EL0](#).

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.

- If FEAT_PMUv3p1 is implemented, for the range 0x4000 to 0x403F, no events are counted, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED events, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVTYPER<n>_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x400 + (4 * n)	PMEVTYPER<n>_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR_EL0](#), and the event counters [PMEVCNTR<n>_EL0](#). Reading the register shows which overflow interrupt requests are enabled.

Configuration

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [PMINTENCLR_EL1\[31:0\]](#).

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENCLR\[31:0\]](#).

PMINTENCLR_EL1 is in the Core power domain.

Attributes

PMINTENCLR_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

[PMCCNTR_EL0](#) overflow interrupt request disable bit. Possible values are:

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR<n>_EL0 interrupt request.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENCLR_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENCLR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC60	PMINTENCLR_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR_EL0](#), and the event counters [PMEVCNTR<n>_EL0](#). Reading the register shows which overflow interrupt requests are enabled.

Configuration

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register [PMINTENSET_EL1\[31:0\]](#).

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENSET\[31:0\]](#).

PMINTENSET_EL1 is in the Core power domain.

Attributes

PMINTENSET_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

[PMCCNTR_EL0](#) overflow interrupt request enable bit. Possible values are:

C	Meaning
0b0	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
0b1	When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request enable bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, enables the PMEVCNTR<n>_EL0 interrupt request.

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENSET_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENSET_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC40	PMINTENSET_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

Purpose

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

It is IMPLEMENTATION DEFINED whether PMITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

PMITCTRL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

The following resets apply:

- If the register is implemented in the Core power domain:
 - On a Cold reset, this field resets to 0.
 - On an External debug reset, the value of this field is unchanged.
 - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
 - On a Cold reset, the value of this field is unchanged.
 - On an External debug reset, this field resets to 0.
 - On a Warm reset, the value of this field is unchanged.

Accessing PMITCTRL

PMITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xF00	PMITCTRL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

Purpose

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and [PMLSR](#) to check the current status of the lock.

Attributes

PMLAR is a 32-bit register.

Field descriptions

When Software Lock is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																KEY															

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																RES0															

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing PMLAR

PMLAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
PMU	0xFB0	PMLAR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

Purpose

Indicates the current status of the software lock for Performance Monitors registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses [PMLAR](#) to set or clear the lock, and PMLSR to check the current status of the lock.

Attributes

PMLSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																													nTT	SLK	SLI

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

When Software Lock is implemented and FEAT_DoPD is not implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behaviour of this field is:

- On an External debug reset, this field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Accessing PMLSR

PMLSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
PMU	0xFB4	PMLSR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation.

Configuration

PMMIR is in the Core power domain.

This register is present only when FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are RES0.

Attributes

PMMIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												BUS WIDTH				BUS SLOTS						SLOTS									

Bits [31:20]

Reserved, RES0.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as $\text{Log}_2(\text{number of bytes}) + 1$. Defined values are:

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is implemented, this field must not be zero.

Accessing PMMIR

If the Core power domain is off or in a low-power state, access on this interface returns an Error.

PMMIR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE40	PMMIR

This interface is accessible as follows:

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or !AllowExternalPMUAccess() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMOVSLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSLR_EL0 characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

Configuration

External register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMOVSLR_EL0\[31:0\]](#).

External register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSR\[31:0\]](#).

PMOVSLR_EL0 is in the Core power domain.

Attributes

PMOVSLR_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Cycle counter overflow clear bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

[PMCR_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow clear bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR](#).N is less than 31, bits [30:[PMCFGR](#).N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, clears the PMEVCNTR<n>_EL0 overflow bit to 0.

If FEAT_PMUv3p5 is implemented, [MDCR_EL2.HLP](#) and [PMCR_EL0.LP](#) control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>_EL0](#)[31:0] or unsigned overflow of [PMEVCNTR<n>_EL0](#)[63:0].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSLR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSLR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC80	PMOVSLR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#).

Configuration

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMOVSSET_EL0\[31:0\]](#).

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSSETI\[31:0\]](#).

PMOVSSET_EL0 is in the Core power domain.

Attributes

PMOVSSET_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Cycle counter overflow set bit.

C	Meaning
0b0	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

[PMCR_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow set bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR](#).N is less than 31, bits [30:[PMCFGR](#).N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, sets the PMEVCNTR<n>_EL0 overflow bit to 1.

If FEAT_PMUv3p5 is implemented, [MDCR_EL2.HLP](#) and [PMCR_EL0.LP](#) control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>_EL0](#)[31:0] or unsigned overflow of [PMEVCNTR<n>_EL0](#)[63:0].

The reset behaviour of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSSET_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSSET_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xCC0	PMOVSSET_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

PMPCSR, Program Counter Sample Register

The PMPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configuration

PMPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMPCSR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID](#).PCSample.

Support for 64-bit atomic reads is IMPLEMENTATION DEFINED. If 64-bit atomic reads are implemented, a 64-bit read of PMPCSR has the same side-effect as a 32-bit read of PMCSR[31:0] followed by a 32-bit read of PMPCSR[63:32], returning the combined value. For example, if the PE is in Debug state then a 64-bit atomic read returns bits[31:0] == 0xFFFFFFFF and bits[63:32] UNKNOWN.

Attributes

PMPCSR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32	
NS	EL	T	NSE	RES0	PCSample[55:32]																											
PCSample[31:0]																																
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	

NS, bit [63]

When FEAT_RME is implemented:

Together with the NSE field, indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

NSE	NS	Meaning
0b0	0b0	Secure.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Otherwise:

Non-secure state sample. Indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

EL	Meaning
0b00	Sample is from EL0.
0b01	Sample is from EL1.
0b10	Sample is from EL2.
0b11	Sample is from EL3.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

T, bit [60]

When FEAT_TME is implemented:

Transactional state of the sample. Indicates the Transactional state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

T	Meaning
0b0	Sample is from Non-transactional state.
0b1	Sample is from Transactional state.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSE, bit [59]

When FEAT_RME is implemented:

Together with the NS field, indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

For a description of the values derived by evaluating NS and NSE together, see PMPCSR.NS.

Otherwise:

Reserved, RES0.

Bits [58:56]

Reserved, RES0.

PCSample[55:32], bits [55:32]

Bits[55:32] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PCSample[31:0], bits [31:0]

Bits[31:0] of the sampled instruction address value.

PMPCSR[31:0] reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If an instruction has retired since the PE left Reset state, then the first read of PMPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

PMPCSR[31:0] reads as an UNKNOWN value when any of the following are true:

- The PE is in Reset state.
- No instruction has retired since the PE left Reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No instruction has retired since the last read of PMPCSR[31:0].

For the cases where a read of PMPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#) to UNKNOWN values.

Otherwise, a read of PMPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#). The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

For a read of PMPCSR[31:0] from the memory-mapped interface, if PMLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#) are unchanged.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

PMPCSR can be accessed through the external debug interface:

Component	Offset	Instance	Range
PMU	0x200	PMPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x204	PMPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x220	PMPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.

- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	0x224	PMPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PART_0							

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

Accessing PMPIDR0

PMPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFE0	PMPIDR0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.
This register is required for CoreSight compliance.

Attributes

PMPIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								DES_0				PART_1			

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

PART_1, bits [3:0]

Part number, most significant nibble.

Accessing PMPIDR1

PMPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFE4	PMPIDR1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMPIDR2, Performance Monitors Peripheral Identification Register 2

The PMPIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.
This register is required for CoreSight compliance.

Attributes

PMPIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								REVISION				JEDEC		DES_1	

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

JEDEC, bit [3]

RAO. Indicates a JEP106 identity code is used.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

Accessing PMPIDR2

PMPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFE8	PMPIDR2

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												REVAND				CMOD			

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using [PMPIDR2](#).REVISION as an extension to the Part number must use this field as a major revision number.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

Accessing PMPIDR3

PMPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFEC	PMPIDR3

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.
For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.
This register is required for CoreSight compliance.

Attributes

PMPIDR4 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								SIZE				DES_2			

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. RAZ. Log2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

Accessing PMPIDR4

PMPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFD0	PMPIDR4

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see 'SW_INCR'.

Configuration

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMSWINC_EL0\[31:0\]](#).

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMSWINC\[31:0\]](#).

PMSWINC_EL0 is in the Core power domain.

Implementation of this register is OPTIONAL.

If this register is implemented, use of it is deprecated.

If 1 is written to bit [n] from the external debug interface, it is CONSTRAINED UNPREDICTABLE whether or not a SW_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

Attributes

PMSWINC_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bit [31]

Reserved, RES0.

P<n>, bit [n], for n = 30 to 0

Event counter software increment bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are WI.

P<n>	Meaning
0b0	No action. The write to this bit is ignored.
0b1	It is CONSTRAINED UNPREDICTABLE whether a SW_INCR event is generated for event counter n.

Accessing PMSWINC_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMSWINC_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xCA0	PMSWINC_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMVIDSR, VMID Sample Register

The PMVIDSR characteristics are:

Purpose

Contains the sampled VMID value that is captured on reading [PMPCSR](#)[31:0].

Configuration

PMVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMVIDSR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID](#).PCSample.

Attributes

PMVIDSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																VMID[15:8]								VMID							

Bits [31:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When FEAT_VMID16 is implemented:

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]

VMID sample. The VMID associated with the most recent [PMPCSR](#) sample. When the most recent [PMPCSR](#) sample was generated:

- This field is set to an UNKNOWN value if any of the following apply:
 - EL2 is disabled in the current Security state.
 - The PE is executing at EL2.

- EL2 is enabled in the current Security state, the PE is executing at EL0, EL2 is using AArch64, HCR_EL2.E2H == 1, and HCR_EL2.TGE == 1.
- Otherwise:
 - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or [VTCR_EL2.VS](#) is 1, this field is set to [VTTBR_EL2.VMID](#).
 - If EL2 is using AArch64, FEAT_VMID16 is implemented, and [VTCR_EL2.VS](#) is 0, PMVIDSR.VMID[7:0] is set to [VTTBR_EL2.VMID\[7:0\]](#) and PMVIDSR.VMID[15:8] is RES0.
 - If EL2 is using AArch32, this field is set to [VTTBR.VMID](#).

Because the value written to PMVIDR is an indirect read of the VMID value, it is CONSTRAINED UNPREDICTABLE whether PMVIDSR is set to the original or new value if [PMPCSR](#) samples:

- An instruction that writes to the VMID value.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behaviour of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

PMVIDSR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x20C	PMVIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/06/2021 15:21; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCACATR<n>, Address Comparator Access Type Register <n>, n = 0 - 15

The TRCACATR<n> characteristics are:

Purpose

Defines the type of access for the corresponding [TRCACVR<n>](#) Register. This register configures the context type, Exception levels, alignment, masking that is applied by the Address Comparator, and how the Address Comparator behaves when it is one half of an Address Range Comparator.

Configuration

External register TRCACATR<n> bits [63:0] are architecturally mapped to AArch64 System register [TRCACATR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS * 2 > n. Otherwise, direct accesses to TRCACATR<n> are RES0.

Attributes

TRCACATR<n> is a 64-bit register.

Field descriptions

63626160595857565554535251	50	49	48	47	46	45
RES0						
EXLEVEL_RL_EL2	EXLEVEL_RL_EL1	EXLEVEL_RL_EL0	RES0	EXLEVEL_NS_EL2	EXLEVEL_NS_EL1	EXLEVEL_NS_EL0
31302928272625242322212019	18	17	16	15	14	13

Bits [63:19]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [18]

When TRCIDR6.EXLEVEL_RL_EL2 == 1:

Realm EL2 address comparison control. Controls whether a comparison can occur at EL2 in Realm state.

EXLEVEL_RL_EL2	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL2 is 0 the Address Comparator performs comparisons in Realm EL2. When TRCACATR<n>.EXLEVEL_NS_EL2 is 1 the Address Comparator does not perform comparisons in Realm EL2.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL2 is 0 the Address Comparator does not perform comparisons in Realm EL2. When TRCACATR<n>.EXLEVEL_NS_EL2 is 1 the Address Comparator performs comparisons in Realm EL2.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [17]**When TRCIDR6.EXLEVEL_RL_EL1 == 1:**

Realm EL1 address comparison control. Controls whether a comparison can occur at EL1 in Realm state.

EXLEVEL_RL_EL1	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator performs comparisons in Realm EL1. When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator does not perform comparisons in Realm EL1.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator does not perform comparisons in Realm EL1. When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator performs comparisons in Realm EL1.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [16]**When TRCIDR6.EXLEVEL_RL_EL0 == 1:**

Realm EL0 address comparison control. Controls whether a comparison can occur at EL0 in Realm state.

EXLEVEL_RL_EL0	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator performs comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator does not perform comparisons in Realm EL0.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator does not perform comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator performs comparisons in Realm EL0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [14]**When Non-secure EL2 is implemented:**

Non-secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Non-secure state.

EXLEVEL_NS_EL2	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL2.
0b1	The Address Comparator does not perform comparisons in Non-secure EL2.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [13]**When Non-secure EL1 is implemented:**

Non-secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Non-secure state.

EXLEVEL_NS_EL1	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL1.
0b1	The Address Comparator does not perform comparisons in Non-secure EL1.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [12]**When Non-secure EL0 is implemented:**

Non-secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Non-secure state.

EXLEVEL_NS_EL0	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL0.
0b1	The Address Comparator does not perform comparisons in Non-secure EL0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [11]**When EL3 is implemented:**

EL3 address comparison control. Controls whether a comparison can occur at EL3.

EXLEVEL_S_EL3	Meaning
0b0	The Address Comparator performs comparisons in EL3.
0b1	The Address Comparator does not perform comparisons in EL3.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [10]**When EL2 is implemented and FEAT_SEL2 is implemented:**

Secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Secure state.

EXLEVEL_S_EL2	Meaning
0b0	The Address Comparator performs comparisons in Secure EL2.
0b1	The Address Comparator does not perform comparisons in Secure EL2.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [9]**When Secure EL1 is implemented:**

Secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Secure state.

EXLEVEL_S_EL1	Meaning
0b0	The Address Comparator performs comparisons in Secure EL1.
0b1	The Address Comparator does not perform comparisons in Secure EL1.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [8]**When Secure EL0 is implemented:**

Secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Secure state.

EXLEVEL S EL0	Meaning
0b0	The Address Comparator performs comparisons in Secure EL0.
0b1	The Address Comparator does not perform comparisons in Secure EL0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

CONTEXT, bits [6:4]

When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:

Selects a Context Identifier Comparator or Virtual Context Identifier Comparator:

CONTEXT	Meaning	Applies when
0b000	Comparator 0.	
0b001	Comparator 1.	When TRCIDR4.NUMCIDC > 0b0001 or TRCIDR4.NUMVMIDC > 0b0001
0b010	Comparator 2.	When TRCIDR4.NUMCIDC > 0b0010 or TRCIDR4.NUMVMIDC > 0b0010
0b011	Comparator 3.	When TRCIDR4.NUMCIDC > 0b0011 or TRCIDR4.NUMVMIDC > 0b0011
0b100	Comparator 4.	When TRCIDR4.NUMCIDC > 0b0100 or TRCIDR4.NUMVMIDC > 0b0100
0b101	Comparator 5.	When TRCIDR4.NUMCIDC > 0b0101 or TRCIDR4.NUMVMIDC > 0b0101
0b110	Comparator 6.	When TRCIDR4.NUMCIDC > 0b0110 or TRCIDR4.NUMVMIDC > 0b0110
0b111	Comparator 7.	When TRCIDR4.NUMCIDC > 0b0111 or TRCIDR4.NUMVMIDC > 0b0111

The width of this field is dependent on the maximum number of Context Identifier Comparators or Virtual Context Identifier Comparators implemented. Unimplemented bits are RES0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CONTEXTTYPE, bits [3:2]

When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:

Controls whether the Address Comparator is dependent on a Context Identifier Comparator, a Virtual Context Identifier Comparator, or both comparisons.

CONTEXTTYPE	Meaning	Applies when
0b00	The Address Comparator is not dependent on the Context Identifier Comparators or Virtual Context Identifier Comparators.	
0b01	The Address Comparator is dependent on the Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Context Identifier Comparator and the address comparison match.	When TRCIDR4.NUMCIDC != 0b0000
0b10	The Address Comparator is dependent on the Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Virtual Context Identifier Comparator and the address comparison match.	When TRCIDR4.NUMVMIDC != 0b0000
0b11	The Address Comparator is dependent on the Context Identifier Comparator and Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if the Context Identifier Comparator, the Virtual Context Identifier Comparator, and address comparison all match.	When TRCIDR4.NUMCIDC != 0b0000 and TRCIDR4.NUMVMIDC != 0b0000

If [TRCIDR4.NUMCIDC](#) == 0b0000, then bit [2] is RES0.

