ERXADDR2, Selected Error Record Address Register 2

The ERXADDR2 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>ADDR for the error record <n> selected by ERRSELR.SEL.

Configuration

AArch32 System register ERXADDR2 bits [31:0] are architecturally mapped to AArch64 System register ERXADDR_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR2 are UNDEFINED.

Attributes

ERXADDR2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bits [63:32] of ERR<n>ADDR																															

Bits [31:0]

ERXADDR2 accesses bits [63:32] of ERR<n>ADDR, where <n> is the value in ERRSELR.SEL.

Accessing ERXADDR2

If ERRIDR.NUM is `0x0000` or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR2 is RAZ/WI.
- Direct reads and writes of ERXADDR2 are NOPs.
- Direct reads and writes of ERXADDR2 are UNDEFINED.

ERR<n>ADDR describes additional constraints that also apply when ERR<n>ADDR is accessed through ERXADDR2.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ERXFR, Selected Error Record Feature Register

The ERXFR characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>FR for the error record <n> selected by ERRSELR.SEL.

Configuration

AArch32 System register ERXFR bits [31:0] are architecturally mapped to AArch64 System register ERXFR_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXFR are UNDEFINED.

Attributes

ERXFR is a 32-bit register.

Field descriptions

31 … 0
Bits [31:0] of ERR<n>FR

Bits [31:0]

ERXFR accesses bits [31:0] of ERR<n>FR, where <n> is the value in ERRSELR.SEL.

Accessing ERXFR

If ERRIDR.NUM is `0x0000` or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXFR is RAZ.
- Direct reads of ERXFR are NOPs.
- Direct reads of ERXFR are UNDEFINED.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0101	0b0100	0b000

```

ERXMISC0, Selected Error Record Miscellaneous Register 0

The ERXMISC0 characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>MISC0 for the error record <n> selected by ERRSELR.SEL.

Configuration

AArch32 System register ERXMISC0 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC0_EL1[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC0 are UNDEFINED.

Attributes

ERXMISC0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bits [31:0] of ERR<n>MISC0																															

Bits [31:0]

ERXMISC0 accesses bits [31:0] of ERR<n>MISC0, where <n> is the value in ERRSELR.SEL.

Accessing ERXMISC0

If ERRIDR.NUM is `0x0000` or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC0 is RAZ/WI.
- Direct reads and writes of ERXMISC0 are NOPs.
- Direct reads and writes of ERXMISC0 are UNDEFINED.

ERR<n>MISC0 describes additional constraints that also apply when ERR<n>MISC0 is accessed through ERXMISC0.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

ERXMISC1, Selected Error Record Miscellaneous Register 1

The ERXMISC1 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>MISC0 for the error record <n> selected by ERRSELR.SEL.

Configuration

AArch32 System register ERXMISC1 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC0_EL1[63:32].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC1 are UNDEFINED.

Attributes

ERXMISC1 is a 32-bit register.

Field descriptions

31 ... 0
Bits [63:32] of ERR<n>MISC0

Bits [31:0]

ERXMISC1 accesses bits [63:32] of ERR<n>MISC0, where <n> is the value in ERRSELR.SEL.

Accessing ERXMISC1

If ERRIDR.NUM is `0x0000` or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC1 is RAZ/WI.
- Direct reads and writes of ERXMISC1 are NOPs.
- Direct reads and writes of ERXMISC1 are UNDEFINED.

ERR<n>MISC0 describes additional constraints that also apply when ERR<n>MISC0 is accessed through ERXMISC1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

ERXMISC4, Selected Error Record Miscellaneous Register 4

The ERXMISC4 characteristics are:

Purpose

Accesses bits [31:0] of ERR<n>MISC2 for the error record <n> selected by ERRSELR.SEL.

Configuration

AArch32 System register ERXMISC4 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC2_EL1[31:0].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC4 are UNDEFINED.

Attributes

ERXMISC4 is a 32-bit register.

Field descriptions

<table>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td colspan="32">Bits [31:0] of ERR<n>MISC2</td></tr>
</table>

Bits [31:0]

ERXMISC4 accesses bits [31:0] of ERR<n>MISC2, where <n> is the value in ERRSELR.SEL.

Accessing ERXMISC4

If ERRIDR.NUM is `0x0000` or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC4 is RAZ/WI.
- Direct reads and writes of ERXMISC4 are NOPs.
- Direct reads and writes of ERXMISC4 are UNDEFINED.

ERR<n>MISC2 describes additional constraints that also apply when ERR<n>MISC2 is accessed through ERXMISC4.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ERXMISC7, Selected Error Record Miscellaneous Register 7

The ERXMISC7 characteristics are:

Purpose

Accesses bits [63:32] of ERR<n>MISC3 for the error record <n> selected by ERRSELR.SEL.

Configuration

AArch32 System register ERXMISC7 bits [31:0] are architecturally mapped to AArch64 System register ERXMISC3_EL1[63:32].

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC7 are UNDEFINED.

Attributes

ERXMISC7 is a 32-bit register.

Field descriptions

31 … 0
Bits [63:32] of ERR<n>MISC3

Bits [31:0]

ERXMISC7 accesses bits [63:32] of ERR<n>MISC3, where <n> is the value in ERRSELR.SEL.

Accessing ERXMISC7

If ERRIDR.NUM is `0x0000` or ERRSELR.SEL is greater than or equal to ERRIDR.NUM, then one of the following occurs:

- An UNKNOWN error record is selected.

FCSEIDR, FCSE Process ID register

The FCSEIDR characteristics are:

Purpose

Identifies whether the Fast Context Switch Extension (FCSE) is implemented.

From Armv8, the FCSE is not implemented, so this register is RAZ/WI. Software can access this register to determine that the implementation does not include the FCSE.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to FCSEIDR are UNDEFINED.

Attributes

FCSEIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RAZ/WI																															

Bits [31:0]

Reserved, RAZ/WI.

Accessing FCSEIDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1101	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T13 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T13 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return FCSEIDR;
elsif PSTATE.EL == EL2 then
    return FCSEIDR;
elsif PSTATE.EL == EL3 then
    return FCSEIDR;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

0b1111	0b000	0b1101	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T13 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T13 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        FCSEIDR = R[t];
elsif PSTATE.EL == EL2 then
    FCSEIDR = R[t];
elsif PSTATE.EL == EL3 then
    FCSEIDR = R[t];
```

FPEXC, Floating-Point Exception Control register

The FPEXC characteristics are:

Purpose

Provides a global enable for the implemented Advanced SIMD and floating-point functionality, and reports floating-point status information.

Configuration

AArch32 System register FPEXC bits [31:0] are architecturally mapped to AArch64 System register FPEXC32_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to FPEXC are UNDEFINED.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPEXC is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EX	EN	DEX	FP2V	VV	TFV	RES0															VECITR			IDF	RES0		IXF	UFF	OFF	DZF	IOF

EX, bit [31]

Exception bit. From Armv8, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [30]

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the FPEXC or FPSID.
- VMRS accesses from the FPEXC, FPSID, MVFR0, MVFR1, or MVFR2.

EN	Meaning
0b0	Accesses to the FPSCR, and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels.
0b1	This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels.

Execution of Advanced SIMD and floating-point instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, CPACR_EL1.FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
  - HCPTR.TCP10, or if EL2 is using AArch64, CPTR_EL2.TFP.
  - NSACR.cp10, or if EL3 is using AArch64, CPTR_EL3.TFP.
- For Advanced SIMD instructions only:
  - CPACR.ASEDIS.

- If executing in Non-secure state, HCPTR.TASE and NSACR.NSTRCDIS.

See the descriptions of the controls for more information.

Note

When executing at EL0 using AArch32:

- If EL1 is using AArch64, then the Effective value of FPEXC.EN is 1. This includes when EL2 is using AArch64 and is enabled in the current Security state, HCR_EL2.TGE is 1, and the Effective value of HCR_EL2.RW is 1.
- If EL2 is using AArch64 and is enabled in the current Security state, HCR_EL2.TGE is 1, and the Effective value of HCR_EL2.RW is 0, then it is IMPLEMENTATION DEFINED whether the Effective value of FPEXC.EN is 1 or the value written to FPEXC.EN. However, Arm deprecates using the value of FPEXC.EN to determine behavior.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

DEX, bit [29]

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC.TFV field is valid.

The meaning of this bit is:

DEX	Meaning
`0b0`	The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC.TFV is RW then it is invalid and UNKNOWN. If FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN.
`0b1`	The exception was generated during the execution of an allocated encoding. FPEXC.TFV is valid and indicates the cause of the exception.

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the FPSCR.{Stride, Len} fields as RAZ, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FP2V, bit [28]

FPINST2 instruction valid bit. From Armv8, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VV, bit [27]

VECITR valid bit. From Armv8, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

TFV	Meaning
`0b0`	The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of FPSCR.{Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN.
`0b1`	FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception.

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements FPSCR.{Stride, Len} as RAZ, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:11]

Reserved, RES0.

VECITR, bits [10:8]

Vector iteration count. From Armv8, this field is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while FPSCR.IDE was 1:

IDF	Meaning
`0b0`	Input Denormal exception has not occurred.
`0b1`	Input Denormal exception has occurred.

Input Denormal exceptions can occur only when FPSCR.FZ is 1.

Note

A half-precision floating-point value that is flushed to zero because the value of FPSCR.FZ16 is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while FPSCR.IXE was 1:

IXF	Meaning
`0b0`	Inexact exception has not occurred.
`0b1`	Inexact exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while FPSCR.UFE was 1:

UFF	Meaning
`0b0`	Underflow exception has not occurred.
`0b1`	Underflow exception has occurred.

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when FPSCR.FZ16 is 0.
- Otherwise only when FPSCR.FZ is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while FPSCR.OFE was 1:

OFF	Meaning
`0b0`	Overflow exception has not occurred.
`0b1`	Overflow exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while FPSCR.DZE was 1:

DZF	Meaning
0b0	Divide by Zero exception has not occurred.
0b1	Divide by Zero exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while FPSCR.IOE was 1:

IOF	Meaning
0b0	Invalid Operation exception has not occurred.
0b1	Invalid Operation exception has occurred.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FPEXC

Accesses to this register use the following encodings in the System register encoding space:

FPSCR, Floating-Point Status and Control Register

The FPSCR characteristics are:

Purpose

Provides floating-point system status information and control.

Configuration

AArch32 System register FPSCR bits [31:27] are architecturally mapped to AArch64 System register FPSR[31:27].

AArch32 System register FPSCR bit [7] is architecturally mapped to AArch64 System register FPSR[7].

AArch32 System register FPSCR bits [4:0] are architecturally mapped to AArch64 System register FPSR[4:0].

AArch32 System register FPSCR bits [26:15] are architecturally mapped to AArch64 System register FPCR[26:15].

AArch32 System register FPSCR bits [12:8] are architecturally mapped to AArch64 System register FPCR[12:8].

This register is present only when AArch32 is supported. Otherwise, direct accesses to FPSCR are UNDEFINED.

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPSCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23 22	21 20	19	18 17 16	15	14 13	12	11	10	9	8	7	6 5	4	3	2	1	0
N	Z	C	V	QC	AHP	DN	FZ	RMode	Stride	FZ16	Len	IDE	RES0	IXE	UFE	OFE	DZE	IOE	IDC	RES0	IXC	UFC	OFC	DZC	IOC

N, bit [31]

Negative condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

QC, bit [27]

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AHP, bit [26]

Alternative half-precision control bit:

AHP	Meaning
0b0	IEEE half-precision format selected.
0b1	Alternative half-precision format selected.

This bit is used only for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the FEAT_FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DN, bit [25]

Default NaN mode control bit:

DN	Meaning
0b0	NaN operands propagate through to the output of a floating-point operation.
0b1	Any operation involving one or more NaNs returns the Default NaN.

The value of this bit controls only scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Default NaN setting, regardless of the value of the DN bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ, bit [24]

Flush-to-zero mode control bit:

FZ	Meaning
0b0	Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
0b1	Flush-to-zero mode enabled.

The value of this bit controls only scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Flush-to-zero setting, regardless of the value of the FZ bit.

This bit has no effect on half-precision calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RMode, bits [23:22]

Rounding Mode control field. The encoding of this field is:

RMode	Meaning
0b00	Round to Nearest (RN) mode.
0b01	Round towards Plus Infinity (RP) mode.
0b10	Round towards Minus Infinity (RM) mode.
0b11	Round towards Zero (RZ) mode.

The specified rounding mode is used by almost all scalar floating-point instructions. Advanced SIMD arithmetic always uses the Round to Nearest setting, regardless of the value of the RMode bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Stride, bits [21:20]

It is IMPLEMENTATION DEFINED whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ16, bit [19]

When FEAT_FP16 is implemented:

Flush-to-zero mode control bit on half-precision data-processing instructions:

FZ16	Meaning
0b0	Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard.
0b1	Flush-to-zero mode enabled.

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Len, bits [18:16]

It is IMPLEMENTATION DEFINED whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDE, bit [15]

Input Denormal floating-point exception trap enable.

IDE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the IDC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IDC bit.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

IXE, bit [12]

Inexact floating-point exception trap enable.

IXE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the IXC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IXC bit.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFE, bit [11]

Underflow floating-point exception trap enable.

UFE	Meaning
0b0	Untrapped exception handling selected. If the floating-point exception occurs, the UFC bit is set to 1.
0b1	Trapped exception handling selected. If the floating-point exception occurs and Flush-to-zero is not enabled, the PE does not update the UFC bit.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFE, bit [10]

Overflow floating-point exception trap enable.

OFE	Meaning
`0b0`	Untrapped exception handling selected. If the floating-point exception occurs, the OFC bit is set to 1.
`0b1`	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the OFC bit.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZE, bit [9]

Divide by Zero floating-point exception trap enable.

DZE	Meaning
`0b0`	Untrapped exception handling selected. If the floating-point exception occurs, the DZC bit is set to 1.
`0b1`	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the DZC bit.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOE, bit [8]

Invalid Operation floating-point exception trap enable.

IOE	Meaning
`0b0`	Untrapped exception handling selected. If the floating-point exception occurs, the IOC bit is set to 1.
`0b1`	Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IOC bit.

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDC, bit [7]

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IDE bit.

Advanced SIMD instructions set this bit if the Input Denormal floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IDE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXC, bit [4]

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IXE bit.

Advanced SIMD instructions set this bit if the Inexact floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IXE bit.

The criteria for the Inexact floating-point exception to occur are different in Flush-to-zero mode. For more information, see 'Flush-to-zero'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFC, bit [3]

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the UFE bit.

Advanced SIMD instructions set this bit if the Underflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, if FPSCR.UFE is 0 or if Flush-to-zero is enabled.

The criteria for the Underflow floating-point exception to occur are different in Flush-to-zero mode. For more information, see 'Flush-to-zero'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFC, bit [2]

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the OFE bit.

Advanced SIMD instructions set this bit if the Overflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the OFE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZC, bit [1]

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the DZE bit.

Advanced SIMD instructions set this bit if the Divide by Zero floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the DZE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOC, bit [0]

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IOE bit.

Advanced SIMD instructions set this bit if the Invalid Operation floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IOE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FPSCR

Accesses to this register use the following encodings in the System register encoding space:

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

reg
0b0001

```
if PSTATE.EL == EL0 then

FPSID, Floating-Point System ID register

The FPSID characteristics are:

Purpose

Provides top-level information about the floating-point implementation.

This register largely duplicates information held in the MIDR. Arm deprecates use of it.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to FPSID are UNDEFINED.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPSID is a 32-bit register.

Field descriptions

31–24	23	22–16	15–8	7–4	3–0
Implementer	SW	Subarchitecture	PartNum	Variant	Revision

Implementer, bits [31:24]

Implementer codes are the same as those used for the MIDR.

For an implementation by Arm this field is `0x41`, the ASCII code for A.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SW, bit [23]

Software bit. Defined values are:

SW	Meaning
`0b0`	The implementation provides a hardware implementation of the floating-point instructions.
`0b1`	The implementation supports only software emulation of the floating-point instructions.

In Armv8-A, the only permitted value is `0b0`.

Access to this field is **RO**.

Subarchitecture, bits [22:16]

Subarchitecture version number. For an implementation by Arm, defined values are:

Subarchitecture	Meaning
0b0000000	VFPv1 architecture with an IMPLEMENTATION DEFINED subarchitecture.
0b0000001	VFPv2 architecture with Common VFP subarchitecture v1.
0b0000010	VFPv3 architecture, or later, with Common VFP subarchitecture v2. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers.
0b0000011	VFPv3 architecture, or later, with Null subarchitecture. The entire floating-point implementation is in hardware, and no software support code is required. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers. This value can be used only by an implementation that does not support the trap enable bits in the FPSCR.
0b0000100	VFPv3 architecture, or later, with Common VFP subarchitecture v3, and support for trap enable bits in FPSCR. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers.

For a subarchitecture designed by Arm the most significant bit of this field, register bit[22], is 0. Values with a most significant bit of 0 that are not listed here are reserved.

When the subarchitecture designer is not Arm, the most significant bit of this field, register bit[22], must be 1. Each implementer must maintain its own list of subarchitectures it has designed, starting at subarchitecture version number `0x40`.

In Armv8-A, the permitted values are `0b0000011` and `0b0000100`.

Access to this field is **RO**.

PartNum, bits [15:8]

Part Number for the floating-point implementation, assigned by the implementer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [7:4]

Variant number. Typically, this field distinguishes between different production variants of a single product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [3:0]

Revision number for the floating-point implementation.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing FPSID

Accesses to this register use the following encodings in the System register encoding space:

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

reg
0b0000

```

HACR, Hyp Auxiliary Configuration Register

The HACR characteristics are:

Purpose

Controls trapping to Hyp mode of IMPLEMENTATION DEFINED aspects of Non-secure EL1 or EL0 operation.

Configuration

AArch32 System register HACR bits [31:0] are architecturally mapped to AArch64 System register HACR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HACR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HACR is a 32-bit register.

Field descriptions

HACTLR2, Hyp Auxiliary Control Register 2

The HACTLR2 characteristics are:

Purpose

Provides additional space to the HACTLR register to hold IMPLEMENTATION DEFINED trap functionality.

Configuration

AArch32 System register HACTLR2 bits [31:0] are architecturally mapped to AArch64 System register ACTLR_EL2[63:32].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HACTLR2 are UNDEFINED.

In Armv8.0 and Armv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining ID_MMFR4.AC2.

From Armv8.2 this register must be implemented.

Attributes

HACTLR2 is a 32-bit register.

