Release Information

For information on the change history and known issues for this release, see the **Release Notes** in the **System Register XML for Armv8.8 (2021-09)**.

Proprietary Notice

This document is protected by copyright and other related rights and the practice or implementation of the information contained in this document may be protected by one or more patents or pending patent applications. No part of this document may be reproduced in any form by any means without the express prior written permission of Arm. **No license, express or implied, by estoppel or otherwise to any intellectual property rights is granted by this document unless specifically stated.**

Your access to the information in this document is conditional upon your acceptance that you will not use or permit others to use the information for the purposes of determining whether implementations infringe any third party patents.

THIS DOCUMENT IS PROVIDED “AS IS”. ARM PROVIDES NO REPRESENTATIONS AND NO WARRANTIES, EXPRESS, IMPLIED OR STATUTORY, INCLUDING, WITHOUT LIMITATION, THE IMPLIED WARRANTIES OF MERCHANTABILITY, SATISFACTORY QUALITY, NON-INFRINGEMENT OR FITNESS FOR A PARTICULAR PURPOSE WITH RESPECT TO THE DOCUMENT. For the avoidance of doubt, Arm makes no representation with respect to, and has undertaken no analysis to identify or understand the scope and content of, patents, copyrights, trade secrets, or other rights.

This document may include technical inaccuracies or typographical errors.

TO THE EXTENT NOT PROHIBITED BY LAW, IN NO EVENT WILL ARM BE LIABLE FOR ANY DAMAGES, INCLUDING WITHOUT LIMITATION ANY DIRECT, INDIRECT, SPECIAL, INCIDENTAL, PUNITIVE, OR CONSEQUENTIAL DAMAGES, HOWEVER CAUSED AND REGARDLESS OF THE THEORY OF LIABILITY, ARISING OUT OF ANY USE OF THIS DOCUMENT, EVEN IF ARM HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

This document consists solely of commercial items. You shall be responsible for ensuring that any use, duplication or disclosure of this document complies fully with any relevant export laws and regulations to assure that this document or any portion thereof is not exported, directly or indirectly, in violation of such export laws. Use of the word “partner” in reference to Arm’s customers is not intended to create or refer to any partnership relationship with any other company. Arm may make changes to this document at any time and without notice.

This document may be translated into other languages for convenience, and you agree that if there is any conflict between the English version of this document and any translation, the terms of the English version of the Agreement shall prevail.

Arm Limited. Company 02557590 registered in England.
110 Fulbourn Road, Cambridge, England CB1 9NJ.

(LES-PRE-20349 version 21.0)

Confidentiality Status

This document is Non-Confidential. The right to use, copy and disclose this document may be subject to license restrictions in accordance with the terms of the agreement entered into by Arm and the party that Arm delivered this document to.

Product Status

This release covers multiple versions of the architecture. The content relating to different versions is given different quality ratings.

The information related to the 2021 Architecture Extensions is at Alpha quality. Alpha quality means that most major features of the specification are described in the manual, some features and details might be missing.

The information related to the remaining Armv8-A features which was also published in previous releases, is at Beta quality. Beta quality means that all major features of the specification are described, some details might be missing.

Progressive Terminology Commitment

Arm values inclusive communities. Arm recognizes that we and our industry have used terms that can be offensive. Arm strives to lead the industry and create change.

Previous issues of this document included terms that can be offensive. We have replaced these terms. If you find offensive terms in this document, please contact `terms@arm.com`.

AArch64 System Registers

ACCDATA_EL1: Accelerator Data

ACTLR_EL1: Auxiliary Control Register (EL1)

ACTLR_EL2: Auxiliary Control Register (EL2)

ACTLR_EL3: Auxiliary Control Register (EL3)

AFSR0_EL1: Auxiliary Fault Status Register 0 (EL1)

AFSR0_EL2: Auxiliary Fault Status Register 0 (EL2)

AFSR0_EL3: Auxiliary Fault Status Register 0 (EL3)

AFSR1_EL1: Auxiliary Fault Status Register 1 (EL1)

AFSR1_EL2: Auxiliary Fault Status Register 1 (EL2)

AFSR1_EL3: Auxiliary Fault Status Register 1 (EL3)

AIDR_EL1: Auxiliary ID Register

ALLINT: All Interrupt Mask Bit

AMAIR_EL1: Auxiliary Memory Attribute Indirection Register (EL1)

AMAIR_EL2: Auxiliary Memory Attribute Indirection Register (EL2)

AMAIR_EL3: Auxiliary Memory Attribute Indirection Register (EL3)

AMCFGR_EL0: Activity Monitors Configuration Register

AMCG1IDR_EL0: Activity Monitors Counter Group 1 Identification Register

AMCGCR_EL0: Activity Monitors Counter Group Configuration Register

AMCNTENCLR0_EL0: Activity Monitors Count Enable Clear Register 0

AMCNTENCLR1_EL0: Activity Monitors Count Enable Clear Register 1

AMCNTENSET0_EL0: Activity Monitors Count Enable Set Register 0

AMCNTENSET1_EL0: Activity Monitors Count Enable Set Register 1

AMCR_EL0: Activity Monitors Control Register

AMEVCNTR0<n>_EL0: Activity Monitors Event Counter Registers 0

AMEVCNTR1<n>_EL0: Activity Monitors Event Counter Registers 1

AMEVCNTVOFF0<n>_EL2: Activity Monitors Event Counter Virtual Offset Registers 0

AMEVCNTVOFF1<n>_EL2: Activity Monitors Event Counter Virtual Offset Registers 1

AMEVTYPER0<n>_EL0: Activity Monitors Event Type Registers 0

AMEVTYPER1<n>_EL0: Activity Monitors Event Type Registers 1

AMUSERENR_EL0: Activity Monitors User Enable Register

APDAKeyHi_EL1: Pointer Authentication Key A for Data (bits[127:64])

APDAKeyLo_EL1: Pointer Authentication Key A for Data (bits[63:0])

APDBKeyHi_EL1: Pointer Authentication Key B for Data (bits[127:64])

APDBKeyLo_EL1: Pointer Authentication Key B for Data (bits[63:0])

CNTV_CTL_EL0: Counter-timer Virtual Timer Control register

CNTV_CVAL_EL0: Counter-timer Virtual Timer CompareValue register

CNTV_TVAL_EL0: Counter-timer Virtual Timer TimerValue register

CONTEXTIDR_EL1: Context ID Register (EL1)

CONTEXTIDR_EL2: Context ID Register (EL2)

CPACR_EL1: Architectural Feature Access Control Register

CPTR_EL2: Architectural Feature Trap Register (EL2)

CPTR_EL3: Architectural Feature Trap Register (EL3)

CSSELR_EL1: Cache Size Selection Register

CTR_EL0: Cache Type Register

CurrentEL: Current Exception Level

DACR32_EL2: Domain Access Control Register

DAIF: Interrupt Mask Bits

DBGAUTHSTATUS_EL1: Debug Authentication Status register

DBGBCR<n>_EL1: Debug Breakpoint Control Registers

DBGBVR<n>_EL1: Debug Breakpoint Value Registers

DBGCLAIMCLR_EL1: Debug CLAIM Tag Clear register

DBGCLAIMSET_EL1: Debug CLAIM Tag Set register

DBGDTRRX_EL0: Debug Data Transfer Register, Receive

DBGDTRTX_EL0: Debug Data Transfer Register, Transmit

DBGDTR_EL0: Debug Data Transfer Register, half-duplex

DBGPRCR_EL1: Debug Power Control Register

DBGVCR32_EL2: Debug Vector Catch Register

DBGWCR<n>_EL1: Debug Watchpoint Control Registers

DBGWVR<n>_EL1: Debug Watchpoint Value Registers

DCZID_EL0: Data Cache Zero ID register

DISR_EL1: Deferred Interrupt Status Register

DIT: Data Independent Timing

DLR_EL0: Debug Link Register

DSPSR_EL0: Debug Saved Program Status Register

ELR_EL1: Exception Link Register (EL1)

ELR_EL2: Exception Link Register (EL2)

ELR_EL3: Exception Link Register (EL3)

ERRIDR_EL1: Error Record ID Register

ERRSELR_EL1: Error Record Select Register

ERXADDR_EL1: Selected Error Record Address Register

ICC_BPR1_EL1: Interrupt Controller Binary Point Register 1

ICC_CTLR_EL1: Interrupt Controller Control Register (EL1)

ICC_CTLR_EL3: Interrupt Controller Control Register (EL3)

ICC_DIR_EL1: Interrupt Controller Deactivate Interrupt Register

ICC_EOIR0_EL1: Interrupt Controller End Of Interrupt Register 0

ICC_EOIR1_EL1: Interrupt Controller End Of Interrupt Register 1

ICC_HPPIR0_EL1: Interrupt Controller Highest Priority Pending Interrupt Register 0

ICC_HPPIR1_EL1: Interrupt Controller Highest Priority Pending Interrupt Register 1

ICC_IAR0_EL1: Interrupt Controller Interrupt Acknowledge Register 0

ICC_IAR1_EL1: Interrupt Controller Interrupt Acknowledge Register 1

ICC_IGRPEN0_EL1: Interrupt Controller Interrupt Group 0 Enable register

ICC_IGRPEN1_EL1: Interrupt Controller Interrupt Group 1 Enable register

ICC_IGRPEN1_EL3: Interrupt Controller Interrupt Group 1 Enable register (EL3)

ICC_NMIAR1_EL1: Interrupt Controller Non-maskable Interrupt Acknowledge Register 1

ICC_PMR_EL1: Interrupt Controller Interrupt Priority Mask Register

ICC_RPR_EL1: Interrupt Controller Running Priority Register

ICC_SGI0R_EL1: Interrupt Controller Software Generated Interrupt Group 0 Register

ICC_SGI1R_EL1: Interrupt Controller Software Generated Interrupt Group 1 Register

ICC_SRE_EL1: Interrupt Controller System Register Enable register (EL1)

ICC_SRE_EL2: Interrupt Controller System Register Enable register (EL2)

ICC_SRE_EL3: Interrupt Controller System Register Enable register (EL3)

ICH_AP0R<n>_EL2: Interrupt Controller Hyp Active Priorities Group 0 Registers

ICH_AP1R<n>_EL2: Interrupt Controller Hyp Active Priorities Group 1 Registers

ICH_EISR_EL2: Interrupt Controller End of Interrupt Status Register

ICH_ELRSR_EL2: Interrupt Controller Empty List Register Status Register

ICH_HCR_EL2: Interrupt Controller Hyp Control Register

ICH_LR<n>_EL2: Interrupt Controller List Registers

ICH_MISR_EL2: Interrupt Controller Maintenance Interrupt State Register

ICH_VMCR_EL2: Interrupt Controller Virtual Machine Control Register

ICH_VTR_EL2: Interrupt Controller VGIC Type Register

ICV_AP0R<n>_EL1: Interrupt Controller Virtual Active Priorities Group 0 Registers

ICV_AP1R<n>_EL1: Interrupt Controller Virtual Active Priorities Group 1 Registers

ICV_BPR0_EL1: Interrupt Controller Virtual Binary Point Register 0

ICV_BPR1_EL1: Interrupt Controller Virtual Binary Point Register 1

ICV_CTLR_EL1: Interrupt Controller Virtual Control Register

ICV_DIR_EL1: Interrupt Controller Deactivate Virtual Interrupt Register

ICV_EOIR0_EL1: Interrupt Controller Virtual End Of Interrupt Register 0

ICV_EOIR1_EL1: Interrupt Controller Virtual End Of Interrupt Register 1

ICV_HPPIR0_EL1: Interrupt Controller Virtual Highest Priority Pending Interrupt Register 0

ICV_HPPIR1_EL1: Interrupt Controller Virtual Highest Priority Pending Interrupt Register 1

ICV_IAR0_EL1: Interrupt Controller Virtual Interrupt Acknowledge Register 0

ICV_IAR1_EL1: Interrupt Controller Virtual Interrupt Acknowledge Register 1

ICV_IGRPEN0_EL1: Interrupt Controller Virtual Interrupt Group 0 Enable register

ICV_IGRPEN1_EL1: Interrupt Controller Virtual Interrupt Group 1 Enable register

ICV_NMIAR1_EL1: Interrupt Controller Virtual Non-maskable Interrupt Acknowledge Register 1

ICV_PMR_EL1: Interrupt Controller Virtual Interrupt Priority Mask Register

ICV_RPR_EL1: Interrupt Controller Virtual Running Priority Register

ACCDATA_EL1, Accelerator Data

The ACCDATA_EL1 characteristics are:

Purpose

Holds the lower 32 bits of the data that is stored by an ST64BV0, Single-copy atomic 64-byte EL0 store instruction.

Configuration

This register is present only when FEAT_LS64_ACCDATA is implemented. Otherwise, direct accesses to ACCDATA_EL1 are UNDEFINED.

Attributes

ACCDATA_EL1 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32

ACTLR_EL1, Auxiliary Control Register (EL1)

The ACTLR_EL1 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

Note

Arm recommends the contents of this register have no effect on the PE when HCR_EL2.{E2H, TGE} is {1, 1}, and instead the configuration and control fields are provided by the ACTLR_EL2 register. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

Configuration

AArch64 System register ACTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ACTLR[31:0].

AArch64 System register ACTLR_EL1 bits [63:32] are architecturally mapped to AArch32 System register ACTLR2[31:0].

Attributes

ACTLR_EL1 is a 64-bit register.

Field descriptions

63–32
IMPLEMENTATION DEFINED

31–0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ACTLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ACTLR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b001

ACTLR_EL2, Auxiliary Control Register (EL2)

The ACTLR_EL2 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for EL2.

Note

Arm recommends the contents of this register are updated to apply to EL0 when HCR_EL2.{E2H, TGE} is {1, 1}, gaining configuration and control fields from the ACTLR_EL1. This avoids the need for software to manage the contents of these register when switching between a Guest OS and a Host OS.

Configuration

AArch64 System register ACTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HACTLR[31:0].

AArch64 System register ACTLR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HACTLR2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ACTLR_EL2 is a 64-bit register.

ALLINT, All Interrupt Mask Bit

The ALLINT characteristics are:

Purpose

Allows access to the all interrupt mask bit.

Configuration

This register is present only when FEAT_NMI is implemented. Otherwise, direct accesses to ALLINT are UNDEFINED.

Attributes

ALLINT is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46	45	44 43 42 41 40 39 38 37 36 35 34 33 32
RES0		
RES0	ALLINT	RES0
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14	13	12 11 10 9 8 7 6 5 4 3 2 1 0

Bits [63:14]

Reserved, RES0.

ALLINT, bit [13]

All interrupt mask.

ALLINT	Meaning
0b0	When SCTLR_ELx.NMI is 1 and execution is at ELx, an IRQ or FIQ interrupt with Superpriority that is targeted to ELx is not masked by PSTATE.I or PSTATE.F, respectively, unless both PSTATE.SP and SCTLR_ELx.SPINTMASK are 1. An IRQ or FIQ interrupt without Superpriority that is targeted to ELx is masked.
0b1	When SCTLR_ELx.NMI is 1 and execution is at ELx, an IRQ or FIQ interrupt that is targeted to ELx is masked by PSTATE.I or PSTATE.F, respectively, regardless of Superpriority.

When executing at EL0 and SCTLR_ELx.NMI is 1, if an IRQ or FIQ interrupt targeted to ELx is masked by PSTATE.I or PSTATE.F, the mask applies only to IRQ or FIQ interrupts without Superpriority. IRQ or FIQ interrupts with Superpriority are not masked.

The value of this bit is set to the inverse value in the SCTLR_ELx.SPINTMASK field on taking an exception to ELx.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [12:0]

Reserved, RES0.

Accessing ALLINT

Accesses to this register use the following encodings in the System register encoding space:

```

AMAIR_EL2, Auxiliary Memory Attribute Indirection Register (EL2)

The AMAIR_EL2 characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by MAIR_EL2.

Configuration

AArch64 System register AMAIR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HAMAIR0[31:0].

AArch64 System register AMAIR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HAMAIR1[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

AMAIR_EL2 is a 64-bit register.

Field descriptions

Bits	Field
63:32	IMPLEMENTATION DEFINED
31:0	IMPLEMENTATION DEFINED

AMAIR_EL2 is permitted to be cached in a TLB.

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMAIR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic AMAIR_EL2 or AMAIR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMAIR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0011	0b000

AMCFGR_EL0, Activity Monitors Configuration Register

The AMCFGR_EL0 characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR_EL0 is applicable to both the architected and the auxiliary counter groups.

Configuration

AArch64 System register AMCFGR_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMCFGR[31:0].

AArch64 System register AMCFGR_EL0 bits [31:0] are architecturally mapped to External register AMCFGR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR_EL0 are UNDEFINED.

Attributes

AMCFGR_EL0 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
RES0

NCG	RES0	HDBG	RAZ	SIZE	N

Bits [63:32]

Reserved, RES0.

NCG, bits [31:28]

Defines the number of counter groups.

The number of implemented counter groups is [AMCFGR_EL0.NCG + 1].

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of `0b0000`. Otherwise, this field has a value of `0b0001`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

This feature must be supported, and so this bit is `0b1`.

HDBG	Meaning
`0b0`	AMCR_EL0.HDBG is RES0.
`0b1`	AMCR_EL0.HDBG is read/write.

Access to this field is **RO**.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the activity monitors Extension is [AMCFGR_EL0.SIZE + 1].

Note

Software also uses this field to determine the spacing of counters in the memory-map. From Armv8, the counters are at doubleword-aligned addresses.

Reads as `0b111111`.

Access to this field is **RO**.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is [AMCFGR_EL0.N + 1].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMCFGR_EL0

Accesses to this register use the following encodings in the System register encoding space:

AMCG1IDR_EL0, Activity Monitors Counter Group 1 Identification Register

The AMCG1IDR_EL0 characteristics are:

Purpose

Defines which auxiliary counters are implemented, and which of them have a corresponding virtual offset register, AMEVCNTVOFF1<n>_EL2 implemented.

Configuration

This register is present only when FEAT_AMUv1p1 is implemented. Otherwise, direct accesses to AMCG1IDR_EL0 are UNDEFINED.

Attributes

AMCG1IDR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	
AMEVCNTOFF115_EL2	AMEVCNTOFF114_EL2	AMEVCNTOFF113_EL2	AMEVCNTOFF112_EL2	AMEVCNTOFF111_EL2	AM
31	30	29	28	27	

Bits [63:32]

Reserved, RES0.

AMEVCNTOFF1<n>_EL2, bit [n+16], for n = 15 to 0

Indicates which implemented auxiliary counters have a corresponding virtual offset register, AMEVCNTVOFF1<n>_EL2 implemented.

AMEVCNTOFF1<n>_EL2	Meaning
0b0	When read, mean that AMEVCNTR1<n>_EL0 does not have an offset, or is not implemented.
0b1	When read, means the offset AMEVCNTVOFF1<n>_EL2 is implemented for AMEVCNTR1<n>_EL0.

AMEVCNTR1<n>_EL0, bit [n], for n = 15 to 0

Indicates which auxiliary counters AMEVCNTR1<n>_EL0 are implemented.

AMEVCNTR1<n>_EL0	Meaning
0b0	When read, means that AMEVCNTR1<n>_EL0 is not implemented.
0b1	When read, means that AMEVCNTR1<n>_EL0 is implemented.

Accessing AMCG1IDR_EL0

AMCGCR_EL0, Activity Monitors Counter Group Configuration Register

The AMCGCR_EL0 characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configuration

AArch64 System register AMCGCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMCGCR[31:0].

AArch64 System register AMCGCR_EL0 bits [31:0] are architecturally mapped to External register AMCGCR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR_EL0 are UNDEFINED.

Attributes

AMCGCR_EL0 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:16	RES0
15:8	CG1NC
7:0	CG0NC

Bits [63:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is `0x0` to `0x10`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

Reads as `0x04`.

Access to this field is **RO**.

Accessing AMCGCR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMCGCR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0010	0b010

AMCNTENCLR0_EL0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0_EL0 characteristics are:

Purpose

Disable control bits for the architected activity monitors event counters, AMEVCNTR0<n>_EL0.

Configuration

AArch64 System register AMCNTENCLR0_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR0[31:0].

AArch64 System register AMCNTENCLR0_EL0 bits [31:0] are architecturally mapped to External register AMCNTENCLR0[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0_EL0 are UNDEFINED.

Attributes

AMCNTENCLR0_EL0 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:16	RES0
15:4	RAZ/WI
3	P3
2	P2
1	P1
0	P0

Bits [63:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for AMEVCNTR0<n>_EL0.

Note

AMCGCR_EL0.CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P<n>	Meaning
`0b0`	When read, means that AMEVCNTR0<n>_EL0 is disabled. When written, has no effect.
`0b1`	When read, means that AMEVCNTR0<n>_EL0 is enabled. When written, disables AMEVCNTR0<n>_EL0.

The reset behavior of this field is:

- On an AMU reset, this field resets to `0`.

Accessing AMCNTENCLR0_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMCNTENCLR0_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0010	0b100

RES0	CG1RZ	RES0	HDBG	RES0

Bits [63:18]

Reserved, RES0.

CG1RZ, bit [17]
When FEAT_AMUv1p1 is implemented:

Counter Group 1 Read Zero.

CG1RZ	Meaning
`0b0`	System register reads of AMEVCNTR1<n>_EL0 return the event count at all implemented and enabled Exception levels.
`0b1`	If the current Exception level is the highest implemented Exception level, system register reads of AMEVCNTR1<n>_EL0 return the event count. Otherwise, reads of AMEVCNTR1<n>_EL0 return a zero value.

Note

Reads from the memory-mapped view are unaffected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

HDBG	Meaning
0b0	Activity monitors do not halt counting when the PE is halted in Debug state.
0b1	Activity monitors halt counting when the PE is halted in Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

AMEVCNTR0<n>_EL0, Activity Monitors Event Counter Registers 0, n = 0 - 3

The AMEVCNTR0<n>_EL0 characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configuration

AArch64 System register AMEVCNTR0<n>_EL0 bits [63:0] are architecturally mapped to AArch32 System register AMEVCNTR0<n>[63:0].

AArch64 System register AMEVCNTR0<n>_EL0 bits [63:0] are architecturally mapped to External register AMEVCNTR0<n>[63:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n>_EL0 are UNDEFINED.

Attributes

AMEVCNTR0<n>_EL0 is a 64-bit register.

Field descriptions

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 3.

If FEAT_AMUv1p1 is implemented, HCR_EL2.AMVOFFEN is 1, SCR_EL3.AMVOFFEN is 1, HCR_EL2.{E2H, TGE} is not {1,1}, and EL2 is implemented in the current Security state, access to these registers at EL0 or EL1 return (PCount<63:0> - AMEVCNTVOFF0<n>_EL2<63:0>).

PCount is the physical count returned when AMEVCNTR0<n>_EL0 is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On an AMU reset, this field resets to `0`.

Accessing AMEVCNTR0<n>_EL0

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n>_EL0 are UNDEFINED.

Note

AMCGCR_EL0.CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMEVCNTR0<n>_EL0
```

AMEVTYPER0<n>_EL0, Activity Monitors Event Type Registers 0, n = 0 - 3

The AMEVTYPER0<n>_EL0 characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter AMEVCNTR0<n>_EL0 counts.

Configuration

AArch64 System register AMEVTYPER0<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPER0<n>[31:0].

AArch64 System register AMEVTYPER0<n>_EL0 bits [31:0] are architecturally mapped to External register AMEVTYPER0<n>[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n>_EL0 are UNDEFINED.

Attributes

AMEVTYPER0<n>_EL0 is a 64-bit register.

Field descriptions

Bits 63–32	
RES0	

Bits 31–16	Bits 15–0
RES0	evtCount

Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>_EL0. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

evtCount	Meaning	Applies when
0x0011	Processor frequency cycles	When n == 0
0x4004	Constant frequency cycles	When n == 1
0x0008	Instructions retired	When n == 2
0x4005	Memory stall cycles	When n == 3

Accessing AMEVTYPER0<n>_EL0

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPER0<n>_EL0 are UNDEFINED.

Note

AMCGCR_EL0.CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMEVTYPER0<n>_EL0
```

AMEVTYPER1<n>_EL0, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n>_EL0 characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter AMEVCNTR1<n>_EL0 counts.

Configuration

AArch64 System register AMEVTYPER1<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPER1<n>[31:0].

AArch64 System register AMEVTYPER1<n>_EL0 bits [31:0] are architecturally mapped to External register AMEVTYPER1<n>[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n>_EL0 are UNDEFINED.

Attributes

AMEVTYPER1<n>_EL0 is a 64-bit register.

Field descriptions

63 - 32	RES0
31 - 16	RES0
15 - 0	evtCount

Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCNTR1<n>_EL0.

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter AMEVCNTR1<n>_EL0, then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by AMEVCNTR1<n>_EL0 might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter AMEVCNTR1<n>_EL0 is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMEVTYPER1<n>_EL0

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n>_EL0 are UNDEFINED.

Note

AMCGCR_EL0.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, AMEVTYPER1<n>_EL0
```

AMUSERENR_EL0, Activity Monitors User Enable Register

The AMUSERENR_EL0 characteristics are:

Purpose

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR_EL0 is applicable to both the architected and the auxiliary counter groups.

Configuration

AArch64 System register AMUSERENR_EL0 bits [31:0] are architecturally mapped to AArch32 System register AMUSERENR[31:0].

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR_EL0 are UNDEFINED.

Attributes

AMUSERENR_EL0 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32

Bits [63:1]

Reserved, RES0.

EN, bit [0]

Traps EL0 accesses to the activity monitors registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value `0x18`:
  - AMCFGR_EL0, AMCGCR_EL0, AMCNTENCLR0_EL0, AMCNTENCLR1_EL0, AMCNTENSET0_EL0, AMCNTENSET1_EL0, AMCR_EL0, AMEVCNTR0<n>_EL0, AMEVCNTR1<n>_EL0, AMEVTYPER0<n>_EL0, and AMEVTYPER1<n>_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value `0x03`, MRRC and MCRR accesses are trapped and reported using EC syndrome value `0x04`:
  - AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVCNTR0<n>, AMEVCNTR1<n>, AMEVTYPER0<n>, and AMEVTYPER1<n>.

EN	Meaning
`0b0`	EL0 accesses to the activity monitors registers are trapped.
`0b1`	This control does not cause any instructions to be trapped. Software can access all activity monitor registers at EL0.

Note

- AMUSERENR_EL0 can always be read at EL0 and is not governed by this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMUSERENR_EL0

Accesses to this register use the following encodings in the System register encoding space:

APDAKeyHi_EL1, Pointer Authentication Key A for Data (bits[127:64])

The APDAKeyHi_EL1 characteristics are:

Purpose

Holds bits[127:64] of key A used for authentication of data pointer values.

Note

The term APDAKey_EL1 is used to describe the concatenation of APDAKeyHi_EL1: APDAKeyLo_EL1.

Configuration

This register is present only when FEAT_PAuth is implemented. Otherwise, direct accesses to APDAKeyHi_EL1 are UNDEFINED.

Attributes

APDAKeyHi_EL1 is a 64-bit register.

Field descriptions

63–32
64 bit value, bits[127:64] of the 128 bit pointer authentication key value

31–0
64 bit value, bits[127:64] of the 128 bit pointer authentication key value

Bits [63:0]

64 bit value, bits[127:64] of the 128 bit pointer authentication key value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing APDAKeyHi_EL1

APDAKeyLo_EL1, Pointer Authentication Key A for Data (bits[63:0])

The APDAKeyLo_EL1 characteristics are:

Purpose

Holds bits[63:0] of key A used for authentication of data pointer values.

Note

The term APDAKey_EL1 is used to describe the concatenation of APDAKeyHi_EL1: APDAKeyLo_EL1.

Configuration

This register is present only when FEAT_PAuth is implemented. Otherwise, direct accesses to APDAKeyLo_EL1 are UNDEFINED.

Attributes

APDAKeyLo_EL1 is a 64-bit register.

Field descriptions

63–32
64 bit value, bits[63:0] of the 128 bit pointer authentication key value

31–0
64 bit value, bits[63:0] of the 128 bit pointer authentication key value

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing APDAKeyLo_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, APDAKeyLo_EL1
```

op0	op1	CRn	CRm	op2

APGAKeyLo_EL1, Pointer Authentication Key A for Code (bits[63:0])

The APGAKeyLo_EL1 characteristics are:

Purpose

Holds bits[63:0] of key used for generic pointer authentication code.

Note

The term APGAKey_EL1 is used to describe the concatenation of APGAKeyHi_EL1: APGAKeyLo_EL1.

Configuration

This register is present only when FEAT_PAuth is implemented. Otherwise, direct accesses to APGAKeyLo_EL1 are UNDEFINED.

Attributes

APGAKeyLo_EL1 is a 64-bit register.

Field descriptions

63–32
64 bit value, bits[63:0] of the 128 bit pointer authentication key value

31–0
64 bit value, bits[63:0] of the 128 bit pointer authentication key value

Bits [63:0]

64 bit value, bits[63:0] of the 128 bit pointer authentication key value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing APGAKeyLo_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, APGAKeyLo_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0011	0b000

AT S12E0R, Address Translate Stages 1 and 2 EL0 Read

The AT S12E0R characteristics are:

Purpose

Performs stage 1 and 2 address translations from EL0, with permissions as if reading from the given virtual address from EL0, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime.
- Otherwise, the EL1&0 translation regime.

Configuration

There are no configuration notes.

Attributes

AT S12E0R is a 64-bit System instruction.

Field descriptions

AT S1E1RP, Address Translate Stage 1 EL1 Read PAN

The AT S1E1RP characteristics are:

Purpose

Performs a stage 1 address translation, where the value of PSTATE.PAN determines if a read from a location will generate a Permission fault for a privileged access, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
    - If HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime, accessed from EL1.
    - If HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime, accessed from EL2.
- Otherwise, the EL1&0 translation regime, accessed from EL1.

Configuration

This instruction is present only when FEAT_PAN2 is implemented. Otherwise, direct accesses to AT S1E1RP are UNDEFINED.

Attributes

AT S1E1RP is a 64-bit System instruction.

Field descriptions

63–32
Input address for translation

31–0
Input address for translation

Bits [63:0]

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

AT S1E1WP, Address Translate Stage 1 EL1 Write PAN

The AT S1E1WP characteristics are:

Purpose

Performs a stage 1 address translation, where the value of PSTATE.PAN determines if a write to a location will generate a Permission fault for a privileged access, using the following translation regime:

- When EL2 is implemented and enabled in the Security state described by the current value of SCR_EL3.NS:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the EL1&0 translation regime, accessed from EL1.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, the EL2&0 translation regime, accessed from EL2.
- Otherwise, the EL1&0 translation regime, accessed from EL1.

Configuration

This instruction is present only when FEAT_PAN2 is implemented. Otherwise, direct accesses to AT S1E1WP are UNDEFINED.

Attributes

AT S1E1WP is a 64-bit System instruction.

Field descriptions

63–32
Input address for translation

31–0
Input address for translation

Bits [63:0]

Input address for translation. The resulting address can be read from the PAR_EL1.

If the address translation instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then VA[63:32] is RES0.

Executing the AT S1E1WP instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
AT S1E1WP, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1001	0b001

```
if PSTATE.EL == EL0 then

CCSIDR2_EL1, Current Cache Size ID Register 2

The CCSIDR2_EL1 characteristics are:

Purpose

Provides the information about the architecture of the currently selected cache from bits[63:32] of CCSIDR_EL1.

Configuration

AArch64 System register CCSIDR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register CCSIDR2[31:0].

This register is present only when FEAT_CCIDX is implemented. Otherwise, direct accesses to CCSIDR2_EL1 are UNDEFINED.

In an implementation which does not support AArch32 at EL1, it is IMPLEMENTATION DEFINED whether reading this register gives an UNKNOWN value or is UNDEFINED.

The implementation includes one CCSIDR2_EL1 for each cache that it can access. CSSELR_EL1 selects which Cache Size ID Register is accessible.

Attributes

CCSIDR2_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:24	RES0
23:0	NumSets

Bits [63:24]

Reserved, RES0.

NumSets, bits [23:0]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Accessing CCSIDR2_EL1

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR2_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR2_EL1 read is treated as NOP.
- The CCSIDR2_EL1 read is UNDEFINED.
- The CCSIDR2_EL1 read returns an UNKNOWN value.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CCSIDR2_EL1
```

op0	op1	CRn	CRm	op2

0b11	0b001	0b0000	0b0000	0b010

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID2 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.TID4 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return CCSIDR2_EL1;
elsif PSTATE.EL == EL2 then
    return CCSIDR2_EL1;
elsif PSTATE.EL == EL3 then
    return CCSIDR2_EL1;
```

CCSIDR_EL1, Current Cache Size ID Register

The CCSIDR_EL1 characteristics are:

Purpose

Provides information about the architecture of the currently selected cache.

Configuration

AArch64 System register CCSIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CCSIDR[31:0].

AArch64 System register CCSIDR_EL1 bits [63:32] are architecturally mapped to AArch32 System register CCSIDR2[31:0].

The implementation includes one CCSIDR_EL1 for each cache that it can access. CSSELR_EL1 selects which Cache Size ID Register is accessible.

Attributes

CCSIDR_EL1 is a 64-bit register.

Field descriptions

When FEAT_CCIDX is implemented:

63 – 56	55 – 32	
RES0	NumSets	
31 – 24	**23 – 3**	**2 – 0**
RES0	Associativity	LineSize

Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [63:56]

Reserved, RES0.

NumSets, bits [55:32]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Bits [31:24]

Reserved, RES0.

Associativity, bits [23:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log$_2$(Number of bytes in cache line)) - 4. For example:

- For a line length of 16 bytes: Log$_2$(16) = 4, LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes: Log$_2$(32) = 5, LineSize entry = 1.

When FEAT_MTE2 is implemented and enabled, where a cache only holds Allocation tags, this field is RES0.

Otherwise:

63 … 32
RES0

31 … 28	27 … 13	12 … 3	2 … 0
UNKNOWN	NumSets	Associativity	LineSize

Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [63:32]

Reserved, RES0.

Bits [31:28]

Reserved, UNKNOWN.

NumSets, bits [27:13]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Associativity, bits [12:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log$_2$(Number of bytes in cache line)) - 4. For example:

- For a line length of 16 bytes: Log$_2$(16) = 4, LineSize entry = 0. This is the minimum line length.
- For a line length of 32 bytes: Log$_2$(32) = 5, LineSize entry = 1.

Accessing CCSIDR_EL1

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR_EL1 the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR_EL1 read is treated as NOP.

- The CCSIDR_EL1 read is UNDEFINED.
- The CCSIDR_EL1 read returns an UNKNOWN value.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CCSIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b000

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID2 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.TID4 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGRTR_EL2.CCSIDR_EL1 == '1'
then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return CCSIDR_EL1;
elsif PSTATE.EL == EL2 then
    return CCSIDR_EL1;
elsif PSTATE.EL == EL3 then
    return CCSIDR_EL1;
```

CFP RCTX, Control Flow Prediction Restriction by Context

The CFP RCTX characteristics are:

Purpose

Control Flow Prediction Restriction by Context applies to all Control Flow Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

Control flow predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when FEAT_SPECRES is implemented. Otherwise, direct accesses to CFP RCTX are UNDEFINED.

Attributes

CFP RCTX is a 64-bit System instruction.

Field descriptions

63:49	48	47:32
RES0	GVMID	VMID

31:27	26	25:24	23:17	16	15:0
RES0	NS	EL	RES0	GASID	ASID

Bits [63:49]

Reserved, RES0.

GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when (HCR_EL2.E2H==0 or HCR_EL2.TGE==0).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==0 or HCR_EL2.TGE==0), this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==1 and HCR_EL2.TGE==1), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

If the implementation supports 16 bits of VMID, then the upper 8 bits of the VMID must be written to 0 by software when the context being affected only uses 8 bits.

Bits [31:27]

Reserved, RES0.

NS, bit [26]

Security State. Defined values are:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASID for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being affected only uses 8 bits.

Executing the CFP RCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
CFP RCTX, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b100

```
if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLR_EL1.EnRCTX == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGITR_EL2.CFPRCTX == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<E2H,TGE> == '11' && SCTLR_EL2.EnRCTX == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        AArch64.RestrictPrediction(X[t], RestrictType_ControlFlow);
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.CFPRCTX == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        AArch64.RestrictPrediction(X[t], RestrictType_ControlFlow);
elsif PSTATE.EL == EL2 then
    AArch64.RestrictPrediction(X[t], RestrictType_ControlFlow);
elsif PSTATE.EL == EL3 then
    AArch64.RestrictPrediction(X[t], RestrictType_ControlFlow);
```

CLIDR_EL1, Cache Level ID Register

The CLIDR_EL1 characteristics are:

Purpose

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

Configuration

AArch64 System register CLIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CLIDR[31:0].

Attributes

CLIDR_EL1 is a 64-bit register.

Field descriptions

63 … 47	46 45	44 43	42 41	40 39	38 37	36 35	34 33	32
RES0	Ttype7	Ttype6	Ttype5	Ttype4	Ttype3	Ttype2	Ttype1	ICB

31 30	29 28 27	26 25 24	23 22 21	20 19 18	17 16 15	14 13 12	11 10 9	8 7 6	5 4 3	2 1 0
ICB	LoUU	LoC	LoUIS	Ctype7	Ctype6	Ctype5	Ctype4	Ctype3	Ctype2	Ctype1

Bits [63:47]

Reserved, RES0.

Ttype<n>, bits [2(n-1)+34:2(n-1)+33], for n = 7 to 1

When FEAT_MTE2 is implemented:

Tag cache type. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy.

Ttype<n>	Meaning
`0b00`	No Tag Cache.
`0b01`	Separate Allocation Tag Cache.
`0b10`	Unified Allocation Tag and Data cache, Allocation Tags and Data in unified lines.
`0b11`	Unified Allocation Tag and Data cache, Allocation Tags and Data in separate lines.

Otherwise:

Reserved, RES0.

ICB, bits [32:30]

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

ICB	Meaning
0b000	Not disclosed by this mechanism.
0b001	L1 cache is the highest Inner Cacheable level.
0b010	L2 cache is the highest Inner Cacheable level.
0b011	L3 cache is the highest Inner Cacheable level.
0b100	L4 cache is the highest Inner Cacheable level.
0b101	L5 cache is the highest Inner Cacheable level.
0b110	L6 cache is the highest Inner Cacheable level.
0b111	L7 cache is the highest Inner Cacheable level.

LoUU, bits [29:27]

Level of Unification Uniprocessor for the cache hierarchy.

Note

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

LoC, bits [26:24]

Level of Coherence for the cache hierarchy.

LoUIS, bits [23:21]

Level of Unification Inner Shareable for the cache hierarchy.

Note

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 7 to 1

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy. Possible values of each field are:

Ctype<n>	Meaning
0b000	No cache.
0b001	Instruction cache only.
0b010	Data cache only.
0b011	Separate instruction and data caches.
0b100	Unified cache.

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

Accessing CLIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CLIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b001

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then

CNTFRQ_EL0, Counter-timer Frequency register

The CNTFRQ_EL0 characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configuration

AArch64 System register CNTFRQ_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTFRQ[31:0].

Attributes

CNTFRQ_EL0 is a 64-bit register.

Field descriptions

Bits	Field
63 ... 32	RES0
31 ... 0	Clock frequency

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFRQ_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTFRQ_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0000	0b000

```
if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CNTKCTL_EL1.<EL0PCTEN,EL0VCTEN> == '00' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    elsif EL2Enabled() && HCR_EL2.<E2H,TGE> == '11' && CNTHCTL_EL2.<EL0PCTEN,EL0VCTEN> == '00' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return CNTFRQ_EL0;
elsif PSTATE.EL == EL1 then
    return CNTFRQ_EL0;
elsif PSTATE.EL == EL2 then
    return CNTFRQ_EL0;
elsif PSTATE.EL == EL3 then
    return CNTFRQ_EL0;
```

```
MSR CNTFRQ_EL0, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0000	0b000

```
if IsHighestEL(PSTATE.EL) then
    CNTFRQ_EL0 = X[t];
else
    UNDEFINED;
```

CNTHCTL_EL2, Counter-timer Hypervisor Control register

The CNTHCTL_EL2 characteristics are:

Purpose

Controls the generation of an event stream from the physical counter, and access from EL1 to the physical counter and the EL1 physical timer.

Configuration

AArch64 System register CNTHCTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHCTL[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

CNTHCTL_EL2 is a 64-bit register.

Field descriptions

When FEAT_VHE is implemented and HCR_EL2.E2H == 1:

63626160595857565554535251 50	49	48	47	46	45	44	43	42	41	40
RES0										
RES0	EVNTIS	EL1NVVCT	EL1NVPCT	EL1TVCT	EL1TVT	ECV	EL1PTEN	EL1PCTEN	EL0PTEN	EL0VTEN
31302928272625242322212019 18	17	16	15	14	13	12	11	10	9	8

Bits [63:18]

Reserved, RES0.

EVNTIS, bit [17]

When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_EL0[15:0].
0b1	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_EL0[23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVVCT, bit [16]
When FEAT_ECV is implemented:

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H==1 && HCR_EL2.TGE==1) || HCR_EL2.NV2==0 || HCR_EL2.NV1==1 || HCR_EL2.NV==0), this control does not cause any instructions to be trapped. If ((HCR_EL2.E2H==0 || HCR_EL2.TGE==0) && HCR_EL2.NV2==1 && HCR_EL2.NV1==0 && HCR_EL2.NV==1), then EL1 accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVPCT, bit [15]
When FEAT_ECV is implemented:

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVPCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H==1 && HCR_EL2.TGE==1) || HCR_EL2.NV2==0 || HCR_EL2.NV1==1 || HCR_EL2.NV==0), this control does not cause any instructions to be trapped. If (HCR_EL2.E2H==0 || HCR_EL2.TGE==0) && HCR_EL2.NV2==1 && HCR_EL2.NV1==0 && HCR_EL2.NV==1, then EL1 accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02, are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVCT, bit [14]

When FEAT_ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

EL1TVCT	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	If HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then: • In AArch64 state, traps EL0 and EL1 accesses to CNTVCT_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN. • In AArch32 state, traps EL0 and EL1 accesses to CNTVCT to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN or CNTKCTL.PL0VCTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVT, bit [13]

When FEAT_ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

EL1TVT	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	If HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then: • In AArch64 state, traps EL0 and EL1 accesses to CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN. • In AArch32 state, traps EL0 and EL1 accesses to CNTV_CTL, CNTV_CVAL, and CNTV_TVAL to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN or CNTKCTL.PL0VTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECV, bit [12]
When FEAT_ECV is implemented:

Enables the Enhanced Counter Virtualization functionality registers.

ECV	Meaning
0b0	Enhanced Counter Virtualization functionality is disabled.
0b1	When HCR_EL2.{E2H, TGE} == {1, 1} or SCR_EL3.{NS, EEL2} == {0, 0}, then Enhanced Counter Virtualization functionality is disabled. When SCR_EL3.NS or SCR_EL3.EEL2 are 1, and HCR_EL2.E2H or HCR_EL2.TGE are 0, then Enhanced Counter Virtualziation functionality is enabled when EL2 is enabled for the current Security state. This means that: • An MRS to CNTPCT_EL0 from either EL0 or EL1 that is not trapped will return the value (PCount<63:0> - CNTPOFF_EL2<63:0>). • The EL1 physical timer interrupt is triggered when ((PCount<63:0> - CNTPOFF_EL2<63:0>) - PCVal<63:0>) is greater than or equal to 0. PCount<63:0> is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3. PCVal<63:0> is the EL1 physical timer compare value for this timer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1PTEN, bit [11]

When HCR_EL2.TGE is 0, traps EL0 and EL1 accesses to the E1 physical timer registers to EL2 when EL2 is enabled in the current Security state.

EL1PTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PTEN. From AArch32 state: EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PTEN or CNTKCTL.PL0PTEN.
0b1	This control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCTEN, bit [10]

When HCR_EL2.TGE is 0, traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to CNTPCT_EL0 are trapped to EL2, reported using EC syndrome value `0x18`.
- In AArch32 state, MRRC or MCRR accesses to CNTPCT are trapped to EL2, reported using EC syndrome value `0x04`.

EL1PCTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTPCT_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN. From AArch32 state: EL0 and EL1 accesses to the CNTPCT are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN or CNTKCTL.PL0PCTEN.
0b1	This control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0PTEN, bit [9]

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, traps EL0 accesses to the physical timer registers to EL2.

EL0PTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 registers are trapped to EL2. EL0 using AArch32: EL0 accesses to the CNTP_CTL, CNTP_CVAL and CNTP_TVAL registers are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, traps EL0 accesses to the virtual timer registers to EL2.

EL0VTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 registers are trapped to EL2. EL0 using AArch32: EL0 accesses to the CNTV_CTL, CNTV_CVAL, and CNTV_TVAL registers are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of CNTPCT_EL0, as seen from EL2, is the trigger for the event stream generated from that counter when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of CNTPCT_EL0.

Otherwise, this field selects a trigger bit in the range 0 to 15 of CNTPCT_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the CNTPCT_EL0 trigger bit, as seen from EL2 and defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from CNTPCT_EL0 as seen from EL2.

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0VCTEN, bit [1]

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, traps EL0 accesses to the frequency register and virtual counter register to EL2.

EL0VCTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the CNTVCT_EL0 are trapped to EL2. EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 register are trapped to EL2, if CNTHCTL_EL2.EL0PCTEN is also 0. EL0 using AArch32: EL0 accesses to the CNTVCT are trapped to EL2. EL0 using AArch32: EL0 accesses to the CNTFRQ register are trapped to EL2, if CNTHCTL.EL0PCTEN is also 0.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

When HCR_EL2.TGE is 0, this control does not cause any instructions to be trapped.

When HCR_EL2.TGE is 1, traps EL0 accesses to the frequency register and physical counter register to EL2.

EL0PCTEN	Meaning
0b0	EL0 using AArch64: EL0 accesses to the CNTPCT_EL0 are trapped to EL2. EL0 using AArch64: EL0 accesses to the CNTFRQ_EL0 register are trapped to EL2, if CNTHCTL_EL2.EL0VCTEN is also 0. EL0 using AArch32: EL0 accesses to the CNTPCT are trapped to EL2. EL0 using AArch32: EL0 accesses to the CNTFRQ and register are trapped to EL2, if CNTHCTL_EL2.EL0VCTEN is also 0.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

63626160595857565554535251 50	49	48	47	46	45	44	4342414039383736	35	34	
RES0										
RES0	EVNTIS	EL1NVVCT	EL1NVPCT	EL1TVCT	EL1TVT	ECV	RES0	EVNTI	EVNTDIR	EVNTEN	El
31302928272625242322212019 18	17	16	15	14	13	12	1110 9 8	7 6 5 4	3	2

This format applies in all Armv8.0 implementations, and it also contains a description of the behavior when EL3 is implemented and EL2 is not implemented.

Bits [63:18]

Reserved, RES0.

EVNTIS, bit [17]

When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
0b0	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_EL0[15:0].
0b1	The CNTHCTL_EL2.EVNTI field applies to CNTPCT_EL0[23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVVCT, bit [16]

When FEAT_ECV is implemented:

Traps EL1 accesses to the specified EL1 virtual timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H==1 && HCR_EL2.TGE==1) || HCR_EL2.NV2==0 || HCR_EL2.NV1==1 || HCR_EL2.NV==0), this control does not cause any instructions to be trapped. If ((HCR_EL2.E2H==0 || HCR_EL2.TGE==0) && HCR_EL2.NV2==1 && HCR_EL2.NV1==0 && HCR_EL2.NV==1), then EL1 accesses to CNTV_CTL_EL02 and CNTV_CVAL_EL02 are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1NVPCT, bit [15]

When FEAT_ECV is implemented:

Traps EL1 accesses to the specified EL1 physical timer registers using the EL02 descriptors to EL2, when EL2 is enabled for the current Security state.

EL1NVPCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If ((HCR_EL2.E2H==1 && HCR_EL2.TGE==1) || HCR_EL2.NV2==0 || HCR_EL2.NV1==1 || HCR_EL2.NV==0), this control does not cause any instructions to be trapped. If (HCR_EL2.E2H==0 || HCR_EL2.TGE==0) && HCR_EL2.NV2==1 && HCR_EL2.NV1==0 && HCR_EL2.NV==1, then EL1 accesses to CNTP_CTL_EL02 and CNTP_CVAL_EL02, are trapped to EL2.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVCT, bit [14]

When FEAT_ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual counter registers to EL2, when EL2 is enabled for the current Security state.

EL1TVCT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then: In AArch64 state, traps EL0 and EL1 accesses to CNTVCT_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN. In AArch32 state, traps EL0 and EL1 accesses to CNTVCT to EL2, unless they are trapped by CNTKCTL_EL1.EL0VCTEN or CNTKCTL.PL0VCTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EL1TVT, bit [13]

When FEAT_ECV is implemented:

Traps EL0 and EL1 accesses to the EL1 virtual timer registers to EL2, when EL2 is enabled for the current Security state.

EL1TVT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped. If HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, then: • In AArch64 state, traps EL0 and EL1 accesses to CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0 to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN. • In AArch32 state, traps EL0 and EL1 accesses to CNTV_CTL, CNTV_CVAL, and CNTV_TVAL to EL2, unless they are trapped by CNTKCTL_EL1.EL0VTEN or CNTKCTL.PL0VTEN.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 0 other than for the purpose of a direct read.

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECV, bit [12]

When FEAT_ECV is implemented:

Enables the Enhanced Counter Virtualization functionality registers.

ECV	Meaning
0b0	Enhanced Counter Virtualization functionality is disabled.
0b1	When HCR_EL2.{E2H, TGE} == {1, 1} or SCR_EL3.{NS, EEL2} == {0, 0}, then Enhanced Counter Virtualization functionality is disabled. When SCR_EL3.NS or SCR_EL3.EEL2 are 1, and HCR_EL2.E2H or HCR_EL2.TGE are 0, then Enhanced Counter Virtualziation functionality is enabled when EL2 is enabled for the current Security state. This means that: • An MRS to CNTPCT_EL0 from either EL0 or EL1 that is not trapped will return the value (PCount<63:0> - CNTPOFF_EL2<63:0>). • The EL1 physical timer interrupt is triggered when ((PCount<63:0> - CNTPOFF_EL2<63:0>) - PCVal<63:0>) is greater than or equal to 0. PCount is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3. PCVal<63:0> is the EL1 physical timer compare value for this timer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [11:8]

Reserved, RES0.

EVNTI, bits [7:4]

Selects which bit of CNTPCT_EL0, as seen from EL2,is the trigger for the event stream generated from that counter when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL_EL2.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of CNTPCT_EL0.

Otherwise, this field selects a trigger bit in the range 0 to 15 of CNTPCT_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the CNTPCT_EL0 trigger bit, as seen from EL2 and defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from CNTPCT_EL0 as seen from EL2.

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCEN, bit [1]

Traps EL0 and EL1 accesses to the EL1 physical timer registers to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to CNTP_CTL_EL0, CNTP_CVAL_EL0, CNTP_TVAL_EL0 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x3 and MRRC and MCRR accesses are trapped to EL2, reported using EC syndrome value 0x04:
    - CNTP_CTL, CNTP_CVAL, CNTP_TVAL.

EL1PCEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PTEN. From AArch32 state: EL0 and EL1 accesses to the CNTP_CTL, CNTP_CVAL, and CNTP_TVAL are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PTEN or CNTKCTL.PL0PTEN.
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL1PCTEN, bit [0]

Traps EL0 and EL1 accesses to the EL1 physical counter register to EL2 when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to CNTPCT_EL0 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, MRRC or MCRR accesses to CNTPCT are trapped to EL2, reported using EC syndrome value 0x04.

EL1PCTEN	Meaning
0b0	From AArch64 state: EL0 and EL1 accesses to the CNTPCT_EL0 are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN. From AArch32 state: EL0 and EL1 accesses to the CNTPCT are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by CNTKCTL_EL1.EL0PCTEN or CNTKCTL.PL0PCTEN.
0b1	This control does not cause any instructions to be trapped.

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHCTL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHCTL_EL2 or CNTKCTL_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTHCTL_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0001	0b000

```

CNTHP_CTL_EL2, Counter-timer Hypervisor Physical Timer Control register

The CNTHP_CTL_EL2 characteristics are:

Purpose

Control register for the EL2 physical timer.

Configuration

AArch64 System register CNTHP_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHP_CTL[31:0].

This register is present only when EL3 is implemented or (EL3 is not implemented, EL2 is implemented and FEAT_SEL2 is not implemented). Otherwise, direct accesses to CNTHP_CTL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_CTL_EL2 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
RES0

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3	2	1	0
RES0	ISTATUS	IMASK	ENABLE

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
`0b0`	Timer interrupt is not masked by the IMASK bit.
`0b1`	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
`0b0`	Timer disabled.
`0b1`	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHP_TVAL_EL2 continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_CTL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP_CTL_EL2 or CNTP_CTL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```

CNTHP_CVAL_EL2, Counter-timer Physical Timer CompareValue register (EL2)

The CNTHP_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the EL2 physical timer.

Configuration

AArch64 System register CNTHP_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTHP_CVAL[63:0].

This register is present only when EL3 is implemented or (EL3 is not implemented, EL2 is implemented and FEAT_SEL2 is not implemented). Otherwise, direct accesses to CNTHP_CVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_CVAL_EL2 is a 64-bit register.

Field descriptions

63–32
CompareValue

31–0
CompareValue

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When CNTHP_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHP_CTL_EL2.ISTATUS is set to 1.
- If CNTHP_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHP_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_CVAL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP_CVAL_EL2 or CNTP_CVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTHP_CVAL_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1110	0b0010	0b010

CNTHP_TVAL_EL2, Counter-timer Physical Timer TimerValue register (EL2)

The CNTHP_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the EL2 physical timer.

Configuration

AArch64 System register CNTHP_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHP_TVAL[31:0].

This register is present only when EL3 is implemented or (EL3 is not implemented, EL2 is implemented and FEAT_SEL2 is not implemented). Otherwise, direct accesses to CNTHP_TVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_TVAL_EL2 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:0	TimerValue

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHP_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHP_CTL_EL2.ENABLE is 1, the value returned is (CNTHP_CVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHP_CVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHP_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHP_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHP_CTL_EL2.ISTATUS is set to 1.
- If CNTHP_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHP_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHP_TVAL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHP_TVAL_EL2 or CNTP_TVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTHP_TVAL_EL2
```

op0	op1	CRn	CRm	op2

CNTHPS_CTL_EL2, Counter-timer Secure Physical Timer Control register (EL2)

The CNTHPS_CTL_EL2 characteristics are:

Purpose

Control register for the Secure EL2 physical timer.

Configuration

AArch64 System register CNTHPS_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHPS_CTL[31:0].

This register is present only when FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL_EL2 are UNDEFINED.

Attributes

CNTHPS_CTL_EL2 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:3	RES0
2	ISTATUS
1	IMASK
0	ENABLE

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
`0b0`	Timer condition is not met.
`0b1`	Timer condition is met.

When the value of the CNTHPS_CTL_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL_EL2.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHPS_TVAL_EL2 continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHPS_CTL_EL2

Accesses to this register use the following encodings in the System register encoding space:

```

CNTHPS_CVAL_EL2, Counter-timer Secure Physical Timer CompareValue register (EL2)

The CNTHPS_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the Secure EL2 physical timer.

Configuration

AArch64 System register CNTHPS_CVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHPS_CVAL[31:0].

This register is present only when EL2 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CVAL_EL2 are UNDEFINED.

Attributes

CNTHPS_CVAL_EL2 is a 64-bit register.

Field descriptions

63–32
CompareValue
CompareValue
31–0

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHPS_CVAL_EL2

Accesses to this register use the following encodings in the System register encoding space:

CNTHPS_TVAL_EL2, Counter-timer Secure Physical Timer TimerValue register (EL2)

The CNTHPS_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the Secure EL2 physical timer.

Configuration

AArch64 System register CNTHPS_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHPS_TVAL[31:0].

This register is present only when EL2 is implemented and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_TVAL_EL2 are UNDEFINED.

Attributes

CNTHPS_TVAL_EL2 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:0	TimerValue

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If CNTHPS_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHPS_CTL_EL2.ENABLE is 1, the value returned is (CNTHPS_CVAL_EL2 - CNTPCT_EL0).

On a write of this register, CNTHPS_CVAL_EL2 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHPS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTHPS_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHPS_CTL_EL2.ISTATUS is set to 1.
- If CNTHPS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHPS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CNTHV_CTL_EL2, Counter-timer Virtual Timer Control register (EL2)

The CNTHV_CTL_EL2 characteristics are:

Purpose

Control register for the EL2 virtual timer.

Configuration

AArch64 System register CNTHV_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHV_CTL[31:0].

This register is present only when FEAT_VHE is implemented and (EL3 is implemented or (EL3 is not implemented and FEAT_SEL2 is not implemented)). Otherwise, direct accesses to CNTHV_CTL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHV_CTL_EL2 is a 64-bit register.

Field descriptions

63 ... 32			
RES0			
RES0	ISTATUS	IMASK	ENABLE
31 ... 3	2	1	0

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHV_TVAL_EL2 continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHV_CTL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV_CTL_EL2 or CNTV_CTL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

CNTHV_CVAL_EL2, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the EL2 virtual timer.

Configuration

AArch64 System register CNTHV_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTHV_CVAL[63:0].

This register is present only when FEAT_VHE is implemented and (EL3 is implemented or (EL3 is not implemented and FEAT_SEL2 is not implemented)). Otherwise, direct accesses to CNTHV_CVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHV_CVAL_EL2 is a 64-bit register.

Field descriptions

Bits	Field
63:32	CompareValue
31:0	CompareValue

CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When CNTHV_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHV_CTL_EL2.ISTATUS is set to 1.
- If CNTHV_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHV_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHV_CVAL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV_CVAL_EL2 or CNTV_CVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

CNTHV_TVAL_EL2, Counter-timer Virtual Timer TimerValue Register (EL2)

The CNTHV_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the EL2 virtual timer.

Configuration

AArch64 System register CNTHV_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHV_TVAL[31:0].

This register is present only when FEAT_VHE is implemented and (EL3 is implemented or (EL3 is not implemented and FEAT_SEL2 is not implemented)). Otherwise, direct accesses to CNTHV_TVAL_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHV_TVAL_EL2 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:0	TimerValue

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHV_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHV_CTL_EL2.ENABLE is 1, the value returned is (CNTHV_CVAL_EL2 - CNTVCT_EL0).

On a write of this register, CNTHV_CVAL_EL2 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHV_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CNTHV_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHV_CTL_EL2.ISTATUS is set to 1.
- If CNTHV_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHV_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHV_TVAL_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CNTHV_TVAL_EL2 or CNTV_TVAL_EL0 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

CNTHVS_CTL_EL2, Counter-timer Secure Virtual Timer Control register (EL2)

The CNTHVS_CTL_EL2 characteristics are:

Purpose

Control register for the Secure EL2 virtual timer.

Configuration

AArch64 System register CNTHVS_CTL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHVS_CTL[31:0].

This register is present only when FEAT_SEL2 is implemented and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHVS_CTL_EL2 are UNDEFINED.

Attributes

CNTHVS_CTL_EL2 is a 64-bit register.

Field descriptions

63:35	34	33	32
RES0			
RES0	ISTATUS	IMASK	ENABLE
31:3	2	1	0

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the CNTHVS_CTL_EL2.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the CNTHVS_CTL_EL2.ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTHVS_TVAL_EL2 continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHVS_CTL_EL2

Accesses to this register use the following encodings in the System register encoding space:

CNTHVS_CVAL_EL2, Counter-timer Secure Virtual Timer CompareValue register (EL2)

The CNTHVS_CVAL_EL2 characteristics are:

Purpose

Holds the compare value for the Secure EL2 virtual timer.

Configuration

AArch64 System register CNTHVS_CVAL_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTHVS_CVAL[63:0].

This register is present only when FEAT_SEL2 is implemented and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHVS_CVAL_EL2 are UNDEFINED.

Attributes

CNTHVS_CVAL_EL2 is a 64-bit register.

Field descriptions

63 – 32
CompareValue

31 – 0
CompareValue

CompareValue, bits [63:0]

Holds the Secure EL2 virtual timer CompareValue.

When CNTHVS_CTL_EL2.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTHVS_CTL_EL2.ISTATUS is set to 1.
- If CNTHVS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHVS_CVAL_EL2

Accesses to this register use the following encodings in the System register encoding space:

```

CNTHVS_TVAL_EL2, Counter-timer Secure Virtual Timer TimerValue register (EL2)

The CNTHVS_TVAL_EL2 characteristics are:

Purpose

Holds the timer value for the Secure EL2 virtual timer.

Configuration

AArch64 System register CNTHVS_TVAL_EL2 bits [31:0] are architecturally mapped to AArch32 System register CNTHVS_TVAL[31:0].

This register is present only when FEAT_SEL2 is implemented and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHVS_TVAL_EL2 are UNDEFINED.

Attributes

CNTHVS_TVAL_EL2 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:0	TimerValue

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If CNTHVS_CTL_EL2.ENABLE is 0, the value returned is UNKNOWN.
- If CNTHVS_CTL_EL2.ENABLE is 1, the value returned is (CNTHVS_CVAL_EL2 - CNTVCT_EL0).

On a write of this register, CNTHVS_CVAL_EL2 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTHVS_CTL_EL2.ENABLE is 1, the timer condition is met when ((CNTVCT_EL0 - CNTHVS_CVAL_EL2) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTHVS_CTL_EL2.ISTATUS is set to 1.
- If CNTHVS_CTL_EL2.IMASK is 0, an interrupt is generated.

When CNTHVS_CTL_EL2.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHVS_TVAL_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTHVS_TVAL_EL2

CNTKCTL_EL1, Counter-timer Kernel Control register

The CNTKCTL_EL1 characteristics are:

Purpose

When FEAT_VHE is not implemented, or when HCR_EL2.{E2H, TGE} is not {1, 1}, this register controls the generation of an event stream from the virtual counter, and access from EL0 to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

When FEAT_VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this register does not cause any event stream from the virtual counter to be generated, and does not control access to the counters and timers. The access to counters and timers at EL0 is controlled by CNTHCTL_EL2.

Configuration

AArch64 System register CNTKCTL_EL1 bits [31:0] are architecturally mapped to AArch32 System register CNTKCTL[31:0].

Attributes

CNTKCTL_EL1 is a 64-bit register.

Field descriptions

63626160595857565554535251 50	49	48474645444342	41	40	39383736	35	34	33	32

Bits [63:18]

Reserved, RES0.

EVNTIS, bit [17]

When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

EVNTIS	Meaning
`0b0`	The CNTKCTL_EL1.EVNTI field applies to CNTVCT_EL0[15:0].
`0b1`	The CNTKCTL_EL1.EVNTI field applies to CNTVCT_EL0[23:8].

This control applies regardless of the value of the CNTHCTL_EL2.ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:10]

Reserved, RES0.

EL0PTEN, bit [9]

Traps EL0 accesses to the physical timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value `0x18`:
  - CNTP_CTL_EL0, CNTP_CVAL_EL0, and CNTP_TVAL_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped, reported using EC syndrome value `0x03`, MRRC and MCRR accesses are trapped, reported using EC syndrome value `0x04`:
  - CNTP_CTL, CNTP_CVAL, CNTP_TVAL.

EL0PTEN	Meaning
`0b0`	EL0 accesses to the physical timer registers are trapped to EL1.
`0b1`	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

Traps EL0 accesses to the virtual timer registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped, reported using EC syndrome value `0x18`:
  - CNTV_CTL_EL0, CNTV_CVAL_EL0, and CNTV_TVAL_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value `0x03`, MRRC and MCRR accesses are trapped using EC syndrome value `0x04`:
  - CNTV_CTL, CNTV_CVAL, and CNTV_TVAL.

EL0VTEN	Meaning
`0b0`	EL0 accesses to the virtual timer registers are trapped.
`0b1`	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of CNTVCT_EL0, as seen from EL1, is the trigger for the event stream generated from that counter when that stream is enabled.

If FEAT_ECV is implemented, and CNTKCTL_EL1.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of CNTVCT_EL0.

Otherwise, this field selects a trigger bit in the range 0 to 15 of CNTVCT_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the CNTVCT_EL0 trigger bit, as seen from EL1 and defined by EVNTI, generates an event when the event stream is enabled.

EVNTDIR	Meaning
0b0	A 0 to 1 transition of the trigger bit triggers an event.
0b1	A 1 to 0 transition of the trigger bit triggers an event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

When FEAT_VHE is not implemented, or when HCR_EL2.{E2H, TGE} is not {1, 1}, enables the generation of an event stream from CNTVCT_EL0 as seen from EL1.

EVNTEN	Meaning
0b0	Disables the event stream.
0b1	Enables the event stream.

When FEAT_VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not enable the event stream.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0VCTEN, bit [1]

Traps EL0 accesses to the frequency register and virtual counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to the following registers are trapped and reported using EC syndrome value `0x18`:
  - CNTVCT_EL0 and if CNTKCTL_EL1.EL0PCTEN is 0, CNTFRQ_EL0.
- In AArch32 state, MRC and MCR accesses to the following registers are trapped and reported using EC syndrome value `0x03`, MRRC and MCRR accesses are trapped and reported using EC syndrome value `0x04`:
  - CNTVCT and if CNTKCTL_EL1.EL0PCTEN is 0, CNTFRQ.

EL0VCTEN	Meaning
0b0	EL0 accesses to the frequency register and virtual counter registers are trapped.
0b1	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Traps EL0 accesses to the frequency register and physical counter register to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, the following registers are trapped, reported using EC syndrome value `0x18`:
  - CNTPCT_EL0 and if CNTKCTL_EL1.EL0VCTEN is 0, CNTFRQ_EL0.

- In AArch32 state, MCR or MRC accesses the following registers are trapped, reported using EC syndrome value `0x03`, MCRR or MRRC accesses are trapped and reported using EC syndrome value `0x04`:
    - CNTPCT and if CNTKCTL_EL1.EL0VCTEN is 0, CNTFRQ.

EL0PCTEN	Meaning
`0b0`	EL0 accesses to the frequency register and physical counter register are trapped.
`0b1`	This control does not cause any instructions to be trapped.

When FEAT_VHE is implemented and HCR_EL2.{E2H, TGE} is {1, 1}, this control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTKCTL_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTKCTL_EL1 or CNTKCTL_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTKCTL_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1110	0b0001	0b000

CNTP_CTL_EL0, Counter-timer Physical Timer Control register

The CNTP_CTL_EL0 characteristics are:

Purpose

Control register for the EL1 physical timer.

Configuration

AArch64 System register CNTP_CTL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTP_CTL[31:0].

Attributes

CNTP_CTL_EL0 is a 64-bit register.

Field descriptions

63–35	34	33	32
RES0			

31–3	2	1	0
RES0	ISTATUS	IMASK	ENABLE

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL_EL0 continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CTL_EL0

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_CTL_EL0 or CNTP_CTL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTP_CTL_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0010	0b001

CNTP_CVAL_EL0, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL_EL0 characteristics are:

Purpose

Holds the compare value for the EL1 physical timer.

Configuration

AArch64 System register CNTP_CVAL_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTP_CVAL[63:0].

Attributes

CNTP_CVAL_EL0 is a 64-bit register.

Field descriptions

63–32
CompareValue

31–0
CompareValue

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When CNTP_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL_EL0.ISTATUS is set to 1.
- If CNTP_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTP_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL_EL0

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_CVAL_EL0 or CNTP_CVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL_EL0.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL_EL0.ENABLE is 1, the value returned is (CNTP_CVAL_EL0 - CNTPCT_EL0).

On a write of this register, CNTP_CVAL_EL0 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTP_CVAL_EL0) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL_EL0.ISTATUS is set to 1.
- If CNTP_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTP_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

Note

The value of CNTPCT_EL0 used in these calculations is the value seen at the Exception Level that the CNTPCT_EL0 regsiter is being read or written from.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_TVAL_EL0

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTP_TVAL_EL0 or CNTP_TVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTP_TVAL_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0010	0b000

```

CNTPCT_EL0, Counter-timer Physical Count register

The CNTPCT_EL0 characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

AArch64 System register CNTPCT_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTPCT[63:0].

All reads to the CNTPCT_EL0 occur in program order relative to reads to CNTPCTSS_EL0 or CNTPCT_EL0.

Attributes

CNTPCT_EL0 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32

Physical count value
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bits [63:0]

Physical count value.

Reads of CNTPCT_EL0 from EL0 or EL1 return (PhysicalCountInt<63:0> - CNTPOFF_EL2<63:0>) if the access is not trapped, and all of the following are true:

- CNTHCTL_EL2.ECV is 1.
- HCR_EL2.{E2H, TGE} is not {1, 1}.

Where PhysicalCountInt<63:0> is the physical count returned when CNTPCT_EL0 is read from EL2 or EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPCT_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTPCT_EL0
```

op0	op1	CRn	CRm	op2

CNTPCTSS_EL0, Counter-timer Self-Synchronized Physical Count register

The CNTPCTSS_EL0 characteristics are:

Purpose

Holds the self-synchronized view of the 64-bit physical count value.

Configuration

AArch64 System register CNTPCTSS_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTPCTSS[63:0].

This register is present only when FEAT_ECV is implemented. Otherwise, direct accesses to CNTPCTSS_EL0 are UNDEFINED.

All reads to the CNTPCTSS_EL0 occur in program order relative to reads to CNTPCT_EL0 or CNTPCTSS_EL0.

This register is a self-synchronised view of the CNTPCT_EL0 counter, and cannot be read speculatively.

Attributes

CNTPCTSS_EL0 is a 64-bit register.

CNTPOFF_EL2, Counter-timer Physical Offset register

The CNTPOFF_EL2 characteristics are:

Purpose

Holds the 64-bit physical offset. This is the offset for the AArch64 physical timers and counters when Enhanced Counter Virtualization is enabled.

Configuration

This register is present only when FEAT_ECV is implemented. Otherwise, direct accesses to CNTPOFF_EL2 are UNDEFINED.

The CNTPOFF_EL2 offset applies to:

- Direct reads of the physical counter from EL0 or EL1.
- Indirect reads of the physical counter by the EL1 physical timer.

When EL2 is implemented and enabled in the current Security state, the physical counter uses a fixed physical offset of zero if any of the following are true:

- CNTHCTL_EL2.ECV is 0.
- SCR_EL3.ECVEn is 0.
- HCR_EL2.{E2H, TGE} is {1, 1}.

Attributes

CNTPOFF_EL2 is a 64-bit register.

Field descriptions

63:32
Physical offset

31:0
Physical offset

Bits [63:0]

CNTPS_CTL_EL1, Counter-timer Physical Secure Timer Control register

The CNTPS_CTL_EL1 characteristics are:

Purpose

Control register for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configuration

There are no configuration notes.

Attributes

CNTPS_CTL_EL1 is a 64-bit register.

Field descriptions

63–32			
RES0			
31–3	**2**	**1**	**0**
RES0	ISTATUS	IMASK	ENABLE

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
`0b0`	Timer condition is not met.
`0b1`	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
`0b0`	Timer interrupt is not masked by the IMASK bit.
`0b1`	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTPS_TVAL_EL1 continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPS_CTL_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, CNTPS_CTL_EL1

op0	op1	CRn	CRm	op2
0b11	0b111	0b1110	0b0010	0b001

```

CNTPS_CVAL_EL1, Counter-timer Physical Secure Timer CompareValue register

The CNTPS_CVAL_EL1 characteristics are:

Purpose

Holds the compare value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configuration

There are no configuration notes.

Attributes

CNTPS_CVAL_EL1 is a 64-bit register.

Field descriptions

63 … 32
CompareValue

31 … 0
CompareValue

CompareValue, bits [63:0]

Holds the secure physical timer CompareValue.

When CNTPS_CTL_EL1.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTPS_CTL_EL1.ISTATUS is set to 1.
- If CNTPS_CTL_EL1.IMASK is 0, an interrupt is generated.

When CNTPS_CTL_EL1.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPS_CVAL_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTPS_CVAL_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b111	0b1110	0b0010	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

CNTPS_TVAL_EL1, Counter-timer Physical Secure Timer TimerValue register

The CNTPS_TVAL_EL1 characteristics are:

Purpose

Holds the timer value for the secure physical timer, usually accessible at EL3 but configurably accessible at EL1 in Secure state.

Configuration

There are no configuration notes.

Attributes

CNTPS_TVAL_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:0	TimerValue

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the secure physical timer.

On a read of this register:

- If CNTPS_CTL_EL1.ENABLE is 0, the value returned is UNKNOWN.
- If CNTPS_CTL_EL1.ENABLE is 1, the value returned is (CNTPS_CVAL_EL1 - CNTPCT_EL0).

On a write of this register, CNTPS_CVAL_EL1 is set to (CNTPCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTPS_CTL_EL1.ENABLE is 1, the timer condition is met when (CNTPCT_EL0 - CNTPS_CVAL_EL1) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTPS_CTL_EL1.ISTATUS is set to 1.
- If CNTPS_CTL_EL1.IMASK is 0, an interrupt is generated.

When CNTPS_CTL_EL1.ENABLE is 0, the timer condition is not met, but CNTPCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPS_TVAL_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTPS_TVAL_EL1

CNTV_CTL_EL0, Counter-timer Virtual Timer Control register

The CNTV_CTL_EL0 characteristics are:

Purpose

Control register for the virtual timer.

Configuration

AArch64 System register CNTV_CTL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTV_CTL[31:0].

Attributes

CNTV_CTL_EL0 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35	34	33	32
RES0			
RES0	ISTATUS	IMASK	ENABLE
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3	2	1	0

Bits [63:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL_EL0 continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CTL_EL0

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_CTL_EL0 or CNTV_CTL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTV_CTL_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b0011	0b001

```

CNTV_CVAL_EL0, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL_EL0 characteristics are:

Purpose

Holds the compare value for the virtual timer.

Configuration

AArch64 System register CNTV_CVAL_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTV_CVAL[63:0].

Attributes

CNTV_CVAL_EL0 is a 64-bit register.

Field descriptions

63–32
CompareValue

31–0
CompareValue

CompareValue, bits [63:0]

Holds the EL1 virtual timer CompareValue.

When CNTV_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL_EL0.ISTATUS is set to 1.
- If CNTV_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTV_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CVAL_EL0

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_CVAL_EL0 or CNTV_CVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTV_CVAL_EL0
```

op0	op1	CRn	CRm	op2

0b11	0b011	0b1110	0b0011	0b010

```

CNTV_TVAL_EL0, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL_EL0 characteristics are:

Purpose

Holds the timer value for the EL1 virtual timer.

Configuration

AArch64 System register CNTV_TVAL_EL0 bits [31:0] are architecturally mapped to AArch32 System register CNTV_TVAL[31:0].

Attributes

CNTV_TVAL_EL0 is a 64-bit register.

Field descriptions

Bits	Field
63–32	RES0
31–0	TimerValue

Bits [63:32]

Reserved, RES0.

TimerValue, bits [31:0]

The TimerValue view of the EL1 virtual timer.

On a read of this register:

- If CNTV_CTL_EL0.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL_EL0.ENABLE is 1, the value returned is (CNTV_CVAL_EL0 - CNTVCT_EL0).

On a write of this register, CNTV_CVAL_EL0 is set to (CNTVCT_EL0 + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTV_CTL_EL0.ENABLE is 1, the timer condition is met when (CNTVCT_EL0 - CNTV_CVAL_EL0) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL_EL0.ISTATUS is set to 1.
- If CNTV_CTL_EL0.IMASK is 0, an interrupt is generated.