If [TRCIDR4.NUMVMIDC](#) == 0b0000, then bit [3] is RES0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [1:0]

Reserved, RES0.

Accessing TRCACATR<n>

Must be programmed if any of the following are true:

- [TRCBBCTL](#)R.RANGE[n/2] == 1.
- [TRCRSCTL](#)R<a>.GROUP == 0b0100 and [TRCRSCTL](#)R<a>.SAC[n] == 1.
- [TRCRSCTL](#)R<a>.GROUP == 0b0101 and [TRCRSCTL](#)R<a>.ARC[n/2] == 1.
- [TRCVIIECTL](#)R.EXCLUDE[n/2] == 1.
- [TRCVIIECTL](#)R.INCLUDE[n/2] == 1.
- [TRCVISSCTL](#)R.START[n] == 1.
- [TRCVISSCTL](#)R.STOP[n] == 1.
- TRCSSCCR<>.ARC[n/2] == 1.
- TRCSSCCR<>.SAC[n] == 1.
- [TRCQCTL](#)R.RANGE[n/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCACATR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x480 + (8 * n)	TRCACATR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCACVR<n>, Address Comparator Value Register <n>, n = 0 - 15

The TRCACVR<n> characteristics are:

Purpose

Contains the address value.

Configuration

External register TRCACVR<n> bits [63:0] are architecturally mapped to AArch64 System register [TRCACVR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS * 2 > n. Otherwise, direct accesses to TRCACVR<n> are RES0.

Attributes

TRCACVR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ADDRESS																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ADDRESS, bits [63:0]

Address Value.

The Address Comparators can support implementations that use multiple address widths. When the trace unit compares the ADDRESS field with an address that has a width less than this field, then the address must be zero-extended to the ADDRESS field width. The trace unit then compares all implemented bits. For example, in a system that supports both 32-bit and 64-bit addresses, when the PE is in AArch32 state the comparator must zero-extend the 32-bit address and compare against the full 64 bits that are stored in the TRCACVR<n>. This requires that the trace analyzer always programs all implemented bits of the TRCACVR<n>.

The result of writing a value other than all zeros or all ones to ADDRESS at bits[63:P] is an UNKNOWN value, where P is defined as the maximum virtual address size supported by the PE.

The result of writing a value of all zeros or all ones to ADDRESS at bits[63:P] is the written value, and a read of the register returns the written value.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCACVR<n>

Must be programmed if any of the following are true:

- [TRCBBCTLR](#).RANGE[n/2] == 1.
- [TRCRSCTLR<a>](#).GROUP == 0b0100 and [TRCRSCTLR<a>](#).SAC[n] == 1.
- [TRCRSCTLR<a>](#).GROUP == 0b0101 and [TRCRSCTLR<a>](#).ARC[n/2] == 1.
- [TRCVIIECTLR](#).EXCLUDE[n/2] == 1.
- [TRCVIIECTLR](#).INCLUDE[n/2] == 1.

- [TRCVISSCTLR](#).START[n] == 1.
- [TRCVISSCTLR](#).STOP[n] == 1.
- TRCSSCCR<>.ARC[n/2] == 1.
- TRCSSCCR<>.SAC[n] == 1.
- [TRCQCTLR](#).RANGE[n/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCACVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x400 + (8 * n)	TRCACVR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCAUTHSTATUS, Authentication Status Register

The TRCAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCAUTHSTATUS bits [31:0] are architecturally mapped to AArch64 System register [TRCAUTHSTATUS\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCAUTHSTATUS are RES0.

Attributes

TRCAUTHSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTNID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLNID.

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.

HNID, bits [11:10]

Hyp Non-invasive Debug. Indicates whether a separate enable control for EL2 non-invasive debug features is implemented and enabled.

HNID	Meaning
0b00	Separate Hyp non-invasive debug enable not implemented, or EL2 non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

HID, bits [9:8]

Hyp Invasive Debug. Indicates whether a separate enable control for EL2 invasive debug features is implemented and enabled.

HID	Meaning
0b00	Separate Hyp invasive debug enable not implemented, or EL2 invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

SNID, bits [7:6]

Secure Non-invasive Debug. Indicates whether Secure non-invasive debug features are implemented and enabled.

SNID	Meaning
0b00	Secure non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

When EL3 is implemented, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b00.

When EL3 is not implemented and the PE is Secure, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

SID, bits [5:4]

Secure Invasive Debug. Indicates whether Secure invasive debug features are implemented and enabled.

SID	Meaning
0b00	Secure invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

NSNID, bits [3:2]

Non-secure Non-invasive Debug. Indicates whether Non-secure non-invasive debug features are implemented and enabled.

NSNID	Meaning
0b00	Non-secure non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

When EL3 is implemented, this field reads as 0b11.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b11.

When EL3 is not implemented and the PE is Secure, this field reads as 0b00.

NSID, bits [1:0]

Non-secure Invasive Debug. Indicates whether Non-secure invasive debug features are implemented and enabled.

NSID	Meaning
0b00	Non-secure invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

Accessing TRCAUTHSTATUS

For implementations that support multiple access mechanisms, different access mechanisms can return different values for reads of TRCAUTHSTATUS if the authentication signals have changed and that change has not yet been synchronized by a Context synchronization event. This scenario can happen if, for example, the external debugger view is implemented separately from the system instruction view to allow for separate power domains, and so observes changes on the signals differently.

External debugger accesses to this register are unaffected by the OS Lock.

TRCAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFB8	TRCAUTHSTATUS

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCAUXCTLR, Auxiliary Control Register

The TRCAUXCTLR characteristics are:

Purpose

The function of this register is IMPLEMENTATION DEFINED.

Configuration

External register TRCAUXCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCAUXCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCAUXCTLR are RES0.

Attributes

TRCAUXCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to 0.

Accessing TRCAUXCTLR

If this register is nonzero then it might cause the behavior of a trace unit to contradict this architecture specification. See the documentation of the specific implementation for information about the IMPLEMENTATION DEFINED support for this register.

TRCAUXCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x018	TRCAUXCTLR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCBBCTLR, Branch Broadcast Control Register

The TRCBBCTLR characteristics are:

Purpose

Controls the regions in the memory map where branch broadcasting is active.

Configuration

External register TRCBBCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCBBCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, TRCIDR0.TRCBB == 1 and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCBBCTLR are RES0.

Attributes

TRCBBCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										MODE		RANGE[7]		RANGE[6]		RANGE[5]		RANGE[4]		RANGE[3]		RANGE[2]		RANGE[1]		RANGE[0]		RANGE[0]			

Bits [31:9]

Reserved, RES0.

MODE, bit [8]

Mode.

MODE	Meaning
0b0	Exclude Mode. Branch broadcasting is not active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then branch broadcasting is active for all instructions.
0b1	Include Mode. Branch broadcasting is active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then the behavior of the trace unit is CONSTRAINED UNPREDICTABLE. That is, the trace unit might or might not consider any instructions to be in a branch broadcasting region.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Address range field.

Selects whether Address Range Comparator <m> is used with branch broadcasting.

RANGE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected.
0b1	The address range that Address Range Comparator <m> defines, is selected.

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCBBCTLR

Must be programmed if [TRCCONFIGR](#).BB == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCBBCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x03C	TRCBBCTLR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

TRCCCCTLR, Cycle Count Control Register

The TRCCCCTLR characteristics are:

Purpose

Set the threshold value for cycle counting.

Configuration

External register TRCCCCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCCCCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR0.TRCCCI == 1. Otherwise, direct accesses to TRCCCCTLR are RES0.

Attributes

TRCCCCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																				THRESHOLD											

Bits [31:12]

Reserved, RES0.

THRESHOLD, bits [11:0]

Sets the threshold value for instruction trace cycle counting.

The minimum threshold value that can be programmed into THRESHOLD is given in [TRCIDR3.CCITMIN](#). If the THRESHOLD value is smaller than the value in [TRCIDR3.CCITMIN](#) then the behavior is CONSTRAINED UNPREDICTABLE. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

Writing a value of zero when [TRCONFIGR.CCI](#) enables instruction trace cycle counting results in CONSTRAINED UNPREDICTABLE behavior. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCCCTLR

Must be programmed if [TRCONFIGR.CCI](#) == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCCCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x038	TRCCCCTLR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCCIDCCTLR0, Context Identifier Comparator Control Register 0

The TRCCIDCCTLR0 characteristics are:

Purpose

Contains Context identifier mask values for the [TRCCIDCVR<n>](#) registers, for n = 0 to 3.

Configuration

External register TRCCIDCCTLR0 bits [31:0] are architecturally mapped to AArch64 System register [TRCCIDCCTLR0\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMCIDC > 0x0 and TRCIDR2.CIDSIZE > 0b00000. Otherwise, direct accesses to TRCCIDCCTLR0 are RES0.

Attributes

TRCCIDCCTLR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	
COMP3[7]	COMP3[6]	COMP3[5]	COMP3[4]	COMP3[3]	COMP3[2]	COMP3[1]	COMP3[0]	COMP2[7]	COMP2[6]	COMP2[5]	COMP2[4]

COMP3[<m>], bit [m+24], for m = 7 to 0
When TRCIDR4.NUMCIDC > 3:

TRCCIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR3. Each bit in this field corresponds to a byte in TRCCIDCVR3.

COMP3[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0
When TRCIDR4.NUMCIDC > 2:

TRCCIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR2. Each bit in this field corresponds to a byte in TRCCIDCVR2.

COMP2[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0

When TRCIDR4.NUMCIDC > 1:

TRCCIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR1. Each bit in this field corresponds to a byte in TRCCIDCVR1.

COMP1[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0

When TRCIDR4.NUMCIDC > 0:

TRCCIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR0. Each bit in this field corresponds to a byte in TRCCIDCVR0.

COMP0[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTLR0

If software uses the [TRCCIDCVR<n>](#) registers, for n = 0 to 3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCCIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCCIDCVR<n>](#) is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCCTLR0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x680	TRCCIDCCTLR0

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCIDCCTL1, Context Identifier Comparator Control Register 1

The TRCCIDCCTL1 characteristics are:

Purpose

Contains Context identifier mask values for the [TRCCIDCVR<n>](#) registers, for n = 4 to 7.

Configuration

External register TRCCIDCCTL1 bits [31:0] are architecturally mapped to AArch64 System register [TRCCIDCCTL1\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMCIDC > 0x4 and TRCIDR2.CIDSIZE > 0b00000. Otherwise, direct accesses to TRCCIDCCTL1 are RES0.

Attributes

TRCCIDCCTL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	
COMP7[7]	COMP7[6]	COMP7[5]	COMP7[4]	COMP7[3]	COMP7[2]	COMP7[1]	COMP7[0]	COMP6[7]	COMP6[6]	COMP6[5]	COMP6[4]

COMP7[<m>], bit [m+24], for m = 7 to 0
When TRCIDR4.NUMCIDC > 7:

TRCCIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR7. Each bit in this field corresponds to a byte in TRCCIDCVR7.

COMP7[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0
When TRCIDR4.NUMCIDC > 6:

TRCCIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR6. Each bit in this field corresponds to a byte in TRCCIDCVR6.

COMP6[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0

When TRCIDR4.NUMCICD > 5:

TRCCIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR5. Each bit in this field corresponds to a byte in TRCCIDCVR5.

COMP5[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0

When TRCIDR4.NUMCICD > 4:

TRCCIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR4. Each bit in this field corresponds to a byte in TRCCIDCVR4.

COMP4[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTLR1

If software uses the [TRCCIDCVR<n>](#) registers, for n = 4 to 7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCCIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCCIDCVR<n>](#) is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCCTLR1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x684	TRCCIDCCTLR1

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

TRCCIDCVR<n>, Context Identifier Comparator Value Registers <n>, n = 0 - 7

The TRCCIDCVR<n> characteristics are:

Purpose

Contains a Context identifier value.

Configuration

External register TRCCIDCVR<n> bits [63:0] are architecturally mapped to AArch64 System register [TRCCIDCVR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMCIDC > n. Otherwise, direct accesses to TRCCIDCVR<n> are RES0.

Attributes

TRCCIDCVR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																VALUE															
																VALUE															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

VALUE, bits [63:0]

Context identifier value. The width of this field is indicated by [TRCIDR2.CIDSIZE](#). Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Context identifier is zero until the PE updates the Context identifier.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCIDCVR<n>

Must be programmed if any of the following are true:

- [TRCRSCTLR<a>.GROUP](#) == 0b0110 and [TRCRSCTLR<a>.CID\[n\]](#) == 1.
- [TRCACATR<a>.CONTEXTTYPE](#) == 0b01 or 0b11 and [TRCACATR<a>.CONTEXT](#) == n.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x600 + (8 * n)	TRCCIDCVR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.

- Otherwise accesses to this register are **RW**.

TRCCIDR0, Component Identification Register 0

The TRCCIDR0 characteristics are:

Purpose

Provides discovery information about the component.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCIDR0 are RES0.

Attributes

TRCCIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_0							

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Component identification preamble, segment 0.
Reads as 0x0D.
Access to this field is **RO**.

Accessing TRCCIDR0

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFF0	TRCCIDR0

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCCIDR1, Component Identification Register 1

The TRCCIDR1 characteristics are:

Purpose

Provides discovery information about the component.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCIDR1 are RES0.

Attributes

TRCCIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								CLASS			PRMBL_1				

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight peripheral.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

PRMBL_1, bits [3:0]

Component identification preamble, segment 1.

Reads as 0b0000.

Access to this field is **RO**.

Accessing TRCCIDR1

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFF4	TRCCIDR1

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCCIDR2, Component Identification Register 2

The TRCCIDR2 characteristics are:

Purpose

Provides discovery information about the component.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCIDR2 are RES0.

Attributes

TRCCIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_2							

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Component identification preamble, segment 2.
Reads as 0x05.
Access to this field is **RO**.

Accessing TRCCIDR2

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFF8	TRCCIDR2

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCCIDR3, Component Identification Register 3

The TRCCIDR3 characteristics are:

Purpose

Provides discovery information about the component.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCIDR3 are RES0.

Attributes

TRCCIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PRMBL_3							

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Component identification preamble, segment 3.
Reads as 0xB1.
Access to this field is **RO**.

Accessing TRCCIDR3

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFFC	TRCCIDR3

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCLAIMCLR, Claim Tag Clear Register

The TRCLAIMCLR characteristics are:

Purpose

In conjunction with [TRCCLAIMSET](#), provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCCLAIMCLR bits [31:0] are architecturally mapped to AArch64 System register [TRCCLAIMCLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCLAIMCLR are RES0.

Attributes

TRCLAIMCLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18
CLR[31]	CLR[30]	CLR[29]	CLR[28]	CLR[27]	CLR[26]	CLR[25]	CLR[24]	CLR[23]	CLR[22]	CLR[21]	CLR[20]	CLR[19]	CLR[18]

CLR[<m>], bit [m], for m = 31 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLR[<m>]	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The number of Claim Tag bits implemented is indicated in [TRCCLAIMSET](#).

This bit reads-as-zero and ignores writes if $m >$ the number of Claim Tag bits.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to 0.

Access to this field is **W1C**.

Accessing TRCLAIMCLR

TRCLAIMCLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFA4	TRCCLAIMCLR

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCLAIMSET, Claim Tag Set Register

The TRCCLAIMSET characteristics are:

Purpose

In conjunction with [TRCCLAIMCLR](#), provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCCLAIMSET bits [31:0] are architecturally mapped to AArch64 System register [TRCCLAIMSET\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCLAIMSET are RES0.

The number of claim tag bits implemented is IMPLEMENTATION DEFINED. Arm recommends that implementations support a minimum of four claim tag bits, that is, SET[3:0] reads as 0b1111.

Attributes

TRCCLAIMSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SET[31]	SET[30]	SET[29]	SET[28]	SET[27]	SET[26]	SET[25]	SET[24]	SET[23]	SET[22]	SET[21]	SET[20]	SET[19]	SET[18]	SET[17]	SET[16]	SET[15]	SET[14]	SET[13]	SET[12]	SET[11]	SET[10]	SET[9]	SET[8]	SET[7]	SET[6]	SET[5]	SET[4]	SET[3]	SET[2]	SET[1]	SET[0]

SET[<m>], bit [m], for m = 31 to 0

Claim Tag Set. Indicates whether Claim Tag bit <m> is implemented, and is used to set Claim Tag bit <m> to 1.

SET[<m>]	Meaning
0b0	On a read: Claim Tag bit <m> is not implemented. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is implemented. On a write: Set Claim Tag bit <m> to 1.

This bit reads-as-zero and ignores writes if m > the number of Claim Tag bits.

Access to this field is **RAO/W1S**.