Purpose

Provides IMPLEMENTATION DEFINED memory attributes for the memory attribute encodings defined by HMAIR1. These IMPLEMENTATION DEFINED attributes can only provide additional qualifiers for the memory attribute encodings, and cannot change the memory attributes defined in HMAIR1.

Configuration

AArch32 System register HAMAIR1 bits [31:0] are architecturally mapped to AArch64 System register AMAIR_EL2[63:32].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HAMAIR1 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HAMAIR1 is a 32-bit register.

Field descriptions

31–0
IMPLEMENTATION DEFINED

If an implementation does not provide any IMPLEMENTATION DEFINED memory attributes, this register is RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HAMAIR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1010	0b0011	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T10 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T10 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HAMAIR1;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HAMAIR1;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1010	0b0011	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T10 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T10 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HAMAIR1 = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HAMAIR1 = R[t];
```

HCPTR, Hyp Architectural Feature Trap Register

The HCPTR characteristics are:

Purpose

Controls:

- Trapping to Hyp mode of Non-secure access, at EL1 or EL0, to trace, and to Advanced SIMD and floating-point functionality.
- Hyp mode access to trace, and to Advanced SIMD and floating-point functionality.

Note

Accesses to this functionality:

- From Non-secure modes other than Hyp mode are also affected by settings in the CPACR and NSACR.
- From Hyp mode are also affected by settings in the NSACR.

Exceptions generated by the CPACR and NSACR controls are higher priority than those generated by the HCPTR controls.

Configuration

AArch32 System register HCPTR bits [31:0] are architecturally mapped to AArch64 System register CPTR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HCPTR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HCPTR is a 32-bit register.

Field descriptions

31	30	29 28 27 26 25 24 23 22 21	20	19 18 17 16	15	14	13 12	11	10	9 8 7 6 5 4 3 2 1 0
TCPAC	TAM	RES0	TTA	RES0	TASE	RES0	RES1	TCP11	TCP10	RES1

TCPAC, bit [31]

Traps Non-secure EL1 accesses to the CPACR to Hyp mode.

TCPAC	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 accesses to the CPACR are trapped to Hyp mode.

Note

The CPACR is not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps Non-secure EL1 and EL0 accesses to all Activity Monitor registers to EL2.

TAM	Meaning
`0b0`	Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are not trapped.
`0b1`	Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are trapped to Hyp mode.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Traps Non-secure System register accesses to all implemented trace registers to Hyp mode.

TTA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any Non-secure System register access to an implemented trace register is trapped to Hyp mode, unless the access is trapped to EL1 by a CPACR or NSACR control, or the access is from Non-secure EL0 and the definition of the register in the appropriate trace architecture specification indicates that the register is not accessible from EL0. A trapped instruction generates: • A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1. • An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

If the implementation does not include a PE trace unit, or does not include a System register interface to the PE trace unit registers, it is IMPLEMENTATION DEFINED whether this bit:

- Is RES0.
- Is RES1.
- Can be written from Hyp mode, and from Secure Monitor mode when SCR.NS is 1.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSTRCDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are UNDEFINED, and a resulting Undefined Instruction exception is higher priority than a HCPTR.TTA Hyp Trap exception.
- The architecture does not provide traps on trace register accesses through the optional memory-mapped debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Bits [19:16]

Reserved, RES0.

TASE, bit [15]

Traps Non-secure execution of Advanced SIMD instructions to Hyp mode when the value of HCPTR.TCP10 is 0.

TASE	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	When the value of HCPTR.TCP10 is 0, any attempt to execute an Advanced SIMD instruction in Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates: • A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1. • An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

When the value of HCPTR.TCP10 is 1, the value of this field is ignored.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, then it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of NSACR.NSASEDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Bit [14]

Reserved, RES0.

Bits [13:12]

Reserved, RES1.

TCP11, bit [11]

The value of this field is ignored. If this field is programmed with a different value to the TCP10 bit then this field is UNKNOWN on a direct read of the HCPTR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of NSACR.cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TCP10, bit [10]

Trap Non-secure accesses to Advanced SIMD and floating-point functionality to Hyp mode:

TCP10	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempted access to Advanced SIMD and floating-point functionality from Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates: • A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1. • An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of NSACR.cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Bits [9:0]

Reserved, RES1.

Accessing HCPTR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b010

```
if PSTATE.EL == EL0 then

HCR, Hyp Configuration Register

The HCR characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various Non-secure operations are trapped to Hyp mode.

Configuration

AArch32 System register HCR bits [31:0] are architecturally mapped to AArch64 System register HCR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11 10	9	8	7	6	5	4
RES0	TRVM	HCD	RES0	TGE	TVM	TTLB	TPU	TPC	TSW	TAC	TIDCP	TSC	TID3	TID2	TID1	TID0	TWE	TWI	DC	BSU	FB	VA	VI	VF	AMO	IMO

Bit [31]

Reserved, RES0.

TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps Non-secure EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

The registers for which read accesses are trapped are as follows:

SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

TRVM	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 read accesses to the specified Virtual Memory controls are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

HCD, bit [29]
When EL3 is not implemented:

HVC instruction disable. Disables Non-secure EL1 and EL2 execution of HVC instructions, when EL2 is enabled in the current Security state.

HCD	Meaning
0b0	HVC instruction execution is enabled at EL2 and EL1.
0b1	HVC instructions are UNDEFINED at EL2 and Non-secure EL1. The Undefined Instruction exception is taken to the Exception level at which the HVC instruction is executed.

Note

HVC instructions are always UNDEFINED at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bit [28]

Reserved, RES0.

TGE, bit [27]

Trap General Exceptions, from Non-secure EL0.

TGE	Meaning
0b0	This control has no effect on execution at EL0.
0b1	When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0. When EL2 is enabled in the current Security state, then: • All exceptions that would be routed to EL1 are routed to EL2. • The SCTLR.M bit is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR. • The HCR.{FMO, IMO, AMO} bits are treated as being 1 for all purposes other than returning the result of a direct read of HCR. • All virtual interrupts are disabled. • Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled. • An exception return to EL1 is treated as an illegal exception return. • Monitor mode execution of an MSR or CPS instruction that changes PSTATE.M to a Non-secure EL1 mode is an illegal change to PSTATE.M. For more information see 'Illegal changes to PSTATE.M'.

Also, when HCR.TGE is 1:

- If EL3 is using AArch32, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing SCR.NS from 0 to 1 results in SCR.NS remaining as 0.
- The HDCR.{TDRA, TDOSA, TDA, TDE} bits are ignored and treated as being 1 other than for the purpose of a direct read of HDCR.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TVM, bit [26]

Trap Virtual Memory controls. Traps Non-secure EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

The registers for which write accesses are trapped are as follows:

SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, CONTEXTIDR.

TVM	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 write accesses to the specified virtual memory control registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TTLB, bit [25]

Trap TLB maintenance instructions. Traps Non-secure EL1 execution of a TLBI instruction to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, TLBIMVAALIS, ITLBIALL, ITLBIMVA, ITLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, TLBIALL, TLBIMVA, TLBIASID, TLBIMVAA, TLBIMVAL, TLBIMVAAL

TTLB	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 accesses to the specified TLB maintenance instructions are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- ICIMVAU, ICIALLU, ICIALLUIS, DCCMVAU.

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TPU	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TPC, bit [23]

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- DCIMVAC, DCCIMVAC, DCCMVAC.

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TPC	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps Non-secure EL1 execution of those cache maintenance instructions by set/way to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- DCISW, DCCSW, DCCISW.

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TSW	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TAC, bit [21]

Trap Auxiliary Control Registers. Traps Non-secure EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, from both Execution states.

This applies to the following register accesses:

ACTLR and, if implemented, ACTLR2.

TAC	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 accesses to the specified registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps Non-secure EL1 accesses to the encodings for IMPLEMENTATION DEFINED System Registers to EL2, when EL2 is enabled in the current Security state.

MCR and MRC instructions accessing the following encodings:

- All coproc==p15, CRn==c9, Opcode1 = {0-7}, CRm == {c0-c2, c5-c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c10, Opcode1 =={0-7}, CRm == {c0, c1, c4, c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c11, Opcode1=={0-7}, CRm == {c0-c8, c15}, opcode2 == {0-7}.

When HCR.TIDCP is set to 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from Non-secure EL0 is trapped to EL2. Otherwise, it is UNDEFINED and the PE takes an Undefined Instruction exception to Non-secure Undefined mode.

TIDCP	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL1 accesses to the specified System register encodings for IMPLEMENTATION DEFINED functionality are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TSC, bit [19]

Trap SMC instructions. Traps Non-secure EL1 execution of SMC instructions to Hyp mode.

TSC	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Any attempt to execute an SMC instruction at Non-secure EL1 is trapped to Hyp mode, regardless of the value of SCR.SCD.

The Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

Note
- This trap is only implemented if the implementation includes EL3.
- SMC instructions are always UNDEFINED at PL0.
- This bit traps execution of the SMC instruction. It is not a routing control for the SMC exception. Hyp Trap exceptions and SMC exceptions have different preferred return addresses.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TID3, bit [18]

Trap ID group 3. Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- VMRS access to MVFR0, MVFR1, and MVFR2, reported using EC syndrome value `0x08`, unless access is also trapped by HCPTR which takes priority.
- MRC access to the following registers are reported using EC syndrome value `0x03`:
  - ID_PFR0, ID_PFR1, ID_PFR2, ID_DFR0, ID_AFR0, ID_MMFR0, ID_MMFR1, ID_MMFR2, ID_MMFR3, ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.
  - If FEAT_FGT is implemented:
    - ID_MMFR4 and ID_MMFR5 are trapped to EL2.
    - ID_ISAR6 is trapped to EL2.
    - ID_DFR1 is trapped to EL2.

        - This field traps all MRC accesses to registers in the following range that are not already mentioned in this field description: coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.
    - If FEAT_FGT is not implemented:
        - ID_MMFR4 and ID_MMFR5 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4 or ID_MMFR5 are trapped.
        - ID_ISAR6 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_ISAR6 are trapped to EL2.
        - ID_DFR1 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_DFR1 are trapped to EL2.
        - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRC accesses to registers not already mentioned, with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

TID3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified Non-secure EL1 read accesses to ID group 3 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 and EL0 reads of the CTR, CCSIDR, CCSIDR2, CLIDR, and CSSELR.
- Non-secure EL1 and EL0 writes to the CSSELR.

TID2	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified Non-secure EL1 and EL0 accesses to ID group 2 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TID1, bit [16]

Trap ID group 1. Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state:

TCMTR, TLBTR, REVIDR, AIDR.

TID1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified Non-secure EL1 read accesses to ID group 1 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TID0, bit [15]

Trap ID group 0. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 reads of the JIDR and FPSID.
- If the JIDR is RAZ from Non-secure EL0, Non-secure EL0 reads of the JIDR.

Note

- It is IMPLEMENTATION DEFINED whether the JIDR is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then the Undefined Instruction exception takes precedence over this trap.
- The FPSID is not accessible at EL0.
- Writes to the FPSID are ignored, and not trapped by this control.

TID0	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified Non-secure EL1 read accesses to ID group 0 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TWE, bit [14]

Traps Non-secure EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TWI, bit [13]

Traps Non-secure EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

DC, bit [12]

Default Cacheability.

DC	Meaning
`0b0`	This control has no effect on the Non-secure EL1&0 translation regime.
`0b1`	In Non-secure state: • The SCTLR.M field behaves as 0 for all purposes other than a direct read of the value of the field. • The HCR.VM field behaves as 1 for all purposes other than a direct read of the value of the field. • The memory type produced by the first stage of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.

This field has no effect on the EL2 and EL3 translation regimes.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

BSU, bits [11:10]

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from Non-secure EL1 or Non-secure EL0:

BSU	Meaning
`0b00`	No effect.
`0b01`	Inner Shareable.
`0b10`	Outer Shareable.
`0b11`	Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

FB, bit [9]

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from Non-secure EL1:

BPIALL, TLBIALL, TLBIMVA, TLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, ITLBIALL, ITLBIMVA, ITLBIASID, TLBIMVAA, ICIALLU, TLBIMVAL, TLBIMVAAL.

FB	Meaning
`0b0`	This field has no effect on the operation of the specified instructions.
`0b1`	When one of the specified instruction is executed at Non-secure EL1, the instruction is broadcast within the Inner Shareable shareability domain.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

VA, bit [8]

Virtual SError interrupt exception.

VA	Meaning
0b0	This mechanism is not making a virtual SError interrupt pending.
0b1	A virtual SError interrupt is pending because of this mechanism.

The virtual SError interrupt is enabled only when the value of HCR.{TGE, AMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

VI, bit [7]

Virtual IRQ exception.

VI	Meaning
0b0	This mechanism is not making a virtual IRQ pending.
0b1	A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of HCR.{TGE, IMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

VF, bit [6]

Virtual FIQ exception.

VF	Meaning
0b0	This mechanism is not making a virtual FIQ pending.
0b1	A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR.{TGE, FMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

AMO, bit [5]

SError interrupt Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.A, and enables virtual exception signaling by the VA bit.

If the value of HCR.TGE is 0, then virtual SError interrupts are enabled in Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.AMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

IMO, bit [4]

IRQ Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.I, and enables virtual exception signaling by the VI bit.

If the value of HCR.TGE is 0, then Virtual IRQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.IMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

FMO, bit [3]

FIQ Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.F, and enables virtual exception signaling by the VF bit.

If the value of HCR.TGE is 0, then Virtual FIQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.FMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

PTW, bit [2]

Protected Table Walk. In the Non-secure PL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs then the value of this bit determines the behavior:

PTW	Meaning
`0b0`	The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.
`0b1`	The memory access generates a stage 2 Permission fault.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

SWIO, bit [1]

Set/Way Invalidation Override. Causes Non-secure EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way.

SWIO	Meaning
`0b0`	This control has no effect on the operation of data cache invalidate by set/way instructions.
`0b1`	Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When this bit is set to 1, DCISW performs the same invalidation as a DCCISW instruction.

As a result of changes to the behavior of DCISW, this bit is redundant in Armv8. This bit can be implemented as RES1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the Non-secure EL1&0 translation regime.

VM	Meaning
`0b0`	Non-secure EL1&0 stage 2 address translation disabled.
`0b1`	Non-secure EL1&0 stage 2 address translation enabled.

If the HCR.DC bit is set to 1, then the behavior of the PE when executing in a Non-secure mode other than Hyp mode is consistent with HCR.VM being 1, regardless of the actual value of HCR.VM, other than the value returned by an explicit read of HCR.VM.

When the value of this bit is 1, data cache invalidate instructions executed at Non-secure EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR.SWIO bit.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Accessing HCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HCR;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HCR;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HCR = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HCR = R[t];
```

HCR2, Hyp Configuration Register 2

The HCR2 characteristics are:

Purpose

Provides additional configuration controls for virtualization.

Configuration

AArch32 System register HCR2 bits [31:0] are architecturally mapped to AArch64 System register HCR_EL2[63:32].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HCR2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HCR2 is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23	22	21	20	19	18	17	16 15 14 13 12 11 10 9 8 7	6	5	4	3 2	1	0
RES0	TTLBIS	RES0	TOCU	RES0	TICAB	TID4	RES0	MIOCNCE	TEA	TERR	RES0	ID	CD

Bits [31:23]

Reserved, RES0.

TTLBIS, bit [22]

When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of the following TLB maintenance instructions at EL1 to EL2:

TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, TLBIMVAALIS

TTLBIS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 execution of the specified TLB maintenance instructions is trapped to EL2.

When FEAT_VHE and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

Bit [21]

Reserved, RES0.

TOCU, bit [20]

When FEAT_EVT is implemented:

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions at EL1 or EL0 using AArch64, and at EL1 using AArch32, to EL2.

This applies to the following instructions:

- When Non-secure EL0 is using AArch64, IC IVAU, DC CVAU. However, if the value of SCTLR_EL1.UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- When EL1 is using AArch64, IC IVAU, IC IALLU, DC CVAU.
- When Non-secure EL1 is using AArch32, ICIMVAU, ICIALLU, DCCMVAU.

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- IC IALLUIS and IC IALLU are always UNDEFINED at EL0 using AArch64.
- ICIMVAU, ICIALLU, ICIALLUIS, and DCCMVAU are always UNDEFINED at EL0 using AArch32.

TOCU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

Bit [19]

Reserved, RES0.

TICAB, bit [18]

When FEAT_EVT is implemented:

Trap ICIALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2.

This applies to the following instructions:

ICIALLUIS.

TICAB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

TID4, bit [17]

When FEAT_EVT is implemented:

Trap ID group 4. Traps the following register accesses to EL2:

- EL1 reads of CCSIDR, CCSIDR2, CLIDR, and CSSELR.
- EL1 writes to CSSELR.

TID4	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified Non-secure EL1 and EL0 accesses to ID group 4 registers are trapped to EL2.

When FEAT_VHE is implemented and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

Bits [16:7]

Reserved, RES0.

MIOCNCE, bit [6]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the Non-secure PL1&0 translation regime.

MIOCNCE	Meaning
0b0	For the Non-secure PL1&0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.
0b1	For the Non-secure PL1&0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute.

For more information, see 'Mismatched memory attributes'.

This field can be implemented as RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

TEA, bit [5]

When FEAT_RAS is implemented:

Route synchronous External abort exceptions from EL0 and EL1 to EL2.

TEA	Meaning
0b0	Does not route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2.
0b1	Route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2, if not routed to EL3.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Otherwise:

Reserved, RES0.

TERR, bit [4]

When FEAT_RAS is implemented:

Trap Error record accesses from EL1 to EL2. Trap accesses to the following registers from EL1 to EL2:

ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXFR, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS.

When FEAT_RASv1p1 is implemented, ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

TERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses to the specified registers from EL1 generate a Trap exception to EL2.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bits [3:2]

Reserved, RES0.

ID, bit [1]

Stage 2 Instruction access cacheability disable. For the Non-secure PL1&0 translation regime, when HCR.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

ID	Meaning
0b0	This control has no effect on stage 2 of the Non-secure PL1&0 translation regime.
0b1	For the Non-secure PL1&0 translation regime, forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2 translation regime.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

CD, bit [0]

Stage 2 Data access cacheability disable. When HCR.VM==1, this forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable for the Non-secure PL1&0 translation regime.

CD	Meaning
0b0	This control has no effect on stage 2 of the Non-secure PL1&0 translation regime for data accesses and translation table walks.
0b1	For the Non-secure PL1&0 translation regime, forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2 translation regime.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Accessing HCR2

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HCR2;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HCR2;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HCR2 = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HCR2 = R[t];
```

HDCR, Hyp Debug Control Register

The HDCR characteristics are:

Purpose

Controls the trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to functions provided by the debug and trace architectures and the Performance Monitors Extension.