When CNTV_CTL_EL0.ENABLE is 0, the timer condition is not met, but CNTVCT_EL0 continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_TVAL_EL0

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CNTV_TVAL_EL0 or CNTV_TVAL_EL02 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTV_TVAL_EL0
```

op0	op1	CRn	CRm	op2

CNTVCT_EL0, Counter-timer Virtual Count register

The CNTVCT_EL0 characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value minus the virtual offset visible in CNTVOFF_EL2.

Configuration

AArch64 System register CNTVCT_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTVCT[63:0].

The value of this register is the same as the value of CNTPCT_EL0 in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented, HCR_EL2.E2H is 1, and this register is read from EL2.
- When EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} is {1, 1}, and this register is read from EL0 or EL2.

All reads to the CNTVCT_EL0 occur in program order relative to reads to CNTVCTSS_EL0 or CNTVCT_EL0.

Attributes

CNTVCT_EL0 is a 64-bit register.

CNTVCTSS_EL0, Counter-timer Self-Synchronized Virtual Count register

The CNTVCTSS_EL0 characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in CNTPCT_EL0 minus the virtual offset visible in CNTVOFF_EL2.

Configuration

AArch64 System register CNTVCTSS_EL0 bits [63:0] are architecturally mapped to AArch32 System register CNTVCTSS[63:0].

This register is present only when FEAT_ECV is implemented. Otherwise, direct accesses to CNTVCTSS_EL0 are UNDEFINED.

All reads to the CNTVCTSS_EL0 occur in program order relative to reads to CNTVCT_EL0 or CNTVCTSS_EL0.

This register is a self-synchronised view of the CNTVCT_EL0 counter, and cannot be read speculatively.

Attributes

CNTVCTSS_EL0 is a 64-bit register.

Field descriptions

<table>
<tr><td>63</td><td>62</td><td>61</td><td>60</td><td>59</td><td>58</td><td>57</td><td>56</td><td>55</td><td>54</td><td>53</td><td>52</td><td>51</td><td>50</td><td>49</td><td>48</td><td>47</td><td>46</td><td>45</td><td>44</td><td>43</td><td>42</td><td>41</td><td>40</td><td>39</td><td>38</td><td>37</td><td>36</td><td>35</td><td>34</td><td>33</td><td>32</td></tr>

CNTVOFF_EL2, Counter-timer Virtual Offset register

The CNTVOFF_EL2 characteristics are:

Purpose

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in CNTPCT_EL0 and the virtual count value visible in CNTVCT_EL0.

Configuration

AArch64 System register CNTVOFF_EL2 bits [63:0] are architecturally mapped to AArch32 System register CNTVOFF[63:0].

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

Note

When EL2 is implemented and enabled in the current Security state, and is using AArch64, the virtual counter uses a fixed virtual offset of zero in the following situations:

- HCR_EL2.E2H is 1, and CNTVCT_EL0 is read from EL2.
- HCR_EL2.{E2H, TGE} is {1, 1}, and either:
  - CNTVCT_EL0 is read from EL0 or EL2.
  - CNTVCT is read from EL0.

Attributes

CNTVOFF_EL2 is a 64-bit register.

Field descriptions

Bits	Field
63:32	Virtual offset
31:0	Virtual offset

Bits [63:0]

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CNTVOFF_EL2
```

op0	op1	CRn	CRm	op2

CONTEXTIDR_EL1, Context ID Register (EL1)

The CONTEXTIDR_EL1 characteristics are:

Purpose

Identifies the current Process Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

Configuration

AArch64 System register CONTEXTIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CONTEXTIDR[31:0].

Attributes

CONTEXTIDR_EL1 is a 64-bit register.

Field descriptions

63–32
RES0
PROCID
31–0

Bits [63:32]

Reserved, RES0.

PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

Note

In AArch32 state, when TTBCR.EAE is set to 0, CONTEXTIDR.ASID holds the ASID.

In AArch64 state, CONTEXTIDR_EL1 is independent of the ASID, and for the EL1&0 translation regime either TTBR0_EL1 or TTBR1_EL1 holds the ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CONTEXTIDR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CONTEXTIDR_EL1 or CONTEXTIDR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CONTEXTIDR_EL1
```

CONTEXTIDR_EL2, Context ID Register (EL2)

The CONTEXTIDR_EL2 characteristics are:

Purpose

Identifies the current Process Identifier for EL2.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

Configuration

This register is present only when FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented. Otherwise, direct accesses to CONTEXTIDR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

CONTEXTIDR_EL2 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:0	PROCID

Bits [63:32]

Reserved, RES0.

PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CONTEXTIDR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic CONTEXTIDR_EL2 or CONTEXTIDR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

CPACR_EL1, Architectural Feature Access Control Register

The CPACR_EL1 characteristics are:

Purpose

Controls access to trace, SVE, and Advanced SIMD and floating-point functionality.

Configuration

AArch64 System register CPACR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CPACR[31:0].

When EL2 is implemented and enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}, the fields in this register have no effect on execution at EL0 and EL1. In this case, the controls provided by CPTR_EL2 are used.

Attributes

CPACR_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:29	RES0
28	TTA
27:22	RES0
21:20	FPEN
19:18	RES0
17:16	ZEN
15:0	RES0

Bits [63:29]

Reserved, RES0.

TTA, bit [28]

Traps EL0 and EL1 System register accesses to all implemented trace registers from both Execution states to EL1, or to EL2 when it is implemented and enabled in the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to trace registers are trapped, reported using ESR_ELx.EC value `0x18`.
- In AArch32 state, MRC and MCR accesses to trace registers are trapped, reported using ESR_ELx.EC value `0x05`.
- In AArch32 state, MRRC and MCRR accesses to trace registers are trapped, reported using ESR_ELx.EC value `0x0C`.

TTA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	This control causes EL0 and EL1 System register accesses to all implemented trace registers to be trapped.

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR_EL1.TTA is 1.
- The Armv8-A architecture does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not implemented, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:22]

Reserved, RES0.

FPEN, bits [21:20]

Traps execution at EL1 and EL0 of instructions that access the Advanced SIMD and floating-point registers from both Execution states to EL1, reported using ESR_ELx.EC value `0x07`, or to EL2 reported using ESR_ELx.EC value `0x00` when EL2 is implemented and enabled in the current Security state and HCR_EL2.TGE is 1, as follows:

- In AArch64 state, accesses to FPCR, FPSR, any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
- In AArch32 state, FPSCR, and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers.

Traps execution at EL1 and EL0 of SVE instructions to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The exception is reported using ESR_ELx.EC value `0x07`.

A trap taken as a result of CPACR_EL1.ZEN has precedence over a trap taken as a result of CPACR_EL1.FPEN.

FPEN	Meaning
`0b00`	This control causes execution of these instructions at EL1 and EL0 to be trapped.
`0b01`	This control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL1 to be trapped.
`0b10`	This control causes execution of these instructions at EL1 and EL0 to be trapped.
`0b11`	This control does not cause execution of any instructions to be trapped.

Writes to MVFR0, MVFR1, and MVFR2 from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

Note
- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to FPSID, MVFR0, MVFR1, MVFR2, and FPEXC are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPACR_EL1.FPEN is not `0b11`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:18]

Reserved, RES0.

ZEN, bits [17:16]
When FEAT_SVE is implemented:

Traps execution at EL1 and EL0 of SVE instructions and instructions that directly access the ZCR_EL1 System register to EL1, or to EL2 when EL2 is implemented and enabled in the current Security state and HCR_EL2.TGE is 1.

The exception is reported using ESR_ELx.EC value `0x19`.

A trap taken as a result of CPACR_EL1.ZEN has precedence over a trap taken as a result of CPACR_EL1.FPEN.

ZEN	Meaning
`0b00`	This control causes execution of these instructions at EL1 and EL0 to be trapped.
`0b01`	This control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL1 to be trapped.
`0b10`	This control causes execution of these instructions at EL1 and EL0 to be trapped.
`0b11`	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:0]

Reserved, RES0.

Accessing CPACR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic CPACR_EL1 or CPACR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CPACR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && CPTR_EL3.TCPAC == '1' then
        UNDEFINED;
    elsif EL2Enabled() && CPTR_EL2.TCPAC == '1' then

CPP RCTX, Cache Prefetch Prediction Restriction by Context

The CPP RCTX characteristics are:

Purpose

Cache Prefetch Prediction Restriction by Context applies to all Cache Allocation Resources that predict cache allocations based on information gathered within the target execution context or contexts.

Cache prefetch predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot influence speculative execution occurring after the instruction is complete and synchronized.

This instruction applies to all:

- Instruction caches.
- Data caches.
- TLB prefetching hardware used by the executing PE that applies to the supplied context or contexts.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when FEAT_SPECRES is implemented. Otherwise, direct accesses to CPP RCTX are UNDEFINED.

Attributes

CPP RCTX is a 64-bit System instruction.

Field descriptions

63:49	48	47:32
RES0	GVMID	VMID

31:27	26	25:24	23:17	16	15:0
RES0	NS	EL	RES0	GASID	ASID

Bits [63:49]

Reserved, RES0.

GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 and EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when (HCR_EL2.E2H==0 or HCR_EL2.TGE==0).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==0 or HCR_EL2.TGE==0), this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==1 and HCR_EL2.TGE==1), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

If the implementation supports 16 bits of VMID, then the upper 8 bits of the VMID must be written to 0 by software when the context being affected only uses 8 bits.

Bits [31:27]

Reserved, RES0.

NS, bit [26]

Security State. Defined values are:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASID for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being affected only uses 8 bits.

Executing the CPP RCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
CPP RCTX, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b111

```
if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLR_EL1.EnRCTX == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGITR_EL2.CPPRCTX == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<E2H,TGE> == '11' && SCTLR_EL2.EnRCTX == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        AArch64.RestrictPrediction(X[t], RestrictType_CachePrefetch);
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGITR_EL2.CPPRCTX == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        AArch64.RestrictPrediction(X[t], RestrictType_CachePrefetch);
elsif PSTATE.EL == EL2 then
    AArch64.RestrictPrediction(X[t], RestrictType_CachePrefetch);
elsif PSTATE.EL == EL3 then
    AArch64.RestrictPrediction(X[t], RestrictType_CachePrefetch);
```

CPTR_EL2, Architectural Feature Trap Register (EL2)

The CPTR_EL2 characteristics are:

Purpose

Controls trapping to EL2 of accesses to CPACR, CPACR_EL1, trace, Activity Monitor, SVE, and Advanced SIMD and floating-point functionality.

Configuration

AArch64 System register CPTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HCPTR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

CPTR_EL2 is a 64-bit register.

Field descriptions

When FEAT_VHE is implemented and HCR_EL2.E2H == 1:

Bits	Field
63:32	RES0
31	TCPAC
30	TAM
29	RES0
28	TTA
27:22	RES0
21:20	FPEN
19:18	RES0
17:16	ZEN
15:0	RES0

Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

In AArch64 state, traps accesses to CPACR_EL1 from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value `0x18`.

In AArch32 state, traps accesses to CPACR from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value `0x03`.

TCPAC	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 accesses to CPACR_EL1 and CPACR are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

Note

CPACR_EL1 and CPACR are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value `0x18`:
    - AMUSERENR_EL0, AMCFGR_EL0, AMCGCR_EL0, AMCNTENCLR0_EL0, AMCNTENCLR1_EL0, AMCNTENSET0_EL0, AMCNTENSET1_EL0, AMCR_EL0, AMEVCNTR0<n>_EL0, AMEVCNTR1<n>_EL0, AMEVTYPER0<n>_EL0, and AMEVTYPER1<n>_EL0.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using ESR_ELx.EC value `0x03`:
    - AMUSERENR, AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVTYPER0<n>, and AMEVTYPER1<n>.
- In AArch32 state, MRRC or MCRR accesses to AMEVCNTR0<n> and AMEVCNTR1<n>, are trapped to EL2, reported using ESR_ELx.EC value `0x04`.

TAM	Meaning
`0b0`	Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.
`0b1`	Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [29]

Reserved, RES0.

TTA, bit [28]

Traps System register accesses to all implemented trace registers from both Execution states to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to trace registers with op0=2, op1=1, and CRn<`0b1000` are trapped to EL2, reported using EC syndrome value `0x18`.
- In AArch32 state, MRC or MCR accesses to trace registers with cpnum=14, opc1=1, and CRn<`0b1000` are trapped to EL2, reported using EC syndrome value `0x05`.

TTA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any attempt at EL0, EL1 or EL2, to execute a System register access to an implemented trace register is trapped to EL2, when EL2 is enabled in the current Security state, unless HCR_EL2.TGE is 0 and it is trapped by CPACR.NSTRCDIS or CPACR_EL1.TTA. When HCR_EL2.TGE is 1, any attempt at EL0 or EL2 to execute a System register access to an implemented trace register is trapped to EL2, when EL2 is enabled in the current Security state.

Note

The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than this trap exception that would be generated because the value of CPTR_EL2.TTA is 1.

EL2 does not provide traps on trace register accesses through the optional Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:22]

Reserved, RES0.

FPEN, bits [21:20]

Traps execution at EL2, EL1, and EL0 of instructions that access the Advanced SIMD and floating-point registers from both Execution states to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value `0x07`.

Traps execution at EL2, EL1, and EL0 of SVE instructions to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value `0x07`.

A trap taken as a result of CPTR_EL2.ZEN has precedence over a trap taken as a result of CPTR_EL2.FPEN.

FPEN	Meaning
`0b00`	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
`0b01`	When HCR_EL2.TGE is 0, this control does not cause execution of any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL2 to be trapped.
`0b10`	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
`0b11`	This control does not cause execution of any instructions to be trapped.

Writes to MVFR0, MVFR1, and MVFR2 from EL1 or higher are CONSTRAINED UNPREDICTABLE and whether these accesses can be trapped by this control depends on implemented CONSTRAINED UNPREDICTABLE behavior.

Note

- Attempts to write to the FPSID count as use of the registers for accesses from EL1 or higher.
- Accesses from EL0 to FPSID, MVFR0, MVFR1, MVFR2, and FPEXC are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.FPEN is not `0b11`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:18]

Reserved, RES0.

ZEN, bits [17:16]

When FEAT_SVE is implemented:

Traps execution at EL2, EL1, and EL0 of SVE instructions, and instructions that directly access the ZCR_EL1 or ZCR_EL2 System registers to EL2, when EL2 is enabled in the current Security state.

The exception is reported using ESR_ELx.EC value `0x19`.

A trap taken as a result of CPTR_EL2.ZEN has precedence over a trap taken as a result of CPTR_EL2.FPEN.

ZEN	Meaning
`0b00`	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
`0b01`	When HCR_EL2.TGE is 0, this control does not cause execution of any instructions to be trapped. When HCR_EL2.TGE is 1, this control causes execution of these instructions at EL0 to be trapped, but does not cause execution of any instructions at EL2 to be trapped.
`0b10`	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
`0b11`	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

30	TAM
29:21	RES0
20	TTA
19:14	RES0
13:12	RES1
11	RES0
10	TFP
9	RES1
8	TZ
7:0	RES1

This format applies in all Armv8.0 implementations.

Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

In AArch64 state, traps accesses to CPACR_EL1 from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value `0x18`.

In AArch32 state, traps accesses to CPACR from EL1 to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value `0x03`.

TCPAC	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 accesses to CPACR_EL1 and CPACR are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, this control does not cause any instructions to be trapped.

Note

CPACR_EL1 and CPACR are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL1 and EL0 accesses to all Activity Monitor registers to EL2, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value `0x18`:
  - AMUSERENR_EL0, AMCFGR_EL0, AMCGCR_EL0, AMCNTENCLR0_EL0, AMCNTENCLR1_EL0, AMCNTENSET0_EL0, AMCNTENSET1_EL0, AMCR_EL0, AMEVCNTR0<n>_EL0, AMEVCNTR1<n>_EL0, AMEVTYPER0<n>_EL0, and AMEVTYPER1<n>_EL0.
- In AArch32 state, MCR or MRC accesses to the following registers are trapped to EL2 and reported using ESR_ELx.EC value `0x03`:
  - AMUSERENR, AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVTYPER0<n>, and AMEVTYPER1<n>.
- In AArch32 state, MCRR or MRRC accesses to AMEVCNTR0<n> and AMEVCNTR1<n>, are trapped to EL2, reported using ESR_ELx.EC value `0x04`.

TAM	Meaning
`0b0`	Accesses from EL1 and EL0 to Activity Monitor registers are not trapped.
`0b1`	Accesses from EL1 and EL0 to Activity Monitor registers are trapped to EL2, when EL2 is enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Traps System register accesses to all implemented trace registers from both Execution states to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to trace registers with op0=2, op1=1, and CRn<`0b1000` are trapped to EL2, reported using EC syndrome value `0x18`.
- In AArch32 state, MRC or MCR accesses to trace registers with cpnum=14, opc1=1, and CRn<`0b1000` are trapped to EL2, reported using EC syndrome value `0x05`.

TTA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt at EL0, EL1, or EL2, to execute a System register access to an implemented trace register is trapped to EL2, when EL2 is enabled in the current Security state, unless it is trapped by CPACR.TRCDIS or CPACR_EL1.TTA.

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than an exception that would be generated because the value of CPTR_EL2.TTA is 1.
- EL2 does not provide traps on trace register accesses through the optional memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

If System register access to the trace functionality is not supported, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

Bits [13:12]

Reserved, RES1.

Bit [11]

Reserved, RES0.

TFP, bit [10]

Traps execution of instructions which access the Advanced SIMD and floating-point functionality, from both Execution states to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value `0x07`:
  - FPCR, FPSR, FPEXC32_EL2, any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-31 registers.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using ESR_ELx.EC value `0x07`:
  - MVFR0, MVFR1, MVFR2, FPSCR, FPEXC, and any of the SIMD and floating-point registers Q0-15, including their views as D0-D31 registers or S0-31 registers. For the purposes of this trap, the architecture defines a VMSR access to FPSID from EL1 or higher as an access to a SIMD and floating-point register. Otherwise, permitted VMSR accesses to FPSID are ignored.

Traps execution at the same Exception levels of SVE instructions to EL2, when EL2 is enabled in the current Security state. The exception is reported using ESR_ELx.EC value `0x07`.

A trap taken as a result of CPTR_EL2.TZ has precedence over a trap taken as a result of CPTR_EL2.TFP.

TFP	Meaning
0b0	This control does not cause execution of any instructions to be trapped.
0b1	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.

Note

FPEXC32_EL2 is not accessible from EL0 using AArch64.

FPSID, MVFR0, MVFR1, and FPEXC are not accessible from EL0 using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES1.

TZ, bit [8]

When FEAT_SVE is implemented:

Traps execution at EL2, EL1, and EL0 of SVE instructions and instructions that directly access the ZCR_EL2 or ZCR_EL1 System registers to EL2, when EL2 is enabled in the current Security state.

The exception is reported using ESR_ELx.EC value `0x19`.

A trap taken as a result of CPTR_EL2.TZ has precedence over a trap taken as a result of CPTR_EL2.TFP.

TZ	Meaning
`0b0`	This control does not cause execution of any instructions to be trapped.
`0b1`	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [7:0]

Reserved, RES1.

CPTR_EL3, Architectural Feature Trap Register (EL3)

The CPTR_EL3 characteristics are:

Purpose

Controls trapping to EL3 of accesses to CPACR, CPACR_EL1, HCPTR, CPTR_EL2, trace, Activity Monitor, SVE, and Advanced SIMD and floating-point functionality.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to CPTR_EL3 are UNDEFINED.

Attributes

CPTR_EL3 is a 64-bit register.

Field descriptions

63:32
RES0

31	30	29:21	20	19:11	10	9	8	7:0
TCPAC	TAM	RES0	TTA	RES0	TFP	RES0	EZ	RES0

Bits [63:32]

Reserved, RES0.

TCPAC, bit [31]

Traps all of the following to EL3, from both Security states and both Execution states.

- EL2 accesses to CPTR_EL2, reported using ESR_ELx.EC value `0x18`, or HCPTR, reported using ESR_ELx.EC value `0x03`.
- EL2 and EL1 accesses to CPACR_EL1 reported using ESR_ELx.EC value `0x18`, or CPACR reported using ESR_ELx.EC value `0x03`.

When CPTR_EL3.TCPAC is:

TCPAC	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL2 accesses to the CPTR_EL2 or HCPTR, and EL2 and EL1 accesses to the CPACR_EL1 or CPACR, are trapped to EL3, unless they are trapped by CPTR_EL2.TCPAC.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TAM, bit [30]
When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps EL2, EL1, and EL0 accesses to all Activity Monitor registers to EL3.

Accesses to the Activity Monitors registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported with ESR_ELx.EC value `0x18`:

    - AMUSERENR_EL0, AMCFGR_EL0, AMCGCR_EL0, AMCNTENCLR0_EL0, AMCNTENCLR1_EL0, AMCNTENSET0_EL0, AMCNTENSET1_EL0, AMCR_EL0, AMEVCNTR0<n>_EL0, AMEVCNTR1<n>_EL0, AMEVTYPER0<n>_EL0, and AMEVTYPER1<n>_EL0.

- In AArch32 state, accesses with MRC or MCR to the following registers reported with ESR_ELx.EC value `0x03`:

    - AMUSERENR, AMCFGR, AMCGCR, AMCNTENCLR0, AMCNTENCLR1, AMCNTENSET0, AMCNTENSET1, AMCR, AMEVTYPER0<n>, and AMEVTYPER1<n>.

- In AArch32 state, accesses with MRRC or MCRR to the following registers, reported with ESR_ELx.EC value `0x04`:

    - AMEVCNTR0<n>, AMEVCNTR1<n>.

TAM	Meaning
`0b0`	Accesses from EL2, EL1, and EL0 to Activity Monitor registers are not trapped.
`0b1`	Accesses from EL2, EL1, and EL0 to Activity Monitor registers are trapped to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Traps System register accesses. Accesses to the trace registers, from all Exception levels, both Security states, and both Execution states are trapped to EL3 as follows:

- In AArch64 state, Trace registers with op0=2, op1=1, and CRn<`0b1000` are trapped to EL3 and reported using EC syndrome value `0x18`.
- In AArch32 state, accesses using MCR or MRC to the Trace registers with cpnum=14, opc1=1, and CRn<`0b1000` are reported using EC syndrome value `0x05`.

TTA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any System register access to the trace registers is trapped to EL3, unless it is trapped by CPACR.TRCDIS, CPACR_EL1.TTA, or CPTR_EL2.TTA.

If System register access to trace functionality is not supported, this bit is RES0.

Note

The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and any resulting exception is higher priority than this trap exception.

EL3 does not provide traps on trace register accesses through the Memory-mapped interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, no side-effects occur before the exception is taken, see 'Traps on instructions'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:11]

Reserved, RES0.

TFP, bit [10]

Traps execution of instructions which access the Advanced SIMD and floating-point functionality, from all Exception levels, both Security states, and both Execution states, to EL3.

This includes the following registers, all reported using ESR_ELx.EC value `0x07`:

- FPCR, FPSR, FPEXC32_EL2, and any of the SIMD and floating-point registers V0-V31, including their views as D0-D31 registers or S0-S31 registers.
- MVFR0, MVFR1, MVFR2, FPSCR, FPEXC, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers.
- VMSR accesses to FPSID.

Permitted VMSR accesses to FPSID are ignored, but for the purposes of this trap the architecture defines a VMSR access to the FPSID from EL1 or higher as an access to a SIMD and floating-point register.

Traps execution at all Exception levels of SVE instructions to EL3 from any Security state. The exception is reported using ESR_ELx.EC value `0x07`.

A trap taken as a result of CPTR_EL3.EZ has precedence over a trap taken as a result of CPTR_EL3.TFP.

Defined values are:

TFP	Meaning
`0b0`	This control does not cause execution of any instructions to be trapped.
`0b1`	This control causes execution of these instructions at all Exception levels to be trapped.

Note

FPEXC32_EL2 is not accessible from EL0 using AArch64.

FPSID, MVFR0, MVFR1, and FPEXC are not accessible from EL0 using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

EZ, bit [8]
When FEAT_SVE is implemented:

Traps execution of SVE instructions and instructions that directly access the ZCR_EL3, ZCR_EL2, or ZCR_EL1 System registers, from all Exception levels and both Security states, to EL3.

The exception is reported using ESR_ELx.EC value `0x19`.

A trap taken as a result of CPTR_EL3.EZ has precedence over a trap taken as a result of CPTR_EL3.TFP.

EZ	Meaning
`0b0`	This control causes execution of these instructions at all Exception levels to be trapped.
`0b1`	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [7:0]

Reserved, RES0.

Accessing CPTR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CPTR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b010

CSSELR_EL1, Cache Size Selection Register

The CSSELR_EL1 characteristics are:

Purpose

Selects the current Cache Size ID Register, CCSIDR_EL1, by specifying the required cache level and the cache type (either instruction or data cache).

Configuration

AArch64 System register CSSELR_EL1 bits [31:0] are architecturally mapped to AArch32 System register CSSELR[31:0].

Attributes

CSSELR_EL1 is a 64-bit register.

Field descriptions

63 … 32			
RES0			

31 … 5	4	3 2 1	0
RES0	TnD	Level	InD

Bits [63:5]

Reserved, RES0.

TnD, bit [4]

When FEAT_MTE2 is implemented:

Allocation Tag not Data bit.

TnD	Meaning
`0b0`	Data, Instruction or Unified cache.
`0b1`	Separate Allocation Tag cache.

When CSSELR_EL1.InD == 1, this bit is RES0.

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR_EL1 is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Level, bits [3:1]

Cache level of required cache.

Level	Meaning
0b000	Level 1 cache.
0b001	Level 2 cache.
0b010	Level 3 cache.
0b011	Level 4 cache.
0b100	Level 5 cache.
0b101	Level 6 cache.
0b110	Level 7 cache.

All other values are reserved.

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR_EL1 is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

InD, bit [0]

Instruction not Data bit.

InD	Meaning
0b0	Data or unified cache.
0b1	Instruction cache.

If CSSELR_EL1.Level is programmed to a cache level that is not implemented, then a read of CSSELR_EL1 is CONSTRAINED UNPREDICTABLE, and returns UNKNOWN values for CSSELR_EL1.{Level, InD}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CSSELR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CSSELR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b010	0b0000	0b0000	0b000

```

CTR_EL0, Cache Type Register

The CTR_EL0 characteristics are:

Purpose

Provides information about the architecture of the caches.

Configuration

AArch64 System register CTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register CTR[31:0].

Attributes

CTR_EL0 is a 64-bit register.

Field descriptions

63–38	37–32
RES0	TminLine

31	30	29	28	27–24	23–20	19–16	15–14	13–4	3–0
RES1	RES0	DIC	IDC	CWG	ERG	DminLine	L1Ip	RES0	IminLine

Bits [63:38]

Reserved, RES0.

TminLine, bits [37:32]

When FEAT_MTE2 is implemented:

Tag minimum Line. Log_2 of the number of words covered by Allocation Tags in the smallest cache line of all caches which can contain Allocation tags that are controlled by the PE.

Note
- For an implementation with cache lines containing 64 bytes of data and 4 Allocation Tags, this will be $\log_2(64/4) = 4$.
- For an implementation with Allocations Tags in separate cache lines of 128 Allocation Tags per line, this will be $\log_2(128*16/4) = 9$.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

Bit [30]

Reserved, RES0.

DIC, bit [29]

Instruction cache invalidation requirements for data to instruction coherence.

DIC	Meaning
0b0	Instruction cache invalidation to the Point of Unification is required for data to instruction coherence.
0b1	Instruction cache invalidation to the Point of Unification is not required for data to instruction coherence.

IDC, bit [28]

Data cache clean requirements for instruction to data coherence. The meaning of this bit is:

IDC	Meaning
0b0	Data cache clean to the Point of Unification is required for instruction to data coherence, unless CLIDR_EL1.LoC == 0b000 or (CLIDR_EL1.LoUIS == 0b000 && CLIDR_EL1.LoUU == 0b000).
0b1	Data cache clean to the Point of Unification is not required for instruction to data coherence.

CWG, bits [27:24]

Cache writeback granule. Log_2 of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of 0b0000 indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than 0b1001 are reserved.

Arm recommends that an implementation that does not support cache write-back implements this field as 0b0001. This applies, for example, to an implementation that supports only write-through caches.

ERG, bits [23:20]

Exclusives reservation granule. Log_2 of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.

The use of the value 0b0000 is deprecated.

The value 0b0001 and values greater than 0b1001 are reserved.

DminLine, bits [19:16]

Log_2 of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

L1Ip, bits [15:14]

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache. Possible values of this field are:

L1Ip	Meaning	Applies when
0b00	VMID aware Physical Index, Physical tag (VPIPT).	When FEAT_VPIPT is implemented
0b01	ASID-tagged Virtual Index, Virtual Tag (AIVIVT).	
0b10	Virtual Index, Physical Tag (VIPT).	
0b11	Physical Index, Physical Tag (PIPT).	

The value 0b01 is reserved in Armv8.

The value 0b00 is permitted only in an implementation that includes FEAT_VPIPT, otherwise the value is reserved.

Bits [13:4]

Reserved, RES0.

IminLine, bits [3:0]

Log_2 of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

Accessing CTR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```

CurrentEL, Current Exception Level

The CurrentEL characteristics are:

Purpose

Holds the current Exception level.

Configuration

There are no configuration notes.

Attributes

CurrentEL is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
RES0

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4	3 2	1 0
RES0	EL	RES0

Bits [63:4]

Reserved, RES0.

EL, bits [3:2]

Current Exception level.

EL	Meaning
`0b00`	EL0.
`0b01`	EL1.
`0b10`	EL2.
`0b11`	EL3.

When the HCR_EL2.NV bit is 1, EL1 read accesses to the CurrentEL register return the value of `0b10` in this field.

This field resets to the highest implemented Exception level.

Bits [1:0]

Reserved, RES0.

Accessing CurrentEL

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, CurrentEL
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0010	0b010

```

DACR32_EL2, Domain Access Control Register

The DACR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 DACR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register DACR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register DACR[31:0].

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to DACR32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Attributes

DACR32_EL2 is a 64-bit register.

Field descriptions

63-32
RES0

31 30	29 28	27 26	25 24	23 22	21 20	19 18	17 16	15 14	13 12	11 10	9 8	7 6	5 4	3 2	1 0
D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

Bits [63:32]

Reserved, RES0.

D<n>, bits [2n+1:2n], for n = 15 to 0

Domain n access permission, where n = 0 to 15. Permitted values are:

D<n>	Meaning
0b00	No access. Any access to the domain generates a Domain fault.
0b01	Client. Accesses are checked against the permission bits in the translation tables.
0b11	Manager. Accesses are not checked against the permission bits in the translation tables.

The value 0b10 is reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DACR32_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DACR32_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0000	0b000

```

DAIF, Interrupt Mask Bits

The DAIF characteristics are:

Purpose

Allows access to the interrupt mask bits.

Configuration

There are no configuration notes.

Attributes

DAIF is a 64-bit register.

Field descriptions

63–32
RES0

31–10	9	8	7	6	5–0
RES0	D	A	I	F	RES0

Bits [63:10]

Reserved, RES0.

D, bit [9]

Process state D mask.

D	Meaning
`0b0`	Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are not masked.
`0b1`	Watchpoint, Breakpoint, and Software Step exceptions targeted at the current Exception level are masked.

When the target Exception level of the debug exception is higher than the current Exception level, the exception is not masked by this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

A, bit [8]

SError interrupt mask bit.

A	Meaning
`0b0`	Exception not masked.
`0b1`	Exception masked.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

I, bit [7]

IRQ mask bit.

I	Meaning
0b0	Exception not masked.
0b1	Exception masked.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

F, bit [6]

FIQ mask bit.

F	Meaning
0b0	Exception not masked.
0b1	Exception masked.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Bits [5:0]

Reserved, RES0.

Accessing DAIF

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DAIF
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b001

```

DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configuration

AArch64 System register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGAUTHSTATUS[31:0].

AArch64 System register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to External register DBGAUTHSTATUS_EL1[31:0].

Attributes

DBGAUTHSTATUS_EL1 is a 64-bit register.

Field descriptions

<table>
<tr><td>63 … 32</td><td colspan="4">RES0</td></tr>
<tr><td>31 … 8</td><td>7 6</td><td>5 4</td><td>3 2</td><td>1 0</td></tr>
<tr><td>RES0</td><td>SNID</td><td>SID</td><td>NSNID</td><td>NSID</td></tr>
</table>

Bits [63:8]

Reserved, RES0.

SNID, bits [7:6]

When FEAT_Debugv8p4 is implemented:

Secure non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

Secure non-invasive debug.

SNID	Meaning
`0b00`	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.
`0b10`	Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
`0b11`	Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

SID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.
0b10	Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSNID, bits [3:2]
When FEAT_Debugv8p4 is implemented:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b11	Implemented and enabled. EL3 is implemented or the Effective value of SCR_EL3.NS is 1.

All other values are reserved.

Otherwise:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b10	Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

NSID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b10	Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

Accessing DBGAUTHSTATUS_EL1

Accesses to this register use the following encodings in the System register encoding space:

DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>_EL1.

Configuration

AArch64 System register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBCR<n>[31:0].

AArch64 System register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to External register DBGBCR<n>_EL1[31:0].

If breakpoint n is not implemented, accesses to this register are UNDEFINED.

Attributes

DBGBCR<n>_EL1 is a 64-bit register.

Field descriptions

63:32
RES0

31:24	23:20	19:16	15:14	13	12:9	8:5	4:3	2:1	0
RES0	BT	LBN	SSC	HMC	RES0	BAS	RES0	PMC	E

Bits [63:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

BT	Meaning
0b0000	Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.
0b0001	As 0b0000, but linked to a Context matching breakpoint.
0b0010	Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value
0b0011	As 0b0010, with linking enabled.
0b0110	Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1.
0b0111	As 0b0110, with linking enabled.
0b1000	Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.
0b1001	As 0b1000, with linking enabled.
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.
0b1011	As 0b1010, with linking enabled.
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBVR<n>_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2.
0b1101	As 0b1100, with linking enabled.
0b1110	Unlinked Full Context ID match. DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.ContextID2 is compared against CONTEXTIDR_EL2.
0b1111	As 0b1110, with linking enabled.

All other values are reserved. Constraints on breakpoint programming mean other values are reserved under some conditions.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, and SSC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved value, see 'Reserved DBGBCR<n>_EL1.BT values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>_EL1.E is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, and SSC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information on the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, and SSC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information, see DBGBCR<n>_EL1.SSC.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When AArch32 is supported:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
`0b0011`	DBGBVR<n>_EL1	Use for T32 instructions
`0b1100`	DBGBVR<n>_EL1 + 2	Use for T32 instructions
`0b1111`	DBGBVR<n>_EL1	Use for A64 and A32 instructions

All other values are reserved. For more information, see 'Reserved DBGBCR<n>_EL1.BAS values'.

For more information on using the BAS field in address match breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, and SSC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

For more information, see DBGBCR<n>_EL1.SSC.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint DBGBVR<n>_EL1.

E	Meaning
`0b0`	Breakpoint disabled.
`0b1`	Breakpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n>_EL1.

Configuration

AArch64 System register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBVR<n>[31:0].

AArch64 System register DBGBVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register DBGBXVR<n>[31:0].

AArch64 System register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to External register DBGBVR<n>_EL1[63:0].

How this register is interpreted depends on the value of DBGBCR<n>_EL1.BT.

- When DBGBCR<n>_EL1.BT is `0b000x`, this register holds a virtual address.
- When DBGBCR<n>_EL1.BT is `0b001x`, `0b011x`, or `0b110x`, this register holds a Context ID.
- When DBGBCR<n>_EL1.BT is `0b100x`, this register holds a VMID.
- When DBGBCR<n>_EL1.BT is `0b101x`, this register holds a VMID and a Context ID.
- When DBGBCR<n>_EL1.BT is `0b111x`, this register holds two Context ID values.

For other values of DBGBCR<n>_EL1.BT, this register is RES0.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGBVR<n>_EL1 is a 64-bit register.

Field descriptions

When DBGBCR<n>_EL1.BT == 0b000x:

Bits	63–53	52–49	48–32
Field	RESS[14:4]	Bits[52:49]	VA[48:2]

Bits	31–2	1–0
Field	VA[48:2]	RES0

RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

- It is CONSTRAINED UNPREDICTABLE whether the PE ignores this field when comparing an address.
- If the breakpoint is not context-aware, it is IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.

VA[52:49], bits [52:49]
When FEAT_LVA is implemented:

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Extension to RESS[14:4]. For more information, see RESS[14:4].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, bits [52:49] are part of the RESS field.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b001x:

63–32
RES0
ContextID
31–0

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented), HCR_EL2.E2H is 1, and either:

- The PE is executing at EL2.
- HCR_EL2.TGE is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b011x:

63–32
RES0
ContextID
31–0

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b100x and EL2 is implemented:

63 - 48	47 - 40	39 - 32
RES0	VMID[15:8]	VMID[7:0]

31 - 0
RES0

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented, VTCR_EL2.VS == 1 and EL2 is using AArch64:

Extension to VMID[7:0]. For more information, see DBGBVR<n>_EL1.VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b101x and EL2 is implemented:

63 - 48	47 - 40	39 - 32
RES0	VMID[15:8]	VMID[7:0]

31 - 0
ContextID

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented, VTCR_EL2.VS == 1 and EL2 is using AArch64:

Extension to VMID[7:0]. For more information, see DBGBVR<n>_EL1.VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b110x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

Bits	Field
63:32	ContextID2
31:0	RES0

ContextID2, bits [63:32]

Context ID value for comparison against CONTEXTIDR_EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b111x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

63-32
ContextID2

31-0
ContextID

ContextID2, bits [63:32]

Context ID value for comparison against CONTEXTIDR_EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMSET_EL1 register.

Configuration

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].

AArch64 System register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:8	RAZ/WI
7:0	CLAIM

Bits [63:32]

Reserved, RES0.

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing DBGCLAIMCLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DBGCLAIMCLR_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b0111	0b1001	0b110

```
if PSTATE.EL == EL0 then

DBGCLAIMSET_EL1, Debug CLAIM Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMCLR_EL1 register.

Configuration

AArch64 System register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].

AArch64 System register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to External register DBGCLAIMSET_EL1[31:0].

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMSET_EL1 is a 64-bit register.

Field descriptions

63–32	RES0
31–8	RAZ/WI
7–0	CLAIM

Bits [63:32]

Reserved, RES0.

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Set CLAIM tag bits.

This field is RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

Accessing DBGCLAIMSET_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DBGCLAIMSET_EL1

DBGDTR_EL0, Debug Data Transfer Register, half-duplex

The DBGDTR_EL0 characteristics are:

Purpose

Transfers 64 bits of data between the PE and an external debugger. Can transfer both ways using only a single register.

Configuration

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to External register DBGDTRRX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0] when written.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to External register DBGDTRTX_EL0[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [63:32] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0] when read.

AArch64 System register DBGDTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0] when read.

Attributes

DBGDTR_EL0 is a 64-bit register.

Field descriptions

Bits	Field
63–32	HighWord
31–0	LowWord

HighWord, bits [63:32]

Writes to this register set DTRRX to the value in this field and do not change RXfull.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRTX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

LowWord, bits [31:0]

Writes to this register set DTRTX to the value in this field and set TXfull to 1.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

Accessing DBGDTR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```

DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

Configuration

AArch64 System register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0].

AArch64 System register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to External register DBGDTRRX_EL0[31:0].

Attributes

DBGDTRRX_EL0 is a 64-bit register.

Field descriptions

63:32
RES0

31:0
Update DTRRX

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Update DTRRX.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRX_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DBGDTRRX_EL0
```

op0	op1	CRn	CRm	op2
0b10	0b011	0b0000	0b0101	0b000

```

DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

Configuration

AArch64 System register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0].

AArch64 System register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to External register DBGDTRTX_EL0[31:0].

Attributes

DBGDTRTX_EL0 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:0	Return DTRTX

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Return DTRTX.

Writes to this register:

- If TXfull is set to 1, set DTRRX and DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull is set to 1.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTX_EL0

Accesses to this register use the following encodings in the System register encoding space:

```

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1	0

Bits [63:1]

Reserved, RES0.

CORENPDRQ, bit [0]
When FEAT_DoPD is implemented:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to its Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

Note

> Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Otherwise:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
`0b0`	If the system responds to a powerdown request, it powers down Core power domain.
`0b1`	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

> **Note**
>
> Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in EDPRCR.COREPURQ.

Accessing DBGPRCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

DBGVCR32_EL2, Debug Vector Catch Register

The DBGVCR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register DBGVCR from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register DBGVCR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register DBGVCR[31:0].

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to DBGVCR32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Attributes

DBGVCR32_EL2 is a 64-bit register.

Field descriptions

When EL3 is implemented:

Bits	Field
63:32	RES0
31	NSF
30	NSI
29	RES0
28	NSD
27	NSP
26	NSS
25	NSU
24:8	RES0
7	SF
6	SI
5	RES0
4	SD
3	SP
2	SS
1	SU
0	RES0

Bits [63:32]

Reserved, RES0.

NSF, bit [31]

FIQ vector catch enable in Non-secure state.

The exception vector offset is `0x1C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSI, bit [30]

IRQ vector catch enable in Non-secure state.

The exception vector offset is `0x18`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

NSD, bit [28]

Data Abort vector catch enable in Non-secure state.

The exception vector offset is `0x10`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSP, bit [27]

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is `0x0C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSS, bit [26]

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is `0x08`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [25]

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is `0x04`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:8]

Reserved, RES0.

SF, bit [7]

FIQ vector catch enable in Secure state.

The exception vector offset is `0x1C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SI, bit [6]

IRQ vector catch enable in Secure state.

The exception vector offset is `0x18`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SD, bit [4]

Data Abort vector catch enable in Secure state.

The exception vector offset is `0x10`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SP, bit [3]

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is `0x0C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is `0x08`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is `0x04`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

When EL3 is not implemented:

63:32
RES0

31:8	7	6	5	4	3	2	1	0
RES0	F	I	RES0	D	P	S	U	RES0

Bits [63:8]

Reserved, RES0.

F, bit [7]

FIQ vector catch enable.

The exception vector offset is `0x1C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [6]

IRQ vector catch enable.

The exception vector offset is `0x18`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

D, bit [4]

Data Abort vector catch enable.

The exception vector offset is `0x10`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P, bit [3]

Prefetch Abort vector catch enable.

The exception vector offset `0x0C`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [2]

Supervisor Call (SVC) vector catch enable.

The exception vector offset is `0x08`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [1]

Undefined Instruction vector catch enable.

The exception vector offset is `0x04`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing DBGVCR32_EL2

Accesses to this register use the following encodings in the System register encoding space:

DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

Configuration

AArch64 System register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWCR<n>[31:0].

AArch64 System register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to External register DBGWCR<n>_EL1[31:0].

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWCR<n>_EL1 is a 64-bit register.

Field descriptions

Bits	63:32
Field	RES0

Bits	31:29	28:24	23:21	20	19:16	15:14	13	12:5	4:3	2:1	0
Field	RES0	MASK	RES0	WT	LBN	SSC	HMC	BAS	LSC	PAC	E

Bits [63:29]

Reserved, RES0.

MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

MASK	Meaning
`0b00000`	No mask.
`0b00001`	Reserved.
`0b00010`	Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from `0b00011` masking 3 address bits (`0x00000007` mask for address) to `0b11111` masking 31 address bits (`0x7FFFFFFF` mask for address).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, and SSC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

For more information on the effect of programming the fields to a reserved value, see 'Reserved DBGWCR<n>_EL1.{SSC, HMC, PAC} values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, and SSC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>_EL1 is being watched.

BAS	Description
xxxxxxx1	Match byte at DBGWVR<n>_EL1
xxxxxx1x	Match byte at DBGWVR<n>_EL1 + 1
xxxxx1xx	Match byte at DBGWVR<n>_EL1 + 2
xxxx1xxx	Match byte at DBGWVR<n>_EL1 + 3

In cases where DBGWVR<n>_EL1 addresses a double-word:

BAS	Description, if DBGWVR<n>_EL1[2] == 0
xxx1xxxx	Match byte at DBGWVR<n>_EL1 + 4
xx1xxxxx	Match byte at DBGWVR<n>_EL1 + 5
x1xxxxxx	Match byte at DBGWVR<n>_EL1 + 6
1xxxxxxx	Match byte at DBGWVR<n>_EL1 + 7

If DBGWVR<n>_EL1[2] == 1, only BAS[3:0] are used and BAS[7:4] are ignored. Arm deprecates setting DBGWVR<n>_EL1[2] == 1.

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>_EL1.BAS values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
`0b01`	Match instructions that load from a watchpointed address.
`0b10`	Match instructions that store to a watchpointed address.
`0b11`	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, and SSC. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

For more information on the operation of these fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n. Possible values are:

E	Meaning
`0b0`	Watchpoint disabled.
`0b1`	Watchpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1.

Configuration

AArch64 System register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWVR<n>[31:0].

AArch64 System register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to External register DBGWVR<n>_EL1[63:0].

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions

63 - 53	52 - 49	48 - 32
RESS[14:4]	Bits[52:49]	VA[48:2]

31 - 2	1 - 0
VA[48:2]	RES0

RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must set all bits in this field to the same value as the most significant bit of the VA field. If all bits in this field are not the same value as the most significant bit of the VA field, then all of the following apply:

- It is CONSTRAINED UNPREDICTABLE whether the PE ignores this field when comparing an address.
- It is IMPLEMENTATION DEFINED whether the value read back in each bit of this field is a copy of the most significant bit of the VA field or the value written.

VA[52:49], bits [52:49]

When FEAT_LVA is implemented:

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Extension to RESS[14:4]. For more information, see RESS[14:4].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, bits [52:49] are part of the RESS field.

Arm deprecates setting DBGWVR<n>_EL1[2] == 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGWVR<n>_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DBGWVR<n>_EL1
```

DC CGDSW, Clean of Data and Allocation Tags by Set/Way

The DC CGDSW characteristics are:

Purpose

Clean data and Allocation Tags in data cache by set/way.

Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC CGDSW are UNDEFINED.

Attributes

DC CGDSW is a 64-bit System instruction.

Field descriptions

63:32
RES0

31:4	3:1	0
SetWay	Level	RES0

Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log_2(ASSOCIATIVITY), L = Log_2(LINELEN), B = (L + S), S = Log_2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DC CGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CGDSW, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1010	0b110

DC CGDVAC, Clean of Data and Allocation Tags by VA to PoC

The DC CGDVAC characteristics are:

Purpose

Clean data and Allocation Tags in data cache by address to Point of Coherency.

Configuration

This instruction is present only when FEAT_MTE is implemented. Otherwise, direct accesses to DC CGDVAC are UNDEFINED.

Attributes

DC CGDVAC is a 64-bit System instruction.

Field descriptions

63–32
Virtual address to use

31–0
Virtual address to use

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DC CGDVAC instruction

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission fault, subject to the constraints described in 'Permission fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CGDVAC, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b1010	0b101

```

DC CGVADP, Clean of Allocation Tags by VA to PoDP

The DC CGVADP characteristics are:

Purpose

Clean Allocation tags by address to Point of Deep Persistence.

If the memory system does not identify a Point of Deep Persistence, then this instruction behaves as a DC CGVAP.

Configuration

This instruction is present only when FEAT_DPB2 is implemented and FEAT_MTE is implemented. Otherwise, direct accesses to DC CGVADP are UNDEFINED.

Attributes

DC CGVADP is a 64-bit System instruction.

Field descriptions

63–32
Virtual address to use

31–0
Virtual address to use

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DC CGVADP instruction

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission fault, see 'Permission fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CGVADP, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b1101	0b011

```

DC CIGDSW, Clean and Invalidate of Data and Allocation Tags by Set/Way

The DC CIGDSW characteristics are:

Purpose

Clean and Invalidate data and Allocation Tags in data cache by set/way.

Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC CIGDSW are UNDEFINED.

Attributes

DC CIGDSW is a 64-bit System instruction.

Field descriptions

63 … 32
RES0

31 … 4	3 … 1	0
SetWay	Level	RES0

Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log_2(ASSOCIATIVITY), L = Log_2(LINELEN), B = (L + S), S = Log_2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DC CIGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CIGDSW, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1110	0b110

```

DC CIGDVAC, Clean and Invalidate of Data and Allocation Tags by VA to PoC

The DC CIGDVAC characteristics are:

Purpose

Clean and Invalidate data and Allocation Tags in data cache by address to Point of Coherency.

Configuration

This instruction is present only when FEAT_MTE is implemented. Otherwise, direct accesses to DC CIGDVAC are UNDEFINED.

Attributes

DC CIGDVAC is a 64-bit System instruction.

Field descriptions

63–32
Virtual address to use

31–0
Virtual address to use

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DC CIGDVAC instruction

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission fault.

If FEAT_CMOW is implemented, HCR_EL2.{E2H, TGE} is not {1, 1}, SCTLR_EL1.CMOW is 1, and EL0 access is enabled, when executed at EL0, the instruction has stage 1 read permission to the VA, but does not have stage 1 write permission to the VA, the instruction generates a stage 1 Permission fault.

If FEAT_CMOW is implemented, HCR_EL2.E2H is 1, SCTLR_EL2.CMOW is 1, and EL0 access is enabled, when executed at EL0, the instruction has stage 1 read permission to the VA but does not have stage 1 write permission to the VA, the instruction generates a stage 1 Permission fault.

If FEAT_CMOW is implemented, HCRX_EL2.CMOW is 1, and EL1 or EL0 access is enabled, when executed at EL1 or EL0, the instruction has stage 2 read permission to the VA but does not have stage 2 write permission to the VA, the instruction generates a stage 2 Permission fault.

For more information, see 'Permission fault'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CIGDVAC, <Xt>
```

op0	op1	CRn	CRm	op2

0b01	0b011	0b0111	0b1110	0b101

```

DC CISW, Data or unified Cache line Clean and Invalidate by Set/Way

The DC CISW characteristics are:

Purpose

Clean and Invalidate data cache by set/way.

When FEAT_MTE2 is implemented, this instruction might clean and invalidate Allocation Tags from caches.

Configuration

AArch64 System instruction DC CISW performs the same function as AArch32 System instruction DCCISW.

Attributes

DC CISW is a 64-bit System instruction.

Field descriptions

63 … 32
RES0

31 … 4	3 2 1	0
SetWay	Level	RES0

Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log_2(ASSOCIATIVITY), L = Log_2(LINELEN), B = (L + S), S = Log_2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DC CISW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
    - No cache lines.
    - A single arbitrary cache line.
    - Multiple arbitrary cache lines.

DC CIVAC, Data or unified Cache line Clean and Invalidate by VA to PoC

The DC CIVAC characteristics are:

Purpose

Clean and Invalidate data cache by address to Point of Coherency.

When FEAT_MTE2 is implemented, this instruction might clean and invalidate Allocation Tags from caches.

Configuration

AArch64 System instruction DC CIVAC performs the same function as AArch32 System instruction DCCIMVAC.

Attributes

DC CIVAC is a 64-bit System instruction.

Field descriptions

63 ... 32
Virtual address to use

31 ... 0
Virtual address to use

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DC CIVAC instruction

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

If EL0 access is enabled, when executed at EL0, this instruction requires read access permission to the VA, otherwise it generates a Permission fault.

When FEAT_CMOW is implemented, HCR_EL2.{E2H, TGE} is not {1, 1}, SCTLR_EL1.CMOW is 1, and EL0 access is implemented, when executed at EL0, the instruction has stage 1 read permission to the VA, but does not have stage 1 write permission to the VA, the instruction generates a stage 1 Permission fault.

When FEAT_CMOW is implemented, HCR_EL2.E2H is 1, SCTLR_EL2.CMOW is 1, and EL0 access is implemented, when executed at EL0, the instruction has stage 1 read permission to the VA but does not have stage 1 write permission to the VA, the instruction generates a stage 1 Permission fault.

When FEAT_CMOW is implemented, HCRX_EL2.CMOW is 1, and EL1 or EL0 access is enabled, when executed at EL1 or EL0, the instruction has stage 2 read permission to the VA but does not have stage 2 write permission to the VA, the instruction generates a stage 2 Permission fault.

For more information, see 'Permission fault'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CIVAC, <Xt>
```

op0	op1	CRn	CRm	op2

0b01	0b011	0b0111	0b1110	0b001

```
if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLR_EL1.UCI == '0' then

DC CSW, Data or unified Cache line Clean by Set/Way

The DC CSW characteristics are:

Purpose

Clean data cache by set/way.

When FEAT_MTE2 is implemented, this instruction might clean Allocation Tags from caches.

Configuration

AArch64 System instruction DC CSW performs the same function as AArch32 System instruction DCCSW.

Attributes

DC CSW is a 64-bit System instruction.

Field descriptions

Bits	Field
63:32	RES0
31:4	SetWay
3:1	Level
0	RES0

Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log_2(ASSOCIATIVITY), L = Log_2(LINELEN), B = (L + S), S = Log_2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DC CSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC CSW, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b1010	0b010

DC GVA, Data Cache set Allocation Tag by VA

The DC GVA characteristics are:

Purpose

Write a value to the Allocation Tags of a naturally aligned block of N bytes, where the size of N is identified in DCZID_EL0. The Allocation Tag used is determined by the input address.

Configuration

This instruction is present only when FEAT_MTE is implemented. Otherwise, direct accesses to DC GVA are UNDEFINED.

Attributes

DC GVA is a 64-bit System instruction.

Field descriptions

63–32
Virtual address to use

31–0
Virtual address to use

Bits [63:0]

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

Executing the DC GVA instruction

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is not set.

If the memory region being modified is any type of Device memory, this instruction can give an alignment fault that is prioritized in the same way as other alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of stores to each Allocation Tag within the block being accessed, and so it:

- Generates a Permission fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC GVA, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0100	0b011

```

DC GZVA, Data Cache set Allocation Tags and Zero by VA

The DC GZVA characteristics are:

Purpose

Zero data and write a value to the Allocation Tags of a naturally aligned block of N bytes, where the size of N is identified in DCZID_EL0. The Allocation Tag used is determined by the input address.

Configuration

This instruction is present only when FEAT_MTE is implemented. Otherwise, direct accesses to DC GZVA are UNDEFINED.

Attributes

DC GZVA is a 64-bit System instruction.

Field descriptions

Bits	Field
63:32	Virtual address to use
31:0	Virtual address to use

Bits [63:0]

Virtual address to use. There is no alignment restriction on the address within the block of N bytes that is used.

Executing the DC GZVA instruction

When this instruction is executed, it can generate memory faults or watchpoints which are prioritized in the same way as other memory-related faults or watchpoints. If a synchronous data abort fault or a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is not set.

If the memory region being zeroed is any type of Device memory, this instruction can give an alignment fault which is prioritized in the same way as other alignment faults that are determined by the memory type.

This instruction applies to Normal memory regardless of cacheability attributes.

This instruction behaves as a set of Stores to each byte and Allocation tag within the block being accessed, and so it:

- Generates a Permission fault if the translation system does not permit writes to the locations.
- Requires the same considerations for ordering and the management of coherency as any other store instructions.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC GZVA, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0100	0b100

```
if PSTATE.EL == EL0 then

DC IGDSW, Invalidate of Data and Allocation Tags by Set/Way

The DC IGDSW characteristics are:

Purpose

Invalidate data and Allocation Tags in data cache by set/way.

Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC IGDSW are UNDEFINED.

Attributes

DC IGDSW is a 64-bit System instruction.

Field descriptions

63 … 32
RES0

31 … 4	3 2 1	0
SetWay	Level	RES0

Bits [63:32]

Reserved, RES0.

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

A = Log_2(ASSOCIATIVITY), L = Log_2(LINELEN), B = (L + S), S = Log_2(NSETS).

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DC IGDSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED.
- The instruction performs cache maintenance on one of:
  - No cache lines.
  - A single arbitrary cache line.
  - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC IGDSW, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0110	0b110

DC IGDVAC, Invalidate of Data and Allocation Tags by VA to PoC

The DC IGDVAC characteristics are:

Purpose

Invalidate data and Allocation Tags in data cache by address to Point of Coherency.

Configuration

This instruction is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to DC IGDVAC are UNDEFINED.

Attributes

DC IGDVAC is a 64-bit System instruction.

Field descriptions

63–32	Virtual address to use
31–0	Virtual address to use

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DC IGDVAC instruction

When the instruction is executed, it can generate a watchpoint, which is prioritized in the same way as other watchpoints. If a watchpoint is generated, the CM bit in the ESR_ELx.ISS field is set to 1.

This instruction requires write access permission to the VA, otherwise it generates a Permission fault, subject to the constraints described in 'Permission fault'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The data cache maintenance instruction (DC)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
DC IGDVAC, <Xt>
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0110	0b101

DCZID_EL0, Data Cache Zero ID register

The DCZID_EL0 characteristics are:

Purpose

Indicates the block size that is written with byte values of 0 by the DC ZVA (Data Cache Zero by Address) System instruction.

If FEAT_MTE is implemented, this register also indicates the granularity at which the DC GVA and DC GZVA instructions write.

Configuration

There are no configuration notes.

Attributes

DCZID_EL0 is a 64-bit register.

Field descriptions

63–32
RES0

31–5	4	3–0
RES0	DZP	BS

Bits [63:5]

Reserved, RES0.

DZP, bit [4]

Data Zero Prohibited. This field indicates whether use of DC ZVA instructions is permitted or prohibited.

If FEAT_MTE is implemented, this field also indicates whether use of the DC GVA and DC GZVA instructions are permitted or prohibited.

DZP	Meaning
0b0	Instructions are permitted.
0b1	Instructions are prohibited.

The value read from this field is governed by the access state and the values of the HCR_EL2.TDZ and SCTLR_EL1.DZE bits.

BS, bits [3:0]

Log_2 of the block size in words. The maximum size supported is 2KB (value == 9).

Accessing DCZID_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DCZID_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0000	0b0000	0b111

```
if PSTATE.EL == EL0 then
    if EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGRTR_EL2.DCZID_EL0 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return DCZID_EL0;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGRTR_EL2.DCZID_EL0 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return DCZID_EL0;
elsif PSTATE.EL == EL2 then
    return DCZID_EL0;
elsif PSTATE.EL == EL3 then
    return DCZID_EL0;
```

DISR_EL1, Deferred Interrupt Status Register

The DISR_EL1 characteristics are:

Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

Configuration

AArch64 System register DISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DISR[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to DISR_EL1 are UNDEFINED.

Attributes

DISR_EL1 is a 64-bit register.

Field descriptions

When DISR_EL1.IDS == 0:

63:32
RES0

31	30:25	24	23:13	12:10	9	8:6	5:0
A	RES0	IDS	RES0	AET	EA	RES0	DFSC

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

Indicates the deferred SError interrupt type.

IDS	Meaning
0b0	Deferred error uses architecturally-defined format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:13]

Reserved, RES0.

AET, bits [12:10]

Asynchronous Error Type. See the description of ESR_ELx.AET for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort Type. See the description of ESR_ELx.EA for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

Fault Status Code. See the description of ESR_ELx.DFSC for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When DISR_EL1.IDS == 1:

63–32			
RES0			

31	30–25	24	23–0
A	RES0	IDS	ISS

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

Indicates the deferred SError interrupt type.

IDS	Meaning
`0b1`	Deferred error uses IMPLEMENTATION DEFINED format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

IMPLEMENTATION DEFINED syndrome. See the description of ESR_ELx[23:0] for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DISR_EL1

An indirect write to DISR_EL1 made by an `ESB` instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR_EL1 occurring in program order after the `ESB` instruction.

DISR_EL1 is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, SCR_EL3.EA == 1, and any of the following apply:

- At EL2.
- At EL1 and ((SCR_EL3.NS == 0 && SCR_EL3.EEL2 == 0) || HCR_EL2.AMO == 0).

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DISR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0001	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.AMO == '1' then
        return VDISR_EL2;
    elsif HaveEL(EL3) && !Halted() && SCR_EL3.EA == '1' then
        return Zeros();
    else
        return DISR_EL1;
elsif PSTATE.EL == EL2 then
    if HaveEL(EL3) && !Halted() && SCR_EL3.EA == '1' then
        return Zeros();
    else
        return DISR_EL1;
elsif PSTATE.EL == EL3 then
    return DISR_EL1;
```

```
MSR DISR_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0001	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.AMO == '1' then
        VDISR_EL2 = X[t];
    elsif HaveEL(EL3) && !Halted() && SCR_EL3.EA == '1' then
        //no operation
    else
        DISR_EL1 = X[t];
elsif PSTATE.EL == EL2 then
    if HaveEL(EL3) && !Halted() && SCR_EL3.EA == '1' then
        //no operation
    else
        DISR_EL1 = X[t];
elsif PSTATE.EL == EL3 then
    DISR_EL1 = X[t];
```

DIT, Data Independent Timing

The DIT characteristics are:

Purpose

Allows access to the Data Independent Timing bit.

Configuration

This register is present only when FEAT_DIT is implemented. Otherwise, direct accesses to DIT are UNDEFINED.

Attributes

DIT is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:25	RES0
24	DIT
23:0	RES0

Bits [63:25]

Reserved, RES0.

DIT, bit [24]

Data Independent Timing.

DIT	Meaning
`0b0`	The architecture makes no statement about the timing properties of any instructions.

`0b1`	The architecture requires that:
	• The timing of every load and store instruction is insensitive to the value of the data being loaded or stored.
	• For certain data processing instructions, the instruction takes a time which is independent of:
	  ◦ The values of the data supplied in any of its registers.
	  ◦ The values of the NZCV flags.
	• For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on:
	  ◦ The values of the data supplied in any of its registers.
	  ◦ The values of the NZCV flags.

The data processing instructions affected by this bit are:

- All cryptographic instructions. These instructions are:
  - `AESD`, `AESE`, `AESIMC`, `AESMC`, `SHA1C`, `SHA1H`, `SHA1M`, `SHA1P`, `SHA1SU0`, `SHA1SU1`, `SHA256H`, `SHA256H2`, `SHA256SU0`, `SHA256SU1`, `SHA512H`, `SHA512H2`, `SHA512SU0`, `SHA512SU1`, `EOR3`, `RAX1`, `XAR`, `BCAX`, `SM3SS1`, `SM3TT1A`, `SM3TT1B`, `SM3TT2A`, `SM3TT2B`, `SM3PARTW1`, `SM3PARTW2`, `SM4E`, and `SM4EKEY`.
- A subset of those instructions which use the general-purpose register file. These instructions are:

- ADC, ADCS, ADD, ADDS, AND, ANDS, ASR, ASRV, BFC, BFI, BFM, BFXIL, BIC, BICS, CCMN, CCMP, CFINV, CINC, CINV, CLS, CLZ, CMN, CMP, CNEG, CSEL, CSET, CSETM, CSINC, CSINV, CSNEG, EON, EOR, EXTR, LSL, LSLV, LSR, LSRV, MADD, MNEG, MOV, MOVK, MOVN, MOVZ, MSUB, MUL, MVN, NEG, NEGS, NGC, NGCS, NOP, ORN, ORR, RBIT, RET, REV, REV16, REV32, REV64, RMIF, ROR, RORV, SBC, SBCS, SBFIZ, SBFM, SBFX, SETF8, SETF16, SMADDL, SMNEGL, SMSUBL, SMULH, SMULL, SUB, SUBS, SXTB, SXTH, SXTW, TST, UBFIZ, UBFM, UBFX, UMADDL, UMNEGL, UMSUBL, UMULH, UMULL, UXTB, and UXTH.
- If FEAT_CRC32 is implemented, CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX.

- A subset of those instructions which use the SIMD&FP register file. These instructions are:
  - ABS, ADD, ADDHN, ADDHN2, ADDP, ADDV, AND, BIC, BIF, BIT, BSL, CLS, CLZ, CMEQ, CMGE, CMGT, CMHI, CMHS, CMLE, CMLT, CMTST, CNT, DUP, EOR, EXT, FCSEL, INS, MLA, MLS, MOV, MOVI, MUL, MVN, MVNI, NEG, NOT, ORN, ORR, PMUL, PMULL, PMULL2, RADDHN, RADDHN2, RBIT, REV16, REV32, RSHRN, RSHRN2, RSUBHN, RSUBHN2, SABA, SABD, SABAL, SABAL2, SABDL, SABDL2, SADALP, SADDL, SADDL2, SADDLP, SADDLV, SADDW, SADDW2, SHADD, SHL, SHLL, SHLL2, SHRN, SHRN2, SHSUB, SLI, SMAX, SMAXP, SMAXV, SMIN, SMINP, SMINV, SMLAL, SMLAL2, SMLSL, SMLSL2, SMOV, SMULL, SMULL2, SRI, SSHL, SSHLL, SSHLL2, SSHR, SSRA, SSUBL, SSUBL2, SSUBW, SSUBW2, SUB, SUBHN, SUBHN2, SXTL, SXTL2, TBL, TBX, TRN1, TRN2, UABA, UABAL, UABAL2, UABD, UABDL, UABDL2, UADALP, UADDL, UADDL2, UADDLP, UADDLV, UADDW, UADDW2, UHADD, UHSUB, UMAX, UMAXP, UMAXV, UMIN, UMINP, UMINV, UMLAL, UMLAL2, UMLSL, UMOV, UMLSL2, UMULL, UMULL2, USHL, USHLL, USHLL2, USHR, USRA, USUBL, USUBL2, USUBW, USUBW2, UXTL, UXTL2, UZP1, UZP2, XTN, XTN2, ZIP1, and ZIP2.

Note

The architecture makes no statement about the timing properties when the PSTATE.DIT bit is not set. However, it is likely that many of these instructions have timing that is invariant of the data in many situations.

In particular, Arm strongly recommends that the Armv8.3 pointer authentication instructions do not have their timing dependent on the key value used in the pointer authentication in all cases, regardless of the PSTATE.DIT bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [23:0]

Reserved, RES0.

Accessing DIT

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, DIT

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b101

DLR_EL0, Debug Link Register

The DLR_EL0 characteristics are:

Purpose

In Debug state, holds the address to restart from.

Configuration

AArch64 System register DLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DLR[31:0].

Attributes

DLR_EL0 is a 64-bit register.

Field descriptions

63–32
Restart address

31–0
Restart address

Bits [63:0]

Restart address.

Accessing DLR_EL0

Accesses to this register use the following encodings in the System register encoding space:

`MRS <Xt>, DLR_EL0`

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b001

```
if !Halted() then
    UNDEFINED;
else
    return DLR_EL0;
```

`MSR DLR_EL0, <Xt>`

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b001

```
if !Halted() then
    UNDEFINED;
else
    DLR_EL0 = X[t];
```

DSPSR_EL0, Debug Saved Program Status Register

The DSPSR_EL0 characteristics are:

Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

Configuration

AArch64 System register DSPSR_EL0 bits [31:0] are architecturally mapped to AArch32 System register DSPSR[31:0].

Attributes

DSPSR_EL0 is a 64-bit register.

Field descriptions

When AArch32 is supported and exiting Debug state to AArch32 state:

63:32
RES0

31	30	29	28	27	26:25	24	23	22	21	20	19:16	15:10	9	8	7	6	5	4	3:0
N	Z	C	V	Q	IT[1:0]	DIT	SSBS	PAN	SS	IL	GE	IT[7:2]	E	A	I	F	T	M[4]	M[3:0]

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Copied to PSTATE.N on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Copied to PSTATE.Z on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Copied to PSTATE.C on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Copied to PSTATE.V on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Copied to PSTATE.Q on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Copied to PSTATE.IT on exiting Debug state.

DSPSR_EL0.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is DSPSR_EL0[26:25].
- IT[7:2] is DSPSR_EL0[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]
When FEAT_DIT is implemented:

Data Independent Timing. Copied to PSTATE.DIT on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Copied to PSTATE.SSBS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Copied to PSTATE.PAN on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Copied to PSTATE.SS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Copied to PSTATE.IL on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Copied to PSTATE.GE on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR_EL0.E is RES0. If the implementation does not support little-endian operation, DSPSR_EL0.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR_EL0.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR_EL0.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Copied to PSTATE.A on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Copied to PSTATE.I on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Copied to PSTATE.F on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Copied to PSTATE.T on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Copied to PSTATE.nRW on exiting Debug state.

M[4]	Meaning
`0b1`	AArch32 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Copied to PSTATE.M[3:0] on exiting Debug state.

M[3:0]	Meaning
`0b0000`	User.
`0b0001`	FIQ.
`0b0010`	IRQ.
`0b0011`	Supervisor.
`0b0110`	Monitor.
`0b0111`	Abort.
`0b1010`	Hyp.
`0b1011`	Undefined.
`0b1111`	System.

Other values are reserved. If DSPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When AArch64 is supported and entering or exiting Debug state from or to AArch64 state:

Bits	63:32
Field	RES0

Bits	31	30	29	28	27:26	25	24	23	22	21	20	19:14	13	12	11:10	9	8	7	6	5	4	3:0
Field	N	Z	C	V	RES0	TCO	DIT	UAO	PAN	SS	IL	RES0	ALLINT	SSBS	BTYPE	D	A	I	F	RES0	M[4]	M[3:0]

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]
When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on entering Debug state, and copied to PSTATE.TCO on exiting Debug state.

When FEAT_MTE2 is not implemented, it is CONSTRAINED UNPREDICTABLE whether this field is RES0 or behaves as if FEAT_MTE is implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]
When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on entering Debug state, and copied to PSTATE.UAO on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

ALLINT, bit [13]
When FEAT_NMI is implemented:

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on entering Debug state, and copied to PSTATE.ALLINT on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]
When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on entering Debug state, and copied to PSTATE.BTYPE on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on entering Debug state, and copied to PSTATE.D on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to `0b0`, the value of PSTATE.nRW, on entering Debug state from AArch64 state, and copied to PSTATE.nRW on exiting Debug state.

M[4]	Meaning
`0b0`	AArch64 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
`0b0000`	EL0t.
`0b0100`	EL1t.
`0b0101`	EL1h.
`0b1000`	EL2t.
`0b1001`	EL2h.
`0b1100`	EL3t.
`0b1101`	EL3h.

Other values are reserved. If DSPSR_EL0.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on entering Debug state and copied to PSTATE.EL on exiting Debug state.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on entering Debug state and copied to PSTATE.SP on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DSPSR_EL0

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, DSPSR_EL0
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    return DSPSR_EL0;
```

```
MSR DSPSR_EL0, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0101	0b000

```
if !Halted() then
    UNDEFINED;
else
    DSPSR_EL0 = X[t];
```

DVP RCTX, Data Value Prediction Restriction by Context

The DVP RCTX characteristics are:

Purpose

Data Value Prediction Restriction by Context applies to all Data Value Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

Data value predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when FEAT_SPECRES is implemented. Otherwise, direct accesses to DVP RCTX are UNDEFINED.

Attributes

DVP RCTX is a 64-bit System instruction.

Field descriptions

63–49	48	47–32
RES0	GVMID	VMID

31–27	26	25–24	23–17	16	15–0
RES0	NS	EL	RES0	GASID	ASID

Bits [63:49]

Reserved, RES0.

GVMID, bit [48]

Execution of this instruction applies to all VMIDs or a specified VMID.

GVMID	Meaning
0b0	Applies to specified VMID for an EL0 or EL1 target execution context.
0b1	Applies to all VMIDs for an EL0 or EL1 target execution context.

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

VMID, bits [47:32]

Only applies when bit[48] is 0 and the target execution context is either:

- EL1.
- EL0 when (HCR_EL2.E2H==0 or HCR_EL2.TGE==0).

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==0 or HCR_EL2.TGE==0), this field is treated as the current VMID.

When the instruction is executed at EL0 and (HCR_EL2.E2H==1 and HCR_EL2.TGE==1), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

If the implementation supports 16 bits of VMID, then the upper 8 bits of the VMID must be written to 0 by software when the context being affected only uses 8 bits.

Bits [31:27]

Reserved, RES0.

NS, bit [26]

Security State. Defined values are:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

When executed in Non-secure state, the Effective value of NS is 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

EL	Meaning
0b00	EL0.
0b01	EL1.
0b10	EL2.
0b11	EL3.

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

Bits [23:17]

Reserved, RES0.

GASID, bit [16]

Execution of this instruction applies to all ASIDs or a specified ASID.

GASID	Meaning
0b0	Applies to specified ASID for an EL0 target execution context.
0b1	Applies to all ASID for an EL0 target execution context.

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [15:0]

Only applies for an EL0 target execution context and when bit[16] is 0.

Otherwise this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being affected only uses 8 bits.

Executing the DVP RCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

`DVP RCTX, <Xt>`

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0011	0b101

```
if PSTATE.EL == EL0 then
    if !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLR_EL1.EnRCTX == '0' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    elsif EL2Enabled() && HCR_EL2.<E2H,TGE> != '11' && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') &&
HFGITR_EL2.DVPRCTX == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<E2H,TGE> == '11' && SCTLR_EL2.EnRCTX == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        AArch64.RestrictPrediction(X[t], RestrictType_DataValue);
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);

ELR_EL1, Exception Link Register (EL1)

The ELR_EL1 characteristics are:

Purpose

When taking an exception to EL1, holds the address to return to.

Configuration

There are no configuration notes.

Attributes

ELR_EL1 is a 64-bit register.

Field descriptions

63–32
Return address

31–0
Return address

Bits [63:0]

Return address.

An exception return from EL1 using AArch64 makes ELR_EL1 become UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ELR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic ELR_EL1 or ELR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ELR_EL1
```

op0	op1	CRn	CRm	op2

ELR_EL2, Exception Link Register (EL2)

The ELR_EL2 characteristics are:

Purpose

When taking an exception to EL2, holds the address to return to.

Configuration

AArch64 System register ELR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ELR_hyp[31:0].

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ELR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
Return address																															
Return address																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:0]

Return address.

An exception return from EL2 using AArch64 makes ELR_EL2 become UNKNOWN.

When EL2 is in AArch32 Execution state and an exception is taken from EL0, EL1, or EL2 to EL3 and AArch64 execution, the upper 32-bits of ELR_EL2 are either set to 0 or hold the same value that they did before AArch32 execution. Which option is adopted is determined by an implementation, and might vary dynamically within an implementation. Correspondingly software must regard the value as being an UNKNOWN choice between the two values.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ELR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic ELR_EL2 or ELR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

ERRIDR_EL1, Error Record ID Register

The ERRIDR_EL1 characteristics are:

Purpose

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

Configuration

AArch64 System register ERRIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERRIDR[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRIDR_EL1 are UNDEFINED.

Attributes

ERRIDR_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:16	RES0
15:0	NUM

Bits [63:16]

Reserved, RES0.

NUM, bits [15:0]

Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates no records can be accessed through the Error Record System registers.

Each implemented record is owned by a node. A node might own multiple records.

Accessing ERRIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ERRIDR_EL1

ERRSELR_EL1, Error Record Select Register

The ERRSELR_EL1 characteristics are:

Purpose

Selects an error record to be accessed through the Error Record System registers.

Configuration

AArch64 System register ERRSELR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERRSELR[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRSELR_EL1 are UNDEFINED.

If ERRIDR_EL1 indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR_EL1 is UNDEFINED or RES0.

Attributes

ERRSELR_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:16	RES0
15:0	SEL

Bits [63:16]

Reserved, RES0.

SEL, bits [15:0]

Selects the error record accessed through the ERX registers.

For example, if ERRSELR_EL1.SEL is `0x0004`, then direct reads and writes of ERXSTATUS_EL1 access ERR4STATUS.

If ERRSELR_EL1.SEL is greater than or equal to ERRIDR_EL1.NUM, then all of the following apply:

- The value read back from ERRSELR_EL1.SEL is UNKNOWN.
- One of the following occurs:
  - An UNKNOWN error record is selected.
  - The ERX*_EL1 registers are RAZ/WI.
  - ERX*_EL1 register reads and writes are NOPs.
  - ERX*_EL1 register reads and writes are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ERRSELR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ERRSELR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0011	0b001

```
if PSTATE.EL == EL0 then

ERXCTLR_EL1, Selected Error Record Control Register

The ERXCTLR_EL1 characteristics are:

Purpose

Accesses ERR<n>CTLR for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

AArch64 System register ERXCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERXCTLR[31:0].

AArch64 System register ERXCTLR_EL1 bits [63:32] are architecturally mapped to AArch32 System register ERXCTLR2[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXCTLR_EL1 are UNDEFINED.

Attributes

ERXCTLR_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	ERR<n>CTLR
31:0	ERR<n>CTLR

Bits [63:0]

ERXCTLR_EL1 accesses ERR<n>CTLR, where <n> is the value in ERRSELR_EL1.SEL.

Accessing ERXCTLR_EL1

If ERRIDR_EL1.NUM is `0x0000` or ERRSELR_EL1.SEL is greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTLR_EL1 is RAZ/WI.
- Direct reads and writes of ERXCTLR_EL1 are NOPs.
- Direct reads and writes of ERXCTLR_EL1 are UNDEFINED.

If ERRSELR_EL1.SEL is not the index of the first error record owned by a node, then ERR<n>CTLR is not present, meaning reads and writes of ERXCTLR_EL1 are RES0.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ERXCTLR_EL1
```

op0	op1	CRn	CRm	op2

ERXMISC1_EL1, Selected Error Record Miscellaneous Register 1

The ERXMISC1_EL1 characteristics are:

Purpose

Accesses ERR<n>MISC1 for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

AArch64 System register ERXMISC1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ERXMISC2[31:0].

AArch64 System register ERXMISC1_EL1 bits [63:32] are architecturally mapped to AArch32 System register ERXMISC3[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC1_EL1 are UNDEFINED.

Attributes

ERXMISC1_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	ERR<n>MISC1
31:0	ERR<n>MISC1

Bits [63:0]

ERXMISC1_EL1 accesses ERR<n>MISC1, where <n> is the value in ERRSELR_EL1.SEL.

Accessing ERXMISC1_EL1

If ERRIDR_EL1.NUM is `0x0000` or ERRSELR_EL1.SEL is greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC1_EL1 is RAZ/WI.
- Direct reads and writes of ERXMISC1_EL1 are NOPs.
- Direct reads and writes of ERXMISC1_EL1 are UNDEFINED.