Accessing TRCCLAIMSET

TRCCLAIMSET can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFA0	TRCCLAIMSET

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCNTCTLR<n>, Counter Control Register <n>, n = 0 - 3

The TRCCNTCTLR<n> characteristics are:

Purpose

Controls the operation of Counter <n>.

Configuration

External register TRCCNTCTLR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCCNTCTLR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMCNTR > n. Otherwise, direct accesses to TRCCNTCTLR<n> are RES0.

Attributes

TRCCNTCTLR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3
RES0														CNTCHAIN	RLDSELF	RLDEVENT_TYPE	RES0	RLDEVENT_SEL	CNTEVENT_TYPE	RES0	CNTEVENT_SEL	RES0	CNTEVENT_TYPE	RES0	CNTEVENT_SEL	RES0	CNTEVENT_TYPE	RES0

Bits [31:18]

Reserved, RES0.

CNTCHAIN, bit [17]

For TRCCNTCTLR3 and TRCCNTCTLR1, this field controls whether the Counter decrements when a reload event occurs for Counter <n-1>.

CNTCHAIN	Meaning
0b0	The Counter does not decrement when a reload event for Counter <n-1> occurs.
0b1	Counter <n> decrements when a reload event for Counter <n-1> occurs. This concatenates Counter <n> and Counter <n-1>, to provide a larger count value.

CNTCHAIN is not implemented for TRCCNTCTLR0 and TRCCNTCTLR2.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDSELF, bit [16]

Controls whether a reload event occurs for the Counter, when the Counter reaches zero.

RLDSELF	Meaning
0b0	Normal mode. The Counter is in Normal mode.
0b1	Self-reload mode. The Counter is in Self-reload mode.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDEVENT_TYPE, bit [15]

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes a reload event for Counter <n>.

RLDEVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCCNTCTLR<n>.RLDEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.RLDEVENT.SEL[4] is RES0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

RLDEVENT_SEL, bits [12:8]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.TYPE controls whether TRCCNTCTLR<n>.RLDEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes a reload event for Counter <n>.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

CNTEVENT_TYPE, bit [7]

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes Counter <n> to decrement.

CNTEVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCCNTCTLR<n>.CNTEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.CNTEVENT.SEL[4] is RES0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

CNTEVENT_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.TYPE controls whether TRCCNTCTLR<n>.CNTEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes Counter <n> to decrement.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTCTLR<n>

Must be programmed if [TRCRSCTLR<a>.GROUP == 0b0010](#) and [TRCRSCTLR<a>.COUNTERS\[n\] == 1](#).

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCNTCTLR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x150 + (4 * n)	TRCCNTCTLR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCNTRLDVR<n>, Counter Reload Value Register <n>, n = 0 - 3

The TRCCNTRLDVR<n> characteristics are:

Purpose

This sets or returns the reload count value for Counter <n>.

Configuration

External register TRCCNTRLDVR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCCNTRLDVR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMCNTR > n. Otherwise, direct accesses to TRCCNTRLDVR<n> are RES0.

Attributes

TRCCNTRLDVR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																VALUE															

Bits [31:16]

Reserved, RES0.

VALUE, bits [15:0]

Contains the reload value for Counter <n>. When a reload event occurs for Counter <n> then the trace unit copies the VALUE<n> field into Counter <n>.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTRLDVR<n>

Must be programmed if [TRCRSCTLR<a>](#).GROUP == 0b0010 and [TRCRSCTLR<a>](#).COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCNTRLDVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x140 + (4 * n)	TRCCNTRLDVR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCNTRLDVR<n>, Counter Reload Value Register <n>, n = 0 - 3

TRCCNTVR<n>, Counter Value Register <n>, n = 0 - 3

The TRCCNTVR<n> characteristics are:

Purpose

This sets or returns the value of Counter <n>.

Configuration

External register TRCCNTVR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCCNTVR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMCNTR > n. Otherwise, direct accesses to TRCCNTVR<n> are RES0.

Attributes

TRCCNTVR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																VALUE															

Bits [31:16]

Reserved, RES0.

VALUE, bits [15:0]

Contains the count value of Counter.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTVR<n>

Must be programmed if [TRCRSCTLR<a>](#).GROUP == 0b0010 and [TRCRSCTLR<a>](#).COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCCNTVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x160 + (4 * n)	TRCCNTVR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCNTVR<n>, Counter Value Register <n>, n = 0 - 3

TRCCONFIGR, Trace Configuration Register

The TRCCONFIGR characteristics are:

Purpose

Controls the tracing options.

Configuration

External register TRCCONFIGR bits [31:0] are architecturally mapped to AArch64 System register [TRCCONFIGR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCONFIGR are RES0.

Attributes

TRCCONFIGR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																VMIDOPT	QE	RSTS	RES0	VMIDCID	RES0	CCI	BB	RES0	RES1						

Bits [31:16]

Reserved, RES0.

VMIDOPT, bit [15]

When TRCIDR2.VMIDOPT == 0b01:

Virtual context identifier selection control.

VMIDOPT	Meaning
0b0	VTTBR_EL2 .VMID is used as the Virtual context identifier.
0b1	CONTEXTIDR_EL2 .PROCID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == 0b00:

Reserved, RES0.

Virtual context identifier selection control.

[VTTBR_EL2](#).VMID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == 0b10:

Reserved, RES1.

Virtual context identifier selection control.

[CONTEXTIDR_EL2](#).PROCID is used as the Virtual context identifier.

Otherwise:

Reserved, RES0.

QE, bits [14:13]

When TRCIDR0.QSUPP == 0b01:

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b01	Q elements with instruction counts are enabled.
	Q elements without instruction counts are disabled.

All other values are reserved.

When TRCIDR0.QSUPP == 0b10:

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b11	Q elements with instruction counts are enabled.
	Q elements without instruction counts are enabled.

All other values are reserved.

When TRCIDR0.QSUPP == 0b11:

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b01	Q elements with instruction counts are enabled.
	Q elements without instruction counts are disabled.
0b11	Q elements with instruction counts are enabled.
	Q elements without instruction counts are enabled.

All other values are reserved.

Otherwise:

Reserved, RES0.

RS, bit [12]

When TRCIDR0.RETSTACK == 1:

Return stack control.

RS	Meaning
0b0	Return stack is disabled.
0b1	Return stack is enabled.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TS, bit [11]

When TRCIDR0.TSSIZE != 0b000000:

Global timestamp tracing control.

TS	Meaning
0b0	Global timestamp tracing is disabled.
0b1	Global timestamp tracing is enabled.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [10:8]

Reserved, RES0.

VMID, bit [7]

When TRCIDR2.VMIDSIZE != 0b000000:

Virtual context identifier tracing control.

VMID	Meaning
0b0	Virtual context identifier tracing is disabled.
0b1	Virtual context identifier tracing is enabled.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CID, bit [6]

When TRCIDR2.CIDSIZE != 0b000000:

Context identifier tracing control.

CID	Meaning
0b0	Context identifier tracing is disabled.
0b1	Context identifier tracing is enabled.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

CCI, bit [4]

When **TRCIDR0.TRCCCI == 1**:

Cycle counting instruction tracing control.

CCI	Meaning
0b0	Cycle counting instruction tracing is disabled.
0b1	Cycle counting instruction tracing is enabled.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BB, bit [3]

When **TRCIDR0.TRCBB == 1**:

Branch broadcasting control.

BB	Meaning
0b0	Branch broadcasting is disabled.
0b1	Branch broadcasting is enabled.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [2:1]

Reserved, RES0.

Bit [0]

Reserved, RES1.

Accessing TRCCONFIGR

Must always be programmed.

TRCCONFIGR.QE must be set to 0b00 if TRCCONFIGR.BB is not 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCONFIGR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x010	TRCCONFIGR

This interface is accessible as follows:

- When OSLockStatus(), or !IsTraceCorePowered() or !AllowExternalTraceAccess() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCDEVAFF, Device Affinity Register

The TRCDEVAFF characteristics are:

Purpose

For additional information, see the CoreSight Architecture Specification.

Reads the same value as the [MPIDR_EL1](#) register for the PE that this trace unit has affinity with.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVAFF are RES0.

Attributes

TRCDEVAFF is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																	MPIDR_EL1														
																	MPIDR_EL1														
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MPIDR_EL1, bits [63:0]

Read-only copy of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing TRCDEVAFF

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVAFF can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFA8	TRCDEVAFF

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

TRCDEVARCH, Device Architecture Register

The TRCDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCDEVARCH bits [31:0] are architecturally mapped to AArch64 System register [TRCDEVARCH\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVARCH are RES0.

Attributes

TRCDEVARCH is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
ARCHITECT											PRESENT	REVISION				ARCHVER				ARCHPART												

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

ARCHITECT	Meaning
0b01000111011	JEP106 continuation code 0x4, ID code 0x3B. Arm Limited.

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

PRESENT, bit [20]

DEVARCH Present. Defines that the DEVARCH register is present.

PRESENT	Meaning
0b0	Device Architecture information not present.
0b1	Device Architecture information present.

This field reads as 1.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

REVISION	Meaning
0b0000	ETEv1.0, FEAT_ETE.
0b0001	ETEv1.1, FEAT_ETEv1p1.
0b0010	ETEv1.2, FEAT_ETEv1p2.

All other values are reserved.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0101	ETEv1.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0x5.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA13	Arm PE trace architecture.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA13.

Accessing TRCDEVARCH

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFBC	TRCDEVARCH

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCDEVID, Device Configuration Register

The TRCDEVID characteristics are:

Purpose

Provides discovery information for the component.
For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCDEVID bits [31:0] are architecturally mapped to AArch64 System register [TRCDEVID\[31:0\]](#).
This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVID are RES0.

Attributes

TRCDEVID is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCDEVID

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVID can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFC8	TRCDEVID

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCDEVID1, Device Configuration Register 1

The TRCDEVID1 characteristics are:

Purpose

Provides discovery information for the component.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVID1 are RES0.

Attributes

TRCDEVID1 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCDEVID1

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFC4	TRCDEVID1

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCDEVID2, Device Configuration Register 2

The TRCDEVID2 characteristics are:

Purpose

Provides discovery information for the component.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVID2 are RES0.

Attributes

TRCDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCDEVID2

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFC0	TRCDEVID2

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCDEVTYPE, Device Type Register

The TRCDEVTYPE characteristics are:

Purpose

Provides discovery information for the component. If the part number field is not recognized, a debugger can report the information that is provided by TRCDEVTYPE about the component instead.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVTYPE are RES0.

Attributes

TRCDEVTYPE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												SUB			MAJOR				

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Component sub-type.

SUB	Meaning
0b0001	When MAJOR == 0x3 (Trace source): Associated with a PE.

This field reads as 0x1.

MAJOR, bits [3:0]

Component major type.

MAJOR	Meaning
0b0011	Trace source.

Other values are defined by the CoreSight Architecture.

This field reads as 0x3.

Accessing TRCDEVTYPE

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
-----------	--------	----------

TRCDEVTYPE, Device Type Register

ETE	0xFCC	TRCDEVTYPE
-----	-------	------------

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

TRCEVENTCTL0R, Event Control 0 Register

The TRCEVENTCTL0R characteristics are:

Purpose

Controls the generation of ETEEvents.

Configuration

External register TRCEVENTCTL0R bits [31:0] are architecturally mapped to AArch64 System register [TRCEVENTCTL0R\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMRSPAIR != 0b0000. Otherwise, direct accesses to TRCEVENTCTL0R are RES0.

Attributes

TRCEVENTCTL0R is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5
EVENT3_TYPE	RES0	EVENT3_SEL	EVENT2_TYPE	RES0	EVENT2_SEL	EVENT1_TYPE	RES0	EVENT1_SEL	EVENT0_TYPE	RES0	EVENT0_SEL	EVENT0_TYPE	RES0	EVENT0_SEL	EVENT0_TYPE	RES0	EVENT0_SEL	EVENT0_TYPE	RES0	EVENT0_SEL	EVENT0_TYPE	RES0	EVENT0_SEL	EVENT0_TYPE	RES0	EVENT0_SEL

EVENT3_TYPE, bit [31]

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b11:

Chooses the type of Resource Selector.

EVENT3_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT3.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT3.SEL[4] is RES0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:29]

Reserved, RES0.

EVENT3_SEL, bits [28:24]**When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b11:**

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.TYPE controls whether TRCEVENTCTL0R.EVENT3.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R](#).INSTEN[3] == 1, then Event element 3 is generated in the instruction trace element stream.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT2_TYPE, bit [23]**When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b10:**

Chooses the type of Resource Selector.

EVENT2_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT2.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT2.SEL[4] is RES0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [22:21]

Reserved, RES0.

EVENT2_SEL, bits [20:16]**When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b10:**

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.TYPE controls whether TRCEVENTCTL0R.EVENT2.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R](#).INSTEN[2] == 1, then Event element 2 is generated in the instruction trace element stream.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT1_TYPE, bit [15]

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b01:

Chooses the type of Resource Selector.

EVENT1_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT1.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT1.SEL[4] is RES0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [14:13]

Reserved, RES0.

EVENT1_SEL, bits [12:8]

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b01:

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.TYPE controls whether TRCEVENTCTL0R.EVENT1.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R](#).INSTEN[1] == 1, then Event element 1 is generated in the instruction trace element stream.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT0_TYPE, bit [7]

When **TRCIDR4.NUMRSPAIR != 0b0000** and **TRCIDR0.NUMEVENT >= 0b00**:

Chooses the type of Resource Selector.

EVENT0_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT0.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT0.SEL[4] is RES0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT0_SEL, bits [4:0]

When **TRCIDR4.NUMRSPAIR != 0b0000** and **TRCIDR0.NUMEVENT >= 0b00**:

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.TYPE controls whether TRCEVENTCTL0R.EVENT0.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R.INSTEN\[0\]](#) == 1, then Event element 0 is generated in the instruction trace element stream.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCEVENTCTL0R

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCEVENTCTL0R can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x020	TRCEVENTCTL0R

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCEVENTCTL1R, Event Control 1 Register

The TRCEVENTCTL1R characteristics are:

Purpose

Controls the behavior of the ETEEvents that [TRCEVENTCTL0R](#) selects.

Configuration

External register TRCEVENTCTL1R bits [31:0] are architecturally mapped to AArch64 System register [TRCEVENTCTL1R\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCEVENTCTL1R are RES0.

Attributes

TRCEVENTCTL1R is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																LPOVERRIDE		ATB	RES0	INSTEN[3]		INSTEN[2]		INSTEN[1]		INSTEN[0]					

Bits [31:13]

Reserved, RES0.

LPOVERRIDE, bit [12]

When TRCIDR5.LPOVERRIDE == 1:

Low-power Override Mode select.

LPOVERRIDE	Meaning
0b0	Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state.
0b1	Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation.

Otherwise:

Reserved, RES0.

ATB, bit [11]

When TRCIDR5.ATBTRIG == 1:

AMBA Trace Bus (ATB) trigger enable.

If a CoreSight ATB interface is implemented then when ETEEvent 0 occurs the trace unit sets:

- ATID == 0x7D.
- ATDATA to the value of [TRCTRACEIDR](#).

If the width of ATDATA is greater than the width of [TRCTraceIDR](#).TRACEID then the trace unit zeros the upper ATDATA bits.

If ETEEvent 0 is programmed to occur based on program execution, such as an Address Comparator, the ATB trigger might not be inserted into the ATB stream at the same time as any trace generated by that program execution is output by the trace unit. Typically, the generated trace might be buffered in a trace unit which means that the ATB trigger would be output before the associated trace is output.

If ETEEvent 0 is asserted multiple times in close succession, the trace unit is required to generate an ATB trigger for the first assertion, but might ignore one or more of the subsequent assertions. Arm recommends that the window in which ETEEvent 0 is ignored is limited only by the time taken to output an ATB trigger.

ATB	Meaning
0b0	ATB trigger is disabled.
0b1	ATB trigger is enabled.

Otherwise:

Reserved, RES0.

Bits [10:4]

Reserved, RES0.

INSTEN[<m>], bit [m], for m = 3 to 0

Event element control.

INSTEN[<m>]	Meaning
0b0	The trace unit does not generate an Event element <m>.
0b1	The trace unit generates an Event element <m>.

This bit is RES0 if m >= the number indicated by [TRCIDR0](#).NUMEVENT.

Accessing TRCEVENTCTL1R

Must be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCEVENTCTL1R can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x024	TRCEVENTCTL1R

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCEXTINSELN<n>, External Input Select Register <n>, n = 0 - 3

The TRCEXTINSELN<n> characteristics are:

Purpose

Use this to set, or read, which External Inputs are resources to the trace unit.

The name TRCEXTINSELN is an alias of TRCEXTINSELN0.