Configuration

AArch32 System register HDCR bits [31:0] are architecturally mapped to AArch64 System register MDCR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HDCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3, and other than for a direct read of the register, the PE behaves as if HDCR.HPMN == PMCR.N.

Attributes

HDCR is a 32-bit register.

Field descriptions

31 30	29	28	27	26	25 24	23	222120	19	18	17	1615141312	11	10	9	8	7	6	5	4
RES0	HPMFZO	MTPME	TDCC	HLP	RES0	HCCD	RES0	TTRF	RES0	HPMD	RES0	TDRA	TDOSA	TDA	TDE	HPME	TPM	TPMCR	H

Bits [31:30]

Reserved, RES0.

HPMFZO, bit [29]
When FEAT_PMUv3p7 is implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

HPMFZO	Meaning
`0b0`	Do not freeze on overflow.
`0b1`	Event counters do not count when PMOVSR[(PMCR.N-1):HDCR.HPMN] is nonzero.

If HDCR.HPMN is less than PMCR.N, this field affects the operation of event counters in the range [HDCR.HPMN .. (PMCR.N-1)].

This field does not affect the operation of other event counters and PMCCNTR.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTPME, bit [28]
When FEAT_MTPMU is implemented and EL3 is not implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>.MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>.MT is zero.
0b1	PMEVTYPER<n>.MT bits not affected by this bit.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0b0.

The reset behavior of this field is:

- On a Cold reset, in a system where the PE resets into EL2 or EL3, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]
When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Hyp Trap exception, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

- DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- 0x05 for trapped MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped LDC to DBGDTRTXint and STC from DBGDTRRXint.

When the PE is in Debug state, HDCR.TDCC does not trap any accesses to:

- DBGDTRRXint and DBGDTRTXint.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

HLP, bit [26]
When FEAT_PMUv3p5 is implemented:

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

HLP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>[31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>[63:0].

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is read/write or RAZ/WI.

If HDCR.HPMN is less than PMCR.N, this bit affects the operation of event counters in the range [HDCR.HPMN..(PMCR.N-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

Note

PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [25:24]

Reserved, RES0.

HCCD, bit [23]
When FEAT_PMUv3p5 is implemented:

Hypervisor Cycle Counter Disable. Prohibits PMCCNTR from counting at EL2.

HCCD	Meaning
0b0	Cycle counting by PMCCNTR is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR is prohibited at EL2.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

TTRF, bit [19]
When FEAT_TRF is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2.

TTRF	Meaning
0b0	Accesses to TRFCR at EL1 are not affected by this control bit.
0b1	Accesses to TRFCR at EL1 generate a Hyp Trap exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]

When FEAT_PMUv3p1 is implemented and FEAT_Debugv8p2 is implemented:

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

HPMD	Meaning
0b0	Event counting and PMCCNTR are not affected by this mechanism.
0b1	Event counting by some event counters is prohibited in Hyp mode. If PMCR.DP is 1, PMCCNTR is disabled in Hyp mode. Otherwise, PMCCNTR is not affected by this mechanism.

If HDCR.HPMN is not 0, this field affects the operation of event counters in the range [0 .. (HDCR.HPMN-1)].

This field does not affect the operation of other event counters.

If PMCR.DP is 1, this field affects PMCCNTR.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

When FEAT_PMUv3p1 is implemented:

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

HPMD	Meaning
0b0	Event counting and PMCCNTR are not affected by this mechanism.
0b1	If `ExternalSecureNoninvasiveDebugEnabled()` is FALSE, event counting by some event counters is prohibited in Hyp mode, and if PMCR.DP is 1, PMCCNTR is disabled in Hyp mode.

If `ExternalSecureNoninvasiveDebugEnabled()` is TRUE, this field does not affect the event counters and does not affect PMCCNTR.

Otherwise:

- If HDCR.HPMN is not 0, this field affects the operation of event counters in the range [0 .. (HDCR.HPMN-1)].
- This field does not affect the operation of other event counters.
- If PMCR.DP is 1, this field affects PMCCNTR.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bits [16:12]

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps Non-secure EL0 and EL1 System register accesses to the Debug ROM registers to Hyp mode.

TDRA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL0 and EL1 System register accesses to the DBGDRAR or DBGDSAR are trapped to Hyp mode, unless it is trapped by DBGDSCRext.UDCCdis.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDOSA, bit [10]
When FEAT_DoubleLock is implemented:

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:

- DBGOSLSR, DBGOSLAR, DBGOSDLR, and DBGPRCR.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

Note

These registers are not accessible at EL0.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode.

The registers for which accesses are trapped are as follows:

- DBGOSLSR, DBGOSLAR, and DBGPRCR.
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to DBGOSDLR are trapped.

Note

These registers are not accessible at EL0.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TDA, bit [9]

Trap debug access. Traps Non-secure EL0 and EL1 System register accesses to those debug System registers in the (coproc==`0b1110`) encoding space that are not trapped by either of the following:

- HDCR.TDRA.
- HDCR.TDOSA.

TDA	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Non-secure EL0 or EL1 System register accesses to the debug registers, other than the registers trapped by HDCR.TDRA and HDCR.TDOSA, are trapped to Hyp mode, unless it is trapped by DBGDSCRext.UDCCdis.

Traps of AArch32 accesses to DBGDTRRXint and DBGDTRTXint are ignored in Debug state.

If HCR.TGE or HDCR.TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

TDE, bit [8]

Trap Debug exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D.

TDE	Meaning
`0b0`	The debug target Exception level is EL1.
`0b1`	If EL2 is enabled for the current Effective value of SCR.NS, the debug target Exception level is EL2, otherwise the debug target Exception level is EL1. The HDCR.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

For more information, see 'Routing debug exceptions'.

When HCR.TGE == 1, the PE behaves as if the value of this field is 1 for all purposes other than returning the value of a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

HPME, bit [7]
When FEAT_PMUv3 is implemented:

[HDCR.HPMN..(N-1)] event counters enable.

HPME	Meaning
0b0	Event counters in the range [HDCR.HPMN..(PMCR.N-1)] are disabled.
0b1	Event counters in the range [HDCR.HPMN..(PMCR.N-1)] are enabled by PMCNTENSET.

If HDCR.HPMN is less than PMCR.N, this field affects the operation of event counters in the range [HDCR.HPMN..(PMCR.N-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPM, bit [6]

When FEAT_PMUv3 is implemented:

Trap Performance Monitors accesses. Traps Non-secure EL0 and EL1 accesses to all Performance Monitors registers to Hyp mode.

TPM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to Hyp mode.

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Otherwise:

Reserved, RES0.

TPMCR, bit [5]

When FEAT_PMUv3 is implemented:

Trap PMCR accesses. Traps Non-secure EL0 and EL1 accesses to the PMCR to Hyp mode.

TPMCR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure EL0 and EL1 accesses to the PMCR are trapped to Hyp mode, unless it is trapped by PMUSERENR.EN.

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Otherwise:

Reserved, RES0.

HPMN, bits [4:0]

When FEAT_PMUv3 is implemented:

Defines the number of event counters that are accessible from Non-secure EL1 modes, and from Non-secure EL0 modes if unprivileged access is enabled.

If HPMN is not 0 and is less than PMCR.N, HPMN divides the event counters into a first range [0..(HPMN-1)], and a second range [HPMN..(PMCR.N-1)].

If FEAT_HPMN0 is implemented and this field is 0, all event counters are in the second range and none are in the first range.

If HPMN is equal to PMCR.N, all event counters are in the first range, and none are in the second range.

For an event counter <n> in the first range:

- The counter is accessible from EL1, EL2, EL3.
- The counter is accessible from EL0 if permitted by PMUSERENR.
- If FEAT_PMUv3p5 is implemented, PMCR.LP determines whether the counter overflows at PMEVCNTR<n>[31:0] or PMEVCNTR<n>[63:0].
- PMCR.E and PMCNTENSET[n] enable the operation of event counter n.

For an event counter <n> in the second range:

- The counter is accessible from EL2 and EL3.
- If EL2 is disabled in the current Security state, the event counter is also accessible from EL1, and from EL0 if permitted by PMUSERENR.
- If FEAT_PMUv3p5 is implemented, HDCR.HLP determines whether the counter overflows at PMEVCNTR<n>[31:0] or PMEVCNTR<n>[63:0].
- HDCR.HPME and PMCNTENSET[n] enable the operation of event counter n.

If HPMN is larger than PMCR.N, or if FEAT_HPMN0 is not implemented and HPMN is 0, the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of HDCR.HPMN is UNKNOWN.
- Either:
  - An UNKNOWN number of counters are reserved for EL2 use. That is, the PE behaves as if HDCR.HPMN is set to an UNKNOWN non-zero value less than or equal to PMCR.N.
  - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in PMCR.N.

Otherwise:

Reserved, RES0.

Accessing HDCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

HDFAR, Hyp Data Fault Address Register

The HDFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception that is taken to Hyp mode.

Configuration

AArch32 System register HDFAR bits [31:0] are architecturally mapped to AArch64 System register FAR_EL2[31:0].

AArch32 System register HDFAR bits [31:0] are architecturally mapped to AArch32 System register DFAR[31:0] (S) when EL2 is implemented, EL3 is implemented and the implementation only supports execution in AArch32 state.

This register is present only when AArch32 is supported. Otherwise, direct accesses to HDFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HDFAR is a 32-bit register.

Field descriptions

<table>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td colspan="32">VA of faulting address of synchronous Data Abort exception taken to Hyp mode</td></tr>
</table>

Bits [31:0]

VA of faulting address of synchronous Data Abort exception taken to Hyp mode.

On a Prefetch Abort exception, this register is UNKNOWN.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HDFAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

HIFAR, Hyp Instruction Fault Address Register

The HIFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception that is taken to Hyp mode.

Configuration

AArch32 System register HIFAR bits [31:0] are architecturally mapped to AArch64 System register FAR_EL2[63:32].

AArch32 System register HIFAR bits [31:0] are architecturally mapped to AArch32 System register IFAR[31:0] (S) when EL2 is implemented, EL3 is implemented and the implementation only supports execution in AArch32 state.

This register is present only when AArch32 is supported. Otherwise, direct accesses to HIFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HIFAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VA of faulting address of synchronous Prefetch Abort exception taken to Hyp mode																															

Bits [31:0]

VA of faulting address of synchronous Prefetch Abort exception taken to Hyp mode.

On a Data Abort exception, this register is UNKNOWN.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HIFAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

HMAIR0, Hyp Memory Attribute Indirection Register 0

The HMAIR0 characteristics are:

Purpose

Along with HMAIR1, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:

- When AttrIndx[2] is 0, HMAIR0 is used.
- When AttrIndx[2] is 1, HMAIR1 is used.

Configuration

AArch32 System register HMAIR0 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HMAIR0 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HMAIR0 is a 32-bit register.

Field descriptions

When TTBCR.EAE == 1:

31 30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0
Attr3	Attr2	Attr1	Attr0

Attr<n>, bits [8n+7:8n], for n = 3 to 0

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
`0b0000`	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not `0b00`	Normal memory, Outer Write-Through Transient.
`0b0100`	Normal memory, Outer Non-cacheable.
0b01RW, RW not `0b00`	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is `0b0000`	Meaning when Attr<n>[7:4] is not `0b0000`
`0b0000`	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not `0b00`	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
`0b0100`	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not `0b00`	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
`0b1000`	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=`0b00`)
0b10RW, RW not `0b00`	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
`0b1100`	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=`0b00`)
0b11RW, RW not `0b00`	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
`0b0`	No Allocate
`0b1`	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HMAIR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1010	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T10 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T10 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HMAIR0;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HMAIR0;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1010	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T10 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T10 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HMAIR0 = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HMAIR0 = R[t];
```

HMAIR1, Hyp Memory Attribute Indirection Register 1

The HMAIR1 characteristics are:

Purpose

Along with HMAIR0, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:

- When AttrIndx[2] is 0, HMAIR0 is used.
- When AttrIndx[2] is 1, HMAIR1 is used.

Configuration

AArch32 System register HMAIR1 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL2[63:32].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HMAIR1 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HMAIR1 is a 32-bit register.

Field descriptions

When TTBCR.EAE == 1:

<table>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td colspan="8">Attr7</td><td colspan="8">Attr6</td><td colspan="8">Attr5</td><td colspan="8">Attr4</td></tr>
</table>

Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 7 to 4

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
`0b0000`	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not `0b00`	Normal memory, Outer Write-Through Transient.
`0b0100`	Normal memory, Outer Non-cacheable.
0b01RW, RW not `0b00`	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HMAIR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

HPFAR, Hyp IPA Fault Address Register

The HPFAR characteristics are:

Purpose

Holds the faulting IPA for some aborts on a stage 2 translation taken to Hyp mode.

Configuration

AArch32 System register HPFAR bits [31:0] are architecturally mapped to AArch64 System register HPFAR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HPFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HPFAR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4	3 2 1 0
FIPA[39:12]	RES0

Execution in any Non-secure mode other than Hyp mode makes this register UNKNOWN.

FIPA[39:12], bits [31:4]

Bits [39:12] of the faulting intermediate physical address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:0]

Reserved, RES0.

Accessing HPFAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0110	0b0000	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T6 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T6 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else

HRMR, Hyp Reset Management Register

The HRMR characteristics are:

Purpose

If EL2 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch32 System register HRMR bits [31:0] are architecturally mapped to AArch64 System register RMR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HRMR are UNDEFINED.

Only implemented if EL2 is the highest implemented Exception level. In this case:

- If EL2 can use AArch32 and AArch64 then this register must be implemented.
- If EL2 cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Attributes

HRMR is a 32-bit register.

Field descriptions

31:2	1	0
RES0	RR	AA64

Bits [31:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

AA64, bit [0]

When EL2 can use AArch64, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
`0b0`	AArch32.
`0b1`	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL2 cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.

Accessing HRMR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b0000	0b010

```
if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T12 ==
'1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
elsif PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && ELUsingAArch32(EL2) && HSTR.T12 ==
'1' then
    AArch32.TakeHypTrapException(0x03);
elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    return HRMR;
else
    UNDEFINED;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b0000	0b010

```
if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T12 ==
'1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
elsif PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && ELUsingAArch32(EL2) && HSTR.T12 ==
'1' then
    AArch32.TakeHypTrapException(0x03);
elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    HRMR = R[t];
else
    UNDEFINED;
```

HSCTLR, Hyp System Control Register

The HSCTLR characteristics are:

Purpose

Provides top level control of the system operation in Hyp mode.

Configuration

AArch32 System register HSCTLR bits [31:0] are architecturally mapped to AArch64 System register SCTLR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HSCTLR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HSCTLR is a 32-bit register.

Field descriptions

31	30	29 28	27 26	25	24	23 22	21 20	19	18	17	16	15 14 13	12	11	10 9	8	7	6	5	4	3
DSSBS	TE	RES1	RES0	EE	RES0	RES1	RES0	WXN	RES1	RES0	RES1	RES0	I	RES1	RES0	SED	ITD	RES0	CP15BEN	LSMAOE	nTLS

DSSBS, bit [31]

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to Hyp mode.
0b1	PSTATE.SSBS is set to 1 on an exception to Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to EL2 are taken to A32 or T32 state:

TE	Meaning
0b0	Exceptions, including reset, taken to A32 state.
0b1	Exceptions, including reset, taken to T32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [29:28]

Reserved, RES1.

Bits [27:26]

Reserved, RES0.

EE, bit [25]

The value of the PSTATE.E bit on entry to Hyp mode, the endianness of stage 1 translation table walks in the EL2 translation regime, and the endianness of stage 2 translation table walks in the PL1&0 translation regime.

EE	Meaning
`0b0`	Little-endian. PSTATE.E is cleared to 0 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&0 translation regime are little-endian.
`0b1`	Big-endian. PSTATE.E is set to 1 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bits [23:22]

Reserved, RES1.

Bits [21:20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 translation regime, this bit can force all memory regions that are writable to be treated as XN.

WXN	Meaning
`0b0`	This control has no effect on memory access permissions.
`0b1`	Any region that is writable in the EL2 translation regime is forced to XN for accesses from software executing at EL2.

This bit applies only when HSCTLR.M bit is set.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:13]

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2:

I	Meaning
`0b0`	All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
`0b1`	All instruction access to Normal memory from EL2 can be cached at all levels of instruction and unified cache. If the value of HSCTLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the PL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Bit [11]

Reserved, RES1.

Bits [10:9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at EL2.

SED	Meaning
`0b0`	SETEND instruction execution is enabled at EL2.
`0b1`	SETEND instructions are UNDEFINED at EL2.

If the implementation does not support mixed-endian operation at EL2, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at EL2.

ITD	Meaning
`0b0`	All IT instruction functionality is enabled at EL2.

`0b1`	Any attempt at EL2 to execute any of the following is UNDEFINED:
	• All encodings of the IT instruction with hw1[3:0]!=1000.
	• All encodings of the subsequent instruction with the following values for hw1:
	  ◦ 11xxxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
	  ◦ 1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'.
	  ◦ 10100xxxxxxxxxxx: ADD Rd, PC, #imm
	  ◦ 01001xxxxxxxxxxx: LDR Rd, [PC, #imm]
	  ◦ 0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.
	  ◦ 010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.
	These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.
	It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:
	• A 16-bit instruction, that can only be followed by another 16-bit instruction.
	• The first half of a 32-bit instruction.
	This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.
	An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information, see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the HSCTLR then it must also be implemented in the SCTLR_EL1, SCTLR_EL2, and SCTLR.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

Bit [6]

Reserved, RES0.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==`0b1111`) encoding space from EL2:

CP15BEN	Meaning
`0b0`	EL2 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.
`0b1`	EL2 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the HSCTLR then it must also be implemented in the SCTLR_EL1, SCTLR_EL2, and SCTLR.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement CP15BEN, access to this field is **RAO/WI**.

LSMAOE, bit [4]
When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL2, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL2 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 1.

Otherwise:

Reserved, RES1.

nTLSMD, bit [3]
When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 1.

Otherwise:

Reserved, RES1.

C, bit [2]

Cacheability control, for data accesses at EL2:

C	Meaning
0b0	All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, can be cached at all levels of data and unified cache.