ERR<n>MISC1 describes additional constraints that also apply when ERR<n>MISC1 is accessed through ERXMISC1_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ERXMISC1_EL1
```

ERXPFGCDN_EL1, Selected Pseudo-fault Generation Countdown register

The ERXPFGCDN_EL1 characteristics are:

Purpose

Accesses ERR<n>PFGCDN for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXPFGCDN_EL1 are UNDEFINED.

Attributes

ERXPFGCDN_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	ERR<n>PFGCDN
31:0	ERR<n>PFGCDN

Bits [63:0]

ERXPFGCDN_EL1 accesses ERR<n>PFGCDN, where <n> is the value in ERRSELR_EL1.SEL.

Accessing ERXPFGCDN_EL1

If ERRIDR_EL1.NUM is `0x0000` or ERRSELR_EL1.SEL is greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXPFGCDN_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCDN_EL1 are NOPs.
- Direct reads and writes of ERXPFGCDN_EL1 are UNDEFINED.

If ERRSELR_EL1.SEL selects an error record owned by a node that does not implement the Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGCDN_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCDN_EL1 are NOPs.
- Direct reads and writes of ERXPFGCDN_EL1 are UNDEFINED.

Note

A node does not implement the Common Fault Injection Model Extension if ERR<q>FR.INJ reads as `0b00`. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in ERRSELR_EL1.SEL. If the node owns a single record, then q = n.

If ERRSELR_EL1.SEL is not the index of the first error record owned by a node, then ERR<n>PFGCDN is not present, meaning reads and writes of ERXPFGCDN_EL1 are RES0.

ERR<n>PFGCDN describes additional constraints that also apply when ERR<n>PFGCDN is accessed through ERXPFGCDN_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ERXPFGCDN_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0100	0b110

ERXPFGCTL_EL1, Selected Pseudo-fault Generation Control register

The ERXPFGCTL_EL1 characteristics are:

Purpose

Accesses ERR<n>PFGCTL for the error record <n> selected by ERRSELR_EL1.SEL.

Configuration

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXPFGCTL_EL1 are UNDEFINED.

Attributes

ERXPFGCTL_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	ERR<n>PFGCTL
31:0	ERR<n>PFGCTL

Bits [63:0]

ERXPFGCTL_EL1 accesses ERR<n>PFGCTL, where <n> is the value in ERRSELR_EL1.SEL.

Accessing ERXPFGCTL_EL1

If ERRIDR_EL1.NUM is `0x0000` or ERRSELR_EL1.SEL is greater than or equal to ERRIDR_EL1.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXPFGCTL_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCTL_EL1 are NOPs.
- Direct reads and writes of ERXPFGCTL_EL1 are UNDEFINED.

If ERRSELR_EL1.SEL selects an error record owned by a node that does not implement the Common Fault Injection Model Extension, then one of the following occurs:

- ERXPFGCTL_EL1 is RAZ/WI.
- Direct reads and writes of ERXPFGCTL_EL1 are NOPs.
- Direct reads and writes of ERXPFGCTL_EL1 are UNDEFINED.

Note

A node does not implement the Common Fault Injection Model Extension if ERR<q>FR.INJ reads as `0b00`. <q> is the index of the first error record owned by the same node as error record <n>, where <n> is the value in ERRSELR_EL1.SEL. If the node owns a single record, then q = n.

If ERRSELR_EL1.SEL is not the index of the first error record owned by a node, then ERR<n>PFGCTL is not present, meaning reads and writes of ERXPFGCTL_EL1 are RES0.

ERR<n>PFGCTL describes additional constraints that also apply when ERR<n>PFGCTL is accessed through ERXPFGCTL_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ERXPFGCTL_EL1
```

ESR_EL1, Exception Syndrome Register (EL1)

The ESR_EL1 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL1.

Configuration

AArch64 System register ESR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DFSR[31:0].

Attributes

ESR_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:37	RES0
36:32	ISS2
31:26	EC
25	IL
24:0	ISS

ESR_EL1 is made UNKNOWN as a result of an exception return from EL1.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL1, the value of ESR_EL1 is UNKNOWN. The value written to ESR_EL1 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:37]

Reserved, RES0.

ISS2, bits [36:32]

When FEAT_LS64 is implemented:

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

Otherwise:

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WF* instruction	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: • An STC to write data to memory from DBGDTRRXint. • An LDC to read data from memory to DBGDTRTXint.	ISS encoding for an exception from an LDC or STC instruction	When AArch32 is supported
0b000111	Access to SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN, CPTR_EL2.FPEN, CPTR_EL2.TFP, or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1'.	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps	
0b001010	Trapped execution of an LD64B,	ISS encoding for an exception	When FEAT_LS64

	ST64B, ST64BV, or ST64BV0 instruction.	from an LD64B or ST64B* instruction	is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported
0b001101	Branch Target Exception.	ISS encoding for an exception from Branch Target Identification instruction	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b010001	SVC instruction execution in AArch32 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch32 is supported
0b010101	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001, or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	When AArch64 is supported
0b011001	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.	ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ	When FEAT_SVE is implemented
0b011100	Exception from a Pointer Authentication instruction authentication failure	ISS encoding for an exception from a Pointer Authentication instruction authentication failure	When FEAT_FPAC is implemented

0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort
0b100010	PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault
0b100100	Data Abort from a lower Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort
0b100101	Data Abort taken without a change in Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort

0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b100111	Memory Operation Exception.	ISS encoding for an exception from the Memory Copy and Memory Set instructions	When FEAT_MOPS is implemented
0b101000	Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	When AArch32 is supported
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	When AArch64 is supported
0b101111	SError interrupt.	ISS encoding for an SError interrupt	
0b110000	Breakpoint exception from a lower Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110001	Breakpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110010	Software Step exception from a lower Exception level.	ISS encoding for an exception from a Software Step exception	

0b110011	Software Step exception taken without a change in Exception level.	ISS encoding for an exception from a Software Step exception	
0b110100	Watchpoint exception from a lower Exception level.	ISS encoding for an exception from a Watchpoint exception	
0b110101	Watchpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Watchpoint exception	
0b111000	BKPT instruction execution in AArch32 state.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch32 is supported
0b111100	BRK instruction execution in AArch64 state.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch64 is supported

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.

0b1	32-bit instruction trapped. This value is also used when the exception is one of the following:
	• An SError interrupt.
	• An Instruction Abort exception.
	• A PC alignment fault exception.
	• An SP alignment fault exception.
	• A Data Abort exception for which the value of the ISV bit is 0.
	• An Illegal Execution state exception.
	• Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning:
	  ◦ 0b0: 16-bit T32 BKPT instruction.
	  ◦ 0b1: 32-bit A32 BKPT instruction or A64 BRK instruction.
	• An exception reported using EC value 0b000000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is `0b1111`, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value `0b11111`.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value `0b11111`.

ISS encoding for exceptions with an unknown reason

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
  - Instruction encodings that are unallocated.
  - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR_EL1.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
  - An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
  - An SMC instruction when disabled by SCR_EL3.SMD.
  - An HLT instruction when disabled by EDSCR.HDE.
- Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSel.SP is 0.
- Attempted execution of an MSR or MRS instruction using a _EL12 register name when HCR_EL2.E2H == 0.
- Attempted execution, in Debug state, of:
  - A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
  - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.

  - A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon. See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
- An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1 that, if the value of HCR_EL2.TGE was 0 would have been reported with an ESR_ELx.EC value of `0b000111`.

ISS encoding for an exception from a WF* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0										RN					RES0		RV	TI	

CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:10]

Reserved, RES0.

RN, bits [9:5]

When FEAT_WFxT is implemented:

Register Number. Indicates the register number supplied for a `WFET` or `WFIT` instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

RV, bit [2]

When FEAT_WFxT is implemented:

Register field Valid.

If TI[1] == 1, then this field indicates whether RN holds a valid register number for the register argument to the trapped `WFET` or `WFIT` instruction.

RV	Meaning
`0b0`	Register field invalid.
`0b1`	Register field valid.

If TI[1] == 0, then this field is RES0.

This field is set to 1 on a trap on `WFET` or `WFIT`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
`0b00`	WFI trapped.	
`0b01`	WFE trapped.	
`0b10`	WFIT trapped.	When FEAT_WFxT is implemented
`0b11`	WFET trapped.	When FEAT_WFxT is implemented

When FEAT_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- SCTLR_EL1.{nTWE, nTWI}.
- HCR_EL2.{TWE, TWI}.
- SCR_EL3.{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access

24	23 22 21 20	19 18 17	16 15 14	13 12 11 10	9 8 7 6 5	4 3 2 1	0
CV	COND	Opc2	Opc1	CRn	Rt	CRm	Direction

CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value `0b000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value `0b111`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

If the Rt value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
  - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
  - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value `0b0000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
`0b0`	Write to System register space. MCR instruction.
`0b1`	Read from System register space. MRC or VMRS instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1 or CPACR using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CNTHCTL_EL2.EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL3.TCPAC, for accesses to CPACR from EL1 and EL2, and accesses to HCPTR from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- For information on other traps using EC value 0b000011, see 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- If FEAT_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000101:

- CPACR_EL1.TTA for accesses to trace registers, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL1 or EL2.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- HCR_EL2.TID0, for accesses to the JIDR register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == 0b1110) trapped to EL2.
- CPTR_EL2.TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and DBGDSAR using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- MDCR_EL2.TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- MDCR_EL2.TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == 0b1110) trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

- MDCR_EL3.TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == 0b1110) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001000:

- HCR_EL2.TID0, for accesses to the FPSID register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- HCR_EL2.TID3, for accesses to registers in ID group 3 including MVFR0, MVFR1 and MVFR2, VMRS access trapped to EL2.

ISS encoding for an exception from an LD64B or ST64B* instruction

24–0
ISS

ISS, bits [24:0]

ISS	Meaning
0b0000000000000000000000000	ST64BV instruction trapped.
0b0000000000000000000000001	ST64BV0 instruction trapped.
0b0000000000000000000000010	LD64B or ST64B instruction trapped.

All other values are reserved.

ISS encoding for an exception from an MCRR or MRRC access

24	23–20	19–16	15	14–10	9–5	4–1	0
CV	COND	Opc1	RES0	Rt2	Rt	CRm	Direction

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
    - If the instruction is conditional, COND is set to the condition code field value from the instruction.

    - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
    - With COND set to `0b1110`, the value for unconditional.
    - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
    - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
    - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

If the Rt2 value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt2 value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

If the Rt value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:

- The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
- The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
`0b0`	Write to System register space. MCRR instruction.
`0b1`	Read from System register space. MRRC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value `0b000100`:

- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- PMUSERENR_EL0.{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- AMUSERENR_EL0.{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL2.
- HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL2.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL3.
- If FEAT_FGT is implemented, HDFGRTR_EL2.PMCCNTR_EL0 for MRRC access and HDFGWTR_EL2.PMCCNTR_EL0 for MCRR access to PMCCNTR at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value `0b001100`:

- MDSCR_EL1.TDCC, for accesses to the Debug ROM registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, MCRR or MRRC access (coproc == `0b1110`) trapped to EL1 or EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and DBGDSAR using AArch32, MCRR or MRRC access (coproc == `0b1110`) trapped to EL2.

- MDCR_EL3.TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- CPACR_EL1.TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- CPTR_EL2.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

ISS encoding for an exception from an LDC or STC instruction

24	23 22 21 20	19 18 17 16 15 14 13 12	11 10	9 8 7 6 5	4	3 2 1	0
CV	COND	imm8	RES0	Rn	Offset	AM	Direction

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to 0b1110.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to 0b1110, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these

definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer.

If the Rn value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rn value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
`0b0`	Subtract offset.
`0b1`	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- MDSCR_EL1.TDCC, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint trapped to EL1 or EL2.
- MDCR_EL2.TDA, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL2.
- MDCR_EL3.TDA, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL3.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for Advanced SIMD and floating-point, the exception is reported using the EC value 0b000000.

CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value `0b000111`:

- CPACR_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.
- CPTR_EL2.FPEN and CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.
- CPTR_EL3.TFP, for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE System registers, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value `0b000000`.

Bits [24:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value `0b011001`:

- CPACR_EL1.ZEN, for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL1.
- CPTR_EL2.ZEN and CPTR_EL2.TZ, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- CPTR_EL3.EZ, for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0

Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions, see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from the Memory Copy and Memory Set instructions

24	23	22 21 20 19	18	17	16	15	14 13 12 11 10	9 8 7 6 5	4 3 2 1 0
MemInst	isSETG	Options	FromEpilogue	WrongOption	OptionA	RES0	destreg	srcreg	sizereg

MemInst, bit [24]

Indicates the memory instruction class causing the exception.

MemInst	Meaning
`0b0`	CPYFE*, CPYFM*, CPYE*, and CPYM* instructions.
`0b1`	SETE*, SETM*, SETGE*, and SETGM* instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

isSETG, bit [23]

Indicates whether the instruction belongs to SETGM* or SETGE* class of instruction.

isSETG	Meaning
0b0	Not a SETGM* or SETGE* instruction.
0b1	SETGM* or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Options, bits [22:19]

Options : the Options field of the instruction.

For Memory Copy instructions, bits[22:19] forms the Options field, which holds the bits[15:12] of the instruction.

For Memory Set instructions:

- Bits[22:21] are RES0.
- Bits[20:19] form the Options field, which holds the bits[13:12] of the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FromEpilogue, bit [18]

Indicates whether the instruction belongs to the epilogue class of Memory Copy or Memory Set instructions.

FromEpilogue	Meaning
0b0	Not an epilogue instruction.
0b1	CPYE*, CPYFE*, SETE*, or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WrongOption, bit [17]

Algorithm option.

WrongOption	Meaning
0b0	WrongOption is false.
0b1	WrongOption is true.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OptionA, bit [16]

Algorithm type indicated by the PSTATE.C bit.

OptionA	Meaning
0b0	OptionB indicated by PSTATE.C is 0.
0b1	OptionA indicated by PSTATE.C is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

destreg, bits [14:10]

The destination register value from the issued instruction, containing the destination address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

srcreg, bits [9:5]

The source register value from the issued instruction, containing either the source address or the source data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

sizereg, bits [4:0]

The size register value from the issued instruction, containing the number of bytes to be transfered or set.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from HVC or SVC instruction execution

24–16	15–0
RES0	imm16

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT_FGT is implemented, HFGITR_EL2.{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state

24	23 22 21 20	19	18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
CV	COND	CCKNOWNPASS	RES0

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because HCR_EL2.TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
    - If the instruction is conditional, COND is set to the condition code field value from the instruction.
    - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
    - With COND set to `0b1110`, the value for unconditional.
    - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
    - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
    - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

Note

In an implementation in which an SMC instruction that fails it code check is not trapped, this field can always return the value 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from SMC instruction execution in AArch64 state

24–16	15–0
RES0	imm16

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

24 23 22	21 20	19 18 17	16 15 14	13 12 11 10	9 8 7 6 5	4 3 2 1	0
RES0	Op0	Op2	Op1	CRn	Rt	CRm	Direction

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write access, including MSR instructions.
0b1	Read access, including MRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value 0b011000:

- SCTLR_EL1.UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.UCT, for accesses to CTR_EL0 using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- CPACR_EL1.TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register, ACTLR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TTRF, for accesses to the trace filter control register, TRFCR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.

- HCR_EL2.{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.AT, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- SCR_EL3.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TCPAC, for accesses to CPTR_EL2 and CPACR_EL1 using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TTRF, for accesses to the trace filter control registers, TRFCR_EL1 and TRFCR_EL2, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - HCR2.{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT_FGT is implemented:
  - SCR_EL3.FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - HFGRTR_EL2 for reads and HFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - HFGITR_EL2 for execution of system instructions, MSR or MRS access trapped to EL2
  - HDFGRTR_EL2 for reads and HDFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - HAFGRTR_EL2 for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.
- If FEAT_RNG_TRAP is implemented:
  - SCR_EL3.TRNDR for reads of RNDR and RNDRRS using AArch64 state, MRS access trapped to EL3.
- If FEAT_NMI is implemented, HCRX_EL2.TALLINT, for MSR writes of ALLINT at EL1, trapped to EL2.

ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

24–0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Instruction Abort

24–13	12–11	10	9	8	7	6	5–0
RES0	SET	FnV	EA	RES0	S1PTW	RES0	IFSC

Bits [24:13]

Reserved, RES0.

SET, bits [12:11]

When FEAT_RAS is implemented:

Synchronous Error Type. When IFSC is `0b010000`, describes the PE error state after taking the Instruction Abort exception.

SET	Meaning
`0b00`	Recoverable state (UER).
`0b10`	Uncontainable (UC).
`0b11`	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is `0b010000`. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
`0b0`	FAR is valid.
`0b1`	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is `0b010000`. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or	When FEAT_RAS is

	hardware update of translation table, level 2.	not implemented
`0b011111`	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
`0b101001`	Address size fault, level -1.	When FEAT_LPA2 is implemented
`0b101011`	Translation fault, level -1.	When FEAT_LPA2 is implemented
`0b110000`	TLB conflict abort.	
`0b110001`	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort

24	23 22	21	20 19 18 17 16	15	14	13	12 11	10	9	8	7	6	5 4 3 2 1 0
ISV	SAS	SSE	SRT	SF	AR	VNCR	Bits[12:11]	FnV	EA	CM	S1PTW	WnR	DFSC

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
`0b0`	No valid instruction syndrome. ISS[23:14] are RES0.
`0b1`	ISS[23:14] hold a valid instruction syndrome.

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with `0b11111`, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.

  - Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR_EL1 or ESR_EL3.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT_MTE2 is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR_ELx.FNV is 0 and FAR_ELx is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]
When ISV == 1:

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is `0b11`.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSE, bit [21]
When ISV == 1:

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SRT, bits [20:16]

When ISV == 1:

Syndrome Register Transfer. The register number of the Wt/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SF, bit [15]

When ISV == 1:

Width of the register accessed by the instruction is Sixty-Four.

SF	Meaning
`0b0`	Instruction loads/stores a 32-bit wide register.
`0b1`	Instruction loads/stores a 64-bit wide register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AR, bit [14]

When ISV == 1:

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VNCR, bit [13]

When FEAT_NV2 is implemented:

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SET, bits [12:11]

When FEAT_RAS is implemented and FEAT_LS64 is not implemented:

Synchronous Error Type. When DFSC is `0b010000`, describes the PE error state after taking the Data Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is `0b010000`. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_LS64 is implemented:

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

LST	Meaning
0b01	An ST64BV instruction generated the Data Abort.
0b10	An LD64B or ST64B instruction generated the Data Abort.
0b11	An ST64BV0 instruction generated the Data Abort.

All other values are reserved.

This field is valid only if the DFSC code is `0b110101`. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is `0b010000`. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of `0b110101` or `0b110001`, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE2 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented

0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

24	23	22 – 11	10 – 8	7	6 – 5	4	3	2	1	0
RES0	TFV	RES0	VECITR	IDF	RES0	IXF	UFF	OFF	DZF	IOF

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from an instruction that is performing floating-point operations on more than one lane of a vector.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from an instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the FPCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDS	RES0										IESB	AET			EA	RES0			DFSC					

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding. **Note** If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]

When FEAT_IESB is implemented:

Implicit error synchronization event.

IESB	Meaning
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is valid only if the DFSC code is `0b010001`. It is RES0 for all other errors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]
When FEAT_RAS is implemented:

Asynchronous Error Type.

When DFSC is `0b010001`, describes the PE error state after taking the SError interrupt exception.

AET	Meaning
`0b000`	Uncontainable (UC).
`0b001`	Unrecoverable state (UEU).
`0b010`	Restartable state (UEO).
`0b011`	Recoverable state (UER).
`0b110`	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is `0b010001`. It is RES0 for all other errors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]
When FEAT_RAS is implemented:

External abort type. When DFSC is `0b010001`, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is `0b010001`. It is RES0 for all other errors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]
When FEAT_RAS is implemented:

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

24–6	5–0
RES0	IFSC

Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

ISS encoding for an exception from a Software Step exception

24	23–7	6	5–0
ISV	RES0	EX	IFSC

ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
0b0	An instruction other than a Load-Exclusive instruction was stepped.
0b1	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Software Step exceptions'.

ISS encoding for an exception from a Watchpoint exception

24:15	14	13	12:9	8	7	6	5:0
RES0	RES0	VNCR	RES0	CM	RES0	WnR	DFSC

Bits [24:15]

Reserved, RES0.

Bit [14]

Reserved, RES0.

VNCR, bit [13]
When FEAT_NV2 is implemented:

Indicates that the watchpoint came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
0b0	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
0b1	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
`0b0`	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
`0b1`	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
`0b0`	Watchpoint exception caused by an instruction reading from a memory location.
`0b1`	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
`0b100010`	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

ISS encoding for an exception from execution of a Breakpoint instruction

24–16	15–0
RES0	Comment

Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction

24–2	1	0
RES0	ERET	ERETA

This EC value applies when FEAT_FGT is implemented, or when HCR_EL2.NV is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2.

ERET	Meaning
`0b0`	ERET instruction trapped to EL2.
`0b1`	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

ERETA	Meaning
`0b0`	ERETAA instruction trapped to EL2.
`0b1`	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see HCR_EL2.NV.

If FEAT_FGT is implemented, HFGITR_EL2.ERET controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

ISS encoding for an exception from Branch Target Identification instruction

24–2	1–0
RES0	BTYPE

Bits [24:2]

Reserved, RES0.

BTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0

24–0
RES0

Bits [24:0]

Reserved, RES0.

For more information about generating these exceptions, see:

- HCR_EL2.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- SCR_EL3.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure

24–2	1	0
RES0	Exception as a result of an Instruction key or a Data key	Exception as a result of an A key or a B key

Bits [24:2]

Reserved, RES0.

Bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

	Meaning
0b0	Instruction Key.
0b1	Data Key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a Translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

Accessing ESR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic ESR_EL1 or ESR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ESR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then

ESR_EL2, Exception Syndrome Register (EL2)

The ESR_EL2 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL2.

Configuration

AArch64 System register ESR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ESR_EL2 is a 64-bit register.

Field descriptions

63 … 37	36 … 32
RES0	ISS2

31 … 26	25	24 … 0
EC	IL	ISS

ESR_EL2 is made UNKNOWN as a result of an exception return from EL2.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of ESR_EL2 is UNKNOWN. The value written to ESR_EL2 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:37]

Reserved, RES0.

ISS2, bits [36:32]

When FEAT_LS64 is implemented:

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

Otherwise:

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.

- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WF* instruction	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: • An STC to write data to memory from DBGDTRRXint. • An LDC to read data from memory to DBGDTRTXint.	ISS encoding for an exception from an LDC or STC instruction	When AArch32 is supported
0b000111	Access to SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN, CPTR_EL2.FPEN, CPTR_EL2.TFP, or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1'.	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps	

0b001000	Trapped VMRS access, from ID group trap, that is not reported using EC 0b000111.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported
0b001001	Trapped use of a Pointer authentication instruction because HCR_EL2.API == 0 || SCR_EL3.API == 0.	ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0	When FEAT_PAuth is implemented
0b001010	Trapped execution of an LD64B, ST64B, ST64BV, or ST64BV0 instruction.	ISS encoding for an exception from an LD64B or ST64B* instruction	When FEAT_LS64 is implemented
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported
0b001101	Branch Target Exception.	ISS encoding for an exception from Branch Target Identification instruction	When FEAT_BTI is implemented
0b001110	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b010001	SVC instruction execution in AArch32 state. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TGE is 1.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch32 is supported
0b010010	HVC instruction execution in AArch32 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch32 is supported
0b010011	SMC instruction execution in AArch32 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.	ISS encoding for an exception from SMC instruction execution in AArch32 state	When AArch32 is supported
0b010101	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported
0b010110	HVC instruction execution in AArch64 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported

0b010111	SMC instruction execution in AArch64 state, when SMC is not disabled. This is reported in ESR_EL2 only when the exception is generated because the value of HCR_EL2.TSC is 1.	ISS encoding for an exception from SMC instruction execution in AArch64 state	When AArch64 is supported
0b011000	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC 0b000000, 0b000001 or 0b000111. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values 0b000000, 0b000001, or 0b000111.	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	When AArch64 is supported
0b011001	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.	ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ	When FEAT_SVE is implemented
0b011010	Trapped ERET, ERETAA, or ERETAB instruction execution.	ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction	When FEAT_PAuth is implemented and FEAT_NV is implemented
0b011100	Exception from a Pointer Authentication instruction authentication failure	ISS encoding for an exception from a Pointer Authentication instruction authentication failure	When FEAT_FPAC is implemented
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	

0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort
0b100010	PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault
0b100100	Data Abort from a lower Exception level, excluding Data Aborts taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. These Data Aborts might be generated from Exception levels in any Execution state. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort
0b100101	Data Abort without a change in Exception level, or Data Aborts taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and	ISS encoding for an exception from a Data Abort

	synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.		
0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b100111	Memory Operation Exception.	ISS encoding for an exception from the Memory Copy and Memory Set instructions	When FEAT_MOPS is implemented
0b101000	Trapped floating-point exception taken from AArch32 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	When AArch32 is supported
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	When AArch64 is supported
0b101111	SError interrupt.	ISS encoding for an SError interrupt	
0b110000	Breakpoint exception from a lower Exception level.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	
0b110001	Breakpoint exception taken without a change in Exception level.	ISS encoding for an exception from a Breakpoint or	

		Vector Catch debug exception	
0b110010	Software Step exception from a lower Exception level.	ISS encoding for an exception from a Software Step exception	
0b110011	Software Step exception taken without a change in Exception level.	ISS encoding for an exception from a Software Step exception	
0b110100	Watchpoint from a lower Exception level, excluding Watchpoint Exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support. These Watchpoint Exceptions might be generated from Exception levels using any Execution state.	ISS encoding for an exception from a Watchpoint exception	
0b110101	Watchpoint exceptions without a change in Exception level, or Watchpoint exceptions taken to EL2 as a result of accesses generated associated with VNCR_EL2 as part of nested virtualization support.	ISS encoding for an exception from a Watchpoint exception	
0b111000	BKPT instruction execution in AArch32 state.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch32 is supported
0b111010	Vector Catch exception from AArch32 state. The only case where a Vector Catch exception is taken to an Exception level that is using AArch64 is when the exception is routed to EL2 and EL2 is using AArch64.	ISS encoding for an exception from a Breakpoint or Vector Catch debug exception	When AArch32 is supported
0b111100	BRK instruction execution in AArch64 state.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch64 is supported

All other EC values are reserved by Arm, and:

- Unused values in the range `0b000000` - `0b101100` (`0x00` - `0x2C`) are reserved for future use for synchronous exceptions.
- Unused values in the range `0b101101` - `0b111111` (`0x2D` - `0x3F`) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
`0b0`	16-bit instruction trapped.
`0b1`	32-bit instruction trapped. This value is also used when the exception is one of the following: • An SError interrupt. • An Instruction Abort exception. • A PC alignment fault exception. • An SP alignment fault exception. • A Data Abort exception for which the value of the ISV bit is 0. • An Illegal Execution state exception. • Any debug exception except for Breakpoint instruction exceptions. For Breakpoint instruction exceptions, this bit has its standard meaning: ◦ `0b0`: 16-bit T32 BKPT instruction. ◦ `0b1`: 32-bit A32 BKPT instruction or A64 BRK instruction. • An exception reported using EC value `0b000000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is `0b1111`, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value `0b11111`.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value `0b11111`.

ISS encoding for exceptions with an unknown reason

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
    - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
    - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.
    - Instruction encodings that are unallocated.
    - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR_EL1.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
    - An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
    - An SMC instruction when disabled by SCR_EL3.SMD.
    - An HLT instruction when disabled by EDSCR.HDE.
- Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSel.SP is 0.
- Attempted execution of an MSR or MRS instruction using a _EL12 register name when HCR_EL2.E2H == 0.
- Attempted execution, in Debug state, of:
    - A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
    - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
    - A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon. See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
- An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1 that, if the value of HCR_EL2.TGE was 0 would have been reported with an ESR_ELx.EC value of `0b000111`.

ISS encoding for an exception from a WF* instruction

24	23:20	19:10	9:5	4:3	2	1:0
CV	COND	RES0	RN	RES0	RV	TI

CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:10]

Reserved, RES0.

RN, bits [9:5]
When FEAT_WFxT is implemented:

Register Number. Indicates the register number supplied for a `WFET` or `WFIT` instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

RV, bit [2]
When FEAT_WFxT is implemented:

Register field Valid.

If TI[1] == 1, then this field indicates whether RN holds a valid register number for the register argument to the trapped `WFET` or `WFIT` instruction.

RV	Meaning
`0b0`	Register field invalid.
`0b1`	Register field valid.

If TI[1] == 0, then this field is RES0.

This field is set to 1 on a trap on `WFET` or `WFIT`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
`0b00`	WFI trapped.	
`0b01`	WFE trapped.	
`0b10`	WFIT trapped.	When FEAT_WFxT is implemented
`0b11`	WFET trapped.	When FEAT_WFxT is implemented

When FEAT_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- SCTLR_EL1.{nTWE, nTWI}.
- HCR_EL2.{TWE, TWI}.
- SCR_EL3.{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access

24	23–20	19–17	16–14	13–10	9–5	4–1	0
CV	COND	Opc2	Opc1	CRn	Rt	CRm	Direction

CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value `0b000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value `0b111`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

If the Rt value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value `0b0000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
`0b0`	Write to System register space. MCR instruction.
`0b1`	Read from System register space. MRC or VMRS instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value `0b000011`:

- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- HCR_EL2.TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- HCR_EL2.{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1 or CPACR using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- CNTHCTL_EL2.EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.

- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL2.
- CPTR_EL3.TCPAC, for accesses to CPACR from EL1 and EL2, and accesses to HCPTR from EL2 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL3.
- For information on other traps using EC value `0b000011`, see 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- If FEAT_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value `0b000101`:

- CPACR_EL1.TTA for accesses to trace registers, MCR or MRC access (coproc == `0b1110`) trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1110`) trapped to EL1 or EL2.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- HCR_EL2.TID0, for accesses to the JIDR register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == `0b1110`) trapped to EL2.
- CPTR_EL2.TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and DBGDSAR using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL2.
- MDCR_EL2.TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == `0b1110`) trapped to EL2.
- MDCR_EL2.TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == `0b1110`) trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL3.
- MDCR_EL3.TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value `0b001000`:

- HCR_EL2.TID0, for accesses to the FPSID register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- HCR_EL2.TID3, for accesses to registers in ID group 3 including MVFR0, MVFR1 and MVFR2, VMRS access trapped to EL2.

ISS encoding for an exception from an LD64B or ST64B* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISS																								

ISS, bits [24:0]

ISS	Meaning
`0b0000000000000000000000000`	ST64BV instruction trapped.
`0b0000000000000000000000001`	ST64BV0 instruction trapped.
`0b0000000000000000000000010`	LD64B or ST64B instruction trapped.

All other values are reserved.

ISS encoding for an exception from an MCRR or MRRC access

24	23 22 21 20	19 18 17 16	15	14 13 12 11 10	9 8 7 6 5	4 3 2 1	0
CV	COND	Opc1	RES0	Rt2	Rt	CRm	Direction

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

If the Rt2 value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt2 value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

If the Rt value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCRR instruction.
0b1	Read from System register space. MRRC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000100:

- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- PMUSERENR_EL0.{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- AMUSERENR_EL0.{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL2.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == 0b1111) trapped to EL3.
- If FEAT_FGT is implemented, HDFGRTR_EL2.PMCCNTR_EL0 for MRRC access and HDFGWTR_EL2.PMCCNTR_EL0 for MCRR access to PMCCNTR at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b001100:

- MDSCR_EL1.TDCC, for accesses to the Debug ROM registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and DBGDSAR using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- MDCR_EL3.TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.
- CPACR_EL1.TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL1 or EL2.
- CPTR_EL2.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == 0b1110) trapped to EL3.

Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

ISS encoding for an exception from an LDC or STC instruction

24	23–20	19–12	11–10	9–5	4	3–1	0
CV	COND	imm8	RES0	Rn	Offset	AM	Direction

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer.

If the Rn value is not 0b1111, then the reported value gives the AArch64 view of the register. Otherwise, if the Rn value is 0b1111:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value 0b11111.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- MDSCR_EL1.TDCC, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint trapped to EL1 or EL2.
- MDCR_EL2.TDA, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL2.
- MDCR_EL3.TDA, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL3.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for Advanced SIMD and floating-point, the exception is reported using the EC value 0b000000.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:

    - If the instruction is conditional, COND is set to the condition code field value from the instruction.
    - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
    - With COND set to `0b1110`, the value for unconditional.
    - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
    - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
    - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value `0b000111`:

- CPACR_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.
- CPTR_EL2.FPEN and CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.
- CPTR_EL3.TFP, for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE System registers, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value `0b000000`.

Bits [24:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value `0b011001`:

- CPACR_EL1.ZEN, for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL1.
- CPTR_EL2.ZEN and CPTR_EL2.TZ, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- CPTR_EL3.EZ, for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions, see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from the Memory Copy and Memory Set instructions

24	23	22 21 20 19	18	17	16	15	14 13 12 11 10	9 8 7 6 5	4 3 2 1 0
MemInst	isSETG	Options	FromEpilogue	WrongOption	OptionA	RES0	destreg	srcreg	sizereg

MemInst, bit [24]

Indicates the memory instruction class causing the exception.

MemInst	Meaning
0b0	CPYFE*, CPYFM*, CPYE*, and CPYM* instructions.
0b1	SETE*, SETM*, SETGE*, and SETGM* instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

isSETG, bit [23]

Indicates whether the instruction belongs to SETGM* or SETGE* class of instruction.

isSETG	Meaning
0b0	Not a SETGM* or SETGE* instruction.
0b1	SETGM* or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Options, bits [22:19]

Options : the Options field of the instruction.

For Memory Copy instructions, bits[22:19] forms the Options field, which holds the bits[15:12] of the instruction.

For Memory Set instructions:

- Bits[22:21] are RES0.
- Bits[20:19] form the Options field, which holds the bits[13:12] of the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FromEpilogue, bit [18]

Indicates whether the instruction belongs to the epilogue class of Memory Copy or Memory Set instructions.

FromEpilogue	Meaning
`0b0`	Not an epilogue instruction.
`0b1`	CPYE*, CPYFE*, SETE*, or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WrongOption, bit [17]

Algorithm option.

WrongOption	Meaning
`0b0`	WrongOption is false.
`0b1`	WrongOption is true.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OptionA, bit [16]

Algorithm type indicated by the PSTATE.C bit.

OptionA	Meaning
`0b0`	OptionB indicated by PSTATE.C is 0.
`0b1`	OptionA indicated by PSTATE.C is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

destreg, bits [14:10]

The destination register value from the issued instruction, containing the destination address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

srcreg, bits [9:5]

The source register value from the issued instruction, containing either the source address or the source data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

sizereg, bits [4:0]

The size register value from the issued instruction, containing the number of bytes to be transfered or set.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from HVC or SVC instruction execution

24–16	15–0
RES0	imm16

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT_FGT is implemented, HFGITR_EL2.{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state

24	23–20	19	18–0
CV	COND	CCKNOWNPASS	RES0

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because HCR_EL2.TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
    - If the instruction is conditional, COND is set to the condition code field value from the instruction.
    - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
    - With COND set to `0b1110`, the value for unconditional.
    - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
    - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
    - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
`0b0`	The instruction was unconditional, or was conditional and passed its condition code check.
`0b1`	The instruction was conditional, and might have failed its condition code check.

Note

In an implementation in which an SMC instruction that fails it code check is not trapped, this field can always return the value 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from SMC instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0									imm16															

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0			Op0		Op2			Op1			CRn				Rt					CRm				Direction

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
`0b0`	Write access, including MSR instructions.
`0b1`	Read access, including MRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value `0b011000`:

- SCTLR_EL1.UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.UCT, for accesses to CTR_EL0 using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- CPACR_EL1.TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.

- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register, ACTLR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TTRF, for accesses to the trace filter control register, TRFCR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.AT, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- SCR_EL3.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TCPAC, for accesses to CPTR_EL2 and CPACR_EL1 using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TTRF, for accesses to the trace filter control registers, TRFCR_EL1 and TRFCR_EL2, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.

- If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
  - HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
  - HCR2.{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT_FGT is implemented:
  - SCR_EL3.FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
  - HFGRTR_EL2 for reads and HFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
  - HFGITR_EL2 for execution of system instructions, MSR or MRS access trapped to EL2
  - HDFGRTR_EL2 for reads and HDFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
  - HAFGRTR_EL2 for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.
- If FEAT_RNG_TRAP is implemented:
  - SCR_EL3.TRNDR for reads of RNDR and RNDRRS using AArch64 state, MRS access trapped to EL3.
- If FEAT_NMI is implemented, HCRX_EL2.TALLINT, for MSR writes of ALLINT at EL1, trapped to EL2.

ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

24–0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Instruction Abort

24–13	12–11	10	9	8	7	6	5–0
RES0	SET	FnV	EA	RES0	S1PTW	RES0	IFSC

Bits [24:13]

Reserved, RES0.

SET, bits [12:11]
When FEAT_RAS is implemented:

Synchronous Error Type. When IFSC is `0b010000`, describes the PE error state after taking the Instruction Abort exception.

SET	Meaning
`0b00`	Recoverable state (UER).
`0b10`	Uncontainable (UC).
`0b11`	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is `0b010000`. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or	When FEAT_RAS is

	hardware update of translation table, level 2.	not implemented
`0b011111`	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
`0b101001`	Address size fault, level -1.	When FEAT_LPA2 is implemented
`0b101011`	Translation fault, level -1.	When FEAT_LPA2 is implemented
`0b110000`	TLB conflict abort.	
`0b110001`	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort

24	23 22	21	20 19 18 17 16	15	14	13	12 11	10	9	8	7	6	5 4 3 2 1 0
ISV	SAS	SSE	SRT	SF	AR	VNCR	Bits[12:11]	FnV	EA	CM	S1PTW	WnR	DFSC

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
`0b0`	No valid instruction syndrome. ISS[23:14] are RES0.
`0b1`	ISS[23:14] hold a valid instruction syndrome.

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with `0b11111`, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
    - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
    - Is not performing register writeback.

- Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR_EL1 or ESR_EL3.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT_MTE2 is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR_ELx.FNV is 0 and FAR_ELx is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]
When ISV == 1:

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is `0b11`.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSE, bit [21]
When ISV == 1:

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SRT, bits [20:16]

When ISV == 1:

Syndrome Register Transfer. The register number of the Wt/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SF, bit [15]

When ISV == 1:

Width of the register accessed by the instruction is Sixty-Four.

SF	Meaning
0b0	Instruction loads/stores a 32-bit wide register.
0b1	Instruction loads/stores a 64-bit wide register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AR, bit [14]

When ISV == 1:

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VNCR, bit [13]
When FEAT_NV2 is implemented:

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SET, bits [12:11]
When FEAT_RAS is implemented and FEAT_LS64 is not implemented:

Synchronous Error Type. When DFSC is `0b010000`, describes the PE error state after taking the Data Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is `0b010000`. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_LS64 is implemented:

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

LST	Meaning
0b01	An ST64BV instruction generated the Data Abort.
0b10	An LD64B or ST64B instruction generated the Data Abort.
0b11	An ST64BV0 instruction generated the Data Abort.

All other values are reserved.

This field is valid only if the DFSC code is 0b110101. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of `0b110101` or `0b110001`, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE2 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented

0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	TFV	RES0												VECITR			IDF	RES0		IXF	UFF	OFF	DZF	IOF

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from an instruction that is performing floating-point operations on more than one lane of a vector.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from an instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the FPCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDS	RES0										IESB	AET			EA	RES0			DFSC					

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding. **Note** If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]
When FEAT_IESB is implemented:

Implicit error synchronization event.

IESB	Meaning
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]
When FEAT_RAS is implemented:

Asynchronous Error Type.

When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

AET	Meaning
0b000	Uncontainable (UC).
0b001	Unrecoverable state (UEU).
0b010	Restartable state (UEO).
0b011	Recoverable state (UER).
0b110	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]
When FEAT_RAS is implemented:

External abort type. When DFSC is 0b010001, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other errors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]
When FEAT_RAS is implemented:

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

24–6	5–0
RES0	IFSC

Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

ISS encoding for an exception from a Software Step exception

24	23–7	6	5–0
ISV	RES0	EX	IFSC

ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
`0b0`	An instruction other than a Load-Exclusive instruction was stepped.
`0b1`	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
`0b100010`	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Software Step exceptions'.

ISS encoding for an exception from a Watchpoint exception

24 23 22 21 20 19 18 17 16 15	14	13	12 11 10 9	8	7	6	5 4 3 2 1 0
RES0	RES0	VNCR	RES0	CM	RES0	WnR	DFSC

Bits [24:15]

Reserved, RES0.

Bit [14]

Reserved, RES0.

VNCR, bit [13]
When FEAT_NV2 is implemented:

Indicates that the watchpoint came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
`0b0`	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
`0b1`	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint exception caused by an instruction reading from a memory location.
0b1	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
0b100010	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

ISS encoding for an exception from execution of a Breakpoint instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0									Comment															

Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																							ERET	ERETA

This EC value applies when FEAT_FGT is implemented, or when HCR_EL2.NV is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2.

ERET	Meaning
`0b0`	ERET instruction trapped to EL2.
`0b1`	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

ERETA	Meaning
`0b0`	ERETAA instruction trapped to EL2.
`0b1`	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see HCR_EL2.NV.

If FEAT_FGT is implemented, HFGITR_EL2.ERET controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

ISS encoding for an exception from Branch Target Identification instruction

24–2	1–0
RES0	BTYPE

Bits [24:2]

Reserved, RES0.

BTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0

24–0
RES0

Bits [24:0]

Reserved, RES0.

For more information about generating these exceptions, see:

- HCR_EL2.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- SCR_EL3.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure

24–2	1	0
RES0	Exception as a result of an Instruction key or a Data key	Exception as a result of an A key or a B key

Bits [24:2]

Reserved, RES0.

Bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

	Meaning
`0b0`	Instruction Key.
`0b1`	Data Key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
`0b0`	A key.
`0b1`	B key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- `AUTIASP`, `AUTIAZ`, `AUTIA1716`.
- `AUTIBSP`, `AUTIBZ`, `AUTIB1716`.
- `AUTIA`, `AUTDA`, `AUTIB`, `AUTDB`.
- `AUTIZA`, `AUTIZB`, `AUTDZA`, `AUTDZB`.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a Translation fault when the address is accessed:

- `RETAA`, `RETAB`.
- `BRAA`, `BRAB`, `BLRAA`, `BLRAB`.
- `BRAAZ`, `BRABZ`, `BLRAAZ`, `BLRABZ`.
- `ERETAA`, `ERETAB`.
- `LDRAA`, `LDRAB`, whether the authenticated address is written back to the base register or not.

Accessing ESR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic ESR_EL2 or ESR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ESR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return ESR_EL1;
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return ESR_EL2;
elsif PSTATE.EL == EL3 then
    return ESR_EL2;
```

MSR ESR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        ESR_EL1 = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    ESR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    ESR_EL2 = X[t];
```

MRS <Xt>, ESR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGRTR_EL2.ESR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        return NVMem[0x138];
    else
        return ESR_EL1;
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        return ESR_EL2;
    else
        return ESR_EL1;
elsif PSTATE.EL == EL3 then
    return ESR_EL1;
```

MSR ESR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGWTR_EL2.ESR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        NVMem[0x138] = X[t];
    else
        ESR_EL1 = X[t];
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        ESR_EL2 = X[t];
    else
        ESR_EL1 = X[t];
elsif PSTATE.EL == EL3 then
    ESR_EL1 = X[t];
```

ESR_EL3, Exception Syndrome Register (EL3)

The ESR_EL3 characteristics are:

Purpose

Holds syndrome information for an exception taken to EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to ESR_EL3 are UNDEFINED.

Attributes

ESR_EL3 is a 64-bit register.

Field descriptions

63 ... 37	36 ... 32
RES0	ISS2

31 ... 26	25	24 ... 0
EC	IL	ISS

ESR_EL3 is made UNKNOWN as a result of an exception return from EL3.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL3, the value of ESR_EL3 is UNKNOWN. The value written to ESR_EL3 must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

Bits [63:37]

Reserved, RES0.

ISS2, bits [36:32]

When FEAT_LS64 is implemented:

If a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field holds register specifier, Xs.

For any other Data Abort, this field is RES0.

Otherwise:

Reserved, RES0.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about.

For each EC value, the table references a subsection that gives information about:

- The cause of the exception, for example the configuration required to enable the trap.
- The encoding of the associated ISS.

Possible values of the EC field are:

EC	Meaning	ISS	Applies when
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason	
0b000001	Trapped WF* instruction execution. Conditional WF* instructions that fail their condition code check do not cause an exception.	ISS encoding for an exception from a WF* instruction	
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for an exception from an MCR or MRC access	When AArch32 is supported
0b000110	Trapped LDC or STC access. The only architected uses of these instruction are: • An STC to write data to memory from DBGDTRRXint. • An LDC to read data from memory to DBGDTRTXint.	ISS encoding for an exception from an LDC or STC instruction	When AArch32 is supported
0b000111	Access to SVE, Advanced SIMD or floating-point functionality trapped by CPACR_EL1.FPEN, CPTR_EL2.FPEN, CPTR_EL2.TFP, or CPTR_EL3.TFP control. Excludes exceptions resulting from CPACR_EL1 when the value of HCR_EL2.TGE is 1, or because SVE or Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000 as described in 'The EC used to report an exception routed to EL2 because HCR_EL2.TGE is 1'.	ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps	
0b001001	Trapped use of a Pointer authentication	ISS encoding for an exception from a Pointer	When FEAT_PAuth

	instruction because HCR_EL2.API == 0 || SCR_EL3.API == 0.	Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0	is implemented
`0b001010`	Trapped execution of an LD64B, ST64B, ST64BV, or ST64BV0 instruction.	ISS encoding for an exception from an LD64B or ST64B* instruction	When FEAT_LS64 is implemented
`0b001100`	Trapped MRRC access with (coproc==`0b1110`).	ISS encoding for an exception from an MCRR or MRRC access	When AArch32 is supported
`0b001101`	Branch Target Exception.	ISS encoding for an exception from Branch Target Identification instruction	When FEAT_BTI is implemented
`0b001110`	Illegal Execution state.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
`0b010011`	SMC instruction execution in AArch32 state, when SMC is not disabled.	ISS encoding for an exception from SMC instruction execution in AArch32 state	When AArch32 is supported
`0b010101`	SVC instruction execution in AArch64 state.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported
`0b010110`	HVC instruction execution in AArch64 state, when HVC is not disabled.	ISS encoding for an exception from HVC or SVC instruction execution	When AArch64 is supported
`0b010111`	SMC instruction execution in AArch64 state, when SMC is not disabled.	ISS encoding for an exception from SMC instruction execution in AArch64 state	When AArch64 is supported
`0b011000`	Trapped MSR, MRS or System instruction execution in AArch64 state, that is not reported using EC `0b000000`, `0b000001` or `0b000111`. This includes all instructions that cause exceptions that are part of the encoding space defined in 'System instruction class encoding overview', except for those exceptions reported using EC values `0b000000`, `0b000001`, or `0b000111`.	ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state	When AArch64 is supported
`0b011001`	Access to SVE functionality trapped as a result of CPACR_EL1.ZEN,	ISS encoding for an exception from an access to SVE functionality.	When FEAT_SVE is implemented

	CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ, that is not reported using EC 0b000000.	resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ	
0b011100	Exception from a Pointer Authentication instruction authentication failure	ISS encoding for an exception from a Pointer Authentication instruction authentication failure	When FEAT_FPAC is implemented
0b011111	IMPLEMENTATION DEFINED exception to EL3.	ISS encoding for an IMPLEMENTATION DEFINED exception to EL3	
0b100000	Instruction Abort from a lower Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	
0b100001	Instruction Abort taken without a change in Exception level. Used for MMU faults generated by instruction accesses and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from an Instruction Abort	
0b100010	PC alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b100100	Data Abort from a lower Exception level. Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.	ISS encoding for an exception from a Data Abort	
0b100101	Data Abort taken without a change in Exception level.	ISS encoding for an exception from a Data Abort	

	Used for MMU faults generated by data accesses, alignment faults other than those caused by Stack Pointer misalignment, and synchronous External aborts, including synchronous parity or ECC errors. Not used for debug-related exceptions.		
0b100110	SP alignment fault exception.	ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault	
0b100111	Memory Operation Exception.	ISS encoding for an exception from the Memory Copy and Memory Set instructions	When FEAT_MOPS is implemented
0b101100	Trapped floating-point exception taken from AArch64 state. This EC value is valid if the implementation supports trapping of floating-point exceptions, otherwise it is reserved. Whether a floating-point implementation supports trapping of floating-point exceptions is IMPLEMENTATION DEFINED.	ISS encoding for an exception from a trapped floating-point exception	When AArch64 is supported
0b101111	SError interrupt.	ISS encoding for an SError interrupt	
0b111100	BRK instruction execution in AArch64 state. This is reported in ESR_EL3 only if a BRK instruction is executed in EL3. This is the only debug exception that can be taken to EL3 when EL3 is using AArch64.	ISS encoding for an exception from execution of a Breakpoint instruction	When AArch64 is supported

All other EC values are reserved by Arm, and:

- Unused values in the range `0b000000` - `0b101100` (`0x00` - `0x2C`) are reserved for future use for synchronous exceptions.
- Unused values in the range `0b101101` - `0b111111` (`0x2D` - `0x3F`) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction Length for synchronous exceptions. Possible values of this bit are:

IL	Meaning
`0b0`	16-bit instruction trapped.
`0b1`	32-bit instruction trapped. This value is also used when the exception is one of the following: • An SError interrupt. • An Instruction Abort exception. • A PC alignment fault exception. • An SP alignment fault exception. • A Data Abort exception for which the value of the ISV bit is 0. • An Illegal Execution state exception. • Any debug exception except for Breakpoint instruction exceptions. • An exception reported using EC value `0b000000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

Typically, an ISS encoding has a number of subfields. When an ISS subfield holds a register number, the value returned in that field is the AArch64 view of the register number.

For an exception taken from AArch32 state, see 'Mapping of the general-purpose registers between the Execution states'.

If the AArch32 register descriptor is `0b1111`, then:

- If the instruction that generated the exception was not UNPREDICTABLE, the field takes the value `0b11111`.
- If the instruction that generated the exception was UNPREDICTABLE, the field takes an UNKNOWN value that must be either:
  - The AArch64 view of the register number of a register that might have been used at the Exception level from which the exception was taken.
  - The value `0b11111`.

ISS encoding for exceptions with an unknown reason

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

Bits [24:0]

Reserved, RES0.

When an exception is reported using this EC code the IL field is set to 1.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or that is not accessible at the current Exception level and Security state, including:
  - A read access using a System register pattern that is not allocated for reads or that does not permit reads at the current Exception level and Security state.
  - A write access using a System register pattern that is not allocated for writes or that does not permit writes at the current Exception level and Security state.

    - Instruction encodings that are unallocated.
    - Instruction encodings for instructions or System registers that are not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- In AArch32 state, attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR_EL1.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
    - An HVC instruction when disabled by HCR_EL2.HCD or SCR_EL3.HCE.
    - An SMC instruction when disabled by SCR_EL3.SMD.
    - An HLT instruction when disabled by EDSCR.HDE.
- Attempted execution of an MSR or MRS instruction to access SP_EL0 when the value of SPSel.SP is 0.
- Attempted execution of an MSR or MRS instruction using a _EL12 register name when HCR_EL2.E2H == 0.
- Attempted execution, in Debug state, of:
    - A DCPS1 instruction when the value of HCR_EL2.TGE is 1 and EL2 is disabled or not implemented in the current Security state.
    - A DCPS2 instruction from EL1 or EL0 when EL2 is disabled or not implemented in the current Security state.
    - A DCPS3 instruction when the value of EDSCR.SDD is 1, or when EL3 is not implemented.
- When EL3 is using AArch64, attempted execution from Secure EL1 of an SRS instruction using R13_mon. See 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.
- In AArch32 state, the attempted execution of an MRS (banked register) or an MSR (banked register) instruction to SPSR_mon, SP_mon, or LR_mon.
- An exception that is taken to EL2 because the value of HCR_EL2.TGE is 1 that, if the value of HCR_EL2.TGE was 0 would have been reported with an ESR_ELx.EC value of `0b000111`.

ISS encoding for an exception from a WF* instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0										RN					RES0		RV	TI	

CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:10]

Reserved, RES0.

RN, bits [9:5]

When FEAT_WFxT is implemented:

Register Number. Indicates the register number supplied for a `WFET` or `WFIT` instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

RV, bit [2]

When FEAT_WFxT is implemented:

Register field Valid.

If TI[1] == 1, then this field indicates whether RN holds a valid register number for the register argument to the trapped `WFET` or `WFIT` instruction.

RV	Meaning
`0b0`	Register field invalid.
`0b1`	Register field valid.

If TI[1] == 0, then this field is RES0.

This field is set to 1 on a trap on `WFET` or `WFIT`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TI, bits [1:0]

Trapped instruction. Possible values of this bit are:

TI	Meaning	Applies when
0b00	WFI trapped.	
0b01	WFE trapped.	
0b10	WFIT trapped.	When FEAT_WFxT is implemented
0b11	WFET trapped.	When FEAT_WFxT is implemented

When FEAT_WFxT is implemented, this is a two bit field as shown. Otherwise, bit[1] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating this exception:

- SCTLR_EL1.{nTWE, nTWI}.
- HCR_EL2.{TWE, TWI}.
- SCR_EL3.{TWE, TWI}.

ISS encoding for an exception from an MCR or MRC access

24	23 22 21 20	19 18 17	16 15 14	13 12 11 10	9 8 7 6 5	4 3 2 1	0
CV	COND	Opc2	Opc1	CRn	Rt	CRm	Direction

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to 0b1110.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:

    - If the instruction is conditional, COND is set to the condition code field value from the instruction.
    - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
    - With COND set to `0b1110`, the value for unconditional.
    - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
    - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
    - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value `0b000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value `0b111`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

If the Rt value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.

- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:

    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.

- The value 0b11111.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to System register space. MCR instruction.
0b1	Read from System register space. MRC or VMRS instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value 0b000011:

- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers from EL0 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.TTLB, for execution of TLB maintenance instructions at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.{TSW, TPC, TPU} for execution of cache maintenance instructions at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register at EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1 or CPACR using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CNTHCTL_EL2.EL1PCEN, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers from EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL2.
- CPTR_EL3.TCPAC, for accesses to CPACR from EL1 and EL2, and accesses to HCPTR from EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == 0b1111) trapped to EL3.

- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCR or MRC access (coproc == `0b1111`) trapped to EL3.
- For information on other traps using EC value `0b000011`, see 'Traps to EL3 of Secure monitor functionality from Secure EL1 using AArch32'.
- If FEAT_FGT is implemented, MCR or MRC access to some registers at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value `0b000101`:

- CPACR_EL1.TTA for accesses to trace registers, MCR or MRC access (coproc == `0b1110`) trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers at EL0 and EL1 using AArch32 state, MCR or MRC access (coproc == `0b1110`) trapped to EL1 or EL2.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- HCR_EL2.TID0, for accesses to the JIDR register in the ID group 0 at EL0 and EL1 using AArch32, MRC access (coproc == `0b1110`) trapped to EL2.
- CPTR_EL2.TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and DBGDSAR using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL2.
- MDCR_EL2.TDOSA, for accesses to powerdown debug registers, using AArch32 state, MCR or MRC access (coproc == `0b1110`) trapped to EL2.
- MDCR_EL2.TDA, for accesses to other debug registers, using AArch32 state, MCR or MRC access (coproc == `0b1110`) trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL3.
- MDCR_EL3.TDA, for accesses to other debug registers, using AArch32, MCR or MRC access (coproc == `0b1110`) trapped to EL3.

The following fields describe configuration settings for generating exceptions that are reported using EC value `0b001000`:

- HCR_EL2.TID0, for accesses to the FPSID register in ID group 0 at EL1 using AArch32 state, VMRS access trapped to EL2.
- HCR_EL2.TID3, for accesses to registers in ID group 3 including MVFR0, MVFR1 and MVFR2, VMRS access trapped to EL2.

ISS encoding for an exception from an LD64B or ST64B* instruction

24 … 0
ISS

ISS, bits [24:0]

ISS	Meaning
`0b0000000000000000000000000`	ST64BV instruction trapped.
`0b0000000000000000000000001`	ST64BV0 instruction trapped.
`0b0000000000000000000000010`	LD64B or ST64B instruction trapped.

All other values are reserved.

ISS encoding for an exception from an MCRR or MRRC access

24	23 22 21 20	19 18 17 16	15	14 13 12 11 10	9 8 7 6 5	4 3 2 1	0
CV	COND	Opc1	RES0	Rt2	Rt	CRm	Direction

CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

Rt2, bits [14:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

If the Rt2 value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt2 value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

If the Rt value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rt value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.
- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:
    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.
    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
`0b0`	Write to System register space. MCRR instruction.
`0b1`	Read from System register space. MRRC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe configuration settings for generating exceptions that are reported using EC value `0b000100`:

- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN}, for accesses to the Generic Timer Registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- PMUSERENR_EL0.{CR, EN}, for accesses to Performance Monitor registers from EL0 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- AMUSERENR_EL0.{EN}, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers from EL1 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL2.
- HSTR_EL2.T<n>, for accesses to System registers using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers AMEVCNTR0<n> and AMEVCNTR1<n> from EL0 and EL1 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL2.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers from EL0, EL1 and EL2 using AArch32 state, MCRR or MRRC access (coproc == `0b1111`) trapped to EL3.
- If FEAT_FGT is implemented, HDFGRTR_EL2.PMCCNTR_EL0 for MRRC access and HDFGWTR_EL2.PMCCNTR_EL0 for MCRR access to PMCCNTR at EL0, trapped to EL2.

The following fields describe configuration settings for generating exceptions that are reported using EC value `0b001100`:

- MDSCR_EL1.TDCC, for accesses to the Debug ROM registers DBGDSAR and DBGDRAR at EL0 using AArch32 state, MCRR or MRRC access (coproc == `0b1110`) trapped to EL1 or EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers DBGDRAR and DBGDSAR using AArch32, MCRR or MRRC access (coproc == `0b1110`) trapped to EL2.
- MDCR_EL3.TDA, for accesses to debug registers, using AArch32, MCRR or MRRC access (coproc == `0b1110`) trapped to EL3.
- CPACR_EL1.TTA for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == `0b1110`) trapped to EL1 or EL2.
- CPTR_EL2.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == `0b1110`) trapped to EL2.
- CPTR_EL3.TTA, for accesses to trace registers using AArch32, MCRR or MRRC access (coproc == `0b1110`) trapped to EL3.

Note

If the Armv8-A architecture is implemented with an ETMv4 implementation, MCRR and MRRC accesses to trace registers are UNDEFINED and the resulting exception is higher priority than an exception due to these traps.

ISS encoding for an exception from an LDC or STC instruction

24	23–20	19–12	11–10	9–5	4	3–1	0
CV	COND	imm8	RES0	Rn	Offset	AM	Direction

CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.

- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
    - If the instruction is conditional, COND is set to the condition code field value from the instruction.
    - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
    - With COND set to `0b1110`, the value for unconditional.
    - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
    - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
    - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

Rn, bits [9:5]

The Rn value from the issued instruction, the general-purpose register used for the transfer.

If the Rn value is not `0b1111`, then the reported value gives the AArch64 view of the register. Otherwise, if the Rn value is `0b1111`:

- If the instruction that generated the exception is not UNPREDICTABLE, then the register specifier takes the value `0b11111`.

- If the instruction that generated the exception is UNPREDICTABLE, then the register specifier takes an UNKNOWN value, which is restricted to either:

    - The AArch64 view of one of the registers that could have been used in AArch32 state at the Exception level that the instruction was executed at.

    - The value `0b11111`.

See 'Mapping of the general-purpose registers between the Execution states'.

This field is valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction. When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE, as described in 'Reserved values in System and memory-mapped registers and translation table entries'.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following fields describe the configuration settings for the traps that are reported using EC value 0b000110:

- MDSCR_EL1.TDCC, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint trapped to EL1 or EL2.

- MDCR_EL2.TDA, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL2.
- MDCR_EL3.TDA, for accesses using AArch32 state, LDC access to DBGDTRTXint or STC access to DBGDTRRXint MCR or MRC access trapped to EL3.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for LDC and STC accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.

ISS encoding for an exception from an access to SVE, Advanced SIMD or floating-point functionality, resulting from the FPEN and TFP traps

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0																			

The accesses covered by this trap include:

- Execution of SVE or Advanced SIMD and floating-point instructions.
- Accesses to the Advanced SIMD and floating-point System registers.

For an implementation that does not include either SVE or support for Advanced SIMD and floating-point, the exception is reported using the EC value `0b000000`.

CV, bit [24]

Condition code valid.

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these

definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value `0b000111`:

- CPACR_EL1.FPEN, for accesses to SIMD and floating-point registers trapped to EL1.
- CPTR_EL2.FPEN and CPTR_EL2.TFP, for accesses to SIMD and floating-point registers trapped to EL2.
- CPTR_EL3.TFP, for accesses to SIMD and floating-point registers trapped to EL3.

ISS encoding for an exception from an access to SVE functionality, resulting from CPACR_EL1.ZEN, CPTR_EL2.ZEN, CPTR_EL2.TZ, or CPTR_EL3.EZ

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

The accesses covered by this trap include:

- Execution of SVE instructions.
- Accesses to the SVE System registers, ZCR_ELx.

For an implementation that does not include SVE, the exception is reported using the EC value `0b000000`.

Bits [24:0]

Reserved, RES0.

The following fields describe the configuration settings for the traps that are reported using EC value `0b011001`:

- CPACR_EL1.ZEN, for execution of SVE instructions and accesses to SVE registers at EL0 or EL1, trapped to EL1.
- CPTR_EL2.ZEN and CPTR_EL2.TZ, for execution of SVE instructions and accesses to SVE registers at EL0, EL1, or EL2, trapped to EL2.
- CPTR_EL3.EZ, for execution of SVE instructions and accesses to SVE registers from all Exception levels, trapped to EL3.

ISS encoding for an exception from an Illegal Execution state, or a PC or SP alignment fault

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

Bits [24:0]

Reserved, RES0.

There are no configuration settings for generating Illegal Execution state exceptions and PC alignment fault exceptions. For more information about these exceptions, see 'The Illegal Execution state exception' and 'PC alignment checking'.

'SP alignment checking' describes the configuration settings for generating SP alignment fault exceptions.

ISS encoding for an exception from the Memory Copy and Memory Set instructions

24	23	22 21 20 19	18	17	16	15	14 13 12 11 10	9 8 7 6 5	4 3 2 1 0
MemInst	isSETG	Options	FromEpilogue	WrongOption	OptionA	RES0	destreg	srcreg	sizereg

MemInst, bit [24]

Indicates the memory instruction class causing the exception.

MemInst	Meaning
0b0	CPYFE*, CPYFM*, CPYE*, and CPYM* instructions.
0b1	SETE*, SETM*, SETGE*, and SETGM* instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

isSETG, bit [23]

Indicates whether the instruction belongs to SETGM* or SETGE* class of instruction.

isSETG	Meaning
0b0	Not a SETGM* or SETGE* instruction.
0b1	SETGM* or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Options, bits [22:19]

Options : the Options field of the instruction.

For Memory Copy instructions, bits[22:19] forms the Options field, which holds the bits[15:12] of the instruction.

For Memory Set instructions:

- Bits[22:21] are RES0.
- Bits[20:19] form the Options field, which holds the bits[13:12] of the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FromEpilogue, bit [18]

Indicates whether the instruction belongs to the epilogue class of Memory Copy or Memory Set instructions.

FromEpilogue	Meaning
0b0	Not an epilogue instruction.
0b1	CPYE*, CPYFE*, SETE*, or SETGE* instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WrongOption, bit [17]

Algorithm option.

WrongOption	Meaning
0b0	WrongOption is false.
0b1	WrongOption is true.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OptionA, bit [16]

Algorithm type indicated by the PSTATE.C bit.

OptionA	Meaning
0b0	OptionB indicated by PSTATE.C is 0.
0b1	OptionA indicated by PSTATE.C is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

destreg, bits [14:10]

The destination register value from the issued instruction, containing the destination address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

srcreg, bits [9:5]

The source register value from the issued instruction, containing either the source address or the source data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

sizereg, bits [4:0]

The size register value from the issued instruction, containing the number of bytes to be transfered or set.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from HVC or SVC instruction execution

24–16	15–0
RES0	imm16

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, and for an A64 SVC instruction, this is the value of the imm16 field of the issued instruction.

For an A32 or T32 SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In AArch32 state, the HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

For T32 and A32 instructions, see 'SVC' and 'HVC'.

For A64 instructions, see 'SVC' and 'HVC'.

If FEAT_FGT is implemented, HFGITR_EL2.{SVC_EL1, SVC_EL0} control fine-grained traps on SVC execution.

ISS encoding for an exception from SMC instruction execution in AArch32 state

24	23 22 21 20	19	18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
CV	COND	CCKNOWNPASS	RES0

For an SMC instruction that completes normally and generates an exception that is taken to EL3, the ISS encoding is RES0.

For an SMC instruction that is trapped to EL2 from EL1 because HCR_EL2.TSC is 1, the ISS encoding is as shown in the diagram.

CV, bit [24]

Condition code valid.

CV	Meaning
0b0	The COND field is not valid.
0b1	The COND field is valid.

For exceptions taken from AArch64, CV is set to 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. See the description of the COND field for more information.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

For exceptions taken from AArch64, this field is set to `0b1110`.

The condition code for the trapped instruction. This field is valid only for exceptions taken from AArch32, and only when the value of CV is 1.

For exceptions taken from AArch32:

- When an A32 instruction is trapped, CV is set to 1 and:
  - If the instruction is conditional, COND is set to the condition code field value from the instruction.
  - If the instruction is unconditional, COND is set to `0b1110`.
- A conditional A32 instruction that is known to pass its condition code check can be presented either:
  - With COND set to `0b1110`, the value for unconditional.
  - With the COND value held in the instruction.
- When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:
  - CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
  - CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.
- For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
`0b0`	The instruction was unconditional, or was conditional and passed its condition code check.
`0b1`	The instruction was conditional, and might have failed its condition code check.

Note

In an implementation in which an SMC instruction that fails it code check is not trapped, this field can always return the value 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

HCR_EL2.TSC describes the configuration settings for trapping SMC instructions to EL2.

'System calls' describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from SMC instruction execution in AArch64 state

24 23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	imm16

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the issued SMC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The value of ISS[24:0] described here is used both:

- When an SMC instruction is trapped from EL1 modes.
- When an SMC instruction is not trapped, so completes normally and generates an exception that is taken to EL3.

HCR_EL2.TSC describes the configuration settings for trapping SMC from EL1 modes.

'System calls' describes the case where these exceptions are trapped to EL3.

ISS encoding for an exception from MSR, MRS, or System instruction execution in AArch64 state

24 23 22	21 20	19 18 17	16 15 14	13 12 11 10	9 8 7 6 5	4 3 2 1	0
RES0	Op0	Op2	Op1	CRn	Rt	CRm	Direction

Bits [24:22]

Reserved, RES0.

Op0, bits [21:20]

The Op0 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op2, bits [19:17]

The Op2 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Op1, bits [16:14]

The Op1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Rt, bits [9:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
`0b0`	Write access, including MSR instructions.
`0b1`	Read access, including MRS instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For exceptions caused by System instructions, see 'System instructions' subsection of 'Branches, exception generating and System instructions' for the encoding values returned by an instruction.

The following fields describe configuration settings for generating the exception that is reported using EC value `0b011000`:

- SCTLR_EL1.UCI, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.UCT, for accesses to CTR_EL0 using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.DZE, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- SCTLR_EL1.UMA, for accesses to the PSTATE interrupt masks using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- CPACR_EL1.TTA, for accesses to the trace registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- MDSCR_EL1.TDCC, for accesses to the Debug Communications Channel (DCC) registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- If FEAT_FGT is implemented, MDCR_EL2.TDCC for accesses to the DCC registers at EL0 and EL1 trapped to EL2, and MDCR_EL3.TDCC for accesses to the DCC registers at EL0, EL1, and EL2 trapped to EL3.
- CNTKCTL_EL1.{EL0PTEN, EL0VTEN, EL0PCTEN, EL0VCTEN} accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- PMUSERENR_EL0.{ER, CR, SW, EN}, for accesses to the Performance Monitor registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- AMUSERENR_EL0.EN, for accesses to Activity Monitors registers using AArch64 state, MSR or MRS access trapped to EL1 or EL2.
- HCR_EL2.{TRVM, TVM}, for accesses to virtual memory control registers using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TDZ, for execution of DC ZVA instructions using AArch64 state, MSR or MRS access trapped to EL2.

- HCR_EL2.TTLB, for execution of TLB maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TSW, TPC, TPU}, for execution of cache maintenance instructions using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TACR, for accesses to the Auxiliary Control Register, ACTLR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.TIDCP, for accesses to lockdown, DMA, and TCM operations using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{TID1, TID2, TID3}, for accesses to ID group 1, ID group 2 or ID group 3 registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TCPAC, for accesses to CPACR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TTRF, for accesses to the trace filter control register, TRFCR_EL1, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDRA, for accesses to Debug ROM registers, using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDOSA, for accesses to powerdown debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- CNTHCTL_EL2.{EL1PCEN, EL1PCTEN}, for accesses to the Generic Timer registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.TDA, for accesses to debug registers using AArch64 state, MSR or MRS access trapped to EL2.
- MDCR_EL2.{TPM, TPMCR}, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL2.
- CPTR_EL2.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.APK, for accesses to Pointer authentication key registers. using AArch64 state, MSR or MRS access trapped to EL2.
- HCR_EL2.{NV, NV1}, for Nested virtualization register access, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.AT, for execution of AT S1E* instructions, using AArch64 state, MSR or MRS access, trapped to EL2.
- HCR_EL2.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access, trapped to EL2.
- SCR_EL3.APK, for accesses to Pointer authentication key registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.ST, for accesses to the Counter-timer Physical Secure timer registers, using AArch64 state, MSR or MRS access trapped to EL3.
- SCR_EL3.{TERR, FIEN}, for accesses to RAS registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TCPAC, for accesses to CPTR_EL2 and CPACR_EL1 using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TTA, for accesses to the trace registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TTRF, for accesses to the trace filter control registers, TRFCR_EL1 and TRFCR_EL2, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDA, for accesses to debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TDOSA, for accesses to powerdown debug registers, using AArch64 state, MSR or MRS access trapped to EL3.
- MDCR_EL3.TPM, for accesses to Performance Monitor registers, using AArch64 state, MSR or MRS access trapped to EL3.
- CPTR_EL3.TAM, for accesses to Activity Monitors registers, using AArch64 state, MSR or MRS access, trapped to EL3.
- If FEAT_EVT is implemented, the following registers control traps for EL1 and EL0 Cache controls that use this EC value:
    - HCR_EL2.{TTLBOS, TTLBIS, TICAB, TOCU, TID4}.
    - HCR2.{TTLBIS, TICAB, TOCU, TID4}.
- If FEAT_FGT is implemented:
    - SCR_EL3.FGTEn, for accesses to the fine-grained trap registers, MSR or MRS access at EL2 trapped to EL3.
    - HFGRTR_EL2 for reads and HFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 trapped to EL2.
    - HFGITR_EL2 for execution of system instructions, MSR or MRS access trapped to EL2
    - HDFGRTR_EL2 for reads and HDFGWTR_EL2 for writes of registers, using AArch64 state, MSR or MRS access at EL0 and EL1 state trapped to EL2.
    - HAFGRTR_EL2 for reads of Activity Monitor counters, using AArch64 state, MRS access at EL0 and EL1 trapped to EL2.

- If FEAT_RNG_TRAP is implemented:
  - SCR_EL3.TRNDR for reads of RNDR and RNDRRS using AArch64 state, MRS access trapped to EL3.
- If FEAT_NMI is implemented, HCRX_EL2.TALLINT, for MSR writes of ALLINT at EL1, trapped to EL2.

ISS encoding for an IMPLEMENTATION DEFINED exception to EL3

24–0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [24:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from an Instruction Abort

24–13	12–11	10	9	8	7	6	5–0
RES0	SET	FnV	EA	RES0	S1PTW	RES0	IFSC

Bits [24:13]

Reserved, RES0.

SET, bits [12:11]

When FEAT_RAS is implemented:

Synchronous Error Type. When IFSC is `0b010000`, describes the PE error state after taking the Instruction Abort exception.

SET	Meaning
`0b00`	Recoverable state (UER).
`0b10`	Uncontainable (UC).
`0b11`	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the IFSC code is `0b010000`. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or	When FEAT_RAS is

	hardware update of translation table, level 2.	not implemented
`0b011111`	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
`0b101001`	Address size fault, level -1.	When FEAT_LPA2 is implemented
`0b101011`	Translation fault, level -1.	When FEAT_LPA2 is implemented
`0b110000`	TLB conflict abort.	
`0b110001`	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a Data Abort

24	23 22	21	20 19 18 17 16	15	14	13	12 11	10	9	8	7	6	5 4 3 2 1 0
ISV	SAS	SSE	SRT	SF	AR	VNCR	Bits[12:11]	FnV	EA	CM	S1PTW	WnR	DFSC

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this ISS encoding includes ISS2, bits[36:32].

ISV, bit [24]

Instruction Syndrome Valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
`0b0`	No valid instruction syndrome. ISS[23:14] are RES0.
`0b1`	ISS[23:14] hold a valid instruction syndrome.

In ESR_EL2, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

For other faults reported in ESR_EL2, ISV is 0 except for the following stage 2 aborts:

- AArch64 loads and stores of a single general-purpose register (including the register specified with `0b11111`, including those with Acquire/Release semantics, but excluding Load Exclusive or Store Exclusive and excluding those with writeback).
- AArch32 instructions where the instruction:
  - Is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
  - Is not performing register writeback.

- Is not using R15 as a source or destination register.

For these stage 2 aborts, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, and otherwise indicates whether ISS[23:14] hold a valid syndrome.

For faults reported in ESR_EL1 or ESR_EL3, ISV is 1 when FEAT_LS64 is implemented and a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault. ISV is 0 for all other faults reported in ESR_EL1 or ESR_EL3.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

For ISS reporting, a stage 2 abort on a stage 1 translation table walk does not return a valid instruction syndrome, and therefore ISV is 0 for these aborts.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

When FEAT_MTE2 is implemented, for a synchronous Tag Check Fault abort taken to ELx, ESR_ELx.FNV is 0 and FAR_ELx is valid.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

When ISV == 1:

Syndrome Access Size. Indicates the size of the access attempted by the faulting operation.

SAS	Meaning
0b00	Byte
0b01	Halfword
0b10	Word
0b11	Doubleword

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is `0b11`.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSE, bit [21]

When ISV == 1:

Syndrome Sign Extend. For a byte, halfword, or word load operation, indicates whether the data item must be sign extended.

SSE	Meaning
0b0	Sign-extension not required.
0b1	Data item must be sign-extended.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

For all other operations, this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SRT, bits [20:16]

When ISV == 1:

Syndrome Register Transfer. The register number of the Wt/Xt/Rt operand of the faulting instruction.

If the exception was taken from an Exception level that is using AArch32, then this is the AArch64 view of the register. See 'Mapping of the general-purpose registers between the Execution states'.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SF, bit [15]

When ISV == 1:

Width of the register accessed by the instruction is Sixty-Four.

SF	Meaning
`0b0`	Instruction loads/stores a 32-bit wide register.
`0b1`	Instruction loads/stores a 64-bit wide register.

Note

This field specifies the register width identified by the instruction, not the Execution state.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 1.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AR, bit [14]

When ISV == 1:

Acquire/Release.

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

When FEAT_LS64 is implemented, if a memory access generated by an ST64BV, ST64BV0, ST64B, or LD64B instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault, then this field is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VNCR, bit [13]
When FEAT_NV2 is implemented:

Indicates that the fault came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
0b0	The fault was not generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.
0b1	The fault was generated by the use of VNCR_EL2, by an MRS or MSR instruction executed at EL1.

This field is 0 in ESR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SET, bits [12:11]
When FEAT_RAS is implemented and FEAT_LS64 is not implemented:

Synchronous Error Type. When DFSC is 0b010000, describes the PE error state after taking the Data Abort exception.

SET	Meaning
0b00	Recoverable state (UER).
0b10	Uncontainable (UC).
0b11	Restartable state (UEO).

All other values are reserved.

Note

Software can use this information to determine what recovery might be possible. Taking a synchronous External Abort exception might result in a PE state that is not recoverable.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_LS64 is implemented:

Load/Store Type. Used when an LD64B, ST64B, ST64BV, or ST64BV0 instruction generates a Data Abort for a Translation fault, Access flag fault, or Permission fault.

LST	Meaning
0b01	An ST64BV instruction generated the Data Abort.
0b10	An LD64B or ST64B instruction generated the Data Abort.
0b11	An ST64BV0 instruction generated the Data Abort.

All other values are reserved.

This field is valid only if the DFSC code is 0b110101. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	FAR is valid.
0b1	FAR is not valid, and holds an UNKNOWN value.