Configuration

External register TRCEXTINSELN<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCEXTINSELN<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMEXTINSEL > n. Otherwise, direct accesses to TRCEXTINSELN<n> are RES0.

Attributes

TRCEXTINSELN<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																evtCount															

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

PMU event to select.

The event number as defined by the Arm ARM.

Software must program this field with a PMU event that is supported by the PE being programmed.

There are three ranges of PMU event numbers:

- PMU event numbers in the range 0x0000 to 0x003F are common architectural and microarchitectural events.
- PMU event numbers in the range 0x0040 to 0x00BF are Arm recommended common architectural and microarchitectural PMU events.
- PMU event numbers in the range 0x00C0 to 0x03FF are IMPLEMENTATION DEFINED PMU events.

If evtCount is programmed to a PMU event that is reserved or not supported by the PE, the behavior depends on the PMU event type:

- For the range 0x0000 to 0x003F, then the PMU event is not active, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED PMU events, it is UNPREDICTABLE what PMU event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

UNPREDICTABLE means the PMU event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include a PMU event from a set of common IMPLEMENTATION DEFINED PMU events, then no PMU event is counted and the value read back on evtCount is the value written.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCEXTINSELN<n>

Must be programmed if any of the following is true: [TRCRSCTLN<a>](#).GROUP == 0b0000 and [TRCRSCTLN<a>](#).EXTIN[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCEXTINSELN<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x120 + (4 * n)	TRCEXTINSELN<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCIDR0, ID Register 0

The TRCIDR0 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR0 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR0\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR0 are RES0.

Attributes

TRCIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9
RES0	COMMTRANS	COMMOPT	TSSIZE	TSMARK	RES0	TRCEXDATA	QSUPP	QFILT	CONDTYPE	NUMEVENT	RETSTACK											

Bit [31]

Reserved, RES0.

COMMTRANS, bit [30]

Transaction Start element behavior.

COMMTRANS	Meaning
0b0	Transaction Start elements are P0 elements.
0b1	Transaction Start elements are not P0 elements.

COMMOPT, bit [29]

Indicates the contents and encodings of Cycle count packets.

COMMOPT	Meaning
0b0	Commit mode 0.
0b1	Commit mode 1.

The Commit mode defines the contents and encodings of Cycle Count packets, in particular how Commit elements are indicated by these packets. See the descriptions of these packets for more details.

Accessing this field has the following behavior:

- **RAO/WI** if all of the following are true:
 - TRCIDR0.TRCCCI == 1
 - TRCIDR8.MAXSPEC == 0x0
- When TRCIDR0.TRCCCI == 0, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

TSSIZE, bits [28:24]

Indicates that the trace unit implements Global timestamping and the size of the timestamp value.

TSSIZE	Meaning
0b000000	Global timestamping not implemented.
0b010000	Global timestamping implemented with a 64-bit timestamp value.

All other values are reserved.

This field reads as 0b010000.

TSMARK, bit [23]

When FEAT_ETEv1p1 is implemented:

Indicates whether Timestamp Marker elements are generated.

TSMARK	Meaning
0b0	Timestamp Marker elements are not generated.
0b1	Timestamp Marker elements are generated.

Otherwise:

Reserved, RES0.

Bits [22:18]

Reserved, RES0.

TRCEXDATA, bit [17]

When TRCIDR0.TRCDATA != 0b00:

Indicates if the trace unit implements tracing of data transfers for exceptions and exception returns. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

TRCEXDATA	Meaning
0b0	Tracing of data transfers for exceptions and exception returns not implemented.
0b1	Tracing of data transfers for exceptions and exception returns implemented.

Otherwise:

Reserved, RES0.

QSUPP, bits [16:15]

Indicates that the trace unit implements Q element support.

QSUPP	Meaning
0b00	Q element support is not implemented.
0b01	Q element support is implemented, and only supports Q elements with instruction counts.
0b10	Q element support is implemented, and only supports Q elements without instruction counts.
0b11	Q element support is implemented, and supports: <ul style="list-style-type: none"> • Q elements with instruction counts. • Q elements without instruction counts.

QFILT, bit [14]

Indicates if the trace unit implements Q element filtering.

QFILT	Meaning
0b0	Q element filtering is not implemented.
0b1	Q element filtering is implemented.

If TRCIDR0.QSUPP == 0b00 then this field is 0.

CONDTYPE, bits [13:12]

When TRCIDR0.TRCOND == 1:

Indicates how conditional instructions are traced. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

CONDTYPE	Meaning
0b00	Conditional instructions are traced with an indication of whether they pass or fail their condition code check.
0b01	Conditional instructions are traced with an indication of the APSR condition flags.

All other values are reserved.

Otherwise:

Reserved, RES0.

NUMEVENT, bits [11:10]

When TRCIDR4.NUMRSPAIR == 0b0000:

Indicates the number of ETEEvents implemented.

NUMEVENT	Meaning
0b00	The trace unit supports 0 ETEEvents.

All other values are reserved.

When TRCIDR4.NUMRSPAIR != 0b0000:

Indicates the number of ETEEvents implemented.

NUMEVENT	Meaning
0b00	The trace unit supports 1 ETEEvent.
0b01	The trace unit supports 2 ETEEvents.
0b10	The trace unit supports 3 ETEEvents.
0b11	The trace unit supports 4 ETEEvents.

Otherwise:

Reserved, RES0.

RETSTACK, bit [9]

Indicates if the trace unit supports the return stack.

RETSTACK	Meaning
0b0	Return stack not implemented.
0b1	Return stack implemented.

Bit [8]

Reserved, RES0.

TRCCCI, bit [7]

Indicates if the trace unit implements cycle counting.

TRCCCI	Meaning
0b0	Cycle counting not implemented.
0b1	Cycle counting implemented.

This field reads as 1.

TRCCOND, bit [6]

Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.

TRCCOND	Meaning
0b0	Conditional instruction tracing not implemented.
0b1	Conditional instruction tracing implemented.

This field reads as 0.

TRCBB, bit [5]

Indicates if the trace unit implements branch broadcasting.

TRCBB	Meaning
0b0	Branch broadcasting not implemented.
0b1	Branch broadcasting implemented.

This field reads as 1.

TRCDATA, bits [4:3]

Indicates if the trace unit implements data tracing. Data tracing is not implemented in ETE and this field is reserved for other trace architectures.

TRCDATA	Meaning
0b00	Data tracing not implemented.
0b11	Data tracing implemented.

All other values are reserved.

This field reads as 0b00.

INSTP0, bits [2:1]

Indicates if load and store instructions are P0 instructions. Load and store instructions as P0 instructions is not implemented in ETE and this field is reserved for other trace architectures.

INSTP0	Meaning
0b00	Load and store instructions are not P0 instructions.
0b11	Load and store instructions are P0 instructions.

All other values are reserved.

This field reads as 0b00.

Bit [0]

Reserved, RES1.

Accessing TRCIDR0

TRCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1E0	TRCIDR0

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCIDR1, ID Register 1

The TRCIDR1 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR1 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR1\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR1 are RES0.

Attributes

TRCIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DESIGNER								RES0								RES1				TRCARCHMAJ				TRCARCHMIN				REVISION			

DESIGNER, bits [31:24]

Indicates which company designed the trace unit. The permitted values of this field are the same as [MIDR_EL1](#).Implementer.

Bits [23:16]

Reserved, RES0.

Bits [15:12]

Reserved, RES1.

TRCARCHMAJ, bits [11:8]

Major architecture version.

TRCARCHMAJ	Meaning
0b1111	If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH .

All other values are reserved.

This field reads as 0b1111.

TRCARCHMIN, bits [7:4]

Minor architecture version.

TRCARCHMIN	Meaning
0b1111	If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH .

All other values are reserved.

This field reads as 0b1111.

REVISION, bits [3:0]

Implementation revision.

Returns an IMPLEMENTATION DEFINED value that identifies the revision of the trace unit.

Arm deprecates any use of this field and recommends that implementations set this field to zero.

Accessing TRCIDR1

TRCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1E4	TRCIDR1

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCIDR10, ID Register 10

The TRCIDR10 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR10 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR10\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR10 are RES0.

Attributes

TRCIDR10 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMP1KEY																															

NUMP1KEY, bits [31:0]

When TRCIDR0.TRCDATA != 0b00:

Indicates the number of P1 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

Accessing TRCIDR10

TRCIDR10 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x188	TRCIDR10

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR11, ID Register 11

The TRCIDR11 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR11 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR11\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR11 are RES0.

Attributes

TRCIDR11 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMP1SPC																															

NUMP1SPC, bits [31:0]

When TRCIDR0.TRCDATA != 0b00:

Indicates the number of special P1 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

Accessing TRCIDR11

TRCIDR11 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x18C	TRCIDR11

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR12, ID Register 12

The TRCIDR12 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR12 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR12\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR12 are RES0.

Attributes

TRCIDR12 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMCONDKEY																															

NUMCONDKEY, bits [31:0]

When TRCIDR0.TRCCOND == 1:

Indicates the number of conditional instruction right-hand keys. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

Accessing TRCIDR12

TRCIDR12 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x190	TRCIDR12

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR13, ID Register 13

The TRCIDR13 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR13 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR13\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR13 are RES0.

Attributes

TRCIDR13 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMCONDSPC																															

NUMCONDSPC, bits [31:0]

When TRCIDR0.TRCCOND == 1:

Indicates the number of special conditional instruction right-hand keys. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

Accessing TRCIDR13

TRCIDR13 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x194	TRCIDR13

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR2, ID Register 2

The TRCIDR2 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR2 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR2\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR2 are RES0.

Attributes

TRCIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WFXMODE	VMIDOPT	CCSIZE						DVSIZE					DASIZE					VMIDSIZE					CIDSIZE								IASIZE

WFXMODE, bit [31]

Indicates whether WFI and WFE instructions are classified as P0 instructions:

WFXMODE	Meaning
0b0	WFI and WFE instructions are not classified as P0 instructions.
0b1	WFI and WFE instructions are classified as P0 instructions.

VMIDOPT, bits [30:29]

Indicates the options for Virtual context identifier selection.

VMIDOPT	Meaning
0b00	Virtual context identifier selection not supported. TRCCONFIGR .VMIDOPT is RES0.
0b01	Virtual context identifier selection supported. TRCCONFIGR .VMIDOPT is implemented.
0b10	Virtual context identifier selection not supported. TRCCONFIGR .VMIDOPT is RES1.

All other values are reserved.

If TRCIDR2.VMIDSIZE == 0b000000 then this field is 0b00.

If TRCIDR2.VMIDSIZE != 0b000000 then this field is 0b10.

CCSIZE, bits [28:25]

When TRCIDR0.TRCCCI == 1:

Indicates the size of the cycle counter.

CCSIZE	Meaning
0b0000	The cycle counter is 12 bits in length.
0b0001	The cycle counter is 13 bits in length.
0b0010	The cycle counter is 14 bits in length.
0b0011	The cycle counter is 15 bits in length.
0b0100	The cycle counter is 16 bits in length.
0b0101	The cycle counter is 17 bits in length.
0b0110	The cycle counter is 18 bits in length.
0b0111	The cycle counter is 19 bits in length.
0b1000	The cycle counter is 20 bits in length.

All other values are reserved.

Otherwise:

Reserved, RES0.

DVSIZE, bits [24:20]

When TRCIDR0.TRCDATA != 0b00:

Indicates the data value size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

DVSIZE	Meaning
0b00000	Data value tracing not implemented.
0b00100	Data value tracing has a maximum of 32-bit data values.
0b01000	Data value tracing has a maximum of 64-bit data values.

All other values are reserved.

Otherwise:

Reserved, RES0.

DASIZE, bits [19:15]

When TRCIDR0.TRCDATA != 0b00:

Indicates the data address size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

DASIZE	Meaning
0b00000	Data address tracing not implemented.
0b00100	Data address tracing has a maximum of 32-bit data addresses.
0b01000	Data address tracing has a maximum of 64-bit data addresses.

All other values are reserved.

Otherwise:

Reserved, RES0.

VMIDSIZE, bits [14:10]

Indicates the trace unit Virtual context identifier size.

VMIDSIZE	Meaning
0b00000	Virtual context identifier tracing is not supported.
0b00001	8-bit Virtual context identifier size.
0b00010	16-bit Virtual context identifier size.
0b00100	32-bit Virtual context identifier size.

All other values are reserved.

If the PE does not implement EL2 then this field is 0b00000.

If the PE implements EL2 then this field is 0b00100.

CIDSIZE, bits [9:5]

Indicates the Context identifier size.

CIDSIZE	Meaning
0b00000	Context identifier tracing is not supported.
0b00100	32-bit Context identifier size.

All other values are reserved.

This field reads as 0b00100.

IASIZE, bits [4:0]

Virtual instruction address size.

IASIZE	Meaning
0b00100	Maximum of 32-bit instruction address size.
0b01000	Maximum of 64-bit instruction address size.

All other values are reserved.

This field reads as 0b01000.

Accessing TRCIDR2

TRCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1E8	TRCIDR2

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR3, ID Register 3

The TRCIDR3 characteristics are:

Purpose

Returns the base architecture of the trace unit.

Configuration

External register TRCIDR3 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR3\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR3 are RES0.

Attributes

TRCIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
NOOVERFLOW	NUMPROC[2:0]	SYSSTALL	STALLCTL	SYNCPR	TRCERR	RES0	EXLEVEL_NS_EL2	EXLEVEL_NS_EL1	EXLEVEL_NS_EL0	EXLEVEL_NS_EL0	EXLEVEL_NS_EL0

NOOVERFLOW, bit [31]

Indicates if overflow prevention is implemented.

NOOVERFLOW	Meaning
0b0	Overflow prevention is not implemented.
0b1	Overflow prevention is implemented.

If TRCIDR3.STALLCTL == 0 then this field is 0.

NUMPROC, bits [13:12, 30:28]

Indicates the number of PEs available for tracing.

NUMPROC	Meaning
0b00000	The trace unit can trace one PE.

This field reads as 0b00000.

The NUMPROC field is split as follows:

- NUMPROC[2:0] is TRCIDR3[30:28].
- NUMPROC[4:3] is TRCIDR3[13:12].

SYSSTALL, bit [27]

Indicates if stalling of the PE is permitted.

SYSSTALL	Meaning
0b0	Stalling of the PE is not permitted.
0b1	Stalling of the PE is permitted.

The value of this field might be dynamic and change based on system conditions.

If TRCIDR3.STALLCTL == 0 then this field is 0.

STALLCTL, bit [26]

Indicates if trace unit implements stalling of the PE.

STALLCTL	Meaning
0b0	Stalling of the PE is not implemented.
0b1	Stalling of the PE is implemented.

SYNCPR, bit [25]

Indicates if an implementation has a fixed synchronization period.

SYNCPR	Meaning
0b0	TRCSYNCPR is read-write so software can change the synchronization period.
0b1	TRCSYNCPR is read-only so the synchronization period is fixed.

This field reads as 0.

TRCERR, bit [24]

Indicates forced tracing of System Error exceptions is implemented.

TRCERR	Meaning
0b0	Forced tracing of System Error exceptions is not implemented.
0b1	Forced tracing of System Error exceptions is implemented.

This field reads as 1.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]

Indicates if Non-secure EL2 is implemented.

EXLEVEL_NS_EL2	Meaning
0b0	Non-secure EL2 is not implemented.
0b1	Non-secure EL2 is implemented.

EXLEVEL_NS_EL1, bit [21]

Indicates if Non-secure EL1 is implemented.

EXLEVEL_NS_EL1	Meaning
0b0	Non-secure EL1 is not implemented.
0b1	Non-secure EL1 is implemented.

EXLEVEL_NS_EL0, bit [20]

Indicates if Non-secure EL0 is implemented.

EXLEVEL_NS_EL0	Meaning
0b0	Non-secure EL0 is not implemented.
0b1	Non-secure EL0 is implemented.

EXLEVEL_S_EL3, bit [19]

Indicates if EL3 is implemented.

EXLEVEL_S_EL3	Meaning
0b0	EL3 is not implemented.
0b1	EL3 is implemented.

EXLEVEL_S_EL2, bit [18]

Indicates if Secure EL2 is implemented.

EXLEVEL_S_EL2	Meaning
0b0	Secure EL2 is not implemented.
0b1	Secure EL2 is implemented.

EXLEVEL_S_EL1, bit [17]

Indicates if Secure EL1 is implemented.

EXLEVEL_S_EL1	Meaning
0b0	Secure EL1 is not implemented.
0b1	Secure EL1 is implemented.

EXLEVEL_S_EL0, bit [16]

Indicates if Secure EL0 is implemented.

EXLEVEL_S_EL0	Meaning
0b0	Secure EL0 is not implemented.
0b1	Secure EL0 is implemented.

Bits [15:14]

Reserved, RES0.