This bit has no effect on the PL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

A	Meaning
0b0	Alignment fault checking disabled when executing at EL2. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element or data elements being accessed.
0b1	Alignment fault checking enabled when executing at EL2. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element or data elements being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL2 stage 1 address translation disabled. See the HSCTLR.I field for the behavior of instruction accesses to Normal memory.
0b1	EL2 stage 1 address translation enabled.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to `0`.

Accessing HSCTLR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HSCTLR;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HSCTLR;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HSCTLR = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HSCTLR = R[t];
```

HSR, Hyp Syndrome Register

The HSR characteristics are:

Purpose

Holds syndrome information for an exception taken to Hyp mode.

Configuration

AArch32 System register HSR bits [31:0] are architecturally mapped to AArch64 System register ESR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HSR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HSR is a 32-bit register.

Field descriptions

31 30 29 28 27 26	25	24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
EC	IL	ISS

Execution in any Non-secure PE mode other than Hyp mode makes this register UNKNOWN.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of HSR is UNKNOWN. The value written to HSR must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about. Possible values of this field are:

EC	Meaning	ISS
0b000000	Unknown reason.	ISS encoding for exceptions with an unknown reason
0b000001	Trapped WFI or WFE instruction execution. Conditional WFE and WFI instructions that fail their condition code check do not cause an exception.	ISS encoding for Exception from a WFI or WFE instruction
0b000011	Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for Exception from an MCR or MRC access
0b000100	Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000.	ISS encoding for Exception from an MCRR or MRRC access
0b000101	Trapped MCR or MRC access with (coproc==0b1110).	ISS encoding for Exception from an MCR or MRC access
0b000110	Trapped LDC or STC access. The only architected uses of these instructions are: • An STC to write data to memory from DBGDTRRXint. • An LDC to read data from memory to DBGDTRTXint.	ISS encoding for Exception from an LDC or STC instruction
0b000111	Access to Advanced SIMD or floating-point functionality trapped by a HCPTR.{TASE, TCP10} control. Excludes exceptions generated because Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000.	ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR
0b001000	Trapped VMRS access, from ID group trap, that is not reported using EC 0b000111.	ISS encoding for Exception from an MCR or MRC access
0b001100	Trapped MRRC access with (coproc==0b1110).	ISS encoding for Exception from an MCRR or MRRC access
0b001110	Illegal exception return to AArch32 state.	ISS encoding for Exception from an Illegal state or PC alignment fault
0b010001	Exception on SVC instruction execution in AArch32 state routed to EL2.	ISS encoding for Exception from HVC or SVC instruction execution
0b010010	HVC instruction execution in AArch32 state, when HVC is not disabled.	ISS encoding for Exception from HVC or SVC instruction execution
0b010011	Trapped execution of SMC instruction in AArch32 state.	ISS encoding for Exception from SMC instruction execution
0b100000	Prefetch Abort from a lower Exception level.	ISS encoding for Exception from a Prefetch Abort
0b100001	Prefetch Abort taken without a change in Exception level.	ISS encoding for Exception from a Prefetch Abort
0b100010	PC alignment fault exception.	ISS encoding for Exception from an

		Illegal state or PC alignment fault
0b100100	Data Abort from a lower Exception level.	ISS encoding for Exception from a Data Abort
0b100101	Data Abort taken without a change in Exception level.	ISS encoding for Exception from a Data Abort

All other EC values are reserved by Arm, and:

- Unused values in the range `0b000000` - `0b101100` (`0x00` - `0x2C`) are reserved for future use for synchronous exceptions.
- Unused values in the range `0b101101` - `0b111111` (`0x2D` - `0x3F`) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction length bit. Indicates the size of the instruction that has been trapped to Hyp mode. When this bit is valid, possible values of this bit are:

IL	Meaning
0b0	16-bit instruction trapped.
0b1	32-bit instruction trapped.

This field is RES1 and not valid for the following cases:

- When the EC field is `0b000000`, indicating an exception with an unknown reason.
- Prefetch Aborts.
- Data Aborts for which the HSR.ISS.ISV field is 0.
- When the EC value is `0b001110`, indicating an Illegal state exception.

Note

This is a change from the behavior in Armv7, where the IL field is UNK/SBZP for the corresponding cases.

The IL field is not valid and is UNKNOWN on an exception from a PC alignment fault.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

ISS encoding for exceptions with an unknown reason

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								

Bits [24:0]

Reserved, RES0.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or is not accessible in the current PE mode in the current Security state, including:
    - A read access using a System register encoding pattern that is not allocated for reads or that does not permit reads in the current PE mode and Security state.
    - A write access using a System register encoding pattern that is not allocated for writes or that does not permit writes in the current PE mode and Security state.
    - Instruction encodings that are unallocated.
    - Instruction encodings for instructions not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- The attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the SCTLR.{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
    - An HVC instruction when disabled by HCR.HCD, SCR.HCE, or SCR_EL3.HCE.
    - An SMC instruction when disabled by SCR.SCD or SCR_EL3.SMD.
    - An HLT instruction when disabled by EDSCR.HDE.
- An HVC instruction when disabled by HCR.HCD, SCR.HCE, or SCR_EL3.HCE.An SMC instruction when disabled by SCR.SCD or SCR_EL3.SMD.An HLT instruction when disabled by EDSCR.HDE.
- An exception generated because of the attempted execution of an MSR (Banked register) or MRS (Banked register) instruction that would access a Banked register that is not accessible from the Security state and PE mode at which the instruction was executed.

Note

An exception is generated only if the CONSTRAINED UNPREDICTABLE behavior of the instruction is that it is UNDEFINED, see 'MSR (banked register) and MRS (banked register)'.

- Attempted execution, in Debug state, of:
    - A DCPS1 instruction in Non-secure state from EL0 when EL2 is using AArch32 and the value of HCR.TGE is 1.
    - A DCPS2 instruction at EL1 or EL0 when EL2 is not implemented, or when EL3 is using AArch32 and the value of SCR.NS is 0, or when EL3 is using AArch64 and the value of SCR_EL3.NS is 0.
    - A DCPS3 instruction when EL3 is not implemented, or when the value of EDSCR.SDD is 1.
- In Debug state when the value of EDSCR.SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.

'Undefined Instruction exception, when the value of HCR.TGE is 1' describes the configuration settings for a trap that returns an HSR.EC value of `0b000000`.

ISS encoding for Exception from a WFI or WFE instruction

24	23–20	19–1	0
CV	COND	RES0	TI

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:1]

Reserved, RES0.

TI, bit [0]

Trapped instruction. Possible values of this bit are:

TI	Meaning
`0b0`	WFI trapped.
`0b1`	WFE trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

'Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions' describes the configuration settings for this trap.

ISS encoding for Exception from an MCR or MRC access

24	23 22 21 20	19 18 17	16 15 14	13 12 11 10	9	8 7 6 5	4 3 2 1	0
CV	COND	Opc2	Opc1	CRn	RES0	Rt	CRm	Direction

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value `0b000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value `0b111`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

Rt, bits [8:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value `0b0000`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
`0b0`	Write to System register space. MCR instruction.
`0b1`	Read from System register space. MRC or VMRS instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for traps that are reported using EC value `0b000011`:

- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the ID registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to lockdown, DMA, and TCM operations'.
- 'Traps to Hyp mode of Non-secure EL1 execution of cache maintenance instructions'.
- 'Traps to Hyp mode of Non-secure EL1 execution of TLB maintenance instructions'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to the Auxiliary Control Register'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Activity Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to the CPACR'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers'.
- 'General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the (coproc == 1111) encoding space'.

The following sections describe configuration settings for traps that are reported using EC value `0b000101`:

- 'ID group 0, Primary device identification registers'.
- 'Traps to Hyp mode of Non-secure System register accesses to trace registers'.
- 'Trapping Non-secure System register accesses to Debug ROM registers'.
- 'Trapping Non-secure System register accesses to powerdown debug registers'.
- 'Trapping general Non-secure System register accesses to debug registers'.

The following sections describes configuration settings for traps that are reported using EC value `0b001000`:

- 'ID group 0, Primary device identification registers'.
- 'ID group 3, Detailed feature identification registers'.

ISS encoding for Exception from an MCRR or MRRC access

24	23 22 21 20	19 18 17 16	15 14	13 12 11 10	9	8 7 6 5	4 3 2 1	0
CV	COND	Opc1	RES0	Rt2	RES0	Rt	CRm	Direction

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:14]

Reserved, RES0.

Rt2, bits [13:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

Rt, bits [8:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
`0b0`	Write to System register space. MCRR instruction.
`0b1`	Read from System register space. MRRC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for traps that are reported using EC value `0b000100`:

- 'Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Activity Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the Generic Timer registers'.
- 'General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the (coproc == 1111) encoding space'.

The following sections describe configuration settings for traps that are reported using EC value `0b001100`:

- 'Traps to Hyp mode of Non-secure System register accesses to trace registers'.
- 'Trapping Non-secure System register accesses to Debug ROM registers'.

ISS encoding for Exception from an LDC or STC instruction

24	23 22 21 20	19 18 17 16 15 14 13 12	11 10 9	8 7 6 5	4	3 2 1	0
CV	COND	imm8	RES0	Rn	Offset	AM	Direction

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:9]

Reserved, RES0.

Rn, bits [8:5]

The Rn value from the issued instruction. Valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction.

When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

Offset	Meaning
0b0	Subtract offset.
0b1	Add offset.

This bit corresponds to the U bit in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

AM	Meaning
0b000	Immediate unindexed.
0b001	Immediate post-indexed.
0b010	Immediate offset.
0b011	Immediate pre-indexed.
0b100	Literal unindexed. LDC instruction in A32 instruction set only. For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved.
0b110	Literal offset. LDC instruction only. For a trapped STC instruction, this encoding is reserved.

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

Direction	Meaning
0b0	Write to memory. STC instruction.
0b1	Read from memory. LDC instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

'Trapping general Non-secure System register accesses to debug registers' describes the configuration settings for the trap that is reported using EC value 0b000110.

ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR

24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CV	COND				RES0														TA	RES0	coproc			

Excludes exceptions that occur because Advanced SIMD and floating-point functionality is not implemented, or because the value of HCR.TGE or HCR_EL2.TGE is 1. These are reported with EC value `0b000000`.

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:6]

Reserved, RES0.

TA, bit [5]

Indicates trapped use of Advanced SIMD functionality.

TA	Meaning
0b0	Exception was not caused by trapped use of Advanced SIMD functionality.
0b1	Exception was caused by trapped use of Advanced SIMD functionality.

Any use of an Advanced SIMD instruction that is not also a floating-point instruction that is trapped to Hyp mode because of a trap configured in the HCPTR sets this bit to 1.

For a list of these instructions, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RES0.

coproc, bits [3:0]

When the HSR.TA field returns the value 1, this field returns the value `0b1010`. Otherwise, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe the configuration settings for the traps that are reported using EC value `0b000111`:

- 'General trapping to Hyp mode of Non-secure accesses to the SIMD and floating-point registers'.
- 'Traps to Hyp mode of Non-secure accesses to Advanced SIMD functionality'.

ISS encoding for Exception from HVC or SVC instruction execution

24–16	15–0
RES0	imm16

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, this is the value of the imm16 field of the issued instruction.

For an SVC instruction:

- If the instruction is unconditional, then:
  - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
  - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

'Supervisor Call exception, when the value of HCR.TGE is 1' describes the configuration settings for the trap reported with EC value `0b010001`.

ISS encoding for Exception from SMC instruction execution

24	23 22 21 20	19	18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
CV	COND	CCKNOWNPASS	RES0

CV, bit [24]

Condition code valid. Possible values of this bit are:

CV	Meaning
`0b0`	The COND field is not valid.
`0b1`	The COND field is valid.

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to `0b1110`.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to `0b1110`, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to `0b1110`, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

CCKNOWNPASS	Meaning
0b0	The instruction was unconditional, or was conditional and passed its condition code check.
0b1	The instruction was conditional, and might have failed its condition code check.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

'Traps to Hyp mode of Non-secure EL1 execution of SMC instructions' describes the configuration settings for this trap, for instructions executed in Non-secure EL1.

ISS encoding for Exception from a Prefetch Abort

24–11	10	9	8	7	6	5–0
RES0	FnV	EA	RES0	S1PTW	RES0	IFSC

Bits [24:11]

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	HIFAR is valid.
0b1	HIFAR is not valid, and holds an UNKNOWN value.

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. Possible values of this field are:

IFSC	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100010	Debug exception.	
0b110000	TLB conflict abort.	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe cases where Prefetch Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value `0b100000`:

- 'Abort exceptions, when the value of HCR.TGE is 1'.
- 'Routing debug exceptions to EL2 using AArch32'.

ISS encoding for Exception from an Illegal state or PC alignment fault

24–0
RES0

Bits [24:0]

Reserved, RES0.

For more information about the Illegal state exception, see:

- 'Illegal changes to PSTATE.M'.
- 'Illegal return events from AArch32 state'.
- 'Legal returns that set PSTATE.IL to 1'.
- 'The Illegal Execution state exception'.

For more information about the PC alignment fault exception, see 'Branching to an unaligned PC'.

ISS encoding for Exception from a Data Abort

24	23 22	21	20	19 18 17 16	15	14	13 12	11 10	9	8	7	6	5 4 3 2 1 0
ISV	SAS	SSE	RES0	SRT	RES0	AR	RES0	Bits[11:10]	EA	CM	S1PTW	WnR	DFSC

ISV, bit [24]

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:14] is valid.

ISV	Meaning
`0b0`	No valid instruction syndrome. ISS[23:14] are RES0.
`0b1`	ISS[23:14] hold a valid instruction syndrome.

This bit is 0 for all faults except Data Aborts generated by stage 2 address translations for which all the following apply to the instruction that generated the Data Abort exception:

- The instruction is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
- The instruction is not performing register writeback.
- The instruction is not using the PC as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, as described in 'Data Aborts in Memory access mode', and otherwise indicates whether ISS[23:14] hold a valid syndrome.

Note

In the A32 instruction set, LDR*T and STR*T instructions always perform register writeback and therefore never return a valid instruction syndrome.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

ISV is set to 0 on a stage 2 abort on a stage 1 translation table walk.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

SAS	Meaning
`0b00`	Byte
`0b01`	Halfword
`0b10`	Word
`0b11`	Doubleword

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

SSE	Meaning
`0b0`	Sign-extension not required.
`0b1`	Data item must be sign-extended.

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [20]

Reserved, RES0.

SRT, bits [19:16]

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

AR, bit [14]

Acquire/Release. When ISV is 1, the possible values of this bit are:

AR	Meaning
0b0	Instruction did not have acquire/release semantics.
0b1	Instruction did have acquire/release semantics.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [13:12]

Reserved, RES0.

AET, bits [11:10]
When FEAT_RAS is implemented:

Asynchronous Error Type. When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

AET	Meaning
0b00	Uncontainable (UC).
0b01	Unrecoverable state (UEU).
0b10	Restartable state (UEO).
0b11	Recoverable state (UER).

On a synchronous Data Abort, this field is RES0.

In the event of multiple errors taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

When FEAT_RAS is not implemented, or when DFSC is not 0b010001:

- Bit[11] is RES0.
- Bit[10] forms the FnV field.

Note

Armv8.2 requires the implementation of FEAT_RAS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	HDFAR is valid.
0b1	HDFAR is not valid, and holds an UNKNOWN value.

When FEAT_RAS is not implemented, this field is valid only if DFSC is 0b010000. It is RES0 for all other aborts.

When FEAT_RAS is implemented:

- **If DFSC is 0b010000, this field is valid.**
- **If DFSC is 0b010001, this bit forms part of the AET field, becoming AET[0].**
- **This field is RES0 for all other aborts.**

Note

Armv8.2 requires the implementation of FEAT_RAS.

The reset behavior of this field is:

- **On a Warm reset, this field resets to an architecturally UNKNOWN value.**

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. For a synchronous fault, identifies fault that comes from a cache maintenance or address translation instruction. For synchronous faults, the possible values of this bit are:

CM	Meaning
0b0	Fault not generated by a cache maintenance or address translation instruction.
0b1	Fault generated by a cache maintenance or address translation instruction.

For an asynchronous Data Abort exception, this bit is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

S1PTW	Meaning
0b0	Fault not on a stage 2 translation for a stage 1 translation table walk.
0b1	Fault on the stage 2 translation of an access for a stage 1 translation table walk.

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by a write instruction or a read instruction.

WnR	Meaning
0b0	Abort caused by a read instruction.
0b1	Abort caused by a write instruction.

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

On an asynchronous Data Abort:

- When FEAT_RAS is not implemented, this bit is UNKNOWN.
- When FEAT_RAS is implemented, this bit is RES0.

Note

Armv8.2 requires the implementation of FEAT_RAS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. Possible values of this field are:

DFSC	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010001	Asynchronous SError interrupt.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011001	Asynchronous SError interrupt, from a parity or ECC error on memory access.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Debug exception.	
0b110000	TLB conflict abort.	
0b110100	IMPLEMENTATION DEFINED fault (Lockdown).	
0b110101	IMPLEMENTATION DEFINED fault (Unsupported Exclusive access).	

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following describe cases where Data Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100100:

- 'Abort exceptions, when the value of HCR.TGE is 1'.
- 'Routing debug exceptions to EL2 using AArch32'.

The following describe cases that can cause a Data Abort exception that is taken to Hyp mode, and reported in the HSR with EC value of `0b100000` or `0b100100`:

- 'Hyp mode control of Non-secure access permissions'.
- 'Memory fault reporting in Hyp mode'.

Accessing HSR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T5 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T5 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HSR;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HSR;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0101	0b0010	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T5 == '1' then

HSTR, Hyp System Trap Register

The HSTR characteristics are:

Purpose

Controls trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to System registers in the coproc == `0b1111` encoding space:

- By the CRn value used to access the register using MCR or MRC instruction.
- By the CRm value used to access the register using MCRR or MRRC instruction.

Configuration

AArch32 System register HSTR bits [31:0] are architecturally mapped to AArch64 System register HSTR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HSTR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HSTR is a 32-bit register.

Bits [31:16, 14, 4]

Reserved, RES0.

T<n>, bit [n], for n = 15, 13 to 5, 3 to 0

The remaining fields control whether Non-secure EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == `0b1111` encoding space are trapped to Hyp mode:

T<n>	Meaning
`0b0`	This control has no effect on Non-secure EL0 or EL1 accesses to System registers.
`0b1`	Any Non-secure EL1 MCR or MRC access with coproc == `0b1111` and CRn == <n> is trapped to Hyp mode. A Non-secure EL0 MCR or MRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0. Any Non-secure EL1 MCRR or MRRC access with coproc == `0b1111` and CRm == <n> is trapped to Hyp mode. A Non-secure EL0 MCRR or MRRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0.

For example, when HSTR.T7 is 1, for instructions executed at Non-secure EL1:

- An MCR or MRC instruction with coproc set to `0b1111` and <CRn> set to c7 is trapped to Hyp mode.
- An MCRR or MRRC instruction with coproc set to `0b1111` and <CRm> set to c7 is trapped to Hyp mode.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Accessing HSTR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HSTR;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HSTR;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0001	0b0001	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HSTR = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HSTR = R[t];
```

HTCR, Hyp Translation Control Register

The HTCR characteristics are:

Purpose

The control register for stage 1 of the EL2 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configuration

AArch32 System register HTCR bits [31:0] are architecturally mapped to AArch64 System register TCR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HTCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22 21 20 19 18 17 16 15 14	13 12	11 10	9 8	7 6 5 4 3	2 1
RES1	IMPLEMENTATION DEFINED	RES0	HWU62	HWU61	HWU60	HWU59	HPD	RES1	RES0	SH0	ORGN0	IRGN0	RES0	T0S

Bit [31]

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [30]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU61, bit [27]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU59, bit [25]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1.