This field is valid only if the DFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. Indicates whether the Data Abort came from a cache maintenance or address translation instruction:

CM	Meaning
0b0	The Data Abort was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Data Abort was generated by either the execution of a cache maintenance instruction or by a synchronous fault on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Abort caused by an instruction reading from a memory location.
0b1	Abort caused by an instruction writing to a memory location.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

For faults from an atomic instruction that both reads and writes from a memory location, this bit is set to 0 if a read of the address specified by the instruction would have generated the fault which is being reported, otherwise it is set to 1. The architecture permits, but does not require, a relaxation of this requirement such that for all stage 2 aborts on stage 1 translation table walks for atomic instructions, the WnR bit is always 0.

This field is UNKNOWN for:

- An External abort on an Atomic access.
- A fault reported using a DFSC value of `0b110101` or `0b110001`, indicating an unsupported Exclusive or atomic access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Synchronous Tag Check Fault.	When FEAT_MTE2 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	
0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented

0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive or Atomic access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults'.

Note

Because Access flag faults and Permission faults can result only from a Block or Page translation table descriptor, they cannot occur at level 0.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS encoding for an exception from a trapped floating-point exception

<table>
<tr><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td>RES0</td><td>TFV</td><td colspan="12">RES0</td><td colspan="3">VECITR</td><td>IDF</td><td colspan="2">RES0</td><td>IXF</td><td>UFF</td><td>OFF</td><td>DZF</td><td>IOF</td></tr>
</table>

Bit [24]

Reserved, RES0.

TFV, bit [23]

Trapped Fault Valid bit. Indicates whether the IDF, IXF, UFF, OFF, DZF, and IOF bits hold valid information about trapped floating-point exceptions.

TFV	Meaning
0b0	The IDF, IXF, UFF, OFF, DZF, and IOF bits do not hold valid information about trapped floating-point exceptions and are UNKNOWN.
0b1	One or more floating-point exceptions occurred during an operation performed while executing the reported instruction. The IDF, IXF, UFF, OFF, DZF, and IOF bits indicate trapped floating-point exceptions that occurred. For more information, see 'Floating-point exceptions and exception traps'.

It is IMPLEMENTATION DEFINED whether this field is set to 0 on an exception generated by a trapped floating-point exception from an instruction that is performing floating-point operations on more than one lane of a vector.

Note

This is not a requirement. Implementations can set this field to 1 on a trapped floating-point exception from an instruction and return valid information in the {IDF, IXF, UFF, OFF, DZF, IOF} fields.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:11]

Reserved, RES0.

VECITR, bits [10:8]

For a trapped floating-point exception from an instruction executed in AArch32 state this field is RES1.

For a trapped floating-point exception from an instruction executed in AArch64 state this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IDF	Meaning
0b0	Input denormal floating-point exception has not occurred.
0b1	Input denormal floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IXF	Meaning
0b0	Inexact floating-point exception has not occurred.
0b1	Inexact floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

UFF	Meaning
0b0	Underflow floating-point exception has not occurred.
0b1	Underflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

OFF	Meaning
0b0	Overflow floating-point exception has not occurred.
0b1	Overflow floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

DZF	Meaning
0b0	Divide by Zero floating-point exception has not occurred.
0b1	Divide by Zero floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation floating-point exception trapped bit. If the TFV field is 0, this bit is UNKNOWN. Otherwise, the possible values of this bit are:

IOF	Meaning
0b0	Invalid Operation floating-point exception has not occurred.
0b1	Invalid Operation floating-point exception occurred during execution of the reported instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

In an implementation that supports the trapping of floating-point exceptions:

- From an Exception level using AArch64, the FPCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.
- From an Exception level using AArch32, the FPSCR.{IDE, IXE, UFE, OFE, DZE, IOE} bits enable each of the floating-point exception traps.

ISS encoding for an SError interrupt

24	23:14	13	12:10	9	8:6	5:0
IDS	RES0	IESB	AET	EA	RES0	DFSC

IDS, bit [24]

IMPLEMENTATION DEFINED syndrome.

IDS	Meaning
0b0	Bits [23:0] of the ISS field holds the fields described in this encoding. **Note** If FEAT_RAS is not implemented, bits [23:0] of the ISS field are RES0.
0b1	Bits [23:0] of the ISS field holds IMPLEMENTATION DEFINED syndrome information that can be used to provide additional information about the SError interrupt.

Note

This field was previously called ISV.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:14]

Reserved, RES0.

IESB, bit [13]

When FEAT_IESB is implemented:

Implicit error synchronization event.

IESB	Meaning
0b0	The SError interrupt was either not synchronized by the implicit error synchronization event or not taken immediately.
0b1	The SError interrupt was synchronized by the implicit error synchronization event and taken immediately.

This field is valid only if the DFSC code is `0b010001`. It is RES0 for all other errors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AET, bits [12:10]

When FEAT_RAS is implemented:

Asynchronous Error Type.

When DFSC is `0b010001`, describes the PE error state after taking the SError interrupt exception.

AET	Meaning
`0b000`	Uncontainable (UC).
`0b001`	Unrecoverable state (UEU).
`0b010`	Restartable state (UEO).
`0b011`	Recoverable state (UER).
`0b110`	Corrected (CE).

All other values are reserved.

If multiple errors are taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

This field is valid only if the DFSC code is `0b010001`. It is RES0 for all other errors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA, bit [9]

When FEAT_RAS is implemented:

External abort type. When DFSC is `0b010001`, provides an IMPLEMENTATION DEFINED classification of External aborts.

This field is valid only if the DFSC code is `0b010001`. It is RES0 for all other errors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

When FEAT_RAS is implemented:

Data Fault Status Code.

DFSC	Meaning
0b000000	Uncategorized error.
0b010001	Asynchronous SError interrupt.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISS encoding for an exception from a Breakpoint or Vector Catch debug exception

24–6	5–0
RES0	IFSC

Bits [24:6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
0b100010	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions:

- For exceptions from AArch64, see 'Breakpoint exceptions'.
- For exceptions from AArch32, see 'Breakpoint exceptions' and 'Vector Catch exceptions'.

ISS encoding for an exception from a Software Step exception

24	23–7	6	5–0
ISV	RES0	EX	IFSC

ISV, bit [24]

Instruction syndrome valid. Indicates whether the EX bit, ISS[6], is valid, as follows:

ISV	Meaning
0b0	EX bit is RES0.
0b1	EX bit is valid.

See the EX bit description for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:7]

Reserved, RES0.

EX, bit [6]

Exclusive operation. If the ISV bit is set to 1, this bit indicates whether a Load-Exclusive instruction was stepped.

EX	Meaning
`0b0`	An instruction other than a Load-Exclusive instruction was stepped.
`0b1`	A Load-Exclusive instruction was stepped.

If the ISV bit is set to 0, this bit is RES0, indicating no syndrome data is available.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IFSC, bits [5:0]

Instruction Fault Status Code.

IFSC	Meaning
`0b100010`	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Software Step exceptions'.

ISS encoding for an exception from a Watchpoint exception

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0										RES0	VNCR	RES0				CM	RES0	WnR	DFSC					

Bits [24:15]

Reserved, RES0.

Bit [14]

Reserved, RES0.

VNCR, bit [13]
When FEAT_NV2 is implemented:

Indicates that the watchpoint came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning
`0b0`	The watchpoint was not generated by the use of VNCR_EL2 by EL1 code.
`0b1`	The watchpoint was generated by the use of VNCR_EL2 by EL1 code.

This field is 0 in ESR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

CM, bit [8]

Cache maintenance. Indicates whether the Watchpoint exception came from a cache maintenance or address translation instruction:

CM	Meaning
`0b0`	The Watchpoint exception was not generated by the execution of one of the System instructions identified in the description of value 1.
`0b1`	The Watchpoint exception was generated by either the execution of a cache maintenance instruction or by a synchronous Watchpoint exception on the execution of an address translation instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not classified as a cache maintenance instructions, and therefore their execution cannot cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

WnR, bit [6]

Write not Read. Indicates whether the Watchpoint exception was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
`0b0`	Watchpoint exception caused by an instruction reading from a memory location.
`0b1`	Watchpoint exception caused by an instruction writing to a memory location.

For Watchpoint exceptions on cache maintenance and address translation instructions, this bit always returns a value of 1.

For Watchpoint exceptions from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint exception, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code.

DFSC	Meaning
`0b100010`	Debug exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Watchpoint exceptions'.

ISS encoding for an exception from execution of a Breakpoint instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0									Comment															

Bits [24:16]

Reserved, RES0.

Comment, bits [15:0]

Set to the instruction comment field value, zero extended as necessary.

For the AArch32 BKPT instructions, the comment field is described as the immediate field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see 'Breakpoint instruction exceptions'.

ISS encoding for an exception from an ERET, ERETAA, or ERETAB instruction

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																							ERET	ERETA

This EC value applies when FEAT_FGT is implemented, or when HCR_EL2.NV is 1.

Bits [24:2]

Reserved, RES0.

ERET, bit [1]

Indicates whether an ERET or ERETA* instruction was trapped to EL2.

ERET	Meaning
`0b0`	ERET instruction trapped to EL2.
`0b1`	ERETAA or ERETAB instruction trapped to EL2.

If this bit is 0, the ERETA field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ERETA, bit [0]

Indicates whether an ERETAA or ERETAB instruction was trapped to EL2.

ERETA	Meaning
`0b0`	ERETAA instruction trapped to EL2.
`0b1`	ERETAB instruction trapped to EL2.

When the ERET field is 0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

For more information about generating these exceptions, see HCR_EL2.NV.

If FEAT_FGT is implemented, HFGITR_EL2.ERET controls fine-grained trap exceptions from ERET, ERETAA and ERETAB execution.

ISS encoding for an exception from Branch Target Identification instruction

24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2	1 0
RES0	BTYPE

Bits [24:2]

Reserved, RES0.

BTYPE, bits [1:0]

This field is set to the PSTATE.BTYPE value that generated the Branch Target Exception.

For more information about generating these exceptions, see 'The AArch64 application level programmers model'.

ISS encoding for an exception from a Pointer Authentication instruction when HCR_EL2.API == 0 || SCR_EL3.API == 0

24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0

Bits [24:0]

Reserved, RES0.

For more information about generating these exceptions, see:

- HCR_EL2.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL2.
- SCR_EL3.API, for exceptions from Pointer authentication instructions, using AArch64 state, trapped to EL3.

ISS encoding for an exception from a Pointer Authentication instruction authentication failure

24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2	1	0
RES0	Exception as a result of an Instruction key or a Data key	Exception as a result of an A key or a B key

Bits [24:2]

Reserved, RES0.

Bit [1]

This field indicates whether the exception is as a result of an Instruction key or a Data key.

	Meaning
0b0	Instruction Key.
0b1	Data Key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

This field indicates whether the exception is as a result of an A key or a B key.

	Meaning
0b0	A key.
0b1	B key.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following instructions generate an exception when the Pointer Authentication Code (PAC) is incorrect:

- AUTIASP, AUTIAZ, AUTIA1716.
- AUTIBSP, AUTIBZ, AUTIB1716.
- AUTIA, AUTDA, AUTIB, AUTDB.
- AUTIZA, AUTIZB, AUTDZA, AUTDZB.

It is IMPLEMENTATION DEFINED whether the following instructions generate an exception directly from the authorization failure, rather than changing the address in a way that will generate a Translation fault when the address is accessed:

- RETAA, RETAB.
- BRAA, BRAB, BLRAA, BLRAB.
- BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB.
- LDRAA, LDRAB, whether the authenticated address is written back to the base register or not.

Accessing ESR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ESR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return ESR_EL3;
```

```
MSR ESR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    ESR_EL3 = X[t];
```

FAR_EL1, Fault Address Register (EL1)

The FAR_EL1 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL1.

Configuration

AArch64 System register FAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DFAR[31:0] (NS).

AArch64 System register FAR_EL1 bits [63:32] are architecturally mapped to AArch32 System register IFAR[31:0] (NS).

Attributes

FAR_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	Faulting Virtual Address for synchronous exceptions taken to EL1
31:0	Faulting Virtual Address for synchronous exceptions taken to EL1

Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL1. Exceptions that set the FAR_EL1 are Instruction Aborts (EC `0x20` or `0x21`), Data Aborts (EC `0x24` or `0x25`), PC alignment faults (EC `0x22`), and Watchpoints (EC `0x34` or `0x35`). ESR_EL1.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL1 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL1.FnV is 0, and the FAR_EL1 is UNKNOWN if ESR_EL1.FnV is 1.

For all other exceptions taken to EL1, the FAR_EL1 is UNKNOWN.

If a memory fault that sets FAR_EL1, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL1 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by DC ZVA.

If the exception that updates FAR_EL1 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are `0x00000001`:

- The faulting address was generated by a load or store instruction that sequentially incremented from address `0xFFFFFFFF`. Such a load or store is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state'.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL0 makes FAR_EL1 become UNKNOWN.

Note

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL1 is made UNKNOWN on an exception return from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FAR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic FAR_EL1 or FAR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, FAR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0110	0b0000	0b000

FAR_EL2, Fault Address Register (EL2)

The FAR_EL2 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort, PC alignment fault and Watchpoint exceptions that are taken to EL2.

Configuration

AArch64 System register FAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HDFAR[31:0].

AArch64 System register FAR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HIFAR[31:0].

AArch64 System register FAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register DFAR[31:0] (S) when EL2 is implemented.

AArch64 System register FAR_EL2 bits [63:32] are architecturally mapped to AArch32 System register IFAR[31:0] (S) when EL2 is implemented.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

FAR_EL2 is a 64-bit register.

Field descriptions

Bits	Field
63–32	Faulting Virtual Address for synchronous exceptions taken to EL2
31–0	Faulting Virtual Address for synchronous exceptions taken to EL2

Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL2. Exceptions that set the FAR_EL2 are Instruction Aborts (EC `0x20` or `0x21`), Data Aborts (EC `0x24` or `0x25`), PC alignment faults (EC `0x22`), and Watchpoints (EC `0x34` or `0x35`). ESR_EL2.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL2 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL2.FnV is 0, and the FAR_EL2 is UNKNOWN if ESR_EL2.FnV is 1.

For all other exceptions taken to EL2, the FAR_EL2 is UNKNOWN.

If a memory fault that sets FAR_EL2, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL2 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by DC ZVA.

If the exception that updates FAR_EL2 is taken from an Exception level that is using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are `0x00000001`:

- The faulting address was generated by a load or store instruction that sequentially incremented from address `0xFFFFFFFF`. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state'.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL1 or EL0 makes FAR_EL2 become UNKNOWN.

Note

The address held in this field is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the instruction or data abort. It is the lower address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL2 is made UNKNOWN on an exception return from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FAR_EL2

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL2 using the mnemonic FAR_EL2 or FAR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, FAR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0110	0b0000	0b000

```

FAR_EL3, Fault Address Register (EL3)

The FAR_EL3 characteristics are:

Purpose

Holds the faulting Virtual Address for all synchronous Instruction or Data Abort and PC alignment fault exceptions that are taken to EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to FAR_EL3 are UNDEFINED.

Attributes

FAR_EL3 is a 64-bit register.

Field descriptions

63–32
Faulting Virtual Address for synchronous exceptions taken to EL3

31–0
Faulting Virtual Address for synchronous exceptions taken to EL3

Bits [63:0]

Faulting Virtual Address for synchronous exceptions taken to EL3. Exceptions that set the FAR_EL3 are Instruction Aborts (EC `0x20` or `0x21`), Data Aborts (EC `0x24` or `0x25`), and PC alignment faults (EC `0x22`). ESR_EL3.EC holds the EC value for the exception.

For a synchronous External abort, if the VA that generated the abort was from an address range for which TCR_ELx.TBI{<0|1>} == 1 for the translation regime in use when the abort was generated, then the top eight bits of FAR_EL3 are UNKNOWN.

For a synchronous External abort other than a synchronous External abort on a translation table walk, this field is valid only if ESR_EL3.FnV is 0, and the FAR_EL3 is UNKNOWN if ESR_EL3.FnV is 1.

For all other exceptions taken to EL3, the FAR_EL3 is UNKNOWN.

If a memory fault that sets FAR_EL3, other than a Tag Check Fault, is generated from a data cache maintenance or other DC instruction, this field holds the address specified in the register argument of the instruction.

On an exception due to a Tag Check Fault caused by a data cache maintenance or other DC instruction, the address held in FAR_EL3 is IMPLEMENTATION DEFINED as one of the following:

- The lowest address that gave rise to the fault.
- The address specified in the register argument of the instruction as generated by MMU faults caused by DC ZVA.

If the exception that updates FAR_EL3 is taken from an Exception level using AArch32, the top 32 bits are all zero, unless both of the following apply, in which case the top 32 bits of FAR_ELx are `0x00000001`:

- The faulting address was generated by a load or store instruction that sequentially incremented from address `0xFFFFFFFF`. Such a load or store instruction is CONSTRAINED UNPREDICTABLE.
- The implementation treats such incrementing as setting bit[32] of the virtual address to 1.

For a Data Abort or Watchpoint exception, if address tagging is enabled for the address accessed by the data access that caused the exception, then this field includes the tag. For more information about address tagging, see 'Address tagging in AArch64 state'.

For a synchronous Tag Check Fault abort, bits[63:60] are UNKNOWN.

Execution at EL2, EL1 or EL0 makes FAR_EL3 become UNKNOWN.

Note

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that actually gave rise to the instruction or data abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

FAR_EL3 is made UNKNOWN on an exception return from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FAR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, FAR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0110	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return FAR_EL3;
```

```
MSR FAR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0110	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    FAR_EL3 = X[t];
```

FPCR, Floating-point Control Register

The FPCR characteristics are:

Purpose

Controls floating-point behavior.

Configuration

AArch64 System register FPCR bits [26:15] are architecturally mapped to AArch32 System register FPSCR[26:15].

AArch64 System register FPCR bits [12:8] are architecturally mapped to AArch32 System register FPSCR[12:8].

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

Attributes

FPCR is a 64-bit register.

Field descriptions

63:32
RES0

31:27	26	25	24	23:22	21:20	19	18:16	15	14:13	12	11	10	9	8	7:3	2	1	0
RES0	AHP	DN	FZ	RMode	Stride	FZ16	Len	IDE	RES0	IXE	UFE	OFE	DZE	IOE	RES0	NEP	AH	FIZ

Bits [63:27]

Reserved, RES0.

AHP, bit [26]

Alternative half-precision control bit.

AHP	Meaning
`0b0`	IEEE half-precision format selected.
`0b1`	Alternative half-precision format selected.

This bit is used only for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the FEAT_FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DN, bit [25]

Default NaN use for NaN propagation.

DN	Meaning
`0b0`	NaN operands propagate through to the output of a floating-point operation.
`0b1`	Any operation involving one or more NaNs returns the Default NaN. This bit has no effect on the output of FABS, FMAX*, FMIN*, and FNEG instructions, and a default NaN is never returned as a result of these instructions.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ, bit [24]

Flushing denormalized numbers to zero control bit.

FZ	Meaning
`0b0`	If FPCR.AH is 0, the flushing to zero of single-precision and double-precision denormalized inputs to, and outputs of, floating-point instructions not enabled by this control, but other factors might cause the input denormalized numbers to be flushed to zero. If FPCR.AH is 1, the flushing to zero of single-precision and double-precision denormalized outputs of floating-point instructions not enabled by this control, but other factors might cause the input denormalized numbers to be flushed to zero.
`0b1`	If FPCR.AH is 0, denormalized single-precision and double-precision inputs to, and outputs from, floating-point instructions are flushed to zero. If FPCR.AH is 1, denormalized single-precision and double-precision outputs from floating-point instructions are flushed to zero.

For more information, see 'Flushing denormalized numbers to zero' and the pseudocode of the floating-point instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RMode, bits [23:22]

Rounding Mode control field.

RMode	Meaning
`0b00`	Round to Nearest (RN) mode.
`0b01`	Round towards Plus Infinity (RP) mode.
`0b10`	Round towards Minus Infinity (RM) mode.
`0b11`	Round towards Zero (RZ) mode.

The specified rounding mode is used by both scalar and Advanced SIMD floating-point instructions.

If FPCR.AH is 1, then the following instructions use Round to Nearest mode regardless of the value of this bit:

- The FRECPE, FRECPS, FRECPX, FRSQRTE, and FRSQRTS instructions.
- The BFCVT, BFCVTN, BFCVTN2, BFCVTNT, BFMLALB, and BFMLALT instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Stride, bits [21:20]

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state.

This field is included only for context saving and restoration of the AArch32 FPSCR.Stride field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ16, bit [19]

When FEAT_FP16 is implemented:

Flushing denormalized numbers to zero control bit on half-precision data-processing instructions.

FZ16	Meaning
0b0	For some instructions, this bit disables flushing to zero of inputs and outputs that are half-precision denormalized numbers.
0b1	Flushing denormalized numbers to zero enabled. For some instructions that do not convert a half-precision input to a higher precision output, this bit enables flushing to zero of inputs and outputs that are half-precision denormalized numbers.

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations.

For more information, see 'Flushing denormalized numbers to zero' and the pseudocode of the floating-point instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Len, bits [18:16]

This field has no function in AArch64 state, and non-zero values are ignored during execution in AArch64 state.

This field is included only for context saving and restoration of the AArch32 FPSCR.Len field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDE, bit [15]

Input Denormal floating-point exception trap enable.

IDE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.IDC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IDC bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

IXE, bit [12]

Inexact floating-point exception trap enable.

IXE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.IXC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IXC bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFE, bit [11]

Underflow floating-point exception trap enable.

UFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.UFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs and Flush-to-zero is not enabled, the PE does not update the FPSR.UFC bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFE, bit [10]

Overflow floating-point exception trap enable.

OFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.OFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.OFC bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZE, bit [9]

Divide by Zero floating-point exception trap enable.

DZE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.DZC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.DZC bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOE, bit [8]

Invalid Operation floating-point exception trap enable.

IOE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the FPSR.IOC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the FPSR.IOC bit.

The value of this bit controls both scalar and Advanced SIMD floating-point arithmetic.

If the implementation does not support this exception, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:3]

Reserved, RES0.

NEP, bit [2]

When FEAT_AFP is implemented:

Controls how the output elements other than the lowest element of the vector are determined for Advanced SIMD scalar instructions.

<table>
<tr><th>NEP</th><th>Meaning</th></tr>
<tr><td>0b0</td><td>Does not affect how the output elements other than the lowest are determined for Advanced SIMD scalar instructions.</td></tr>
<tr><td>0b1</td><td>The output elements other than the lowest are taken from the following registers:

For 3-input scalar versions of the FMLA (by element) and FMLS (by element) instructions, the <Hd>, <Sd>, or <Dd> register.
For 3-input versions of the FMADD, FMSUB, FNMADD, and FNMSUB instructions, the <Ha>, <Sa>, or <Da> register.
For 2-input scalar versions of the FACGE, FACGT, FCMEQ (register), FCMGE (register), and FCMGT (register) instructions, the <Hm>, <Sm>, or <Dm> register.
For 2-input scalar versions of the FABD, FADD (scalar), FDIV (scalar), FMAX (scalar), FMAXNM (scalar), FMIN (scalar), FMINNM (scalar), FMUL (by element), FMUL (scalar), FMULX (by element), FMULX, FNMUL (scalar), FRECPS, FRSQRTS, and FSUB (scalar) instructions, the <Hn>, <Sn>, or <Dn> register.
For 1-input scalar versions of the following instructions, the <Hd>, <Sd>, or <Dd> register:

The (vector) versions of the FCVTAS, FCVTAU, FCVTMS, FCVTMU, FCVTNS, FCVTNU, FCVTPS, and FCVTPU instructions.
The (vector, fixed-point) and (vector, integer) versions of the FCVTZS, FCVTZU, SCVTF, and UCVTF instructions.
The (scalar) versions of the FABS, FNEG, FRINT32X, FRINT32Z, FRINT64X, FRINT64Z, FRINTA, FRINTI, FRINTM, FRINTN, FRINTP, FRINTX, FRINTZ, and FSQRT instructions.
The (scalar, fixed-point) and (scalar, integer) versions of the SCVTF and UCVTF instructions.
The BFCVT, FCVT, FCVTXN, FRECPE, FRECPX, and FRSQRTE instructions.

</td></tr>
</table>

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AH, bit [1]

When FEAT_AFP is implemented:

Alternate Handling. Controls alternate handling of floating-point numbers.

The Arm architecture supports two models for handling some of the corner cases of the floating-point behaviors, such as the nature of flushing of denormalized numbers, the detection of tininess and other exceptions and a range of other behaviors. The value of the FPCR.AH bit selects between these models.

For more information on the FPCR.AH bit, see 'Flushing denormalized numbers to zero', 'Floating-point exceptions and exception traps' and the pseudocode of the floating-point instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FIZ, bit [0]

When FEAT_AFP is implemented:

Flush Inputs to Zero. Controls whether single-precision, double-precision and BFloat16 input operands that are denormalized numbers are flushed to zero.

FIZ	Meaning
0b0	The flushing to zero of single-precision and double-precision denormalized inputs to floating-point instructions not enabled by this control, but other factors might cause the input denormalized numbers to be flushed to zero.
0b1	Denormalized single-precision and double-precision inputs to most floating-point instructions flushed to zero.

For more information, see 'Flushing denormalized numbers to zero' and the pseudocode of the floating-point instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing FPCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, FPCR
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0100	0b000

```
if PSTATE.EL == EL0 then

FPEXC32_EL2, Floating-Point Exception Control register

The FPEXC32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register FPEXC from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register FPEXC32_EL2 bits [31:0] are architecturally mapped to AArch32 System register FPEXC[31:0].

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to FPEXC32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPEXC32_EL2 is a 64-bit register.

Field descriptions

63–32
RES0

31	30	29	28	27	26	25–11	10–8	7	6–5	4	3	2	1	0
EX	EN	DEX	FP2V	VV	TFV	RES0	VECITR	IDF	RES0	IXF	UFF	OFF	DZF	IOF

Bits [63:32]

Reserved, RES0.

EX, bit [31]

Exception bit. From Armv8, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [30]

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the FPEXC or FPSID.
- VMRS accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.

EN	Meaning
0b0	Accesses to the FPSCR, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.
0b1	This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of Advanced SIMD and floating-point instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
    - HCPTR.TCP10, or if EL2 is using AArch64, CPTR_EL2.TFP.
    - NSACR.cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
- For Advanced SIMD instructions only:
    - CPACR.ASEDIS.
    - If executing in Non-secure state, HCPTR.TASE and NSACR.NSTRCDIS.

See the descriptions of the controls for more information.

Note

When executing at EL0 using AArch32:

- If EL1 is using AArch64, then the Effective value of FPEXC.EN is 1.
- If EL2 is using AArch64 and is enabled in the current Security state, HCR_EL2.TGE is 1, and the Effective value of HCR_EL2.RW is 1, then the Effective value of FPEXC.EN is 1. However, Arm deprecates using the value of FPEXC32_EL2.EN to determine behavior.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DEX, bit [29]

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC32_EL2.TFV field is valid.

The meaning of this bit is:

DEX	Meaning
0b0	The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC32_EL2.TFV is RW then it is invalid and UNKNOWN. If FPEXC32_EL2.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
0b1	The exception was generated during the execution of an allocated encoding. FPEXC32_EL2.TFV is valid and indicates the cause of the exception.

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the AArch32 FPSCR.{Stride, Len} fields as RAZ, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FP2V, bit [28]

FPINST2 instruction valid bit. From Armv8, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VV, bit [27]

VECITR valid bit. From Armv8, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

TFV	Meaning
0b0	The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of FPSCR.{Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.
0b1	FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements FPSCR.{Stride, Len} as RAZ, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:11]

Reserved, RES0.

VECITR, bits [10:8]

Vector iteration count. From Armv8, this field is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while FPSCR.IDE was 1:

IDF	Meaning
0b0	Input Denormal exception has not occurred.
0b1	Input Denormal exception has occurred.

Input Denormal exceptions can occur only when FPSCR.FZ is 1.

Note

A half-precision floating-point value that is flushed to zero because the value of FPSCR.FZ16 is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while FPSCR.IXE was 1:

IXF	Meaning
0b0	Inexact exception has not occurred.
0b1	Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while FPSCR.UFE was 1:

UFF	Meaning
0b0	Underflow exception has not occurred.
0b1	Underflow exception has occurred.

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when FPSCR.FZ16 is 0.
- Otherwise only when FPSCR.FZ is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC32_EL2.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while FPSCR.OFE was 1:

OFF	Meaning
0b0	Overflow exception has not occurred.
0b1	Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while FPSCR.DZE was 1:

DZF	Meaning
0b0	Divide by Zero exception has not occurred.
0b1	Divide by Zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while FPSCR.IOE was 1:

IOF	Meaning
0b0	Invalid Operation exception has not occurred.
0b1	Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FPEXC32_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, FPEXC32_EL2

FPSR, Floating-point Status Register

The FPSR characteristics are:

Purpose

Provides floating-point system status information.

Configuration

AArch64 System register FPSR bits [31:27] are architecturally mapped to AArch32 System register FPSCR[31:27].

AArch64 System register FPSR bit [7] is architecturally mapped to AArch32 System register FPSCR[7].

AArch64 System register FPSR bits [4:0] are architecturally mapped to AArch32 System register FPSCR[4:0].

Attributes

FPSR is a 64-bit register.

Field descriptions

63-32
RES0

31	30	29	28	27	26-8	7	6-5	4	3	2	1	0
N	Z	C	V	QC	RES0	IDC	RES0	IXC	UFC	OFC	DZC	IOC

Bits [63:32]

Reserved, RES0.

N, bit [31]

When AArch32 is supported and AArch32 floating-point is implemented:

Negative condition flag for AArch32 floating-point comparison operations.

Note

AArch64 floating-point comparisons set the PSTATE.N flag instead.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Z, bit [30]

When AArch32 is supported and AArch32 floating-point is implemented:

Zero condition flag for AArch32 floating-point comparison operations.

Note

AArch64 floating-point comparisons set the PSTATE.Z flag instead.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [29]

When AArch32 is supported and AArch32 floating-point is implemented:

Carry condition flag for AArch32 floating-point comparison operations.

Note

AArch64 floating-point comparisons set the PSTATE.C flag instead.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

V, bit [28]

When AArch32 is supported and AArch32 floating-point is implemented:

Overflow condition flag for AArch32 floating-point comparison operations.

Note

AArch64 floating-point comparisons set the PSTATE.V flag instead.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

QC, bit [27]

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [26:8]

Reserved, RES0.

IDC, bit [7]

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IDE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.IDE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXC, bit [4]

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IXE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.IXE is 0.

The criteria for the Inexact floating-point exception to occur are affected by whether denormalized numbers are flushed to zero and by the value of the FPCR.AH bit. For more information, see 'Floating-point exceptions and exception traps'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFC, bit [3]

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.UFE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.UFE is 0 or if flushing denormalized numbers to zero is enabled.

The criteria for the Underflow floating-point exception to occur are affected by whether denormalized numbers are flushed to zero and by the value of the FPCR.AH bit. For more information, see 'Floating-point exceptions and exception traps'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFC, bit [2]

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.OFE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.OFE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZC, bit [1]

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.DZE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.DZE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOC, bit [0]

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How scalar and Advanced SIMD floating-point instructions update this bit depends on the value of the FPCR.IOE bit. This bit is set to 1 to indicate a floating-point exception only if FPCR.IOE is 0.

The criteria for the Invalid Operation floating-point exception to occur are affected by the value of the FPCR.AH bit. For more information, see 'Floating-point exceptions and exception traps'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FPSR

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, FPSR
```

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0100	0b001

```
if PSTATE.EL == EL0 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && CPTR_EL3.TFP == '1' then
        UNDEFINED;
    elsif !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && CPACR_EL1.FPEN != '11' then
        if EL2Enabled() && HCR_EL2.TGE == '1' then

GCR_EL1, Tag Control Register.

The GCR_EL1 characteristics are:

Purpose

Tag Control Register.

Configuration

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to GCR_EL1 are UNDEFINED.

Attributes

GCR_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:17	RES0
16	RRND
15:0	Exclude

Bits [63:17]

Reserved, RES0.

RRND, bit [16]

Controls generation of tag values by the `IRG` instruction.

RRND	Meaning
`0b0`	`IRG` generates a tag value as defined by RandomTag().
`0b1`	`IRG` generates an implementation-specific tag value with a distribution of tag values no worse than generated with GCR_EL1.RRND == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Exclude, bits [15:0]

Allocation Tag values excluded from selection by ChooseNonExcludedTag().

If all bits of GCR_EL1.Exclude are 1, then the Allocation Tag value 0 will be used.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, GCR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0000	0b110

GMID_EL1, Multiple tag transfer ID register

The GMID_EL1 characteristics are:

Purpose

Indicates the block size that is accessed by the LDGM and STGM System instructions.

Configuration

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to GMID_EL1 are UNDEFINED.

Attributes

GMID_EL1 is a 64-bit register.

Field descriptions

63–32	
RES0	
31–4	**3–0**
RES0	BS

Bits [63:4]

Reserved, RES0.

BS, bits [3:0]

Log_2 of the block size in words. The minimum supported size is 16B (value == 2) and the maximum is 256B (value == 6).

Accessing GMID_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, GMID_EL1
```

CRn	op0	op1	op2	CRm
0b0000	0b11	0b001	0b100	0b0000

HACR_EL2, Hypervisor Auxiliary Control Register

The HACR_EL2 characteristics are:

Purpose

Controls trapping to EL2 of IMPLEMENTATION DEFINED aspects of EL1 or EL0 operation.

Note

Arm recommends that the values in this register do not cause unnecessary traps to EL2 when HCR_EL2.{E2H, TGE} == {1, 1}.

Configuration

AArch64 System register HACR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HACR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

HACR_EL2 is a 64-bit register.

Field descriptions

Bits	Field
63:32	IMPLEMENTATION DEFINED
31:0	IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HAFGRTR_EL2, Hypervisor Activity Monitors Fine-Grained Read Trap Register

The HAFGRTR_EL2 characteristics are:

Purpose

Provides controls for traps of MRS reads of Activity Monitors System registers.

Configuration

This register is present only when FEAT_AMUv1 is implemented and FEAT_FGT is implemented. Otherwise, direct accesses to HAFGRTR_EL2 are UNDEFINED.

Attributes

HAFGRTR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58
AMEVTYPER16_EL0	AMEVCNTR16_EL0	AMEVTYPER15_EL0	AMEVCNTR15_EL0	AMEVTYPER14_EL0	AMEVCNTR14_EL0
31	30	29	28	27	26

Bits [63:50]

Reserved, RES0.

AMEVTYPER1<x>_EL0, bit [19+2x], for x = 15 to 0
When AMEVTYPER1<x> is implemented:

Trap MRS reads of AMEVTYPER1<x>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER1<x> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVTYPER1<x>_EL0	Meaning
0b0	MRS reads of AMEVTYPER1<x>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVTYPER1<x> at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVTYPER1<x>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVTYPER1<x> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

AMEVCNTR1<x>_EL0, bit [18+2x], for x = 15 to 0

When AMEVCNTR1<x> is implemented:

Trap MRS reads of AMEVCNTR1<x>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR1<x> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR1<x>_EL0	Meaning
0b0	MRS reads of AMEVCNTR1<x>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR1<x> at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR1<x>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR1<x> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

AMCNTEN<x>, bit [17x], for x = 1 to 0

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of AMCNTENCLR<x>_EL0 and AMCNTENSET<x>_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: MRC reads of AMCNTENCLR<x> and AMCNTENSET<x>.

AMCNTEN<x>	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of AMCNTENCLR<x>_EL0 and AMCNTENSET<x>_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 of AMCNTENCLR<x> and AMCNTENSET<x> are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bits [16:5]

Reserved, RES0.

AMEVCNTR0<x>_EL0, bit [x+1], for x = 3 to 0

Trap MRS reads of AMEVCNTR0<x>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR0<x> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

AMEVCNTR0<x>_EL0	Meaning
0b0	MRS reads of AMEVCNTR0<x>_EL0 at EL1 and EL0 using AArch64 and MRC reads of AMEVCNTR0<x> at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of AMEVCNTR0<x>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of AMEVCNTR0<x> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

HCR_EL2, Hypervisor Configuration Register

The HCR_EL2 characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

Configuration

AArch64 System register HCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HCR[31:0].

AArch64 System register HCR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HCR2[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

The bits in this register behave as if they are 0 for all purposes other than direct reads of the register if EL2 is not enabled in the current Security state.

Attributes

HCR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44

RW	TRVM	HCD	TDZ	TGE	TVM	TTLB	TPU	Bit[23]	TSW	TACR	TIDCP	TSC	TID3	TID2	TID1	TID0	TWE	TWI	DC
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12

TWEDEL, bits [63:60]
When FEAT_TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when HCR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by HCR_EL2.TWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [59]
When FEAT_TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by HCR_EL2.TWE.

TWEDEn	Meaning
0b0	The delay for taking the trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking the trap is at least the number of cycles defined in HCR_EL2.TWEDEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID5, bit [58]
When FEAT_MTE2 is implemented:

Trap ID group 5. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- GMID_EL1.

TID5	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 5 registers are trapped to EL2.

When the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has an Effective value of 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DCT, bit [57]
When FEAT_MTE2 is implemented:

Default Cacheability Tagging. When HCR_EL2.DC is in effect, controls whether stage 1 translations are treated as Tagged or Untagged.

DCT	Meaning
0b0	Stage 1 translations are treated as Untagged.
0b1	Stage 1 translations are treated as Tagged.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [56]
When FEAT_MTE2 is implemented:

Allocation Tag Access. When HCR_EL2.{E2H,TGE} != {1,1}, controls EL1 and EL0 access to Allocation Tags.

ATA	Meaning
0b0	Access to Allocation Tags is prevented. Accesses at EL1 to GCR_EL1, RGSR_EL1, TFSR_EL1, TFSR_EL2, or TFSRE0_EL1 that are not UNDEFINED are trapped to EL2.
0b1	This control does not prevent access to Allocation Tags.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBOS, bit [55]
When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Outer Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

TLBI VMALLE1OS, TLBI VAE1OS, TLBI ASIDE1OS,TLBI VAAE1OS, TLBI VALE1OS, TLBI VAALE1OS,TLBI RVAE1OS, TLBI RVAAE1OS,TLBI RVALE1OS, and TLBI RVAALE1OS.

TTLBOS	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Execution of the specified instructions are trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBIS, bit [54]
When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, TLBI VMALLE1IS, TLBI VAE1IS, TLBI ASIDE1IS, TLBI VAAE1IS, TLBI VALE1IS, TLBI VAALE1IS, TLBI RVAE1IS, TLBI RVAAE1IS, TLBI RVALE1IS, and TLBI RVAALE1IS.
- When EL1 is using AArch32, TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, and TLBIMVAALIS.

TTLBIS	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Execution of the specified instructions are trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [53]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Enable Access to the SCXTNUM_EL1 and SCXTNUM_EL0 registers. The defined values are:

EnSCXT	Meaning
0b0	When HCR_EL2.E2H is 0 or HCR_EL2.TGE is 0, and EL2 is enabled in the current Security state, EL1 and EL0 access to SCXTNUM_EL0 and EL1 access to SCXTNUM_EL1 is disabled by this mechanism, causing an exception to EL2, and the values of these registers to be treated as 0. When HCR_EL2.{E2H, TGE} is {1, 1} and EL2 is enabled in the current Security state, EL0 access to SCXTNUM_EL0 is disabled by this mechanism, causing an exception to EL2, and the value of this register to be treated as 0.
0b1	This control does not cause accesses to SCXTNUM_EL0 or SCXTNUM_EL1 to be trapped.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TOCU, bit [52]

When FEAT_EVT is implemented:

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When SCTLR_EL1.UCI is 1, HCR_EL2.{TGE, E2H} is not {1, 1}, and EL0 is using AArch64, IC IVAU, DC CVAU.
- When EL1 is using AArch64, IC IVAU, IC IALLU, DC CVAU.
- When EL1 is using AArch32, ICIMVAU, ICIALLU, DCCMVAU.

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- IC IALLUIS and IC IALLU are always UNDEFINED at EL0 using AArch64.
- ICIMVAU, ICIALLU, ICIALLUIS, and DCCMVAU are always UNDEFINED at EL0 using AArch32.

TOCU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [51]
When FEAT_AMUv1p1 is implemented:

Activity Monitors Virtual Offsets Enable.

AMVOFFEN	Meaning
0b0	Virtualization of the Activity Monitors is disabled. Indirect reads of the virtual offset registers are zero.
0b1	Virtualization of the Activity Monitors is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TICAB, bit [50]
When FEAT_EVT is implemented:

Trap ICIALLUIS/IC IALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state. This applies to the following instructions:

- When EL1 is using AArch64, IC IALLUIS.
- When EL1 is using AArch32, ICIALLUIS.

TICAB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified instructions is trapped to EL2.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID4, bit [49]
When FEAT_EVT is implemented:

Trap ID group 4. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- EL1 reads of CCSIDR_EL1, CCSIDR2_EL1, CLIDR_EL1, and CSSELR_EL1.
- EL1 writes to CSSELR_EL1.

AArch32:

- EL1 reads of CCSIDR, CCSIDR2, CLIDR, and CSSELR.
- EL1 writes to CSSELR.

TID4	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [48]

Reserved, RES0.

FIEN, bit [47]

When FEAT_RASv1p1 is implemented:

Fault Injection Enable. Unless this bit is set to 1, accesses to the ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18.

FIEN	Meaning
0b0	Accesses to the specified registers from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

If EL2 is disabled in the current Security state, the Effective value of HCR_EL2.FIEN is 0b1.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FWB, bit [46]

When FEAT_S2FWB is implemented:

Forced Write-Back. Defines the combined cacheability attributes in a 2 stage translation regime.

> **Note**
>
> When FEAT_MTE2 is implemented, if the stage 1 page or block descriptor specifies the Tagged attribute, the final memory type is Tagged only if the final cacheable memory type is Inner and Outer Write-back cacheable and the final allocation hints are Read-Allocate, Write-Allocate.

FWB	Meaning
`0b0`	When this bit is 0, then: • The combination of stage 1 and stage 2 translations on memory type and cacheability attributes are as described in the Armv8.0 architecture. For more information, see 'Combining the stage 1 and stage 2 attributes, EL1&0 translation regime'. • The encoding of the stage 2 memory type and cacheability attributes in bits[5:2] of the stage 2 page or block descriptors are as described in the Armv8.0 architecture.

`0b1`	When this bit is 1, then:
	• Bit[5] of stage 2 page or block descriptor is RES0.
	• When bit[4] of stage 2 page or block descriptor is 1 and when:
	  ◦ Bits[3:2] of stage 2 page or block descriptor are `0b11`, the resultant memory type and inner or outer cacheability attribute is the same as the stage 1 memory type and inner or outer cacheability attribute.
	  ◦ Bits[3:2] of stage 2 page or block descriptor are `0b10`, the resultant memory type and attribute is Normal Write-Back.
	  ◦ Bits[3:2] of stage 2 page or block descriptor are `0b0x`, the resultant memory type will be Normal Non-cacheable except where the stage 1 memory type was Device-<attr> the resultant memory type will be Device-<attr>
	• When bit[4] of stage 2 page or block descriptor is 0 the memory type is Device, and when:
	  ◦ Bits[3:2] of stage 2 page or block descriptor are `0b00`, the stage 2 memory type is Device-nGnRnE.
	  ◦ Bits[3:2] of stage 2 page or block descriptor are `0b01`, the stage 2 memory type is Device-nGnRE.
	  ◦ Bits[3:2] of stage 2 page or block descriptor are `0b10`, the stage 2 memory type is Device-nGRE.
	  ◦ Bits[3:2] of stage 2 page or block descriptor are `0b11`, the stage 2 memory type is Device-GRE.
	• If the stage 1 translation specifies a cacheable memory type, then the stage 1 cache allocation hint is applied to the final cache allocation hint where the final memory type is cacheable.
	• If the stage 1 translation does not specify a cacheable memory type, then if the final memory type is cacheable, it is treated as read allocate, write allocate.
	The stage 1 and stage 2 memory types are combined in the manner described in 'Combining the stage 1 and stage 2 attributes, EL1&0 translation regime'.

In Secure state, this bit applies to both the Secure stage 2 translation and the Non-secure stage 2 translation.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV2, bit [45]

When FEAT_NV2 is implemented:

Nested Virtualization. Changes the behaviors of HCR_EL2.{NV1, NV} to provide a mechanism for hardware to transform reads and writes from System registers into reads and writes from memory.

NV2	Meaning
`0b0`	This bit has no effect on the behavior of HCR_EL2.{NV1, NV}. The behavior of HCR_EL2.{NV1, NV} is as defined for FEAT_NV.
`0b1`	Redefines behavior of HCR_EL2{NV1, NV} to enable: • Transformation of read/writes to registers into read/writes to memory. • Redirection of EL2 registers to EL1 registers. Any exception taken from EL1 and taken to EL1 causes SPSR_EL1.M[3:2] to be set to `0b10` and not `0b01`.

When HCR_EL2.NV is 0, the Effective value of this field is 0 and this field is treated as 0 for all purposes other than direct reads and writes of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AT, bit [44]

When FEAT_NV is implemented:

Address Translation. EL1 execution of the following address translation instructions is trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value `0x18`:

- AT S1E0R, AT S1E0W, AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP.

AT	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 execution of the specified instructions is trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV1, bit [43]

When FEAT_NV2 is implemented:

Nested Virtualization.

NV1	Meaning
`0b0`	If HCR_EL2.{NV2, NV} are both 1, accesses executed from EL1 to implemented EL12, EL02, or EL2 registers are transformed to loads and stores. If HCR_EL2.NV2 is 0 or HCR_EL2.{NV2, NV} == {1, 0}, this control does not cause any instructions to be trapped.
`0b1`	If HCR_EL2.NV2 is 1, accesses executed from EL1 to implemented EL2 registers are transformed to loads and stores. If HCR_EL2.NV2 is 0, EL1 accesses to VBAR_EL1, ELR_EL1, SPSR_EL1, and, when FEAT_CSV2_2 or FEAT_CSV2_1p2 is implemented, SCXTNUM_EL1, are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value `0x18`.

If HCR_EL2.NV2 is 1, the value of HCR_EL2.NV1 defines which EL1 register accesses are transformed to loads and stores. These transformed accesses have priority over the trapping of registers.

The trapping of EL1 registers caused by other control bits has priority over the transformation of these accesses.

If a register is specified that is not implemented by an implementation, then access to that register are UNDEFINED.

For the list of registers affected, see 'Enhanced support for nested virtualization'.

If HCR_EL2.{NV1, NV} is {0, 1}, any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to `0b10`, and not `0b01`.

If HCR_EL2.{NV1, NV} is {1, 1}, then:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.
- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.{NV1, NV} are {1, 0}, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading back the value of the HCR_EL2.NV bit.
- Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_NV is implemented:

Nested Virtualization. EL1 accesses to certain registers are trapped to EL2, when EL2 is enabled in the current Security state.

NV1	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 accesses to VBAR_EL1, ELR_EL1, SPSR_EL1, and, when FEAT_CSV2_2 or FEAT_CSV2_1p2 is implemented, SCXTNUM_EL1, are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value `0x18`.

If HCR_EL2.NV is 1 and HCR_EL2.NV1 is 0, then the following effects also apply:

- Any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to `0b10`, and not `0b01`.

If HCR_EL2.NV and HCR_EL2.NV1 are both set to 1, then the following effects also apply:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
- When executing at EL1, the PSTATE.PAN bit is treated as zero for all purposes except reading the value of the bit.

- When executing at EL1, the LDTR* instructions are treated as the equivalent LDR* instructions, and the STTR* instructions are treated as the equivalent STR* instructions.

If HCR_EL2.NV is 0 and HCR_EL2.NV1 is 1, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if HCR_EL2.NV is 1 and HCR_EL2.NV1 is 1 for all purposes other than reading back the value of the HCR_EL2.NV bit.
- Behaving as if HCR_EL2.NV is 0 and HCR_EL2.NV1 is 0 for all purposes other than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the HCR_EL2.NV and HCR_EL2.NV1 bits behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV, bit [42]

When FEAT_NV2 is implemented:

Nested Virtualization.

When HCR_EL2.NV2 is 1, redefines register accesses so that:

- Instructions accessing the Special purpose registers SPSR_EL2 and ELR_EL2 instead access SPSR_EL1 and ELR_EL1 respectively.
- Instructions accessing the System registers ESR_EL2 and FAR_EL2 instead access ESR_EL1 and FAR_EL1.

When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

NV	Meaning
`0b0`	When this bit is set to 0, then the PE behaves as if HCR_EL2.NV2 is 0 for all purposes other than reading this register. This control does not cause any instructions to be trapped. When HCR_EL2.NV2 is 1, no FEAT_NV2 functionality is implemented.
`0b1`	When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the CurrentEL register return a value of `0x2`. When HCR_EL2.NV2 is 1, this control redefines EL1 register accesses so that instructions accessing SPSR_EL2, ELR_EL2, ESR_EL2, and FAR_EL2 instead access SPSR_EL1, ELR_EL1, ESR_EL1, and FAR_EL1 respectively.

When HCR_EL2.NV2 is 0, or if FEAT_NV2 is not implemented, then:

- The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value `0x18` are as follows:
  - Registers accessed using MRS or MSR with a name ending in _EL2, except SP_EL2.
  - Registers accessed using MRS or MSR with a name ending in _EL12.
  - Registers accessed using MRS or MSR with a name ending in _EL02.
  - Special-purpose registers SPSR_irq, SPSR_abt, SPSR_und and SPSR_fiq, accessed using MRS or MSR.

    - Special-purpose register SP_EL1 accessed using the dedicated MRS or MSR instruction.
- The instructions for which the execution is trapped and reported using EC syndrome value `0x18` are as follows:
    - EL2 translation regime Address Translation instructions and TLB maintenance instructions.
    - EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.
- The instructions for which the execution is trapped as follows:
    - SMC in an implementation that does not include EL3 and when HCR_EL2.TSC is 1. HCR_EL2.TSC bit is not RES0 in this case. This is reported using EC syndrome value `0x17`.
    - The ERET, ERETAA, and ERETAB instructions, reported using EC syndrome value `0x1A`.

Note

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is `0x1A`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_NV is implemented:

Nested Virtualization. Traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

NV	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the CurrentEL register return a value of `0x2`.

The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value `0x18` are as follows:

- Registers accessed using MRS or MSR with a name ending in _EL2, except SP_EL2.
- Registers accessed using MRS or MSR with a name ending in _EL12.
- Registers accessed using MRS or MSR with a name ending in _EL02.
- Special-purpose registers SPSR_irq, SPSR_abt, SPSR_und and SPSR_fiq, accessed using MRS or MSR.
- Special-purpose register SP_EL1 accessed using the dedicated MRS or MSR instruction.

The instructions for which the execution is trapped and reported using EC syndrome value `0x18` are as follows:

- EL2 translation regime Address Translation instructions and TLB maintenance instructions.
- EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.

The execution of the ERET, ERETAA, and ERETAB instructions are trapped and reported using EC syndrome value `0x1A`.

Note

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is `0x1A`.

The execution of the SMC instructions in an implementation that does not include EL3 and when HCR_EL2.TSC is 1 are trapped and reported using EC syndrome value `0x17`. HCR_EL2.TSC bit is not RES0 in this case.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [41]

When FEAT_PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- In EL0, when HCR_EL2.TGE==0 or HCR_EL2.E2H==0, and the associated SCTLR_EL1.En<N><M>==1.
- In EL1, the associated SCTLR_EL1.En<N><M>==1.

Traps are reported using EC syndrome value `0x09`. The Pointer Authentication instructions trapped are:

- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB.
- PACGA, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB.
- RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB, LDRAA, and LDRAB.

API	Meaning
`0b0`	The instructions related to Pointer Authentication are trapped to EL2, when EL2 is enabled in the current Security state and the instructions are enabled for the EL1&0 translation regime, from: • EL0 when HCR_EL2.TGE==0 or HCR_EL2.E2H==0. • EL1. If HCR_EL2.NV is 1, the HCR_EL2.NV trap takes precedence over the HCR_EL2.API trap for the `ERETAA` and `ERETAB` instructions. If EL2 is implemented and enabled in the current Security state and HFGITR_EL2.ERET == 1, execution at EL1 using AArch64 of `ERETAA` or `ERETAB` instructions is reported with EC syndrome value `0x1A` with its associated ISS field, as the fine-grained trap has higher priority than the HCR_EL2.API == 0.
`0b1`	This control does not cause any instructions to be trapped.

If FEAT_PAuth is implemented but EL2 is not implemented or disabled in the current Security state, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [40]

When FEAT_PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers from EL1 to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value `0x18`:

- APIAKeyLo_EL1, APIAKeyHi_EL1, APIBKeyLo_EL1, APIBKeyHi_EL1, APDAKeyLo_EL1, APDAKeyHi_EL1, APDBKeyLo_EL1, APDBKeyHi_EL1, APGAKeyLo_EL1, and APGAKeyHi_EL1.

APK	Meaning
0b0	Access to the registers holding "key" values for pointer authentication from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

Note

If FEAT_PAuth is implemented but EL2 is not implemented or is disabled in the current Security state, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [39]

Reserved, RES0.

MIOCNCE, bit [38]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the EL1&0 translation regimes.

MIOCNCE	Meaning
0b0	For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.
0b1	For the EL1&0 translation regimes, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

For more information, see 'Mismatched memory attributes'.

This field can be implemented as RAZ/WI.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TEA, bit [37]
When FEAT_RAS is implemented:

Route synchronous External abort exceptions to EL2.

TEA	Meaning
0b0	This control does not cause exceptions to be routed from EL0 and EL1 to EL2.
0b1	Route synchronous External abort exceptions from EL0 and EL1 to EL2, when EL2 is enabled in the current Security state, if not routed to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [36]

When FEAT_RAS is implemented:

Trap Error record accesses. Trap accesses to the RAS error registers from EL1 to EL2 as follows:

- If EL1 is using AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x18`:
  - ERRIDR_EL1, ERRSELR_EL1, ERXADDR_EL1, ERXCTLR_EL1, ERXFR_EL1, ERXMISC0_EL1, ERXMISC1_EL1, and ERXSTATUS_EL1.
  - When FEAT_RASv1p1 is implemented, ERXMISC2_EL1, and ERXMISC3_EL1.
- If EL1 is using AArch32 state, MCR or MRC accesses are trapped to EL2, reported using EC syndrome value `0x03`, MCRR or MRRC accesses are trapped to EL2, reported using EC syndrome value `0x04`:
  - ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXFR, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS.
  - When FEAT_RASv1p1 is implemented, ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

TERR	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Accesses to the specified registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [35]

When FEAT_LOR is implemented:

Trap LOR registers. Traps Non-secure EL1 accesses to LORSA_EL1, LOREA_EL1, LORN_EL1, LORC_EL1, and LORID_EL1 registers to EL2.

TLOR	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 accesses to the LOR registers are trapped to EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2H, bit [34]

When FEAT_VHE is implemented:

EL2 Host. Enables a configuration where a Host Operating System is running in EL2, and the Host Operating System's applications are running in EL0.

E2H	Meaning
0b0	The facilities to support a Host Operating System at EL2 are disabled.
0b1	The facilities to support a Host Operating System at EL2 are enabled.

For information on the behavior of this bit see 'Behavior of HCR_EL2.E2H'.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ID, bit [33]

Stage 2 Instruction access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

ID	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime.
0b1	Forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CD, bit [32]

Stage 2 Data access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

CD	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime for data accesses and translation table walks.
0b1	Forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RW, bit [31]

When EL1 is capable of using AArch32:

Execution state control for lower Exception levels:

RW	Meaning
0b0	Lower levels are all AArch32.
0b1	The Execution state for EL1 is AArch64. The Execution state for EL0 is determined by the current value of PSTATE.nRW when executing at EL0.

In an implementation that includes EL3, when EL2 is not enabled in Secure state, the PE behaves as if this bit has the same value as the SCR_EL3.RW bit for all purposes other than a direct read or write access of HCR_EL2.

The RW bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 1 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.

TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value 0x18.
  - SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, CONTEXTIDR_EL1.
- If EL1 is using AArch32 state, accesses using MRC to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MRRC are trapped to EL2 and reported using EC syndrome value 0x04:
  - SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

TRVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 read accesses to the specified Virtual Memory controls are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

EL2 provides a second stage of address translation, that a hypervisor can use to remap the address map defined by a Guest OS. In addition, a hypervisor can trap attempts by a Guest OS to write to the registers that control the memory system. A hypervisor might use this trap as part of its virtualization of memory management.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HCD, bit [29]

When EL3 is not implemented:

HVC instruction disable. Disables EL1 execution of HVC instructions, from both Execution states, when EL2 is enabled in the current Security state, reported using EC syndrome value `0x00`.

HCD	Meaning
`0b0`	HVC instruction execution is enabled at EL2 and EL1.
`0b1`	HVC instructions are UNDEFINED at EL2 and EL1. Any resulting exception is taken to the Exception level at which the HVC instruction is executed.

Note

HVC instructions are always UNDEFINED at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDZ, bit [28]

Trap DC ZVA instructions. Traps EL0 and EL1 execution of DC ZVA instructions to EL2, when EL2 is enabled in the current Security state, from AArch64 state only, reported using EC syndrome value `0x18`.

If FEAT_MTE is implemented, this trap also applies to DC GVA and DC GZVA.

TDZ	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	In AArch64 state, any attempt to execute an instruction this trap applies to at EL1, or at EL0 when the instruction is not UNDEFINED at EL0, is trapped to EL2 when EL2 is enabled in the current Security state. Reading the DCZID_EL0 returns a value that indicates that the instructions this trap applies to are not supported.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TGE, bit [27]

Trap General Exceptions, from EL0.

TGE	Meaning
0b0	This control has no effect on execution at EL0.
0b1	When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0. When EL2 is enabled in the current Security state, in all cases: • All exceptions that would be routed to EL1 are routed to EL2. • If EL1 is using AArch64, the SCTLR_EL1.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR_EL1. • If EL1 is using AArch32, the SCTLR.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR. • All virtual interrupts are disabled. • Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled. • An exception return to EL1 is treated as an illegal exception return. • The MDCR_EL2.{TDRA, TDOSA, TDA, TDE} fields are treated as being 1 for all purposes other than returning the result of a direct read of MDCR_EL2. In addition, when EL2 is enabled in the current Security state, if: • HCR_EL2.E2H is 0, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 1. • HCR_EL2.E2H is 1, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 0. For further information on the behavior of this bit when E2H is 1, see 'Behavior of HCR_EL2.E2H'.

HCR_EL2.TGE must not be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TVM, bit [26]

Trap Virtual Memory controls. Traps EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, the following registers are trapped to EL2 and reported using EC syndrome value `0x18`:
  - SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, CONTEXTIDR_EL1.
- If EL1 is using AArch32 state, accesses using MCR to the following registers are trapped to EL2 and reported using EC syndrome value `0x03`, accesses using MCRR are trapped to EL2 and reported using EC syndrome value `0x04`:
  - SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

TVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 write accesses to the specified EL1 virtual memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TTLB, bit [25]

Trap TLB maintenance instructions. Traps EL1 execution of TLB maintenance instructions to EL2, when EL2 is enabled in the current Security state, as follows:

- When EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value `0x18`:
    - TLBI VMALLE1, TLBI VAE1, TLBI ASIDE1, TLBI VAAE1, TLBI VALE1, TLBI VAALE1.
    - TLBI VMALLE1IS, TLBI VAE1IS, TLBI ASIDE1IS, TLBI VAAE1IS, TLBI VALE1IS, TLBI VAALE1IS.
    - If FEAT_TLBIOS is implemented, this trap applies to TLBI VMALLE1OS, TLBI VAE1OS, TLBI ASIDE1OS, TLBI VAAE1OS, TLBI VALE1OS, TLBI VAALE1OS.
    - If FEAT_TLBIRANGE is implemented, this trap applies to TLBI RVAE1, TLBI RVAAE1, TLBI RVALE1, TLBI RVAALE1, TLBI RVAE1IS, TLBI RVAAE1IS, TLBI RVALE1IS, TLBI RVAALE1IS.
    - If FEAT_TLBIOS and FEAT_TLBIRANGE are implemented, this trap applies to TLBI RVAE1OS, TLBI RVAAE1OS, TLBI RVALE1OS, TLBI RVAALE1OS.

- When EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value `0x03`:
    - TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, TLBIMVAALIS.
    - TLBIALL, TLBIMVA, TLBIASID, TLBIMVAA, TLBIMVAL, TLBIMVAAL
    - ITLBIALL, ITLBIMVA, ITLBIASID.
    - DTLBIALL, DTLBIMVA, DTLBIASID.

TTLB	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

The TLB maintenance instructions are UNDEFINED at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of SCTLR_EL1.UCI is not 0, the following instructions are trapped to EL2 and reported with EC syndrome value `0x18`:
    - IC IVAU, DC CVAU. If the value of SCTLR_EL1.UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported with EC syndrome value `0x18`:
    - IC IVAU, IC IALLU, IC IALLUIS, DC CVAU.
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported with EC syndrome value `0x18`:
    - ICIMVAU, ICIALLU, ICIALLUIS, DCCMVAU.

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- IC IALLUIS and IC IALLU are always UNDEFINED at EL0 using AArch64.
- ICIMVAU, ICIALLU, ICIALLUIS, and DCCMVAU are always UNDEFINED at EL0 using AArch32.

TPU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPCP, bit [23]

When FEAT_DPB is implemented:

Trap data or unified cache maintenance instructions that operate to the Point of Coherency or Persistence. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of SCTLR_EL1.UCI is not 0, the following instructions are trapped to EL2 and reported using EC syndrome value `0x18`:
  - DC CIVAC, DC CVAC, DC CVAP. If the value of SCTLR_EL1.UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, the following instructions are trapped to EL2 and reported using EC syndrome value `0x18`:
  - DC IVAC, DC CIVAC, DC CVAC, DC CVAP.
- If EL1 is using AArch32 state, the following instructions are trapped to EL2 and reported using EC syndrome value `0x03`:
  - DCIMVAC, DCCIMVAC, DCCMVAC.

If FEAT_DPB2 is implemented, this trap also applies to DC CVADP.

If FEAT_MTE is implemented, this trap also applies to DC CIGVAC, DC CIGDVAC, DC IGVAC, DC IGDVAC, DC CGVAC, DC CGDVAC, DC CGVAP and DC CGDVAP.

If FEAT_DPB2 and FEAT_MTE are implemented, this trap also applies to DC CGVADP and DC CGDVADP.

Note

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
  - AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
  - DCIMVAC, DCCIMVAC, and DCCMVAC are always UNDEFINED at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2, it is named TPCP.

TPCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If HCR_EL2.{E2H, TGE} is set to {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state as follows:

- If EL0 is using AArch64 state and the value of SCTLR_EL1.UCI is not 0, accesses to the following registers are trapped and reported using EC syndrome value `0x18`:
  - DC CIVAC, DC CVAC. However, if the value of SCTLR_EL1.UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- If EL1 is using AArch64 state, accesses to DC IVAC, DC CIVAC, DC CVAC are trapped and reported using EC syndrome value `0x18`.
- When EL1 is using AArch32, accesses to DCIMVAC, DCCIMVAC, and DCCMVAC are trapped and reported using EC syndrome value `0x03`.

Note

- An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:
  - AArch64 instructions which invalidate by VA to the Point of Coherency are always UNDEFINED at EL0 using AArch64.
  - DCIMVAC, DCCIMVAC, and DCCMVAC are always UNDEFINED at EL0 using AArch32.
- In Armv8.0 and Armv8.1, this field is named TPC. From Armv8.2, it is named TPCP.

TPC	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to DC ISW, DC CSW, DC CISW are trapped to EL2, reported using EC syndrome value `0x18`.
- If EL1 is using AArch32 state, accesses to DCISW, DCCSW, DCCISW are trapped to EL2, reported using EC syndrome value `0x03`.

If FEAT_MTE2 is implemented, this trap also applies to DC IGSW, DC IGDSW, DC CGSW, DC CGDW, DC CIGSW, and DC CIGDSW.

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TSW	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TACR, bit [21]

Trap Auxiliary Control Registers. Traps EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64 state, accesses to ACTLR_EL1 to EL2, are trapped to EL2 and reported using EC syndrome value `0x18`.
- If EL1 is using AArch32 state, accesses to ACTLR and, if implemented, ACTLR2 are trapped to EL2 and reported using EC syndrome value `0x03`.

TACR	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 accesses to the specified registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

ACTLR_EL1 is not accessible at EL0.

ACTLR and ACTLR2 are not accessible at EL0.

The Auxiliary Control Registers are IMPLEMENTATION DEFINED registers that might implement global control bits for the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps EL1 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, access to any of the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome `0x18`:
  - IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}.
  - IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name.
- In AArch32 state, MCR and MRC access to instructions with the following encodings are trapped and reported using EC syndrome `0x03`:
  - All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}.
  - All coproc==p15, CRn==c10, opc1 =={0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}.
  - All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

When the value of HCR_EL2.TIDCP is 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from EL0 is trapped to EL2. If it is not, then it is UNDEFINED, and any attempt to access it from EL0 generates an exception that is taken to EL1.

TIDCP	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 accesses to or execution of the specified encodings reserved for IMPLEMENTATION DEFINED functionality are trapped to EL2, when EL2 is enabled in the current Security state.

An implementation can also include IMPLEMENTATION DEFINED registers that provide additional controls, to give finer-grained control of the trapping of IMPLEMENTATION DEFINED features.

Note

Arm expects the trapping of EL0 accesses to these functions to EL2 to be unusual, and used only when the hypervisor is virtualizing EL0 operation. Arm strongly recommends that unless the hypervisor must virtualize EL0 operation, an EL0 access to any of these functions is UNDEFINED, as it would be if the implementation did not include EL2. The PE then takes any resulting exception to EL1.

The trapping of accesses to these registers from EL1 is higher priority than an exception resulting from the register access being UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TSC, bit [19]

Trap `SMC` instructions. Traps EL1 execution of `SMC` instructions to EL2, when EL2 is enabled in the current Security state.

If execution is in AArch64 state, the trap is reported using EC syndrome value `0x17`.

If execution is in AArch32 state, the trap is reported using EC syndrome value `0x13`.

Note

HCR_EL2.TSC traps execution of the `SMC` instruction. It is not a routing control for the `SMC` exception. Trap exceptions and `SMC` exceptions have different preferred return addresses.

TSC	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	If EL3 is implemented, then any attempt to execute an `SMC` instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state, regardless of the value of SCR_EL3.SMD. If EL3 is not implemented, FEAT_NV is implemented, and HCR_EL2.NV is 1, then any attempt to execute an SMC instruction at EL1 using AArch64 is trapped to EL2, when EL2 is enabled in the current Security state. If EL3 is not implemented, and either FEAT_NV is not implemented or HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether: • Any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state. • Any attempt to execute an SMC instruction is UNDEFINED.

In AArch32 state, the Armv8-A architecture permits, but does not require, this trap to apply to conditional `SMC` instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

`SMC` instructions are UNDEFINED at EL0.

If EL3 is not implemented, and either FEAT_NV is not implemented or HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether this bit is:

- RES0.
- Implemented with the functionality as described in HCR_EL2.TSC.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID3, bit [18]

Trap ID group 3. Traps EL1 reads of group 3 ID registers to EL2, when EL2 is enabled in the current Security state, as follows:

In AArch64 state:

- Reads of the following registers are trapped to EL2, reported using EC syndrome value `0x18`:
    - ID_PFR0_EL1, ID_PFR1_EL1, ID_PFR2_EL1, ID_DFR0_EL1, ID_AFR0_EL1, ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, ID_ISAR5_EL1, MVFR0_EL1, MVFR1_EL1, MVFR2_EL1.
    - ID_AA64PFR0_EL1, ID_AA64PFR1_EL1, ID_AA64DFR0_EL1, ID_AA64DFR1_EL1, ID_AA64ISAR0_EL1, ID_AA64ISAR1_EL1, ID_AA64MMFR0_EL1, ID_AA64MMFR1_EL1, ID_AA64AFR0_EL1, ID_AA64AFR1_EL1.
    - If FEAT_FGT is implemented:
        - ID_MMFR4_EL1 and ID_MMFR5_EL1 are trapped to EL2.
        - ID_AA64MMFR2_EL1 and ID_ISAR6_EL1 are trapped to EL2.
        - ID_DFR1_EL1 is trapped to EL2.
        - ID_AA64ZFR0_EL1 is trapped to EL2.
        - ID_AA64ISAR2_EL1 is trapped to EL2.
        - This field traps all MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.
    - If FEAT_FGT is not implemented:
        - ID_MMFR4_EL1 and ID_MMFR5_EL1 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4_EL1 or ID_MMFR5_EL1 are trapped to EL2.
        - ID_AA64MMFR2_EL1 and ID_ISAR6_EL1 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_AA64MMFR2_EL1 or ID_ISAR6_EL1 are trapped to EL2.
        - ID_DFR1_EL1 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_DFR1_EL1 are trapped to EL2.
        - ID_AA64ZFR0_EL1 is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to ID_AA64ZFR0_EL1 are trapped to EL2.
        - ID_AA64ISAR2_EL1 is trapped to EL2, unless implemented as RAZ then it is IMPLEMENTATION DEFINED whether accesses to ID_AA64ISAR2_EL1 are trapped to EL2.
        - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRS accesses to registers in the following range that are not already mentioned in this field description: Op0 == 3, op1 == 0, CRn == c0, CRm == {c1-c7}, op2 == {0-7}.

In AArch32 state:

- VMRS access to MVFR0, MVFR1, and MVFR2, are trapped to EL2, reported using EC syndrome value `0x08`, unless access is also trapped by HCPTR which takes priority.
- MRC access to the following registers are trapped to EL2, reported using EC syndrome value `0x03`:
    - ID_PFR0, ID_PFR1, ID_PFR2, ID_DFR0, ID_AFR0, ID_MMFR0, ID_MMFR1, ID_MMFR2, ID_MMFR3, ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, ID_ISAR5.
    - If FEAT_FGT is implemented:
        - ID_MMFR4 and ID_MMFR5 are trapped to EL2.

        - ID_ISAR6 is trapped to EL2.
        - ID_DFR1 is trapped to EL2.
        - This field traps all MRC accesses to encodings in the following range that are not already mentioned in this field description: coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

    - If FEAT_FGT is not implemented:
        - ID_MMFR4 and ID_MMFR5 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4 or ID_MMFR5 are trapped.
        - ID_ISAR6 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_ISAR6 are trapped to EL2.
        - ID_DFR1 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_DFR1 are trapped to EL2.
        - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps all MRC accesses to registers in the following range not already mentioned in this field description with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

TID3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 3 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, reads of CTR_EL0, CCSIDR_EL1, CCSIDR2_EL1, CLIDR_EL1, and CSSELR_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 is using AArch64 and the value of SCTLR_EL1.UCT is not 0, reads of CTR_EL0 are trapped to EL2, reported using EC syndrome value 0x18. If the value of SCTLR_EL1.UCT is 0, then EL0 reads of CTR_EL0 are trapped to EL1 and the resulting exception takes precedence over this trap.
- If EL1 is using AArch64, writes to CSSELR_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- If EL1 is using AArch32, reads of CTR, CCSIDR, CCSIDR2, CLIDR, and CSSELR are trapped to EL2, reported using EC syndrome value 0x03.
- If EL1 is using AArch32, writes to CSSELR are trapped to EL2, reported using EC syndrome value 0x03.

TID2	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 2 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID1, bit [16]

Trap ID group 1. Traps EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, accesses of REVIDR_EL1, AIDR_EL1, reported using EC syndrome value `0x18`.
- In AArch32 state, accesses of TCMTR, TLBTR, REVIDR, AIDR, reported using EC syndrome value `0x03`.

TID1	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	The specified EL1 read accesses to ID group 1 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID0, bit [15]

When AArch32 is supported:

Trap ID group 0. Traps the following register accesses to EL2:

- EL1 reads of the JIDR, reported using EC syndrome value `0x05`.
- If the JIDR is RAZ from EL0, EL0 reads of the JIDR, reported using EC syndrome value `0x05`.
- EL1 accesses using VMRS of the FPSID, reported using EC syndrome value `0x08`.

Note

- It is IMPLEMENTATION DEFINED whether the JIDR is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0, then any resulting exception takes precedence over this trap.
- The FPSID is not accessible at EL0 using AArch32.
- Writes to the FPSID are ignored, and not trapped by this control.

TID0	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	The specified EL1 read accesses to ID group 0 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [14]

Traps EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value `0x01`.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

TWE	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any attempt to execute a WFE instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE or SCTLR_EL1.nTWE.

In AArch32 state, the attempted execution of a conditional WFE instruction is trapped only if the instruction passes its condition code check.

Note

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TWI, bit [13]

Traps EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value `0x01`.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

TWI	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any attempt to execute a WFI instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI or SCTLR_EL1.nTWI.

In AArch32 state, the attempted execution of a conditional WFI instruction is trapped only if the instruction passes its condition code check.

Note

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DC, bit [12]

Default Cacheability.

DC	Meaning
0b0	This control has no effect on the EL1&0 translation regime.
0b1	In both Security states: • When EL1 is using AArch64, the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of SCTLR_EL1. • When EL1 is using AArch32, the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of SCTLR. • The PE behaves as if the value of the HCR_EL2.VM field is 1 for all purposes other than returning the value of a direct read of HCR_EL2. • The memory type produced by stage 1 of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.

This field has no effect on the EL2, EL2&0, and EL3 translation regimes.

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BSU, bits [11:10]

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from EL1 or EL0:

BSU	Meaning
0b00	No effect.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as `0b00` for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FB, bit [9]

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from EL1:

AArch32: BPIALL, TLBIALL, TLBIMVA, TLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, ITLBIALL, ITLBIMVA, ITLBIASID, TLBIMVAA, ICIALLU, TLBIMVAL, TLBIMVAAL.

AArch64: TLBI VMALLE1, TLBI VAE1, TLBI ASIDE1, TLBI VAAE1, TLBI VALE1, TLBI VAALE1, IC IALLU, TLBI RVAE1, TLBI RVAAE1, TLBI RVALE1, TLBI RVAALE1.

FB	Meaning
0b0	This field has no effect on the operation of the specified instructions.
0b1	When one of the specified instruction is executed at EL1, the instruction is broadcast within the Inner Shareable shareability domain.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VSE, bit [8]

Virtual SError interrupt.

VSE	Meaning
0b0	This mechanism is not making a virtual SError interrupt pending.
0b1	A virtual SError interrupt is pending because of this mechanism.

The virtual SError interrupt is enabled only when the value of HCR_EL2.{TGE, AMO} is {0, 1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VI, bit [7]

Virtual IRQ Interrupt.

VI	Meaning
0b0	This mechanism is not making a virtual IRQ pending.
0b1	A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of HCR_EL2.{TGE, IMO} is {0, 1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VF, bit [6]

Virtual FIQ Interrupt.

VF	Meaning
0b0	This mechanism is not making a virtual FIQ pending.
0b1	A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR_EL2.{TGE, FMO} is {0, 1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AMO, bit [5]

Physical SError interrupt routing.

AMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: • When the value of HCR_EL2.TGE is 0, Physical SError interrupts are not taken to EL2. • When the value of HCR_EL2.TGE is 1, Physical SError interrupts are taken to EL2 unless they are routed to EL3. • Virtual SError interrupts are disabled.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: • Physical SError interrupts are taken to EL2, unless they are routed to EL3. • When the value of HCR_EL2.TGE is 0, then virtual SError interrupts are enabled.

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the AMO bit physical asynchronous External aborts and SError interrupts target EL2 unless they are routed to EL3.
- When FEAT_VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When FEAT_VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMO, bit [4]

Physical IRQ Routing.

IMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: • When the value of HCR_EL2.TGE is 0, Physical IRQ interrupts are not taken to EL2. • When the value of HCR_EL2.TGE is 1, Physical IRQ interrupts are taken to EL2 unless they are routed to EL3. • Virtual IRQ interrupts are disabled.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: • Physical IRQ interrupts are taken to EL2, unless they are routed to EL3. • When the value of HCR_EL2.TGE is 0, then Virtual IRQ interrupts are enabled.

If EL2 is enabled in the current Security state, and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the IMO bit, physical IRQ Interrupts target EL2 unless they are routed to EL3.
- When FEAT_VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When FEAT_VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FMO, bit [3]

Physical FIQ Routing.

FMO	Meaning
0b0	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state: • When the value of HCR_EL2.TGE is 0, Physical FIQ interrupts are not taken to EL2. • When the value of HCR_EL2.TGE is 1, Physical FIQ interrupts are taken to EL2 unless they are routed to EL3. • Virtual FIQ interrupts are disabled.
0b1	When executing at any Exception level, and EL2 is enabled in the current Security state: • Physical FIQ interrupts are taken to EL2, unless they are routed to EL3. • When HCR_EL2.TGE is 0, then Virtual FIQ interrupts are enabled.

If EL2 is enabled in the current Security state and the value of HCR_EL2.TGE is 1:

- Regardless of the value of the FMO bit, physical FIQ Interrupts target EL2 unless they are routed to EL3.
- When FEAT_VHE is not implemented, or if HCR_EL2.E2H is 0, this field behaves as 1 for all purposes other than a direct read of the value of this bit.
- When FEAT_VHE is implemented and HCR_EL2.E2H is 1, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [2]

Protected Table Walk. In the EL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs, then the value of this bit determines the behavior:

PTW	Meaning
0b0	The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.
0b1	The memory access generates a stage 2 Permission fault.

This bit is permitted to be cached in a TLB.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SWIO, bit [1]

Set/Way Invalidation Override. Causes EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way:

SWIO	Meaning
0b0	This control has no effect on the operation of data cache invalidate by set/way instructions.
0b1	Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When the value of this bit is 1:

AArch32: DCISW performs the same invalidation as a DCCISW instruction.

AArch64: DC ISW performs the same invalidation as a DC CISW instruction.

This bit can be implemented as RES1.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the EL1&0 translation regime, when EL2 is enabled in the current Security state.

VM	Meaning
`0b0`	EL1&0 stage 2 address translation disabled.
`0b1`	EL1&0 stage 2 address translation enabled.

When the value of this bit is 1, data cache invalidate instructions executed at EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR_EL2.SWIO bit.

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

`MRS <Xt>, HCR_EL2`

op0	op1	CRn	CRm	op2

HCRX_EL2, Extended Hypervisor Configuration Register

The HCRX_EL2 characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

Configuration

This register is present only when FEAT_HCX is implemented. Otherwise, direct accesses to HCRX_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

The bits in this register behave as if they are 0 for all purposes other than direct reads of the register if:

- EL2 is not enabled in the current Security state.
- SCR_EL3.HXEn is 0.

Attributes

HCRX_EL2 is a 64-bit register.

Field descriptions

63626160595857565554535251504948474645 44	43	42	41	40	39	38	37	36	35	34	33	
RES0

Bits [63:12]

Reserved, RES0.

MSCEn, bit [11]
When FEAT_MOPS is implemented:

Memory Set and Memory Copy instructions Enable. Enables execution of the CPY*, SETG*, SETP*, SETM*, and SETE* instructions at EL1 or EL0.

MSCEn	Meaning
0b0	Execution of the Memory Copy and Memory Set instructions is UNDEFINED at EL1 or EL0.
0b1	This control does not cause any instructions to be UNDEFINED.

If EL2 is not implemented or enabled, this bit behaves as if it is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MCE2, bit [10]

When FEAT_MOPS is implemented:

Controls Memory Copy and Memory Set exceptions generated as part of attempting to execute the Memory Copy and Memory Set instructions from EL1.

MCE2	Meaning
0b0	Memory Copy and Memory Set exceptions generated from EL1 are taken to EL1.
0b1	Memory Copy and Memory Set exceptions generated from EL1 are taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CMOW, bit [9]

When FEAT_CMOW is implemented:

Controls cache maintenance instruction permission for the following instructions executed at EL1 or EL0.

- IC IVAU, DC CIVAC, DC CIGDVAC and DC CIGVAC.
- ICIMVAU, DCCIMVAC.

CMOW	Meaning
0b0	These instructions executed at EL1 or EL0 with stage 2 read permission, but without stage 2 write permission do not generate a stage 2 permission fault.
0b1	These instructions executed at EL1 or EL0, if enabled as a result of SCTLR_EL1.UCI==1, with stage 2 read permission, but without stage 2 write permission generate a stage 2 permission fault.

For this control, stage 2 has write permission if S2AP[1] is 1 or DBM is 1 in the stage 2 descriptor. The instructions do not cause an update to the dirty state.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VFNMI, bit [8]

When FEAT_NMI is implemented:

Virtual FIQ Interrupt with Superpriority. Enables signaling of virtual FIQ interrupts with Superpriority.

VFNMI	Meaning
0b0	When HCR_EL2.VF is 1, a signaled pending virtual FIQ interrupt does not have Superpriority.
0b1	When HCR_EL2.VF is 1, a signaled pending virtual FIQ interrupt has Superpriority.

The reset behavior of this field is:

- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to `0`.

Otherwise:

Reserved, RES0.

VINMI, bit [7]

When FEAT_NMI is implemented:

Virtual IRQ Interrupt with Superpriority. Enables signaling of virtual IRQ interrupts with Superpriority.

VINMI	Meaning
0b0	When HCR_EL2.VI is 1, a signaled pending virtual IRQ interrupt does not have Superpriority.
0b1	When HCR_EL2.VI is 1, a signaled pending virtual IRQ interrupt has Superpriority.

The reset behavior of this field is:

- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to `0`.

Otherwise:

Reserved, RES0.

TALLINT, bit [6]

When FEAT_NMI is implemented:

Trap `MSR` writes of ALLINT at EL1 using AArch64 to EL2, when EL2 is implemented and enabled in the current Security state, reported using EC syndrome value `0x18`.

TALLINT	Meaning
0b0	`MSR` writes of ALLINT are not trapped by this mechanism.
0b1	`MSR` writes of ALLINT at EL1 using AArch64 are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

FGTnXS, bit [4]

When FEAT_XS is implemented:

Determines if the fine-grained traps in HFGITR_EL2 that apply to each of the TLBI maintenance instructions that are accessible at EL1 also apply to the corresponding TLBI maintenance instructions with the nXS qualifier.

FGTnXS	Meaning
`0b0`	The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 also applies to the corresponding TLBI instruction with the nXS qualifier at EL1.
`0b1`	The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 does not apply to the corresponding TLBI instruction with the nXS qualifier at EL1.

The reset behavior of this field is:

- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to `0`.

Otherwise:

Reserved, RES0.

FnXS, bit [3]

When FEAT_XS is implemented:

Determines the behavior of TLBI instructions affected by the XS attribute.

This control bit also determines whether an AArch64 DSB instruction behaves as a DSB instruction with an nXS qualifier when executed at EL0 and EL1.

FnXS	Meaning
`0b0`	This control does not have any effect on the behavior of the TLBI maintenance instructions.
`0b1`	A TLBI maintenance instruction without the nXS qualifier executed at EL1 behaves in the same way as the corresponding TLBI maintenance instruction with the nXS qualifier. An AArch64 DSB instruction executed at EL1 or EL0 behaves in the same way as the corresponding DSB instruction with the nXS qualifier executed at EL1 or EL0.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to `0`.

Otherwise:

Reserved, RES0.

EnASR, bit [2]

When FEAT_LS64 is implemented:

When HCR_EL2.{E2H, TGE} != {1, 1}, traps execution of an ST64BV instruction at EL0 or EL1 to EL2.

EnASR	Meaning
`0b0`	Execution of an ST64BV instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1.EnASR. Execution of an ST64BV instruction at EL1 is trapped to EL2.
`0b1`	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of `0x0A`, with an ISS code of `0x0000000`.

The reset behavior of this field is:

- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to `0`.

Otherwise:

Reserved, RES0.

EnALS, bit [1]
When FEAT_LS64 is implemented:

When HCR_EL2.{E2H, TGE} != {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 or EL1 to EL2.

EnALS	Meaning
`0b0`	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1.EnALS. Execution of an LD64B or ST64B instruction at EL1 is trapped to EL2.
`0b1`	This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of `0x0A`, with an ISS code of `0x0000002`.

The reset behavior of this field is:

- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to `0`.

Otherwise:

Reserved, RES0.

EnAS0, bit [0]
When FEAT_LS64 is implemented:

When HCR_EL2.{E2H, TGE} != {1, 1}, traps execution of an ST64BV0 instruction at EL0 or EL1 to EL2.

EnAS0	Meaning
`0b0`	Execution of an ST64BV0 instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1.EnAS0. Execution of an ST64BV0 instruction at EL1 is trapped to EL2.
`0b1`	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of `0x0A`, with an ISS code of `0x0000001`.

The reset behavior of this field is:

- On a Warm reset, when EL3 is not implemented and EL2 is implemented, this field resets to `0`.

Otherwise:

Reserved, RES0.

HDFGRTR_EL2, Hypervisor Debug Fine-Grained Read Trap Register

The HDFGRTR_EL2 characteristics are:

Purpose

Provides controls for traps of MRS and MRC reads of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HDFGRTR_EL2 are UNDEFINED.

Attributes

HDFGRTR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56
PMBIDR_EL1	nPMSNEVFR_EL1	RES0			PMCEIDn_EL0	PMUSERENR_EL0	
PMSIRR_EL1	PMSIDR_EL1	PMSICR_EL1	PMSFCR_EL1	PMSEVFR_EL1	PMSCR_EL1	PMBSR_EL1	PMBPTR_EL1
31	30	29	28	27	26	25	24

PMBIDR_EL1, bit [63]

When FEAT_SPE is implemented:

Trap MRS reads of PMBIDR_EL1 at EL1 using AArch64 to EL2.

PMBIDR_EL1	Meaning
0b0	MRS reads of PMBIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

nPMSNEVFR_EL1, bit [62]

When FEAT_SPEv1p2 is implemented:

Trap MRS reads of PMSNEVFR_EL1 at EL1 using AArch64 to EL2.

nPMSNEVFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSNEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMSNEVFR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [61:59]

Reserved, RES0.

PMCEIDn_EL0, bit [58]

When FEAT_PMUv3 is implemented:

Trap MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCEIDn_EL0	Meaning
0b0	MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMCEID<n> at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMUSERENR_EL0, bit [57]

When FEAT_PMUv3 is implemented:

Trap MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMUSERENR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMUSERENR_EL0	Meaning
0b0	MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMUSERENR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMUSERENR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [56:49]

Reserved, RES0.

TRCVICTLR, bit [48]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCVICTLR at EL1 using AArch64 to EL2.

TRCVICTLR	Meaning
0b0	MRS reads of TRCVICTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCVICTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCSTATR, bit [47]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCSTATR at EL1 using AArch64 to EL2.

TRCSTATR	Meaning
0b0	MRS reads of TRCSTATR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSTATR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCSSCSRn, bit [46]

When FEAT_ETMv4 is implemented, TRCSSCSR<n> are implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCSSCSR<n> at EL1 using AArch64 to EL2.

TRCSSCSRn	Meaning
0b0	MRS reads of TRCSSCSR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSSCSR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Single-shot Comparator n is not implementented, a read of TRCSSCSR<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCSEQSTR, bit [45]

When FEAT_ETMv4 is implemented, TRCSEQSTR is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCSEQSTR at EL1 using AArch64 to EL2.

TRCSEQSTR	Meaning
0b0	MRS reads of TRCSEQSTR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSEQSTR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCPRGCTLR, bit [44]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCPRGCTLR at EL1 using AArch64 to EL2.

TRCPRGCTLR	Meaning
0b0	MRS reads of TRCPRGCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCPRGCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCOSLSR, bit [43]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCOSLSR at EL1 using AArch64 to EL2.

TRCOSLSR	Meaning
0b0	MRS reads of TRCOSLSR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCOSLSR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TRCIMSPECn, bit [41]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCIMSPEC<n> at EL1 using AArch64 to EL2.

TRCIMSPECn	Meaning
0b0	MRS reads of TRCIMSPEC<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCIMSPEC<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If TRCIMSPEC<n> is not implemented, a read of TRCIMSPEC<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCID, bit [40]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TRCDEVARCH.
- TRCDEVID.
- TRCIDR<n>.

TRCID	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

TRCCNTVRn, bit [37]

When FEAT_ETMv4 is implemented, TRCCNTVR<n> are implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCCNTVR<n> at EL1 using AArch64 to EL2.

TRCCNTVRn	Meaning
0b0	MRS reads of TRCCNTVR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCCNTVR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Counter n is not implemented, a read of TRCCNTVR<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCCLAIM, bit [36]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TRCCLAIMCLR.
- TRCCLAIMSET.

TRCCLAIM	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCAUXCTLR, bit [35]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MRS reads of TRCAUXCTLR at EL1 using AArch64 to EL2.

TRCAUXCTLR	Meaning
0b0	MRS reads of TRCAUXCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCAUXCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

TRCAUTHSTATUS, bit [34]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap `MRS` reads of TRCAUTHSTATUS at EL1 using AArch64 to EL2.

TRCAUTHSTATUS	Meaning
`0b0`	`MRS` reads of TRCAUTHSTATUS are not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then `MRS` reads of TRCAUTHSTATUS at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value `0x18`, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

TRC, bit [33]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap `MRS` reads of multiple System registers. Enables a trap on `MRS` reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TRCACATR<n>.
- TRCACVR<n>.
- TRCBBCTLR.
- TRCCCCTLR.
- TRCCIDCCTLR0.
- TRCCIDCCTLR1.
- TRCCIDCVR<n>.
- TRCCNTCTLR<n>.
- TRCCNTRLDVR<n>.
- TRCCONFIGR.
- TRCEVENTCTL0R.
- TRCEVENTCTL1R.
- TRCEXTINSELR.
- TRCQCTLR.
- TRCRSCTLR<n>.
- TRCSEQEVR<n>.
- TRCSEQRSTEVR.
- TRCSSCCR<n>.
- TRCSSPCICR<n>.
- TRCSTALLCTLR.
- TRCSYNCPR.
- TRCTRACEIDR.
- TRCTSCTLR.
- TRCVIIECTLR.
- TRCVIPCSSCTLR.
- TRCVISSCTLR.
- TRCVMIDCCTLR0.
- TRCVMIDCCTLR1.

- TRCVMIDCVR<n>.

TRC	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

A read of an unimplemented register is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSLATFR_EL1, bit [32]

When FEAT_SPE is implemented:

Trap MRS reads of PMSLATFR_EL1 at EL1 using AArch64 to EL2.

PMSLATFR_EL1	Meaning
0b0	MRS reads of PMSLATFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSLATFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSIRR_EL1, bit [31]

When FEAT_SPE is implemented:

Trap MRS reads of PMSIRR_EL1 at EL1 using AArch64 to EL2.

PMSIRR_EL1	Meaning
0b0	MRS reads of PMSIRR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSIRR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSIDR_EL1, bit [30]

When FEAT_SPE is implemented:

Trap MRS reads of PMSIDR_EL1 at EL1 using AArch64 to EL2.

PMSIDR_EL1	Meaning
0b0	MRS reads of PMSIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSICR_EL1, bit [29]

When FEAT_SPE is implemented:

Trap MRS reads of PMSICR_EL1 at EL1 using AArch64 to EL2.

PMSICR_EL1	Meaning
0b0	MRS reads of PMSICR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSICR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSFCR_EL1, bit [28]

When FEAT_SPE is implemented:

Trap MRS reads of PMSFCR_EL1 at EL1 using AArch64 to EL2.

PMSFCR_EL1	Meaning
0b0	MRS reads of PMSFCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSEVFR_EL1, bit [27]

When FEAT_SPE is implemented:

Trap MRS reads of PMSEVFR_EL1 at EL1 using AArch64 to EL2.

PMSEVFR_EL1	Meaning
0b0	MRS reads of PMSEVFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSCR_EL1, bit [26]

When FEAT_SPE is implemented:

Trap MRS reads of PMSCR_EL1 at EL1 using AArch64 to EL2.

PMSCR_EL1	Meaning
0b0	MRS reads of PMSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBSR_EL1, bit [25]

When FEAT_SPE is implemented:

Trap MRS reads of PMBSR_EL1 at EL1 using AArch64 to EL2.

PMBSR_EL1	Meaning
0b0	MRS reads of PMBSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBPTR_EL1, bit [24]

When FEAT_SPE is implemented:

Trap MRS reads of PMBPTR_EL1 at EL1 using AArch64 to EL2.

PMBPTR_EL1	Meaning
0b0	MRS reads of PMBPTR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBLIMITR_EL1, bit [23]

When FEAT_SPE is implemented:

Trap MRS reads of PMBLIMITR_EL1 at EL1 using AArch64 to EL2.

PMBLIMITR_EL1	Meaning
0b0	MRS reads of PMBLIMITR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMMIR_EL1, bit [22]
When FEAT_PMUv3 is implemented:

Trap MRS reads of PMMIR_EL1 at EL1 using AArch64 to EL2.

PMMIR_EL1	Meaning
0b0	MRS reads of PMMIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMMIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [21:20]

Reserved, RES0.

PMSELR_EL0, bit [19]
When FEAT_PMUv3 is implemented:

Trap MRS reads of PMSELR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMSELR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSELR_EL0	Meaning
0b0	MRS reads of PMSELR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMSELR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of PMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMSELR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMOVS, bit [18]

When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of PMOVSCLR_EL0 and PMOVSSET_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: MRC reads of PMOVSR and PMOVSSET.

PMOVS	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of PMOVSCLR_EL0 and PMOVSSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 of PMOVSR and PMOVSSET are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMINTEN, bit [17]

When FEAT_PMUv3 is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- PMINTENCLR_EL1.
- PMINTENSET_EL1.

PMINTEN	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCNTEN, bit [16]

When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of PMCNTENCLR_EL0 and PMCNTENSET_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: MRC reads of PMCNTENCLR and PMCNTENSET.

PMCNTEN	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of PMCNTENCLR_EL0 and PMCNTENSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 of PMCNTENCLR and PMCNTENSET are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCNTR_EL0, bit [15]

When FEAT_PMUv3 is implemented:

Trap MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MRC and MRRC reads of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCNTR_EL0	Meaning
0b0	MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MRC and MRRC reads of PMCCNTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC and MRRC reads of PMCCNTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03 (for MRC) or 0x04 (for MRRC).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCFILTR_EL0, bit [14]

When FEAT_PMUv3 is implemented:

Trap MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCFILTR_EL0	Meaning
0b0	MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCCFILTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMCCFILTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

PMCCFILTR_EL0 can also be accessed in AArch64 state using PMXEVTYPER_EL0 when PMSELR_EL0.SEL == 31, and PMCCFILTR can also be accessed in AArch32 state using PMXEVTYPER when PMSELR.SEL == 31.

Setting this field to 1 has no effect on accesses to PMXEVTYPER_EL0 and PMXEVTYPER, regardless of the value of PMSELR_EL0.SEL or PMSELR.SEL.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMEVTYPERn_EL0, bit [13]
When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of PMEVTYPER<n>_EL0 and PMXEVTYPER_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: MRC reads of PMEVTYPER<n> and PMXEVTYPER.

PMEVTYPERn_EL0	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of PMEVTYPER<n>_EL0 and PMXEVTYPER_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 of PMEVTYPER<n> and PMXEVTYPER are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
    - In AArch64 state, a read of PMEVTYPER<n>_EL0, or, if n is not 31, a read of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n.
    - In AArch32 state, a read of PMEVTYPER<n>, or, if n is not 31, a read of PMXEVTYPER when PMSELR.SEL == n.
- If event counter n is implemented, n is greater-than-or-equal-to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
    - In AArch64 state, a read of PMEVTYPER<n>_EL0, or a read of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n, reported with EC syndrome value 0x18.
    - In AArch32 state, a read of PMEVTYPER<n>, or a read of PMXEVTYPER when PMSELR.SEL == n, reported with EC syndrome value 0x03.

See also HDFGRTR_EL2.PMCCFILTR_EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMEVCNTRn_EL0, bit [12]
When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MRS reads of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: MRC reads of PMEVCNTR<n> and PMXEVCNTR.

PMEVCNTRn_EL0	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 of PMEVCNTR<n> and PMXEVCNTR are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of PMEVCNTR<n>_EL0, or a read of PMXEVCNTR_EL0 when PMSELR_EL0.SEL == n.
  - In AArch32 state, a read of PMEVCNTR<n> , or a read of PMXEVCNTR when PMSELR.SEL == n.
- If event counter n is implemented, n is greater-than-or-equal-to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - In AArch64 state, a read of PMEVCNTR<n>_EL0, or a read of PMXEVCNTR_EL0 when PMSELR_EL0.SEL == n, reported with EC syndrome value 0x18.
  - In AArch32 state, a read of PMEVCNTR<n>, or a read of PMXEVCNTR when PMSELR.SEL == n, reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

OSDLR_EL1, bit [11]

When FEAT_DoubleLock is implemented:

Trap MRS reads of OSDLR_EL1 at EL1 using AArch64 to EL2.

OSDLR_EL1	Meaning
0b0	MRS reads of OSDLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSDLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

OSECCR_EL1, bit [10]

Trap MRS reads of OSECCR_EL1 at EL1 using AArch64 to EL2.

OSECCR_EL1	Meaning
0b0	MRS reads of OSECCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSECCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

OSLSR_EL1, bit [9]

Trap MRS reads of OSLSR_EL1 at EL1 using AArch64 to EL2.

OSLSR_EL1	Meaning
0b0	MRS reads of OSLSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSLSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [8]

Reserved, RES0.

DBGPRCR_EL1, bit [7]

Trap MRS reads of DBGPRCR_EL1 at EL1 using AArch64 to EL2.

DBGPRCR_EL1	Meaning
0b0	MRS reads of DBGPRCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGPRCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGAUTHSTATUS_EL1, bit [6]

Trap MRS reads of DBGAUTHSTATUS_EL1 at EL1 using AArch64 to EL2.

DBGAUTHSTATUS_EL1	Meaning
0b0	MRS reads of DBGAUTHSTATUS_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGAUTHSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGCLAIM, bit [5]

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- DBGCLAIMCLR_EL1.
- DBGCLAIMSET_EL1.

DBGCLAIM	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

MDSCR_EL1, bit [4]

Trap MRS reads of MDSCR_EL1 at EL1 using AArch64 to EL2.

MDSCR_EL1	Meaning
0b0	MRS reads of MDSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MDSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGWVRn_EL1, bit [3]

Trap MRS reads of DBGWVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWVRn_EL1	Meaning
0b0	MRS reads of DBGWVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGWVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint n is not implemented, a read of DBGWVR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGWCRn_EL1, bit [2]

Trap MRS reads of DBGWCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWCRn_EL1	Meaning
0b0	MRS reads of DBGWCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGWCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint n is not implemented, a read of DBGWCR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGBVRn_EL1, bit [1]

Trap MRS reads of DBGBVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBVRn_EL1	Meaning
0b0	MRS reads of DBGBVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGBVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint n is not implemented, a read of DBGBVR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGBCRn_EL1, bit [0]

Trap MRS reads of DBGBCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBCRn_EL1	Meaning
0b0	MRS reads of DBGBCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGBCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint n is not implemented, a read of DBGBCR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HDFGRTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HDFGRTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x1D0];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && SCR_EL3.FGTEn == '0' then
        UNDEFINED;
    elsif HaveEL(EL3) && SCR_EL3.FGTEn == '0' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return HDFGRTR_EL2;
elsif PSTATE.EL == EL3 then
    return HDFGRTR_EL2;
```