CCITMIN, bits [11:0]

Indicates the minimum value that can be programmed in [TRCCCCTLR.THRESHOLD](#).

If [TRCIDR0.TRCCCI](#) == 1 then the minimum value of this field is 0x001.

If [TRCIDR0.TRCCCI](#) == 0 then this field is zero.

Accessing TRCIDR3

TRCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1EC	TRCIDR3

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR4, ID Register 4

The TRCIDR4 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR4 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR4\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR4 are RES0.

Attributes

TRCIDR4 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMVMIDC	NUMCIDC	NUMSSCC	NUMRSPAIR	NUMPC	RES0	SUPPDAC	NUMDVC	NUMACPAIRS																							

NUMVMIDC, bits [31:28]

Indicates the number of Virtual Context Identifier Comparators that are available for tracing.

NUMVMIDC	Meaning
0b0000	No Virtual Context Identifier Comparators are available.
0b0001	The implementation has one Virtual Context Identifier Comparator.
0b0010	The implementation has two Virtual Context Identifier Comparators.
0b0011	The implementation has three Virtual Context Identifier Comparators.
0b0100	The implementation has four Virtual Context Identifier Comparators.
0b0101	The implementation has five Virtual Context Identifier Comparators.
0b0110	The implementation has six Virtual Context Identifier Comparators.
0b0111	The implementation has seven Virtual Context Identifier Comparators.
0b1000	The implementation has eight Virtual Context Identifier Comparators.

All other values are reserved.

NUMCIDC, bits [27:24]

Indicates the number of Context Identifier Comparators that are available for tracing.

NUMCIDC	Meaning
0b0000	No Context Identifier Comparators are available.
0b0001	The implementation has one Context Identifier Comparator.
0b0010	The implementation has two Context Identifier Comparators.
0b0011	The implementation has three Context Identifier Comparators.
0b0100	The implementation has four Context Identifier Comparators.
0b0101	The implementation has five Context Identifier Comparators.
0b0110	The implementation has six Context Identifier Comparators.
0b0111	The implementation has seven Context Identifier Comparators.
0b1000	The implementation has eight Context Identifier Comparators.

All other values are reserved.

NUMSSCC, bits [23:20]

Indicates the number of Single-shot Comparator Controls that are available for tracing.

NUMSSCC	Meaning
0b0000	No Single-shot Comparator Controls are available.
0b0001	The implementation has one Single-shot Comparator Control.
0b0010	The implementation has two Single-shot Comparator Controls.
0b0011	The implementation has three Single-shot Comparator Controls.
0b0100	The implementation has four Single-shot Comparator Controls.
0b0101	The implementation has five Single-shot Comparator Controls.
0b0110	The implementation has six Single-shot Comparator Controls.
0b0111	The implementation has seven Single-shot Comparator Controls.
0b1000	The implementation has eight Single-shot Comparator Controls.

All other values are reserved.

NUMRSPAIR, bits [19:16]

Indicates the number of resource selector pairs that are available for tracing.

NUMRSPAIR	Meaning
0b0000	The implementation has zero resource selectors.
0b0001	The implementation has two resource selector pairs.
0b0010	The implementation has three resource selector pairs.
0b0011	The implementation has four resource selector pairs.
0b0100	The implementation has five resource selector pairs.
0b0101	The implementation has six resource selector pairs.
0b0110	The implementation has seven resource selector pairs.
0b0111	The implementation has eight resource selector pairs.
0b1000	The implementation has nine resource selector pairs.
0b1001	The implementation has ten resource selector pairs.
0b1010	The implementation has eleven resource selector pairs.
0b1011	The implementation has twelve resource selector pairs.
0b1100	The implementation has thirteen resource selector pairs.
0b1101	The implementation has fourteen resource selector pairs.
0b1110	The implementation has fifteen resource selector pairs.
0b1111	The implementation has sixteen resource selector pairs.

All other values are reserved.

NUMPC, bits [15:12]

Indicates the number of PE Comparator Inputs that are available for tracing.

NUMPC	Meaning
0b0000	No PE Comparator Inputs are available.
0b0001	The implementation has one PE Comparator Input.
0b0010	The implementation has two PE Comparator Inputs.
0b0011	The implementation has three PE Comparator Inputs.
0b0100	The implementation has four PE Comparator Inputs.
0b0101	The implementation has five PE Comparator Inputs.
0b0110	The implementation has six PE Comparator Inputs.
0b0111	The implementation has seven PE Comparator Inputs.
0b1000	The implementation has eight PE Comparator Inputs.

All other values are reserved.

Bits [11:9]

Reserved, RES0.

SUPPDAC, bit [8]

When TRCIDR4.NUMACPAIRS != 0b0000:

Indicates whether data address comparisons are implemented. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

SUPPDAC	Meaning
0b0	Data address comparisons not implemented.
0b1	Data address comparisons implemented.

This field reads as 0.

Otherwise:

Reserved, RES0.

NUMDVC, bits [7:4]

Indicates the number of data value comparators. Data value comparators are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

NUMDVC	Meaning
0b0000	No data value comparators implemented.
0b0001	One data value comparator implemented.
0b0010	Two data value comparators implemented.
0b0011	Three data value comparators implemented.
0b0100	Four data value comparators implemented.
0b0101	Five data value comparators implemented.
0b0110	Six data value comparators implemented.
0b0111	Seven data value comparators implemented.
0b1000	Eight data value comparators implemented.

All other values are reserved.

This field reads as 0b0000.

NUMACPAIRS, bits [3:0]

Indicates the number of Address Comparator pairs that are available for tracing.

NUMACPAIRS	Meaning
0b0000	No Address Comparator pairs are available.
0b0001	The implementation has one Address Comparator pair.
0b0010	The implementation has two Address Comparator pairs.
0b0011	The implementation has three Address Comparator pairs.
0b0100	The implementation has four Address Comparator pairs.
0b0101	The implementation has five Address Comparator pairs.
0b0110	The implementation has six Address Comparator pairs.
0b0111	The implementation has seven Address Comparator pairs.
0b1000	The implementation has eight Address Comparator pairs.

All other values are reserved.

Accessing TRCIDR4

TRCIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1F0	TRCIDR4

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR5, ID Register 5

The TRCIDR5 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR5 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR5\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR5 are RES0.

Attributes

TRCIDR5 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0								
RES0				NUMCNTR				NUMSEQSTATE				RES0				LPOVERRIDE				ATBTRIG				TRACEIDSIZE				RES0				NUMEXTINSEL				NUMEXTIN			

Bit [31]

Reserved, RES0.

NUMCNTR, bits [30:28]

Indicates the number of Counters that are available for tracing.

NUMCNTR	Meaning
0b000	No Counters are available.
0b001	One Counter implemented.
0b010	Two Counters implemented.
0b011	Three Counters implemented.
0b100	Four Counters implemented.

All other values are reserved.

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0b000.

NUMSEQSTATE, bits [27:25]

Indicates if the Sequencer is implemented and the number of Sequencer states that are implemented.

NUMSEQSTATE	Meaning
0b000	The Sequencer is not implemented.
0b100	Four Sequencer states are implemented.

All other values are reserved.

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0b000.

Bit [24]

Reserved, RES0.

LPOVERRIDE, bit [23]

Indicates support for Low-power Override Mode.

LPOVERRIDE	Meaning
0b0	The trace unit does not support Low-power Override Mode.
0b1	The trace unit supports Low-power Override Mode.

ATBTRIG, bit [22]

Indicates if the implementation can support ATB triggers.

ATBTRIG	Meaning
0b0	The implementation does not support ATB triggers.
0b1	The implementation supports ATB triggers.

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0.

TRACEIDSIZE, bits [21:16]

Indicates the trace ID width.

TRACEIDSIZE	Meaning
0b000000	The external trace interface is not implemented.
0b000111	The implementation supports a 7-bit trace ID.

All other values are reserved.

Note that AMBA ATB requires a 7-bit trace ID width.

Bits [15:12]

Reserved, RES0.

NUMEXTINSEL, bits [11:9]

Indicates how many External Input Selector resources are implemented.

NUMEXTINSEL	Meaning
0b000	No External Input Selector resources are available.
0b001	1 External Input Selector resource is available.
0b010	2 External Input Selector resources are available.
0b011	3 External Input Selector resources are available.
0b100	4 External Input Selector resources are available.

All other values are reserved.

NUMEXTIN, bits [8:0]

Indicates how many External Inputs are implemented.

NUMEXTIN	Meaning
0b11111111	Unified PMU event selection.

All other values are reserved.

Accessing TRCIDR5

TRCIDR5 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1F4	TRCIDR5

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

TRCIDR6, ID Register 6

The TRCIDR6 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR6 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR6\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR6 are RES0.

Attributes

TRCIDR6 is a 32-bit register.

Field descriptions

313029282726252423222120191817161514131211109876543	2	1	0
RES0	EXLEVEL_RL_EL2	EXLEVEL_RL_EL1	EXLEVEL_RL_EL0

Bits [31:3]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [2]

Indicates if Realm EL2 is implemented.

EXLEVEL_RL_EL2	Meaning
0b0	Realm EL2 is not implemented.
0b1	Realm EL2 is implemented.

EXLEVEL_RL_EL1, bit [1]

Indicates if Realm EL1 is implemented.

EXLEVEL_RL_EL1	Meaning
0b0	Realm EL1 is not implemented.
0b1	Realm EL1 is implemented.

EXLEVEL_RL_EL0, bit [0]

Indicates if Realm EL0 is implemented.

EXLEVEL_RL_EL0	Meaning
0b0	Realm EL0 is not implemented.
0b1	Realm EL0 is implemented.

Accessing TRCIDR6

TRCIDR6 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1F8	TRCIDR6

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCIDR7, ID Register 7

The TRCIDR7 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR7 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR7\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR7 are RES0.

Attributes

TRCIDR7 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																RES0															

Bits [31:0]

Reserved, RES0.

Accessing TRCIDR7

TRCIDR7 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1FC	TRCIDR7

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCIDR8, ID Register 8

The TRCIDR8 characteristics are:

Purpose

Returns the maximum speculation depth of the instruction trace element stream.

Configuration

External register TRCIDR8 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR8\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR8 are RES0.

Attributes

TRCIDR8 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																MAXSPEC															

MAXSPEC, bits [31:0]

Indicates the maximum speculation depth of the instruction trace element stream. This is the maximum number of P0 elements in the trace element stream that can be speculative at any time.

Accessing TRCIDR8

TRCIDR8 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x180	TRCIDR8

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCIDR9, ID Register 9

The TRCIDR9 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR9 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR9\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR9 are RES0.

Attributes

TRCIDR9 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUMPOKEY																															

NUMPOKEY, bits [31:0]

When **TRCIDR0.TRCDATA** != 0b00:

Indicates the number of P0 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

Accessing TRCIDR9

TRCIDR9 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x184	TRCIDR9

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIMSPEC0, IMP DEF Register 0

The TRCIMSPEC0 characteristics are:

Purpose

TRCIMSPEC0 shows the presence of any IMPLEMENTATION DEFINED features, and provides an interface to enable the features that are provided.

Configuration

External register TRCIMSPEC0 bits [31:0] are architecturally mapped to AArch64 System register [TRCIMSPEC0\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIMSPEC0 are RES0.

Attributes

TRCIMSPEC0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
												RES0															EN			SUPPORT		

Bits [31:8]

Reserved, RES0.

EN, bits [7:4]

When TRCIMSPEC0.SUPPORT != 0b0000:

Enable. Controls whether the IMPLEMENTATION DEFINED features are enabled.

EN	Meaning
0b0000	The IMPLEMENTATION DEFINED features are not enabled. The trace unit must behave as if the IMPLEMENTATION DEFINED features are not supported.
0b0001	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0010	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0011	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0100	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0101	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0110	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0111	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1000	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1001	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1010	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1011	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1100	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1101	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1110	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1111	The trace unit behavior is IMPLEMENTATION DEFINED.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SUPPORT, bits [3:0]

Indicates whether the implementation supports IMPLEMENTATION DEFINED features.

SUPPORT	Meaning
0b0000	No IMPLEMENTATION DEFINED features are supported.
0b0001	IMPLEMENTATION DEFINED features are supported.
0b0010	IMPLEMENTATION DEFINED features are supported.
0b0011	IMPLEMENTATION DEFINED features are supported.
0b0100	IMPLEMENTATION DEFINED features are supported.
0b0101	IMPLEMENTATION DEFINED features are supported.
0b0110	IMPLEMENTATION DEFINED features are supported.
0b0111	IMPLEMENTATION DEFINED features are supported.
0b1000	IMPLEMENTATION DEFINED features are supported.
0b1001	IMPLEMENTATION DEFINED features are supported.
0b1010	IMPLEMENTATION DEFINED features are supported.
0b1011	IMPLEMENTATION DEFINED features are supported.
0b1100	IMPLEMENTATION DEFINED features are supported.
0b1101	IMPLEMENTATION DEFINED features are supported.
0b1110	IMPLEMENTATION DEFINED features are supported.
0b1111	IMPLEMENTATION DEFINED features are supported.

Use of nonzero values requires written permission from Arm.

Access to this field is **RO**.

Accessing TRCIMSPEC0

TRCIMSPEC0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1C0	TRCIMSPEC0

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCIMSPEC<n>, IMP DEF Register <n>, n = 1 - 7

The TRCIMSPEC<n> characteristics are:

Purpose

These registers might return information that is specific to an implementation, or enable features specific to an implementation to be programmed. The product Technical Reference Manual describes these registers.

Configuration

External register TRCIMSPEC<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCIMSPEC<n>\[31:0\]](#).

This register is present only when the trace unit implements this OPTIONAL register and FEAT_ETE is implemented. Otherwise, direct accesses to TRCIMSPEC<n> are RES0.

Attributes

TRCIMSPEC<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

Accessing TRCIMSPEC<n>

TRCIMSPEC<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	$0 \times 1C0 + (4 * n)$	TRCIMSPEC<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCITCTRL, Integration Mode Control Register

The TRCITCTRL characteristics are:

Purpose

A component can use TRCITCTRL to dynamically switch between functional mode and integration mode. In integration mode, topology detection is enabled. After switching to integration mode and performing integration tests or topology detection, reset the system to ensure correct behavior of CoreSight and other connected system components.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCITCTRL are RES0.

Attributes

TRCITCTRL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]

When topology detection or integration functionality is implemented:

Integration Mode Enable.

IME	Meaning
0b0	Component functional mode.
0b1	Component integration mode. Support for topology detection and integration testing is enabled.

Otherwise:

Reserved, RES0.

Accessing TRCITCTRL

External debugger accesses to this register are IMPLEMENTATION DEFINED when the trace unit is not in the Idle state.

TRCITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xF00	TRCITCTRL

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

TRCLAR, Lock Access Register

The TRCLAR characteristics are:

Purpose

Used to lock and unlock the Software Lock.

Note that ETE does not implement the Software Lock.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCLAR are RES0.

Attributes

TRCLAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																KEY															

KEY, bits [31:0]

When Software Lock is implemented:

Software Lock Key.

A value of 0xC5ACCE55 unlocks the Software Lock.

Any other value locks the Software Lock.

Otherwise:

Reserved, RES0.

Accessing TRCLAR

External debugger accesses to this register are unaffected by the OS Lock.

TRCLAR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFB0	TRCLAR

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **WO**.

TRCLSR, Lock Status Register

The TRCLSR characteristics are:

Purpose

Indicates whether the Software Lock is implemented, and the current status of the Software Lock.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCLSR are RES0.

Attributes

TRCLSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																nTT			SLK		SLI										

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Software lock size.

Reads as 0b0.

Access to this field is **RO**.

SLK, bit [1]

The current Software Lock status.

SLK	Meaning
0b0	Software Lock is unlocked.
0b1	Software Lock is locked. Writes to the other registers in this component, except for the TRCLAR , are ignored.

This field reads as 0.

SLI, bit [0]

Indicates whether the Software Lock is implemented.

SLI	Meaning
0b0	Software Lock is not implemented. Writes to the TRCLAR are ignored.
0b1	Software Lock is implemented.

This field reads as 0.

Accessing TRCLSR

External debugger accesses to this register are unaffected by the OS Lock.

TRCLSR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFB4	TRCLSR

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCOSLSR, Trace OS Lock Status Register

The TRCOSLSR characteristics are:

Purpose

Returns the status of the Trace OS Lock.

Configuration

External register TRCOSLSR bits [31:0] are architecturally mapped to AArch64 System register [TRCOSLSR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCOSLSR are RES0.

Attributes

TRCOSLSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																									OSLM[2:1]		RES0	OSLK	OSLM[0]		

Bits [31:5]

Reserved, RES0.

OSLM, bits [4:3, 0]

OS Lock model.