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HPD, bit [24]
When FEAT_AA32HPD is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the PL2 translation regime.

HPD	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

Bits [22:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using HTTBR.

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using HTTBR.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using HTTBR.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:3]

Reserved, RES0.

T0SZ, bits [2:0]

The size offset of the memory region addressed by HTTBR. The region size is $2^{(32\text{-}T0SZ)}$ bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HTCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

HTPIDR, Hyp Software Thread ID Register

The HTPIDR characteristics are:

Purpose

Provides a location where software running in Hyp mode can store thread identifying information that is not visible to Non-secure software executing at EL0 or EL1, for hypervisor management purposes.

The PE makes no use of this register.

Configuration

AArch32 System register HTPIDR bits [31:0] are architecturally mapped to AArch64 System register TPIDR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HTPIDR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Note

The PE never updates this register.

Attributes

HTPIDR is a 32-bit register.

Field descriptions

<table>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td colspan="32">Thread ID</td></tr>
</table>

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HTPIDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

HTRFCR, Hyp Trace Filter Control Register

The HTRFCR characteristics are:

Purpose

Provides EL2 controls for Trace.

Configuration

AArch32 System register HTRFCR bits [31:0] are architecturally mapped to AArch64 System register TRFCR_EL2[31:0].

This register is present only when AArch32 is supported and FEAT_TRF is implemented. Otherwise, direct accesses to HTRFCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from Monitor mode when SCR.NS == 1.

Attributes

HTRFCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																									TS		RES0	CX	RES0	E2TRE	E0HTRE

Bits [31:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

TS	Meaning
`0b00`	The timestamp is controlled by TRFCR.TS.
`0b01`	Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF.
`0b11`	Physical timestamp. The traced timestamp is the physical counter value.

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Bit [4]

Reserved, RES0.

CX, bit [3]

VMID Trace Enable.

CX	Meaning
`0b0`	VMID tracing is not allowed.
`0b1`	VMID tracing is allowed.

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Bit [2]

Reserved, RES0.

E2TRE, bit [1]

EL2 Trace Enable.

E2TRE	Meaning
`0b0`	Tracing is prohibited at EL2.
`0b1`	Tracing is allowed at EL2.

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

E0HTRE, bit [0]

EL0 Trace Enable.

E0HTRE	Meaning
`0b0`	Tracing is prohibited at EL0 when HCR.TGE == 1.
`0b1`	Tracing is allowed at EL0 when HCR.TGE == 1.

This field is ignored if any of the following are true:

- The PE is in Secure state.
- SelfHostedTraceEnabled() == FALSE.
- HCR.TGE == 0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

Accessing HTRFCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

HTTBR, Hyp Translation Table Base Register

The HTTBR characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

Configuration

AArch32 System register HTTBR bits [47:1] are architecturally mapped to AArch64 System register TTBR0_EL2[47:1].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HTTBR is a 64-bit register.

Field descriptions

63–48	47–32
RES0	BADDR

31–1	0
BADDR	CnP

Bits [63:48]

Reserved, RES0.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of HTCR.T0SZ as follows:

- If HTCR.T0SZ is 0 or 1, x = 5 - HTCR.T0SZ.
- If HTCR.T0SZ is greater than 1, x = 14 - HTCR.T0SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by HTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by HTTBR are permitted to differ from corresponding entries for HTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of HTTBR.CnP on those other PEs.
0b1	The translation table entries pointed to by HTTBR are the same as the translation table entries pointed to by HTTBR on every other PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.

Note

If the value of the HTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those HTTBRs do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HVBAR, Hyp Vector Base Address Register

The HVBAR characteristics are:

Purpose

Holds the vector base address for any exception that is taken to Hyp mode.

Configuration

AArch32 System register HVBAR bits [31:0] are architecturally mapped to AArch64 System register VBAR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to HVBAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HVBAR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5	4 3 2 1 0
Vector Base Address	RES0

Bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:0]

Reserved, RES0.

Accessing HVBAR

ICC_AP0R<n>, Interrupt Controller Active Priorities Group 0 Registers, n = 0 - 3

The ICC_AP0R<n> characteristics are:

Purpose

Provides information about Group 0 active priorities.

Configuration

AArch32 System register ICC_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register ICC_AP0R<n>_EL1[31:0].

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_AP0R<n> are UNDEFINED.

Attributes

ICC_AP0R<n> is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value `0x00000000` is consistent with no interrupts being active.

Accessing ICC_AP0R<n>

Writing to these registers with any value other than the last read value of the register (or `0x00000000` when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP0R1 is only implemented in implementations that support 6 or more bits of preemption. ICC_AP0R2 and ICC_AP0R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR.PREbits.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICC_AP0R<n>.

- Secure ICC_AP1R<n>.
- Non-secure ICC_AP1R<n>.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICC_ASGI1R, Interrupt Controller Alias Software Generated Interrupt Group 1 Register

The ICC_ASGI1R characteristics are:

Purpose

Generates Group 1 SGIs for the Security state that is not the current Security state.

Configuration

AArch32 System register ICC_ASGI1R performs the same function as AArch64 System register ICC_ASGI1R_EL1.

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_ASGI1R are UNDEFINED.

Under certain conditions a write to ICC_ASGI1R can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_ASGI1R is a 64-bit register.

Field descriptions

63–56	55–48	47–44	43–41	40	39–32
RES0	Aff3	RS	RES0	IRM	Aff2

31–28	27–24	23–16	15–0
RES0	INTID	Aff1	TargetList

Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing ICC_ASGI1R

This register allows software executing in a Secure state to generate Non-secure Group 1 SGIs. It will also allow software executing in a Non-secure state to generate Secure Group 1 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.

Accesses to this register use the following encodings in the System register encoding space:

```
MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1

ICC_BPR0, Interrupt Controller Binary Point Register 0

The ICC_BPR0 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

Configuration

AArch32 System register ICC_BPR0 bits [31:0] are architecturally mapped to AArch64 System register ICC_BPR0_EL1[31:0].

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_BPR0 are UNDEFINED.

Attributes

ICC_BPR0 is a 32-bit register.

Field descriptions

31–3	2–0
RES0	BinaryPoint

Bits [31:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	gggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.ssssssss

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_BPR0

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by ICC_CTLR.PRIbits and ICC_MCTLR.PRIbits.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1000	0b011

```

ICC_BPR1, Interrupt Controller Binary Point Register 1

The ICC_BPR1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

Configuration

AArch32 System register ICC_BPR1 bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_BPR1_EL1[31:0] (S).

AArch32 System register ICC_BPR1 bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_BPR1_EL1[31:0] (NS).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_BPR1 are UNDEFINED.

In GIC implementations supporting two Security states, this register is Banked.

Attributes

ICC_BPR1 is a 32-bit register.

Field descriptions

31–3	2–0
RES0	BinaryPoint

Bits [31:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Writing 0 to this field will set this field to its reset value.

If EL3 is implemented and ICC_MCTLR.CBPR_EL1S is 1:

- Accesses to this register at EL3 not in Monitor mode access the state of ICC_BPR0.
- When SCR_EL3.EEL2 is 1 and HCR_EL2.IMO is 1, Secure accesses to this register at EL1 access the state of ICV_BPR1.
- Otherwise, Secure accesses to this register at EL1 access the state of ICC_BPR0.

If EL3 is implemented and ICC_MCTLR.CBPR_EL1NS is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR.IMO and SCR.IRQ:

HCR.IMO	SCR_IRQ	Behavior
0b0	0b0	Non-secure EL1 and EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b0	0b1	Non-secure EL1 and EL2 accesses trap to EL3.
0b1	0b0	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL2 writes ignored.
0b1	0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 accesses trap to EL3.

If EL3 is not implemented and ICC_CTLR.CBPR is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR.IMO:

HCR.IMO	Behavior
0b0	Non-secure EL1 and EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.

This field resets to an IMPLEMENTATION DEFINED non-zero value.

Accessing ICC_BPR1

When the PE resets into an Exception level that is using AArch32, the reset value is equal to:

- For the Secure copy of the register, the minimum value of ICC_BPR0 plus one.
- For the Non-secure copy of the register, the minimum value of ICC_BPR0.

Where the minimum value of ICC_BPR0 is IMPLEMENTATION DEFINED.

If EL3 is not implemented:

- If the PE is Secure this reset value is (minimum value of ICC_BPR0 plus one).
- If the PE is Non-secure this reset value is (minimum value of ICC_BPR0).

An attempt to program the binary point field to a value less than the reset value sets the field to the reset value.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b011

```

ICC_CTLR, Interrupt Controller Control Register

The ICC_CTLR characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Configuration

AArch32 System register ICC_CTLR bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_CTLR_EL1[31:0] (S).

AArch32 System register ICC_CTLR bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_CTLR_EL1[31:0] (NS).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_CTLR are UNDEFINED.

Attributes

ICC_CTLR is a 32-bit register.

Field descriptions

31:20	19	18	17:16	15	14	13:11	10:8	7	6	5:2	1	0
RES0	ExtRange	RSS	RES0	A3V	SEIS	IDbits	PRIbits	RES0	PMHE	RES0	EOImode	CBPR

Bits [31:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. **Note** Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.

If EL3 is implemented, ICC_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL3.ExtRange.

RSS, bit [18]

Range Selector Support. Possible values are:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

A3V	Meaning
0b0	The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

If EL3 is implemented and using AArch32, this bit is an alias of ICC_MCTLR.A3V.

If EL3 is implemented and using AArch64, this bit is an alias of ICC_CTLR_EL3.A3V.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

SEIS	Meaning
0b0	The CPU interface logic does not support local generation of SEIs.
0b1	The CPU interface logic supports local generation of SEIs.

If EL3 is implemented and using AArch32, this bit is an alias of ICC_MCTLR.SEIS.

If EL3 is implemented and using AArch64, this bit is an alias of ICC_CTLR_EL3.SEIS.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is implemented and using AArch32, this field is an alias of ICC_MCTLR.IDbits.

If EL3 is implemented and using AArch64, this field is an alias of ICC_CTLR_EL3.IDbits.

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

> This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of GICD_CTLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0 and ICC_BPR1.

If EL3 is implemented and using AArch32, physical accesses return the value from ICC_MCTLR.PRIbits.

If EL3 is implemented and using AArch64, physical accesses return the value from ICC_CTLR_EL3.PRIbits.

If EL3 is not implemented, physical accesses return the value from this field.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

PMHE	Meaning
`0b0`	Disables use of ICC_PMR as a hint for interrupt distribution.
`0b1`	Enables use of ICC_PMR as a hint for interrupt distribution.

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.PMHE.
- If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.PMHE.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

Bits [5:2]

Reserved, RES0.

EOImode, bit [1]

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

EOImode	Meaning
`0b0`	ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
`0b1`	ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.EOImode_EL1{S, NS} where S or NS corresponds to the current Security state.
- If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.EOImode_EL1{S, NS} where S or NS corresponds to the current Security state.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Group 1 interrupts.
0b1	ICC_BPR0 determines the preemption group for both Group 0 and Group 1 interrupts.

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of ICC_MCTLR.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If EL3 is using AArch64, this bit is an alias of ICC_CTLR_EL3.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

Accessing ICC_CTLR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

ICC_DIR, Interrupt Controller Deactivate Interrupt Register

The ICC_DIR characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

Configuration

AArch32 System register ICC_DIR performs the same function as AArch64 System register ICC_DIR_EL1.

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_DIR are UNDEFINED.

Attributes

ICC_DIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								INTID																							

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_DIR

There are two cases when writing to ICC_DIR_EL1 that were UNPREDICTABLE for a corresponding GICv2 write to GICC_DIR:

- When EOImode == 0. GICv3 implementations must ignore such writes. In systems supporting system error generation, an implementation might generate an SEI.
- When EOImode == 1 but no EOI has been issued. The interrupt will be de-activated by the Distributor, however the active priority in the CPU interface for the interrupt will remain set (because no EOI was issued).

Accesses to this register use the following encodings in the System register encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1011	0b001

ICC_EOIR0, Interrupt Controller End Of Interrupt Register 0

The ICC_EOIR0 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

Configuration

AArch32 System register ICC_EOIR0 performs the same function as AArch64 System register ICC_EOIR0_EL1.

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_EOIR0 are UNDEFINED.

Attributes

ICC_EOIR0 is a 32-bit register.

Field descriptions

31–24	23–0
RES0	INTID

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICC_IAR0 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR to deactivate the interrupt.

The appropriate EOImode bit varies as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR.EOImode.
- If EL3 is implemented and the software is executing in Monitor mode, the appropriate bit is ICC_MCTLR.EOImode_EL3.
- If EL3 is implemented and the software is not executing in Monitor mode, the bit depends on the current Security state:
    - If the software is executing in Secure state, the bit is ICC_CTLR.EOImode in the Secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1S.
    - If the software is executing in Non-secure state, the bit is ICC_CTLR.EOImode in the Non-secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1NS.

Accessing ICC_EOIR0

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR0, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings in the System register encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

ICC_EOIR1, Interrupt Controller End Of Interrupt Register 1

The ICC_EOIR1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 1 interrupt.

Configuration

AArch32 System register ICC_EOIR1 performs the same function as AArch64 System register ICC_EOIR1_EL1.

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_EOIR1 are UNDEFINED.

Attributes

ICC_EOIR1 is a 32-bit register.

Field descriptions

31 … 24	23 … 0
RES0	INTID

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICC_IAR1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR to deactivate the interrupt.

The appropriate EOImode bit varies as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR.EOImode.
- If EL3 is implemented and the software is executing in Monitor mode, the appropriate bit is ICC_MCTLR.EOImode_EL3.
- If EL3 is implemented and the software is not executing in Monitor mode, the bit depends on the current Security state:
    - If the software is executing in Secure state, the bit is ICC_CTLR.EOImode in the Secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1S.
    - If the software is executing in Non-secure state, the bit is ICC_CTLR.EOImode in the Non-secure instance of ICC_CTLR. This is an alias of ICC_MCTLR.EOImode_EL1NS.

Accessing ICC_EOIR1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings in the System register encoding space:

ICC_HSRE, Interrupt Controller Hyp System Register Enable register

The ICC_HSRE characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL2.

Configuration

AArch32 System register ICC_HSRE bits [31:0] are architecturally mapped to AArch64 System register ICC_SRE_EL2[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICC_HSRE are UNDEFINED.

Attributes

ICC_HSRE is a 32-bit register.

Field descriptions

31 ... 4	3	2	1	0
RES0	Enable	DIB	DFB	SRE

Bits [31:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to ICC_SRE.

Enable	Meaning
`0b0`	Non-secure EL1 accesses to ICC_SRE trap to EL2.
`0b1`	Non-secure EL1 accesses to ICC_SRE do not trap to EL2.

If ICC_HSRE.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_HSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
`0b0`	IRQ bypass enabled.
`0b1`	IRQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_MSRE.DIB.

If EL3 is implemented and GICD_CTLR.DS is 1, this field is a read-write alias of ICC_MSRE.DIB.

In systems that do not support IRQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
`0b0`	FIQ bypass enabled.
`0b1`	FIQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_MSRE.DFB.

If EL3 is implemented and GICD_CTLR.DS is 1, this field is a read-write alias of ICC_MSRE.DFB.

In systems that do not support FIQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

SRE, bit [0]

System Register Enable.

SRE	Meaning
`0b0`	The memory-mapped interface must be used. Accesses at EL2 or below to any ICH_* System register, or any EL1 or EL2 ICC_* register other than ICC_SRE or ICC_HSRE, are UNDEFINED.
`0b1`	The System register interface to the ICH_* registers and the EL1 and EL2 ICC_* registers is enabled for EL2.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and using AArch64:

- When ICC_SRE_EL3.SRE==0 this bit is RAZ/WI.

If EL3 is implemented using AArch32:

- When ICC_MSRE.SRE==0 this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICC_HSRE

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_HSRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1001	0b101

ICC_IAR0, Interrupt Controller Interrupt Acknowledge Register 0

The ICC_IAR0 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 0 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch32 System register ICC_IAR0 performs the same function as AArch64 System register ICC_IAR0_EL1.

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_IAR0 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_IAR0 is a 32-bit register.

Field descriptions

31:24	23:0
RES0	INTID

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. These special INTIDs can be one of: 1020, 1021, or 1023. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_IAR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICC_IAR1, Interrupt Controller Interrupt Acknowledge Register 1

The ICC_IAR1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 1 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch32 System register ICC_IAR1 performs the same function as AArch64 System register ICC_IAR1_EL1.

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_IAR1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_IAR1 is a 32-bit register.

Field descriptions

31–24	23–0
RES0	INTID

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR.IDbits and ICC_MCTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_IAR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b000

ICC_IGRPEN0, Interrupt Controller Interrupt Group 0 Enable register

The ICC_IGRPEN0 characteristics are:

Purpose

Controls whether Group 0 interrupts are enabled or not.

Configuration

AArch32 System register ICC_IGRPEN0 bits [31:0] are architecturally mapped to AArch64 System register ICC_IGRPEN0_EL1[31:0].

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_IGRPEN0 are UNDEFINED.

Attributes

ICC_IGRPEN0 is a 32-bit register.

Field descriptions

31–1	0
RES0	Enable

Bits [31:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 0 interrupts.

Enable	Meaning
`0b0`	Group 0 interrupts are disabled.
`0b1`	Group 0 interrupts are enabled.

Virtual accesses to this register update ICH_VMCR.VENG0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICC_IGRPEN0

The lowest Exception level at which this register can be accessed is governed by the Exception level to which FIQ is routed. This routing depends on SCR.FIQ, SCR.NS and HCR.FMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICC_IGRPEN1, Interrupt Controller Interrupt Group 1 Enable register

The ICC_IGRPEN1 characteristics are:

Purpose

Controls whether Group 1 interrupts are enabled for the current Security state.

Configuration

AArch32 System register ICC_IGRPEN1 bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_IGRPEN1_EL1[31:0] (S).

AArch32 System register ICC_IGRPEN1 bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_IGRPEN1_EL1[31:0] (NS).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_IGRPEN1 are UNDEFINED.

Attributes

ICC_IGRPEN1 is a 32-bit register.

Field descriptions

31–1	0
RES0	Enable

Bits [31:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 1 interrupts for the current Security state.

Enable	Meaning
0b0	Group 1 interrupts are disabled for the current Security state.
0b1	Group 1 interrupts are enabled for the current Security state.

Virtual accesses to this register update ICH_VMCR.VENG1.

If EL3 is present:

- This bit is a read/write alias of ICC_MGRPEN1.EnableGrp1{S, NS} as appropriate if EL3 is using AArch32, or ICC_IGRPEN1_EL3.EnableGrp1{S, NS} as appropriate if EL3 is using AArch64.
- When this register is accessed at EL3, the copy of this register appropriate to the current setting of SCR.NS is accessed.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICC_IGRPEN1

The lowest Exception level at which this register can be accessed is governed by the Exception level to which IRQ is routed. This routing depends on SCR.IRQ, SCR.NS and HCR.IMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b111

ICC_MCTLR, Interrupt Controller Monitor Control Register

The ICC_MCTLR characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Configuration

AArch32 System register ICC_MCTLR bits [31:0] can be mapped to AArch64 System register ICC_CTLR_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL3 is implemented. Otherwise, direct accesses to ICC_MCTLR are UNDEFINED.

Attributes

ICC_MCTLR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20	19	18	17	16	15	14	13 12 11	10 9 8	7	6	5	4	3
RES0	ExtRange	RSS	nDS	RES0	A3V	SEIS	IDbits	PRIbits	RES0	PMHE	RM	EOImode_EL1NS	EOImode_EL1

Bits [31:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. **Note** Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191 All INTIDs in the range 1024..8191 are treated as requiring deactivation.

RSS, bit [18]

Range Selector Support. Possible values are:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

nDS, bit [17]

Disable Security not supported. Read-only and writes are ignored.

nDS	Meaning
0b0	The CPU interface logic supports disabling of security.
0b1	The CPU interface logic does not support disabling of security, and requires that security is not disabled.

Bit [16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored.

A3V	Meaning
0b0	The CPU interface logic does not support non-zero values of the Aff3 field in SGI generation System registers.
0b1	The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers.

If EL3 is present, ICC_CTLR.A3V is an alias of ICC_MCTLR.A3V

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs.

SEIS	Meaning
0b0	The CPU interface logic does not support generation of SEIs.
0b1	The CPU interface logic supports generation of SEIs.

If EL3 is present, ICC_CTLR.SEIS is an alias of ICC_MCTLR.SEIS

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. Indicates the number of physical interrupt identifier bits supported.

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is present, ICC_CTLR.IDbits is an alias of ICC_MCTLR.IDbits

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the value of SCR.NS or the value of GICD_CTLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0 and ICC_BPR1.

This field determines the minimum value of ICC_BPR0.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable.

PMHE	Meaning
`0b0`	Disables use of the priority mask register as a hint for interrupt distribution.
`0b1`	Enables use of the priority mask register as a hint for interrupt distribution.

Software must write ICC_PMR to `0xFF` before clearing this field to 0.

An implementation might choose to make this field RAO/WI.

If EL3 is present, ICC_CTLR.PMHE is an alias of ICC_MCTLR.PMHE.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

RM, bit [5]

SBZ.

The equivalent bit in AArch64 is the Routing Modifier bit. This feature is not supported when EL3 is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1NS, bit [4]

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1NS	Meaning
`0b0`	ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
`0b1`	ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

If EL3 is present, ICC_CTLR(NS).EOImode is an alias of ICC_MCTLR.EOImode_EL1NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1S, bit [3]

EOI mode for interrupts handled at Secure EL1. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1S	Meaning
0b0	ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
0b1	ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

If EL3 is present, ICC_CTLR(S).EOImode is an alias of ICC_MCTLR.EOImode_EL1S.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL3, bit [2]

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL3	Meaning
0b0	ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE.
0b1	ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1NS, bit [1]

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.

CBPR_EL1NS	Meaning
0b0	ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Non-secure Group 1 interrupts.
0b1	ICC_BPR0 determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1 access the state of ICC_BPR0.

If EL3 is present, ICC_CTLR(NS).CBPR is an alias of ICC_MCTLR.CBPR_EL1NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts in Secure non-Monitor modes.

CBPR_EL1S	Meaning
0b0	ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Secure Group 1 interrupts.
0b1	ICC_BPR0 determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 accesses, or EL3 accesses when not in Monitor mode, to ICC_BPR1 access the state of ICC_BPR0.

If EL3 is present, ICC_CTLR(S).CBPR is an alias of ICC_MCTLR.CBPR_EL1S.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_MCTLR

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b110	0b1100	0b1100	0b100