MSR HDFGRTR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

HDFGWTR_EL2, Hypervisor Debug Fine-Grained Write Trap Register

The HDFGWTR_EL2 characteristics are:

Purpose

Provides controls for traps of MSR and MCR writes of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HDFGWTR_EL2 are UNDEFINED.

Attributes

HDFGWTR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	
RES0	nPMSNEVFR_EL1	RES0				PMUSERENR_EL0		
PMSIRR_EL1	RES0	PMSICR_EL1	PMSFCR_EL1	PMSEVFR_EL1	PMSCR_EL1	PMBSR_EL1	PMBPTR_EL1	PMB
31	30	29	28	27	26	25	24	

Bit [63]

Reserved, RES0.

nPMSNEVFR_EL1, bit [62]

When FEAT_SPEv1p2 is implemented:

Trap MSR writes of PMSNEVFR_EL1 at EL1 using AArch64 to EL2.

nPMSNEVFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSNEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMSNEVFR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [61:58]

Reserved, RES0.

PMUSERENR_EL0, bit [57]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMUSERENR_EL0 at EL1 using AArch64 to EL2.

PMUSERENR_EL0	Meaning
0b0	MSR writes of PMUSERENR_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMUSERENR_EL0 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [56:50]

Reserved, RES0.

TRFCR_EL1, bit [49]

When FEAT_TRF is implemented:

Trap MSR writes of TRFCR_EL1 at EL1 using AArch64 to EL2.

TRFCR_EL1	Meaning
0b0	MSR writes of TRFCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCVICTLR, bit [48]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCVICTLR at EL1 using AArch64 to EL2.

TRCVICTLR	Meaning
0b0	MSR writes of TRCVICTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCVICTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [47]

Reserved, RES0.

TRCSSCSRn, bit [46]

When FEAT_ETMv4 is implemented, TRCSSCSR<n> are implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCSSCSR<n> at EL1 using AArch64 to EL2.

TRCSSCSRn	Meaning
0b0	MSR writes of TRCSSCSR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCSSCSR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Single-shot Comparator n is not implementented, a write of TRCSSCSR<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCSEQSTR, bit [45]

When FEAT_ETMv4 is implemented, TRCSEQSTR is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCSEQSTR at EL1 using AArch64 to EL2.

TRCSEQSTR	Meaning
0b0	MSR writes of TRCSEQSTR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCSEQSTR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

TRCPRGCTLR, bit [44]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap `MSR` writes of TRCPRGCTLR at EL1 using AArch64 to EL2.

TRCPRGCTLR	Meaning
`0b0`	`MSR` writes of TRCPRGCTLR are not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then `MSR` writes of TRCPRGCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value `0x18`, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bit [43]

Reserved, RES0.

TRCOSLAR, bit [42]

When System register access to the PE Trace Unit registers is implemented and FEAT_ETMv4 is implemented:

Trap `MSR` writes of TRCOSLAR at EL1 using AArch64 to EL2.

TRCOSLAR	Meaning
`0b0`	`MSR` writes of TRCOSLAR are not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then `MSR` writes of TRCOSLAR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value `0x18`, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

TRCIMSPECn, bit [41]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCIMSPEC<n> at EL1 using AArch64 to EL2.

TRCIMSPECn	Meaning
0b0	MSR writes of TRCIMSPEC<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCIMSPEC<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If TRCIMSPEC<n> is not implemented, a write of TRCIMSPEC<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [40:38]

Reserved, RES0.

TRCCNTVRn, bit [37]

When FEAT_ETMv4 is implemented, TRCCNTVR<n> are implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCCNTVR<n> at EL1 using AArch64 to EL2.

TRCCNTVRn	Meaning
0b0	MSR writes of TRCCNTVR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCCNTVR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Counter n is not implemented, a write of TRCCNTVR<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCCLAIM, bit [36]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TRCCLAIMCLR.
- TRCCLAIMSET.

TRCCLAIM	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TRCAUXCTLR, bit [35]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of TRCAUXCTLR at EL1 using AArch64 to EL2.

TRCAUXCTLR	Meaning
0b0	MSR writes of TRCAUXCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCAUXCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [34]

Reserved, RES0.

TRC, bit [33]

When FEAT_ETMv4 is implemented and System register access to the PE Trace Unit registers is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TRCACATR<n>.
- TRCACVR<n>.
- TRCBBCTLR.
- TRCCCCTLR.
- TRCCIDCCTLR0.
- TRCCIDCCTLR1.
- TRCCIDCVR<n>.
- TRCCNTCTLR<n>.

- TRCCNTRLDVR<n>.
- TRCCONFIGR.
- TRCEVENTCTL0R.
- TRCEVENTCTL1R.
- TRCEXTINSELR.
- TRCQCTLR.
- TRCRSCTLR<n>.
- TRCSEQEVR<n>.
- TRCSEQRSTEVR.
- TRCSSCCR<n>.
- TRCSSPCICR<n>.
- TRCSTALLCTLR.
- TRCSYNCPR.
- TRCTRACEIDR.
- TRCTSCTLR.
- TRCVIIECTLR.
- TRCVIPCSSCTLR.
- TRCVISSCTLR.
- TRCVMIDCCTLR0.
- TRCVMIDCCTLR1.
- TRCVMIDCVR<n>.

TRC	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

A write of an unimplemented register is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSLATFR_EL1, bit [32]

When FEAT_SPE is implemented:

Trap MSR writes of PMSLATFR_EL1 at EL1 using AArch64 to EL2.

PMSLATFR_EL1	Meaning
0b0	MSR writes of PMSLATFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSLATFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSIRR_EL1, bit [31]

When FEAT_SPE is implemented:

Trap MSR writes of PMSIRR_EL1 at EL1 using AArch64 to EL2.

PMSIRR_EL1	Meaning
0b0	MSR writes of PMSIRR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSIRR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [30]

Reserved, RES0.

PMSICR_EL1, bit [29]

When FEAT_SPE is implemented:

Trap MSR writes of PMSICR_EL1 at EL1 using AArch64 to EL2.

PMSICR_EL1	Meaning
0b0	MSR writes of PMSICR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSICR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSFCR_EL1, bit [28]

When FEAT_SPE is implemented:

Trap MSR writes of PMSFCR_EL1 at EL1 using AArch64 to EL2.

PMSFCR_EL1	Meaning
0b0	MSR writes of PMSFCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSEVFR_EL1, bit [27]

When FEAT_SPE is implemented:

Trap MSR writes of PMSEVFR_EL1 at EL1 using AArch64 to EL2.

PMSEVFR_EL1	Meaning
0b0	MSR writes of PMSEVFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSCR_EL1, bit [26]

When FEAT_SPE is implemented:

Trap MSR writes of PMSCR_EL1 at EL1 using AArch64 to EL2.

PMSCR_EL1	Meaning
0b0	MSR writes of PMSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBSR_EL1, bit [25]
When FEAT_SPE is implemented:

Trap MSR writes of PMBSR_EL1 at EL1 using AArch64 to EL2.

PMBSR_EL1	Meaning
0b0	MSR writes of PMBSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBPTR_EL1, bit [24]
When FEAT_SPE is implemented:

Trap MSR writes of PMBPTR_EL1 at EL1 using AArch64 to EL2.

PMBPTR_EL1	Meaning
0b0	MSR writes of PMBPTR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMBLIMITR_EL1, bit [23]
When FEAT_SPE is implemented:

Trap MSR writes of PMBLIMITR_EL1 at EL1 using AArch64 to EL2.

PMBLIMITR_EL1	Meaning
0b0	MSR writes of PMBLIMITR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [22]

Reserved, RES0.

PMCR_EL0, bit [21]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMCR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCR_EL0	Meaning
0b0	MSR writes of PMCR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes of PMCR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMCR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSWINC_EL0, bit [20]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSWINC at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSWINC_EL0	Meaning
0b0	MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSWINC at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMSWINC at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMSELR_EL0, bit [19]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSELR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSELR_EL0	Meaning
0b0	MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSELR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMSELR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMOVS, bit [18]

When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of PMOVSCLR_EL0 and PMOVSSET_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: MCR writes of PMOVSR and PMOVSSET.

PMOVS	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes at EL1 and EL0 using AArch64 of PMOVSCLR_EL0 and PMOVSSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 of PMOVSR and PMOVSSET are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMINTEN, bit [17]

When FEAT_PMUv3 is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- PMINTENCLR_EL1.
- PMINTENSET_EL1.

PMINTEN	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCNTEN, bit [16]

When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of PMCNTENCLR_EL0 and PMCNTENSET_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: MCR writes of PMCNTENCLR and PMCNTENSET.

PMCNTEN	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes at EL1 and EL0 using AArch64 of PMCNTENCLR_EL0 and PMCNTENSET_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 of PMCNTENCLR and PMCNTENSET are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCNTR_EL0, bit [15]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MCR and MCRR writes of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCNTR_EL0	Meaning
0b0	MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MCR and MCRR writes of PMCCNTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR and MCRR writes of PMCCNTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03 (for MCR) or 0x04 (for MCRR).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMCCFILTR_EL0, bit [14]

When FEAT_PMUv3 is implemented:

Trap MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCFILTR_EL0	Meaning
0b0	MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCCFILTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMCCFILTR at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

PMCCFILTR_EL0 can also be accessed in AArch64 state using PMXEVTYPER_EL0 when PMSELR_EL0.SEL == 31, and PMCCFILTR can also be accessed in AArch32 state using PMXEVTYPER when PMSELR.SEL == 31.

Setting this field to 1 has no effect on accesses to PMXEVTYPER_EL0 and PMXEVTYPER, regardless of the value of PMSELR_EL0.SEL or PMSELR.SEL.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

PMEVTYPERn_EL0, bit [13]

When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: MSR writes of PMEVTYPER<n>_EL0 and PMXEVTYPER_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: MCR writes of PMEVTYPER<n> and PMXEVTYPER.

PMEVTYPERn_EL0	Meaning
0b0	The operations listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes at EL1 and EL0 using AArch64 of PMEVTYPER<n>_EL0 and PMXEVTYPER_EL0 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 of PMEVTYPER<n> and PMXEVTYPER are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a write of PMEVTYPER<n>_EL0, or, if n is not 31, a write of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n.
  - In AArch32 state, a write of PMEVTYPER<n>, or, if n is not 31, a write of PMXEVTYPER when PMSELR.SEL == n.

- If event counter n is implemented, n is greater-than-or-equal-to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - In AArch64 state, a write of PMEVTYPER<n>_EL0, or a write of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n, reported with EC syndrome value `0x18`.
  - In AArch32 state, a write of PMEVTYPER<n>, or a write of PMXEVTYPER when PMSELR.SEL == n, reported with EC syndrome value `0x03`.

See also HDFGWTR_EL2.PMCCFILTR_EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

PMEVCNTRn_EL0, bit [12]

When FEAT_PMUv3 is implemented:

Trap `MSR` writes and `MCR` writes of multiple System registers.

Enables a trap to EL2 the following operations:

- At EL1 and EL0 using AArch64: `MSR` writes of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: `MCR` writes of PMEVCNTR<n> and PMXEVCNTR.

PMEVCNTRn_EL0	Meaning
`0b0`	The operations listed above are not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • `MSR` writes at EL1 and EL0 using AArch64 of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0 are trapped to EL2 and reported with EC syndrome value `0x18`. • `MCR` writes at EL0 using AArch32 of PMEVCNTR<n> and PMXEVCNTR are trapped to EL2 and reported with EC syndrome value `0x03`.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a write of PMEVCNTR<n>_EL0, or a write of PMXEVCNTR_EL0 when PMSELR_EL0.SEL == n.
  - In AArch32 state, a write of PMEVCNTR<n> , or a write of PMXEVCNTR when PMSELR.SEL == n.
- If event counter n is implemented, n is greater-than-or-equal-to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - In AArch64 state, a write of PMEVCNTR<n>_EL0, or a write of PMXEVCNTR_EL0 when PMSELR_EL0.SEL == n, reported with EC syndrome value `0x18`.
  - In AArch32 state, a write of PMEVCNTR<n>, or a write of PMXEVCNTR when PMSELR.SEL == n, reported with EC syndrome value `0x03`.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

OSDLR_EL1, bit [11]

When FEAT_DoubleLock is implemented:

Trap MSR writes of OSDLR_EL1 at EL1 using AArch64 to EL2.

OSDLR_EL1	Meaning
0b0	MSR writes of OSDLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of OSDLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

OSECCR_EL1, bit [10]

Trap MSR writes of OSECCR_EL1 at EL1 using AArch64 to EL2.

OSECCR_EL1	Meaning
0b0	MSR writes of OSECCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of OSECCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [9]

Reserved, RES0.

OSLAR_EL1, bit [8]

Trap MSR writes of OSLAR_EL1 at EL1 using AArch64 to EL2.

OSLAR_EL1	Meaning
0b0	MSR writes of OSLAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of OSLAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGPRCR_EL1, bit [7]

Trap MSR writes of DBGPRCR_EL1 at EL1 using AArch64 to EL2.

DBGPRCR_EL1	Meaning
0b0	MSR writes of DBGPRCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGPRCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [6]

Reserved, RES0.

DBGCLAIM, bit [5]

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- DBGCLAIMCLR_EL1.
- DBGCLAIMSET_EL1.

DBGCLAIM	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

MDSCR_EL1, bit [4]

Trap MSR writes of MDSCR_EL1 at EL1 using AArch64 to EL2.

MDSCR_EL1	Meaning
0b0	MSR writes of MDSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of MDSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGWVRn_EL1, bit [3]

Trap MSR writes of DBGWVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWVRn_EL1	Meaning
0b0	MSR writes of DBGWVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGWVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of DBGWVR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGWCRn_EL1, bit [2]

Trap MSR writes of DBGWCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWCRn_EL1	Meaning
0b0	MSR writes of DBGWCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGWCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of DBGWCR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGBVRn_EL1, bit [1]

Trap MSR writes of DBGBVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBVRn_EL1	Meaning
0b0	MSR writes of DBGBVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGBVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of DBGBVR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DBGBCRn_EL1, bit [0]

Trap MSR writes of DBGBCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBCRn_EL1	Meaning
0b0	MSR writes of DBGBCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGBCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of DBGBCR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HDFGWTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HDFGWTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x1D8];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then

HFGITR_EL2, Hypervisor Fine-Grained Instruction Trap Register

The HFGITR_EL2 characteristics are:

Purpose

Provides instruction trap controls.

Configuration

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HFGITR_EL2 are UNDEFINED.

Attributes

HFGITR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56
RES0							
TLBIVAAE1IS	TLBIASIDE1IS	TLBIVAE1IS	TLBIVMALLE1IS	TLBIRVAALE1OS	TLBIRVALE1OS	TLBIRVAAE1OS	TLBIRVAE1OS
31	30	29	28	27	26	25	24

Bits [63:55]

Reserved, RES0.

DCCVAC, bit [54]

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- DC CVAC.
- DC CGVAC, if FEAT_MTE is implemented.
- DC CGDVAC, if FEAT_MTE is implemented.

DCCVAC	Meaning
`0b0`	Execution of the instructions listed above is not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value `0x18`, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

SVC_EL1, bit [53]

Trap execution of `SVC` at EL1 using AArch64 to EL2.

SVC_EL1	Meaning
0b0	Execution of SVC is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of SVC at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

SVC_EL0, bit [52]

Trap execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 when EL1 is using AArch64 to EL2.

SVC_EL0	Meaning
0b0	Execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the instruction generates a higher priority exception: • Execution of SVC at EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15. • Execution of SVC at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x11.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ERET, bit [51]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- ERET.
- ERETAA, if FEAT_PAuth is implemented.
- ERETAB, if FEAT_PAuth is implemented.

ERET	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x1A, unless the instruction generates a higher priority exception.

If EL2 is implemented and enabled in the current Security state, HCR_EL2.API == 0, and this field enables a fine-grained trap on the instruction, then execution at EL1 using AArch64 of ERETAA or ERETAB instructions is trapped to EL2 and reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the trap enabled by HCR_EL2.API == 0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CPPRCTX, bit [50]

When FEAT_SPECRES is implemented:

Trap execution of CPP RCTX at EL1 and EL0 using AArch64 and execution of CPPRCTX at EL0 using AArch32 when EL1 is using AArch64 to EL2.

CPPRCTX	Meaning
0b0	Execution of CPP RCTX at EL1 and EL0 using AArch64 and execution of CPPRCTX at EL0 using AArch32 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the instruction generates a higher priority exception: • Execution of CPP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. • Execution of CPPRCTX at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

DVPRCTX, bit [49]

When FEAT_SPECRES is implemented:

Trap execution of DVP RCTX at EL1 and EL0 using AArch64 and execution of DVPRCTX at EL0 using AArch32 when EL1 is using AArch64 to EL2.

DVPRCTX	Meaning
0b0	Execution of DVP RCTX at EL1 and EL0 using AArch64 and execution of DVPRCTX at EL0 using AArch32 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the instruction generates a higher priority exception: • Execution of DVP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. • Execution of DVPRCTX at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

CFPRCTX, bit [48]

When FEAT_SPECRES is implemented:

Trap execution of CFP RCTX at EL1 and EL0 using AArch64 and execution of CFPRCTX at EL0 using AArch32 when EL1 is using AArch64 to EL2.

CFPRCTX	Meaning
0b0	Execution of CFP RCTX at EL1 and EL0 using AArch64 and execution of CFPRCTX at EL0 using AArch32 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the instruction generates a higher priority exception: • Execution of CFP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. • Execution of CFPRCTX at EL0 using AArch32 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIVAALE1, bit [47]

Trap execution of TLBI VAALE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAALE1NXS.

TLBIVAALE1	Meaning
0b0	Execution of TLBI VAALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVALE1, bit [46]

Trap execution of TLBI VALE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VALE1NXS.

TLBIVALE1	Meaning
0b0	Execution of TLBI VALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVAAE1, bit [45]

Trap execution of TLBI VAAE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAAE1NXS.

TLBIVAAE1	Meaning
0b0	Execution of TLBI VAAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIASIDE1, bit [44]

Trap execution of TLBI ASIDE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI ASIDE1NXS.

TLBIASIDE1	Meaning
0b0	Execution of TLBI ASIDE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI ASIDE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVAE1, bit [43]

Trap execution of TLBI VAE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAE1NXS.

TLBIVAE1	Meaning
0b0	Execution of TLBI VAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVMALLE1, bit [42]

Trap execution of TLBI VMALLE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VMALLE1NXS.

TLBIVMALLE1	Meaning
0b0	Execution of TLBI VMALLE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VMALLE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIRVAALE1, bit [41]
When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAALE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAALE1NXS.

TLBIRVAALE1	Meaning
0b0	Execution of TLBI RVAALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVALE1, bit [40]
When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVALE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVALE1NXS.

TLBIRVALE1	Meaning
0b0	Execution of TLBI RVALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAAE1, bit [39]
When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAAE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAAE1NXS.

TLBIRVAAE1	Meaning
0b0	Execution of TLBI RVAAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAE1, bit [38]
When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAE1NXS.

TLBIRVAE1	Meaning
0b0	Execution of TLBI RVAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAALE1IS, bit [37]
When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAALE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAALE1ISNXS.

TLBIRVAALE1IS	Meaning
0b0	Execution of TLBI RVAALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVALE1IS, bit [36]

When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVALE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVALE1ISNXS.

TLBIRVALE1IS	Meaning
0b0	Execution of TLBI RVALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAAE1IS, bit [35]

When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAAE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAAE1ISNXS.

TLBIRVAAE1IS	Meaning
0b0	Execution of TLBI RVAAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAE1IS, bit [34]
When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAE1ISNXS.

TLBIRVAE1IS	Meaning
0b0	Execution of TLBI RVAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIVAALE1IS, bit [33]

Trap execution of TLBI VAALE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAALE1ISNXS.

TLBIVAALE1IS	Meaning
0b0	Execution of TLBI VAALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVALE1IS, bit [32]

Trap execution of TLBI VALE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VALE1ISNXS.

TLBIVALE1IS	Meaning
0b0	Execution of TLBI VALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVAAE1IS, bit [31]

Trap execution of TLBI VAAE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAAE1ISNXS.

TLBIVAAE1IS	Meaning
0b0	Execution of TLBI VAAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIASIDE1IS, bit [30]

Trap execution of TLBI ASIDE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI ASIDE1ISNXS.

TLBIASIDE1IS	Meaning
0b0	Execution of TLBI ASIDE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI ASIDE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVAE1IS, bit [29]

Trap execution of TLBI VAE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAE1ISNXS.

TLBIVAE1IS	Meaning
0b0	Execution of TLBI VAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIVMALLE1IS, bit [28]

Trap execution of TLBI VMALLE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VMALLE1ISNXS.

TLBIVMALLE1IS	Meaning
0b0	Execution of TLBI VMALLE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VMALLE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TLBIRVAALE1OS, bit [27]

When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVAALE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAALE1OSNXS.

TLBIRVAALE1OS	Meaning
0b0	Execution of TLBI RVAALE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVALE1OS, bit [26]

When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVALE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVALE1OSNXS.

TLBIRVALE1OS	Meaning
0b0	Execution of TLBI RVALE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAAE1OS, bit [25]

When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVAAE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAAE1OSNXS.

TLBIRVAAE1OS	Meaning
0b0	Execution of TLBI RVAAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIRVAE1OS, bit [24]

When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVAE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAE1OSNXS.

TLBIRVAE1OS	Meaning
0b0	Execution of TLBI RVAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

TLBIVAALE1OS, bit [23]

When FEAT_TLBIOS is implemented:

Trap execution of TLBI VAALE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAALE1OSNXS.

TLBIVAALE1OS	Meaning
`0b0`	Execution of TLBI VAALE1OS is not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value `0x18`, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

TLBIVALE1OS, bit [22]

When FEAT_TLBIOS is implemented:

Trap execution of TLBI VALE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VALE1OSNXS.

TLBIVALE1OS	Meaning
`0b0`	Execution of TLBI VALE1OS is not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value `0x18`, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

TLBIVAAE1OS, bit [21]

When FEAT_TLBIOS is implemented:

Trap execution of TLBI VAAE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAAE1OSNXS.

TLBIVAAE1OS	Meaning
0b0	Execution of TLBI VAAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIASIDE1OS, bit [20]

When FEAT_TLBIOS is implemented:

Trap execution of TLBI ASIDE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI ASIDE1OSNXS.

TLBIASIDE1OS	Meaning
0b0	Execution of TLBI ASIDE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI ASIDE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIVAE1OS, bit [19]

When FEAT_TLBIOS is implemented:

Trap execution of TLBI VAE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAE1OSNXS.

TLBIVAE1OS	Meaning
0b0	Execution of TLBI VAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

TLBIVMALLE1OS, bit [18]

When FEAT_TLBIOS is implemented:

Trap execution of TLBI VMALLE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VMALLE1OSNXS.

TLBIVMALLE1OS	Meaning
0b0	Execution of TLBI VMALLE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VMALLE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ATS1E1WP, bit [17]

When FEAT_PAN2 is implemented:

Trap execution of AT S1E1WP at EL1 using AArch64 to EL2.

ATS1E1WP	Meaning
0b0	Execution of AT S1E1WP is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1WP at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ATS1E1RP, bit [16]

When FEAT_PAN2 is implemented:

Trap execution of AT S1E1RP at EL1 using AArch64 to EL2.

ATS1E1RP	Meaning
`0b0`	Execution of AT S1E1RP is not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1RP at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value `0x18`, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

ATS1E0W, bit [15]

Trap execution of AT S1E0W at EL1 using AArch64 to EL2.

ATS1E0W	Meaning
`0b0`	Execution of AT S1E0W is not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E0W at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value `0x18`, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

ATS1E0R, bit [14]

Trap execution of AT S1E0R at EL1 using AArch64 to EL2.

ATS1E0R	Meaning
`0b0`	Execution of AT S1E0R is not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E0R at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value `0x18`, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

ATS1E1W, bit [13]

Trap execution of AT S1E1W at EL1 using AArch64 to EL2.

ATS1E1W	Meaning
0b0	Execution of AT S1E1W is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1W at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ATS1E1R, bit [12]

Trap execution of AT S1E1R at EL1 using AArch64 to EL2.

ATS1E1R	Meaning
0b0	Execution of AT S1E1R is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1R at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCZVA, bit [11]

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- DC ZVA.
- DC GVA, if FEAT_MTE is implemented.
- DC GZVA, if FEAT_MTE is implemented.

Note

Unlike HCR_EL2.TDZ, this field has no effect on DCZID_EL0.DZP.

DCZVA	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCCIVAC, bit [10]

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- DC CIVAC.
- DC CIGVAC, if FEAT_MTE is implemented.
- DC CIGDVAC, if FEAT_MTE is implemented.

DCCIVAC	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCCVADP, bit [9]
When FEAT_DPB2 is implemented:

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- DC CVADP.
- DC CGVADP, if FEAT_MTE is implemented.
- DC CGDVADP, if FEAT_MTE is implemented.

DCCVADP	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

DCCVAP, bit [8]

Trap execution of multiple instructions. Enables a trap on execution at EL1 and EL0 using AArch64 of any of the following AArch64 instructions to EL2:

- DC CVAP.
- DC CGVAP, if FEAT_MTE is implemented.
- DC CGDVAP, if FEAT_MTE is implemented.

DCCVAP	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 and EL0 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCCVAU, bit [7]

Trap execution of DC CVAU at EL1 and EL0 using AArch64 to EL2.

DCCVAU	Meaning
0b0	Execution of DC CVAU is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of DC CVAU at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCCISW, bit [6]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- DC CISW.
- DC CIGSW, if FEAT_MTE2 is implemented.
- DC CIGDSW, if FEAT_MTE2 is implemented.

DCCISW	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCCSW, bit [5]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- DC CSW.
- DC CGSW, if FEAT_MTE2 is implemented.
- DC CGDSW, if FEAT_MTE2 is implemented.

DCCSW	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCISW, bit [4]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- DC ISW.
- DC IGSW, if FEAT_MTE2 is implemented.
- DC IGDSW, if FEAT_MTE2 is implemented.

DCISW	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCIVAC, bit [3]

Trap execution of multiple instructions. Enables a trap on execution at EL1 using AArch64 of any of the following AArch64 instructions to EL2:

- DC IVAC.
- DC IGVAC, if FEAT_MTE2 is implemented.
- DC IGDVAC, if FEAT_MTE2 is implemented.

DCIVAC	Meaning
0b0	Execution of the instructions listed above is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the instructions listed above is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ICIVAU, bit [2]

Trap execution of IC IVAU at EL1 and EL0 using AArch64 to EL2.

ICIVAU	Meaning
0b0	Execution of IC IVAU is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of IC IVAU at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ICIALLU, bit [1]

Trap execution of IC IALLU at EL1 using AArch64 to EL2.

ICIALLU	Meaning
0b0	Execution of IC IALLU is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of IC IALLU at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ICIALLUIS, bit [0]

Trap execution of IC IALLUIS at EL1 using AArch64 to EL2.

ICIALLUIS	Meaning
0b0	Execution of IC IALLUIS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of IC IALLUIS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HFGITR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HFGITR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b110

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x1C8];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then

HFGRTR_EL2, Hypervisor Fine-Grained Read Trap Register

The HFGRTR_EL2 characteristics are:

Purpose

Provides controls for traps of MRS and MRC reads of System registers.

Configuration

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HFGRTR_EL2 are UNDEFINED.

Attributes

HFGRTR_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54
						RES0			
SCXTNUM_EL0	SCXTNUM_EL1	SCTLR_EL1	REVIDR_EL1	PAR_EL1	MPIDR_EL1	MIDR_EL1	MAIR_EL1	LORSA_EL1	LORN_EL1
31	30	29	28	27	26	25	24	23	22

Bits [63:51]

Reserved, RES0.

nACCDATA_EL1, bit [50]

When FEAT_LS64 is implemented:

Trap MRS reads of ACCDATA_EL1 at EL1 using AArch64 to EL2.

nACCDATA_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of ACCDATA_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXADDR_EL1, bit [49]

When FEAT_RAS is implemented:

Trap MRS reads of ERXADDR_EL1 at EL1 using AArch64 to EL2.

ERXADDR_EL1	Meaning
0b0	MRS reads of ERXADDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFGCDN_EL1, bit [48]

When FEAT_RASv1p1 is implemented:

Trap MRS reads of ERXPFGCDN_EL1 at EL1 using AArch64 to EL2.

ERXPFGCDN_EL1	Meaning
0b0	MRS reads of ERXPFGCDN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFGCTL_EL1, bit [47]

When FEAT_RASv1p1 is implemented:

Trap MRS reads of ERXPFGCTL_EL1 at EL1 using AArch64 to EL2.

ERXPFGCTL_EL1	Meaning
0b0	MRS reads of ERXPFGCTL_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFGCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFGF_EL1, bit [46]
When FEAT_RAS is implemented:

Trap MRS reads of ERXPFGF_EL1 at EL1 using AArch64 to EL2.

ERXPFGF_EL1	Meaning
0b0	MRS reads of ERXPFGF_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFGF_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXMISCn_EL1, bit [45]
When FEAT_RAS is implemented:

Trap MRS reads of ERXMISC<n>_EL1 at EL1 using AArch64 to EL2.

ERXMISCn_EL1	Meaning
0b0	MRS reads of ERXMISC<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXMISC<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXSTATUS_EL1, bit [44]
When FEAT_RAS is implemented:

Trap MRS reads of ERXSTATUS_EL1 at EL1 using AArch64 to EL2.

ERXSTATUS_EL1	Meaning
0b0	MRS reads of ERXSTATUS_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXCTLR_EL1, bit [43]

When FEAT_RAS is implemented:

Trap MRS reads of ERXCTLR_EL1 at EL1 using AArch64 to EL2.

ERXCTLR_EL1	Meaning
0b0	MRS reads of ERXCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXFR_EL1, bit [42]

When FEAT_RAS is implemented:

Trap MRS reads of ERXFR_EL1 at EL1 using AArch64 to EL2.

ERXFR_EL1	Meaning
0b0	MRS reads of ERXFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERRSELR_EL1, bit [41]
When FEAT_RAS is implemented:

Trap MRS reads of ERRSELR_EL1 at EL1 using AArch64 to EL2.

ERRSELR_EL1	Meaning
0b0	MRS reads of ERRSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERRSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERRIDR_EL1, bit [40]
When FEAT_RAS is implemented:

Trap MRS reads of ERRIDR_EL1 at EL1 using AArch64 to EL2.

ERRIDR_EL1	Meaning
0b0	MRS reads of ERRIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERRIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ICC_IGRPENn_EL1, bit [39]
When FEAT_GICv3 is implemented:

Trap MRS reads of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 to EL2.

ICC_IGRPENn_EL1	Meaning
0b0	MRS reads of ICC_IGRPEN<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

VBAR_EL1, bit [38]

Trap MRS reads of VBAR_EL1 at EL1 using AArch64 to EL2.

VBAR_EL1	Meaning
0b0	MRS reads of VBAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of VBAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TTBR1_EL1, bit [37]

Trap MRS reads of TTBR1_EL1 at EL1 using AArch64 to EL2.

TTBR1_EL1	Meaning
0b0	MRS reads of TTBR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TTBR0_EL1, bit [36]

Trap MRS reads of TTBR0_EL1 at EL1 using AArch64 to EL2.

TTBR0_EL1	Meaning
0b0	MRS reads of TTBR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDR_EL0, bit [35]

Trap MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURW at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDR_EL0	Meaning
0b0	MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURW at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of TPIDRURW at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDRRO_EL0, bit [34]

Trap MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURO at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDRRO_EL0	Meaning
0b0	MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURO at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the read generates a higher priority exception: • MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of TPIDRURO at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDR_EL1, bit [33]

Trap MRS reads of TPIDR_EL1 at EL1 using AArch64 to EL2.

TPIDR_EL1	Meaning
0b0	MRS reads of TPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TCR_EL1, bit [32]

Trap MRS reads of TCR_EL1 at EL1 using AArch64 to EL2.

TCR_EL1	Meaning
0b0	MRS reads of TCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

SCXTNUM_EL0, bit [31]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MRS reads of SCXTNUM_EL0 at EL1 and EL0 using AArch64 to EL2.

SCXTNUM_EL0	Meaning
0b0	MRS reads of SCXTNUM_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCXTNUM_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

SCXTNUM_EL1, bit [30]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MRS reads of SCXTNUM_EL1 at EL1 using AArch64 to EL2.

SCXTNUM_EL1	Meaning
0b0	MRS reads of SCXTNUM_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCXTNUM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

SCTLR_EL1, bit [29]

Trap MRS reads of SCTLR_EL1 at EL1 using AArch64 to EL2.

SCTLR_EL1	Meaning
0b0	MRS reads of SCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

REVIDR_EL1, bit [28]

Trap MRS reads of REVIDR_EL1 at EL1 using AArch64 to EL2.

REVIDR_EL1	Meaning
0b0	MRS reads of REVIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of REVIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

PAR_EL1, bit [27]

Trap MRS reads of PAR_EL1 at EL1 using AArch64 to EL2.

PAR_EL1	Meaning
0b0	MRS reads of PAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

MPIDR_EL1, bit [26]

Trap MRS reads of MPIDR_EL1 at EL1 using AArch64 to EL2.

MPIDR_EL1	Meaning
0b0	MRS reads of MPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

MIDR_EL1, bit [25]

Trap MRS reads of MIDR_EL1 at EL1 using AArch64 to EL2.

MIDR_EL1	Meaning
0b0	MRS reads of MIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

MAIR_EL1, bit [24]

Trap MRS reads of MAIR_EL1 at EL1 using AArch64 to EL2.

MAIR_EL1	Meaning
0b0	MRS reads of MAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

LORSA_EL1, bit [23]

When FEAT_LOR is implemented:

Trap MRS reads of LORSA_EL1 at EL1 using AArch64 to EL2.

LORSA_EL1	Meaning
0b0	MRS reads of LORSA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORSA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORN_EL1, bit [22]

When FEAT_LOR is implemented:

Trap MRS reads of LORN_EL1 at EL1 using AArch64 to EL2.

LORN_EL1	Meaning
0b0	MRS reads of LORN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORID_EL1, bit [21]

When FEAT_LOR is implemented:

Trap MRS reads of LORID_EL1 at EL1 using AArch64 to EL2.

LORID_EL1	Meaning
0b0	MRS reads of LORID_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORID_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LOREA_EL1, bit [20]

When FEAT_LOR is implemented:

Trap MRS reads of LOREA_EL1 at EL1 using AArch64 to EL2.

LOREA_EL1	Meaning
0b0	MRS reads of LOREA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LOREA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORC_EL1, bit [19]

When FEAT_LOR is implemented:

Trap MRS reads of LORC_EL1 at EL1 using AArch64 to EL2.

LORC_EL1	Meaning
0b0	MRS reads of LORC_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORC_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ISR_EL1, bit [18]

Trap MRS reads of ISR_EL1 at EL1 using AArch64 to EL2.

ISR_EL1	Meaning
0b0	MRS reads of ISR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ISR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

FAR_EL1, bit [17]

Trap MRS reads of FAR_EL1 at EL1 using AArch64 to EL2.

FAR_EL1	Meaning
0b0	MRS reads of FAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of FAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ESR_EL1, bit [16]

Trap MRS reads of ESR_EL1 at EL1 using AArch64 to EL2.

ESR_EL1	Meaning
0b0	MRS reads of ESR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ESR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

DCZID_EL0, bit [15]

Trap MRS reads of DCZID_EL0 at EL1 and EL0 using AArch64 to EL2.

DCZID_EL0	Meaning
0b0	MRS reads of DCZID_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DCZID_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CTR_EL0, bit [14]

Trap MRS reads of CTR_EL0 at EL1 and EL0 using AArch64 to EL2.

CTR_EL0	Meaning
0b0	MRS reads of CTR_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CSSELR_EL1, bit [13]

Trap MRS reads of CSSELR_EL1 at EL1 using AArch64 to EL2.

CSSELR_EL1	Meaning
0b0	MRS reads of CSSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CSSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CPACR_EL1, bit [12]

Trap MRS reads of CPACR_EL1 at EL1 using AArch64 to EL2.

CPACR_EL1	Meaning
0b0	MRS reads of CPACR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CPACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CONTEXTIDR_EL1, bit [11]

Trap MRS reads of CONTEXTIDR_EL1 at EL1 using AArch64 to EL2.

CONTEXTIDR_EL1	Meaning
0b0	MRS reads of CONTEXTIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CONTEXTIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

CLIDR_EL1, bit [10]

Trap MRS reads of CLIDR_EL1 at EL1 using AArch64 to EL2.

CLIDR_EL1	Meaning
0b0	MRS reads of CLIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CLIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

CCSIDR_EL1, bit [9]

Trap MRS reads of CCSIDR_EL1 at EL1 using AArch64 to EL2.

CCSIDR_EL1	Meaning
0b0	MRS reads of CCSIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CCSIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

APIBKey, bit [8]
When FEAT_PAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APIBKeyHi_EL1.
- APIBKeyLo_EL1.

APIBKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

APIAKey, bit [7]
When FEAT_PAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APIAKeyHi_EL1.
- APIAKeyLo_EL1.

APIAKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APGAKey, bit [6]
When FEAT_PAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APGAKeyHi_EL1.
- APGAKeyLo_EL1.

APGAKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APDBKey, bit [5]
When FEAT_PAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDBKeyHi_EL1.
- APDBKeyLo_EL1.

APDBKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APDAKey, bit [4]

When FEAT_PAuth is implemented:

Trap MRS reads of multiple System registers. Enables a trap on MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDAKeyHi_EL1.
- APDAKeyLo_EL1.

APDAKey	Meaning
0b0	MRS reads of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

AMAIR_EL1, bit [3]

Trap MRS reads of AMAIR_EL1 at EL1 using AArch64 to EL2.

AMAIR_EL1	Meaning
0b0	MRS reads of AMAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AMAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

AIDR_EL1, bit [2]

Trap MRS reads of AIDR_EL1 at EL1 using AArch64 to EL2.

AIDR_EL1	Meaning
0b0	MRS reads of AIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

AFSR1_EL1, bit [1]

Trap MRS reads of AFSR1_EL1 at EL1 using AArch64 to EL2.

AFSR1_EL1	Meaning
0b0	MRS reads of AFSR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AFSR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

AFSR0_EL1, bit [0]

Trap MRS reads of AFSR0_EL1 at EL1 using AArch64 to EL2.

AFSR0_EL1	Meaning
0b0	MRS reads of AFSR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AFSR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HFGRTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HFGRTR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x1B8];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then

HFGWTR_EL2, Hypervisor Fine-Grained Write Trap Register

The HFGWTR_EL2 characteristics are:

Purpose

Provides controls for traps of MSR and MCR writes of System registers.

Configuration

This register is present only when FEAT_FGT is implemented. Otherwise, direct accesses to HFGWTR_EL2 are UNDEFINED.

Attributes

HFGWTR_EL2 is a 64-bit register.

Bits [63:51]

Reserved, RES0.

nACCDATA_EL1, bit [50]
When FEAT_LS64 is implemented:

Trap MSR writes of ACCDATA_EL1 at EL1 using AArch64 to EL2.

nACCDATA_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of ACCDATA_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXADDR_EL1, bit [49]
When FEAT_RAS is implemented:

Trap MSR writes of ERXADDR_EL1 at EL1 using AArch64 to EL2.

ERXADDR_EL1	Meaning
0b0	MSR writes of ERXADDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFGCDN_EL1, bit [48]
When FEAT_RASv1p1 is implemented:

Trap MSR writes of ERXPFGCDN_EL1 at EL1 using AArch64 to EL2.

ERXPFGCDN_EL1	Meaning
0b0	MSR writes of ERXPFGCDN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXPFGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

ERXPFGCTL_EL1, bit [47]
When FEAT_RASv1p1 is implemented:

Trap MSR writes of ERXPFGCTL_EL1 at EL1 using AArch64 to EL2.

ERXPFGCTL_EL1	Meaning
0b0	MSR writes of ERXPFGCTL_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXPFGCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bit [46]

Reserved, RES0.

ERXMISCn_EL1, bit [45]

When FEAT_RAS is implemented:

Trap `MSR` writes of ERXMISC<n>_EL1 at EL1 using AArch64 to EL2.

ERXMISCn_EL1	Meaning
`0b0`	`MSR` writes of ERXMISC<n>_EL1 are not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then `MSR` writes of ERXMISC<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value `0x18`, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

ERXSTATUS_EL1, bit [44]

When FEAT_RAS is implemented:

Trap `MSR` writes of ERXSTATUS_EL1 at EL1 using AArch64 to EL2.

ERXSTATUS_EL1	Meaning
`0b0`	`MSR` writes of ERXSTATUS_EL1 are not trapped by this mechanism.
`0b1`	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then `MSR` writes of ERXSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value `0x18`, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Otherwise:

Reserved, RES0.

ERXCTLR_EL1, bit [43]
When FEAT_RAS is implemented:

Trap MSR writes of ERXCTLR_EL1 at EL1 using AArch64 to EL2.

ERXCTLR_EL1	Meaning
0b0	MSR writes of ERXCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

ERRSELR_EL1, bit [41]
When FEAT_RAS is implemented:

Trap MSR writes of ERRSELR_EL1 at EL1 using AArch64 to EL2.

ERRSELR_EL1	Meaning
0b0	MSR writes of ERRSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERRSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [40]

Reserved, RES0.

ICC_IGRPENn_EL1, bit [39]
When FEAT_GICv3 is implemented:

Trap MSR writes of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 to EL2.

ICC_IGRPENn_EL1	Meaning
0b0	MSR writes of ICC_IGRPEN<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

VBAR_EL1, bit [38]

Trap MSR writes of VBAR_EL1 at EL1 using AArch64 to EL2.

VBAR_EL1	Meaning
0b0	MSR writes of VBAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of VBAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TTBR1_EL1, bit [37]

Trap MSR writes of TTBR1_EL1 at EL1 using AArch64 to EL2.

TTBR1_EL1	Meaning
0b0	MSR writes of TTBR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TTBR0_EL1, bit [36]

Trap MSR writes of TTBR0_EL1 at EL1 using AArch64 to EL2.

TTBR0_EL1	Meaning
0b0	MSR writes of TTBR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDR_EL0, bit [35]

Trap MSR writes of TPIDR_EL0 at EL1 and EL0 using AArch64 and MCR writes of TPIDRURW at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDR_EL0	Meaning
0b0	MSR writes of TPIDR_EL0 at EL1 and EL0 using AArch64 and MCR writes of TPIDRURW at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, EL1 is using AArch64, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then, unless the write generates a higher priority exception: • MSR writes of TPIDR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of TPIDRURW at EL0 using AArch32 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDRRO_EL0, bit [34]

Trap MSR writes of TPIDRRO_EL0 at EL1 using AArch64 to EL2.

TPIDRRO_EL0	Meaning
0b0	MSR writes of TPIDRRO_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDRRO_EL0 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TPIDR_EL1, bit [33]

Trap MSR writes of TPIDR_EL1 at EL1 using AArch64 to EL2.

TPIDR_EL1	Meaning
0b0	MSR writes of TPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

TCR_EL1, bit [32]

Trap MSR writes of TCR_EL1 at EL1 using AArch64 to EL2.

TCR_EL1	Meaning
0b0	MSR writes of TCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

SCXTNUM_EL0, bit [31]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MSR writes of SCXTNUM_EL0 at EL1 and EL0 using AArch64 to EL2.

SCXTNUM_EL0	Meaning
0b0	MSR writes of SCXTNUM_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, HCR_EL2.{E2H, TGE} != {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCXTNUM_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

SCXTNUM_EL1, bit [30]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MSR writes of SCXTNUM_EL1 at EL1 using AArch64 to EL2.

SCXTNUM_EL1	Meaning
0b0	MSR writes of SCXTNUM_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCXTNUM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

SCTLR_EL1, bit [29]

Trap MSR writes of SCTLR_EL1 at EL1 using AArch64 to EL2.

SCTLR_EL1	Meaning
0b0	MSR writes of SCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [28]

Reserved, RES0.

PAR_EL1, bit [27]

Trap MSR writes of PAR_EL1 at EL1 using AArch64 to EL2.

PAR_EL1	Meaning
0b0	MSR writes of PAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bits [26:25]

Reserved, RES0.

MAIR_EL1, bit [24]

Trap MSR writes of MAIR_EL1 at EL1 using AArch64 to EL2.

MAIR_EL1	Meaning
0b0	MSR writes of MAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of MAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

LORSA_EL1, bit [23]
When FEAT_LOR is implemented:

Trap MSR writes of LORSA_EL1 at EL1 using AArch64 to EL2.

LORSA_EL1	Meaning
0b0	MSR writes of LORSA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORSA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORN_EL1, bit [22]
When FEAT_LOR is implemented:

Trap MSR writes of LORN_EL1 at EL1 using AArch64 to EL2.

LORN_EL1	Meaning
0b0	MSR writes of LORN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [21]

Reserved, RES0.

LOREA_EL1, bit [20]
When FEAT_LOR is implemented:

Trap MSR writes of LOREA_EL1 at EL1 using AArch64 to EL2.

LOREA_EL1	Meaning
0b0	MSR writes of LOREA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LOREA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

LORC_EL1, bit [19]
When FEAT_LOR is implemented:

Trap MSR writes of LORC_EL1 at EL1 using AArch64 to EL2.

LORC_EL1	Meaning
0b0	MSR writes of LORC_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORC_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

FAR_EL1, bit [17]

Trap MSR writes of FAR_EL1 at EL1 using AArch64 to EL2.

FAR_EL1	Meaning
0b0	MSR writes of FAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of FAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

ESR_EL1, bit [16]

Trap MSR writes of ESR_EL1 at EL1 using AArch64 to EL2.

ESR_EL1	Meaning
0b0	MSR writes of ESR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ESR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bits [15:14]

Reserved, RES0.

CSSELR_EL1, bit [13]

Trap MSR writes of CSSELR_EL1 at EL1 using AArch64 to EL2.

CSSELR_EL1	Meaning
0b0	MSR writes of CSSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CSSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CPACR_EL1, bit [12]

Trap MSR writes of CPACR_EL1 at EL1 using AArch64 to EL2.

CPACR_EL1	Meaning
0b0	MSR writes of CPACR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CPACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

CONTEXTIDR_EL1, bit [11]

Trap MSR writes of CONTEXTIDR_EL1 at EL1 using AArch64 to EL2.

CONTEXTIDR_EL1	Meaning
0b0	MSR writes of CONTEXTIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CONTEXTIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bits [10:9]

Reserved, RES0.

APIBKey, bit [8]
When FEAT_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APIBKeyHi_EL1.
- APIBKeyLo_EL1.

APIBKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APIAKey, bit [7]

When FEAT_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APIAKeyHi_EL1.
- APIAKeyLo_EL1.

APIAKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APGAKey, bit [6]

When FEAT_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APGAKeyHi_EL1.
- APGAKeyLo_EL1.

APGAKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APDBKey, bit [5]

When FEAT_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDBKeyHi_EL1.
- APDBKeyLo_EL1.

APDBKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

APDAKey, bit [4]

When FEAT_PAuth is implemented:

Trap MSR writes of multiple System registers. Enables a trap on MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDAKeyHi_EL1.
- APDAKeyLo_EL1.

APDAKey	Meaning
0b0	MSR writes of the System registers listed above are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the System registers listed above are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

AMAIR_EL1, bit [3]

Trap MSR writes of AMAIR_EL1 at EL1 using AArch64 to EL2.

AMAIR_EL1	Meaning
0b0	MSR writes of AMAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AMAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [2]

Reserved, RES0.

AFSR1_EL1, bit [1]

Trap MSR writes of AFSR1_EL1 at EL1 using AArch64 to EL2.

AFSR1_EL1	Meaning
0b0	MSR writes of AFSR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AFSR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

AFSR0_EL1, bit [0]

Trap MSR writes of AFSR0_EL1 at EL1 using AArch64 to EL2.

AFSR0_EL1	Meaning
0b0	MSR writes of AFSR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AFSR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HFGWTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HFGWTR_EL2

HPFAR_EL2, Hypervisor IPA Fault Address Register

The HPFAR_EL2 characteristics are:

Purpose

Holds the faulting IPA for some aborts on a stage 2 translation taken to EL2.

Configuration

AArch64 System register HPFAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HPFAR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

The HPFAR_EL2 is written for:

- Translation or Access faults in the second stage of translation.
- An abort in the second stage of translation performed during the translation table walk of a first stage translation, caused by a Translation fault, an Access flag fault, or a Permission fault.
- A stage 2 Address size fault.

For all other exceptions taken to EL2, this register is UNKNOWN.

Note

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the Instruction Abort or Data Abort. It is the lowest address that gave rise to the fault. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize between those different faults.

Attributes

HPFAR_EL2 is a 64-bit register.

Field descriptions

63	62–44	43–32
NS	RES0	FIPA

31–4	3–0
FIPA	RES0

Execution at EL1 or EL0 makes HPFAR_EL2 become UNKNOWN.

NS, bit [63]

When FEAT_SEL2 is implemented:

Faulting IPA address space.

NS	Meaning
`0b0`	Faulting IPA is from the Secure IPA space.
`0b1`	Faulting IPA is from the Non-secure IPA space.

For Data Aborts or Instruction Aborts taken to Non-secure EL2:

- This field is RES0.
- The address is from the Non-secure IPA space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [62:44]

Reserved, RES0.

FIPA, bits [43:4]

FIPA encoding when FEAT_LPA is implemented

38 … 0
FIPA

FIPA, bits [38:0]

Bits [51:12] of the Faulting Intermediate Physical Address.

For implementations with fewer than 52 physical address bits, the corresponding upper bits in this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIPA encoding when FEAT_LPA is not implemented

38 … 35	34 … 0
RES0	FIPA

Bits [38:35]

Reserved, RES0.

FIPA, bits [34:0]

Bits[47:12] Faulting Intermediate Physical Address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:0]

Reserved, RES0.

Accessing HPFAR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HPFAR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0110	0b0000	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HPFAR_EL2;
elsif PSTATE.EL == EL3 then
    return HPFAR_EL2;
```

```
MSR HPFAR_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0110	0b0000	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

HSTR_EL2, Hypervisor System Trap Register

The HSTR_EL2 characteristics are:

Purpose

Controls trapping to EL2 of EL1 or lower AArch32 accesses to the System register in the coproc == `0b1111` encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCRR or MRRC instruction, this is the CRm value used to access the register.

Configuration

AArch64 System register HSTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSTR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

HSTR_EL2 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63:32
RES0

31:16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	T15	RES0	T13	T12	T11	T10	T9	T8	T7	T6	T5	RES0	T3	T2	T1	T0

Bits [63:16, 14, 4]

Reserved, RES0.

T<n>, bit [n], for n = 15, 13 to 5, 3 to 0

The remaining fields control whether EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == `0b1111` encoding space, are trapped to EL2 as follows:

- MCR or MRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value `0x03`, unless the access is UNDEFINED.
- MCRR or MRRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value `0x04`, unless the access is UNDEFINED.

T<n>	Meaning
`0b0`	This control has no effect on EL0 or EL1 accesses to System registers.
`0b1`	System registers in the coproc == `0b1111` encoding space and CRn == <n> or CRm == <n> where T<n> is the name of this field, are trapped as follows: • An EL1 MCR or MRC access is trapped to EL2. • An EL0 MCR or MRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0. • An EL1 MCRR or MRRC access is trapped to EL2. • An EL0 MCRR or MRRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0. It is IMPLEMENTATION DEFINED whether an EL0 access using AArch32 is trapped to EL2, or is UNDEFINED. If the access is UNDEFINED, and generates an exception that is taken to EL1 or EL2 using AArch64, this is reported with EC syndrome value `0x00`. **Note** Arm expects that trapping to EL2 of EL0 accesses to these registers is unusual and used only when the hypervisor must virtualize EL0 operation. Arm recommends that, whenever possible, EL0 accesses to these registers behave as they would if the implementation did not include EL2. This means that, if the architecture does not support the EL0 access, then the register access instruction is treated as UNDEFINED and generates an exception that is taken to EL1.

For example, when HSTR_EL2.T7 is 1, for instructions executed at EL1:

- An MCR or MRC instruction with coproc set to `0b1111` and <CRn> set to c7 is trapped to EL2.
- An MCRR or MRRC instruction with coproc set to `0b1111` and <CRm> set to c7 is trapped to EL2.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

63–32
RES0

31–0
RES0

Bits [63:0]

Reserved, RES0.

Accessing HSTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, HSTR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x080];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HSTR_EL2;
elsif PSTATE.EL == EL3 then
    return HSTR_EL2;
```

```
MSR HSTR_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x080] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HSTR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    HSTR_EL2 = X[t];

IC IALLU, Instruction Cache Invalidate All to PoU

The IC IALLU characteristics are:

Purpose

Invalidate all instruction caches of the PE executing the instruction to the Point of Unification.

Configuration

AArch64 System instruction IC IALLU performs the same function as AArch32 System instruction ICIALLU.

Attributes

IC IALLU is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the IC IALLU instruction

The Rt field should be set to `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
IC IALLU{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0101	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

IC IALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable

The IC IALLUIS characteristics are:

Purpose

Invalidate all instruction caches in the Inner Shareable domain of the PE executing the instruction to the Point of Unification.

Configuration

AArch64 System instruction IC IALLUIS performs the same function as AArch32 System instruction ICIALLUIS.

Attributes

IC IALLUIS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the IC IALLUIS instruction

The Rt field should be set to `0b11111`. If the Rt field is not set to `0b11111`, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to `0b11111`.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
IC IALLUIS{, <Xt>}
```

IC IVAU, Instruction Cache line Invalidate by VA to PoU

The IC IVAU characteristics are:

Purpose

Invalidate instruction cache by address to Point of Unification.

Configuration

AArch64 System instruction IC IVAU performs the same function as AArch32 System instruction ICIMVAU.

Attributes

IC IVAU is a 64-bit System instruction.

Field descriptions

63–32
Virtual address to use

31–0
Virtual address to use

Bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the IC IVAU instruction

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The instruction cache maintenance instruction (IC)'.

If EL0 access is enabled, when executed at EL0, if this instruction does not have read access permission to the VA, it is IMPLEMENTATION DEFINED whether it generates a Permission fault.

When FEAT_CMOW is implemented, HCR_EL2.{E2H, TGE} is not {1, 1}, SCTLR_EL1.CMOW is 1, and EL0 is implemented, when executed at EL0, the instruction has stage 1 read permission to the VA, but does not have stage 1 write permission to the VA, the instruction generates a stage 1 Permission fault.

When FEAT_CMOW is implemented, HCR_EL2.E2H is 1, SCTLR_EL2.CMOW is 1, and EL0 access is enabled, when executed at EL0, the instruction has stage 1 read permission to the VA but does not have stage 1 write permission to the VA, the instruction generates a stage 1 Permission fault.

When FEAT_CMOW is implemented, HCRX_EL2.CMOW is 1, and EL1 or EL0 access is enabled, when executed at EL1 or EL0 the instruction has stage 2 read permission to the VA but does not have stage 2 write permission to the VA, the instruction generates a stage 2 Permission fault.

For more information, see 'Permission fault'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
IC IVAU{, <Xt>}
```

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0101	0b001

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value `0x00000000` is consistent with no interrupts being active.