OSLM	Meaning
0b000	Trace OS Lock is not implemented.
0b010	Trace OS Lock is implemented.
0b100	Trace OS Lock is not implemented, and the trace unit is controlled by the PE OS Lock.

All other values are reserved.

This field reads as 0b100.

The OSLM field is split as follows:

- OSLM[2:1] is TRCOSLSR[4:3].
- OSLM[0] is TRCOSLSR[0].

Bit [2]

Reserved, RES0.

OSLK, bit [1]

OS Lock status.

OSLK	Meaning
0b0	The OS Lock is unlocked.
0b1	The OS Lock is locked.

Note that this field indicates the state of the PE OS Lock.

Accessing TRCOSLSR

External debugger accesses to this register are unaffected by the OS Lock.

TRCOSLSR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x304	TRCOSLSR

This interface is accessible as follows:

- When !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCPDCR, PowerDown Control Register

The TRCPDCR characteristics are:

Purpose

Requests the system to provide power to the trace unit.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPDCR are RES0.

Attributes

TRCPDCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																													PU	RES0	

Bits [31:4]

Reserved, RES0.

PU, bit [3]

Power Up Request.

PU	Meaning
0b0	The system can remove power from the trace unit core power domain, or requests for power to the trace unit core power domain are implemented outside of the trace unit.
0b1	The system must provide power to the trace unit core power domain.

This field is RES0.

Bits [2:0]

Reserved, RES0.

Accessing TRCPDCR

External debugger accesses to this register are unaffected by the OS Lock.

TRCPDCR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x310	TRCPDCR

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCPDSR, PowerDown Status Register

The TRCPDSR characteristics are:

Purpose

Indicates the power status of the trace unit.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPDSR are RES0.

Attributes

TRCPDSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0				OSLK		RES0		STICKYPD		POWER									

Bits [31:6]

Reserved, RES0.

OSLK, bit [5]

OS Lock Status.

OSLK	Meaning
0b0	The OS Lock is unlocked.
0b1	The OS Lock is locked.

Note that this field indicates the state of the PE OS Lock.

Bits [4:2]

Reserved, RES0.

STICKYPD, bit [1]

Sticky powerdown status. Indicates whether the trace register state is valid.

STICKYPD	Meaning
0b0	The state of TRCOSLSR and the trace registers are valid.
0b1	The state of TRCOSLSR and the trace registers might not be valid.

This field is set to 1 if the power to the trace unit core power domain is removed and the trace unit register state is not valid.

The STICKYPD field is read-sensitive. On a read of the TRCPDSR, this field is cleared to 0 after the register has been read.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to 1.

POWER, bit [0]

Power Status.

POWER	Meaning
0b0	The trace unit core power domain is not powered. All trace unit registers are not accessible and they all return an error response.
0b1	The trace unit core power domain is powered. Trace unit registers are accessible.

Access to this field is **RAO/WI**.

Accessing TRCPDSR

External debugger accesses to this register are unaffected by the OS Lock.

TRCPDSR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x314	TRCPDSR

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCPIDR0, Peripheral Identification Register 0

The TRCPIDR0 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR0 are RES0.

Attributes

TRCPIDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								PART_0							

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, bits [7:0].

The part number is selected by the designer of the component, and is stored in [TRCPIDR1](#).PART_1 and TRCPIDR0.PART_0.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCPIDR0

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFE0	TRCPIDR0

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCPIDR1, Peripheral Identification Register 1

The TRCPIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR1 are RES0.

Attributes

TRCPIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												DES_0			PART_1				

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0]. TRCPIDR1.DES_0 and [TRCPIDR2.DES_1](#) together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, bits [11:8].

The part number is selected by the designer of the component, and is stored in TRCPIDR1.PART_1 and [TRCPIDR0.PART_0](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCPIDR1

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFE4	TRCPIDR1

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCPIDR2, Peripheral Identification Register 2

The TRCPIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR2 are RES0.

Attributes

TRCPIDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								REVISION				JEDEC		DES 1	

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Component major revision. TRCPIDR2.REVISION and [TRCPIDR3.REVAND](#) together form the revision number of the component, with TRCPIDR2.REVISION being the most significant part and [TRCPIDR3.REVAND](#) the least significant part. When a component is changed, TRCPIDR2.REVISION or [TRCPIDR3.REVAND](#) are increased to ensure that software can differentiate the different revisions of the component. [TRCPIDR3.REVAND](#) should be set to 0b0000 when TRCPIDR2.REVISION is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4]. [TRCPIDR1.DES_0](#) and TRCPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCPIDR2

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFE8	TRCPIDR2

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCPIDR3, Peripheral Identification Register 3

The TRCPIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR3 are RES0.

Attributes

TRCPIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												REVAND			CMOD				

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Component minor revision. [TRCPIDR2.REVISION](#) and TRCPIDR3.REVAND together form the revision number of the component, with [TRCPIDR2.REVISION](#) being the most significant part and TRCPIDR3.REVAND the least significant part. When a component is changed, [TRCPIDR2.REVISION](#) or TRCPIDR3.REVAND are increased to ensure that software can differentiate the different revisions of the component. TRCPIDR3.REVAND should be set to 0b0000 when [TRCPIDR2.REVISION](#) is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer Modified.

Indicates the component has been modified.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCPIDR3

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFEC	TRCPIDR3

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCPIDR4, Peripheral Identification Register 4

The TRCPIDR4 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR4 are RES0.

Attributes

TRCPIDR4 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												RES0												SIZE				DES_2			

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component.

The distance from the start of the address space used by this component to the end of the component identification registers.

A value of 0b0000 means one of the following is true:

- The component uses a single 4KB block.
- The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.

Any other value means the component occupies $2^{\text{TRCPIDR4.SIZE}}$ 4KB blocks.

Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

Reads as 0b0000.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 bank is 5, meaning this field has the value 0x4.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCPIDR4

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFD0	TRCPIDR4

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCPIDR5, Peripheral Identification Register 5

The TRCPIDR5 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR5 are RES0.

Attributes

TRCPIDR5 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																RES0															

Bits [31:0]

Reserved, RES0.

Accessing TRCPIDR5

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR5 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFD4	TRCPIDR5

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCPIDR6, Peripheral Identification Register 6

The TRCPIDR6 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR6 are RES0.

Attributes

TRCPIDR6 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																RES0															

Bits [31:0]

Reserved, RES0.

Accessing TRCPIDR6

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR6 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFD8	TRCPIDR6

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCPIDR7, Peripheral Identification Register 7

The TRCPIDR7 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR7 are RES0.

Attributes

TRCPIDR7 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																RES0															

Bits [31:0]

Reserved, RES0.

Accessing TRCPIDR7

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR7 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFDC	TRCPIDR7

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCPRGCTLR, Programming Control Register

The TRCPRGCTLR characteristics are:

Purpose

Enables the trace unit.

Configuration

External register TRCPRGCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCPRGCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPRGCTLR are RES0.

Attributes

TRCPRGCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															EN

Bits [31:1]

Reserved, RES0.

EN, bit [0]

Trace unit enable.

EN	Meaning
0b0	The trace unit is disabled.
0b1	The trace unit is enabled.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to 0.

Accessing TRCPRGCTLR

Must be programmed.

TRCPRGCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x004	TRCPRGCTLR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCQCTLR, Q Element Control Register

The TRCQCTLR characteristics are:

Purpose

Controls when Q elements are enabled.

Configuration

External register TRCQCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCQCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR0.QFILT == 1. Otherwise, direct accesses to TRCQCTLR are RES0.

Attributes

TRCQCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										MODE		RANGE[7]		RANGE[6]		RANGE[5]		RANGE[4]		RANGE[3]		RANGE[2]		RANGE[1]		RANGE[0]		RANGE[0]		RANGE[0]	

Bits [31:9]

Reserved, RES0.

MODE, bit [8]

Selects whether the Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:

MODE	Meaning
0b0	Exclude mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit must not generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map.
0b1	Include Mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0 then Q elements are disabled.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Specifies whether Address Range Comparator <m> controls Q elements.

RANGE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected.
0b1	The address range that Address Range Comparator <m> defines, is selected.

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCQCTLR

Must be programmed if [TRCCONFIGR](#).QE != 0b00.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCQCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x044	TRCQCTLR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCRSCTLR<n>, Resource Selection Control Register <n>, n = 2 - 31

The TRCRSCTLR<n> characteristics are:

Purpose

Controls the selection of the resources in the trace unit.

Configuration

External register TRCRSCTLR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCRSCTLR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and $((\text{TRCIDR4.NUMRSPAIR} + 1) * 2) > n$. Otherwise, direct accesses to TRCRSCTLR<n> are RES0.

Resource selector 0 always returns FALSE.

Resource selector 1 always returns TRUE.

Resource selectors are implemented in pairs. Each odd numbered resource selector is part of a pair with the even numbered resource selector that is numbered as one less than it. For example, resource selectors 2 and 3 form a pair.

Attributes

TRCRSCTLR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
RES0										PAIRINV		INV		GROUP					SELECT													

Bits [31:22]

Reserved, RES0.

PAIRINV, bit [21]

When n is even:

Controls whether the combined result from a resource selector pair is inverted.

PAIRINV	Meaning
0b0	Do not invert the combined output of the 2 resource selectors.
0b1	Invert the combined output of the 2 resource selectors.

If:

- A is the register TRCRSCTLR<n>.
- B is the register TRCRSCTLR<n+1>.

Then the combined output of the 2 resource selectors A and B depends on the value of (A.PAIRINV, A.INV, B.INV) as follows:

- 0b000 -> A and B.
- 0b001 -> Reserved.
- 0b010 -> not(A) and B.
- 0b011 -> not(A) and not(B).

- 0b100 -> not(A) or not(B).
- 0b101 -> not(A) or B.
- 0b110 -> Reserved.
- 0b111 -> A or B.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

INV, bit [20]

Controls whether the resource, that TRCRSCTLR<n>.GROUP and TRCRSCTLR<n>.SELECT selects, is inverted.

INV	Meaning
0b0	Do not invert the output of this selector.
0b1	Invert the output of this selector.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

GROUP, bits [19:16]

Selects a group of resources.

GROUP	Meaning	SELECT
0b0000	External Input Selectors.	SELECT encoding for External Input Selectors
0b0001	PE Comparator Inputs.	SELECT encoding for PE Comparator Inputs
0b0010	Counters and Sequencer.	SELECT encoding for Counters and Sequencer
0b0011	Single-shot Comparator Controls.	SELECT encoding for Single-shot Comparator Controls
0b0100	Single Address Comparators.	SELECT encoding for Single Address Comparators
0b0101	Address Range Comparators.	SELECT encoding for Address Range Comparators
0b0110	Context Identifier Comparators.	SELECT encoding for Context Identifier Comparators
0b0111	Virtual Context Identifier Comparators.	SELECT encoding for Virtual Context Identifier Comparators

All other values are reserved.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT, bits [15:0]

Resource Specific Controls. Contains the controls specific to the resource group selected by GROUP, described in the following sections.

SELECT encoding for External Input Selectors

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												EXTIN[3]	EXTIN[2]	EXTIN[1]	EXTIN[0]

Bits [15:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

Selects one or more External Inputs.

EXTIN[<m>]	Meaning
0b0	Ignore EXTIN <m>.
0b1	Select EXTIN <m>.

This bit is RES0 if m >= [TRCIDR5](#).NUMEXTINSEL.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for PE Comparator Inputs

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
								RES0	PECOMP[7]	PECOMP[6]	PECOMP[5]	PECOMP[4]	PECOMP[3]	PECOMP[2]	PECOMP[1]	PECOMP[0]

Bits [15:8]

Reserved, RES0.

PECOMP[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs.

PECOMP[<m>]	Meaning
0b0	Ignore PE Comparator Input <m>.
0b1	Select PE Comparator Input <m>.

This bit is RES0 if m >= [TRCIDR4](#).NUMPC.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Counters and Sequencer

15	14	13	12	11	10	9	8	7	6	5	4	3	2			
								RES0	SEQUENCER[3]	SEQUENCER[2]	SEQUENCER[1]	SEQUENCER[0]	COUNTERS[3]	COUNTERS[2]	COUNTERS[1]	COUNTERS[0]

Bits [15:8]

Reserved, RES0.

SEQUENCER[<m>], bit [m+4], for m = 3 to 0

Sequencer states.

SEQUENCER[<m>]	Meaning
0b0	Ignore Sequencer state <m>.
0b1	Select Sequencer state <m>.

This bit is RES0 if m >= [TRCIDR5](#).NUMSEQSTATE.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COUNTERS[<m>], bit [m], for m = 3 to 0

Counters resources at zero.

COUNTERS[<m>]	Meaning
0b0	Ignore Counter <m>.
0b1	Select Counter <m> is zero.

This bit is RES0 if m >= [TRCIDR5](#).NUMCNTR.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single-shot Comparator Controls

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	SINGLE_SHOT[7]	SINGLE_SHOT[6]	SINGLE_SHOT[5]	SINGLE_SHOT[4]	SINGLE_SHOT[3]	SINGLE_SHOT[2]	SINGLE_SHOT[1]	SINGLE_SHOT[0]	SINGLE_SHOT[7]	SINGLE_SHOT[6]	SINGLE_SHOT[5]	SINGLE_SHOT[4]	SINGLE_SHOT[3]	SINGLE_SHOT[2]	SINGLE_SHOT[1]

Bits [15:8]

Reserved, RES0.

SINGLE_SHOT[<m>], bit [m], for m = 7 to 0

Selects one or more Single-shot Comparator Controls.

SINGLE_SHOT[<m>]	Meaning
0b0	Ignore Single-shot Comparator Control <m>.
0b1	Select Single-shot Comparator Control <m>.

This bit is RES0 if m >= [TRCIDR4](#).NUMSSCC.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single Address Comparators

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SAC[15]	SAC[14]	SAC[13]	SAC[12]	SAC[11]	SAC[10]	SAC[9]	SAC[8]	SAC[7]	SAC[6]	SAC[5]	SAC[4]	SAC[3]	SAC[2]	SAC[1]	SAC[0]

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators.

SAC[<m>]	Meaning
0b0	Ignore Single Address Comparator <m>.
0b1	Select Single Address Comparator <m>.

This bit is RES0 if m >= 2 × [TRCIDR4](#).NUMACPAIRS.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Address Range Comparators

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								ARC[7]	ARC[6]	ARC[5]	ARC[4]	ARC[3]	ARC[2]	ARC[1]	ARC[0]

Bits [15:8]

Reserved, RES0.

ARC[<m>], bit [m], for m = 7 to 0

Selects one or more Address Range Comparators.

ARC[<m>]	Meaning
0b0	Ignore Address Range Comparator <m>.
0b1	Select Address Range Comparator <m>.

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Context Identifier Comparators

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								CID[7]	CID[6]	CID[5]	CID[4]	CID[3]	CID[2]	CID[1]	CID[0]

Bits [15:8]

Reserved, RES0.

CID[<m>], bit [m], for m = 7 to 0

Selects one or more Context Identifier Comparators.

CID[<m>]	Meaning
0b0	Ignore Context Identifier Comparator <m>.
0b1	Select Context Identifier Comparator <m>.

This bit is RES0 if m >= [TRCIDR4](#).NUMCIDC.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Virtual Context Identifier Comparators

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								VMID[7]	VMID[6]	VMID[5]	VMID[4]	VMID[3]	VMID[2]	VMID[1]	VMID[0]

Bits [15:8]

Reserved, RES0.

VMID[<m>], bit [m], for m = 7 to 0

Selects one or more Virtual Context Identifier Comparators.

VMID[<m>]	Meaning
0b0	Ignore Virtual Context Identifier Comparator <m>.
0b1	Select Virtual Context Identifier Comparator <m>.