```
if PSTATE.EL == EL0 then

ICC_MGRPEN1, Interrupt Controller Monitor Interrupt Group 1 Enable register

The ICC_MGRPEN1 characteristics are:

Purpose

Controls whether Group 1 interrupts are enabled or not.

Configuration

AArch32 System register ICC_MGRPEN1 bits [31:0] can be mapped to AArch64 System register ICC_IGRPEN1_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL3 is implemented. Otherwise, direct accesses to ICC_MGRPEN1 are UNDEFINED.

Attributes

ICC_MGRPEN1 is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2	1	0
RES0	EnableGrp1S	EnableGrp1NS

Bits [31:2]

Reserved, RES0.

EnableGrp1S, bit [1]

Enables Group 1 interrupts for the Secure state.

EnableGrp1S	Meaning
0b0	Secure Group 1 interrupts are disabled.
0b1	Secure Group 1 interrupts are enabled.

The Secure ICC_IGRPEN1.Enable bit is a read/write alias of the ICC_MGRPEN1.EnableGrp1S bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EnableGrp1NS, bit [0]

Enables Group 1 interrupts for the Non-secure state.

EnableGrp1NS	Meaning
0b0	Non-secure Group 1 interrupts are disabled.
0b1	Non-secure Group 1 interrupts are enabled.

The Non-secure ICC_IGRPEN1.Enable bit is a read/write alias of the ICC_MGRPEN1.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICC_MGRPEN1

If an interrupt is pending within the CPU interface when an Enable bit becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICC_MSRE, Interrupt Controller Monitor System Register Enable register

The ICC_MSRE characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

Configuration

AArch32 System register ICC_MSRE bits [31:0] can be mapped to AArch64 System register ICC_SRE_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL3 is implemented. Otherwise, direct accesses to ICC_MSRE are UNDEFINED.

Attributes

ICC_MSRE is a 32-bit register.

Field descriptions

31–4	3	2	1	0
RES0	Enable	DIB	DFB	SRE

Bits [31:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to ICC_SRE and ICC_HSRE.

Enable	Meaning
0b0	Secure EL1 accesses to Secure ICC_SRE trap to EL3. EL2 accesses to Non-secure ICC_SRE and ICC_HSRE trap to EL3. Non-secure EL1 accesses to ICC_SRE trap to EL3, unless these accesses are trapped to EL2 as a result of ICC_HSRE.Enable == 0.
0b1	Secure EL1 accesses to Secure ICC_SRE do not trap to EL3. EL2 accesses to Non-secure ICC_SRE and ICC_HSRE do not trap to EL3. Non-secure EL1 accesses to ICC_SRE do not trap to EL3.

If ICC_MSRE.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_MSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

In systems that do not support IRQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

In systems that do not support FIQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Accesses at EL3 or below to any ICH_* System register, or any EL1, EL2, or EL3 ICC_* register other than ICC_SRE, ICC_HSRE, or ICC_MSRE, are UNDEFINED.
0b1	The System register interface to the ICH_* registers and the EL1, EL2, and EL3 ICC_* registers is enabled for EL3.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICC_MSRE

This register is always System register accessible.

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_MSRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

0b1111	0b110	0b1100	0b1100	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return ICC_MSRE;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b110	0b1100	0b1100	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    if CP15SDISABLE2 == HIGH then
        UNDEFINED;
    else
        ICC_MSRE = R[t];
```

ICC_PMR, Interrupt Controller Interrupt Priority Mask Register

The ICC_PMR characteristics are:

Purpose

Provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Configuration

AArch32 System register ICC_PMR bits [31:0] are architecturally mapped to AArch64 System register ICC_PMR_EL1[31:0].

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_PMR are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_PMR is a 32-bit register.

Field descriptions

31–8	7–0
RES0	Priority

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	`0x00`-`0xFF` (0-255), all values	256
[7:1]	`0x00`-`0xFE` (0-254), even values only	128
[7:2]	`0x00`-`0xFC` (0-252), in steps of 4	64
[7:3]	`0x00`-`0xF8` (0-248), in steps of 8	32
[7:4]	`0x00`-`0xF0` (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICC_PMR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICC_RPR, Interrupt Controller Running Priority Register

The ICC_RPR characteristics are:

Purpose

Indicates the Running priority of the CPU interface.

Configuration

AArch32 System register ICC_RPR performs the same function as AArch64 System register ICC_RPR_EL1.

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_RPR are UNDEFINED.

Attributes

ICC_RPR is a 32-bit register.

Field descriptions

31–8	7–0
RES0	Priority

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

Note

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

Accessing ICC_RPR

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICC_SGI0R, Interrupt Controller Software Generated Interrupt Group 0 Register

The ICC_SGI0R characteristics are:

Purpose

Generates Secure Group 0 SGIs.

Configuration

AArch32 System register ICC_SGI0R performs the same function as AArch64 System register ICC_SGI0R_EL1.

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_SGI0R are UNDEFINED.

Attributes

ICC_SGI0R is a 64-bit register.

Field descriptions

63:56	55:48	47:44	43:41	40	39:32
RES0	Aff3	RS	RES0	IRM	Aff2

31:28	27:24	23:16	15:0
RES0	INTID	Aff1	TargetList

Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing ICC_SGI0R

This register allows software executing in a Secure state to generate Group 0 SGIs. It will also allow software executing in a Non-secure state to generate Group 0 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.

Accesses to this register use the following encodings in the System register encoding space:

```
MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1
0b1111	0b1100	0b0010

ICC_SGI1R, Interrupt Controller Software Generated Interrupt Group 1 Register

The ICC_SGI1R characteristics are:

Purpose

Generates Group 1 SGIs for the current Security state.

Configuration

AArch32 System register ICC_SGI1R performs the same function as AArch64 System register ICC_SGI1R_EL1.

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_SGI1R are UNDEFINED.

Under certain conditions a write to ICC_SGI1R can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_SGI1R is a 64-bit register.

Field descriptions

63–56	55–48	47–44	43–41	40	39–32
RES0	Aff3	RS	RES0	IRM	Aff2

31–28	27–24	23–16	15–0
RES0	INTID	Aff1	TargetList

Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
`0b0`	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
`0b1`	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing ICC_SGI1R

Note

Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.

Accesses to this register use the following encodings in the System register encoding space:

```
MCRR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1
0b1111	0b1100	0b0000

ICC_SRE, Interrupt Controller System Register Enable register

The ICC_SRE characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL0 and EL1.

Configuration

AArch32 System register ICC_SRE bits [31:0] (S) are architecturally mapped to AArch64 System register ICC_SRE_EL1[31:0] (S).

AArch32 System register ICC_SRE bits [31:0] (NS) are architecturally mapped to AArch64 System register ICC_SRE_EL1[31:0] (NS).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_SRE are UNDEFINED.

Attributes

ICC_SRE is a 32-bit register.

Field descriptions

31–3	2	1	0
RES0	DIB	DFB	SRE

Bits [31:3]

Reserved, RES0.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
`0b0`	IRQ bypass enabled.
`0b1`	IRQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS == 0, this field is a read-only alias of ICC_MSRE.DIB.

If EL3 is implemented and GICD_CTLR.DS == 1, and EL2 is not implemented, this field is a read-write alias of ICC_MSRE.DIB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of ICC_HSRE.DIB.

If GICD_CTLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_HSRE.DIB.

In systems that do not support IRQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS == 0, this field is a read-only alias of ICC_MSRE.DFB.

If EL3 is implemented and GICD_CTLR.DS == 1, and EL2 is not implemented, this field is a read-write alias of ICC_MSRE.DFB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of ICC_HSRE.DFB.

If GICD_CTLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_HSRE.DFB.

In systems that do not support FIQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Accesses at EL1 to any ICC_* System register other than ICC_SRE are UNDEFINED.
0b1	The System register interface for the current Security state is enabled.

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and using AArch64:

- When ICC_SRE_EL3.SRE==0 the Secure copy of this bit is RAZ/WI.
- When ICC_SRE_EL3.SRE==0 the Non-secure copy of this bit is RAZ/WI.

If EL3 is implemented and using AArch32:

- When ICC_MSRE.SRE==0 the Secure copy of this bit is RAZ/WI.
- When ICC_MSRE.SRE==0 the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch64:

- When ICC_SRE_EL2.SRE==0 the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch32:

- When ICC_HSRE.SRE==0 the Non-secure copy of this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICC_SRE

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_SRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b101

```

ICH_AP0R<n>, Interrupt Controller Hyp Active Priorities Group 0 Registers, n = 0 - 3

The ICH_AP0R<n> characteristics are:

Purpose

Provides information about Group 0 active priorities for EL2.

Configuration

AArch32 System register ICH_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_AP0R<n>_EL2[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_AP0R<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_AP0R<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

P<x>, bit [x], for x = 31 to 0

Provides the access to the virtual active priorities for Group 0 interrupts. Possible values of each bit are:

P<x>	Meaning
`0b0`	There is no Group 0 interrupt active at the priority corresponding to that bit.
`0b1`	There is a Group 0 interrupt active at the priority corresponding to that bit.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP0R0 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP0R0 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP0R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP0R0 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP0R1 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP0R2 in the bits corresponding to 10:Priority[5:1].

- The active state of preemption levels 192 - 254 are held in ICH_AP0R3 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n> and ICH_AP1R<n> might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICH_AP0R<n>

ICH_AP0R1 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP0R2 and ICH_AP0R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR.PREbits

ICH_EISR, Interrupt Controller End of Interrupt Status Register

The ICH_EISR characteristics are:

Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

Configuration

AArch32 System register ICH_EISR bits [31:0] are architecturally mapped to AArch64 System register ICH_EISR_EL2[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_EISR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_EISR is a 32-bit register.

Field descriptions

31302928272625242322212019181716	15	14	13	12	11	10	9	8	7	
RES0	Status15	Status14	Status13	Status12	Status11	Status10	Status9	Status8	Status7	Sta

Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

EOI maintenance interrupt status bit for List register <n>:

Status<n>	Meaning
`0b0`	List register <n>, ICH_LR<n>, does not have an EOI maintenance interrupt.
`0b1`	List register <n>, ICH_LR<n>, has an EOI maintenance interrupt that has not been handled.

For any ICH_LR<n>, the corresponding status bit is set to 1 if all of the following are true:

- ICH_LRC<n>.State is `0b00`.
- ICH_LRC<n>.HW is 0.
- ICH_LRC<n>.EOI (bit [9]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICH_EISR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICH_ELRSR, Interrupt Controller Empty List Register Status Register

The ICH_ELRSR characteristics are:

Purpose

Indicates which List registers contain valid interrupts.

Configuration

AArch32 System register ICH_ELRSR bits [31:0] are architecturally mapped to AArch64 System register ICH_ELRSR_EL2[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_ELRSR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_ELRSR is a 32-bit register.

Field descriptions

31302928272625242322212019181716	15	14	13	12	11	10	9	8	7	
RES0	Status15	Status14	Status13	Status12	Status11	Status10	Status9	Status8	Status7	Sta

Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>, ICH_LR<n>:

Status<n>	Meaning
`0b0`	List register ICH_LR<n>, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.
`0b1`	List register ICH_LR<n> does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.

For any List register <n>, the corresponding status bit is set to 1 if ICH_LRC<n>.State is `0b00` and either ICH_LRC<n>.HW is 1 or ICH_LRC<n>.EOI (bit [9]) is 0.

Accessing ICH_ELRSR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICH_HCR, Interrupt Controller Hyp Control Register

The ICH_HCR characteristics are:

Purpose

Controls the environment for VMs.

Configuration

AArch32 System register ICH_HCR bits [31:0] are architecturally mapped to AArch64 System register ICH_HCR_EL2[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_HCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_HCR is a 32-bit register.

Field descriptions

31 30 29 28 27	26 25 24 23 22 21 20 19 18 17 16 15	14	13	12	11	10	9	8	7	6	5	4
EOIcount	RES0	TDIR	TSEI	TALL1	TALL0	TC	RES0	vSGIEOICount	VGrp1DIE	VGrp1EIE	VGrp0DIE	VGrp0

EOIcount, bits [31:27]

This field is incremented whenever a successful write to a virtual EOIR or DIR register would have resulted in a virtual interrupt deactivation. That is either:

- A virtual write to EOIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is zero and no List Register was found.
- A virtual write to DIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is one and no List Register was found.

This allows software to manage more active interrupts than there are implemented List Registers.

It is CONSTRAINED UNPREDICTABLE whether a virtual write to EOIR that does not clear a bit in the Active Priorities registers (ICH_AP0R<n>/ICH_AP1R<n>) increments EOIcount. Permitted behaviors are:

- Increment EOIcount.
- Leave EOIcount unchanged.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Bits [26:15]

Reserved, RES0.

TDIR, bit [14]
When FEAT_GICv3_TDIR is implemented:

Trap Non-secure EL1 writes to ICC_DIR and ICV_DIR.

TDIR	Meaning
0b0	Non-secure EL1 writes of ICC_DIR and ICV_DIR are not trapped to EL2, unless trapped by other mechanisms.
0b1	Non-secure EL1 writes of ICV_DIR are trapped to EL2. It is IMPLEMENTATION DEFINED whether Non-secure writes of ICC_DIR are trapped. Not trapping ICC_DIR writes is DEPRECATED.