Accessing ICC_AP0R<n>_EL1

Writing to these registers with any value other than the last read value of the register (or `0x00000000` when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP0R1_EL1 is only implemented in implementations that support 6 or more bits of priority. ICC_AP0R2_EL1 and ICC_AP0R3_EL1 are only implemented in implementations that support 7 or more bits of priority. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICC_AP0R<n>_EL1.
- Secure ICC_AP1R<n>_EL1.
- Non-secure ICC_AP1R<n>_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_AP0R<n>_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b1:n[1:0]

ICC_AP1R<n>_EL1, Interrupt Controller Active Priorities Group 1 Registers, n = 0 - 3

The ICC_AP1R<n>_EL1 characteristics are:

Purpose

Provides information about Group 1 active priorities.

Configuration

AArch64 System register ICC_AP1R<n>_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register ICC_AP1R<n>[31:0] (S).

AArch64 System register ICC_AP1R<n>_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register ICC_AP1R<n>[31:0] (NS).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_AP1R<n>_EL1 are UNDEFINED.

Attributes

ICC_AP1R<n>_EL1 is a 64-bit register.

Field descriptions

63	62:32
NMI	RES0

31:0
IMPLEMENTATION DEFINED

NMI, bit [63]

When FEAT_GICv3_NMI is implemented:

Indicates whether there is an active NMI priority.

NMI	Meaning
`0b0`	There is no active Group 1 NMI, or all active Group 1 NMIs have undergone priority drop.
`0b1`	There is an active Group 1 NMI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bits [62:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value `0x00000000` is consistent with no interrupts being active.

Accessing ICC_AP1R<n>_EL1

Writing to these registers with any value other than the last read value of the register (or `0x00000000` when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.

ICC_ASGI1R_EL1, Interrupt Controller Alias Software Generated Interrupt Group 1 Register

The ICC_ASGI1R_EL1 characteristics are:

Purpose

Generates Group 1 SGIs for the Security state that is not the current Security state.

Configuration

AArch64 System register ICC_ASGI1R_EL1 performs the same function as AArch32 System register ICC_ASGI1R.

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_ASGI1R_EL1 are UNDEFINED.

Under certain conditions a write to ICC_ASGI1R_EL1 can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_ASGI1R_EL1 is a 64-bit register.

Field descriptions

63:56	55:48	47:44	43:41	40	39:32
RES0	Aff3	RS	RES0	IRM	Aff2

31:28	27:24	23:16	15:0
RES0	INTID	Aff1	TargetList

Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
`0b0`	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
`0b1`	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing ICC_ASGI1R_EL1

This register allows software executing in a Secure state to generate Non-secure Group 1 SGIs. It will also allow software executing in a Non-secure state to generate Secure Group 1 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding'.

Note

Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_ASGI1R_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b110

```
if PSTATE.EL == EL0 then

ICC_BPR0_EL1, Interrupt Controller Binary Point Register 0

The ICC_BPR0_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

Configuration

AArch64 System register ICC_BPR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_BPR0[31:0].

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_BPR0_EL1 are UNDEFINED.

Virtual accesses to this register update ICH_VMCR_EL2.VBPR0.

Attributes

ICC_BPR0_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:3	RES0
2:0	BinaryPoint

Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	gggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.ssssssss

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_BPR0_EL1

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by ICC_CTLR_EL1.PRIbits and ICC_CTLR_EL3.PRIbits.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_BPR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b011

```

ICC_BPR1_EL1, Interrupt Controller Binary Point Register 1

The ICC_BPR1_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

Configuration

AArch64 System register ICC_BPR1_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register ICC_BPR1[31:0] (S).

AArch64 System register ICC_BPR1_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register ICC_BPR1[31:0] (NS).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_BPR1_EL1 are UNDEFINED.

Virtual accesses to this register update ICH_VMCR_EL2.VBPR1.

Attributes

ICC_BPR1_EL1 is a 64-bit register.

Field descriptions

63–32	
RES0	
31–3	**2–0**
RES0	BinaryPoint

Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The minimum value of the Non-secure copy of this register is the minimum value of ICC_BPR0_EL1 + 1. The minimum value of the Secure copy of this register is the minimum value of ICC_BPR0_EL1.

If EL3 is implemented and ICC_CTLR_EL3.CBPR_EL1S is 1:

- Accesses to this register from Secure EL2 access the state of ICC_BPR0_EL1.
- Accesses to this register from Secure EL1:
    - When SCR_EL3.EEL2 is 1 and HCR_EL2.IMO is 1, access the state of ICV_BPR1_EL1.
    - Otherwise, access the state of ICC_BPR0_EL1.

If EL3 is implemented and ICC_CTLR_EL3.CBPR_EL1NS is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR_EL2.IMO and SCR_EL3.IRQ:

HCR_EL2.IMO	SCR_EL3.IRQ	Behavior
0b0	0b0	Non-secure EL1 and EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b0	0b1	Non-secure EL1 and EL2 accesses trap to EL3.
0b1	0b0	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.
0b1	0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 accesses trap to EL3.

If EL3 is not implemented and ICC_CTLR_EL1.CBPR is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR_EL2.IMO:

HCR_EL2.IMO	Behavior
0b0	Non-secure EL1 and EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_BPR1_EL1

On a reset, the binary point field is UNKNOWN.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_BPR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b011

ICC_CTLR_EL1, Interrupt Controller Control Register (EL1)

The ICC_CTLR_EL1 characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Configuration

AArch64 System register ICC_CTLR_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register ICC_CTLR[31:0] (S).

AArch64 System register ICC_CTLR_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register ICC_CTLR[31:0] (NS).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_CTLR_EL1 are UNDEFINED.

Attributes

ICC_CTLR_EL1 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52	51	50	49 48	47	46	45 44 43	42 41 40	39	38	37 36 35 34	33	32
RES0												
RES0	ExtRange	RSS	RES0	A3V	SEIS	IDbits	PRIbits	RES0	PMHE	RES0	EOImode	CBPR
31 30 29 28 27 26 25 24 23 22 21 20	19	18	17 16	15	14	13 12 11	10 9 8	7	6	5 4 3 2	1	0

Bits [63:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
`0b0`	CPU interface does not support INTIDs in the range 1024..8191. • Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. **Note** Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
`0b1`	CPU interface supports INTIDs in the range 1024..8191 • All INTIDs in the range 1024..8191 are treated as requiring deactivation.

If EL3 is implemented, ICC_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL3.ExtRange.

RSS, bit [18]

Range Selector Support. Possible values are:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

A3V	Meaning
0b0	The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.A3V.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

SEIS	Meaning
0b0	The CPU interface logic does not support local generation of SEIs.
0b1	The CPU interface logic supports local generation of SEIs.

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.SEIS.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is implemented, this field is an alias of ICC_CTLR_EL3.IDbits.

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of GICD_CTLR.DS.

For physical accesses, this field determines the minimum value of ICC_BPR0_EL1.

If EL3 is implemented, physical accesses return the value from ICC_CTLR_EL3.PRIbits.

If EL3 is not implemented, physical accesses return the value from this field.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

PMHE	Meaning
`0b0`	Disables use of ICC_PMR_EL1 as a hint for interrupt distribution.
`0b1`	Enables use of ICC_PMR_EL1 as a hint for interrupt distribution.

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.PMHE. Whether this bit can be written as part of an access to this register depends on the value of GICD_CTLR.DS:

- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

Bits [5:2]

Reserved, RES0.

EOImode, bit [1]

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

EOImode	Meaning
`0b0`	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
`0b1`	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

The Secure ICC_CTLR_EL1.EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1S.

The Non-secure ICC_CTLR_EL1.EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1NS

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

CBPR	Meaning
`0b0`	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Group 1 interrupts.
`0b1`	ICC_BPR0_EL1 determines the preemption group for both Group 0 and Group 1 interrupts.

If EL3 is implemented:

- This bit is an alias of ICC_CTLR_EL3.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, this bit is read/write.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_CTLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

ICC_CTLR_EL3, Interrupt Controller Control Register (EL3)

The ICC_CTLR_EL3 characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Configuration

AArch64 System register ICC_CTLR_EL3 bits [31:0] can be mapped to AArch32 System register [ICC_MCTLR[31:0]](#), but this is not architecturally mandated.

This register is present only when FEAT_GICv3 is implemented and EL3 is implemented. Otherwise, direct accesses to ICC_CTLR_EL3 are UNDEFINED.

Attributes

ICC_CTLR_EL3 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52	51	50	49	48	47	46	45 44 43	42 41 40	39	38	37	36	35
RES0													
RES0	ExtRange	RSS	nDS	RES0	A3V	SEIS	IDbits	PRIbits	RES0	PMHE	RM	EOImode_EL1NS	EOImode_EL
31 30 29 28 27 26 25 24 23 22 21 20	19	18	17	16	15	14	13 12 11	10 9 8	7	6	5	4	3

Bits [63:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. • Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. **Note** Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191 • All INTIDs in the range 1024..8191 are treated as requiring deactivation.

RSS, bit [18]

Range Selector Support.

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0-15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0-255 are supported.

This bit is read-only.

nDS, bit [17]

Disable Security not supported. Read-only and writes are ignored.

nDS	Meaning
0b0	The CPU interface logic supports disabling of security.
0b1	The CPU interface logic does not support disabling of security, and requires that security is not disabled.

Bit [16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored.

A3V	Meaning
0b0	The CPU interface logic does not support non-zero values of the Aff3 field in SGI generation System registers.
0b1	The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers.

If EL3 is present, ICC_CTLR_EL1.A3V is an alias of ICC_CTLR_EL3.A3V

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The CPU interface logic does not support generation of SEIs.
0b1	The CPU interface logic supports generation of SEIs.

If EL3 is present, ICC_CTLR_EL1.SEIS is an alias of ICC_CTLR_EL3.SEIS

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. Indicates the number of physical interrupt identifier bits supported.

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is present, ICC_CTLR_EL1.IDbits is an alias of ICC_CTLR_EL3.IDbits

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the value of SCR_EL3.NS or the value of GICD_CTLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0_EL1 and ICC_BPR1_EL1.

This field determines the minimum value of ICC_BPR0_EL1.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable.

PMHE	Meaning
`0b0`	Disables use of the priority mask register as a hint for interrupt distribution.
`0b1`	Enables use of the priority mask register as a hint for interrupt distribution.

Software must write ICC_PMR_EL1 to `0xFF` before clearing this field to 0.

- An implementation might choose to make this field RAO/WI if priority-based routing is always used
- An implementation might choose to make this field RAZ/WI if priority-based routing is never used

If EL3 is present, ICC_CTLR_EL1.PMHE is an alias of ICC_CTLR_EL3.PMHE.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

RM, bit [5]

Routing Modifier. This bit controls whether EL3 can acknowledge, or observe as the Highest Priority Pending Interrupt, Secure Group 0 and Non-secure Group 1 interrupts.

RM	Meaning
`0b0`	Secure Group 0 and Non-secure Group 1 interrupts can be acknowledged and observed as the highest priority interrupt at EL3.
`0b1`	Secure Group 0 and Non-secure Group 1 interrupts cannot be acknowledged and observed as the highest priority interrupt at EL3. Secure Group 0 interrupts return a special INTID value of 1020. This affects accesses to ICC_IAR0_EL1 and ICC_HPPIR0_EL1. Non-secure Group 1 interrupts return a special INTID value of 1021. This affects accesses to ICC_IAR1_EL1 and ICC_HPPIR1_EL1.

Note

The Routing Modifier bit is supported in AArch64 only. In systems without EL3 the behavior is as if the value is 0. Software must ensure this bit is 0 when the Secure copy of ICC_SRE_EL1.SRE is 1, otherwise system behavior is UNPREDICTABLE. In systems without EL3 or where the Secure copy of ICC_SRE_EL1.SRE is RAO/WI, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1NS, bit [4]

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1NS	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

If EL3 is present, ICC_CTLR_EL1(NS).EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1S, bit [3]

EOI mode for interrupts handled at Secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1S	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

If EL3 is present, ICC_CTLR_EL1(S).EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1S.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL3, bit [2]

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL3	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1NS, bit [1]

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.

CBPR_EL1NS	Meaning
0b0	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Non-secure Group 1 interrupts.
0b1	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1_EL1 access the state of ICC_BPR0_EL1.

If EL3 is present, ICC_CTLR_EL1(NS).CBPR is an alias of ICC_CTLR_EL3.CBPR_EL1NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts at EL1 and EL2.

CBPR_EL1S	Meaning
0b0	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Secure Group 1 interrupts.
0b1	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 accesses to ICC_BPR1_EL1 access the state of ICC_BPR0_EL1.

If EL3 is present, ICC_CTLR_EL1(S).CBPR is an alias of ICC_CTLR_EL3.CBPR_EL1S.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_CTLR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_CTLR_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICC_CTLR_EL3;
```

```
MSR ICC_CTLR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

ICC_DIR_EL1, Interrupt Controller Deactivate Interrupt Register

The ICC_DIR_EL1 characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

Configuration

AArch64 System register ICC_DIR_EL1 performs the same function as AArch32 System register ICC_DIR.

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_DIR_EL1 are UNDEFINED.

Attributes

ICC_DIR_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:24	RES0
23:0	INTID

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_DIR_EL1

There are two cases when writing to ICC_DIR_EL1 that were UNPREDICTABLE for a corresponding GICv2 write to GICC_DIR:

- When EOImode == 0. GICv3 implementations must ignore such writes. In systems supporting system error generation, an implementation might generate an SEI.
- When EOImode == 1 but no EOI has been issued. The interrupt will be de-activated by the Distributor, however the active priority in the CPU interface for the interrupt will remain set (because no EOI was issued).

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_DIR_EL1, <Xt>
```

op0	op1	CRn	CRm	op2

0b11	0b000	0b1100	0b1011	0b001

```
if PSTATE.EL == EL0 then

ICC_EOIR0_EL1, Interrupt Controller End Of Interrupt Register 0

The ICC_EOIR0_EL1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

Configuration

AArch64 System register ICC_EOIR0_EL1 performs the same function as AArch32 System register ICC_EOIR0.

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_EOIR0_EL1 are UNDEFINED.

Attributes

ICC_EOIR0_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:24	RES0
23:0	INTID

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICC_IAR0_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR_EL1 to deactivate the interrupt.

The EOImode bit for the current Exception level and Security state is determined as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR_EL1.EOImode.
- If EL3 is implemented and the software is executing at EL3, the appropriate bit is ICC_CTLR_EL3.EOImode_EL3.
- If EL3 is implemented and the software is not executing at EL3, the bit depends on the current Security state:
    - If the software is executing in Secure state, the bit is ICC_CTLR_EL3.EOImode_EL1S.
    - If the software is executing in Non-secure state, the bit is ICC_CTLR_EL3.EOImode_EL1NS.

Accessing ICC_EOIR0_EL1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR0_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_EOIR0_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

ICC_EOIR1_EL1, Interrupt Controller End Of Interrupt Register 1

The ICC_EOIR1_EL1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 1 interrupt.

Configuration

AArch64 System register ICC_EOIR1_EL1 performs the same function as AArch32 System register ICC_EOIR1.

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_EOIR1_EL1 are UNDEFINED.

Attributes

ICC_EOIR1_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:24	RES0
23:0	INTID

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICC_IAR1_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR_EL1 to deactivate the interrupt.

The EOImode bit for the current Exception level and Security state is determined as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR_EL1.EOIMode.
- If EL3 is implemented and the software is executing at EL3, the appropriate bit is ICC_CTLR_EL3.EOImode_EL3.
- If EL3 is implemented and the software is not executing at EL3, the bit depends on the current Security state:
    - If the software is executing in Secure state, the bit is ICC_CTLR_EL3.EOImode_EL1S.
    - If the software is executing in Non-secure state, the bit is ICC_CTLR_EL3.EOImode_EL1NS.

Accessing ICC_EOIR1_EL1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR1_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings in the System register encoding space:

```

ICC_HPPIR0_EL1, Interrupt Controller Highest Priority Pending Interrupt Register 0

The ICC_HPPIR0_EL1 characteristics are:

Purpose

Indicates the highest priority pending Group 0 interrupt on the CPU interface.

Configuration

AArch64 System register ICC_HPPIR0_EL1 performs the same function as AArch32 System register ICC_HPPIR0.

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_HPPIR0_EL1 are UNDEFINED.

Attributes

ICC_HPPIR0_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:24	RES0
23:0	INTID

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the highest priority pending interrupt, if that interrupt is observable at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. These special INTIDs can be one of: 1020, 1021, or 1023. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_HPPIR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

ICC_IAR0_EL1, Interrupt Controller Interrupt Acknowledge Register 0

The ICC_IAR0_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 0 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch64 System register ICC_IAR0_EL1 performs the same function as AArch32 System register ICC_IAR0.

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_IAR0_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers'.

Attributes

ICC_IAR0_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:24	RES0
23:0	INTID

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

ICC_IGRPEN0_EL1, Interrupt Controller Interrupt Group 0 Enable register

The ICC_IGRPEN0_EL1 characteristics are:

Purpose

Controls whether Group 0 interrupts are enabled or not.

Configuration

AArch64 System register ICC_IGRPEN0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_IGRPEN0[31:0].

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_IGRPEN0_EL1 are UNDEFINED.

Attributes

ICC_IGRPEN0_EL1 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33	32
RES0	
RES0	Enable
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1	0

Bits [63:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 0 interrupts.

Enable	Meaning
`0b0`	Group 0 interrupts are disabled.
`0b1`	Group 0 interrupts are enabled.

Virtual accesses to this register update ICH_VMCR_EL2.VENG0.

If the highest priority pending interrupt for that PE is a Group 0 interrupt using 1 of N model, then the interrupt will be targeted to another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICC_IGRPEN0_EL1

Accesses to this register use the following encodings in the System register encoding space:

ICC_IGRPEN1_EL1, Interrupt Controller Interrupt Group 1 Enable register

The ICC_IGRPEN1_EL1 characteristics are:

Purpose

Controls whether Group 1 interrupts are enabled for the current Security state.

Configuration

AArch64 System register ICC_IGRPEN1_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register ICC_IGRPEN1[31:0] (S).

AArch64 System register ICC_IGRPEN1_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register ICC_IGRPEN1[31:0] (NS).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_IGRPEN1_EL1 are UNDEFINED.

Attributes

ICC_IGRPEN1_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:1	RES0
0	Enable

Bits [63:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 1 interrupts for the current Security state.

Enable	Meaning
`0b0`	Group 1 interrupts are disabled for the current Security state.
`0b1`	Group 1 interrupts are enabled for the current Security state.

Virtual accesses to this register update ICH_VMCR_EL2.VENG1.

If EL3 is present:

- The Secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1S bit.
- The Non-secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICC_IGRPEN1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_IGRPEN1_EL1

ICC_IGRPEN1_EL3, Interrupt Controller Interrupt Group 1 Enable register (EL3)

The ICC_IGRPEN1_EL3 characteristics are:

Purpose

Controls whether Group 1 interrupts are enabled or not.

Configuration

AArch64 System register ICC_IGRPEN1_EL3 bits [31:0] can be mapped to AArch32 System register ICC_MGRPEN1[31:0], but this is not architecturally mandated.

This register is present only when FEAT_GICv3 is implemented and EL3 is implemented. Otherwise, direct accesses to ICC_IGRPEN1_EL3 are UNDEFINED.

Attributes

ICC_IGRPEN1_EL3 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34	33	32
RES0		
RES0	EnableGrp1S	EnableGrp1NS
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2	1	0

Bits [63:2]

Reserved, RES0.

EnableGrp1S, bit [1]

Enables Group 1 interrupts for the Secure state.

EnableGrp1S	Meaning
`0b0`	Secure Group 1 interrupts are disabled.
`0b1`	Secure Group 1 interrupts are enabled.

The Secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1S bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

EnableGrp1NS, bit [0]

Enables Group 1 interrupts for the Non-secure state.

EnableGrp1NS	Meaning
`0b0`	Non-secure Group 1 interrupts are disabled.
`0b1`	Non-secure Group 1 interrupts are enabled.

The Non-secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

ICC_NMIAR1_EL1, Interrupt Controller Non-maskable Interrupt Acknowledge Register 1

The ICC_NMIAR1_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 1 non-maskable interrupt. This read acts as an acknowledge for the interrupt.

Configuration

This register is present only when FEAT_GICv3_NMI is implemented. Otherwise, direct accesses to ICC_NMIAR1_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_NMIAR1_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:24	RES0
23:0	INTID

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt has the Non-maskable property and is of sufficient priority for it to be signalled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_NMIAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_NMIAR1_EL1
```

op0	op1	CRn	CRm	op2

ICC_PMR_EL1, Interrupt Controller Interrupt Priority Mask Register

The ICC_PMR_EL1 characteristics are:

Purpose

Provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Writes to this register must be high performance and must ensure that no interrupt of lower priority than the written value occurs after the write, without requiring an ISB or an exception boundary.

Configuration

AArch64 System register ICC_PMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_PMR[31:0].

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_PMR_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_PMR_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:8	RES0
7:0	Priority

Bits [63:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	`0x00`-`0xFF` (0-255), all values	256
[7:1]	`0x00`-`0xFE` (0-254), even values only	128
[7:2]	`0x00`-`0xFC` (0-252), in steps of 4	64
[7:3]	`0x00`-`0xF8` (0-248), in steps of 8	32
[7:4]	`0x00`-`0xF0` (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

ICC_RPR_EL1, Interrupt Controller Running Priority Register

The ICC_RPR_EL1 characteristics are:

Purpose

Indicates the Running priority of the CPU interface.

Configuration

AArch64 System register ICC_RPR_EL1 performs the same function as AArch32 System register ICC_RPR.

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_RPR_EL1 are UNDEFINED.

Attributes

ICC_RPR_EL1 is a 64-bit register.

Field descriptions

63	62	61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
NMI	NMI_NS	RES0

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0
RES0	Priority

NMI, bit [63]

When FEAT_GICv3_NMI is implemented:

Indicates whether the running priority is from a NMI.

NMI	Meaning
`0b0`	When GICD_CTLR.DS==1, there are no Active NMIs, or all Active NMIs have undergone priority drop. When GICD_CTLR.DS==0: • For Non-secure reads, there are no Active Non-secure Group 1 NMIs, or all Active Non-secure Group 1 NMIs have undergone priority drop. • For Secure reads, there are no Active Secure Group 1 NMIs, or all Active Secure Group 1 NMIs have undergone priority drop.
`0b1`	When GICD_CTLR.DS==1, there is an Active NMI. When GICD_CTLR.DS==0: • For Non-secure reads, there is an Active Non-secure Group 1 NMIs. • For Secure reads, there is an Active Secure Group 1 NMIs.

Otherwise:

Reserved, RES0.

NMI_NS, bit [62]

When FEAT_GICv3_NMI is implemented and EL3 is implemented:

Indicates whether the running priority is from a Non-secure NMI.

NMI_NS	Meaning
0b0	There are no Active Non-secure Group 1 NMIs, or all Active Non-secure Group 1 NMIs have undergone priority drop.
0b1	There is an Active Non-secure Group 1 NMI which has not undergone priority drop.

Otherwise:

Reserved, RES0.

Bits [61:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

Note

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

Accessing ICC_RPR_EL1

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_RPR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b011

```

ICC_SGI0R_EL1, Interrupt Controller Software Generated Interrupt Group 0 Register

The ICC_SGI0R_EL1 characteristics are:

Purpose

Generates Secure Group 0 SGIs.

Configuration

AArch64 System register ICC_SGI0R_EL1 performs the same function as AArch32 System register ICC_SGI0R.

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_SGI0R_EL1 are UNDEFINED.

Attributes

ICC_SGI0R_EL1 is a 64-bit register.

Field descriptions

63–56	55–48	47–44	43–41	40	39–32
RES0	Aff3	RS	RES0	IRM	Aff2

31–28	27–24	23–16	15–0
RES0	INTID	Aff1	TargetList

Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing ICC_SGI0R_EL1

This register allows software executing in a Secure state to generate Group 0 SGIs. It will also allow software executing in a Non-secure state to generate Group 0 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_SGI0R_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b111

```

ICC_SGI1R_EL1, Interrupt Controller Software Generated Interrupt Group 1 Register

The ICC_SGI1R_EL1 characteristics are:

Purpose

Generates Group 1 SGIs for the current Security state.

Configuration

AArch64 System register ICC_SGI1R_EL1 performs the same function as AArch32 System register ICC_SGI1R.

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_SGI1R_EL1 are UNDEFINED.

Under certain conditions a write to ICC_SGI1R_EL1 can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_SGI1R_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:56	RES0
55:48	Aff3
47:44	RS
43:41	RES0
40	IRM
39:32	Aff2
31:28	RES0
27:24	INTID
23:16	Aff1
15:0	TargetList

Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing ICC_SGI1R_EL1

Note

Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_SGI1R_EL1, <Xt>

ICC_SRE_EL1, Interrupt Controller System Register Enable register (EL1)

The ICC_SRE_EL1 characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL1.

Configuration

AArch64 System register ICC_SRE_EL1 bits [31:0] (S) are architecturally mapped to AArch32 System register ICC_SRE[31:0] (S).

AArch64 System register ICC_SRE_EL1 bits [31:0] (NS) are architecturally mapped to AArch32 System register ICC_SRE[31:0] (NS).

This register is present only when FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_SRE_EL1 are UNDEFINED.

Attributes

ICC_SRE_EL1 is a 64-bit register.

Field descriptions

63–32			
RES0			
31–3	**2**	**1**	**0**
RES0	DIB	DFB	SRE

Bits [63:3]

Reserved, RES0.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
`0b0`	IRQ bypass enabled.
`0b1`	IRQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS == 0, this field is a read-only alias of ICC_SRE_EL3.DIB.

If EL3 is implemented and GICD_CTLR.DS == 1, and EL2 is not implemented, this field is a read-write alias of ICC_SRE_EL3.DIB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DIB.

If GICD_CTLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DIB.

In systems that do not support IRQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS == 0, this field is a read-only alias of ICC_SRE_EL3.DFB.

If EL3 is implemented and GICD_CTLR.DS == 1, and EL2 is not implemented, this field is a read-write alias of ICC_SRE_EL3.DFB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DFB.

If GICD_CTLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DFB.

In systems that do not support FIQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL1 to any ICC_* System register other than ICC_SRE_EL1 is trapped to EL1.
0b1	The System register interface for the current Security state is enabled.

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and ICC_SRE_EL3.SRE==0 the Secure copy of this bit is RAZ/WI. If ICC_SRE_EL3.SRE is changed from zero to one, the Secure copy of this bit becomes UNKNOWN.

If EL2 is implemented and ICC_SRE_EL2.SRE==0 the Non-secure copy of this bit is RAZ/WI. If ICC_SRE_EL2.SRE is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

If EL3 is implemented and ICC_SRE_EL3.SRE==0 the Non-secure copy of this bit is RAZ/WI. If ICC_SRE_EL3.SRE is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI. The following options are supported:

- The Non-secure copy of ICC_SRE_EL1.SRE can be RAO/WI if ICC_SRE_EL2.SRE is also RAO/WI. This means all Non-secure software, including VMs using only virtual interrupts, must access the GIC using System registers.
- The Secure copy of ICC_SRE_EL1.SRE can be RAO/WI if ICC_SRE_EL3.SRE and ICC_SRE_EL2.SRE are also RAO/WI. This means that all Secure software must access the GIC using System registers and all Non-secure accesses to registers for physical interrupts must use System registers.

Note

A VM using only virtual interrupts might still use memory-mapped access if the Non-secure copy of ICC_SRE_EL1.SRE is not RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICC_SRE_EL1

Execution with ICC_SRE_EL1.SRE set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_SRE_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && ICC_SRE_EL3.Enable == '0' then
        UNDEFINED;
    elsif EL2Enabled() && ICC_SRE_EL2.Enable == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif HaveEL(EL3) && ICC_SRE_EL3.Enable == '0' then

ICC_SRE_EL2, Interrupt Controller System Register Enable register (EL2)

The ICC_SRE_EL2 characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL2.

Configuration

AArch64 System register ICC_SRE_EL2 is architecturally mapped to AArch32 System register ICC_HSRE.

This register is present only when FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICC_SRE_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICC_SRE_EL2 is a 64-bit register.

Field descriptions

63–32
RES0

31–4	3	2	1	0
RES0	Enable	DIB	DFB	SRE

Bits [63:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to ICC_SRE_EL1.

Enable	Meaning
0b0	When EL2 is implemented and enabled in the current Security state, EL1 accesses to ICC_SRE_EL1 trap to EL2.
0b1	EL1 accesses to ICC_SRE_EL1 do not trap to EL2.

If ICC_SRE_EL2.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_SRE_EL2.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_SRE_EL3.DIB.

If EL3 is implemented and GICD_CTLR.DS is 1, this field is a read-write alias of ICC_SRE_EL3.DIB.

In systems that do not support IRQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_SRE_EL3.DFB.

If EL3 is implemented and GICD_CTLR.DS is 1, this field is a read-write alias of ICC_SRE_EL3.DFB.

In systems that do not support FIQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL2 to any ICH_* or ICC_* register other than ICC_SRE_EL1 or ICC_SRE_EL2, is trapped to EL2.
0b1	The System register interface to the ICH_* registers and the EL1 and EL2 ICC_* registers is enabled for EL2.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and ICC_SRE_EL3.SRE==0 this bit is RAZ/WI. If ICC_SRE_EL3.SRE is changed from zero to one, this bit becomes UNKNOWN.

FEAT_GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI, but this is only allowed if ICC_SRE_EL3.SRE is also RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICC_SRE_EL2

Execution with ICC_SRE_EL2.SRE set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_SRE_EL2
```

op0	op1	CRn	CRm	op2

0b11	0b100	0b1100	0b1001	0b101

```
if PSTATE.EL == EL0 then

ICC_SRE_EL3, Interrupt Controller System Register Enable register (EL3)

The ICC_SRE_EL3 characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

Configuration

AArch64 System register ICC_SRE_EL3 bits [31:0] can be mapped to AArch32 System register ICC_MSRE[31:0], but this is not architecturally mandated.

This register is present only when FEAT_GICv3 is implemented and EL3 is implemented. Otherwise, direct accesses to ICC_SRE_EL3 are UNDEFINED.

Attributes

ICC_SRE_EL3 is a 64-bit register.

Field descriptions

Bits	63:32				
	RES0				
Bits	31:4	3	2	1	0
	RES0	Enable	DIB	DFB	SRE

Bits [63:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to ICC_SRE_EL1 and ICC_SRE_EL2.

Enable	Meaning
`0b0`	EL1 accesses to ICC_SRE_EL1 trap to EL3, unless these accesses are trapped to EL2 as a result of ICC_SRE_EL2.Enable == 0. EL2 accesses to ICC_SRE_EL1 and ICC_SRE_EL2 trap to EL3.
`0b1`	EL1 accesses to ICC_SRE_EL1 do not trap to EL3. EL2 accesses to ICC_SRE_EL1 and ICC_SRE_EL2 do not trap to EL3.

If ICC_SRE_EL3.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_SRE_EL3.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

In systems that do not support IRQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

In systems that do not support FIQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL3 to any ICH_* or ICC_* register other than ICC_SRE_EL1, ICC_SRE_EL2, or ICC_SRE_EL3 is trapped to EL3
0b1	The System register interface to the ICH_* registers and the EL1, EL2, and EL3 ICC_* registers is enabled for EL3.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

FEAT_GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICC_SRE_EL3

This register is always System register accessible.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_SRE_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return ICC_SRE_EL3;
```

```
MSR ICC_SRE_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    ICC_SRE_EL3 = X[t];
```

ICH_AP0R<n>_EL2, Interrupt Controller Hyp Active Priorities Group 0 Registers, n = 0 - 3

The ICH_AP0R<n>_EL2 characteristics are:

Purpose

Provides information about Group 0 virtual active priorities for EL2.

Configuration

AArch64 System register ICH_AP0R<n>_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_AP0R<n>[31:0].

This register is present only when FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_AP0R<n>_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_AP0R<n>_EL2 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

P<x>, bit [x], for x = 31 to 0

Provides the access to the virtual active priorities for Group 0 interrupts. Possible values of each bit are:

P<x>	Meaning
`0b0`	There is no Group 0 interrupt active with this priority level, or all active Group 0 interrupts with this priority level have undergone priority-drop.
`0b1`	There is a Group 0 interrupt active with this priority level which has not undergone priority drop.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP0R0_EL2 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP0R0_EL2 in the bits corresponding to 0:Priority[6:2].

- The active state of preemption levels 128 - 252 are held in ICH_AP0R1_EL2 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP0R0_EL2 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP0R1_EL2 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP0R2_EL2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH_AP0R3_EL2 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Software must ensure that ICH_AP0R<n>_EL2 is 0 for legacy VMs otherwise behaviour is UNPREDICTABLE. For more information about support for legacy VMs, see 'Support for legacy operation of VMs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The active priorities for Group 0 and Group 1 interrupts for legacy VMs are held in ICH_AP1R<n>_EL2 and reads and writes to GICV_APR access ICH_AP1R<n>_EL2. This means that ICH_AP0R<n>_EL2 is inaccessible to legacy VMs.

Accessing ICH_AP0R<n>_EL2

ICH_AP0R1_EL2 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP0R2_EL2 and ICH_AP0R3_EL2 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits

---

Writing to these registers with any value other than the last read value of the register (or `0x00000000` for a newly set up virtual machine) can result in UNPREDICTABLE behavior of the virtual interrupt prioritization system allowing either:

- Virtual interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution at EL1 or EL0.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICH_AP0R<n>_EL2.
- ICH_AP1R<n>_EL2.

Having the bit corresponding to a priority set in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 can result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_AP0R<n>_EL2
```

ICH_AP1R<n>_EL2, Interrupt Controller Hyp Active Priorities Group 1 Registers, n = 0 - 3

The ICH_AP1R<n>_EL2 characteristics are:

Purpose

Provides information about Group 1 virtual active priorities for EL2.

Configuration

AArch64 System register ICH_AP1R<n>_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_AP1R<n>[31:0].

This register is present only when FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_AP1R<n>_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_AP1R<n>_EL2 is a 64-bit register.

Field descriptions

63	62:32
NMI	RES0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

NMI, bit [63]

When FEAT_GICv3_NMI is implemented:

Indicates whether the running virtual priority is from a NMI.

NMI	Meaning
`0b0`	There is no active Group 1 NMI, or all active Group 1 NMIs have undergone priority drop.
`0b1`	There is an active Group 1 NMI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bits [62:32]

Reserved, RES0.

P<x>, bit [x], for x = 31 to 0

Group 1 interrupt active priorities. Possible values of each bit are:

P<x>	Meaning
0b0	There is no Group 1 interrupt active with this priority level, or all active Group 1 interrupts with this priority level have undergone priority-drop.
0b1	There is a Group 1 interrupt active with this priority level which has not undergone priority drop.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP1R0_EL2 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP1R0_EL2 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP1R1_EL2 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP1R0_EL2 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP1R1_EL2 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP1R2_EL2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH_AP1R3_EL2 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

This register is always used for legacy VMs, regardless of the group of the virtual interrupt. Reads and writes to GICV_APR<n> access ICH_AP1R<n>_EL2. For more information about support for legacy VMs, see 'Support for legacy operation of VMs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accessing ICH_AP1R<n>_EL2

ICH_AP1R1_EL2 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP1R2_EL2 and ICH_AP1R3_EL2 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits

Writing to these registers with any value other than the last read value of the register (or `0x00000000` for a newly set up virtual machine) can result in UNPREDICTABLE behavior of the virtual interrupt prioritization system allowing either:

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_AP1R<n>_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1001	0b0:n[1:0]

ICH_EISR_EL2, Interrupt Controller End of Interrupt Status Register

The ICH_EISR_EL2 characteristics are:

Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

Configuration

AArch64 System register ICH_EISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_EISR[31:0].

This register is present only when FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_EISR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_EISR_EL2 is a 64-bit register.

Field descriptions

63626160595857565554535251504948	47	46	45	44	43	42	41	40	39	3

31302928272625242322212019181716	15	14	13	12	11	10	9	8	7	

Bits [63:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

EOI maintenance interrupt status bit for List register <n>:

Status<n>	Meaning
`0b0`	List register <n>, ICH_LR<n>_EL2, does not have an EOI maintenance interrupt.
`0b1`	List register <n>, ICH_LR<n>_EL2, has an EOI maintenance interrupt that has not been handled.

For any ICH_LR<n>_EL2, the corresponding status bit is set to 1 if all of the following are true:

- ICH_LR<n>_EL2.State is `0b00`.
- ICH_LR<n>_EL2.HW is 0.
- ICH_LR<n>_EL2.EOI (bit [41]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

Otherwise the status bit takes the value 0.

Accessing ICH_EISR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_EISR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_EISR_EL2;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_EISR_EL2;
```

ICH_ELRSR_EL2, Interrupt Controller Empty List Register Status Register

The ICH_ELRSR_EL2 characteristics are:

Purpose

These registers can be used to locate a usable List register when the hypervisor is delivering an interrupt to a VM.

Configuration

AArch64 System register ICH_ELRSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_ELRSR[31:0].

This register is present only when FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_ELRSR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_ELRSR_EL2 is a 64-bit register.

Field descriptions

63626160595857565554535251504948	47	46	45	44	43	42	41	40	39	3

31302928272625242322212019181716	15	14	13	12	11	10	9	8	7	

Bits [63:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>, ICH_LR<n>_EL2:

Status<n>	Meaning
`0b0`	List register ICH_LR<n>_EL2, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.
`0b1`	List register ICH_LR<n>_EL2 does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.

For any List register <n>, the corresponding status bit is set to 1 if ICH_LR<n>_EL2.State is `0b00` and either ICH_LR<n>_EL2.HW is 1 or ICH_LR<n>_EL2.EOI (bit [41]) is 0.

Otherwise the status bit takes the value 0.

Accessing ICH_ELRSR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_ELRSR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b101

ICH_HCR_EL2, Interrupt Controller Hyp Control Register

The ICH_HCR_EL2 characteristics are:

Purpose

Controls the environment for VMs.

Configuration

AArch64 System register ICH_HCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_HCR[31:0].

This register is present only when FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_HCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_HCR_EL2 is a 64-bit register.

Field descriptions

63626160595857565554535251504948		47	46	45	44	43	42	41	40	39	38	37	
RES0													
EOIcount	RES0	DVIM	TDIR	TSEI	TALL1	TALL0	TC	RES0	vSGIEOICount	VGrp1DIE	VGrp1EIE	VGrp0DIE	VG
31302928272625242322212019181716		15	14	13	12	11	10	9	8	7	6	5	

Bits [63:32]

Reserved, RES0.

EOIcount, bits [31:27]

This field is incremented whenever a successful write to a virtual EOIR or DIR register would have resulted in a virtual interrupt deactivation. That is either:

- A virtual write to EOIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is zero and no List Register was found.
- A virtual write to DIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is one and no List Register was found.

This allows software to manage more active interrupts than there are implemented List Registers.

It is CONSTRAINED UNPREDICTABLE whether a virtual write to EOIR that does not clear a bit in the Active Priorities registers (ICH_AP0R<n>_EL2/ICH_AP1R<n>_EL2) increments EOIcount. Permitted behaviors are:

- Increment EOIcount.
- Leave EOIcount unchanged.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Bits [26:16]

Reserved, RES0.

DVIM, bit [15]

When ICH_VTR_EL2.DVIM == 1:

Directly-injected Virtual Interrupt Mask.

DVIM	Meaning
0b0	This control has no effect on the signalling of virtual interrupts.
0b1	Virtual interrupts received via direct-injection are not presented to the virtual CPU interface and not considered when determining the highest priority pending virtual interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

TDIR, bit [14]

When FEAT_GICv3_TDIR is implemented:

Trap EL1 writes to ICC_DIR_EL1 and ICV_DIR_EL1.

TDIR	Meaning
0b0	EL1 writes of ICC_DIR_EL1 and ICV_DIR_EL1 are not trapped to EL2, unless trapped by other mechanisms.
0b1	EL1 writes of ICV_DIR_EL1 are trapped to EL2. It is IMPLEMENTATION DEFINED whether writes of ICC_DIR_EL1 are trapped. Not trapping ICC_DIR_EL1 writes is DEPRECATED.

Arm deprecates not including this trap bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

TSEI, bit [13]

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at EL1.

TSEI	Meaning
0b0	Locally generated SEIs do not cause a trap to EL2.
0b1	Locally generated SEIs trap to EL2.

If ICH_VTR_EL2.SEIS is 0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TALL1, bit [12]

Trap all EL1 accesses to ICC_* and ICV_* System registers for Group 1 interrupts to EL2.

TALL1	Meaning
0b0	EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal.
0b1	EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TALL0, bit [11]

Trap all EL1 accesses to ICC_* and ICV_* System registers for Group 0 interrupts to EL2.

TALL0	Meaning
0b0	EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal.
0b1	EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TC, bit [10]

Trap all EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.

TC	Meaning
0b0	EL1 accesses to common registers proceed as normal.
0b1	EL1 accesses to common registers trap to EL2.

This affects accesses to ICC_SGI0R_EL1, ICC_SGI1R_EL1, ICC_ASGI1R_EL1, ICC_CTLR_EL1, ICC_DIR_EL1, ICC_PMR_EL1, ICC_RPR_EL1, ICV_CTLR_EL1, ICV_DIR_EL1, ICV_PMR_EL1, and ICV_RPR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bit [9]

Reserved, RES0.

vSGIEOICount, bit [8]
When FEAT_GICv4p1 is implemented:

Controls whether deactivation of virtual SGIs can increment ICH_HCR_EL2.EOIcount

vSGIEOICount	Meaning
0b0	Deactivation of virtual SGIs can increment ICH_HCR_EL2.EOIcount.
0b1	Deactivation of virtual SGIs does not increment ICH_HCR_EL2.EOIcount.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp1DIE	Meaning
`0b0`	Maintenance interrupt disabled.
`0b1`	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp1EIE	Meaning
`0b0`	Maintenance interrupt disabled.
`0b1`	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG1 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp0DIE	Meaning
`0b0`	Maintenance interrupt disabled.
`0b1`	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp0EIE	Meaning
`0b0`	Maintenance interrupt disabled.
`0b1`	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG0 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

NPIE, bit [3]

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to `0b01` (pending):

NPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

LRENPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted while the EOIcount field is not 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

UIE, bit [1]

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

UIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

En, bit [0]

Enable. Global enable bit for the virtual CPU interface:

En	Meaning
0b0	Virtual CPU interface operation disabled.
0b1	Virtual CPU interface operation enabled.

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of ICV_IAR0_EL1, ICV_IAR1_EL1, GICV_IAR or GICV_AIAR returns a spurious interrupt ID.

Note

This field is RES0 when SCR_EL3.{NS,EEL2}=={0,0}

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICH_HCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_HCR_EL2
```

ICH_LR<n>_EL2, Interrupt Controller List Registers, n = 0 - 15

The ICH_LR<n>_EL2 characteristics are:

Purpose

Provides interrupt context information for the virtual CPU interface.

Configuration

AArch64 System register ICH_LR<n>_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_LR<n>[31:0].

AArch64 System register ICH_LR<n>_EL2 bits [63:32] are architecturally mapped to AArch32 System register ICH_LRC<n>[31:0].

This register is present only when FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_LR<n>_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_LR<n>_EL2 is a 64-bit register.

Field descriptions

63 62	61	60	59	58 57 56	55 54 53 52 51 50 49 48	47 46 45	44 43 42 41 40 39 38 37 36 35 34 33 32

vINTID

State, bits [63:62]

The state of the interrupt:

State	Meaning
`0b00`	Invalid (Inactive).
`0b01`	Pending.
`0b10`	Active.
`0b11`	Pending and active.

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the invalid state are ignored, except for the purpose of generating virtual maintenance interrupts.

For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HW, bit [61]

Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the ID that the pINTID field indicates.

HW	Meaning
`0b0`	The interrupt is triggered entirely by software. No notification is sent to the Distributor when the virtual interrupt is deactivated.
`0b1`	The interrupt maps directly to a hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using the pINTID field from this register to indicate the physical interrupt ID. If ICH_VMCR_EL2.VEOIM is 0, this request corresponds to a write to ICC_EOIR0_EL1 or ICC_EOIR1_EL1. Otherwise, it corresponds to a write to ICC_DIR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Group, bit [60]

Indicates the group for this virtual interrupt.

Group	Meaning
`0b0`	This is a Group 0 virtual interrupt. ICH_VMCR_EL2.VFIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and ICH_VMCR_EL2.VENG0 enables signaling of this interrupt to the virtual machine.
`0b1`	This is a Group 1 virtual interrupt, signaled as a virtual IRQ. ICH_VMCR_EL2.VENG1 enables the signalling of this interrupt to the virtual machine. If ICH_VMCR_EL2.VCBPR is 0, then ICC_BPR1_EL1 determines if a pending Group 1 interrupt has sufficient priority to preempt current execution. Otherwise, ICH_LR<n>_EL2 determines preemption.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NMI, bit [59]

When FEAT_GICv3_NMI is implemented:

Indicates whether the virtual priority has the non-maskable property.

NMI	Meaning
`0b0`	vINTID does not have the non-maskable interrupt property.
`0b1`	vINTID has the non-maskable interrupt property.

Setting ICH_LR<n>_EL2.NMI to 1 when ICH_LR<n>_EL2.State is not Invalid is CONSTRAINTED UNPREDICTABLE if either ICH_LR<n>_EL2.vINTID indicates an LPI or ICH_LR<n>_EL2.Group is 0.

The permitted behaviours are:

- ICH_LR<n>_EL2.NMI is treated as 0 for all purposes other than a direct read of the register.
- The virtual interrupt is presented with superpriority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [58:56]

Reserved, RES0.

Priority, bits [55:48]

The priority of this interrupt.

It is IMPLEMENTATION DEFINED how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit[48] up to bit[50]. The number of implemented bits can be discovered from ICH_VTR_EL2.PRIbits.

When ICH_LR<n>_EL2.NMI is set to 1, this field is RES0 and the virtual interrupt's priority is treated as `0x00`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:45]

Reserved, RES0.

pINTID, bits [44:32]

Physical INTID, for hardware interrupts.

When ICH_LR<n>_EL2.HW is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[44:42] : RES0.
- Bit[41] : EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, a maintenance interrupt is asserted.
- Bits[40:32] : RES0.

When ICH_LR<n>_EL2.HW is 1 (there is a corresponding physical interrupt):

- This field indicates the physical INTID. This field is only required to implement enough bits to hold a valid value for the implemented INTID size. Any unused higher order bits are RES0.
- When ICC_CTLR_EL1.ExtRange is 0, then bits[44:42] of this field are RES0.
- If the value of pINTID is not a vald INTID, behavior is UNPREDICTABLE. If the value of pINTID indicates a PPI, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 13 bits of Physical INTID are required, regardless of the number specified by ICC_CTLR_EL1.IDbits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

vINTID, bits [31:0]

Virtual INTID of the interrupt.

If the value of vINTID is 1020-1023 and ICH_LR<n>_EL2.State!=`0b00` (Inactive), behavior is UNPREDICTABLE.

Behavior is UNPREDICTABLE if two or more List Registers specify the same vINTID when:

- ICH_LR<n>_EL2.State == `0b01`.
- ICH_LR<n>_EL2.State == `0b10`.
- ICH_LR<n>_EL2.State == `0b11`.

It is IMPLEMENTATION DEFINED how many bits are implemented, though at least 16 bits must be implemented. Unimplemented bits are RES0. The number of implemented bits can be discovered from ICH_VTR_EL2.IDbits.

When ICC_SRE_EL1.SRE == 0, specifying a vINTID in the LPI range is UNPREDICTABLE

Note

When a VM is using memory-mapped access to the GIC, software must ensure that the correct source PE ID is provided in bits[12:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICH_LR<n>_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_LR<n>_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b110:n[3]	n[2:0]

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x400+8*UInt(CRm<0>:op2<2:0>)];

ICH_MISR_EL2, Interrupt Controller Maintenance Interrupt State Register

The ICH_MISR_EL2 characteristics are:

Purpose

Indicates which maintenance interrupts are asserted.

Configuration

AArch64 System register ICH_MISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_MISR[31:0].

This register is present only when FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_MISR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_MISR_EL2 is a 64-bit register.

Field descriptions

63:32								
RES0								

31:8	7	6	5	4	3	2	1	0
RES0	VGrp1D	VGrp1E	VGrp0D	VGrp0E	NP	LRENP	U	EOI

Bits [63:8]

Reserved, RES0.

VGrp1D, bit [7]

vPE Group 1 Disabled.

VGrp1D	Meaning
0b0	vPE Group 1 Disabled maintenance interrupt not asserted.
0b1	vPE Group 1 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.VGrp1DIE==1 and ICH_VMCR_EL2.VENG1==is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp1E, bit [6]

vPE Group 1 Enabled.

VGrp1E	Meaning
0b0	vPE Group 1 Enabled maintenance interrupt not asserted.
0b1	vPE Group 1 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.VGrp1EIE==1 and ICH_VMCR_EL2.VENG1==is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp0D, bit [5]

vPE Group 0 Disabled.

VGrp0D	Meaning
0b0	vPE Group 0 Disabled maintenance interrupt not asserted.
0b1	vPE Group 0 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.VGrp0DIE==1 and ICH_VMCR_EL2.VENG0==0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp0E, bit [4]

vPE Group 0 Enabled.

VGrp0E	Meaning
0b0	vPE Group 0 Enabled maintenance interrupt not asserted.
0b1	vPE Group 0 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.VGrp0EIE==1 and ICH_VMCR_EL2.VENG0==1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

NP, bit [3]

No Pending.

NP	Meaning
0b0	No Pending maintenance interrupt not asserted.
0b1	No Pending maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.NPIE==1 and no List register is in pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

LRENP, bit [2]

List Register Entry Not Present.

LRENP	Meaning
0b0	List Register Entry Not Present maintenance interrupt not asserted.
0b1	List Register Entry Not Present maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.LRENPIE==1 and ICH_HCR_EL2.EOIcount is non-zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

U, bit [1]

Underflow.

U	Meaning
0b0	Underflow maintenance interrupt not asserted.
0b1	Underflow maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.UIE==1 and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding ICH_LR<n>_EL2.State bits do not equal 0x0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EOI, bit [0]

End Of Interrupt.

EOI	Meaning
0b0	End Of Interrupt maintenance interrupt not asserted.
0b1	End Of Interrupt maintenance interrupt asserted.

This maintenance interrupt is asserted when at least one bit in ICH_EISR_EL2 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

The U and NP bits do not include the status of any pending/active 'VSet (IRI)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069) packets because these bits control generation of interrupts that allow software management of the contents of the List Registers (which are not affected by 'VSet (IRI)' packets).

Accessing ICH_MISR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_MISR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_MISR_EL2;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_MISR_EL2;
```

ICH_VMCR_EL2, Interrupt Controller Virtual Machine Control Register

The ICH_VMCR_EL2 characteristics are:

Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state.

Configuration

AArch64 System register ICH_VMCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_VMCR[31:0].

This register is present only when FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_VMCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_VMCR_EL2 is a 64-bit register.

Field descriptions

63:32										
RES0										
VPMR	VBPR0	VBPR1	RES0	VEOIM	RES0	VCBPR	VFIQEn	VAckCtl	VENG1	VENG0
31:24	23:21	20:18	17:10	9	8:5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

VPMR, bits [31:24]

Virtual Priority Mask. The priority mask level for the virtual CPU interface. If the priority of a pending virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

This field is an alias of ICV_PMR_EL1.Priority.

VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if ICH_VMCR_EL2.VCBPR == 1.

This field is an alias of ICV_BPR0_EL1.BinaryPoint.

The minimum value of this field is determined by ICH_VTR_EL2.PREbits. An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption if ICH_VMCR_EL2.VCBPR == 0.

This field is an alias of ICV_BPR1_EL1.BinaryPoint.

This field is always accessible to EL2 accesses, regardless of the setting of the ICH_VMCR_EL2.VCBPR field.

For Non-secure writes, the minimum value of this field is the minimum value of ICH_VMCR_EL2.VBPR0 plus one.

For Secure writes, the minimum value of this field is the minimum value of ICH_VMCR_EL2.VBPR0.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

Bits [17:10]

Reserved, RES0.

VEOIM, bit [9]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

VEOIM	Meaning
`0b0`	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR_EL1 are UNPREDICTABLE.
`0b1`	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide priority drop functionality only. ICV_DIR_EL1 provides interrupt deactivation functionality.

This bit is an alias of ICV_CTLR_EL1.EOImode.

Bits [8:5]

Reserved, RES0.

VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

VCBPR	Meaning
`0b0`	ICV_BPR1_EL1 determines the preemption group for virtual Group 1 interrupts.
`0b1`	Reads of ICV_BPR1_EL1 return ICV_BPR0_EL1 plus one, saturated to `0b111`. Writes to ICV_BPR1_EL1 are ignored.

This field is an alias of ICV_CTLR_EL1.CBPR.

VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

VFIQEn	Meaning
`0b0`	Group 0 virtual interrupts are presented as virtual IRQs.
`0b1`	Group 0 virtual interrupts are presented as virtual FIQs.

This bit is an alias of GICV_CTLR.FIQEn.

In implementations where the Non-secure copy of ICC_SRE_EL1.SRE is always 1, this bit is RES1.

VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

VAckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.

This bit is an alias of GICV_CTLR.AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

In implementations where the Non-secure copy of ICC_SRE_EL1.SRE is always 1, this bit is RES0.

VENG1, bit [1]

Virtual Group 1 interrupt enable. Possible values of this bit are:

VENG1	Meaning
0b0	Virtual Group 1 interrupts are disabled.
0b1	Virtual Group 1 interrupts are enabled.

This bit is an alias of ICV_IGRPEN1_EL1.Enable.

VENG0, bit [0]

Virtual Group 0 interrupt enable. Possible values of this bit are:

VENG0	Meaning
0b0	Virtual Group 0 interrupts are disabled.
0b1	Virtual Group 0 interrupts are enabled.

This bit is an alias of ICV_IGRPEN0_EL1.Enable.

Accessing ICH_VMCR_EL2

When EL2 is using System register access, EL1 using either System register or memory-mapped access must be supported.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_VMCR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b111

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x4C8];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_VMCR_EL2;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_VMCR_EL2;
```

```
MSR ICH_VMCR_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b111

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x4C8] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        ICH_VMCR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        ICH_VMCR_EL2 = X[t];
```

ICH_VTR_EL2, Interrupt Controller VGIC Type Register

The ICH_VTR_EL2 characteristics are:

Purpose

Reports supported GIC virtualization features.

Configuration

AArch64 System register ICH_VTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_VTR[31:0].

This register is present only when FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_VTR_EL2 are UNDEFINED.

If EL2 is not implemented, all bits in this register are RES0 from EL3, except for nV4, which is RES1 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_VTR_EL2 is a 64-bit register.

Field descriptions

63 … 32
RES0

31 30 29	28 27 26	25 24 23	22	21	20	19	18	17 … 5	4 3 2 1 0
PRIbits	PREbits	IDbits	SEIS	A3V	nV4	TDS	DVIM	RES0	ListRegs

Bits [63:32]

Reserved, RES0.

PRIbits, bits [31:29]

Priority bits. The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

This field is an alias of ICV_CTLR_EL1.PRIbits.

PREbits, bits [28:26]

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH_VTR_EL2.PRIbits.

The maximum value of this field is 6, indicating 7 bits of preemption.

This field determines the minimum value of ICH_VMCR_EL2.VBPR0.

IDbits, bits [25:23]

The number of virtual interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

This field is an alias of ICV_CTLR_EL1.IDbits.

SEIS, bit [22]

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support generation of SEIs.
0b1	The virtual CPU interface logic supports generation of SEIs.

This bit is an alias of ICV_CTLR_EL1.SEIS.

A3V, bit [21]

Affinity 3 Valid. Possible values are:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

This bit is an alias of ICV_CTLR_EL1.A3V.

nV4, bit [20]

Direct injection of virtual interrupts not supported. Possible values are:

nV4	Meaning
0b0	The CPU interface logic supports direct injection of virtual interrupts.
0b1	The CPU interface logic does not support direct injection of virtual interrupts.

In GICv3, the only permitted value is 0b1.

TDS, bit [19]

Separate trapping of EL1 writes to ICV_DIR_EL1 supported.

TDS	Meaning
0b0	Implementation does not support ICH_HCR_EL2.TDIR.
0b1	Implementation supports ICH_HCR_EL2.TDIR.

FEAT_GICv3_TDIR implements the functionality added by the value 0b1.

DVIM, bit [18]

Masking of directly-injected virtual interrupts.

DVIM	Meaning
0b0	Masking of Directly-injected Virtual Interrupts not supported.
0b1	Masking of Directly-injected Virtual Interrupts is supported.

Bits [17:5]

Reserved, RES0.

ListRegs, bits [4:0]

The number of implemented List registers, minus one. For example, a value of `0b01111` indicates that the maximum of 16 List registers are implemented.

Accessing ICH_VTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICH_VTR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_VTR_EL2;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_VTR_EL2;
```

ICV_AP0R<n>_EL1, Interrupt Controller Virtual Active Priorities Group 0 Registers, n = 0 - 3

The ICV_AP0R<n>_EL1 characteristics are:

Purpose

Provides information about virtual Group 0 active priorities.

Configuration

AArch64 System register ICV_AP0R<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_AP0R<n>[31:0].

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_AP0R<n>_EL1 are UNDEFINED.

Attributes

ICV_AP0R<n>_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:0	IMPLEMENTATION DEFINED

Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value `0x00000000` is consistent with no interrupts being active.

Accessing ICV_AP0R<n>_EL1

Writing to these registers with any value other than the last read value of the register (or `0x00000000` when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP0R1_EL1 is only implemented in implementations that support 6 or more bits of priority. ICV_AP0R2_EL1 and ICV_AP0R3_EL1 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>_EL1.
- ICV_AP1R<n>_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_AP0R<n>_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b1:n[1:0]

```

ICV_AP1R<n>_EL1, Interrupt Controller Virtual Active Priorities Group 1 Registers, n = 0 - 3

The ICV_AP1R<n>_EL1 characteristics are:

Purpose

Provides information about virtual Group 1 active priorities.

Configuration

AArch64 System register ICV_AP1R<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_AP1R<n>[31:0].

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_AP1R<n>_EL1 are UNDEFINED.

Attributes

ICV_AP1R<n>_EL1 is a 64-bit register.

Field descriptions

63	62 … 32
NMI	RES0

31 … 0
IMPLEMENTATION DEFINED

NMI, bit [63]
When FEAT_GICv3_NMI is implemented:

Indicates whether the running priority is from a NMI.

NMI	Meaning
`0b0`	There is no active Group 1 NMI, or all active Group 1 NMIs have undergone priority-drop.
`0b1`	There is an active Group 1 NMI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bits [62:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value `0x00000000` is consistent with no interrupts being active.

Accessing ICV_AP1R<n>_EL1

Writing to these registers with any value other than the last read value of the register (or `0x00000000` when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP1R1_EL1 is only implemented in implementations that support 6 or more bits of priority. ICV_AP1R2_EL1 and ICV_AP1R3_EL1 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>_EL1.
- ICV_AP1R<n>_EL1.

Accesses to this register use the following encodings in the System register encoding space:

```

ICV_BPR0_EL1, Interrupt Controller Virtual Binary Point Register 0

The ICV_BPR0_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 0 interrupt preemption.

Configuration

AArch64 System register ICV_BPR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_BPR0[31:0].

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_BPR0_EL1 are UNDEFINED.

Attributes

ICV_BPR0_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:3	RES0
2:0	BinaryPoint

Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	gggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.ssssssss

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR0_EL1

The minimum binary point value is derived from the number of implemented preemption bits, as shown in the following table:

Number of implemented preemption bits	Minimum value of BPR0
7	0
6	1
5	2

The number of implemented preemption bits is indicated by ICH_VTR_EL2.PREbits.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_BPR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b011

ICV_BPR1_EL1, Interrupt Controller Virtual Binary Point Register 1

The ICV_BPR1_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 1 interrupt preemption.

Configuration

AArch64 System register ICV_BPR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_BPR1[31:0].

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_BPR1_EL1 are UNDEFINED.

Attributes

ICV_BPR1_EL1 is a 64-bit register.

Field descriptions

63 ... 32
RES0

31 ... 3	2 1 0
RES0	BinaryPoint

Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

An attempt to program this field to a value less than the minimum value sets the field to the minimum value.

If ICV_CTLR_EL1.CBPR is set to 1, Non-secure EL1 reads return ICV_BPR0_EL1 + 1 saturated to `0b111`. Non-secure EL1 writes are ignored.

If ICV_CTLR_EL1.CBPR is set to 1, Secure EL1 reads return ICV_BPR0_EL1. Secure EL1 writes modify ICV_BPR0_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR1_EL1

For Non-secure writes, the minimum value of this field is the minimum value of ICH_VMCR_EL2.VBPR0 plus one.

For Secure writes, the minimum value of this field is the minimum value of ICH_VMCR_EL2.VBPR0.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_BPR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b011

ICV_CTLR_EL1, Interrupt Controller Virtual Control Register

The ICV_CTLR_EL1 characteristics are:

Purpose

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

Configuration

AArch64 System register ICV_CTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_CTLR[31:0].

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_CTLR_EL1 are UNDEFINED.

Attributes

ICV_CTLR_EL1 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52	51	50	49 48	47	46	45 44 43	42 41 40	39 38 37 36 35 34	33	32
RES0										
RES0	ExtRange	RSS	RES0	A3V	SEIS	IDbits	PRIbits	RES0	EOImode	CBPR
31 30 29 28 27 26 25 24 23 22 21 20	19	18	17 16	15	14	13 12 11	10 9 8	7 6 5 4 3 2	1	0

Bits [63:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
`0b0`	CPU interface does not support INTIDs in the range 1024..8191. • Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. **Note** Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
`0b1`	CPU interface supports INTIDs in the range 1024..8191 • All INTIDs in the range 1024..8191 are treated as requiring deactivation.

ICV_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL1.ExtRange.

RSS, bit [18]

Range Selector Support. Possible values are:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support local generation of SEIs.
0b1	The virtual CPU interface logic supports local generation of SEIs.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation must implement at least 32 levels of physical priority (5 priority bits).

Note

This field always returns the number of priority bits implemented.

The division between group priority and subpriority is defined in the binary point registers ICV_BPR0_EL1 and ICV_BPR1_EL1.

Bits [7:2]

Reserved, RES0.

EOImode, bit [1]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

EOImode	Meaning
0b0	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR_EL1 are UNPREDICTABLE.
0b1	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide priority drop functionality only. ICV_DIR_EL1 provides interrupt deactivation functionality.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

CBPR	Meaning
0b0	ICV_BPR1_EL1 determines the preemption group for virtual Group 1 interrupts.
0b1	Non-secure reads of ICV_BPR1_EL1 return ICV_BPR0_EL1 plus one, saturated to 0b111. Non-secure writes to ICV_BPR1_EL1 are ignored. Secure reads of ICV_BPR1_EL1 return ICV_BPR0_EL1. Secure writes of ICV_BPR1_EL1 modify ICV_BPR0_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_CTLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

ICV_DIR_EL1, Interrupt Controller Deactivate Virtual Interrupt Register

The ICV_DIR_EL1 characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified virtual interrupt.

Configuration

AArch64 System register ICV_DIR_EL1 bits [31:0] performs the same function as AArch32 System register ICV_DIR[31:0].

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_DIR_EL1 are UNDEFINED.

Attributes

ICV_DIR_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:24	RES0
23:0	INTID

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the virtual interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_DIR_EL1

When EOImode == 0, writes are ignored. In systems supporting system error generation, an implementation might generate an SEI.

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_DIR_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b001

```

ICV_EOIR0_EL1, Interrupt Controller Virtual End Of Interrupt Register 0

The ICV_EOIR0_EL1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 0 interrupt.

Configuration

AArch64 System register ICV_EOIR0_EL1 performs the same function as AArch32 System register ICV_EOIR0.

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_EOIR0_EL1 are UNDEFINED.

Attributes

ICV_EOIR0_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:24	RES0
23:0	INTID

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICV_IAR0_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR_EL1 to deactivate the virtual interrupt.

Accessing ICV_EOIR0_EL1

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR0_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_EOIR0_EL1, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b001

```

ICV_EOIR1_EL1, Interrupt Controller Virtual End Of Interrupt Register 1

The ICV_EOIR1_EL1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 1 interrupt.

Configuration

AArch64 System register ICV_EOIR1_EL1 performs the same function as AArch32 System register ICV_EOIR1.

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_EOIR1_EL1 are UNDEFINED.

Attributes

ICV_EOIR1_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:24	RES0
23:0	INTID

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICV_IAR1_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR_EL1 to deactivate the virtual interrupt.

Accessing ICV_EOIR1_EL1

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR1_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings in the System register encoding space:

```
MSR ICC_EOIR1_EL1, <Xt>
```

ICV_HPPIR0_EL1, Interrupt Controller Virtual Highest Priority Pending Interrupt Register 0

The ICV_HPPIR0_EL1 characteristics are:

Purpose

Indicates the highest priority pending virtual Group 0 interrupt on the virtual CPU interface.

Configuration

AArch64 System register ICV_HPPIR0_EL1 performs the same function as AArch32 System register ICV_HPPIR0.

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_HPPIR0_EL1 are UNDEFINED.

Attributes

ICV_HPPIR0_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:24	RES0
23:0	INTID

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the highest priority pending virtual interrupt.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_HPPIR0_EL1

ICV_IAR0_EL1, Interrupt Controller Virtual Interrupt Acknowledge Register 0

The ICV_IAR0_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 0 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch64 System register ICV_IAR0_EL1 performs the same function as AArch32 System register ICV_IAR0.

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_IAR0_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_IAR0_EL1 is a 64-bit register.

Field descriptions

63 – 32
RES0

31 – 24	23 – 0
RES0	INTID

Bits [63:24]

ICV_IGRPEN0_EL1, Interrupt Controller Virtual Interrupt Group 0 Enable register

The ICV_IGRPEN0_EL1 characteristics are:

Purpose

Controls whether virtual Group 0 interrupts are enabled or not.

Configuration

AArch64 System register ICV_IGRPEN0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_IGRPEN0[31:0].

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_IGRPEN0_EL1 are UNDEFINED.

Attributes

ICV_IGRPEN0_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:1	RES0
0	Enable

Bits [63:1]

Reserved, RES0.

Enable, bit [0]

Enables virtual Group 0 interrupts.

Enable	Meaning
0b0	Virtual Group 0 interrupts are disabled.
0b1	Virtual Group 0 interrupts are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_IGRPEN0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_IGRPEN0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b110

```

ICV_IGRPEN1_EL1, Interrupt Controller Virtual Interrupt Group 1 Enable register

The ICV_IGRPEN1_EL1 characteristics are:

Purpose

Controls whether virtual Group 1 interrupts are enabled for the current Security state.

Configuration

AArch64 System register ICV_IGRPEN1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_IGRPEN1[31:0].

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_IGRPEN1_EL1 are UNDEFINED.

Attributes

ICV_IGRPEN1_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:1	RES0
0	Enable

Bits [63:1]

Reserved, RES0.

Enable, bit [0]

Enables virtual Group 1 interrupts.

Enable	Meaning
`0b0`	Virtual Group 1 interrupts are disabled.
`0b1`	Virtual Group 1 interrupts are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_IGRPEN1_EL1

Accesses to this register use the following encodings in the System register encoding space:

ICV_NMIAR1_EL1, Interrupt Controller Virtual Non-maskable Interrupt Acknowledge Register 1

The ICV_NMIAR1_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 1 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

This register is present only when FEAT_GICv3_NMI is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_NMIAR1_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_NMIAR1_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:24	RES0
23:0	INTID

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled virtual interrupt.

This is the INTID of the highest priority pending virtual interrupt, if that virtual interrupt has the Non-maskable property and is of sufficient priority for it to be signalled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_NMIAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_NMIAR1_EL1
```

ICV_PMR_EL1, Interrupt Controller Virtual Interrupt Priority Mask Register

The ICV_PMR_EL1 characteristics are:

Purpose

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

Configuration

AArch64 System register ICV_PMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_PMR[31:0].

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_PMR_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_PMR_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:8	RES0
7:0	Priority

Bits [63:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	`0x00`-`0xFF` (0-255), all values	256
[7:1]	`0x00`-`0xFE` (0-254), even values only	128
[7:2]	`0x00`-`0xFC` (0-252), in steps of 4	64
[7:3]	`0x00`-`0xF8` (0-248), in steps of 8	32
[7:4]	`0x00`-`0xF0` (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_PMR_EL1

Accesses to this register use the following encodings in the System register encoding space:

ICV_RPR_EL1, Interrupt Controller Virtual Running Priority Register

The ICV_RPR_EL1 characteristics are:

Purpose

Indicates the Running priority of the virtual CPU interface.

Configuration

AArch64 System register ICV_RPR_EL1 performs the same function as AArch32 System register ICV_RPR.

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_RPR_EL1 are UNDEFINED.

Attributes

ICV_RPR_EL1 is a 64-bit register.

Field descriptions

63	62–32
NMI	RES0

31–8	7–0
RES0	Priority

NMI, bit [63]

When FEAT_GICv3_NMI is implemented:

Indicates whether the running priority is from a NMI.

NMI	Meaning
`0b0`	There is no active Group 1 NMI, or all active Group 1 NMIs have undergone priority drop.
`0b1`	There is an active Group 1 NMI.

Otherwise:

Reserved, RES0.

Bits [62:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt.

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

Note

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

Accessing ICV_RPR_EL1

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ICC_RPR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;

ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0

The ID_AA64DFR0_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

The external register EDDFR gives information from this register.

Attributes

ID_AA64DFR0_EL1 is a 64-bit register.

Field descriptions

63:60	59:52	51:48	47:44	43:40	39:36	35:32
HPMN0	RES0	MTPMU	RES0	TraceFilt	DoubleLock	PMSVer

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
CTX_CMPs	RES0	WRPs	RES0	BRPs	PMUVer	TraceVer	DebugVer

HPMN0, bits [63:60]

Zero PMU event counters for a Guest operating system. Defined values are:

HPMN0	Meaning
`0b0000`	Setting MDCR_EL2.HPMN to zero has CONSTRAINED UNPREDICTABLE behavior.
`0b0001`	Setting MDCR_EL2.HPMN to zero has defined behavior.

All other values are reserved.

If FEAT_PMUv3 is not implemented, FEAT_FGT is not implemented, or EL2 is not implemented, the only permitted value is `0b0000`.

FEAT_HPMN0 implements the functionality identified by the value `0b0001`.

From Armv8.8, in an implementation that includes FEAT_PMUv3, FEAT_FGT, and EL2, the value `0b0000` is not permitted.

Bits [59:52]

Reserved, RES0.

MTPMU, bits [51:48]

Multi-threaded PMU extension. Defined values are:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are read/write or RES0.
0b0001	FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are 0.
0b1111	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are RES0.

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value `0b0001`.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value `0b0000` is not permitted.

In an implementation that does not include FEAT_PMUv3, the value `0b0001` is not permitted.

Bits [47:44]

Reserved, RES0.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality identified by the value `0b0001`.

From Armv8.4, if an Embedded Trace Macrocell Architecture PE Trace Unit is implemented, the value `0b0000` is not permitted.

DoubleLock, bits [39:36]

OS Double Lock implemented. Defined values are:

DoubleLock	Meaning
0b0000	OS Double Lock implemented. OSDLR_EL1 is RW.
0b1111	OS Double Lock not implemented. OSDLR_EL1 is RAZ/WI.

All other values are reserved.

FEAT_DoubleLock implements the functionality identified by the value `0b0000`.

In Armv8.0, the only permitted value is `0b0000`.

If FEAT_Debugv8p2 is implemented and FEAT_DoPD is not implemented, the permitted values are `0b0000` and `0b1111`.

If FEAT_DoPD is implemented, the only permitted value is `0b1111`.

PMSVer, bits [35:32]

Statistical Profiling Extension version. Defined values are:

PMSVer	Meaning
0b0000	Statistical Profiling Extension not implemented.
0b0001	Statistical Profiling Extension implemented.
0b0010	As 0b0001, and adds: • Support for the Event packet Alignment flag. • If FEAT_SVE is implemented, support for the Scalable Vector extensions to Statistical Profiling.
0b0011	As 0b0010, and adds: • Discard mode. • Extended event filtering, including the PMSNEVFR_EL1 System register. • Support for the OPTIONAL previous branch target Address packet. • If FEAT_PMUv3 is implemented, controls to freeze the PMU event counters after an SPE buffer management event occurs. • If FEAT_PMUv3 is implemented, the SAMPLE_FEED_BR, SAMPLE_FEED_EVENT, SAMPLE_FEED_LAT, SAMPLE_FEED_LD, SAMPLE_FEED_OP, and SAMPLE_FEED_ST PMU events.
0b0100	As 0b0011, and adds: • If FEAT_MOPS is implemented, Operation Type packet encodings for Memory Copy and Set operations. • If FEAT_MTE is implemented, Operation Type packet encodings for loads and stores of Allocation Tags.

All other values are reserved.

FEAT_SPE implements the functionality identified by the value 0b0001.

FEAT_SPEv1p1 implements the functionality identified by the value 0b0010.

FEAT_SPEv1p2 implements the functionality identified by the value 0b0011.

FEAT_SPEv1p3 implements the functionality identified by the value 0b0100.

From Armv8.5, if FEAT_SPE is implemented, the value 0b0001 is not permitted.

From Armv8.7, if FEAT_SPE is implemented, the value 0b0010 is not permitted.

From Armv8.8, if FEAT_SPE is implemented, the value 0b0011 is not permitted.

CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and adds support for: • Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. • If EL2 is implemented, the MDCR_EL2.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR_EL1 register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: • 64-bit event counters. • If EL2 is implemented, the MDCR_EL2.HCCD control. • If EL3 is implemented, the MDCR_EL3.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: • The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO controls. • If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: • Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. • Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

TraceVer	Meaning
0b0000	PE trace unit System registers not implemented.
0b0001	PE trace unit System registers implemented.

All other values are reserved.

See the ETM Architecture Specification for more information.

A value of `0b0000` only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.

DebugVer, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

DebugVer	Meaning
`0b0110`	Armv8 debug architecture.
`0b0111`	Armv8 debug architecture with Virtualization Host Extensions.
`0b1000`	Armv8.2 debug architecture, FEAT_Debugv8p2.
`0b1001`	Armv8.4 debug architecture, FEAT_Debugv8p4.
`0b1010`	Armv8.8 debug architecture, FEAT_Debugv8p8.

All other values are reserved.

FEAT_VHE adds the functionality identified by the value `0b0111`.

FEAT_Debugv8p2 adds the functionality identified by the value `0b1000`.

FEAT_Debugv8p4 adds the functionality identified by the value `0b1001`.

FEAT_Debugv8p8 adds the functionality identified by the value `0b1010`.

From Armv8.1, when FEAT_VHE is implemented the value `0b0110` is not permitted.

From Armv8.2, the values `0b0110` and `0b0111` are not permitted.

From Armv8.4, the value `0b1000` is not permitted.

From Armv8.8, the value `0b1001` is not permitted.

RNDR, bits [63:60]

Indicates support for Random Number instructions in AArch64 state.

When FEAT_RNG_TRAP is implemented, the value returned by a direct read of ID_AA64ISAR0_EL1.RNDR is further controlled by the value of SCR_EL3.TRNDR.

Defined values are:

RNDR	Meaning
`0b0000`	No Random Number instructions are implemented.
`0b0001`	RNDR and RNDRRS registers are implemented.

All other values are reserved.

FEAT_RNG implements the functionality identified by the value `0b0001`.

From Armv8.5, the permitted values are `0b0000` and `0b0001`.

TLB, bits [59:56]

Indicates support for Outer shareable and TLB range maintenance instructions. Defined values are:

TLB	Meaning
`0b0000`	Outer shareable and TLB range maintenance instructions are not implemented.
`0b0001`	Outer shareable TLB maintenance instructions are implemented.
`0b0010`	Outer shareable and TLB range maintenance instructions are implemented.

All other values are reserved.

FEAT_TLBIOS implements the functionality identified by the values 0b0001 and 0b0010.

FEAT_TLBIRANGE implements the functionality identified by the value 0b0010.

From Armv8.4, the only permitted value is 0b0010.

TS, bits [55:52]

Indicates support for flag manipulation instructions. Defined values are:

TS	Meaning
0b0000	No flag manipulation instructions are implemented.
0b0001	CFINV, RMIF, SETF16, and SETF8 instructions are implemented.
0b0010	CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented.

All other values are reserved.

FEAT_FlagM implements the functionality identified by the value 0b0001.

FEAT_FlagM2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

In Armv8.4, the only permitted value is 0b0001.

From Armv8.5, the only permitted value is 0b0010.

FHM, bits [51:48]

Indicates support for FMLAL and FMLSL instructions. Defined values are:

FHM	Meaning
0b0000	FMLAL and FMLSL instructions are not implemented.
0b0001	FMLAL and FMLSL instructions are implemented.

All other values are reserved.

FEAT_FHM implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

DP, bits [47:44]

Indicates support for Dot Product instructions in AArch64 state. Defined values are:

DP	Meaning
0b0000	No Dot Product instructions implemented.
0b0001	UDOT and SDOT instructions implemented.

All other values are reserved.

FEAT_DotProd implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

SM4, bits [43:40]

Indicates support for SM4 instructions in AArch64 state. Defined values are:

SM4	Meaning
0b0000	No SM4 instructions implemented.
0b0001	SM4E and SM4EKEY instructions implemented.

All other values are reserved.

If FEAT_SM4 is not implemented, the value `0b0001` is reserved.

From Armv8.2, the permitted values are `0b0000` and `0b0001`.

This field must have the same value as ID_AA64ISAR0_EL1.SM3.

SM3, bits [39:36]

Indicates support for SM3 instructions in AArch64 state. Defined values are:

SM3	Meaning
`0b0000`	No SM3 instructions implemented.
`0b0001`	SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 instructions implemented.

All other values are reserved.

If FEAT_SM3 is not implemented, the value `0b0001` is reserved.

FEAT_SM3 implements the functionality identified by the value `0b0001`.

From Armv8.2, the permitted values are `0b0000` and `0b0001`.

This field must have the same value as ID_AA64ISAR0_EL1.SM4.

SHA3, bits [35:32]

Indicates support for SHA3 instructions in AArch64 state. Defined values are:

SHA3	Meaning
`0b0000`	No SHA3 instructions implemented.
`0b0001`	EOR3, RAX1, XAR, and BCAX instructions implemented.

All other values are reserved.

If FEAT_SHA3 is not implemented, the value `0b0001` is reserved.

FEAT_SHA3 implements the functionality identified by the value `0b0001`.

From Armv8.2, the permitted values are `0b0000` and `0b0001`.

If the value of ID_AA64ISAR0_EL1.SHA1 is `0b0000`, this field must have the value `0b0000`.

If the value of this field is `0b0001`, ID_AA64ISAR0_EL1.SHA2 must have the value `0b0010`.

RDM, bits [31:28]

Indicates support for SQRDMLAH and SQRDMLSH instructions in AArch64 state. Defined values are:

RDM	Meaning
`0b0000`	No RDMA instructions implemented.
`0b0001`	SQRDMLAH and SQRDMLSH instructions implemented.

All other values are reserved.

FEAT_RDM implements the functionality identified by the value `0b0001`.

From Armv8.1, the only permitted value is `0b0001`.

Bits [27:24]

Reserved, RES0.

Atomic, bits [23:20]

Indicates support for Atomic instructions in AArch64 state. Defined values are:

Atomic	Meaning
0b0000	No Atomic instructions implemented.
0b0010	LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.

All other values are reserved.

FEAT_LSE implements the functionality identified by the value 0b0010.

From Armv8.1, the only permitted value is 0b0010.

CRC32, bits [19:16]

Indicates support for CRC32 instructions in AArch64 state. Defined values are:

CRC32	Meaning
0b0000	No CRC32 instructions implemented.
0b0001	CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates support for SHA2 instructions in AArch64 state. Defined values are:

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	Implements instructions: SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.
0b0010	Implements instructions: • SHA256H, SHA256H2, SHA256SU0, and SHA256SU1. • SHA512H, SHA512H2, SHA512SU0, and SHA512SU1.

All other values are reserved.

FEAT_SHA256 implements the functionality identified by the value 0b0001.

FEAT_SHA512 implements the functionality identified by the value 0b0010.

In Armv8, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0010, ID_AA64ISAR0_EL1.SHA3 must have the value 0b0001.

SHA1, bits [11:8]

Indicates support for SHA1 instructions in AArch64 state. Defined values are:

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented.

All other values are reserved.

FEAT_SHA1 implements the functionality identified by the value `0b0001`.

From Armv8, the permitted values are `0b0000` and `0b0001`.

If the value of ID_AA64ISAR0_EL1.SHA2 is `0b0000`, this field must have the value `0b0000`.

AES, bits [7:4]

Indicates support for AES instructions in AArch64 state. Defined values are:

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC instructions implemented.
0b0010	As for `0b0001`, plus PMULL/PMULL2 instructions operating on 64-bit data quantities.

FEAT_AES implements the functionality identified by the value `0b0001`.

FEAT_PMULL implements the functionality identified by the value `0b0010`.

All other values are reserved.

From Armv8, the permitted values are `0b0000` and `0b0010`.

Bits [3:0]

Reserved, RES0.

Accessing ID_AA64ISAR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64ISAR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b000

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64ISAR0_EL1;
elsif PSTATE.EL == EL2 then
    return ID_AA64ISAR0_EL1;
elsif PSTATE.EL == EL3 then
    return ID_AA64ISAR0_EL1;
```

ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1

The ID_AA64ISAR1_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64ISAR1_EL1 is a 64-bit register.