This bit is RES0 if m >= [TRCIDR4.NUMVMIDC](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCRSCTLR<n>

Must be programmed if any of the following are true:

- [TRCCNTCTLR<a>.RLDEVENT](#).TYPE == 0 and [TRCCNTCTLR<a>.RLDEVENT](#).SEL == n.
- [TRCCNTCTLR<a>.RLDEVENT](#).TYPE == 1 and [TRCCNTCTLR<a>.RLDEVENT](#).SEL == n/2.
- [TRCCNTCTLR<a>.CNTEVENT](#).TYPE == 0 and [TRCCNTCTLR<a>.CNTEVENT](#).SEL == n.
- [TRCCNTCTLR<a>.CNTEVENT](#).TYPE == 1 and [TRCCNTCTLR<a>.CNTEVENT](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT0](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT0](#).SEL == n.
- [TRCEVENTCTL0R.EVENT0](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT0](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT1](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT1](#).SEL == n.
- [TRCEVENTCTL0R.EVENT1](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT1](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT2](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT2](#).SEL == n.
- [TRCEVENTCTL0R.EVENT2](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT2](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT3](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT3](#).SEL == n.
- [TRCEVENTCTL0R.EVENT3](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT3](#).SEL == n/2.
- [TRCSEQEVR<a>.B](#).TYPE == 0 and [TRCSEQEVR<a>.B](#).SEL == n.
- [TRCSEQEVR<a>.B](#).TYPE == 1 and [TRCSEQEVR<a>.B](#).SEL == n/2.
- [TRCSEQEVR<a>.F](#).TYPE == 0 and [TRCSEQEVR<a>.F](#).SEL == n.
- [TRCSEQEVR<a>.F](#).TYPE == 1 and [TRCSEQEVR<a>.F](#).SEL == n/2.
- [TRCSEQRSTEV.RST](#).TYPE == 0 and [TRCSEQRSTEV.RST](#).SEL == n.
- [TRCSEQRSTEV.RST](#).TYPE == 1 and [TRCSEQRSTEV.RST](#).SEL == n/2.
- [TRCTSCTLR.EVENT](#).TYPE == 0 and [TRCTSCTLR.EVENT](#).SEL == n.
- [TRCTSCTLR.EVENT](#).TYPE == 1 and [TRCTSCTLR.EVENT](#).SEL == n/2.
- [TRCVICTLR.EVENT](#).TYPE == 0 and [TRCVICTLR.EVENT](#).SEL == n.
- [TRCVICTLR.EVENT](#).TYPE == 1 and [TRCVICTLR.EVENT](#).SEL == n/2.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCRSCTLR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x200 + (4 * n)	TRCRSCTLR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCRSR, Resources Status Register

The TRCRSR characteristics are:

Purpose

Use this to set, or read, the status of the resources.

Configuration

External register TRCRSR bits [31:0] are architecturally mapped to AArch64 System register [TRCRSR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCRSR are RES0.

Attributes

TRCRSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												TA	EVENT[3]	EVENT[2]	EVENT[1]	EVENT[0]	RES0	EXTIN[3]	EXTIN[2]	EXTIN[1]	EXTIN[0]										

Bits [31:13]

Reserved, RES0.

TA, bit [12]

Tracing active.

TA	Meaning
0b0	Tracing is not active.
0b1	Tracing is active.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

EVENT[<m>], bit [m+8], for m = 3 to 0

Untraced status of ETEEvents.

EVENT[<m>]	Meaning
0b0	An ETEEvent <m> has not occurred.
0b1	An ETEEvent <m> has occurred while the resources were in the Paused state.

This bit is RES0 if [TRCIDR4](#).NUMRSPAIR == 0 || m > [TRCIDR0](#).NUMEVENT.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

The sticky status of the External Input Selectors.

EXTIN[<m>]	Meaning
0b0	An event selected by External Input Selector <m> has not occurred.
0b1	At least one event selected by External Input Selector <m> has occurred while the resources were in the Paused state.

This bit is RES0 if m >= [TRCIDR5.NUMEXTINSEL](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCRSR

Must always be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCRSR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x028	TRCRSR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCSEQEVR<n>, Sequencer State Transition Control Register <n>, n = 0 - 2

The TRCSEQEVR<n> characteristics are:

Purpose

Moves the Sequencer state:

- Backwards, from state n+1 to state n when a programmed resource event occurs.
- Forwards, from state n to state n+1 when a programmed resource event occurs.

Configuration

External register TRCSEQEVR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCSEQEVR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQEVR<n> are RES0.

Attributes

TRCSEQEVR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																B_TYPE	RES0	B_SEL				F_TYPE	RES0	F_SEL							

Bits [31:16]

Reserved, RES0.

B_TYPE, bit [15]

Chooses the type of Resource Selector.

Backward field. Defines whether the backward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == 0x14 then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

B_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQEVR<n>.B.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.B.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.B.SEL[4] is RES0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

B_SEL, bits [12:8]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.B.TYPE controls whether TRCSEQEVR<n>.B.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Backward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

F_TYPE, bit [7]

Chooses the type of Resource Selector.

Backward field. Defines whether the forward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == 0x12 then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

F_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQEVR<n>.F.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.F.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.F.SEL[4] is RES0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

F_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.F.TYPE controls whether TRCSEQEVR<n>.F.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Forward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQEVR<n>

Must be programmed if [TRCRSCTLR<a>.GROUP == 0b0010](#) and [TRCRSCTLR<a>.SEQUENCER != 0b0000](#).

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSEQEVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	$0x100 + (4 * n)$	TRCSEQEVR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCSEQRSTEVR, Sequencer Reset Control Register

The TRCSEQRSTEVR characteristics are:

Purpose

Moves the Sequencer to state 0 when a programmed resource event occurs.

Configuration

External register TRCSEQRSTEVR bits [31:0] are architecturally mapped to AArch64 System register [TRCSEQRSTEVR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQRSTEVR are RES0.

Attributes

TRCSEQRSTEVR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												RST TYPE		RES0		RST SEL															

Bits [31:8]

Reserved, RES0.

RST_TYPE, bit [7]

Chooses the type of Resource Selector.

RST_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQRSTEVR.RST.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQRSTEVR.RST.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQRSTEVR.RST.SEL[4] is RES0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

RST_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQRSTEVR.RST.TYPE controls whether TRCSEQRSTEVR.RST.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQRSTEVR

Must be programmed if [TRCRSCTLR<a>.GROUP == 0b0010](#) and [TRCRSCTLR<a>.SEQUENCER != 0b0000](#).

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSEQRSTEVR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x118	TRCSEQRSTEVR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

TRCSEQSTR, Sequencer State Register

The TRCSEQSTR characteristics are:

Purpose

Use this to set, or read, the Sequencer state.

Configuration

External register TRCSEQSTR bits [31:0] are architecturally mapped to AArch64 System register [TRCSEQSTR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQSTR are RES0.

Attributes

TRCSEQSTR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															STATE

Bits [31:2]

Reserved, RES0.

STATE, bits [1:0]

Set or returns the state of the Sequencer.

STATE	Meaning
0b00	State 0.
0b01	State 1.
0b10	State 2.
0b11	State 3.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQSTR

Must be programmed if [TRCRSCTLR<a>.GROUP](#) == 0b0010 and [TRCRSCTLR<a>.SEQUENCER](#) != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSEQSTR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x11C	TRCSEQSTR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

TRCSSCCR<n>, Single-shot Comparator Control Register <n>, n = 0 - 7

The TRCSSCCR<n> characteristics are:

Purpose

Controls the corresponding Single-shot Comparator Control resource.

Configuration

External register TRCSSCCR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCSSCCR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMSSCC > n. Otherwise, direct accesses to TRCSSCCR<n> are RES0.

Attributes

TRCSSCCR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	
							RES0	RST	ARC[7]	ARC[6]	ARC[5]	ARC[4]	ARC[3]	ARC[2]	ARC[1]	ARC[0]	SAC[15]	SAC[14]	SAC[13]	SAC[12]	SAC[11]

Bits [31:25]

Reserved, RES0.

RST, bit [24]

Selects the Single-shot Comparator Control mode.

RST	Meaning
0b0	The Single-shot Comparator Control is in single-shot mode.
0b1	The Single-shot Comparator Control is in multi-shot mode.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

ARC[<m>], bit [m+16], for m = 7 to 0

Selects one or more Address Range Comparators for Single-shot control.

ARC[<m>]	Meaning
0b0	The Address Range Comparator <m>, is not selected for Single-shot control.
0b1	The Address Range Comparator <m>, is selected for Single-shot control.

This bit is RES0 if m >= [TRCIDR4.NUMACPAIRS](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators for Single-shot control.

SAC[<m>]	Meaning
0b0	The Single Address Comparator <m>, is not selected for Single-shot control.
0b1	The Single Address Comparator <m>, is selected for Single-shot control.

This bit is RES0 if $m \geq 2 \times \text{TRCIDR4.NUMACPAIRS}$.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSSCCR<n>

Must be programmed if any [TRCRSCTLR<a>](#).GROUP == 0b0011 and [TRCRSCTLR<a>](#).SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSSCCR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	$0x280 + (4 * n)$	TRCSSCCR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCSSCSR<n>, Single-shot Comparator Control Status Register <n>, n = 0 - 7

The TRCSSCSR<n> characteristics are:

Purpose

Returns the status of the corresponding Single-shot Comparator Control.

Configuration

External register TRCSSCSR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCSSCSR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMSSCC > n. Otherwise, direct accesses to TRCSSCSR<n> are RES0.

Attributes

TRCSSCSR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0										
STATUS		PENDING																										RES0								PCDV		DA		INST	

STATUS, bit [31]

Single-shot Comparator Control status. Indicates if any of the comparators selected by this Single-shot Comparator control have matched. The selected comparators are defined by [TRCSSCCR<n>.ARC](#), [TRCSSCCR<n>.SAC](#), and [TRCSSPCICR<n>.PC](#).

STATUS	Meaning
0b0	No match has occurred. When the first match occurs, this field takes a value of 1. It remains at 1 until explicitly modified by a write to this register.
0b1	One or more matches has occurred. If TRCSSCCR<n>.RST == 0 then: <ul style="list-style-type: none"> There is only one match and no more matches are possible. Software must reset this field to 0 to re-enable the Single-shot Comparator Control.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

PENDING, bit [30]

Single-shot pending status. The Single-shot Comparator Control fired while the resources were in the Paused state.

PENDING	Meaning
0b0	No match has occurred.
0b1	One or more matches has occurred.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [29:4]

Reserved, RES0.

PC, bit [3]

PE Comparator Input support. Indicates if the Single-shot Comparator Control supports PE Comparator Inputs.

PC	Meaning
0b0	This Single-shot Comparator Control does not support PE Comparator Inputs. Selecting any PE Comparator Inputs using the associated TRCSSPCICR<n> results in CONSTRAINED UNPREDICTABLE behavior of the Single-shot Comparator Control resource. The Single-shot Comparator Control might match unexpectedly or might not match.
0b1	This Single-shot Comparator Control supports PE Comparator Inputs.

Access to this field is **RO**.

DV, bit [2]

Data value comparator support. Data value comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

DV	Meaning
0b0	This Single-shot Comparator Control does not support data value comparisons.
0b1	This Single-shot Comparator Control supports data value comparisons.

This field reads as 0.

Access to this field is **RO**.

DA, bit [1]

Data Address Comparator support. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

DA	Meaning
0b0	This Single-shot Comparator Control does not support data address comparisons.
0b1	This Single-shot Comparator Control supports data address comparisons.

This field reads as 0.

Access to this field is **RO**.

INST, bit [0]

Instruction Address Comparator support. Indicates if the Single-shot Comparator Control supports instruction address comparisons.

INST	Meaning
0b0	This Single-shot Comparator Control does not support instruction address comparisons.
0b1	This Single-shot Comparator Control supports instruction address comparisons.

This field reads as 1.

Access to this field is **RO**.

Accessing TRCSSCSR<n>

Must be programmed if [TRCRSCTLR<a>](#).GROUP == 0b0011 and [TRCRSCTLR<a>](#).SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSSCSR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x2A0 + (4 * n)	TRCSSCSR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCSSPCICR<n>, Single-shot Processing Element Comparator Input Control Register <n>, n = 0 - 7

The TRCSSPCICR<n> characteristics are:

Purpose

Returns the status of the corresponding Single-shot Comparator Control.

Configuration

External register TRCSSPCICR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCSSPCICR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMSSCC > n, TRCIDR4.NUMPC > 0b0000 and TRCSSCSR<n>.PC == 1. Otherwise, direct accesses to TRCSSPCICR<n> are RES0.

Attributes

TRCSSPCICR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												PC[7]PC[6]PC[5]PC[4]PC[3]PC[2]PC[1]PC[0]																			

Bits [31:8]

Reserved, RES0.

PC[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs for Single-shot control.

PC[<m>]	Meaning
0b0	The single PE Comparator Input <m>, is not selected as for Single-shot control.
0b1	The single PE Comparator Input <m>, is selected as for Single-shot control.

This bit is RES0 if m >= [TRCIDR4](#).NUMPC.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSSPCICR<n>

Must be programmed if implemented and any [TRCRSCTLR<a>](#).GROUP == 0b0011 and [TRCRSCTLR<a>](#).SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSSPCICR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	$0x2C0 + (4 * n)$	TRCSSPCICR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

TRCSTALLCTLR, Stall Control Register

The TRCSTALLCTLR characteristics are:

Purpose

Enables trace unit functionality that prevents trace unit buffer overflows.

Configuration

External register TRCSTALLCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCSTALLCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR3.STALLCTL == 1. Otherwise, direct accesses to TRCSTALLCTLR are RES0.

Attributes

TRCSTALLCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0														NOOVERFLOW		RES0		ISTALL		RES0		LEVEL									

Bits [31:14]

Reserved, RES0.

NOOVERFLOW, bit [13]

When TRCIDR3.NOOVERFLOW == 1:

Trace overflow prevention.

NOOVERFLOW	Meaning
0b0	Trace unit buffer overflow prevention is disabled.
0b1	Trace unit buffer overflow prevention is enabled.

Note that enabling this feature might cause a significant performance impact.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

ISTALL, bit [8]

Instruction stall control. Controls if a trace unit can stall the PE when the trace buffer space is less than LEVEL.

ISTALL	Meaning
0b0	The trace unit must not stall the PE.
0b1	The trace unit can stall the PE.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

LEVEL, bits [3:0]

Threshold level field. The field can support 16 monotonic levels from 0b0000 to 0b1111.

The value 0b0000 defines the Minimal invasion level. This setting has a greater risk of a trace unit buffer overflow.

The value 0b1111 defines the Maximum invasion level. This setting has a reduced risk of a trace unit buffer overflow.

Note that for some implementations, invasion might occur at the minimal invasion level.

One or more of the least significant bits of LEVEL are permitted to be RES0. Arm recommends that LEVEL[3:2] are fully implemented. Arm strongly recommends that LEVEL[3] is always implemented. If one or more bits are RES0 and are written with a non-zero value, the effective value of LEVEL is rounded down to the nearest power of 2 value which has the RES0 bits as zero. For example, if LEVEL[1:0] are RES0 and a value of 0b1110 is written to LEVEL, the effective value of LEVEL is 0b1100.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSTALLCTLR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSTALLCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x02C	TRCSTALLCTLR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCSTATR, Trace Status Register

The TRCSTATR characteristics are:

Purpose

Returns the trace unit status.

Configuration

External register TRCSTATR bits [31:0] are architecturally mapped to AArch64 System register [TRCSTATR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCSTATR are RES0.

Attributes

TRCSTATR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																	PMSTABLE		IDLE												

Bits [31:2]

Reserved, RES0.

PMSTABLE, bit [1]

Programmers' model stable.

PMSTABLE	Meaning
0b0	The programmers' model is not stable.
0b1	The programmers' model is stable.

Accessing this field has the following behavior:

- When the trace unit is enabled, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

IDLE, bit [0]

Idle status.

IDLE	Meaning
0b0	The trace unit is not idle.
0b1	The trace unit is idle.

Accessing TRCSTATR

TRCSTATR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x00C	TRCSTATR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCSYNCPR, Synchronization Period Register

The TRCSYNCPR characteristics are:

Purpose

Controls how often trace protocol synchronization requests occur.

Configuration

External register TRCSYNCPR bits [31:0] are architecturally mapped to AArch64 System register [TRCSYNCPR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCSYNCPR are RES0.

Attributes

TRCSYNCPR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																		PERIOD													

Bits [31:5]

Reserved, RES0.

PERIOD, bits [4:0]

Defines the number of bytes of trace between each periodic trace protocol synchronization request.

PERIOD	Meaning
0b00000	Trace protocol synchronization is disabled.
0b01000	Trace protocol synchronization request occurs after 2^8 bytes of trace.
0b01001	Trace protocol synchronization request occurs after 2^9 bytes of trace.
0b01010	Trace protocol synchronization request occurs after 2^{10} bytes of trace.
0b01011	Trace protocol synchronization request occurs after 2^{11} bytes of trace.
0b01100	Trace protocol synchronization request occurs after 2^{12} bytes of trace.
0b01101	Trace protocol synchronization request occurs after 2^{13} bytes of trace.
0b01110	Trace protocol synchronization request occurs after 2^{14} bytes of trace.
0b01111	Trace protocol synchronization request occurs after 2^{15} bytes of trace.
0b10000	Trace protocol synchronization request occurs after 2^{16} bytes of trace.
0b10001	Trace protocol synchronization request occurs after 2^{17} bytes of trace.
0b10010	Trace protocol synchronization request occurs after 2^{18} bytes of trace.
0b10011	Trace protocol synchronization request occurs after 2^{19} bytes of trace.
0b10100	Trace protocol synchronization request occurs after 2^{20} bytes of trace.