Arm deprecates not including this trap bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

TSEI, bit [13]

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at Non-secure EL1.

TSEI	Meaning
0b0	Locally generated SEIs do not cause a trap to EL2.
0b1	Locally generated SEIs trap to EL2.

If ICH_VTR.SEIS is 0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TALL1, bit [12]

Trap all Non-secure EL1 accesses to ICC_* and ICV_* System registers for Group 1 interrupts to EL2.

TALL1	Meaning
0b0	Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal.
0b1	Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TALL0, bit [11]

Trap all Non-secure EL1 accesses to ICC_* and ICV_* System registers for Group 0 interrupts to EL2.

TALL0	Meaning
0b0	Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal.
0b1	Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TC, bit [10]

Trap all Non-secure EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.

TC	Meaning
0b0	Non-secure EL1 accesses to common registers proceed as normal.
0b1	Non-secure EL1 accesses to common registers trap to EL2.

This affects accesses to ICC_SGI0R, ICC_SGI1R, ICC_ASGI1R, ICC_CTLR, ICC_DIR, ICC_PMR, ICC_RPR, ICV_CTLR, ICV_DIR, ICV_PMR, and ICV_RPR.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bit [9]

Reserved, RES0.

vSGIEOICount, bit [8]

When FEAT_GICv4p1 is implemented:

Controls whether deactivation of virtual SGIs can increment ICH_HCR_EL2.EOIcount

vSGIEOICount	Meaning
0b0	Deactivation of virtual SGIs can increment ICH_HCR.EOIcount.
0b1	Deactivation of virtual SGIs does not increment ICH_HCR.EOIcount.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp1DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR.VENG1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp1EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR.VENG1 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp0DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR.VENG0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp0EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR.VENG0 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

NPIE, bit [3]

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to 0b01 (pending):

NPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

LRENPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted while the EOIcount field is not 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

UIE, bit [1]

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

UIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

En, bit [0]

Enable. Global enable bit for the virtual CPU interface:

En	Meaning
`0b0`	Virtual CPU interface operation disabled.
`0b1`	Virtual CPU interface operation enabled.

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of ICV_IAR0, ICV_IAR1, GICV_IAR or GICV_AIAR returns a spurious interrupt ID.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICH_HCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1011	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

ICH_LRC<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH_LRC<n> characteristics are:

Purpose

Provides interrupt context information for the virtual CPU interface.

Configuration

AArch32 System register ICH_LRC<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_LR<n>_EL2[63:32].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_LRC<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

Attributes

ICH_LRC<n> is a 32-bit register.

Field descriptions

31 30	29	28	27 26 25 24	23 22 21 20 19 18 17 16	15 14 13	12 11 10 9 8 7 6 5 4 3 2 1 0
State	HW	Group	RES0	Priority	RES0	pINTID

State, bits [31:30]

The state of the interrupt:

State	Meaning
`0b00`	Invalid (Inactive).
`0b01`	Pending.
`0b10`	Active.
`0b11`	Pending and active.

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the invalid state are ignored, except for the purpose of generating virtual maintenance interrupts.

For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

HW, bit [29]

Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the INTID that the pINTID field indicates.

HW	Meaning
`0b0`	The interrupt is triggered entirely by software. No notification is sent to the Distributor when the virtual interrupt is deactivated.
`0b1`	The interrupt maps directly to a hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using the pINTID field from this register to indicate the physical INTID. If ICH_VMCR.VEOIM is 0, this request corresponds to a write to ICC_EOIR0 or ICC_EOIR1. Otherwise, it corresponds to a write to ICC_DIR.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Group, bit [28]

Indicates the group for this virtual interrupt.

Group	Meaning
`0b0`	This is a Group 0 virtual interrupt. ICH_VMCR.VFIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and ICH_VMCR.VENG0 enables signaling of this interrupt to the virtual machine.
`0b1`	This is a Group 1 virtual interrupt, signaled as a virtual IRQ. ICH_VMCR.VENG1 enables the signaling of this interrupt to the virtual machine. If ICH_VMCR.VCBPR is 0, then ICC_BPR1 determines if a pending Group 1 interrupt has sufficient priority to preempt current execution. Otherwise, ICH_LR<n> determines preemption.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Bits [27:24]

Reserved, RES0.

Priority, bits [23:16]

The priority of this interrupt.

It is IMPLEMENTATION DEFINED how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit[16] up to bit[18]. The number of implemented bits can be discovered from ICH_VTR.PRIbits.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Bits [15:13]

Reserved, RES0.

pINTID, bits [12:0]

Physical INTID, for hardware interrupts.

When ICH_LRC<n>.HW is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[12:10] : RES0.

- Bit[9] : EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits[8:0] : Reserved, RES0.

When ICH_LRC<n>.HW is 1 (there is a corresponding physical interrupt):

- This field indicates the physical INTID. This field is only required to implement enough bits to hold a valid value for the implemented INTID size. Any unused higher order bits are RES0.
- When ICC_CTLR_EL1.ExtRange is 0, then bits[44:42] of this field are RES0.
- If the value of pINTID is not a valid INTID, behavior is UNPREDICTABLE. If the value of pINTID indicates a PPI, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 13 bits of Physical INTID are required, regardless of the number specified by ICC_CTLR.IDbits.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICH_LRC<n>

ICH_LR<n> and ICH_LRC<n> can be updated independently.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICH_LR<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH_LR<n> characteristics are:

Purpose

Provides interrupt context information for the virtual CPU interface.

Configuration

AArch32 System register ICH_LR<n> bits [31:0] are architecturally mapped to AArch64 System register ICH_LR<n>_EL2[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_LR<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

Attributes

ICH_LR<n> is a 32-bit register.

Field descriptions

31:0
vINTID

vINTID, bits [31:0]

Virtual INTID of the interrupt.

If the value of vINTID is 1020-1023 and ICH_LRC<n>.State!=`0b00` (Inactive), behavior is UNPREDICTABLE.

Behavior is UNPREDICTABLE if two or more List Registers specify the same vINTID when:

- ICH_LRC<n>.State == 01.
- ICH_LRC<n>.State == 10.
- ICH_LRC<n>.State == 11.

It is IMPLEMENTATION DEFINED how many bits are implemented, though at least 16 bits must be implemented. Unimplemented bits are RES0. The number of implemented bits can be discovered from ICH_VTR.IDbits.

> **Note**
>
> When a VM is using memory-mapped access to the GIC, software must ensure that the correct source PE ID is provided in bits[12:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICH_LR<n>

ICH_LR<n> and ICH_LRC<n> can be updated independently.

Accesses to this register use the following encodings in the System register encoding space:

ICH_MISR, Interrupt Controller Maintenance Interrupt State Register

The ICH_MISR characteristics are:

Purpose

Indicates which maintenance interrupts are asserted.

Configuration

AArch32 System register ICH_MISR bits [31:0] are architecturally mapped to AArch64 System register ICH_MISR_EL2[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_MISR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_MISR is a 32-bit register.

Field descriptions

31:8	7	6	5	4	3	2	1	0
RES0	VGrp1D	VGrp1E	VGrp0D	VGrp0E	NP	LRENP	U	EOI

Bits [31:8]

Reserved, RES0.

VGrp1D, bit [7]

vPE Group 1 Disabled.

VGrp1D	Meaning
`0b0`	vPE Group 1 Disabled maintenance interrupt not asserted.
`0b1`	vPE Group 1 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR.VGrp1DIE is 1 and ICH_VMCR.VENG0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

VGrp1E, bit [6]

vPE Group 1 Enabled.

VGrp1E	Meaning
`0b0`	vPE Group 1 Enabled maintenance interrupt not asserted.
`0b1`	vPE Group 1 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR.VGrp1EIE is 1 and ICH_VMCR.VENG1 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

VGrp0D, bit [5]

vPE Group 0 Disabled.

VGrp0D	Meaning
`0b0`	vPE Group 0 Disabled maintenance interrupt not asserted.
`0b1`	vPE Group 0 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR.VGrp0DIE is 1 and ICH_VMCR.VENG0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

VGrp0E, bit [4]

vPE Group 0 Enabled.

VGrp0E	Meaning
`0b0`	vPE Group 0 Enabled maintenance interrupt not asserted.
`0b1`	vPE Group 0 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR.VGrp0EIE is 1 and ICH_VMCR.VENG0 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

NP, bit [3]

No Pending.

NP	Meaning
`0b0`	No Pending maintenance interrupt not asserted.
`0b1`	No Pending maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR.NPIE is 1 and no List register is in pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

LRENP, bit [2]

List Register Entry Not Present.

LRENP	Meaning
`0b0`	List Register Entry Not Present maintenance interrupt not asserted.
`0b1`	List Register Entry Not Present maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR.LRENPIE is 1 and ICH_HCR.EOIcount is non-zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

U, bit [1]

Underflow.

U	Meaning
0b0	Underflow maintenance interrupt not asserted.
0b1	Underflow maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR.UIE is 1 and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding ICH_LRC<n>.State bits do not equal 0x0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EOI, bit [0]

End Of Interrupt.

EOI	Meaning
0b0	End Of Interrupt maintenance interrupt not asserted.
0b1	End Of Interrupt maintenance interrupt asserted.

This maintenance interrupt is asserted when at least one bit in ICH_EISR is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICH_MISR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1011	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_HSRE.SRE == '0' then
        UNDEFINED;
    else
        return ICH_MISR;
elsif PSTATE.EL == EL3 then
    if ICC_MSRE.SRE == '0' then
        UNDEFINED;
    else
        return ICH_MISR;
```

ICH_VMCR, Interrupt Controller Virtual Machine Control Register

The ICH_VMCR characteristics are:

Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state.

Configuration

AArch32 System register ICH_VMCR bits [31:0] are architecturally mapped to AArch64 System register ICH_VMCR_EL2[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_VMCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_VMCR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24	23 22 21	20 19 18	17 16 15 14 13 12 11 10	9	8 7 6 5	4	3	2	1	0
VPMR	VBPR0	VBPR1	RES0	VEOIM	RES0	VCBPR	VFIQEn	VAckCtl	VENG1	VENG0

VPMR, bits [31:24]

Virtual Priority Mask. The priority mask level for the virtual CPU interface. If the priority of a pending virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

This field is an alias of ICV_PMR.Priority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if ICH_VMCR.VCBPR == 1.

This field is an alias of ICV_BPR0.BinaryPoint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption if ICH_VMCR.VCBPR == 0.

This field is an alias of ICV_BPR1.BinaryPoint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [17:10]

Reserved, RES0.

VEOIM, bit [9]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

VEOIM	Meaning
0b0	ICV_EOIR0 and ICV_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR are UNPREDICTABLE.
0b1	ICV_EOIR0 and ICV_EOIR1 provide priority drop functionality only. ICV_DIR provides interrupt deactivation functionality.

This bit is an alias of ICV_CTLR.EOImode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

VCBPR	Meaning
0b0	ICV_BPR0 determines the preemption group for virtual Group 0 interrupts only. ICV_BPR1 determines the preemption group for virtual Group 1 interrupts.
0b1	ICV_BPR0 determines the preemption group for both virtual Group 0 and virtual Group 1 interrupts. Reads of ICV_BPR1 return ICV_BPR0 plus one, saturated to 0b111. Writes to ICV_BPR1 are ignored.

This field is an alias of ICV_CTLR.CBPR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

VFIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

This bit is an alias of GICV_CTLR.FIQEn.

In implementations where the Non-secure copy of ICC_SRE.SRE is always 1, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

VAckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.

This bit is an alias of GICV_CTLR.AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

In implementations where the Non-secure copy of ICC_SRE.SRE is always 1, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VENG1, bit [1]

Virtual Group 1 interrupt enable. Possible values of this bit are:

VENG1	Meaning
0b0	Virtual Group 1 interrupts are disabled.
0b1	Virtual Group 1 interrupts are enabled.

This bit is an alias of ICV_IGRPEN1.Enable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VENG0, bit [0]

Virtual Group 0 interrupt enable. Possible values of this bit are:

VENG0	Meaning
0b0	Virtual Group 0 interrupts are disabled.
0b1	Virtual Group 0 interrupts are enabled.

This bit is an alias of ICV_IGRPEN0.Enable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICH_VMCR

When EL2 is using System register access, EL1 using either System register or memory-mapped access must be supported.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1011	0b111

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_HSRE.SRE == '0' then

ICH_VTR, Interrupt Controller VGIC Type Register

The ICH_VTR characteristics are:

Purpose

Reports supported GIC virtualization features.

Configuration

AArch32 System register ICH_VTR bits [31:0] are architecturally mapped to AArch64 System register ICH_VTR_EL2[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_VTR are UNDEFINED.

If EL2 is not implemented, all bits in this register are RES0 from EL3, except for nV4, which is RES1 from EL3.

Attributes

ICH_VTR is a 32-bit register.

Field descriptions

31 30 29	28 27 26	25 24 23	22	21	20	19	18 17 16 15 14 13 12 11 10 9 8 7 6 5	4 3 2 1 0
PRIbits	PREbits	IDbits	SEIS	A3V	nV4	TDS	RES0	ListRegs

PRIbits, bits [31:29]

Priority bits. The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

This field is an alias of ICV_CTLR.PRIbits.

PREbits, bits [28:26]

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH_VTR.PRIbits.

IDbits, bits [25:23]

The number of virtual interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

This field is an alias of ICV_CTLR.IDbits.

SEIS, bit [22]

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support generation of SEIs.
0b1	The virtual CPU interface logic supports generation of SEIs.

This bit is an alias of ICV_CTLR.SEIS.

A3V, bit [21]

Affinity 3 Valid. Possible values are:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

This bit is an alias of ICV_CTLR.A3V.

nV4, bit [20]

Direct injection of virtual interrupts not supported. Possible values are:

nV4	Meaning
0b0	The CPU interface logic supports direct injection of virtual interrupts.
0b1	The CPU interface logic does not support direct injection of virtual interrupts.

In GICv3, the only permitted value is `0b1`.

TDS, bit [19]

Separate trapping of Non-secure EL1 writes to ICV_DIR supported.

TDS	Meaning
0b0	Implementation does not support ICH_HCR.TDIR.
0b1	Implementation supports ICH_HCR.TDIR.

FEAT_GICv3_TDIR implements the functionality added by the value `0b1`.

Bits [18:5]

Reserved, RES0.

ListRegs, bits [4:0]

The number of implemented List registers, minus one. For example, a value of `0b01111` indicates that the maximum of 16 List registers are implemented.

Accessing ICH_VTR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b1011	0b001

```
if PSTATE.EL == EL0 then

ICIALLU, Instruction Cache Invalidate All to PoU

The ICIALLU characteristics are:

Purpose

Invalidate all instruction caches of the PE executing the instruction to the Point of Unification. If branch predictors are architecturally visible, also flush branch predictors.

Configuration

AArch32 System instruction ICIALLU performs the same function as AArch64 System instruction IC IALLU.

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ICIALLU are UNDEFINED.

Attributes

ICIALLU is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the ICIALLU instruction

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

When HCR.FB is 1, at Non-secure EL1 this instruction executes as a ICIALLUIS.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICIALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable

The ICIALLUIS characteristics are:

Purpose

Invalidate all instruction caches in the Inner Shareable domain of the PE executing the instruction to the Point of Unification. If branch predictors are architecturally visible, also flush branch predictors.

Configuration

AArch32 System instruction ICIALLUIS performs the same function as AArch64 System instruction IC IALLUIS.

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ICIALLUIS are UNDEFINED.

Attributes

ICIALLUIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the ICIALLUIS instruction

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T7 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T7 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TPU == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TICAB == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TPU == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR2.TICAB == '1' then
        AArch32.TakeHypTrapException(0x03);
    else

ICIMVAU, Instruction Cache line Invalidate by VA to PoU

The ICIMVAU characteristics are:

Purpose

Invalidate instruction cache line by virtual address to PoU.

Configuration

AArch32 System instruction ICIMVAU performs the same function as AArch64 System instruction IC IVAU.

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ICIMVAU are UNDEFINED.

Attributes

ICIMVAU is a 32-bit System instruction.

Field descriptions

<table>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td colspan="32">Virtual address to use</td></tr>
</table>

Bits [31:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the ICIMVAU instruction

Execution of this instruction might require an address translation from VA to PA, and that translation might fault.

If FEAT_CMOW is implemented, HCRX_EL2.CMOW is 1, and EL1 or EL0 access is enabled, when executed at EL1 or EL0, the instruction has stage 2 read permission to the VA but does not have stage 2 write permission to the VA, the instruction generates a stage 2 Permission fault.