Field descriptions

63 62 61 60	59 58 57 56	55 54 53 52	51 50 49 48	47 46 45 44	43 42 41 40	39 38 37 36	35 34 33 32

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
GPI	GPA	LRCPC	FCMA	JSCVT	API	APA	DPB

LS64, bits [63:60]

Indicates support for LD64B and ST64B* instructions, and the ACCDATA_EL1 register. Defined values of this field are:

LS64	Meaning
`0b0000`	The LD64B and ST64B* instructions, the ACCDATA_EL1 register, and associated traps are not supported.
`0b0001`	The LD64B and ST64B instructions are supported.
`0b0010`	The LD64B, ST64B, and ST64BV instructions, and their associated traps are supported.
`0b0011`	The LD64 and ST64B* instructions, the ACCDATA_EL1 register, and their associated traps are supported.

All other values are reserved.

FEAT_LS64 implements the functionality identified by `0b0001`.

FEAT_LS64_V implements the functionality identified by `0b0010`.

FEAT_LS64_ACCDATA implements the functionality identified by `0b0011`.

From Armv8.7, the permitted values are `0b0000`, `0b0001`, `0b0010`, and `0b0011`.

XS, bits [59:56]

Indicates support for the XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields in AArch64 state. Defined values are:

XS	Meaning
0b0000	The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields are not supported.
0b0001	The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields are supported.

All other values are reserved.

FEAT_XS implements the functionality identified by 0b0001.

From Armv8.7, the only permitted value is 0b0001.

I8MM, bits [55:52]

Indicates support for Advanced SIMD and Floating-point Int8 matrix multiplication instructions in AArch64 state. Defined values are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.

All other values are reserved.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ZFR0_EL1.I8MM.

From Armv8.6, the only permitted value is 0b0001.

DGH, bits [51:48]

Indicates support for the Data Gathering Hint instruction. Defined values are:

DGH	Meaning
0b0000	Data Gathering Hint is not implemented.
0b0001	Data Gathering Hint is implemented.

All other values are reserved.

FEAT_DGH implements the functionality identified by 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

If the DGH instruction has no effect in preventing the merging of memory accesses, the value of this field is 0b0000.

BF16, bits [47:44]

Indicates support for Advanced SIMD and Floating-point BFloat16 instructions in AArch64 state. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	BFCVT, BFCVTN, BFCVTN2, BFDOT, BFMLALB, BFMLALT, and BFMMLA instructions are implemented.

All other values are reserved.

FEAT_BF16 implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ZFR0_EL1.BF16.

From Armv8.6, the only permitted value is 0b0001.

SPECRES, bits [43:40]

Indicates support for prediction invalidation instructions in AArch64 state. Defined values are:

SPECRES	Meaning
0b0000	CFP RCTX, DVP RCTX, and CPP RCTX instructions are not implemented.
0b0001	CFP RCTX, DVP RCTX, and CPP RCTX instructions are implemented.

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [39:36]

Indicates support for SB instruction in AArch64 state. Defined values are:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

FRINTTS, bits [35:32]

Indicates support for the FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented. Defined values are:

FRINTTS	Meaning
0b0000	FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are not implemented.
0b0001	FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented.

All other values are reserved.

FEAT_FRINTTS implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

GPI, bits [31:28]

Indicates support for an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

GPI	Meaning
0b0000	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

FEAT_PACIMP implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPA is non-zero, or the value of ID_AA64ISAR2_EL1.GPA3 is non-zero, this field must have the value 0b0000.

GPA, bits [27:24]

Indicates whether the QARMA5 algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

GPA	Meaning
0b0000	Generic Authentication using the QARMA5 algorithm is not implemented.
0b0001	Generic Authentication using the QARMA5 algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

FEAT_PACQARMA5 implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPI is non-zero, or the value of ID_AA64ISAR2_EL1.GPA3 is non-zero, this field must have the value 0b0000.

LRCPC, bits [23:20]

Indicates support for weaker release consistency, RCpc, based model. Defined values are:

LRCPC	Meaning
0b0000	The LDAPR*, LDAPUR*, and STLUR* instructions are not implemented.
0b0001	The LDAPR* instructions are implemented. The LDAPUR*, and STLUR* instructions are not implemented.
0b0010	The LDAPR*, LDAPUR*, and STLUR* instructions are implemented.

All other values are reserved.

FEAT_LRCPC implements the functionality identified by the value 0b0001.

FEAT_LRCPC2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

In Armv8.3, the permitted values are 0b0001 and 0b0010.

From Armv8.4, the only permitted value is 0b0010.

FCMA, bits [19:16]

Indicates support for complex number addition and multiplication, where numbers are stored in vectors. Defined values are:

FCMA	Meaning
0b0000	The FCMLA and FCADD instructions are not implemented.
0b0001	The FCMLA and FCADD instructions are implemented.

All other values are reserved.

FEAT_FCMA implements the functionality identified by the value 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

JSCVT, bits [15:12]

Indicates support for JavaScript conversion from double precision floating point values to integers in AArch64 state. Defined values are:

JSCVT	Meaning
0b0000	The FJCVTZS instruction is not implemented.
0b0001	The FJCVTZS instruction is implemented.

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

API, bits [11:8]

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

API	Meaning
0b0000	Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE, and the HaveEnhancedPAC2() function returning FALSE.
0b0011	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.
0b0100	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.

FEAT_EPAC implements the functionality identified by 0b0010.

FEAT_PAuth2 implements the functionality identified by 0b0011.

FEAT_FPAC implements the functionality identified by 0b0100.

FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

When this field is non-zero, FEAT_PACIMP is implemented.

In Armv8.3, the permitted values are 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.APA is non-zero, or the value of ID_AA64ISAR2_EL1.APA3 is non-zero, this field must have the value 0b0000.

APA, bits [7:4]

Indicates whether the QARMA5 algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

APA	Meaning
0b0000	Address Authentication using the QARMA5 algorithm is not implemented.
0b0001	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE.
0b0011	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0100	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101	Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.

FEAT_EPAC implements the functionality identified by 0b0010.

FEAT_PAuth2 implements the functionality identified by 0b0011.

FEAT_FPAC implements the functionality identified by 0b0100.

FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

When this field is non-zero, FEAT_PACQARMA5 is implemented.

In Armv8.3, the permitted values are 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.API is non-zero, or the value of ID_AA64ISAR2_EL1.APA3 is non-zero, this field must have the value 0b0000.

DPB, bits [3:0]

Data Persistence writeback. Indicates support for the DC CVAP and DC CVADP instructions in AArch64 state. Defined values are:

DPB	Meaning
0b0000	DC CVAP not supported.
0b0001	DC CVAP supported.
0b0010	DC CVAP and DC CVADP supported.

All other values are reserved.

FEAT_DPB implements the functionality identified by the value 0b0001.

FEAT_DPB2 implements the functionality identified by the value `0b0010`.

In Armv8.2, the permitted values are `0b0001` and `0b0010`.

From Armv8.5, the only permitted value is `0b0010`.

Accessing ID_AA64ISAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64ISAR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b001

```

ID_AA64ISAR2_EL1, AArch64 Instruction Set Attribute Register 2

The ID_AA64ISAR2_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64ISAR2_EL1 is a 64-bit register.

Field descriptions

63–32
RES0

31–28	27–24	23–20	19–16	15–12	11–8	7–4	3–0
RES0	PAC_frac	BC	MOPS	APA3	GPA3	RPRES	WFxT

Bits [63:28]

Reserved, RES0.

PAC_frac, bits [27:24]

Indicates whether the ConstPACField() function used as part of the PAC addition returns FALSE or TRUE.

PAC_frac	Meaning
`0b0000`	ConstPACField() returns FALSE.
`0b0001`	ConstPACField() returns TRUE.

All other values are reserved.

FEAT_CONSTPACFIELD implements the functionality identified by `0b0001`.

From Armv8.3, the permitted values are `0b0000` and `0b0001`.

BC, bits [23:20]

Indicates support for the BC instruction in AArch64 state. Defined values are:

BC	Meaning
`0b0000`	BC instruction is not implemented.
`0b0001`	BC instruction is implemented.

All other values are reserved.

FEAT_HBC implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

MOPS, bits [19:16]

Indicates support for the Memory Copy and Memory Set instructions in AArch64 state.

MOPS	Meaning
0b0000	The Memory Copy and Memory Set instructions are not implemented in AArch64 state.
0b0001	The Memory Copy and Memory Set instructions are implemented in AArch64 state with the following exception. If FEAT_MTE is implemented, then SETGP*, SETGM* and SETGE* instructions are also supported.

All other values are reserved.

FEAT_MOPS implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

APA3, bits [15:12]

Indicates whether the QARMA3 algorithm is implemented in the PE for address authentication in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

APA3	Meaning
0b0000	Address Authentication using the QARMA3 algorithm is not implemented.
0b0001	Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE.
0b0010	Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE.
0b0011	Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0100	Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE.
0b0101	Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE.

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.

FEAT_EPAC implements the functionality identified by 0b0010.

FEAT_PAuth2 implements the functionality identified by 0b0011.

FEAT_FPAC implements the functionality identified by 0b0100.

FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

When this field is non-zero, FEAT_PACQARMA3 is implemented.

In Armv8.3, the permitted values are `0b0000`, `0b0001`, `0b0010`, `0b0011`, `0b0100`, and `0b0101`.

From Armv8.6, the permitted values are `0b0011`, `0b0100`, and `0b0101`.

If the value of ID_AA64ISAR1_EL1.API is non-zero, or the value of ID_AA64ISAR1_EL1.APA is non-zero, this field must have the value `0b0000`.

GPA3, bits [11:8]

Indicates whether the QARMA3 algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

GPA3	Meaning
`0b0000`	Generic Authentication using the QARMA3 algorithm is not implemented.
`0b0001`	Generic Authentication using the QARMA3 algorithm is implemented. This includes the `PACGA` instruction.

All other values are reserved.

FEAT_PACQARMA3 implements the functionality identified by `0b0001`.

From Armv8.3, the permitted values are `0b0000` and `0b0001`.

If the value of ID_AA64ISAR1_EL1.GPI is non-zero, or the value of ID_AA64ISAR1_EL1.GPA is non-zero, this field must have the value `0b0000`.

RPRES, bits [7:4]

When FPCR.AH is 1, indicates support for 12 bits of mantissa in reciprocal and reciprocal square root instructions in AArch64 state. Defined values are:

RPRES	Meaning
`0b0000`	Reciprocal and reciprocal square root estimates give 8 bits of mantissa.
`0b0001`	Reciprocal and reciprocal square root estimates give 12 bits of mantissa.

All other values are reserved.

FEAT_RPRES implements the functionality identified by the value `0b0001`.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is `0b0001`.

WFxT, bits [3:0]

Indicates support for the `WFET` and `WFIT` instructions in AArch64 state. Defined values are:

WFxT	Meaning
`0b0000`	`WFET` and `WFIT` are not supported.
`0b0010`	`WFET` and `WFIT` are supported, and the register number is reported in the ESR_ELx on exceptions.

All other values are reserved.

FEAT_WFxT implements the functionality identified by the value `0b0010`.

From Armv8.7, the only permitted value is `0b0010`.

Accessing ID_AA64ISAR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64ISAR2_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b010

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64ISAR2_EL1;
elsif PSTATE.EL == EL2 then
    return ID_AA64ISAR2_EL1;
elsif PSTATE.EL == EL3 then
    return ID_AA64ISAR2_EL1;
```

ID_AA64MMFR0_EL1, AArch64 Memory Model Feature Register 0

The ID_AA64MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64MMFR0_EL1 is a 64-bit register.

Field descriptions

<table>
<tr><td>63</td><td>62</td><td>61</td><td>60</td><td>59</td><td>58</td><td>57</td><td>56</td><td>55</td><td>54</td><td>53</td><td>52</td><td>51</td><td>50</td><td>49</td><td>48</td><td>47</td><td>46</td><td>45</td><td>44</td><td>43</td><td>42</td><td>41</td><td>40</td><td>39</td><td>38</td><td>37</td><td>36</td><td>35</td><td>34</td><td>33</td><td>32</td></tr>

</table>

ECV, bits [63:60]

Indicates presence of Enhanced Counter Virtualization. Defined values are:

ECV	Meaning
`0b0000`	Enhanced Counter Virtualization is not implemented.
`0b0001`	Enhanced Counter Virtualization is implemented. Supports CNTHCTL_EL2.{EL1TVT, EL1TVCT, EL1NVPCT, EL1NVVCT, EVNTIS}, CNTKCTL_EL1.EVNTIS, CNTPCTSS_EL0 counter views, and CNTVCTSS_EL0 counter views. Extends the PMSCR_EL1.PCT, PMSCR_EL2.PCT, TRFCR_EL1.TS, and TRFCR_EL2.TS fields.
`0b0010`	As `0b0001`, and also includes support for CNTHCTL_EL2.ECV and CNTPOFF_EL2.

All other values are reserved.

FEAT_ECV implements the functionality identified by the values `0b0001` and `0b0010`.

From Armv8.6, the only permitted values are `0b0001` and `0b0010`.

FGT, bits [59:56]

Indicates presence of the Fine-Grained Trap controls:

- If EL2 is implemented, the HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2 and HFGWTR_EL2 registers, and their associated traps.
- If EL2 is implemented, MDCR_EL2.TDCC.
- If EL3 is implemented, MDCR_EL3.TDCC.
- If both EL2 and EL3 are implemented, SCR_EL3.FGTEn.

Defined values are:

FGT	Meaning
0b0000	The fine-grained trap controls are not implemented.
0b0001	The fine-grained trap controls are implemented.

All other values are reserved.

FEAT_FGT implements the functionality identified by the value 0b0001.

From Armv8.6, the only permitted value is 0b0001.

Bits [55:48]

Reserved, RES0.

ExS, bits [47:44]

Indicates support for disabling context synchronizing exception entry and exit. Defined values are:

ExS	Meaning
0b0000	All exception entries and exits are context synchronization events.
0b0001	Non-context synchronizing exception entry and exit are supported.

All other values are reserved.

FEAT_ExS implements the functionality identified by the value 0b0001.

TGran4_2, bits [43:40]

Indicates support for 4KB memory granule size at stage 2. Defined values are:

TGran4_2	Meaning	Applies when
0b0000	Support for 4KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran4 field.	
0b0001	4KB granule not supported at stage 2.	
0b0010	4KB granule supported at stage 2.	
0b0011	4KB granule at stage 2 supports 52-bit input and output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

The 0b0000 value is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

TGran64_2, bits [39:36]

Indicates support for 64KB memory granule size at stage 2. Defined values are:

TGran64_2	Meaning
0b0000	Support for 64KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran64 field.
0b0001	64KB granule not supported at stage 2.
0b0010	64KB granule supported at stage 2.

All other values are reserved.

The 0b0000 value is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

TGran16_2, bits [35:32]

Indicates support for 16KB memory granule size at stage 2. Defined values are:

TGran16_2	Meaning	Applies when
0b0000	Support for 16KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran16 field.	
0b0001	16KB granule not supported at stage 2.	
0b0010	16KB granule supported at stage 2.	
0b0011	16KB granule at stage 2 supports 52-bit input and output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

The 0b0000 value is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

TGran4, bits [31:28]

Indicates support for 4KB memory translation granule size. Defined values are:

TGran4	Meaning	Applies when
0b0000	4KB granule supported.	
0b0001	4KB granule supports 52-bit input and output addresses.	When FEAT_LPA2 is implemented
0b1111	4KB granule not supported.	

All other values are reserved.

TGran64, bits [27:24]

Indicates support for 64KB memory translation granule size. Defined values are:

TGran64	Meaning
0b0000	64KB granule supported.
0b1111	64KB granule not supported.

All other values are reserved.

TGran16, bits [23:20]

Indicates support for 16KB memory translation granule size. Defined values are:

TGran16	Meaning	Applies when
0b0000	16KB granule not supported.	
0b0001	16KB granule supported.	
0b0010	16KB granule supports 52-bit input and output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

BigEndEL0, bits [19:16]

Indicates support for mixed-endian at EL0 only. Defined values are:

BigEndEL0	Meaning
0b0000	No mixed-endian support at EL0. The SCTLR_EL1.E0E bit has a fixed value.
0b0001	Mixed-endian support at EL0. The SCTLR_EL1.E0E bit can be configured.

All other values are reserved.

This field is invalid and is RES0 if ID_AA64MMFR0_EL1.BigEnd is not 0b0000.

SNSMem, bits [15:12]

Indicates support for a distinction between Secure and Non-secure Memory. Defined values are:

SNSMem	Meaning
0b0000	Does not support a distinction between Secure and Non-secure Memory.
0b0001	Does support a distinction between Secure and Non-secure Memory.

Note

If EL3 is implemented, the value 0b0000 is not permitted.

All other values are reserved.

BigEnd, bits [11:8]

Indicates support for mixed-endian configuration. Defined values are:

BigEnd	Meaning
0b0000	No mixed-endian support. The SCTLR_ELx.EE bits have a fixed value. See the BigEndEL0 field, bits[19:16], for whether EL0 supports mixed-endian.
0b0001	Mixed-endian support. The SCTLR_ELx.EE and SCTLR_EL1.E0E bits can be configured.

All other values are reserved.

ASIDBits, bits [7:4]

Number of ASID bits. Defined values are:

ASIDBits	Meaning
0b0000	8 bits.
0b0010	16 bits.

All other values are reserved.

PARange, bits [3:0]

Physical Address range supported. Defined values are:

PARange	Meaning
0b0000	32 bits, 4GB.
0b0001	36 bits, 64GB.
0b0010	40 bits, 1TB.
0b0011	42 bits, 4TB.
0b0100	44 bits, 16TB.
0b0101	48 bits, 256TB.
0b0110	52 bits, 4PB.

All other values are reserved.

The value `0b0110` is permitted only if the implementation includes FEAT_LPA, otherwise it is reserved.

Accessing ID_AA64MMFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64MMFR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b000

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64MMFR0_EL1;
elsif PSTATE.EL == EL2 then
    return ID_AA64MMFR0_EL1;
elsif PSTATE.EL == EL3 then
    return ID_AA64MMFR0_EL1;
```

ID_AA64MMFR1_EL1, AArch64 Memory Model Feature Register 1

The ID_AA64MMFR1_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64MMFR1_EL1 is a 64-bit register.

Field descriptions

63:60	59:56	55:52	51:48	47:44	43:40	39:36	35:32
RES0	CMOW	TIDCP1	nTLBPA	AFP	HCX	ETS	TWED
XNX	SpecSEI	PAN	LO	HPDS	VH	VMIDBits	HAFDBS
31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0

Bits [63:60]

Reserved, RES0.

CMOW, bits [59:56]

Indicates support for cache maintenance instruction permission. Defined values are:

CMOW	Meaning
0b0000	SCTLR_EL1.CMOW, SCTLR_EL2.CMOW, and HCRX_EL2.CMOW bits are not implemented.
0b0001	SCTLR_EL1.CMOW is implemented. If EL2 is implemented, SCTLR_EL2.CMOW and HCRX_EL2.CMOW bits are implemented.

All other values are reserved.

FEAT_CMOW implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

TIDCP1, bits [55:52]

Indicates whether SCTLR_EL1.TIDCP and SCTLR_EL2.TIDCP are implemented in AArch64 state. Defined values are:

TIDCP1	Meaning
0b0000	SCTLR_EL1.TIDCP and SCTLR_EL2.TIDCP bits are not implemented and are RES0.
0b0001	SCTLR_EL1.TIDCP bit is implemented. If EL2 is implemented, SCTLR_EL2.TIDCP bit is implemented.

All other values are reserved.

FEAT_TIDCP1 implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

nTLBPA, bits [51:48]

Indicates support for intermediate caching of translation table walks. Defined values are:

nTLBPA	Meaning
0b0000	The intermediate caching of translation table walks might include non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE where either: • The caching is indexed by the physical address of the location holding the translation table entry. • The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.
0b0001	The intermediate caching of translation table walks does not include non-coherent caches of previous valid translation table entries since the last completed TLBI applicable to the PE where either: • The caching is indexed by the physical address of the location holding the translation table entry. • The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.

All other values are reserved.

FEAT_nTLBPA implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

AFP, bits [47:44]

Indicates support for FPCR.{AH, FIZ, NEP}. Defined values are:

AFP	Meaning
0b0000	The FPCR.{AH, FIZ, NEP} fields are not supported.
0b0001	The FPCR.{AH, FIZ, NEP} fields are supported.

All other values are reserved.

FEAT_AFP implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

HCX, bits [43:40]

Indicates support for HCRX_EL2 and its associated EL3 trap. Defined values are:

HCX	Meaning
0b0000	HCRX_EL2 and its associated EL3 trap are not supported.
0b0001	HCRX_EL2 and its associated EL3 trap are supported.

All other values are reserved.

FEAT_HCX implements the functionality identified by the value 0b0001.

From Armv8.7, if EL2 is implemented, the only permitted value is 0b0001.

ETS, bits [39:36]

Indicates support for Enhanced Translation Synchronization. Defined values are:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is supported.

All other values are reserved.

FEAT_ETS implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

TWED, bits [35:32]

Indicates support for the configurable delayed trapping of WFE. Defined values are:

TWED	Meaning
0b0000	Configurable delayed trapping of WFE is not supported.
0b0001	Configurable delayed trapping of WFE is supported.

All other values are reserved.

FEAT_TWED implements the functionality identified by the value 0b0001.

From Armv8.6, the permitted values are 0b0000 and 0b0001.

XNX, bits [31:28]

Indicates support for execute-never control distinction by Exception level at stage 2. Defined values are:

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [27:24]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

SpecSEI	Meaning
0b0000	The PE never generates an SError interrupt due to an External abort on a speculative read.
0b0001	The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

PAN, bits [23:20]

Privileged Access Never. Indicates support for the PAN bit in PSTATE, SPSR_EL1, SPSR_EL2, SPSR_EL3, and DSPSR_EL0. Defined values are:

PAN	Meaning
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and AT S1E1RP and AT S1E1WP instructions supported.
0b0011	PAN supported, AT S1E1RP and AT S1E1WP instructions supported, and SCTLR_EL1.EPAN and SCTLR_EL2.EPAN bits supported.

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

FEAT_PAN3 implements the functionality added by the value 0b0011.

In Armv8.1, the permitted values are 0b0001, 0b0010, and 0b0011.

From Armv8.2, the permitted values are 0b0010 and 0b0011.

From Armv8.7, the only permitted value is 0b0011.

LO, bits [19:16]

LORegions. Indicates support for LORegions. Defined values are:

LO	Meaning
0b0000	LORegions not supported.
0b0001	LORegions supported.

All other values are reserved.

FEAT_LOR implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

HPDS, bits [15:12]

Hierarchical Permission Disables. Indicates support for disabling hierarchical controls in translation tables. Defined values are:

HPDS	Meaning
0b0000	Disabling of hierarchical controls not supported.
0b0001	Disabling of hierarchical controls supported with the TCR_EL1.{HPD1, HPD0}, TCR_EL2.HPD or TCR_EL2.{HPD1, HPD0}, and TCR_EL3.HPD bits.
0b0010	As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

FEAT_HPDS implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality identified by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

VH, bits [11:8]

Virtualization Host Extensions. Defined values are:

VH	Meaning
0b0000	Virtualization Host Extensions not supported.
0b0001	Virtualization Host Extensions supported.

All other values are reserved.

FEAT_VHE implements the functionality identified by the value `0b0001`.

From Armv8.1, the only permitted value is `0b0001`.

VMIDBits, bits [7:4]

Number of VMID bits. Defined values are:

VMIDBits	Meaning
0b0000	8 bits
0b0010	16 bits

All other values are reserved.

FEAT_VMID16 implements the functionality identified by the value `0b0010`.

From Armv8.1, the permitted values are `0b0000` and `0b0010`.

HAFDBS, bits [3:0]

Hardware updates to Access flag and Dirty state in translation tables. Defined values are:

HAFDBS	Meaning
0b0000	Hardware update of the Access flag and dirty state are not supported.
0b0001	Hardware update of the Access flag is supported.
0b0010	Hardware update of both the Access flag and dirty state is supported.

All other values are reserved.

FEAT_HAFDBS implements the functionality identified by the values `0b0001` and `0b0010`.

From Armv8.1, the permitted values are `0b0000`, `0b0001`, and `0b0010`.

Accessing ID_AA64MMFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64MMFR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b001

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64MMFR1_EL1;
elsif PSTATE.EL == EL2 then
    return ID_AA64MMFR1_EL1;
elsif PSTATE.EL == EL3 then
    return ID_AA64MMFR1_EL1;
```

ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2

The ID_AA64MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64MMFR2_EL1 is a 64-bit register.

Field descriptions

63:60	59:56	55:52	51:48	47:44	43:40	39:36	35:32
E0PD	EVT	BBM	TTL	RES0	FWB	IDS	AT
ST	NV	CCIDX	VARange	IESB	LSM	UAO	CnP
31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0

E0PD, bits [63:60]

Indicates support for the E0PD mechanism. Defined values are:

E0PD	Meaning
`0b0000`	E0PDx mechanism is not implemented.
`0b0001`	E0PDx mechanism is implemented.

All other values are reserved.

FEAT_E0PD implements the functionality identified by the value `0b0001`.

In Armv8.4, the permitted values are `0b0000` and `0b0001`.

From Armv8.5, the only permitted value is `0b0001`.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

EVT, bits [59:56]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

EVT	Meaning
0b0000	HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	HCR_EL2.{TOCU, TICAB, TID4} traps are supported. HCR_EL2.{TTLBOS, TTLBIS} traps are not supported.
0b0010	HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

FEAT_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

BBM, bits [55:52]

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block size for a translation.

BBM	Meaning
0b0000	Level 0 support for changing block size is supported.
0b0001	Level 1 support for changing block size is supported.
0b0010	Level 2 support for changing block size is supported.

All other values are reserved.

FEAT_BBM implements the functionality identified by the values 0b0000, 0b0001, and 0b0010.

From Armv8.4, the permitted values are 0b0000, 0b0001, and 0b0010.

TTL, bits [51:48]

Indicates support for TTL field in address operations. Defined values are:

TTL	Meaning
0b0000	TLB maintenance instructions by address have bits[47:44] as RES0.
0b0001	TLB maintenance instructions by address have bits[47:44] holding the TTL field.

All other values are reserved.

FEAT_TTL implements the functionality identified by the value 0b0001.

This field affects TLBI IPAS2E1, TLBI IPAS2E1IS, TLBI IPAS2E1OS, TLBI IPAS2LE1, TLBI IPAS2LE1IS, TLBI IPAS2LE1OS, TLBI VAAE1, TLBI VAAE1IS, TLBI VAAE1OS, TLBI VAALE1, TLBI VAALE1IS, TLBI VAALE1OS, TLBI VAE1, TLBI VAE1IS, TLBI VAE1OS, TLBI VAE2, TLBI VAE2IS, TLBI VAE2OS, TLBI VAE3, TLBI VAE3IS, TLBI VAE3OS,TLBI VALE1, TLBI VALE1IS, TLBI VALE1OS, TLBI VALE2, TLBI VALE2IS, TLBI VALE2OS, TLBI VALE3, TLBI VALE3IS, TLBI VALE3OS.

From Armv8.4, the only permitted value is 0b0001.

Bits [47:44]

Reserved, RES0.

FWB, bits [43:40]

Indicates support for HCR_EL2.FWB. Defined values are:

FWB	Meaning
0b0000	HCR_EL2.FWB bit is not supported.
0b0001	HCR_EL2.FWB is supported.

All other values reserved.

FEAT_S2FWB implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

IDS, bits [39:36]

Indicates the value of ESR_ELx.EC that reports an exception generated by a read access to the feature ID space. Defined values are:

IDS	Meaning
0b0000	An exception which is generated by a read access to the feature ID space, other than a trap caused by HCR_EL2.TIDx, SCTLR_EL1.UCT, or SCTLR_EL2.UCT, is reported by ESR_ELx.EC == 0x0.
0b0001	All exceptions generated by an AArch64 read access to the feature ID space are reported by ESR_ELx.EC == 0x18.

All other values are reserved.

The Feature ID space is defined as the System register space in AArch64 with op0==3, op1=={0, 1, 3}, CRn==0, CRm=={0-7}, op2=={0-7}.

FEAT_IDST implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AT, bits [35:32]

Identifies support for unaligned single-copy atomicity and atomic functions. Defined values are:

AT	Meaning
0b0000	Unaligned single-copy atomicity and atomic functions are not supported.
0b0001	Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.

All other values are reserved.

FEAT_LSE2 implements the functionality identified by the value 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

ST, bits [31:28]

Identifies support for small translation tables. Defined values are:

ST	Meaning
0b0000	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 39.
0b0001	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.

All other values are reserved.

FEAT_TTST implements the functionality identified by the value 0b0001.

If FEAT_SEL2 is implemented, the only permitted value is 0b0001.

In an implementation which does not support FEAT_SEL2, the permitted values are 0b0000 and 0b0001.

NV, bits [27:24]

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are:

NV	Meaning
0b0000	Nested virtualization is not supported.
0b0001	The HCR_EL2.{AT, NV1, NV} bits are implemented.
0b0010	The VNCR_EL2 register and the HCR_EL2.{NV2, AT, NV1, NV} bits are implemented.

All other values are reserved.

If EL2 is not implemented, the only permitted value is 0b0000.

FEAT_NV implements the functionality identified by the value 0b0001.

FEAT_NV2 implements the functionality identified by the value 0b0010.

In Armv8.3, if EL2 is implemented, the permitted values are 0b0000 and 0b0001.

From Armv8.4, if EL2 is implemented, the permitted values are 0b0000, 0b0001, and 0b0010.

CCIDX, bits [23:20]

Support for the use of revised CCSIDR_EL1 register format. Defined values are:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR_EL1.
0b0001	64-bit format implemented for all levels of the CCSIDR_EL1.

All other values are reserved.

FEAT_CCIDX implements the functionality identified by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

VARange, bits [19:16]

Indicates support for a larger virtual address. Defined values are:

VARange	Meaning
0b0000	VMSAv8-64 supports 48-bit VAs.
0b0001	VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The size for other translation granules is not defined by this field.

All other values are reserved.

FEAT_LVA implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

IESB, bits [15:12]

Indicates support for the IESB bit in the SCTLR_ELx registers. Defined values are:

IESB	Meaning
0b0000	IESB bit in the SCTLR_ELx registers is not supported.
0b0001	IESB bit in the SCTLR_ELx registers is supported.

All other values are reserved.

FEAT_IESB implements the functionality identified by the value 0b0001.

LSM, bits [11:8]

Indicates support for LSMAOE and nTLSMD bits in SCTLR_EL1 and SCTLR_EL2. Defined values are:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

UAO, bits [7:4]

User Access Override. Defined values are:

UAO	Meaning
0b0000	UAO not supported.
0b0001	UAO supported.

All other values are reserved.

FEAT_UAO implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

CnP, bits [3:0]

Indicates support for Common not Private translations. Defined values are:

CnP	Meaning
0b0000	Common not Private translations not supported.
0b0001	Common not Private translations supported.

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Accessing ID_AA64MMFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64MMFR2_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b010

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && (!IsZero(ID_AA64MMFR2_EL1) || boolean IMPLEMENTATION_DEFINED
"ID_AA64MMFR2_EL1 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64MMFR2_EL1;
elsif PSTATE.EL == EL2 then
    return ID_AA64MMFR2_EL1;
elsif PSTATE.EL == EL3 then
    return ID_AA64MMFR2_EL1;
```

ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0

The ID_AA64PFR0_EL1 characteristics are:

Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

The external register EDPFR gives information from this register.

Attributes

ID_AA64PFR0_EL1 is a 64-bit register.

Field descriptions

63–60	59–56	55–52	51–48	47–44	43–40	39–36	35–32
CSV3	CSV2	RES0	DIT	AMU	MPAM	SEL2	SVE
RAS	GIC	AdvSIMD	FP	EL3	EL2	EL1	EL0
31–28	27–24	23–20	19–16	15–12	11–8	7–4	3–0

CSV3, bits [63:60]

Speculative use of faulting data. Defined values are:

CSV3	Meaning
0b0000	This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence.
0b0001	Data loaded under speculation with a permission or domain fault cannot be used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence. The execution timing of any other instructions in the speculative sequence is not a function of the data loaded under speculation.

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

CSV2, bits [59:56]

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	This PE does not disclose whether branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context.
0b0001	Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Contexts do not include the SCXTNUM_ELx register contexts. Support for the SCXTNUM_ELx registers is defined in ID_AA64PFR1_EL1.CSV2_frac.
0b0010	Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. The SCXTNUM_ELx registers are supported and the contexts include the SCXTNUM_ELx register contexts.

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the value 0b0001.

FEAT_CSV2_2 implements the functionality identified by the value 0b0010.

In Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

Bits [55:52]

Reserved, RES0.

DIT, bits [51:48]

Data Independent Timing. Defined values are:

DIT	Meaning
0b0000	AArch64 does not guarantee constant execution time of any instructions.
0b0001	AArch64 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are `0b0000`, `0b0001`, and `0b0010`.

MPAM, bits [43:40]

Indicates support for MPAM Extension. Defined values are:

MPAM	Meaning
0b0000	If ID_AA64PFR1_EL1.MPAM_frac == 0b0000, MPAM Extension is not implemented. If ID_AA64PFR1_EL1.MPAM_frac == 0b0001, MPAM Extension version 0.1 is implemented.
0b0001	If ID_AA64PFR1_EL1.MPAM_frac == 0b0000, MPAM Extension version 1.0 is implemented. If ID_AA64PFR1_EL1.MPAM_frac == 0b0001, MPAM Extension version 1.1 is implemented.

All other values are reserved.

SEL2, bits [39:36]

Secure EL2. Defined values are:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

All other values are reserved.

FEAT_SEL2 implements the functionality identified by the value `0b0001`.

SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

SVE	Meaning
0b0000	SVE architectural state and programmers' model are not implemented.
0b0001	SVE architectural state and programmers' model are implemented.

All other values are reserved.

If implemented, refer to ID_AA64ZFR0_EL1 for information about which SVE instructions are available.

RAS, bits [31:28]

RAS Extension version. Defined values are:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	RAS Extension implemented.
0b0010	FEAT_RASv1p1 implemented and, if EL3 is implemented, FEAT_DoubleFault implemented. As 0b0001, and adds support for: • If EL3 is implemented, FEAT_DoubleFault. • Additional ERXMISC<m>_EL1 System registers. • Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 and FEAT_DoubleFault implement the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT_DoubleFault is not implemented, and ERRIDR_EL1 is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

Note

When the value of this field is 0b0001, ID_AA64PFR1_EL1.RAS_frac indicates whether FEAT_RASv1p1 is implemented.

GIC, bits [27:24]

System register GIC CPU interface. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following SISD and SIMD operations: • Integer byte, halfword, word and doubleword element operations. • Single-precision and double-precision floating-point arithmetic. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

FP, bits [19:16]

Floating-point. Defined values are:

FP	Meaning
0b0000	Floating-point is implemented, and includes support for: • Single-precision and double-precision floating-point types. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with floating-point support that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without floating-point support.

EL3, bits [15:12]

EL3 Exception level handling. Defined values are:

EL3	Meaning
0b0000	EL3 is not implemented.
0b0001	EL3 can be executed in AArch64 state only.
0b0010	EL3 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL2, bits [11:8]

EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL1, bits [7:4]

EL1 Exception level handling. Defined values are:

EL1	Meaning
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

EL0, bits [3:0]

EL0 Exception level handling. Defined values are:

EL0	Meaning
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

Accessing ID_AA64PFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64PFR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b000

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then

ID_AA64PFR1_EL1, AArch64 Processor Feature Register 1

The ID_AA64PFR1_EL1 characteristics are:

Purpose

Reserved for future expansion of information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64PFR1_EL1 is a 64-bit register.

Field descriptions

63–40	39–36	35–32
RES0	NMI	CSV2_frac

31–28	27–20	19–16	15–12	11–8	7–4	3–0
RNDR_trap	RES0	MPAM_frac	RAS_frac	MTE	SSBS	BT

Bits [63:40]

Reserved, RES0.

NMI, bits [39:36]

Non-maskable Interrupt. Indicates support for Non-maskable interrupts. Defined values are:

NMI	Meaning
`0b0000`	SCTLR_ELx.{SPINTMASK, NMI} and PSTATE.ALLINT with its associated instructions are not supported.
`0b0001`	SCTLR_ELx.{SPINTMASK, NMI} and PSTATE.ALLINT with its associated instructions are supported.

All other values are reserved.

FEAT_NMI implements the functionality identified by the value `0b0001`.

From Armv8.8, the only permitted value is `0b0001`.

CSV2_frac, bits [35:32]

CSV2 fractional field. Defined values are:

CSV2_frac	Meaning
0b0000	This PE does not disclose whether branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context. The SCXTNUM_ELx registers are not supported.
0b0001	If ID_AA64PFR0_EL1.CSV2 is 0b0001, branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Within a hardware-described context, branch targets trained for branches situated at one address can control speculative execution of branches situated at different addresses only in a hard-to-determine way. The SCXTNUM_ELx registers are not supported and the contexts do not include the SCXTNUM_ELx register contexts.
0b0010	If ID_AA64PFR0_EL1.CSV2 is 0b0001, branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Within a hardware-described context, branch targets trained for branches situated at one address can control speculative execution of branches situated at different addresses only in a hard-to-determine way. The SCXTNUM_ELx registers are supported, but the contexts do not include the SCXTNUM_ELx register contexts.

All other values are reserved.

FEAT_CSV2_1p1 implements the functionality identified by the value 0b0001.

FEAT_CSV2_1p2 implements the functionality identified by the value 0b0010.

From Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

This field is valid only if ID_AA64PFR0_EL1.CSV2 is 0b0001.

RNDR_trap, bits [31:28]

Random Number trap to EL3 field. Defined values are:

RNDR_trap	Meaning
0b0000	Trapping of RNDR and RNDRRS to EL3 is not supported.
0b0001	Trapping of RNDR and RNDRRS to EL3 is supported. SCR_EL3.TRNDR is present.

All other values are reserved.

FEAT_RNG_TRAP implements the functionality identified by the value 0b0001.

Bits [27:20]

Reserved, RES0.

MPAM_frac, bits [19:16]

MPAM Extension fractional field. Defined values are:

MPAM_frac	Meaning
0b0000	If ID_AA64PFR0_EL1.MPAM == 0b0000, MPAM Extension not implemented. If ID_AA64PFR0_EL1.MPAM == 0b0001, MPAM Extension v1.0 is implemented.
0b0001	If ID_AA64PFR0_EL1.MPAM == 0b0000, implements MPAM v0.1, which is like v1.1 but reduces support for Secure PARTIDs. If ID_AA64PFR0_EL1.MPAM == 0b0001, implements MPAM v1.1 and adds support for MPAM2_EL2.TIDR to provide trapping of MPAMIDR_EL1 when MPAMHCR_EL2 is not present.

All other values are reserved.

RAS_frac, bits [15:12]

RAS Extension fractional field. Defined values are:

RAS_frac	Meaning
0b0000	If ID_AA64PFR0_EL1.RAS == 0b0001, RAS Extension implemented.
0b0001	If ID_AA64PFR0_EL1.RAS == 0b0001, as 0b0000 and adds support for: • Additional ERXMISC<m>_EL1 System registers. • Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS, and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

FEAT_RASv1p1 implements the functionality identified by the value 0b0001.

This field is valid only if ID_AA64PFR0_EL1.RAS == 0b0001.

MTE, bits [11:8]

Support for the Memory Tagging Extension. Defined values are:

MTE	Meaning
0b0000	Memory Tagging Extension is not implemented.
0b0001	Instruction-only Memory Tagging Extension is implemented.
0b0010	Full Memory Tagging Extension is implemented.
0b0011	Memory Tagging Extension is implemented with support for asymmetric Tag Check Fault handling.

All other values are reserved.

FEAT_MTE implements the functionality identified by the value 0b0001.

FEAT_MTE2 implements the functionality identified by the value 0b0010.

FEAT_MTE3 implements the functionality identified by the value 0b0011.

In Armv8.5, the permitted values are 0b0000, 0b0001 and 0b0010.

From Armv8.7, the value 0b0001 is not permitted.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

SSBS	Meaning
`0b0000`	AArch64 provides no mechanism to control the use of Speculative Store Bypassing.
`0b0001`	AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.
`0b0010`	As `0b0001`, and adds the MSR and MRS instructions to directly read and write the PSTATE.SSBS field.

All other values are reserved.

FEAT_SSBS implements the functionality identified by the value `0b0001`.

FEAT_SSBS2 implements the functionality identified by the value `0b0010`.

BT, bits [3:0]

Branch Target Identification mechanism support in AArch64 state. Defined values are:

BT	Meaning
`0b0000`	The Branch Target Identification mechanism is not implemented.
`0b0001`	The Branch Target Identification mechanism is implemented.

All other values are reserved.

FEAT_BTI implements the functionality identified by the value `0b0001`.

From Armv8.5, the only permitted value is `0b0001`.

Accessing ID_AA64PFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64PFR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b001

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64PFR1_EL1;
elsif PSTATE.EL == EL2 then
    return ID_AA64PFR1_EL1;
elsif PSTATE.EL == EL3 then
    return ID_AA64PFR1_EL1;
```

ID_AA64ZFR0_EL1, SVE Feature ID register 0

The ID_AA64ZFR0_EL1 characteristics are:

Purpose

Provides additional information about the implemented features of the AArch64 Scalable Vector Extension, when the ID_AA64PFR0_EL1.SVE field is not zero.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64ZFR0_EL1 is a 64-bit register.

Field descriptions

63:60	59:56	55:52	51:48	47:44	43:32
RES0	F64MM	F32MM	RES0	I8MM	RES0

31:24	23:20	19:4	3:0
RES0	BF16	RES0	SVEver

Bits [63:60]

Reserved, RES0.

F64MM, bits [59:56]

Indicates support for SVE FP64 double-precision floating-point matrix multiplication instructions. Defined values are:

F64MM	Meaning
`0b0000`	FP64 matrix multiplication and related instructions are not implemented.
`0b0001`	FP64 variant of the FMMLA instruction, and LD1RO* instructions are implemented. The 128-bit element variations of TRN1, TRN2, UZP1, UZP2, ZIP1, and ZIP2 are also implemented.

All other values are reserved.

FEAT_F64MM implements the functionality identified by `0b0001`.

From Armv8.2, the permitted values are `0b0000` and `0b0001`.

F32MM, bits [55:52]

Indicates support for the SVE FP32 single-precision floating-point matrix multiplication instruction. Defined values are:

F32MM	Meaning
0b0000	FP32 matrix multiplication instruction is not implemented.
0b0001	FP32 variant of the FMMLA instruction is implemented.

All other values are reserved.

FEAT_F32MM implements the functionality identified by `0b0001`.

From Arm v8.2, the permitted values are `0b0000` and `0b0001`.

Bits [51:48]

Reserved, RES0.

I8MM, bits [47:44]

Indicates support for SVE Int8 matrix multiplication instructions. Defined values are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented.

All other values are reserved.

FEAT_I8MM implements the functionality identified by `0b0001`.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ISAR1_EL1.I8MM.

From Armv8.6, the only permitted value is `0b0001`.

Bits [43:24]

Reserved, RES0.

BF16, bits [23:20]

Indicates support for SVE BFloat16 instructions. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	BFCVT, BFCVTNT, BFDOT, BFMLALB, BFMLALT, and BFMMLA instructions are implemented.

All other values are reserved.

FEAT_BF16 implements the functionality identified by `0b0001`.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ISAR1_EL1.BF16.

From Armv8.6, the only permitted value is `0b0001`.

Bits [19:4]

Reserved, RES0.

SVEver, bits [3:0]

Indicates support for SVE. Defined values are:

SVEver	Meaning
0b0000	SVE instructions are implemented.

All other values are reserved.

Accessing ID_AA64ZFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_AA64ZFR0_EL1

ID_AFR0_EL1, AArch32 Auxiliary Feature Register 0

The ID_AFR0_EL1 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, MIDR_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_AFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_AFR0[31:0].

Attributes

ID_AFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

ID_DFR0_EL1, AArch32 Debug Feature Register 0

The ID_DFR0_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, MIDR_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_DFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR0[31:0].

Attributes

ID_DFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63 ... 32
RES0

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
TraceFilt	PerfMon	MProfDbg	MMapTrc	CopTrc	MMapDbg	CopSDbg	CopDbg

Bits [63:32]

Reserved, RES0.

TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
`0b0000`	Armv8.4 Self-hosted Trace Extension not implemented.
`0b0001`	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality added by the value `0b0001`.

From Armv8.3, the permitted values are `0b0000` and `0b0001`.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PerfMon	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv1 implemented.
0b0010	Performance Monitors Extension, PMUv2 implemented.
0b0011	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0011, and adds support for: • Extended 16-bit PMEVTYPER<n>.evtCount field. • If EL2 is implemented, the HDCR.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: • 64-bit event counters. • If EL2 is implemented, the HDCR.HCCD control. • If EL3 is implemented, the MDCR_EL3.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: • The PMCR.FZO and, if EL2 is implemented, HDCR.HPMFZO controls. • If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: • Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. • Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

Note

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

MProfDbg, bits [23:20]

M-profile Debug. Support for memory-mapped debug model for M-profile processors. Defined values are:

MProfDbg	Meaning
0b0000	Not supported.
0b0001	Support for M-profile Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

MMapTrc, bits [19:16]

Memory-mapped Trace. Support for memory-mapped trace model. Defined values are:

MMapTrc	Meaning
`0b0000`	Not supported.
`0b0001`	Support for Arm trace architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == `0b1110` encoding space. Defined values are:

CopTrc	Meaning
`0b0000`	Not supported.
`0b0001`	Support for Arm trace architecture, with System registers access.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

MMapDbg, bits [11:8]

Memory-mapped Debug. Support for Armv7 memory-mapped debug model for A and R-profile processors. Defined values are:

MMapDbg	Meaning
`0b0000`	Not supported.
`0b0100`	Support for Armv7, v7 Debug architecture, with memory-mapped access.
`0b0101`	Support for Armv7, v7.1 Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

The optional memory map defined by Armv8 is not compatible with Armv7.

CopSDbg, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = `0b1110` encoding space, for an A-profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

CopDbg, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

CopDbg	Meaning
`0b0000`	Not supported.
`0b0010`	Armv6, v6 Debug architecture, with System registers access.
`0b0011`	Armv6, v6.1 Debug architecture, with System registers access.
`0b0100`	Armv7, v7 Debug architecture, with System registers access.
`0b0101`	Armv7, v7.1 Debug architecture, with System registers access.
`0b0110`	Armv8 debug architecture.
`0b0111`	Armv8 debug architecture with Virtualization Host Extensions.
`0b1000`	Armv8.2 debug architecture, FEAT_Debugv8p2.
`0b1001`	Armv8.4 debug architecture, FEAT_Debugv8p4.
`0b1010`	Armv8.8 debug architecture, FEAT_Debugv8p8.

All other values are reserved.

The values `0b0000`, `0b0010`, `0b0011`, `0b0100`, and `0b0101` are not permitted in Armv8.

FEAT_VHE adds the functionality identified by the value `0b0111`.

FEAT_Debugv8p2 adds the functionality identified by the value `0b1000`.

FEAT_Debugv8p4 adds the functionality identified by the value `0b1001`.

FEAT_Debugv8p8 adds the functionality identified by the value `0b1010`.

From Armv8.1, when FEAT_VHE is implemented the value `0b0110` is not permitted.

From Armv8.2, the values `0b0110` and `0b0111` are not permitted.

From Armv8.4, the value `0b1000` is not permitted.

From Armv8.8, the value `0b1001` is not permitted.

Otherwise:

ID_DFR1_EL1, Debug Feature Register 1

The ID_DFR1_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch32.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_DFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR1[31:0].

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_DFR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63:32		
RES0		
31:8	**7:4**	**3:0**
RES0	HPMN0	MTPMU

Bits [63:8]

Reserved, RES0.

HPMN0, bits [7:4]

Zero PMU event counters for a Guest operating system. Defined values are:

HPMN0	Meaning
`0b0000`	Setting HDCR.HPMN to zero has CONSTRAINED UNPREDICTABLE behavior.
`0b0001`	Setting HDCR.HPMN to zero has defined behavior.

All other values are reserved.

If FEAT_PMUv3 is not implemented, FEAT_FGT is not implemented, or EL2 is not implemented, the only permitted value is `0b0000`.

FEAT_HPMN0 implements the functionality identified by the value `0b0001`.

From Armv8.8, in an implementation that includes FEAT_PMUv3, FEAT_FGT, and EL2, the value `0b0000` is not permitted.

MTPMU, bits [3:0]

Multi-threaded PMU extension. Defined values are:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>.MT are read/write or RES0.
0b0001	FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER<n>.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER<n>.MT are 0.
0b1111	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER<n>.MT are RES0.

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value `0b0001`.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value `0b0000` is not permitted.

In an implementation that does not include FEAT_PMUv3, the value `0b0001` is not permitted.

Otherwise:

Bits	Field
63:32	UNKNOWN
31:0	UNKNOWN

Bits [63:0]

Reserved, UNKNOWN.

ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0

The ID_ISAR0_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR0[31:0].

Attributes

ID_ISAR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63:32
RES0

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
RES0	Divide	Debug	Coproc	CmpBranch	BitField	BitCount	Swap

Bits [63:28]

Reserved, RES0.

Divide, bits [27:24]

Indicates the implemented Divide instructions. Defined values are:

Divide	Meaning
`0b0000`	None implemented.
`0b0001`	Adds SDIV and UDIV in the T32 instruction set.
`0b0010`	As for `0b0001`, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0010`.

Debug, bits [23:20]

Indicates the implemented Debug instructions. Defined values are:

Debug	Meaning
`0b0000`	None implemented.
`0b0001`	Adds BKPT.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Coproc, bits [19:16]

Indicates the implemented System register access instructions. Defined values are:

Coproc	Meaning
`0b0000`	None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.
`0b0001`	Adds generic CDP, LDC, MCR, MRC, and STC.
`0b0010`	As for `0b0001`, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.
`0b0011`	As for `0b0010`, and adds generic MCRR and MRRC.
`0b0100`	As for `0b0011`, and adds generic MCRR2 and MRRC2.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

CmpBranch	Meaning
`0b0000`	None implemented.
`0b0001`	Adds CBNZ and CBZ.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:

BitField	Meaning
`0b0000`	None implemented.
`0b0001`	Adds BFC, BFI, SBFX, and UBFX.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:

BitCount	Meaning
`0b0000`	None implemented.
`0b0001`	Adds CLZ.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

Swap	Meaning
0b0000	None implemented.
0b0001	Adds SWP and SWPB.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Otherwise:

63 … 32
UNKNOWN

31 … 0
UNKNOWN

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1

The ID_ISAR1_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR1[31:0].

Attributes

ID_ISAR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63–32
RES0

31–28	27–24	23–20	19–16	15–12	11–8	7–4	3–0
Jazelle	Interwork	Immediate	IfThen	Extend	Except_AR	Except	Endian

Bits [63:32]

Reserved, RES0.

Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions. Defined values are:

Jazelle	Meaning
`0b0000`	No support for Jazelle.
`0b0001`	Adds the BXJ instruction and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Interwork, bits [27:24]

Indicates the implemented Interworking instructions. Defined values are:

Interwork	Meaning
0b0000	None implemented.
0b0001	Adds the BX instruction, and the T bit in the PSR.
0b0010	As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.
0b0011	As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

Immediate	Meaning
0b0000	None implemented.
0b0001	Adds: • The MOVT instruction. • The MOV instruction encodings with zero-extended 16-bit immediates. • The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

IfThen	Meaning
0b0000	None implemented.
0b0001	Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

Extend	Meaning
0b0000	No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.
0b0001	Adds the SXTB, SXTH, UXTB, and UXTH instructions.
0b0010	As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Except_AR, bits [11:8]

Indicates the implemented A and R-profile exception-handling instructions. Defined values are:

Except_AR	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the SRS and RFE instructions, and the A and R-profile forms of the CPS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:

Except	Meaning
`0b0000`	Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.
`0b0001`	Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Endian, bits [3:0]

Indicates the implemented Endian instructions. Defined values are:

Endian	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

Otherwise:

63 … 32
UNKNOWN
UNKNOWN
31 … 0

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_ISAR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b001

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then

ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2

The ID_ISAR2_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR2[31:0].

Attributes

ID_ISAR2_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63–32							
RES0							
Reversal	PSR_AR	MultU	MultS	Mult	MultiAccessInt	MemHint	LoadStore
31–28	27–24	23–20	19–16	15–12	11–8	7–4	3–0

Bits [63:32]

Reserved, RES0.

Reversal, bits [31:28]

Indicates the implemented Reversal instructions. Defined values are:

Reversal	Meaning
0b0000	None implemented.
0b0001	Adds the REV, REV16, and REVSH instructions.
0b0010	As for 0b0001, and adds the RBIT instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

PSR_AR, bits [27:24]

Indicates the implemented A and R-profile instructions to manipulate the PSR. Defined values are:

PSR_AR	Meaning
0b0000	None implemented.
0b0001	Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

MultU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

MultU	Meaning
0b0000	None implemented.
0b0001	Adds the UMULL and UMLAL instructions.
0b0010	As for 0b0001, and adds the UMAAL instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

MultS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions. Defined values are:

MultS	Meaning
0b0000	None implemented.
0b0001	Adds the SMULL and SMLAL instructions.
0b0010	As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
0b0011	As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Mult, bits [15:12]

Indicates the implemented additional Multiply instructions. Defined values are:

Mult	Meaning
0b0000	No additional instructions implemented. This means only MUL is implemented.
0b0001	Adds the MLA instruction.
0b0010	As for 0b0001, and adds the MLS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions. Defined values are:

MultiAccessInt	Meaning
0b0000	No support. This means the LDM and STM instructions are not interruptible.
0b0001	LDM and STM instructions are restartable.
0b0010	LDM and STM instructions are continuable.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:

MemHint	Meaning
0b0000	None implemented.
0b0001	Adds the PLD instruction.
0b0010	Adds the PLD instruction. (`0b0001` and `0b0010` have identical effects.)
0b0011	As for `0b0001` (or `0b0010`), and adds the PLI instruction.
0b0100	As for `0b0011`, and adds the PLDW instruction.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0100`.

LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

LoadStore	Meaning
0b0000	No additional load/store instructions implemented.
0b0001	Adds the LDRD and STRD instructions.
0b0010	As for `0b0001`, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0010`.

Otherwise:

ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3

The ID_ISAR3_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR3[31:0].

Attributes

ID_ISAR3_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63 … 32
RES0

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
T32EE	TrueNOP	T32Copy	TabBranch	SynchPrim	SVC	SIMD	Saturate

Bits [63:32]

Reserved, RES0.

T32EE, bits [31:28]

Indicates the implemented T32EE instructions. Defined values are:

T32EE	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions. Defined values are:

TrueNOP	Meaning
0b0000	None implemented. This means there are no NOP instructions that do not have any register dependencies.
0b0001	Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

T32Copy	Meaning
0b0000	Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.
0b0001	Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

TabBranch	Meaning
0b0000	None implemented.
0b0001	Adds the TBB and TBH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

SynchPrim	Meaning
0b0000	If SynchPrim_frac == `0b0000`, no Synchronization Primitives implemented.
0b0001	If SynchPrim_frac == `0b0000`, adds the LDREX and STREX instructions. If SynchPrim_frac == `0b0011`, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.
0b0010	If SynchPrim_frac == `0b0000`, as for [`0b0001`, `0b0011`] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is `0b0010`.

SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

SVC	Meaning
0b0000	Not implemented.
0b0001	Adds the SVC instruction.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:

SIMD	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
`0b0011`	As for `0b0001`, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0011`.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports Advanced SIMD and floating-point instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

Saturate	Meaning
`0b0000`	None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
`0b0001`	Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Otherwise:

63 … 32
UNKNOWN
UNKNOWN
31 … 0

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR3_EL1

Accesses to this register use the following encodings in the System register encoding space:

ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4

The ID_ISAR4_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR4[31:0].

Attributes

ID_ISAR4_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63:32
RES0

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
SWP_frac	PSR_M	SynchPrim_frac	Barrier	SMC	Writeback	WithShifts	Unpriv

Bits [63:32]

Reserved, RES0.

SWP_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

SWP_frac	Meaning
`0b0000`	SWP or SWPB instructions not implemented.
`0b0001`	SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if ID_ISAR0.Swap is `0b0000`.

In Armv8-A, the only permitted value is `0b0000`.

PSR_M, bits [27:24]

Indicates the implemented M-profile instructions to modify the PSRs. Defined values are:

PSR_M	Meaning
0b0000	None implemented.
0b0001	Adds the M-profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

SynchPrim_frac, bits [23:20]

Used in conjunction with ID_ISAR3.SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

SynchPrim_frac	Meaning
0b0000	If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.
0b0011	If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

Barrier	Meaning
0b0000	None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.
0b0001	Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SMC, bits [15:12]

Indicates the implemented SMC instructions. Defined values are:

SMC	Meaning
0b0000	None implemented.
0b0001	Adds the SMC instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

- If EL3 is implemented and EL1 can use AArch32, the only permitted value is 0b0001.
- If neither EL3 nor EL2 is implemented, the only permitted value is 0b0000.

If EL1 cannot use AArch32, this field has the value 0b0000.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes. Defined values are:

Writeback	Meaning
0b0000	Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.
0b0001	Adds support for all of the writeback addressing modes.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

WithShifts	Meaning
0b0000	Nonzero shifts supported only in MOV and shift instructions.
0b0001	Adds support for shifts of loads and stores over the range LSL 0-3.
0b0011	As for `0b0001`, and adds support for other constant shift options, both on load/store and other instructions.
0b0100	As for `0b0011`, and adds support for register-controlled shift options.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0100`.

Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

Unpriv	Meaning
0b0000	None implemented. No T variant instructions are implemented.
0b0001	Adds the LDRBT, LDRT, STRBT, and STRT instructions.
0b0010	As for `0b0001`, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0010`.

Otherwise:

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32

ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5

The ID_ISAR5_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR5[31:0].

Attributes

ID_ISAR5_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63–32
RES0

31–28	27–24	23–20	19–16	15–12	11–8	7–4	3–0
VCMA	RDM	RES0	CRC32	SHA2	SHA1	AES	SEVL

Bits [63:32]

Reserved, RES0.

VCMA, bits [31:28]

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

VCMA	Meaning
`0b0000`	The VCMLA and VCADD instructions are not implemented in AArch32.
`0b0001`	The VCMLA and VCADD instructions are implemented in AArch32.

All other values are reserved.

FEAT_FCMA implements the functionality identified by `0b0001`.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is `0b0000`.

From Armv8.3, the only permitted value is `0b0001`.

RDM, bits [27:24]

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

RDM	Meaning
0b0000	No VQRDMLAH and VQRDMLSH instructions implemented.
0b0001	VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

In Armv8.0, the only permitted value is 0b0000.

From Armv8.1, the only permitted value is 0b0001.

Bits [23:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates whether the CRC32 instructions are implemented in AArch32 state.

CRC32	Meaning
0b0000	No CRC32 instructions implemented.
0b0001	CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates whether the SHA2 instructions are implemented in AArch32 state.

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SHA1, bits [11:8]

Indicates whether the SHA1 instructions are implemented in AArch32 state.

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

AES, bits [7:4]

Indicates whether the AES instructions are implemented in AArch32 state.

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC implemented.
0b0010	As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

SEVL, bits [3:0]

Indicates whether the SEVL instruction is implemented in AArch32 state.

SEVL	Meaning
0b0000	SEVL is implemented as a NOP.
0b0001	SEVL is implemented as Send Event Local.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Otherwise:

63–32
UNKNOWN

31–0
UNKNOWN

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR5_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_ISAR5_EL1
```

op0	op1	CRn	CRm	op2

ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6

The ID_ISAR6_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1 and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR6_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR6[31:0].

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_ISAR6_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

Bits	Field
63:32	RES0
31:28	RES0
27:24	I8MM
23:20	BF16
19:16	SPECRES
15:12	SB
11:8	FHM
7:4	DP
3:0	JSCVT

Bits [63:28]

Reserved, RES0.

I8MM, bits [27:24]

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values of this field are:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.

All other values are reserved.

FEAT_AA32I8MM implements the functionality identified by 0b0001.

BF16, bits [23:20]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	VCVT, VCVTB, VCVTT, VDOT, VFMAB, VFMAT, and VMMLA instructions with BF16 operand or result types are implemented.

All other values are reserved.

FEAT_AA32BF16 implements the functionality identified by 0b0001.

SPECRES, bits [19:16]

Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:

SPECRES	Meaning
0b0000	Prediction invalidation instructions are not implemented.
0b0001	CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [15:12]

Indicates support for the SB instruction in AArch32 state. Defined values are:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

FHM, bits [11:8]

Indicates support for Advanced SIMD and floating-point VFMAL and VFMSL instructions in AArch32 state. Defined values are:

FHM	Meaning
0b0000	VFMAL and VMFSL instructions are not implemented.
0b0001	VFMAL and VMFSL instructions are implemented.

All other values are reserved.

FEAT_FHM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

DP, bits [7:4]

Indicates support for dot product instructions in AArch32 state. Defined values are:

DP	Meaning
0b0000	Dot product instructions are not implemented.
0b0001	VUDOT and VSDOT instructions are implemented.

All other values are reserved.

FEAT_DotProd implements the functionality identified by `0b0001`.

In Armv8.2, the permitted values are `0b0000` and `0b0001`.

From Armv8.4, the only permitted value is `0b0001`.

JSCVT, bits [3:0]

Indicates support for the VJCVT instruction in AArch32 state. Defined values are:

JSCVT	Meaning
`0b0000`	The VJCVT instruction is not implemented.
`0b0001`	The VJCVT instruction is implemented.

All other values are reserved.

FEAT_JSCVT implements the functionality identified by `0b0001`.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is `0b0000`.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is `0b0001`.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is `0b0000`.

Otherwise:

Bits	Field
63–32	UNKNOWN
31–0	UNKNOWN

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR6_EL1

Accesses to this register use the following encodings in the System register encoding space:

ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0

The ID_MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR0[31:0].

Attributes

ID_MMFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63:32
RES0

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
InnerShr	FCSE	AuxReg	TCM	ShareLvl	OuterShr	PMSA	VMSA

Bits [63:32]

Reserved, RES0.

InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

InnerShr	Meaning
`0b0000`	Implemented as Non-cacheable.
`0b0001`	Implemented with hardware coherency support.
`0b1111`	Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are `0b0000`, `0b0001`, and `0b1111`.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0_EL1.ShareLvl having the value `0b0001`.

When ID_MMFR0_EL1.ShareLvl is zero, this field is UNKNOWN.

FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE. Defined values are:

FCSE	Meaning
0b0000	Not supported.
0b0001	Support for FCSE.

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

AuxReg	Meaning
0b0000	None supported.
0b0001	Support for Auxiliary Control Register only.
0b0010	Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

TCM	Meaning
0b0000	Not supported.
0b0001	Support is IMPLEMENTATION DEFINED. Armv7 requires this setting.
0b0010	Support for TCM only, Armv6 implementation.
0b0011	Support for TCM and DMA, Armv6 implementation.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

ShareLvl	Meaning
0b0000	One level of shareability implemented.
0b0001	Two levels of shareability implemented.

All other values are reserved.

From Armv8 the only permitted value is 0b0001.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

OuterShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

PMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED PMSA.
0b0010	Support for PMSAv6, with a Cache Type Register implemented.
0b0011	Support for PMSAv7, with support for memory subsections. Armv7-R profile.

All other values are reserved.

In Armv8-A the only permitted value is `0b0000`.

VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

VMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED VMSA.
0b0010	Support for VMSAv6, with Cache and TLB Type Registers implemented.
0b0011	Support for VMSAv7, with support for remapping and the Access flag. Armv7-A profile.
0b0100	As for `0b0011`, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
0b0101	As for `0b0100`, and adds support for the Long-descriptor translation table format.

All other values are reserved.

In Armv8-A the only permitted value is `0b0101`.

Otherwise:

63–32
UNKNOWN

31–0
UNKNOWN

Bits [63:0]

Reserved, UNKNOWN.

ID_MMFR1_EL1, AArch32 Memory Model Feature Register 1

The ID_MMFR1_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR1[31:0].

Attributes

ID_MMFR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63:32
RES0

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
BPred	L1TstCln	L1Uni	L1Hvd	L1UniSW	L1HvdSW	L1UniVA	L1HvdVA

Bits [63:32]

Reserved, RES0.

BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

BPred	Meaning
0b0000	No branch predictor, or no MMU present. Implies a fixed MPU configuration.
0b0001	Branch predictor requires flushing on: • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Changes to the TTBR0, TTBR1, or TTBCR registers. • Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.
0b0010	Branch predictor requires flushing on: • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.
0b0011	Branch predictor requires flushing only on writing new data to instruction locations.
0b0100	For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In Armv8-A, the permitted values are `0b0010`, `0b0011`, and `0b0100`. For values other than `0b0000` and `0b0100` the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

L1TstCln	Meaning
0b0000	None supported.
0b0001	Supported Level 1 data cache test and clean operations are: • Test and clean data cache.
0b0010	As for `0b0001`, and adds: • Test, clean, and invalidate data cache.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

L1Uni	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: • Invalidate cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
0b0010	As for `0b0001`, and adds: • Clean cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

L1Hvd	Meaning
`0b0000`	None supported.
`0b0001`	Supported entire Level 1 cache operations are: • Invalidate instruction cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
`0b0010`	As for `0b0001`, and adds: • Invalidate data cache. • Invalidate data cache and instruction cache, including branch predictor if appropriate.
`0b0011`	As for `0b0010`, and adds: • Clean data cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

L1UniSW	Meaning
`0b0000`	None supported.
`0b0001`	Supported Level 1 unified cache line maintenance operations by set/way are: • Clean cache line by set/way.
`0b0010`	As for `0b0001`, and adds: • Clean and invalidate cache line by set/way.
`0b0011`	As for `0b0010`, and adds: • Invalidate cache line by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

L1HvdSW	Meaning
`0b0000`	None supported.
`0b0001`	Supported Level 1 Harvard cache line maintenance operations by set/way are: • Clean data cache line by set/way. • Clean and invalidate data cache line by set/way.
`0b0010`	As for `0b0001`, and adds: • Invalidate data cache line by set/way.
`0b0011`	As for `0b0010`, and adds: • Invalidate instruction cache line by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

L1UniVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by VA are: • Clean cache line by VA. • Invalidate cache line by VA. • Clean and invalidate cache line by VA.
0b0010	As for 0b0001, and adds: • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

L1HvdVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by VA are: • Clean data cache line by VA. • Invalidate data cache line by VA. • Clean and invalidate data cache line by VA. • Clean instruction cache line by VA.
0b0010	As for 0b0001, and adds: • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Otherwise:

ID_MMFR2_EL1, AArch32 Memory Model Feature Register 2

The ID_MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR2[31:0].

Attributes

ID_MMFR2_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63–32
RES0

31–28	27–24	23–20	19–16	15–12	11–8	7–4	3–0
HWAccFlg	WFIStall	MemBarr	UniTLB	HvdTLB	L1HvdRng	L1HvdBG	L1HvdFG

Bits [63:32]

Reserved, RES0.

HWAccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

HWAccFlg	Meaning
0b0000	Not supported.
0b0001	Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

From Armv8, the only permitted value is `0b0000`.

WFIStall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

WFIStall	Meaning
0b0000	Not supported.
0b0001	Support for WFI stalling.

All other values are reserved.

From Armv8, the permitted values are `0b0000` and `0b0001`.

MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==`0b1111`) encoding space:

MemBarr	Meaning
`0b0000`	None supported.
`0b0001`	Supported memory barrier System instructions are: • Data Synchronization Barrier (DSB).
`0b0010`	As for `0b0001`, and adds: • Instruction Synchronization Barrier (ISB). • Data Memory Barrier (DMB).

All other values are reserved.

From Armv8, the only permitted value is `0b0010`.

Arm deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

UniTLB	Meaning
`0b0000`	Not supported.
`0b0001`	Supported unified TLB maintenance operations are: • Invalidate all entries in the TLB. • Invalidate TLB entry by VA.
`0b0010`	As for `0b0001`, and adds: • Invalidate TLB entries by ASID match.
`0b0011`	As for `0b0010`, and adds: • Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.
`0b0100`	As for `0b0011`, and adds: • Invalidate Hyp mode unified TLB entry by VA. • Invalidate entire Non-secure PL1&0 unified TLB. • Invalidate entire Hyp mode unified TLB.
`0b0101`	As for `0b0100`, and adds the following operations: TLBIMVALIS, TLBIMVAALIS, TLBIMVALHIS, TLBIMVAL, TLBIMVAAL, TLBIMVALH.
`0b0110`	As for `0b0101`, and adds the following operations: TLBIIPAS2IS, TLBIIPAS2LIS, TLBIIPAS2, TLBIIPAS2L.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0110`.

HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

L1HvdRng	Meaning
`0b0000`	Not supported.
`0b0001`	Supported Level 1 Harvard cache maintenance range operations are: • Invalidate data cache range by VA. • Invalidate instruction cache range by VA. • Clean data cache range by VA. • Clean and invalidate data cache range by VA.

All other values are reserved.

From Armv8, the only permitted value is `0b0000`.

L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

L1HvdBG	Meaning
`0b0000`	Not supported.
`0b0001`	Supported Level 1 Harvard cache background fetch operations are: • Fetch instruction cache range by VA. • Fetch data cache range by VA.

All other values are reserved.

From Armv8, the only permitted value is `0b0000`.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

L1HvdFG	Meaning
`0b0000`	Not supported.
`0b0001`	Supported Level 1 Harvard cache foreground fetch operations are: • Fetch instruction cache range by VA. • Fetch data cache range by VA.

All other values are reserved.

From Armv8, the only permitted value is `0b0000`.

Otherwise:

Bits 63–32

ID_MMFR3_EL1, AArch32 Memory Model Feature Register 3

The ID_MMFR3_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR3[31:0].

Attributes

ID_MMFR3_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
RES0

Supersec	CMemSz	CohWalk	PAN	MaintBcst	BPMaint	CMaintSW	CMaintVA
31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0

Bits [63:32]

Reserved, RES0.

Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

Supersec	Meaning
`0b0000`	Supersections supported.
`0b1111`	Supersections not supported.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b1111`.

CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

CMemSz	Meaning
`0b0000`	4GB, corresponding to a 32-bit physical address range.
`0b0001`	64GB, corresponding to a 36-bit physical address range.
`0b0010`	1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000`, `0b0001`, and `0b0010`.

CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

CohWalk	Meaning
`0b0000`	Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.
`0b0001`	Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

PAN, bits [19:16]

Privileged Access Never. Indicates support for the PAN bit in CPSR, SPSR, and DSPSR in AArch32 state. Defined values are:

PAN	Meaning
`0b0000`	PAN not supported.
`0b0001`	PAN supported.
`0b0010`	PAN supported and ATS1CPRP and ATS1CPWP instructions supported.

All other values are reserved.

FEAT_PAN implements the functionality identified by the value `0b0001`.

FEAT_PAN2 implements the functionality added by the value `0b0010`.

In Armv8.1, the value `0b0000` is not permitted.

From Armv8.2, the only permitted value is `0b0010`.

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

MaintBcst	Meaning
`0b0000`	Cache, TLB, and branch predictor operations only affect local structures.
`0b0001`	Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.
`0b0010`	Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0010`.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

BPMaint	Meaning
`0b0000`	None supported.
`0b0001`	Supported branch predictor maintenance operations are: • Invalidate all branch predictors.
`0b0010`	As for `0b0001`, and adds: • Invalidate branch predictors by VA.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0010`.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

CMaintSW	Meaning
`0b0000`	None supported.
`0b0001`	Supported hierarchical cache maintenance instructions by set/way are: • Invalidate data cache by set/way. • Clean data cache by set/way. • Clean and invalidate data cache by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

CMaintVA	Meaning
`0b0000`	None supported.
`0b0001`	Supported hierarchical cache maintenance operations by VA are: • Invalidate data cache by VA. • Clean data cache by VA. • Clean and invalidate data cache by VA. • Invalidate instruction cache by VA. • Invalidate all instruction cache entries.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

ID_MMFR4_EL1, AArch32 Memory Model Feature Register 4

The ID_MMFR4_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR4[31:0].

Attributes

ID_MMFR4_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63–32
RES0

31–28	27–24	23–20	19–16	15–12	11–8	7–4	3–0
EVT	CCIDX	LSM	HPDS	CnP	XNX	AC2	SpecSEI

Bits [63:32]

Reserved, RES0.

EVT, bits [31:28]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR2.{TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

EVT	Meaning
`0b0000`	HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are not supported.
`0b0001`	HCR2.{TOCU, TICAB, TID4} traps are supported. HCR2.TTLBIS trap is not supported.
`0b0010`	HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

FEAT_EVT implements the functionality identified by the values `0b0001` and `0b0010`.

If EL2 is not implemented supporting AArch32, the only permitted value is `0b0000`.

In Armv8.2, the permitted values are `0b0000`, `0b0001`, and `0b0010`.

From Armv8.5, the permitted values are:

- `0b0000` when EL2 is not implemented or does not support AArch32.
- `0b0010` when EL2 is implemented and supports AArch32.

CCIDX, bits [27:24]

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.
0b0001	64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.

All other values are reserved.

FEAT_CCIDX implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

LSM, bits [23:20]

Indicates support for LSMAOE and nTLSMD bits in HSCTLR and SCTLR. Defined values are:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

HPDS, bits [19:16]

Hierarchical permission disables bits in translation tables. Defined values are:

HPDS	Meaning
0b0000	Disabling of hierarchical controls not supported.
0b0001	Supports disabling of hierarchical controls using the TTBCR2.HPD0, TTBCR2.HPD1, and HTCR.HPD bits.
0b0010	As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

FEAT_AA32HPD implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality added by the value 0b0010.

Note

The value 0b0000 implies that the encoding for TTBCR2 is UNDEFINED.

CnP, bits [15:12]

Common not Private translations. Defined values are:

CnP	Meaning
0b0000	Common not Private translations not supported.
0b0001	Common not Private translations supported.

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2 the only permitted value is 0b0001.

XNX, bits [11:8]

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

When FEAT_XNX is implemented:

- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4_EL1.XNX is 0b0000 or 0b0001:
    - ID_AA64MMFR1_EL1.XNX ==1.
    - EL2 cannot use AArch32.
    - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0b0001.

AC2, bits [7:4]

Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2. Defined values are:

AC2	Meaning
0b0000	ACTLR2 and HACTLR2 are not implemented.
0b0001	ACTLR2 and HACTLR2 are implemented.

All other values are reserved.

In Armv8.0 and Armv8.1 the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [3:0]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

SpecSEI	Meaning
0b0000	The PE never generates an SError interrupt due to an External abort on a speculative read.
0b0001	The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

Otherwise:

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32

ID_MMFR5_EL1, AArch32 Memory Model Feature Register 5

The ID_MMFR5_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR5[31:0].

Attributes

ID_MMFR5_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63 … 32
RES0

31 … 8	7 … 4	3 … 0
RES0	nTLBPA	ETS

Bits [63:8]

Reserved, RES0.

nTLBPA, bits [7:4]

Indicates support for intermediate caching of translation table walks. Defined values are:

nTLBPA	Meaning
`0b0000`	The intermediate caching of translation table walks might include non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE where either: • The caching is indexed by the physical address of the location holding the translation table entry. • The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.
`0b0001`	The intermediate caching of translation table walks does not include non-coherent caches of previous valid translation table entries since the last completed TLBI applicable to the PE where either: • The caching is indexed by the physical address of the location holding the translation table entry. • The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.

All other values are reserved.

FEAT_nTLBPA implements the functionality identified by the value `0b0001`.

From Armv8.0, the permitted values are `0b0000` and `0b0001`.

ETS, bits [3:0]

Indicates support for Enhanced Translation Synchronization. Defined values are:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is supported.

All other values are reserved.

FEAT_ETS implements the functionality identified by the value `0b0001`.

From Armv8.0, the permitted values are `0b0000` and `0b0001`.

From Armv8.7, the only permitted value is `0b0001`.

Otherwise:

63–32
UNKNOWN
UNKNOWN
31–0

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR5_EL1

Accesses to this register use the following encodings in the System register encoding space:

ID_PFR0_EL1, AArch32 Processor Feature Register 0

The ID_PFR0_EL1 characteristics are:

Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR0[31:0].

Attributes

ID_PFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63–32
RES0

31–28	27–24	23–20	19–16	15–12	11–8	7–4	3–0
RAS	DIT	AMU	CSV2	State3	State2	State1	State0

Bits [63:32]

Reserved, RES0.

RAS, bits [31:28]

RAS Extension version. Defined values are:

RAS	Meaning
`0b0000`	No RAS Extension.
`0b0001`	RAS Extension implemented.
`0b0010`	FEAT_RASv1p1 implemented. As `0b0001`, and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value `0b0001`.

FEAT_RASv1p1 implements the functionality identified by the value `0b0010`.

In Armv8.0 and Armv8.1, the permitted values are `0b0000` and `0b0001`.

In Armv8.2, the only permitted value is `0b0001`.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is `0b0010`.

From Armv8.4, when FEAT_DoubleFault is not implemented, and ERRIDR_EL1.NUM is 0, the permitted values are IMPLEMENTATION DEFINED `0b0001` or `0b0010`.

Note

When the value of this field is `0b0001`, ID_PFR2_EL1.RAS_frac indicates whether FEAT_RASv1p1 is implemented.

DIT, bits [27:24]

Data Independent Timing. Defined values are:

DIT	Meaning
`0b0000`	AArch32 does not guarantee constant execution time of any instructions.
`0b0001`	AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT_DIT implements the functionality identified by the value `0b0001`.

From Armv8.4, the only permitted value is `0b0001`.

AMU, bits [23:20]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
`0b0000`	Activity Monitors Extension is not implemented.
`0b0001`	FEAT_AMUv1 is implemented.
`0b0010`	FEAT_AMUv1p1 is implemented. As `0b0001` and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value `0b0001`.

FEAT_AMUv1p1 implements the functionality identified by the value `0b0010`.

In Armv8.0, the only permitted value is `0b0000`.

In Armv8.4, the permitted values are `0b0000` and `0b0001`.

From Armv8.6, the permitted values are `0b0000`, `0b0001`, and `0b0010`.

CSV2, bits [19:16]

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	This PE does not disclose whether branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context.
0b0001	Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way.
0b0010	Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Within a hardware-described context, branch targets trained for branches situated at one address can control speculative execution of branches situated at different addresses only in a hard-to-determine way.

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the values `0b0001` and `0b0010`.

From Armv8.5, the permitted values are `0b0001` and `0b0010`.

State3, bits [15:12]

T32EE instruction set support. Defined values are:

State3	Meaning
0b0000	Not implemented.
0b0001	T32EE instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

State2, bits [11:8]

Jazelle extension support. Defined values are:

State2	Meaning
0b0000	Not implemented.
0b0001	Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.
0b0010	Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

State1, bits [7:4]

T32 instruction set support. Defined values are:

State1	Meaning
0b0000	T32 instruction set not implemented.
0b0001	T32 encodings before the introduction of Thumb-2 technology implemented: • All instructions are 16-bit. • A BL or BLX is a pair of 16-bit instructions. • 32-bit instructions other than BL and BLX cannot be encoded.
0b0011	T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0011`.

State0, bits [3:0]

A32 instruction set support. Defined values are:

State0	Meaning
`0b0000`	A32 instruction set not implemented.
`0b0001`	A32 instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Otherwise:

63 … 32
UNKNOWN

31 … 0
UNKNOWN

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_PFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_PFR0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b000

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_PFR0_EL1;
elsif PSTATE.EL == EL2 then
    return ID_PFR0_EL1;
elsif PSTATE.EL == EL3 then
    return ID_PFR0_EL1;
```

ID_PFR1_EL1, AArch32 Processor Feature Register 1

The ID_PFR1_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR1[31:0].