Other values are reserved. If a reserved value is programmed into PERIOD, then the behavior of the synchronization period counter is CONSTRAINED UNPREDICTABLE and one of the following behaviors occurs:

- No trace protocol synchronization requests are generated by this counter.
- Trace protocol synchronization requests occur at the specified period.
- Trace protocol synchronization requests occur at some other UNKNOWN period which can vary.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSYNCP

Must be programmed if [TRCIDR3](#).SYNCP == 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSYNCP can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x034	TRCSYNCP

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCTRACEIDR, Trace ID Register

The TRCTRACEIDR characteristics are:

Purpose

Sets the trace ID for instruction trace.

Configuration

External register TRCTRACEIDR bits [31:0] are architecturally mapped to AArch64 System register [TRCTRACEIDR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCTRACEIDR are RES0.

Attributes

TRCTRACEIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								TRACEID							

Bits [31:7]

Reserved, RES0.

TRACEID, bits [6:0]

Trace ID field. Sets the trace ID value for instruction trace. The width of the field is indicated by the value of [TRCIDR5](#).TRACEIDSIZE. Unimplemented bits are RES0.

If an implementation supports AMBA ATB, then:

- The width of the field is 7 bits.
- Writing a reserved trace ID value does not affect behavior of the trace unit but it might cause UNPREDICTABLE behavior of the trace capture infrastructure.

See the AMBA ATB Protocol Specification for information about which ATID values are reserved.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCTRACEIDR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCTRACEIDR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x040	TRCTRACEIDR

This interface is accessible as follows:

- When OSLockStatus(), or !IsTraceCorePowered() or !AllowExternalTraceAccess() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCTSCTLR, Timestamp Control Register

The TRCTSCTLR characteristics are:

Purpose

Controls the insertion of global timestamps in the trace stream.

Configuration

External register TRCTSCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCTSCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR0.TSSIZE != 0b00000. Otherwise, direct accesses to TRCTSCTLR are RES0.

Attributes

TRCTSCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0												EVENT_TYPE				RES0		EVENT_SEL													

Bits [31:8]

Reserved, RES0.

EVENT_TYPE, bit [7]
When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

EVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCTSCTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCTSCTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCTSCTLR.EVENT.SEL[4] is RES0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT_SEL, bits [4:0]**When TRCIDR4.NUMRSPAIR != 0b0000:**

Defines the selected Resource Selector or pair of Resource Selectors. TRCTSCTLR.EVENT.TYPE controls whether TRCTSCTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCTSCTLR

Must be programmed if [TRCCONFIGR.TS](#) == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCTSCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x030	TRCTSCTLR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCVICTLR, ViewInst Main Control Register

The TRCVICTLR characteristics are:

Purpose

Controls instruction trace filtering.

Configuration

External register TRCVICTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCVICTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCVICTLR are RES0.

Attributes

TRCVICTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
RES0	EXLEVEL_RL_EL2	EXLEVEL_RL_EL1	EXLEVEL_RL_EL0	RES0	EXLEVEL_NS_EL2	EXLEVEL_NS_EL1	EXLEVEL_NS_EL0	RES0	EXLEVEL_RL_EL2	EXLEVEL_RL_EL1	EXLEVEL_RL_EL0

Bits [31:27]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [26]

When TRCIDR6.EXLEVEL_RL_EL2 == 1:

Filter instruction trace for EL2 in Realm state.

EXLEVEL_RL_EL2	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit generates instruction trace for EL2 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit does not generate instruction trace for EL2 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit does not generate instruction trace for EL2 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit generates instruction trace for EL2 in Realm state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [25]**When TRCIDR6.EXLEVEL_RL_EL1 == 1:**

Filter instruction trace for EL1 in Realm state.

EXLEVEL_RL_EL1	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit generates instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit does not generate instruction trace for EL1 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit does not generate instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit generates instruction trace for EL1 in Realm state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [24]**When TRCIDR6.EXLEVEL_RL_EL0 == 1:**

Filter instruction trace for EL0 in Realm state.

EXLEVEL_RL_EL0	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit generates instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit does not generate instruction trace for EL0 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit does not generate instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit generates instruction trace for EL0 in Realm state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]**When Non-secure EL2 is implemented:**

Filter instruction trace for EL2 in Non-secure state.

EXLEVEL_NS_EL2	Meaning
0b0	The trace unit generates instruction trace for EL2 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL2 in Non-secure state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [21]

When Non-secure EL1 is implemented:

Filter instruction trace for EL1 in Non-secure state.

EXLEVEL_NS_EL1	Meaning
0b0	The trace unit generates instruction trace for EL1 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL1 in Non-secure state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_ELO, bit [20]

When Non-secure ELO is implemented:

Filter instruction trace for ELO in Non-secure state.

EXLEVEL_NS_ELO	Meaning
0b0	The trace unit generates instruction trace for ELO in Non-secure state.
0b1	The trace unit does not generate instruction trace for ELO in Non-secure state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [19]

When EL3 is implemented:

Filter instruction trace for EL3.

EXLEVEL_S_EL3	Meaning
0b0	The trace unit generates instruction trace for EL3.
0b1	The trace unit does not generate instruction trace for EL3.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [18]

When EL2 is implemented and FEAT_SEL2 is implemented:

Filter instruction trace for EL2 in Secure state.

EXLEVEL_S_EL2	Meaning
0b0	The trace unit generates instruction trace for EL2 in Secure state.
0b1	The trace unit does not generate instruction trace for EL2 in Secure state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [17]

When Secure EL1 is implemented:

Filter instruction trace for EL1 in Secure state.

EXLEVEL_S_EL1	Meaning
0b0	The trace unit generates instruction trace for EL1 in Secure state.
0b1	The trace unit does not generate instruction trace for EL1 in Secure state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [16]

When Secure EL0 is implemented:

Filter instruction trace for EL0 in Secure state.

EXLEVEL S_ELO	Meaning
0b0	The trace unit generates instruction trace for ELO in Secure state.
0b1	The trace unit does not generate instruction trace for ELO in Secure state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:12]

Reserved, RES0.

TRCERR, bit [11]

When TRCIDR3.TRCERR == 1:

Controls the forced tracing of System Error exceptions.

TRCERR	Meaning
0b0	Forced tracing of System Error exceptions is disabled.
0b1	Forced tracing of System Error exceptions is enabled.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCRESET, bit [10]

Controls the forced tracing of PE Resets.

TRCRESET	Meaning
0b0	Forced tracing of PE Resets is disabled.
0b1	Forced tracing of PE Resets is enabled.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SSSTATUS, bit [9]

ViewInst start/stop function status.

SSSTATUS	Meaning
0b0	Stopped State. The ViewInst start/stop function is in the stopped state.
0b1	Started State. The ViewInst start/stop function is in the started state.

Before software enables the trace unit, it must write to this field to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this field to 1. Arm recommends that the value of this field is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR.SSSTATUS is UNKNOWN and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing [TRCPRGCTLR.EN](#) or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- RES1** if all of the following are true:
 - TRCIDR4.NUMACPAIRS == 0b0000
 - TRCIDR4.NUMPC == 0b0000
- Otherwise, access to this field is **RW**.

Bit [8]

Reserved, RES0.

EVENT_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

EVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCVICTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCVICTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT.SEL[4] is RES0.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors. TRCVICTLR.EVENT.TYPE controls whether TRCVICTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

When TRCIDR4.NUMRSPAIR == 0b0000:

This field is reserved:

- Bits [4:1] are RES0.
- Bit [0] is RES1.

Otherwise:

Reserved, RES0.

Accessing TRCVICTLR

Must be programmed.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCVICTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x080	TRCVICTLR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCVIIECTLR, ViewInst Include/Exclude Control Register

The TRCVIIECTLR characteristics are:

Purpose

Use this to select, or read, the Address Range Comparators for the ViewInst include/exclude function.

Configuration

External register TRCVIIECTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCVIIECTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCVIIECTLR are RES0.

Attributes

TRCVIIECTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								EXCLUDE[7]		EXCLUDE[6]		EXCLUDE[5]		EXCLUDE[4]		EXCLUDE[3]		EXCLUDE[2]		EXCLUDE[1]		EXCLUDE[0]									

Bits [31:24]

Reserved, RES0.

EXCLUDE[<m>], bit [m+16], for m = 7 to 0

Exclude Address Range Comparator <m>. Selects whether Address Range Comparator <m> is in use with the ViewInst exclude function.

EXCLUDE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected for the ViewInst exclude function.
0b1	The address range that Address Range Comparator <m> defines, is selected for the ViewInst exclude function.

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [15:8]

Reserved, RES0.

INCLUDE[<m>], bit [m], for m = 7 to 0

Include Address Range Comparator <m>.

Selects whether Address Range Comparator <m> is in use with the ViewInst include function.

Selecting no comparators for the ViewInst include function indicates that all instructions are included by default.

The ViewInst exclude function then indicates which ranges are excluded.

INCLUDE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected for the ViewInst include function.
0b1	The address range that Address Range Comparator <m> defines, is selected for the ViewInst include function.

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVIIECTLR

Must be programmed if [TRCIDR4](#).NUMACPAIRS > 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVIIECTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x084	TRCVIIECTLR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCVIPCSSCTLR, ViewInst Start/Stop PE Comparator Control Register

The TRCVIPCSSCTLR characteristics are:

Purpose

Use this to select, or read, which PE Comparator Inputs can control the ViewInst start/stop function.

Configuration

External register TRCVIPCSSCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCVIPCSSCTLR\[31:0\]](#).
This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMPC > 0b0000. Otherwise, direct accesses to TRCVIPCSSCTLR are RES0.

Attributes

TRCVIPCSSCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6
RES0								STOP[7]	STOP[6]	STOP[5]	STOP[4]	STOP[3]	STOP[2]	STOP[1]	STOP[0]	RES0								START[7]	START[6]

Bits [31:24]

Reserved, RES0.

STOP[<m>], bit [m+16], for m = 7 to 0

Selects whether PE Comparator Input <m> is in use with ViewInst start/stop function, for the purpose of stopping trace.

STOP[<m>]	Meaning
0b0	The PE Comparator Input <m>, is not selected as a stop resource.
0b1	The PE Comparator Input <m>, is selected as a stop resource.

This bit is RES0 if m >= [TRCIDR4](#).NUMPC.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [15:8]

Reserved, RES0.

START[<m>], bit [m], for m = 7 to 0

Selects whether PE Comparator Input <m> is in use with ViewInst start/stop function, for the purpose of starting trace.

START[<m>]	Meaning
0b0	The PE Comparator Input <m>, is not selected as a start resource.
0b1	The PE Comparator Input <m>, is selected as a start resource.

This bit is RES0 if m >= [TRCIDR4](#).NUMPC.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVIPCSSCTL

Must be programmed if [TRCIDR4](#).NUMPC != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVIPCSSCTL can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x08C	TRCVIPCSSCTL

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCVISSCTLR, ViewInst Start/Stop Control Register

The TRCVISSCTLR characteristics are:

Purpose

Use this to select, or read, the Single Address Comparators for the ViewInst start/stop function.

Configuration

External register TRCVISSCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCVISSCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCVISSCTLR are RES0.

Attributes

TRCVISSCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19
STOP[15]	STOP[14]	STOP[13]	STOP[12]	STOP[11]	STOP[10]	STOP[9]	STOP[8]	STOP[7]	STOP[6]	STOP[5]	STOP[4]	STOP[3]

STOP[<m>], bit [m+16], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of stopping trace.

STOP[<m>]	Meaning
0b0	The Single Address Comparator <m>, is not selected as a stop resource.
0b1	The Single Address Comparator <m>, is selected as a stop resource.

This bit is RES0 if $m \geq 2 \times \text{TRCIDR4.NUMACPAIRS}$.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

START[<m>], bit [m], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of starting trace.

START[<m>]	Meaning
0b0	The Single Address Comparator <m>, is not selected as a start resource.
0b1	The Single Address Comparator <m>, is selected as a start resource.

This bit is RES0 if $m \geq 2 \times \text{TRCIDR4.NUMACPAIRS}$.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVISSCTLR

Must be programmed if [TRCIDR4](#).NUMACPAIRS > 0b0000.

For any 2 comparators selected for the ViewInst start/stop function, the comparator containing the lower address must be a lower numbered comparator.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVISSCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x088	TRCVISSCTLR

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

TRCVMIDCCTRL0, Virtual Context Identifier Comparator Control Register 0

The TRCVMIDCCTL0 characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the [TRCVMIDCVR<n>](#) registers, where n=0-3.

Configuration

External register TRCVMIDCCTLRO bits [31:0] are architecturally mapped to AArch64 System register [TRCVMIDCCTLRO\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMVMIDC > 0x0 and TRCIDR2.VMIDSIZE > 0b000000. Otherwise, direct accesses to TRCVMIDCCTLR0 are RES0.

Attributes

TRCVMIDCTL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21
COMP3[7]	COMP3[6]	COMP3[5]	COMP3[4]	COMP3[3]	COMP3[2]	COMP3[1]	COMP3[0]	COMP2[7]	COMP2[6]	COMP2[5]

COMP3[<m>], bit [m+24], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 3:

TRCVMIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR3. Each bit in this field corresponds to a byte in TRCVMIDCVR3.

COMP3[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if $m \geq \text{TRCIDR2.VMIDSIZE}$.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 2:

TRCVMIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR2. Each bit in this field corresponds to a byte in TRCVMIDCVR2.

COMP2[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 1:

TRCVMIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR1. Each bit in this field corresponds to a byte in TRCVMIDCVR1.

COMP1[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 0:

TRCVMIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR0. Each bit in this field corresponds to a byte in TRCVMIDCVR0.

COMP0[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCCTLRO

If software uses the [TRCVMIDCVR<n>](#) registers, where n=0-3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCVMIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCVMIDCVR<n>](#) is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVMIDCCTLRO can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x688	TRCVMIDCCTLRO

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/06/2021 15:22; 2a17f7750cfd1ab239f20f6cf29877ba8041794f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCVMIDCTRL1, Virtual Context Identifier Comparator Control Register 1

The TRCVMIDCCTL1 characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the [TRCVMIDCVR<n>](#) registers, where n=4-7.

Configuration

External register TRCVMIDCCTL1 bits [31:0] are architecturally mapped to AArch64 System register [TRCVMIDCCTL1\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMVMIDC > 0x4 and TRCIDR2.VMIDSIZE > 0b00000. Otherwise, direct accesses to TRCVMIDCCTLR1 are RES0.

Attributes

TRCVMIDCCTL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21
COMP7[7]	COMP7[6]	COMP7[5]	COMP7[4]	COMP7[3]	COMP7[2]	COMP7[1]	COMP7[0]	COMP6[7]	COMP6[6]	COMP6[5]

COMP7[<m>], bit [m+24], for m = 7 to 0
When TRCIDR4.NUMVMIDC > 7:

TRCVMIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR7. Each bit in this field corresponds to a byte in TRCVMIDCVR7.

COMP7[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if $m \geq \text{TRCIDR2.VMIDSIZE}$.

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0
When TRCIDR4.NUMVMIDC > 6:

TRCVMIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR6. Each bit in this field corresponds to a byte in TRCVMIDCVR6.

COMP6[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 5:

TRCVMIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR5. Each bit in this field corresponds to a byte in TRCVMIDCVR5.

COMP5[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 4:

TRCVMIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR4. Each bit in this field corresponds to a byte in TRCVMIDCVR4.

COMP4[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCCTLR1

If software uses the [TRCVMIDCVR<n>](#) registers, where n=4-7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCVMIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCVMIDCVR<n>](#) is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVMIDCCTLR1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x68C	TRCVMIDCCTLR1

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCVMIDCVR<n>, Virtual Context Identifier Comparator Value Register <n>, n = 0 - 7

The TRCVMIDCVR<n> characteristics are:

Purpose

Contains the Virtual Context Identifier Comparator value.

Configuration

External register TRCVMIDCVR<n> bits [63:0] are architecturally mapped to AArch64 System register [TRCVMIDCVR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMVMIDC > n. Otherwise, direct accesses to TRCVMIDCVR<n> are RES0.

Attributes

TRCVMIDCVR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
																VALUE															
																VALUE															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

VALUE, bits [63:0]

Virtual context identifier value. The width of this field is indicated by [TRCIDR2.VMIDSIZE](#). Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Virtual context identifier is zero until the PE updates the Virtual context identifier .

The reset behaviour of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVMIDCVR<n>

Must be programmed if any of the following are true:

- [TRCRSCTLR<a>](#).GROUP == 0b0111 and [TRCRSCTLR<a>](#).VMID[n] == 1.
- [TRCACATR<a>](#).CONTEXTTYPE == 0b10 or 0b11 and [TRCACATR<a>](#).CONTEXT == n.

TRCVMIDCVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x640 + (8 * n)	TRCVMIDCVR<n>

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.