Attributes

ID_PFR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63:32
RES0

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
GIC	Virt_frac	Sec_frac	GenTimer	Virtualization	MProgMod	Security	ProgMod

Bits [63:32]

Reserved, RES0.

GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for Virtualization Extensions. Defined values are:

Virt_frac	Meaning
0b0000	No Virtualization Extensions are implemented.
0b0001	The following Virtualization Extensions are implemented: • The SCR.SIF bit, if EL3 is implemented. • The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented. • The MSR (banked register) and MRS (banked register) instructions. • The ERET instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

- `0b0000` when EL2 is implemented.
- `0b0001` when EL2 is not implemented.

This field is valid only when the value of ID_PFR1_EL1.Virtualization is 0, otherwise it holds the value `0b0000`.

Note

The ID_ISAR registers do not identify whether the instructions added by the Virtualization Extensions are implemented.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is `0b0000`, determines the support for Security Extensions. Defined values are:

Sec_frac	Meaning
0b0000	No Security Extensions are implemented.
0b0001	The following Security Extensions are implemented: • The VBAR register. • The TTBCR.PD0 and TTBCR.PD1 bits.
0b0010	As for `0b0001`, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In Armv8-A, the permitted values are:

- `0b0000` when EL3 is implemented.
- `0b0001` or `0b0010` when EL3 is not implemented.

This field is valid only when the value of ID_PFR1_EL1.Security is 0, otherwise it holds the value `0b0000`.

GenTimer, bits [19:16]

Generic Timer support. Defined values are:

GenTimer	Meaning
0b0000	Generic Timer is not implemented.
0b0001	Generic Timer is implemented.
0b0010	Generic Timer is implemented, and also includes support for CNTHCTL.EVNTIS and CNTKCTL.EVNTIS fields, and CNTPCTSS and CNTVCTSS counter views.

All other values are reserved.

FEAT_ECV implements the functionality identified by the value `0b0010`.

In Armv8.0, the only permitted value is `0b0001`.

From Armv8.6, the only permitted value is `0b0010`.

Virtualization, bits [15:12]

Virtualization support. Defined values are:

Virtualization	Meaning
0b0000	EL2, Hyp mode, and the HVC instruction not implemented.
0b0001	EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Note

The ID_ISARs do not identify whether the HVC instruction is implemented.

MProgMod, bits [11:8]

M-profile programmers' model support. Defined values are:

MProgMod	Meaning
0b0000	Not supported.
0b0010	Support for two-stack programmers' model.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Security, bits [7:4]

Security support. Defined values are:

Security	Meaning
0b0000	EL3, Monitor mode, and the SMC instruction not implemented.
0b0001	EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.
0b0010	As for 0b0001, and adds the ability to set the NSACR.RFR bit. Not permitted in Armv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

ProgMod, bits [3:0]

Support for the standard programmers' model for Armv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

ProgMod	Meaning
`0b0000`	Not supported.
`0b0001`	Supported.

All other values are reserved.

In Armv8-A, the permitted values are `0b0001` and `0b0000`.

If EL1 cannot use AArch32 then this field has the value `0b0000`.

Otherwise:

63 – 32
UNKNOWN

31 – 0
UNKNOWN

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_PFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_PFR1_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b001

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);

ID_PFR2_EL1, AArch32 Processor Feature Register 2

The ID_PFR2_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1 and ID_PFR1_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR2[31:0].

Attributes

ID_PFR2_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

63:32
RES0

31:12	11:8	7:4	3:0
RES0	RAS_frac	SSBS	CSV3

Bits [63:12]

Reserved, RES0.

RAS_frac, bits [11:8]

RAS Extension fractional field. Defined values are:

RAS_frac	Meaning
`0b0000`	If ID_PFR0_EL1.RAS == `0b0001`, RAS Extension implemented.
`0b0001`	If ID_PFR0_EL1.RAS == `0b0001`, as `0b0000` and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

This field is valid only if ID_PFR0_EL1.RAS == `0b0001`.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

SSBS	Meaning
`0b0000`	AArch32 provides no mechanism to control the use of Speculative Store Bypassing.
`0b0001`	AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.

In Armv8.0, the permitted values are `0b0000` and `0b0001`.

From Armv8.5, the only permitted value is `0b0001`.

All other values are reserved.

CSV3, bits [3:0]

Speculative use of faulting data. Defined values are:

CSV3	Meaning
`0b0000`	This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence.
`0b0001`	Data loaded under speculation with a permission or domain fault cannot be used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence. The execution timing of any other instructions in the speculative sequence is not a function of the data loaded under speculation.

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value `0b0001`.

In Armv8.0, the permitted values are `0b0000` and `0b0001`.

From Armv8.5, the only permitted value is `0b0001`.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

Otherwise:

63 – 32
UNKNOWN

31 – 0
UNKNOWN

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_PFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ID_PFR2_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b100

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else

IFSR32_EL2, Instruction Fault Status Register (EL2)

The IFSR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 IFSR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register IFSR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register IFSR[31:0].

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to IFSR32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Attributes

IFSR32_EL2 is a 64-bit register.

Field descriptions

When TTBCR.EAE == 0:

63:32
RES0

31:17	16	15:13	12	11	10	9	8:4	3:0
RES0	FnV	RES0	ExT	RES0	FS[4]	LPAE	RES0	FS[3:0]

Bits [63:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
`0b0`	IFAR is valid.
`0b1`	IFAR is not valid, and holds an UNKNOWN value.

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault Status bits. Bits [10] and [3:0] are interpreted together.

FS	Meaning	Applies when
0b00001	PC alignment fault.	
0b00010	Debug exception.	
0b00011	Access flag fault, level 1.	
0b00101	Translation fault, level 1.	
0b00110	Access flag fault, level 2.	
0b00111	Translation fault, level 2.	
0b01000	Synchronous External abort, not on translation table walk.	
0b01001	Domain fault, level 1.	
0b01011	Domain fault, level 2.	
0b01100	Synchronous External abort, on translation table walk, level 1.	
0b01101	Permission fault, level 1.	
0b01110	Synchronous External abort, on translation table walk, level 2.	
0b01111	Permission fault, level 2.	
0b10000	TLB conflict abort.	
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault).	
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b11100	Synchronous parity or ECC error on translation table walk, level 1.	When FEAT_RAS is not implemented
0b11110	Synchronous parity or ECC error on translation table walk, level 2.	When FEAT_RAS is not implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is IFSR32_EL2[10].
- FS[3:0] is IFSR32_EL2[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == 1:

63–32
RES0

31–17	16	15–13	12	11–10	9	8–6	5–0
RES0	FnV	RES0	ExT	RES0	LPAE	RES0	STATUS

Bits [63:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	IFAR is valid.
0b1	IFAR is not valid, and holds an UNKNOWN value.

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

STATUS	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100001	PC alignment fault.	
0b100010	Debug exception.	
0b110000	TLB conflict abort.	

All other values are reserved.

When FEAT_RAS is implemented, `0b011000`, `0b011101`, `0b011110`, and `0b011111` are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing IFSR32_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, IFSR32_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0000	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return IFSR32_EL2;
elsif PSTATE.EL == EL3 then
    return IFSR32_EL2;
```

MSR IFSR32_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0000	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

ISR_EL1, Interrupt Status Register

The ISR_EL1 characteristics are:

Purpose

Shows the pending status of the IRQ, FIQ, or SError interrupt.

When executing at EL2, EL3 or Secure EL1 when SCR_EL3.EEL2 == `0b0`, this shows the pending status of the physical IRQ, FIQ, or SError interrupts.

When executing at either Non-secure EL1 or at Secure EL1 when SCR_EL3.EEL2 == `0b1`:

- If the HCR_EL2.{IMO,FMO,AMO} bit has a value of 1, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the HCR_EL2.{IMO,FMO,AMO} bit has a value of 0, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the physical IRQ, FIQ, or SError.

Configuration

AArch64 System register ISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ISR[31:0].

Attributes

ISR_EL1 is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:11	RES0
10	IS
9	FS
8	A
7	I
6	F
5:0	RES0

Bits [63:11]

Reserved, RES0.

IS, bit [10]

When FEAT_NMI is implemented:

IRQ with Superpriority pending bit. Indicates whether an IRQ interrupt with Superpriority is pending.

IS	Meaning
`0b0`	No pending IRQ with Superpriority.
`0b1`	An IRQ interrupt with Superpriority is pending.

Note

The function of ISR_EL1.I to indicate the presence of a pending IRQ interrupt is unchanged regardless of Superpriority.

Otherwise:

Reserved, RES0.

FS, bit [9]

When FEAT_NMI is implemented:

FIQ with Superpriority pending bit. Indicates whether an FIQ interrupt with Superpriority is pending.

FS	Meaning
`0b0`	No pending FIQ with Superpriority.
`0b1`	An FIQ interrupt with Superpriority is pending.

Note

The function of ISR_EL1.F to indicate the presence of a pending FIQ interrupt is unchanged regardless of Superpriority.

Otherwise:

Reserved, RES0.

A, bit [8]

SError interrupt pending bit. Indicates whether an SError interrupt is pending.

A	Meaning
`0b0`	No pending SError.
`0b1`	An SError interrupt is pending.

If the SError interrupt is edge-triggered, this field is cleared to zero when the physical SError interrupt is taken.

I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending.

I	Meaning
`0b0`	No pending IRQ.
`0b1`	An IRQ interrupt is pending.

F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

F	Meaning
`0b0`	No pending FIQ.
`0b1`	An FIQ interrupt is pending.

Bits [5:0]

Reserved, RES0.

Accessing ISR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, ISR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGRTR_EL2.ISR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ISR_EL1;
elsif PSTATE.EL == EL2 then
    return ISR_EL1;
elsif PSTATE.EL == EL3 then
    return ISR_EL1;
```

LORC_EL1, LORegion Control (EL1)

The LORC_EL1 characteristics are:

Purpose

Enables and disables LORegions, and selects the current LORegion descriptor.

Configuration

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORC_EL1 are UNDEFINED.

If no LORegion descriptors are supported by the PE, then this register is RES0.

Attributes

LORC_EL1 is a 64-bit register.

Field descriptions

63 ... 32			
RES0			

31 ... 10	9 ... 2	1	0
RES0	DS	RES0	EN

Bits [63:10]

Reserved, RES0.

DS, bits [9:2]

Descriptor Select. Selects the current LORegion descriptor accessed by LORSA_EL1, LOREA_EL1, and LORN_EL1.

The number of LORegion descriptors in IMPLEMENTATION DEFINED. The maximum number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are RES0, where M is Log_2(Number of LORegion descriptors supported by the implementation).

If this field points to an LORegion descriptor that is not supported by an implementation, then the registers LORN_EL1, LOREA_EL1, and LORSA_EL1 are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [1]

Reserved, RES0.

EN, bit [0]

Enable. Indicates whether LORegions are enabled.

EN	Meaning
0b0	Disabled. Memory accesses do not match any LORegions.
0b1	Enabled. Memory accesses may match a LORegion.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing LORC_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, LORC_EL1

LOREA_EL1, LORegion End Address (EL1)

The LOREA_EL1 characteristics are:

Purpose

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Configuration

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LOREA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

Attributes

LOREA_EL1 is a 64-bit register.

Field descriptions

63–52	51–48	47–32
RES0	EA[51:48]	EA[47:16]

31–16	15–0
EA[47:16]	RES0

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:52]

Reserved, RES0.

EA[51:48], bits [51:48]

When FEAT_LPA is implemented:

Extension to EA[47:16]. For more information, see EA[47:16].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA[47:16], bits [47:16]

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by LORC_EL1.DS. Bits[15:0] of this address are `0xFFFF`. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented and 52-bit addresses are in use, EA[51:48] form bits [51:48] of the end physical address of the LORegion. Otherwise, when 52-bit addresses are not in use, EA[51:48] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:0]

Reserved, RES0.

LORID_EL1, LORegionID (EL1)

The LORID_EL1 characteristics are:

Purpose

Indicates the number of LORegions and LORegion descriptors supported by the PE.

Configuration

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORID_EL1 are UNDEFINED.

If no LORegion descriptors are implemented, then the registers LORC_EL1, LORN_EL1, LOREA_EL1, and LORSA_EL1 are RES0.

Attributes

LORID_EL1 is a 64-bit register.

Field descriptions

63:32
RES0

31:24	23:16	15:8	7:0
RES0	LD	RES0	LR

Bits [63:24]

Reserved, RES0.

LD, bits [23:16]

Number of LORegion descriptors supported by the PE. This is an 8-bit binary number.

Bits [15:8]

Reserved, RES0.

LR, bits [7:0]

Number of LORegions supported by the PE. This is an 8-bit binary number.

Note

If LORID_EL1 indicates that no LORegions are implemented, then LoadLOAcquire and StoreLORelease will behave as LoadAcquire and StoreRelease.

Accessing LORID_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, LORID_EL1
```

LORN_EL1, LORegion Number (EL1)

The LORN_EL1 characteristics are:

Purpose

Holds the number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Configuration

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORN_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

Attributes

LORN_EL1 is a 64-bit register.

Field descriptions

63–32
RES0

31–8	7–0
RES0	Num

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:8]

Reserved, RES0.

Num, bits [7:0]

Number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are RES0, where N is (Log$_2$(Number of LORegions supported by the PE)).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing LORN_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, LORN_EL1
```

op0	op1	CRn	CRm	op2

0b11	0b000	0b1010	0b0100	0b010

LORSA_EL1, LORegion Start Address (EL1)

The LORSA_EL1 characteristics are:

Purpose

Indicates whether the current LORegion descriptor selected by LORC_EL1.DS is enabled, and holds the physical address of the start of the LORegion.

Configuration

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORSA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

Attributes

LORSA_EL1 is a 64-bit register.

Field descriptions

63:52	51:32
RES0	SA

31:16	15:1	0
SA	RES0	Valid

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:52]

Reserved, RES0.

SA, bits [51:16]

SA encoding when FEAT_LPA is implemented

35:0
SA

SA, bits [35:0]

Bits [51:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Bits[15:0] of this address are `0x0000`.

For implementations with fewer than 52 physical address bits, the corresponding upper bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SA encoding when FEAT_LPA is not implemented

35 34 33 32	31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	SA

Bits [35:32]

Reserved, RES0.

SA, bits [31:0]

Bits [47:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Bits[15:0] of this address are `0x0000`.

For implementations with fewer than 48 physical address bits, the corresponding upper bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:1]

Reserved, RES0.

Valid, bit [0]

Indicates whether the current LORegion descriptor is enabled.

Valid	Meaning
`0b0`	LORegion descriptor is disabled.
`0b1`	LORegion descriptor is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing LORSA_EL1

Accesses to this register use the following encodings in the System register encoding space:

MAIR_EL1, Memory Attribute Indirection Register (EL1)

The MAIR_EL1 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

Configuration

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PRRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MAIR0[31:0] when TTBCR.EAE == 1.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register NMRR[31:0] when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register MAIR1[31:0] when TTBCR.EAE == 1.

Attributes

MAIR_EL1 is a 64-bit register.

Field descriptions

63–56	55–48	47–40	39–32
Attr7	Attr6	Attr5	Attr4
Attr3	Attr2	Attr1	Attr0
31–24	23–16	15–8	7–0

MAIR_EL1 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where AttrIndx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0booooiiii, (oooo != 0000 and iiii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b01000000	If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000	If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111)	UNPREDICTABLE.

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, access from EL3 using the mnemonic MAIR_EL1 or MAIR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MAIR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0010	0b000

MAIR_EL2, Memory Attribute Indirection Register (EL2)

The MAIR_EL2 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

Configuration

AArch64 System register MAIR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HMAIR0[31:0].

AArch64 System register MAIR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HMAIR1[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MAIR_EL2 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56	55 54 53 52 51 50 49 48	47 46 45 44 43 42 41 40	39 38 37 36 35 34 33 32
Attr7	Attr6	Attr5	Attr4
Attr3	Attr2	Attr1	Attr0
31 30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0

MAIR_EL2 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where AttrIndx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0boooooiiii, (oooo != 0000 and iiii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b01000000	If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000	If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111)	UNPREDICTABLE.

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL2

MAIR_EL3, Memory Attribute Indirection Register (EL3)

The MAIR_EL3 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to MAIR_EL3 are UNDEFINED.

Attributes

MAIR_EL3 is a 64-bit register.

Field descriptions

63 - 56	55 - 48	47 - 40	39 - 32
Attr7	Attr6	Attr5	Attr4
Attr3	Attr2	Attr1	Attr0
31 - 24	23 - 16	15 - 8	7 - 0

MAIR_EL3 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where AttrIndx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

Attr	Meaning
0b0000dd00	Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01	If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE.
0b0000dd1x	UNPREDICTABLE.
0booooiiii, (oooo != 0000 and iiii != 0000)	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory.
0b01000000	If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b10100000	If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE.
0b11110000	If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE.
0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111)	UNPREDICTABLE.

'dd' is encoded as follows:

dd	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Device-nGRE memory
0b11	Device-GRE memory

'oooo' is encoded as follows:

'oooo'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient
0b0100	Normal memory, Outer Non-cacheable
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient
0b10RW	Normal memory, Outer Write-Through Non-transient
0b11RW	Normal memory, Outer Write-Back Non-transient

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

'iiii'	Meaning
0b0000	See encoding of Attr
0b00RW, RW not 0b00	Normal memory, Inner Write-Through Transient
0b0100	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	Normal memory, Inner Write-Back Transient
0b10RW	Normal memory, Inner Write-Through Non-transient
0b11RW	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

R or W	Meaning
`0b0`	No Allocate
`0b1`	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MAIR_EL3

MDCCINT_EL1, Monitor DCC Interrupt Enable Register

The MDCCINT_EL1 characteristics are:

Purpose

Enables interrupt requests to be signaled based on the DCC status flags.

Configuration

AArch64 System register MDCCINT_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDCCINT[31:0].

Attributes

MDCCINT_EL1 is a 64-bit register.

Field descriptions

63–32
RES0

31	30	29	28–0
RES0	RX	TX	RES0

Bits [63:31]

Reserved, RES0.

RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

RX	Meaning
`0b0`	No interrupt request generated by DTRRX.
`0b1`	Interrupt request will be generated on RXfull == 1.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

TX	Meaning
`0b0`	No interrupt request generated by DTRTX.
`0b1`	Interrupt request will be generated on TXfull == 0.

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Bits [28:0]

Reserved, RES0.

Accessing MDCCINT_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

MDCCSR_EL0, Monitor DCC Status Register

The MDCCSR_EL0 characteristics are:

Purpose

Read-only register containing control status flags for the DCC.

Configuration

AArch64 System register MDCCSR_EL0 bits [30:29] are architecturally mapped to External register EDSCR[30:29].

AArch64 System register MDCCSR_EL0 bits [30:29] are architecturally mapped to AArch32 System register DBGDSCRint[30:29].

Attributes

MDCCSR_EL0 is a 64-bit register.

Field descriptions

63:32

MDCR_EL2, Monitor Debug Configuration Register (EL2)

The MDCR_EL2 characteristics are:

Purpose

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

Configuration

AArch64 System register MDCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HDCR[31:0].

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MDCR_EL2 is a 64-bit register.

Field descriptions

63 62	61	60	59	58	57 56	55	545352	51	50	49	48 47	46	45 44	43	42	41	40	39	38

Bits [63:37]

Reserved, RES0.

HPMFZS, bit [36]

When FEAT_SPEv1p2 is implemented:

Hyp Performance Monitors Freeze-on-SPE event. Stop counters when PMBLIMITR_EL1.{PMFZ, E} == {1, 1} and PMBSR_EL1.S == 1.

HPMFZS	Meaning
0b0	Do not freeze on Statistical Profiling Buffer Management event.
0b1	Event counters do not count following a Statistical Profiling Buffer Management event.

If MDCR_EL2.HPMN is less than PMCR_EL0.N, this field affects the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].

This field does not affect the operation of other event counters and PMCCNTR_EL0.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:30]

Reserved, RES0.

HPMFZO, bit [29]
When FEAT_PMUv3p7 is implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

HPMFZO	Meaning
`0b0`	Do not freeze on overflow.
`0b1`	Event counters do not count when PMOVSCLR_EL0[(PMCR_EL0.N-1):MDCR_EL2.HPMN] is nonzero.

If MDCR_EL2.HPMN is less than PMCR_EL0.N, this field affects the operation of event counters in the range [MDCR_EL2.HPMN .. (PMCR_EL0.N-1)].

This field does not affect the operation of other event counters and PMCCNTR_EL0.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTPME, bit [28]
When FEAT_MTPMU is implemented and EL3 is not implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>_EL0.MT bits.

MTPME	Meaning
`0b0`	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>_EL0.MT is zero.
`0b1`	PMEVTYPER<n>_EL0.MT bits not affected by this field.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]
When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Trap exception to EL2, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: OSDTRRX_EL1, OSDTRTX_EL1, MDCCSR_EL0, MDCCINT_EL1, and, when the PE is in Non-debug state, DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- `0x05` for trapped AArch32 `MRC` and `MCR` accesses with coproc == `0b1110`.
- `0x06` for trapped AArch32 `LDC` to DBGDTRTXint and `STC` from DBGDTRRXint.
- `0x18` for trapped AArch64 `MRS` and `MSR` accesses.

When the PE is in Debug state, MDCR_EL2.TDCC does not trap any accesses to:

AArch64: DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXint and DBGDTRTXint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HLP, bit [26]

When FEAT_PMUv3p5 is implemented:

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

HLP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[63:0].

If MDCR_EL2.HPMN is less than PMCR_EL0.N, this bit affects the operation of event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [25:24]

Reserved, RES0.

HCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

Hypervisor Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting at EL2.

HCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited at EL2.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

TTRF, bit [19]

When FEAT_TRF is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2, as follows:

- Access to TRFCR_EL1 is trapped to EL2, reported using EC syndrome value `0x18`.
- Access to TRFCR is trapped to EL2, reported using EC syndrome value `0x03`.

TTRF	Meaning
0b0	Accesses to TRFCR_EL1 and TRFCR at EL1 are not affected by this control.
0b1	Accesses to TRFCR_EL1 and TRFCR at EL1 generate a trap exception to EL2 when EL2 is enabled in the current Security state.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]

When FEAT_PMUv3p1 is implemented and FEAT_Debugv8p2 is implemented:

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

HPMD	Meaning
0b0	Event counting and PMCCNTR_EL0 are not affected by this mechanism.
0b1	Event counting by some event counters is prohibited at EL2. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled at EL2. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.

If MDCR_EL2.HPMN is not 0, this field affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)].

This field does not affect the operation of other event counters.

If PMCR_EL0.DP is 1, this field affects PMCCNTR_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

When FEAT_PMUv3p1 is implemented:

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

HPMD	Meaning
0b0	Event counting and PMCCNTR_EL0 are not affected by this mechanism.
0b1	If `ExternalSecureNoninvasiveDebugEnabled`() is FALSE, event counting by some event counters is prohibited at EL2, and if PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled at EL2.

If `ExternalSecureNoninvasiveDebugEnabled`() is TRUE, this feid does not affect the event counters and does not affect PMCCNTR_EL0.

Otherwise:

- If MDCR_EL2.HPMN is not 0, this field affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)].
- This field does not affect the operation of other event counters.
- If PMCR_EL0.DP is 1, this field affects PMCCNTR_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bits [16:15]

Reserved, RES0.

TPMS, bit [14]

When FEAT_SPE is implemented:

Trap Performance Monitor Sampling. If EL2 is implemented and enabled in the current Security state, controls access to Statistical Profiling control registers from EL1.

TPMS	Meaning
0b0	Do not trap Statistical Profiling controls to EL2.
0b1	If EL2 is implemented and enabled in the current Security state, accesses to Statistical Profiling control registers at EL1 generate a Trap exception to EL2.

The Statistical Profiling control registers trapped by this control are:

- PMSCR_EL1, PMSEVFR_EL1, PMSFCR_EL1, PMSICR_EL1, PMSIDR_EL1, PMSIRR_EL1, and PMSLATFR_EL1.
- If FEAT_SPEv1p2 is implemented, PMSNEVFR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2PB, bits [13:12]

When FEAT_SPE is implemented:

EL2 Profiling Buffer. If EL2 is implemented and enabled in the Profiling Buffer owning Security state, this field controls the owning translation regime. If EL2 is implemented and enabled in the current Security state, this field controls access to Profiling Buffer control registers from EL1.

E2PB	Meaning
`0b00`	If EL2 is implemented and enabled in the Profiling Buffer owning Security state, the Profiling Buffer uses the EL2 or EL2&0 stage 1 translation regime. Otherwise the Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.
`0b10`	Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2.
`0b11`	Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer control registers at EL1 are not trapped to EL2.

All other values are reserved.

The Profiling Buffer control registers trapped by this control are: PMBLIMITR_EL1, PMBPTR_EL1, and PMBSR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to MDRAR_EL1 are trapped to EL2, reported using EC syndrome value `0x18`.
- If EL0 or EL1 is using AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x05` and MRRC or MCRR accesses are trapped to EL2, reported using EC syndrome value `0x0C`:
  - DBGDRAR, DBGDSAR.

TDRA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by DBGDSCRext.UDCCdis or MDSCR_EL1.TDCC.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDOSA, bit [10]
When FEAT_DoubleLock is implemented:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x18`:
  - OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, and DBGPRCR_EL1.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x05`:
  - DBGOSLSR, DBGOSLAR, DBGOSDLR, and DBGPRCR.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x18`:
    - OSLAR_EL1, OSLSR_EL1, and DBGPRCR_EL1.
    - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x05`:
    - DBGOSLSR, DBGOSLAR, and DBGPRCR.
    - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 are trapped.

It is IMPLEMENTATION DEFINED whether accesses to DBGOSDLR are trapped.

TDOSA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1.
- HCR_EL2.TGE == 1.

Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL0 and EL1 System register accesses to debug System registers that are not trapped by MDCR_EL2.TDRA or MDCR_EL2.TDOSA, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 reported using EC syndrome value `0x18`:
    - MDCCSR_EL0, MDCCINT_EL1, OSDTRRX_EL1, MDSCR_EL1, OSDTRTX_EL1, OSECCR_EL1, DBGBVR<n>_EL1, DBGBCR<n>_EL1, DBGWVR<n>_EL1, DBGWCR<n>_El1, DBGCLAIMSET_EL1, DBGCLAIMCLR_EL1, DBGAUTHSTATUS_EL1.
    - When not in Debug state, DBGDTR_EL0, DBGDTRRX_EL0, DBGDTRTX_EL0.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x05`.
    - DBGDIDR, DBGDSCRint, DBGDCCINT, DBGWFAR, DBGVCR, DBGDSCRext, DBGDTRTXext, DBGDTRRXext, DBGBVR<n>, DBGBCR<n>, DBGBXVR<n>, DBGWCR<n>, DBGWVR<n>,

        - DBGCLAIMSET, DBGCLAIMCLR, DBGAUTHSTATUS, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGOSECCR.
        - When not in Debug state, DBGDTRRXint and DBGDTRTXint.
- In AArch32 state, STC accesses to DBGDTRRXint and LDC accesses to DBGDTRTXint are trapped to EL2, reported using EC syndrome value `0x06`.

TDA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL0 or EL1 System register accesses to the debug registers are trapped from both Execution states to EL2 when EL2 is enabled in the current Security state, unless the access generates a higher priority exception.

Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

Traps of AArch64 accesses to DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0 are ignored in Debug state.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- MDCR_EL2.TDE == 1
- HCR_EL2.TGE == 1

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDE, bit [8]

Trap Debug Exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D.

TDE	Meaning
`0b0`	The debug target Exception level is EL1.
`0b1`	If EL2 is enabled for the current Effective value of SCR_EL3.NS, the debug target Exception level is EL2, otherwise the debug target Exception level is EL1. The MDCR_EL2.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

For more information, see 'Routing debug exceptions'.

This field is treated as being 1 for all purposes other than a direct read when HCR_EL2.TGE == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPME, bit [7]
When FEAT_PMUv3 is implemented:

[MDCR_EL2.HPMN..(N-1)] event counters enable.

HPME	Meaning
`0b0`	Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are disabled.
`0b1`	Event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)] are enabled by PMCNTENSET_EL0.

If MDCR_EL2.HPMN is less than PMCR_EL0.N, this field affects the operation of event counters in the range [MDCR_EL2.HPMN..(PMCR_EL0.N-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPM, bit [6]
When FEAT_PMUv3 is implemented:

Trap Performance Monitors accesses. Traps EL0 and EL1 accesses to all Performance Monitor registers to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value `0x18`:
  - PMCR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMOVSCLR_EL0, PMSWINC_EL0, PMSELR_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPER_EL0, PMXEVCNTR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMOVSSET_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMCCFILTR_EL0.
  - If FEAT_PMUv3p4 is implemented, PMMIR_EL1
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value `0x03`, MRRC or MCRR accesses are trapped to EL2 and reported using EC syndrome value `0x04`:
  - PMCR, PMCNTENSET, PMCNTENCLR, PMOVSR, PMSWINC, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXEVCNTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR.
  - If FEAT_PMUv3p1 is implemented, PMCEID2, and PMCEID3.
  - If FEAT_PMUv3p4 is implemented, PMMIR.

TPM	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL0 and EL1 accesses to all Performance Monitor registers are trapped to EL2 when EL2 is enabled in the current Security state.

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPMCR, bit [5]
When FEAT_PMUv3 is implemented:

Trap PMCR_EL0 or PMCR accesses. Traps EL0 and EL1 accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to PMCR_EL0 are trapped to EL2, reported using EC syndrome value `0x18`.
- In AArch32 state, accesses to PMCR are trapped to EL2, reported using EC syndrome value `0x03`.

TPMCR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 accesses to the PMCR_EL0 or PMCR are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by PMUSERENR.EN or PMUSERENR_EL0.EN.

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPMN, bits [4:0]

When FEAT_PMUv3 is implemented:

Defines the number of event counters that are accessible from EL3, EL2, EL1, and from EL0 if permitted.

If HPMN is not 0 and is less than PMCR_EL0.N, HPMN divides the Performance Monitors into a first range [0..(HPMN-1)], and a second range [HPMN..(PMCR_EL0.N-1)].

If FEAT_HPMN0 is implemented and this field is 0, all events counters are in the second range and none are in the first range.

If HPMN is equal to PMCR_EL0.N, all event counters are in the first range and none are in the second range.

For an event counter <n> in the first range:

- The counter is accessible from EL1, EL2, and EL3.
- The counter is accessible from EL0 if permitted by PMUSERENR_EL0 or PMUSERENR.
- If FEAT_PMUv3p5 is implemented, PMCR_EL0.LP or PMCR.LP determines whether the counter overflow flag is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- PMCR_EL0.E and PMCNTENSET_EL0[n] enable the operation of event counter n.

For an event counter <n> in the second range:

- The counter is accessible from EL2 and EL3.
- If EL2 is disabled in the current Security state, the event counter is also accessible from EL1, and from EL0 if permitted by PMUSERENR_EL0.
- If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP determines whether the counter overflow flag is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- MDCR_EL2.HPME and PMCNTENSET_EL0[n] enable the operation of event counter n.

If HPMN is larger than PMCR_EL0.N, or if FEAT_HPMN0 is not implemented, and HPMN is 0, the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of MDCR_EL2.HPMN is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 and EL3 use. That is, the PE behaves as if MDCR_EL2.HPMN is set to an UNKNOWN non-zero value less than or equal to PMCR_EL0.N.
  - All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in PMCR_EL0.N.

Otherwise:

Reserved, RES0.

Accessing MDCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MDCR_EL2
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elsif HaveEL(EL3) && MDCR_EL3.TDA == '1' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return MDCR_EL2;
elsif PSTATE.EL == EL3 then
    return MDCR_EL2;
```

```
MSR MDCR_EL2, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elsif HaveEL(EL3) && MDCR_EL3.TDA == '1' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
    else
        MDCR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    MDCR_EL2 = X[t];
```

MDCR_EL3, Monitor Debug Configuration Register (EL3)

The MDCR_EL3 characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

Configuration

AArch64 System register MDCR_EL3 bits [31:0] can be mapped to AArch32 System register SDCR[31:0], but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to MDCR_EL3 are UNDEFINED.

Attributes

MDCR_EL3 is a 64-bit register.

Field descriptions

Bits [63:37]

Reserved, RES0.

EnPMSN, bit [36]
When FEAT_SPEv1p2 is implemented:

Trap accesses to PMSNEVFR_EL1. Controls access to Statistical Profiling PMSNEVFR_EL1 System register from EL2 and EL1.

EnPMSN	Meaning
`0b0`	Accesses to PMSNEVFR_EL1 at EL2 and EL1 generate a Trap exception to EL3.
`0b1`	Do not trap PMSNEVFR_EL1 to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MPMX, bit [35]
When FEAT_PMUv3p7 is implemented:

Monitor Performance Monitors Extended control. In conjunction with MDCR_EL3.SPME, controls when event counters are enabled at EL3 and in other Secure Exception levels.

MPMX	Meaning
0b0	Event counting and PMCCNTR_EL0 are not affected by this mechanism.
0b1	Event counting by some or all event counters is prohibited at EL3. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled at EL3. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.

If EL2 is implemented, MDCR_EL3.SPME == 1, and MDCR_EL2.HPMN is less than PMCR_EL0.N then all the following are true:

- If MDCR_EL2.HPMN is not 0, this field affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)] at EL3.
- This field does not affect the operation of other event counters.
- If PMCR_EL0.DP is 1, this field affects the operation of PMCCNTR_EL0 at EL3.

The operation of this field applies even when EL2 is disabled in the current Security state.

If EL2 is not implemented, MDCR_EL3.SPME == 0, or MDCR_EL2.HPMN is equal to PMCR_EL0.N then this field affects the operation of all event counters at EL3, and if PMCR_EL0.DP is 1, the operation of PMCCNTR_EL0 at EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

MCCD, bit [34]

When FEAT_PMUv3p7 is implemented:

Monitor Cycle Counter Disable. Prohibits the Cycle Counter, PMCCNTR_EL0, from counting at EL3.

MCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited at EL3.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bits [33:29]

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>_EL0.MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>_EL0.MT is zero.
0b1	PMEVTYPER<n>_EL0.MT bits not affected by this field.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: OSDTRRX_EL1, OSDTRTX_EL1, MDCCSR_EL0, MDCCINT_EL1, and, when the PE is in Non-debug state, DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- `0x05` for trapped AArch32 `MRC` and `MCR` accesses with coproc == `0b1110`.
- `0x06` for trapped AArch32 `LDC` to DBGDTRTXint and `STC` from DBGDTRRXint.
- `0x18` for trapped AArch64 `MRS` and `MSR` accesses.

When the PE is in Debug state, MDCR_EL3.TDCC does not trap any accesses to:

AArch64: DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXint and DBGDTRTXint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [26:24]

Reserved, RES0.

SCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

Secure Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting in Secure state.

SCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited in Secure state.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [22]

Reserved, RES0.

EPMAD, bit [21]

When FEAT_Debugv8p4 is implemented, FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

External Performance Monitors Non-secure Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

EPMAD	Meaning
0b0	Non-secure access to Performance Monitor registers from external debugger is permitted.
0b1	Non-secure access to Performance Monitor registers from external debugger is not permitted.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

EPMAD	Meaning
0b0	Access to Performance Monitor registers from external debugger is permitted.
0b1	Access to Performance Monitor registers from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EDAD, bit [20]

When FEAT_Debugv8p4 is implemented:

External Debug Non-secure Access Disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
0b0	Non-secure access to debug registers from external debugger is permitted.
0b1	Non-secure access to breakpoint and watchpoint registers, and OSLAR_EL1 from external debugger is not permitted.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable. Controls access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers, and to OSLAR_EL1 from external debugger is permitted.
0b1	Access to breakpoint and watchpoint registers, and to OSLAR_EL1 from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

External Debug Access disable. Controls access to breakpoint, watchpoint, and optionally OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers from external debugger is permitted.
0b1	Access to breakpoint and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TTRF, bit [19]

When FEAT_TRF is implemented:

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

The Trace Filter registers trapped by this control are:

- TRFCR_EL2, TRFCR_EL12, TRFCR_EL1, reported using EC syndrome value `0x18`.
- HTRFCR and TRFCR, reported using EC syndrome value `0x03`.

TTRF	Meaning
`0b0`	Accesses to Trace Filter registers at EL2 and EL1 are not affected by this bit.
`0b1`	Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception.

Otherwise:

Reserved, RES0.

STE, bit [18]
When FEAT_TRF is implemented:

Secure Trace enable. Enables tracing in Secure state.

STE	Meaning
`0b0`	Trace prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
`0b1`	Trace in Secure state is not affected by this bit.

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is `0b0`, the Effective value of this bit is `0b1`.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

SPME, bit [17]
When FEAT_PMUv3 is implemented and FEAT_PMUv3p7 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state and EL3.

SPME	Meaning
`0b0`	When MDCR_EL3.MPMX == 0: Event counting is prohibited in Secure state. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.
`0b1`	When MDCR_EL3.MPMX == 0: Event counting and PMCCNTR_EL0 are not affected by this mechanism.

When MDCR_EL3.MPMX is 0, this field affects the operation of all event counters in Secure state, and if PMCR_EL0.DP is 1, the operation of PMCCNTR_EL0 in Secure state.

When MDCR_EL3.MPMX is 1, this field affects the operation of event counters at EL3 only, and if PMCR_EL0.DP is 1, the operation of PMCCNTR_EL0 at EL3 only. See MDCR_EL3.MPMX for more information.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
`0b0`	Event counting is prohibited in Secure state. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.
`0b1`	Event counting and PMCCNTR_EL0 are not affected by this mechanism.

This field affects the operation of all event counters in Secure state, and if PMCR_EL0.DP is 1, the operation of PMCCNTR_EL0 in Secure state. When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

When FEAT_PMUv3 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
`0b0`	If `ExternalSecureNoninvasiveDebugEnabled()` is FALSE, event counting is prohibited in Secure state, and if PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state.
`0b1`	Event counting and PMCCNTR_EL0 are not affected by this mechanism.

If `ExternalSecureNoninvasiveDebugEnabled()` is TRUE, the event counters and PMCCNTR_EL0 are not affected by this field.

Otherwise, this field affects the operation of all event counters in Secure state, and if PMCR_EL0.DP is 1, the operation of PMCCNTR_EL0 in Secure state. When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

SDD, bit [16]

AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

SDD	Meaning
`0b0`	Debug exceptions in Secure state are not affected by this bit.
`0b1`	Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of SCR_EL3.RW is `0b1`.

If Secure EL2 is implemented and enabled, and Secure EL1 is using AArch32, then:

- If debug exceptions from Secure EL1 are enabled, debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER32_EL3.SUIDEN is `0b1`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SPD32, bits [15:14]
When EL1 is capable of using AArch32:

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

SPD32	Meaning
`0b00`	Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.
`0b10`	Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.
`0b11`	Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as `0b00`. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of SCR_EL3.RW is `0b0`.

If Secure EL1 is using AArch32, then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER32_EL3.SUIDEN is `0b1`.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is `0b0`, then the Effective value of this field is `0b11`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSPB, bits [13:12]
When FEAT_SPE is implemented:

Non-secure Profiling Buffer. Controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

NSPB	Meaning
`0b00`	Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Secure states generate Trap exceptions to EL3.
`0b01`	Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3.
`0b10`	Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Secure states generate Trap exceptions to EL3.
`0b11`	Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3.

The Statistical Profiling and Profiling Buffer control registers trapped by this control are:

- PMBLIMITR_EL1, PMBPTR_EL1, PMBSR_EL1, PMSCR_EL1, PMSCR_EL2, PMSCR_EL12, PMSEVFR_EL1, PMSFCR_EL1, PMSICR_EL1, PMSIDR_EL1, PMSIRR_EL1, and PMSLATFR_EL1.
- If FEAT_SPEv1p2 is implemented, PMSNEVFR_EL1.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 1, then the Effective value of this field is `0b11`.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is `0b01`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES0.

TDOSA, bit [10]

When FEAT_DoubleLock is implemented:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:

- Accesses from AArch64 state, OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, DBGPRCR_EL1, and any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit, are trapped to EL3 and reported using EC syndrome value `0x18`.
- Accesses using MCR or MRC to DBGOSLAR, DBGOSLSR, DBGOSDLR, and DBGPRCR, are trapped to EL3 and reported using EC syndrome value `0x05`.
- Accesses to any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

TDOSA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA.

Note

The powerdown debug registers are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:

- AArch64: OSLAR_EL1, OSLSR_EL1, and DBGPRCR_EL1.
- AArch32: DBGOSLAR, DBGOSLSR, and DBGPRCR.
- AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 and DBGOSDLR are trapped.

TDOSA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA.

Note

The powerdown debug registers are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the MDCR_EL3.TDOSA field.

Accesses to the debug registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported using EC syndrome value `0x18`:
  - DBGBVR<n>_EL1, DBGBCR<n>_EL1, DBGWVR<n>_EL1, DBGWCR<n>_EL1, DBGCLAIMSET_EL1, DBGCLAIMCLR_EL1, DBGAUTHSTATUS_EL1, DBGVCR32_EL2.
  - AArch64: MDCR_EL2, MDRAR_EL1, MDCCSR_EL0, MDCCINT_EL1, MDSCR_EL1, OSDTRRX_EL1, OSDTRTX_EL1, OSECCR_EL1.
- In AArch32 state, SDER is trapped to EL3 and reported using EC syndrome value `0x03`.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value `0x05`, accesses using MCRR or MRRC are reported using EC syndrome value `0x0C`:
  - HDCR, DBGDRAR, DBGDSAR, DBGDIDR, DBGDCCINT, DBGWFAR, DBGVCR, DBGBVR<n>, DBGBCR<n>, DBGBXVR<n>, DBGWCR<n>, DBGWVR<n>.
  - DBGCLAIMSET, DBGCLAIMCLR, DBGAUTHSTATUS, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGOSECCR.
- In AArch32 state, STC accesses to DBGDTRRXint and LDC accesses to DBGDTRTXint are reported using EC syndrome value `0x06`.
- When not in Debug state, the following registers are also trapped to EL3:
  - AArch64 accesses to DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0, reported using EC syndrome value `0x18`.
  - AArch32 accesses using MCR or MRC to DBGDTRRXint and DBGDTRTXint, reported using EC syndrome value `0x05`.

TDA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by MDCR_EL3.TDOSA, are trapped to EL3, from both Security states and both Execution states, unless it is trapped by DBGDSCRext.UDCCdis, MDSCR_EL1.TDCC, HDCR.TDA or MDCR_EL2.TDA.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:7]

Reserved, RES0.

TPM, bit [6]

When FEAT_PMUv3 is implemented:

Trap Performance Monitor register accesses. Accesses to all Performance Monitor registers from EL0, EL1, and EL2 to EL3, from both Security states and both Execution states are trapped as follows:

- In AArch64 state, accesses to the following registers are trapped to EL3 and are reported using EC syndrome value `0x18`:
  - PMCR_EL0, PMCNTENSET_EL0, PMCNTENCLR_EL0, PMOVSCLR_EL0, PMSWINC_EL0, PMSELR_EL0, PMCEID0_EL0, PMCEID1_EL0, PMCCNTR_EL0, PMXEVTYPER_EL0, PMXEVCNTR_EL0, PMUSERENR_EL0, PMINTENSET_EL1, PMINTENCLR_EL1, PMOVSSET_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMCCFILTR_EL0.
  - If FEAT_PMUv3p4 is implemented, PMMIR_EL1.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value `0x03`, accesses using MCRR or MRRC are reported using EC syndrome value `0x04`:
  - PMCR, PMCNTENSET, PMCNTENCLR, PMOVSR, PMSWINC, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXEVCNTR, PMUSERENR, PMINTENSET, PMINTENCLR, PMOVSSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR.
  - If FEAT_PMUv3p1 is implemented, PMCEID2, and PMCEID3.
  - If FEAT_PMUv3p4 is implemented, PMMIR.

TPM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2, EL1, and EL0 System register accesses to all Performance Monitor registers are trapped to EL3, unless it is trapped by HDCR.TPM or MDCR_EL2.TPM.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:0]

Reserved, RES0.

Accessing MDCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MDCR_EL3
```

op0	op1	CRn	CRm	op2

0b11	0b110	0b0001	0b0011	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MDCR_EL3;
```

```
MSR MDCR_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0011	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MDCR_EL3 = X[t];
```

MDRAR_EL1, Monitor Debug ROM Address Register

The MDRAR_EL1 characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

Configuration

AArch64 System register MDRAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register DBGDRAR[63:0].

Attributes

MDRAR_EL1 is a 64-bit register.

Field descriptions

63–52	51–32
RES0	ROMADDR

31–12	11–2	1–0
ROMADDR	RES0	Valid

Bits [63:52]

Reserved, RES0.

ROMADDR, bits [51:12]

ROMADDR encoding when FEAT_LPA is implemented and MDRAR_EL1.Valid != 0b00

39–0
ROMADDR

ROMADDR, bits [39:0]

Bits [51:12] of the ROM table physical address.

Bits [11:0] of the ROM table physical address are zero.

For implementations with fewer than 52 physical address bits, the corresponding upper bits of this field are RES0

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

ROMADDR encoding when FEAT_LPA is not implemented and MDRAR_EL1.Valid != 0b00

39 38 37 36	35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	ROMADDR

Bits [39:36]

Reserved, RES0.

ROMADDR, bits [35:0]

Bits [39:12] of the ROM table physical address.

Bits [11:0] of the ROM table physical address are zero.

For implementations with fewer than 48 physical address bits, the corresponding upper bits of this field are RES0

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

ROMADDR encoding when MDRAR_EL1.Valid == 0b00

39 38 37 36 35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
UNKNOWN

Bits [39:0]

Reserved, UNKNOWN.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid.

Valid	Meaning
`0b00`	ROM Table address is not valid. Software must ignore ROMADDR.
`0b11`	ROM Table address is valid.

Other values are reserved.

Arm recommends implementations set this field to zero.

Accessing MDRAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MDRAR_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;

MDSCR_EL1, Monitor Debug System Control Register

The MDSCR_EL1 characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

AArch64 System register MDSCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDSCRext[31:0].

AArch64 System register MDSCR_EL1 bit [15] is architecturally mapped to AArch32 System register DBGDSCRint[15].

AArch64 System register MDSCR_EL1 bit [12] is architecturally mapped to AArch32 System register DBGDSCRint[12].

AArch64 System register MDSCR_EL1 bits [5:2] are architecturally mapped to AArch32 System register DBGDSCRint[5:2].

Attributes

MDSCR_EL1 is a 64-bit register.

Field descriptions

63:32
RES0

31	30	29	28	27	26	25:24	23:22	21	20	19	18:16	15	14	13	12	11:7	6	5:1	0
TFO	RXfull	TXfull	RES0	RXO	TXU	RES0	INTdis	TDA	RES0	SC2	RAZ/WI	MDE	HDE	KDE	TDCC	RES0	ERR	RES0	SS

Bits [63:32]

Reserved, RES0.

TFO, bit [31]

When FEAT_TRF is implemented:

Trace Filter override. Used for save/restore of EDSCR.TFO.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TFO. Reads and writes of this bit are indirect accesses to EDSCR.TFO.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

Used for save/restore of EDSCR.RXfull.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.RXfull. Reads and writes of this bit are indirect accesses to EDSCR.RXfull.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

TXfull, bit [29]

Used for save/restore of EDSCR.TXfull.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TXfull. Reads and writes of this bit are indirect accesses to EDSCR.TXfull.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of EDSCR.RXO.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.RXO. Reads and writes of this bit are indirect accesses to EDSCR.RXO.

When OSLSR_EL1.OSLK == 1, if bits [27,6] of the value written to MDSCR_EL1 are {1,0}, that is, the RXO bit is 1 and the ERR bit is 0, the PE sets EDSCR.{RXO,ERR} to UNKNOWN values.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

TXU, bit [26]

Used for save/restore of EDSCR.TXU.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TXU. Reads and writes of this bit are indirect accesses to EDSCR.TXU.

When OSLSR_EL1.OSLK == 1, if bits [26,6] of the value written to MDSCR_EL1 are {1,0}, that is, the TXU bit is 1 and the ERR bit is 0, the PE sets EDSCR.{TXU,ERR} to UNKNOWN values.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Bits [25:24]

Reserved, RES0.

INTdis, bits [23:22]

Used for save/restore of EDSCR.INTdis.

When OSLSR_EL1.OSLK == 0, and software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this field holds the value of EDSCR.INTdis. Reads and writes of this field are indirect accesses to EDSCR.INTdis.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

TDA, bit [21]

Used for save/restore of EDSCR.TDA.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TDA. Reads and writes of this bit are indirect accesses to EDSCR.TDA.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Bit [20]

Reserved, RES0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented and FEAT_PCSRv8p2 is not implemented:

Used for save/restore of EDSCR.SC2.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.SC2. Reads and writes of this bit are indirect accesses to EDSCR.SC2.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [18:16]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

MDE, bit [15]

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

MDE	Meaning
0b0	Breakpoint, Watchpoint, and Vector Catch exceptions disabled.
0b1	Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HDE, bit [14]

Used for save/restore of EDSCR.HDE.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.HDE. Reads and writes of this bit are indirect accesses to EDSCR.HDE.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

KDE, bit [13]

Local (kernel) debug enable. If EL_D is using AArch64, enable debug exceptions within EL_D. Permitted values are:

KDE	Meaning
0b0	Debug exceptions, other than Breakpoint Instruction exceptions, disabled within EL_D.
0b1	All debug exceptions enabled within EL_D.

RES0 if EL_D is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDCC, bit [12]

Traps EL0 accesses to the Debug Communication Channel (DCC) registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, as follows:

- In AArch64 state, MRS or MSR accesses to the following DCC registers are trapped, reported using EC syndrome value `0x18`:
    - MDCCSR_EL0.
    - If not in Debug state, DBGDTR_EL0, DBGDTRTX_EL0, and DBGDTRRX_EL0.

- In AArch32 state, MRC or MCR accesses to the following registers are trapped, reported using EC syndrome value `0x05`.
    - DBGDSCRint, DBGDIDR, DBGDSAR, DBGDRAR.
    - If not in Debug state, DBGDTRRXint, and DBGDTRTXint.
- In AArch32 state, LDC access to DBGDTRRXint and STC access to DBGDTRTXint are trapped, reported using EC syndrome value `0x06`.
- In AArch32 state, MRRC accesses to DBGDSAR and DBGDRAR are trapped, reported using EC syndrome value `0x0C`.

TDCC	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	EL0 using AArch64: EL0 accesses to the AArch64 DCC registers are trapped. EL0 using AArch32: EL0 accesses to the AArch32 DCC registers are trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of EDSCR.ERR.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.ERR. Reads and writes of this bit are indirect accesses to EDSCR.ERR.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Bits [5:1]

Reserved, RES0.

SS, bit [0]

Software step control bit. If EL_D is using AArch64, enable Software step. Permitted values are:

SS	Meaning
`0b0`	Software step disabled
`0b1`	Software step enabled.

RES0 if EL_D is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MDSCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MDSCR_EL1
```

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0010	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TDA == '1' then

MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MIDR[31:0].

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to External register MIDR_EL1[31:0].

Attributes

MIDR_EL1 is a 64-bit register.

Field descriptions

63–32
RES0

31–24	23–20	19–16	15–4	3–0
Implementer	Variant	Architecture	PartNum	Revision

Bits [63:32]

Reserved, RES0.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is **RO**.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture, bits [19:16]

Architecture version. Defined values are:

Architecture	Meaning
`0b0001`	Armv4.
`0b0010`	Armv4T.
`0b0011`	Armv5 (obsolete).
`0b0100`	Armv5T.
`0b0101`	Armv5TE.
`0b0110`	Armv5TEJ.
`0b0111`	Armv6.
`0b1111`	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

Access to this field is **RO**.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are `0x0` or `0x7`, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing MIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b000

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then

MPAM0_EL1, MPAM0 Register (EL1)

The MPAM0_EL1 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL0. When EL2 is implemented and enabled in the current Security state, the MPAM virtualization option is present, MPAMHCR_EL2.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM information to label memory requests.

If EL2 is implemented and enabled in the current Security state, and HCR_EL2.E2H == 0 or HCR_EL2.TGE == 0, the MPAM virtualization option is present and MPAMHCR_EL2.EL0_VPMEN == 1, then MPAM PARTIDs in MPAM0_EL1 are virtual and mapped into physical PARTIDs for the current Security state.

Configuration

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM0_EL1 are UNDEFINED.

Attributes

MPAM0_EL1 is a 64-bit register.

Field descriptions

63:48	47:40	39:32
RES0	PMG_D	PMG_I

31:16	15:0
PARTID_D	PARTID_I

Bits [63:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group property for PARTID_I.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM0_EL1

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAM0_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0101	0b001

MPAM1_EL1, MPAM1 Register (EL1)

The MPAM1_EL1 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL1.

When EL2 is implemented and enabled in the current Security state, the MPAM virtualization option is present, MPAMHCR_EL2.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests when executing at EL0.

MPAM1_EL1 is an alias for MPAM2_EL2 when executing at EL2 with HCR_EL2.E2H == 1.

MPAM1_EL12 is an alias for MPAM1_EL1 when executing at EL2 or EL3 with HCR_EL2.E2H == 1.

If EL2 is implemented and enabled in the current Security state, the MPAM virtualization option is present and MPAMHCR_EL2.EL1_VPMEN == 1, MPAM PARTIDs in MPAM1_EL1 are virtual and mapped into physical PARTIDs for the current Security state. This mapping of MPAM1_EL1 virtual PARTIDs to physical PARTIDs when EL1_VPMEN is 1 also applies when MPAM1_EL1 is used at EL0 due to MPAMHCR_EL2.GSTAPP_PLK.

Configuration

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when EL3 is implemented.

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when EL3 is not implemented and EL2 is implemented.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM1_EL1 are UNDEFINED.

Attributes

MPAM1_EL1 is a 64-bit register.

Field descriptions

63	62 61	60	59 58 57 56 55 54 53 52 51 50 49 48	47 46 45 44 43 42 41 40	39 38 37 36 35 34 33 32
MPAMEN	RES0	FORCED_NS	RES0	PMG_D	PMG_I

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
PARTID_D	PARTID_I

MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

If neither EL3 nor EL2 is implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write bit MPAM3_EL3.MPAMEN.

If EL3 is not implemented and EL2 is implemented, this field is read-only and reads the current value of the read/write bit MPAM2_EL2.MPAMEN.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing this field has the following behavior:

- **RW** if all of the following are true:
  - EL3 is not implemented
  - EL2 is not implemented
- Otherwise, access to this field is **RO**.

Bits [62:61]

Reserved, RES0.

FORCED_NS, bit [60]

When FEAT_MPAMv0p1 is implemented:

In the Secure state, FORCED_NS indicates the state of MPAM3_EL3.FORCE_NS.

FORCED_NS	Meaning
`0b0`	In the Non-secure state, always reads as 0. In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 0.
`0b1`	In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 1.

Always reads as 0 in the Non-secure state.

Writes are ignored.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [59:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group property for PARTID_I.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM1_EL1

When HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the mnemonic MPAM1_EL1 or MPAM1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAM1_EL1

MPAM2_EL2, MPAM2 Register (EL2)

The MPAM2_EL2 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL2.

Configuration

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when EL3 is implemented.

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register MPAM1_EL1[63].

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAM2_EL2 is a 64-bit register.

Field descriptions

63	62616059	58	5756555453525150	49	48	4746454443424140	3938373635343332
MPAMEN	RES0	TIDR	RES0	TRAPMPAM0EL1	TRAPMPAM1EL1	PMG_D	PMG_I
PARTID_D						PARTID_I	
31	30292827	26	2524232221201918	17	16	151413121110 9 8	7 6 5 4 3 2 1 0

MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
`0b0`	The default PARTID and default PMG are output in MPAM information from all Exception levels.
`0b1`	MPAM information is output based on the MPAMn_ELx register for ELn according to the MPAM configuration.

If EL3 is not implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write MPAM3_EL3.MPAMEN bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing this field has the following behavior:

- When EL3 is not implemented, access to this field is **RW**.
- Otherwise, access to this field is **RO**.

Bits [62:59]

Reserved, RES0.

TIDR, bit [58]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMIDR_EL1.HAS_TIDR == 1:

TIDR traps accesses to MPAMIDR_EL1 from EL1 to EL2.

TIDR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Trap accesses to MPAMIDR_EL1 from EL1 to EL2.

MPAMHCR_EL2.TRAP_MPAMIDR_EL1 == 1 also traps MPAMIDR_EL1 accesses from EL1 to EL2. If either TIDR or TRAP_MPAMIDR_EL1 are 1, accesses are trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [57:50]

Reserved, RES0.

TRAPMPAM0EL1, bit [49]

Trap accesses from EL1 to the MPAM0_EL1 register trap to EL2.

TRAPMPAM0EL1	Meaning
0b0	Accesses to MPAM0_EL1 from EL1 are not trapped.
0b1	Accesses to MPAM0_EL1 from EL1 are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When EL3 is not implemented, this field resets to 1.
  - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

TRAPMPAM1EL1, bit [48]

Trap accesses from EL1 to the MPAM1_EL1 register trap to EL2.

TRAPMPAM1EL1	Meaning
0b0	Accesses to MPAM1_EL1 from EL1 are not trapped.
0b1	Accesses to MPAM1_EL1 from EL1 are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When EL3 is not implemented, this field resets to 1.
  - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

PMG_D, bits [47:40]

Performance monitoring group for data accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group for instruction accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM2_EL2

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAM2_EL2
```

op0	op1	CRn	CRm	op2

MPAM3_EL3, MPAM3 Register (EL3)

The MPAM3_EL3 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL3.

Configuration

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when EL2 is implemented.

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register MPAM1_EL1[63].

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM3_EL3 are UNDEFINED.

Attributes

MPAM3_EL3 is a 64-bit register.

Field descriptions

63	62	61	60	59 58 57 56 55 54 53 52 51 50 49 48	47 46 45 44 43 42 41 40	39 38 37 36 35 34 33 32
MPAMEN	TRAPLOWER	SDEFLT	FORCE_NS	RES0	PMG_D	PMG_I

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
PARTID_D	PARTID_I

MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

Values of this field are:

MPAMEN	Meaning
`0b0`	The default PARTID and default PMG are output in MPAM information when executing at any ELn.
`0b1`	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Access to this field is **RW**.

TRAPLOWER, bit [62]

Trap direct accesses to MPAM System registers that are not UNDEFINED from all ELn lower than EL3.

TRAPLOWER	Meaning
`0b0`	Do not force trapping of direct accesses of MPAM System registers to EL3.
`0b1`	Force direct accesses of MPAM System registers to trap to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

SDEFLT, bit [61]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMIDR_EL1.HAS_SDEFLT == 1:

SDEFLT overrides the PARTID and PMG with the default PARTID and default PMG when executing in the Secure state.

SDEFLT	Meaning
0b0	The PARTID and PMG are determined normally in the Secure state.
0b1	When executing in the Secure state, the PARTID is always PARTID 0, and the PMG is always PMG 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FORCE_NS, bit [60]

When FEAT_MPAMv0p1 is implemented and MPAMIDR_EL1.HAS_FORCE_NS == 1:

FORCE_NS forces MPAM_NS to always be 1 in the Secure state.

FORCE_NS	Meaning
0b0	MPAM_NS is 0 when executing in the Secure state.
0b1	MPAM_NS is 1 when executing in the Secure state.

An implementation is permitted to have this field as RAO if the implementation does not support generating MPAM_NS as 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [59:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group for data accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group for instruction accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM3_EL3

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAM3_EL3
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MPAM3_EL3;
```

```
MSR MPAM3_EL3, <Xt>
```

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MPAM3_EL3 = X[t];
```

MPAMHCR_EL2, MPAM Hypervisor Control Register (EL2)

The MPAMHCR_EL2 characteristics are:

Purpose

Controls the PARTID virtualization features of MPAM. It controls the mapping of virtual PARTIDs into physical PARTIDs in MPAM0_EL1 when EL0_VPMEN == 1 and in MPAM1_EL1 when EL1_VPMEN == 1.

Configuration

This register is present only when FEAT_MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMHCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMHCR_EL2 is a 64-bit register.

Field descriptions

63	62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41	40	39 38 37 36 35 34	33	32
RES0					
TRAP_MPAMIDR_EL1	RES0	GSTAPP_PLK	RES0	EL1_VPMEN	EL0_VPMEN
31	30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9	8	7 6 5 4 3 2	1	0

Bits [63:32]

Reserved, RES0.

TRAP_MPAMIDR_EL1, bit [31]

Trap accesses from EL1 to MPAMIDR_EL1 to EL2.

TRAP_MPAMIDR_EL1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Direct accesses to MPAMIDR_EL1 from EL1 are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When EL3 is not implemented, this field resets to 1.
  - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

Bits [30:9]

Reserved, RES0.

GSTAPP_PLK, bit [8]

Make the PARTIDs at EL0 the same as the PARTIDs at EL1. When executing at EL0, EL2 is enabled, HCR_EL2.TGE == 0 and GSTAPP_PLK = 1, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests.

GSTAPP_PLK	Meaning
0b0	MPAM0_EL1 is used to generate MPAM labels when executing at EL0.
0b1	MPAM1_EL1 is used to generate MPAM labels when executing at EL0 with EL2 enabled and HCR_EL2.TGE == 0. Otherwise MPAM0_EL1 is used.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL1_VPMEN, bit [1]

Enable the virtual PARTID mapping of the PARTID fields in MPAM1_EL1 when executing at EL1. This bit also enables virtual PARTID mapping when MPAM1_EL1 is used to generate MPAM labels for memory requests at EL0 due to GSTAPP_PLK == 1.

EL1_VPMEN	Meaning
0b0	MPAM1_EL1.PARTID_I and MPAM1_EL1.PARTID_D are physical PARTIDs that are used to label memory system requests.
0b1	MPAM1_EL1.PARTID_I and MPAM1_EL1.PARTID_D are virtual PARTIDs that are used to index the PhyPARTID fields of MPAMVPM0_EL2 to MPAMVPM7_EL2 registers to map the virtual PARTID into a physical PARTID to label memory system requests.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0_VPMEN, bit [0]

Enable the virtual PARTID mapping of the PARTID fields of MPAM0_EL1 unless HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1.

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1, EL0_VPMEN is ignored and MPAM0_EL1 PARTID fields are not mapped.

When MPAMHCR_EL2.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used as the source of PARTIDs and the virtual PARTID mapping of MPAM1_EL1 PARTIDs is controlled by MPAMHCR_EL2.EL1_VPMEN.

EL0_VPMEN	Meaning
0b0	MPAM0_EL1.PARTID_I and MPAM0_EL1.PARTID_D are physical PARTIDs that are used to label memory system requests.
0b1	MPAM0_EL1.PARTID_I and MPAM0_EL1.PARTID_D are virtual PARTIDs that are used to index the PhyPARTID fields of MPAMVPM0_EL2 to MPAMVPM7_EL2 registers to map the virtual PARTID into a physical PARTID to label memory system requests.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMHCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

```

MPAMIDR_EL1, MPAM ID Register (EL1)

The MPAMIDR_EL1 characteristics are:

Purpose

Indicates the presence and maximum PARTID and PMG values supported in the implementation. It also indicates whether the implementation supports MPAM virtualization.

Configuration

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMIDR_EL1 are UNDEFINED.

Attributes

MPAMIDR_EL1 is a 64-bit register.

RES0	VPMR_MAX	HAS_HCR	RES0	PARTID_MAX

MPAMIDR_EL1 indicates the MPAM implementation parameters of the PE.

Bits [63:62]

Reserved, RES0.

HAS_SDEFLT, bit [61]

HAS_SDEFLT indicates support for MPAM3_EL3.SDEFLT bit. Defined values are:

HAS_SDEFLT	Meaning
0b0	The SDEFLT bit is not implemented in MPAM3_EL3.
0b1	The SDEFLT bit is implemented in MPAM3_EL3.

When MPAM3_EL3.SDEFLT == 1, accesses from the Secure Execution state use the default PARTID, PARTID == 0.

HAS_FORCE_NS, bit [60]

HAS_FORCE_NS indicates support for MPAM3_EL3.FORCE_NS bit. Defined values are:

HAS_FORCE_NS	Meaning
0b0	The FORCE_NS bit is not implemented in MPAM3_EL3.
0b1	The FORCE_NS bit is implemented in MPAM3_EL3.

When MPAM3_EL3.FORCE_NS == 1, accesses from the Secure Execution state have MPAM_NS == 1.

Bit [59]

Reserved, RES0.

HAS_TIDR, bit [58]

HAS_TIDR indicates support for MPAM2_EL2.TIDR bit. Defined values are:

HAS_TIDR	Meaning
0b0	The TIDR bit is not implemented in MPAM2_EL2.
0b1	The TIDR bit is implemented in MPAM2_EL2.

Note

Arm recommends that when the MPAM version is MPAM v0.1 or MPAM v1.1, MPAMIDR_EL1.HAS_TIDR is 1 and that the MPAM2_EL2.TIDR field is implemented.

Bits [57:40]

Reserved, RES0.

PMG_MAX, bits [39:32]

The largest value of PMG that the implementation can generate. The PMG_I and PMG_D fields of every MPAMn_ELx must implement at least enough bits to represent PMG_MAX.

Bits [31:21]

Reserved, RES0.

VPMR_MAX, bits [20:18]

When MPAMIDR_EL1.HAS_HCR == 1:

Indicates the maximum register index n for the MPAMVPM<n>_EL2 registers.

Otherwise:

Reserved, RAZ.

HAS_HCR, bit [17]

HAS_HCR indicates that the PE implementation supports MPAM virtualization, including MPAMHCR_EL2, MPAMVPMV_EL2, and MPAMVPM<n>_EL2 with n in the range 0 to VPMR_MAX. Must be 0 if EL2 is not implemented in either Security state.

HAS_HCR	Meaning
0b0	MPAM virtualization is not supported.
0b1	MPAM virtualization is supported.

Bit [16]

Reserved, RES0.

PARTID_MAX, bits [15:0]

The largest value of PARTID that the implementation can generate. The PARTID_I and PARTID_D fields of every MPAMn_ELx must implement at least enough bits to represent PARTID_MAX.

Accessing MPAMIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```
MRS <Xt>, MPAMIDR_EL1
```

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b100

```

MPAMVPM0_EL2, MPAM Virtual PARTID Mapping Register 0

The MPAMVPM0_EL2 characteristics are:

Purpose

MPAMVPM0_EL2 provides mappings from virtual PARTIDs 0 - 3 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 register. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

This register is present only when FEAT_MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMVPM0_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM0_EL2 is a 64-bit register.

PhyPARTID3, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 3. PhyPARTID3 gives the mapping of virtual PARTID 3 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID2, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 2. PhyPARTID2 gives the mapping of virtual PARTID 2 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID1, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 1. PhyPARTID1 gives the mapping of virtual PARTID 1 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID0, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 0. PhyPARTID0 gives the mapping of virtual PARTID 0 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM1_EL2, MPAM Virtual PARTID Mapping Register 1

The MPAMVPM1_EL2 characteristics are:

Purpose

MPAMVPM1_EL2 provides mappings from virtual PARTIDs 4 - 7 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM0_EL2 to MPAMVPM7_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1 and MPAMIDR_EL1.VPMR_MAX > 0. Otherwise, direct accesses to MPAMVPM1_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM1_EL2 is a 64-bit register.

Field descriptions

63–48	47–32
PhyPARTID7	PhyPARTID6
31–16	**15–0**
PhyPARTID5	PhyPARTID4

PhyPARTID7, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 7. PhyPARTID7 gives the mapping of virtual PARTID 7 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID6, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 6. PhyPARTID6 gives the mapping of virtual PARTID 6 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID5, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 5. PhyPARTID5 gives the mapping of virtual PARTID 5 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID4, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 4. PhyPARTID4 gives the mapping of virtual PARTID 4 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM2_EL2, MPAM Virtual PARTID Mapping Register 2

The MPAMVPM2_EL2 characteristics are:

Purpose

MPAMVPM2_EL2 provides mappings from virtual PARTIDs 8 - 11 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM0_EL2 to MPAMVPM7_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1 and MPAMIDR_EL1.VPMR_MAX > 1. Otherwise, direct accesses to MPAMVPM2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM2_EL2 is a 64-bit register.

63:32	PhyPARTID11	PhyPARTID10

Bits	31:16	15:0
31:0	PhyPARTID9	PhyPARTID8

PhyPARTID11, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 11. PhyPARTID11 gives the mapping of virtual PARTID 11 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID10, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 10. PhyPARTID10 gives the mapping of virtual PARTID 10 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID9, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 9. PhyPARTID9 gives the mapping of virtual PARTID 9 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID8, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 8. PhyPARTID8 gives the mapping of virtual PARTID 8 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM3_EL2, MPAM Virtual PARTID Mapping Register 3

The MPAMVPM3_EL2 characteristics are:

Purpose

MPAMVPM3_EL2 provides mappings from virtual PARTIDs 12 - 15 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for PARTIDs in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for PARTIDs in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1 and MPAMIDR_EL1.VPMR_MAX > 2. Otherwise, direct accesses to MPAMVPM3_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM3_EL2 is a 64-bit register.

Field descriptions

63 – 48	47 – 32
PhyPARTID15	PhyPARTID14