For more information, see 'AArch32 instruction cache maintenance instructions (IC*)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0111	0b0101	0b001

```
if PSTATE.EL == EL0 then

ICV_AP0R<n>, Interrupt Controller Virtual Active Priorities Group 0 Registers, n = 0 - 3

The ICV_AP0R<n> characteristics are:

Purpose

Provides information about virtual Group 0 active priorities.

Configuration

AArch32 System register ICV_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register ICV_AP0R<n>_EL1[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_AP0R<n> are UNDEFINED.

Attributes

ICV_AP0R<n> is a 32-bit register.

Field descriptions

31–0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value `0x00000000` is consistent with no interrupts being active.

Accessing ICV_AP0R<n>

Writing to these registers with any value other than the last read value of the register (or `0x00000000` when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP0R1 is only implemented in implementations that support 6 or more bits of priority. ICV_AP0R2 and ICV_AP0R3 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>.
- ICV_AP1R<n>.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICV_AP1R<n>, Interrupt Controller Virtual Active Priorities Group 1 Registers, n = 0 - 3

The ICV_AP1R<n> characteristics are:

Purpose

Provides information about virtual Group 1 active priorities.

Configuration

AArch32 System register ICV_AP1R<n> bits [31:0] are architecturally mapped to AArch64 System register ICV_AP1R<n>_EL1[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_AP1R<n> are UNDEFINED.

Attributes

ICV_AP1R<n> is a 32-bit register.

Field descriptions

31-0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value `0x00000000` is consistent with no interrupts being active.

Accessing ICV_AP1R<n>

Writing to these registers with any value other than the last read value of the register (or `0x00000000` when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP1R1 is only implemented in implementations that support 6 or more bits of priority. ICV_AP1R2 and ICV_AP1R3 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>.
- ICV_AP1R<n>.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICV_BPR0, Interrupt Controller Virtual Binary Point Register 0

The ICV_BPR0 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 0 interrupt preemption.

Configuration

AArch32 System register ICV_BPR0 bits [31:0] are architecturally mapped to AArch64 System register ICV_BPR0_EL1[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_BPR0 are UNDEFINED.

Attributes

ICV_BPR0 is a 32-bit register.

Field descriptions

31–3	2–0
RES0	BinaryPoint

Bits [31:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	gggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.ssssssss

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR0

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by ICV_CTLR.PRIbits.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1000	0b011

ICV_BPR1, Interrupt Controller Virtual Binary Point Register 1

The ICV_BPR1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 1 interrupt preemption.

Configuration

AArch32 System register ICV_BPR1 bits [31:0] are architecturally mapped to AArch64 System register ICV_BPR1_EL1[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_BPR1 are UNDEFINED.

Attributes

ICV_BPR1 is a 32-bit register.

Field descriptions

31–3	2–0
RES0	BinaryPoint

Bits [31:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

An attempt to program this field to a value less than the minimum value sets the field to the minimum value.

If ICV_CTLR.CBPR is set to 1, Non-secure EL1 reads return ICV_BPR0 + 1 saturated to `0b111`. Non-secure EL1 writes are ignored.

If ICV_CTLR.CBPR is set to 1, Secure EL1 reads return ICV_BPR0. Secure EL1 writes modify ICV_BPR0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR1

The minimum valuse of this register is equal to the minimum value of ICV_BPR0 plus one.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b011

ICV_CTLR, Interrupt Controller Virtual Control Register

The ICV_CTLR characteristics are:

Purpose

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

Configuration

AArch32 System register ICV_CTLR bits [31:0] are architecturally mapped to AArch64 System register ICV_CTLR_EL1[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_CTLR are UNDEFINED.

Attributes

ICV_CTLR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20	19	18	17 16	15	14	13 12 11	10 9 8	7 6 5 4 3 2	1	0
RES0	ExtRange	RSS	RES0	A3V	SEIS	IDbits	PRIbits	RES0	EOImode	CBPR

Bits [31:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
`0b0`	CPU interface does not support INTIDs in the range 1024..8191. Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. **Note** Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
`0b1`	CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation.

ICV_CTLR.ExtRange is an alias of ICC_CTLR.ExtRange.

RSS, bit [18]

Range Selector Support. Possible values are:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support local generation of SEIs.
0b1	The virtual CPU interface logic supports local generation of SEIs.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation must implement at least 32 levels of physical priority (5 priority bits).

Note

This field always returns the number of priority bits implemented.

The division between group priority and subpriority is defined in the binary point registers ICV_BPR0 and ICV_BPR1.

Bits [7:2]

Reserved, RES0.

EOImode, bit [1]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

EOImode	Meaning
`0b0`	ICV_EOIR0 and ICV_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR are UNPREDICTABLE.
`0b1`	ICV_EOIR0 and ICV_EOIR1 provide priority drop functionality only. ICV_DIR provides interrupt deactivation functionality.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

CBPR	Meaning
`0b0`	ICV_BPR0 determines the preemption group for virtual Group 0 interrupts only. ICV_BPR1 determines the preemption group for virtual Group 1 interrupts.
`0b1`	Non-secure reads of ICV_BPR1 return ICV_BPR0 plus one, saturated to `0b111`. Non-secure writes to ICV_BPR1 are ignored. Secure reads of ICV_BPR1 return ICV_BPR0. Secure writes of ICV_BPR1 modify ICV_BPR0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_CTLR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICV_DIR, Interrupt Controller Deactivate Virtual Interrupt Register

The ICV_DIR characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified virtual interrupt.

Configuration

AArch32 System register ICV_DIR bits [31:0] performs the same function as AArch64 System register ICV_DIR_EL1[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_DIR are UNDEFINED.

Attributes

ICV_DIR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24	23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	INTID

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the virtual interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_DIR

When EOImode == 0, writes are ignored. In systems supporting system error generation, an implementation might generate an SEI.

Accesses to this register use the following encodings in the System register encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICV_EOIR0, Interrupt Controller Virtual End Of Interrupt Register 0

The ICV_EOIR0 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 0 interrupt.

Configuration

AArch32 System register ICV_EOIR0 performs the same function as AArch64 System register ICV_EOIR0_EL1.

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_EOIR0 are UNDEFINED.

Attributes

ICV_EOIR0 is a 32-bit register.

Field descriptions

31–24	23–0
RES0	INTID

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICV_IAR0 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR to deactivate the virtual interrupt.

Accessing ICV_EOIR0

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR0, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings in the System register encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICV_HPPIR0, Interrupt Controller Virtual Highest Priority Pending Interrupt Register 0

The ICV_HPPIR0 characteristics are:

Purpose

Indicates the highest priority pending virtual Group 0 interrupt on the virtual CPU interface.

Configuration

AArch32 System register ICV_HPPIR0 performs the same function as AArch64 System register ICV_HPPIR0_EL1.

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_HPPIR0 are UNDEFINED.

Attributes

ICV_HPPIR0 is a 32-bit register.

Field descriptions

31–24	23–0
RES0	INTID

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the highest priority pending virtual interrupt.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_HPPIR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICV_HPPIR1, Interrupt Controller Virtual Highest Priority Pending Interrupt Register 1

The ICV_HPPIR1 characteristics are:

Purpose

Indicates the highest priority pending virtual Group 1 interrupt on the virtual CPU interface.

Configuration

AArch32 System register ICV_HPPIR1 performs the same function as AArch64 System register ICV_HPPIR1_EL1.

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_HPPIR1 are UNDEFINED.

Attributes

ICV_HPPIR1 is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24	23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	INTID

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the highest priority pending virtual interrupt.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. This special INTID can take the value 1023 only. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_HPPIR1

Accesses to this register use the following encodings in the System register encoding space:

ICV_IAR0, Interrupt Controller Virtual Interrupt Acknowledge Register 0

The ICV_IAR0 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 0 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch32 System register ICV_IAR0 performs the same function as AArch64 System register ICV_IAR0_EL1.

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_IAR0 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when PSTATE.{I,F} == {0,0}). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_IAR0 is a 32-bit register.

Field descriptions

31–24	23–0
RES0	INTID

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled virtual interrupt.

ICV_IGRPEN0, Interrupt Controller Virtual Interrupt Group 0 Enable register

The ICV_IGRPEN0 characteristics are:

Purpose

Controls whether virtual Group 0 interrupts are enabled or not.

Configuration

AArch32 System register ICV_IGRPEN0 bits [31:0] are architecturally mapped to AArch64 System register ICV_IGRPEN0_EL1[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_IGRPEN0 are UNDEFINED.

Attributes

ICV_IGRPEN0 is a 32-bit register.

Field descriptions

31–1	0
RES0	Enable

Bits [31:1]

Reserved, RES0.

Enable, bit [0]

Enables virtual Group 0 interrupts.

Enable	Meaning
`0b0`	Virtual Group 0 interrupts are disabled.
`0b1`	Virtual Group 0 interrupts are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICV_IGRPEN0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b1100	0b110

```

ICV_IGRPEN1, Interrupt Controller Virtual Interrupt Group 1 Enable register

The ICV_IGRPEN1 characteristics are:

Purpose

Controls whether virtual Group 1 interrupts are enabled for the current Security state.

Configuration

AArch32 System register ICV_IGRPEN1 bits [31:0] are architecturally mapped to AArch64 System register ICV_IGRPEN1_EL1[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_IGRPEN1 are UNDEFINED.

Attributes

ICV_IGRPEN1 is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1	0
RES0	Enable

Bits [31:1]

Reserved, RES0.

Enable, bit [0]

Enables virtual Group 1 interrupts.

Enable	Meaning
`0b0`	Virtual Group 1 interrupts are disabled.
`0b1`	Virtual Group 1 interrupts are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICV_IGRPEN1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ICV_PMR, Interrupt Controller Virtual Interrupt Priority Mask Register

The ICV_PMR characteristics are:

Purpose

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

Configuration

AArch32 System register ICV_PMR bits [31:0] are architecturally mapped to AArch64 System register ICV_PMR_EL1[31:0].

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_PMR are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_PMR is a 32-bit register.

Field descriptions

31:8	7:0
RES0	Priority

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	`0x00`-`0xFF` (0-255), all values	256
[7:1]	`0x00`-`0xFE` (0-254), even values only	128
[7:2]	`0x00`-`0xFC` (0-252), in steps of 4	64
[7:3]	`0x00`-`0xF8` (0-248), in steps of 8	32
[7:4]	`0x00`-`0xF0` (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing ICV_PMR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0100	0b0110	0b000

ICV_RPR, Interrupt Controller Virtual Running Priority Register

The ICV_RPR characteristics are:

Purpose

Indicates the Running priority of the virtual CPU interface.

Configuration

AArch32 System register ICV_RPR performs the same function as AArch64 System register ICV_RPR_EL1.

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_RPR are UNDEFINED.

Attributes

ICV_RPR is a 32-bit register.

Field descriptions

31–8	7–0
RES0	Priority

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

> **Note**
>
> If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

Accessing ICV_RPR

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

0b1111	0b000	0b1100	0b1011	0b011

```

ID_AFR0, Auxiliary Feature Register 0

The ID_AFR0 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, MIDR.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_AFR0 bits [31:0] are architecturally mapped to AArch64 System register ID_AFR0_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_AFR0 are UNDEFINED.

Attributes

ID_AFR0 is a 32-bit register.

ID_DFR0, Debug Feature Register 0

The ID_DFR0 characteristics are:

Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, MIDR.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_DFR0 bits [31:0] are architecturally mapped to AArch64 System register ID_DFR0_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_DFR0 are UNDEFINED.

Attributes

ID_DFR0 is a 32-bit register.

Field descriptions

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
TraceFilt	PerfMon	MProfDbg	MMapTrc	CopTrc	MMapDbg	CopSDbg	CopDbg

TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality added by the value `0b0001`.

From Armv8.3, the permitted values are `0b0000` and `0b0001`.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'.

Defined values are:

PerfMon	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv1 implemented.
0b0010	Performance Monitors Extension, PMUv2 implemented.
0b0011	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0011, and adds support for: • Extended 16-bit PMEVTYPER<n>.evtCount field. • If EL2 is implemented, the HDCR.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: • 64-bit event counters. • If EL2 is implemented, the HDCR.HCCD control. • If EL3 is implemented, the SDCR.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: • The PMCR.FZO and, if EL2 is implemented, HDCR.HPMFZO controls. • If EL3 is implemented and using AArch64, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: • Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. • Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

Note

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

MProfDbg, bits [23:20]

M-profile Debug. Support for memory-mapped debug model for M-profile processors. Defined values are:

MProfDbg	Meaning
0b0000	Not supported.
0b0001	Support for M-profile Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

MMapTrc, bits [19:16]

Memory-mapped Trace. Support for memory-mapped trace model. Defined values are:

MMapTrc	Meaning
`0b0000`	Not supported.
`0b0001`	Support for Arm trace architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == `0b1110` encoding space. Defined values are:

CopTrc	Meaning
`0b0000`	Not supported.
`0b0001`	Support for Arm trace architecture, with System registers access.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

MMapDbg, bits [11:8]

Memory-mapped Debug. Support for Armv7 memory-mapped debug model for A and R-profile processors. Defined values are:

MMapDbg	Meaning
`0b0000`	Not supported.
`0b0100`	Support for Armv7, v7 Debug architecture, with memory-mapped access.
`0b0101`	Support for Armv7, v7.1 Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

The optional memory map defined by Armv8 is not compatible with Armv7.

CopSDbg, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = `0b1110` encoding space, for an A-profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

CopDbg, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

CopDbg	Meaning
`0b0000`	Not supported.
`0b0010`	Armv6, v6 Debug architecture, with System registers access.
`0b0011`	Armv6, v6.1 Debug architecture, with System registers access.
`0b0100`	Armv7, v7 Debug architecture, with System registers access.
`0b0101`	Armv7, v7.1 Debug architecture, with System registers access.
`0b0110`	Armv8 debug architecture.
`0b0111`	Armv8 debug architecture with Virtualization Host Extensions.
`0b1000`	Armv8.2 debug architecture, FEAT_Debugv8p2.
`0b1001`	Armv8.4 debug architecture, FEAT_Debugv8p4.
`0b1010`	Armv8.8 debug architecture, FEAT_Debugv8p8.

All other values are reserved.

The values `0b0000`, `0b0010`, `0b0011`, `0b0100`, and `0b0101` are not permitted in Armv8.

FEAT_VHE adds the functionality identified by the value `0b0111`.

FEAT_Debugv8p2 adds the functionality identified by the value `0b1000`.

FEAT_Debugv8p4 adds the functionality identified by the value `0b1001`.

FEAT_Debugv8p8 adds the functionality identified by the value `0b1010`.

From Armv8.1, when FEAT_VHE is implemented the value `0b0110` is not permitted.

From Armv8.2, the values `0b0110` and `0b0111` are not permitted.

From Armv8.4, the value `0b1000` is not permitted.

From Armv8.8, the value `0b1001` is not permitted.

ID_DFR1, Debug Feature Register 1

The ID_DFR1 characteristics are:

Purpose

Provides top level information about the debug system in AArch32.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_DFR1 bits [31:0] are architecturally mapped to AArch64 System register ID_DFR1_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_DFR1 are UNDEFINED.

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_DFR1 is a 32-bit register.

Field descriptions

31–8	7–4	3–0
RES0	HPMN0	MTPMU

Bits [31:8]

Reserved, RES0.

HPMN0, bits [7:4]

Zero PMU event counters for a Guest operating system. Defined values are:

HPMN0	Meaning
0b0000	Setting HDCR.HPMN to zero has CONSTRAINED UNPREDICTABLE behavior.
0b0001	Setting HDCR.HPMN to zero has defined behavior.

All other values are reserved.

If FEAT_PMUv3 is not implemented, FEAT_FGT is not implemented, or EL2 is not implemented, the only permitted value is 0b0000.

FEAT_HPMN0 implements the functionality identified by the value 0b0001.

From Armv8.8, in an implementation that includes FEAT_PMUv3, FEAT_FGT, and EL2, the value 0b0000 is not permitted.

MTPMU, bits [3:0]

Multi-threaded PMU extension. Defined values are:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>.MT are read/write or RES0.
0b0001	FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER<n>.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER<n>.MT are 0.
0b1111	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER<n>.MT are RES0.

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value `0b0001`.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value `0b0000` is not permitted.

In an implementation that does not include FEAT_PMUv3, the value `0b0001` is not permitted.

Accessing ID_DFR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0011	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!IsZero(ID_DFR1) || boolean
IMPLEMENTATION_DEFINED "ID_DFR1 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then

ID_ISAR0, Instruction Set Attribute Register 0

The ID_ISAR0 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR0 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR0_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_ISAR0 are UNDEFINED.

Attributes

ID_ISAR0 is a 32-bit register.

Field descriptions

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
RES0	Divide	Debug	Coproc	CmpBranch	BitField	BitCount	Swap

Bits [31:28]

Reserved, RES0.

Divide, bits [27:24]

Indicates the implemented Divide instructions. Defined values are:

Divide	Meaning
`0b0000`	None implemented.
`0b0001`	Adds SDIV and UDIV in the T32 instruction set.
`0b0010`	As for `0b0001`, and adds SDIV and UDIV in the A32 instruction set.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0010`.

Debug, bits [23:20]

Indicates the implemented Debug instructions. Defined values are:

Debug	Meaning
`0b0000`	None implemented.
`0b0001`	Adds BKPT.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Coproc, bits [19:16]

Indicates the implemented System register access instructions. Defined values are:

Coproc	Meaning
0b0000	None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.
0b0001	Adds generic CDP, LDC, MCR, MRC, and STC.
0b0010	As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.
0b0011	As for 0b0010, and adds generic MCRR and MRRC.
0b0100	As for 0b0011, and adds generic MCRR2 and MRRC2.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

CmpBranch	Meaning
0b0000	None implemented.
0b0001	Adds CBNZ and CBZ.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:

BitField	Meaning
0b0000	None implemented.
0b0001	Adds BFC, BFI, SBFX, and UBFX.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:

BitCount	Meaning
0b0000	None implemented.
0b0001	Adds CLZ.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

Swap	Meaning
0b0000	None implemented.
0b0001	Adds SWP and SWPB.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

Accessing ID_ISAR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b000

```
if PSTATE.EL == EL0 then

ID_ISAR1, Instruction Set Attribute Register 1

The ID_ISAR1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR1 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR1_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_ISAR1 are UNDEFINED.

Attributes

ID_ISAR1 is a 32-bit register.

Field descriptions

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Jazelle	Interwork	Immediate	IfThen	Extend	Except_AR	Except	Endian

Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions. Defined values are:

Jazelle	Meaning
`0b0000`	No support for Jazelle.
`0b0001`	Adds the BXJ instruction, and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Interwork, bits [27:24]

Indicates the implemented Interworking instructions. Defined values are:

Interwork	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the BX instruction, and the T bit in the PSR.
`0b0010`	As for `0b0001`, and adds the BLX instruction. PC loads have BX-like behavior.
`0b0011`	As for `0b0010`, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0011`.

Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

Immediate	Meaning
0b0000	None implemented.
0b0001	Adds: • The MOVT instruction • The MOV instruction encodings with zero-extended 16-bit immediates. • The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

IfThen	Meaning
0b0000	None implemented.
0b0001	Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

Extend	Meaning
0b0000	No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.
0b0001	Adds the SXTB, SXTH, UXTB, and UXTH instructions.
0b0010	As for `0b0001`, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0010`.

Except_AR, bits [11:8]

Indicates the implemented A and R-profile exception-handling instructions. Defined values are:

Except_AR	Meaning
0b0000	None implemented.
0b0001	Adds the SRS and RFE instructions, and the A and R-profile forms of the CPS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:

Except	Meaning
`0b0000`	Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.
`0b0001`	Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Endian, bits [3:0]

Indicates the implemented Endian instructions. Defined values are:

Endian	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

Accessing ID_ISAR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

ID_ISAR2, Instruction Set Attribute Register 2

The ID_ISAR2 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR2 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR2_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_ISAR2 are UNDEFINED.

Attributes

ID_ISAR2 is a 32-bit register.

Field descriptions

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Reversal	PSR_AR	MultU	MultS	Mult	MultiAccessInt	MemHint	LoadStore

Reversal, bits [31:28]

Indicates the implemented Reversal instructions. Defined values are:

Reversal	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the REV, REV16, and REVSH instructions.
`0b0010`	As for `0b0001`, and adds the RBIT instruction.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0010`.

PSR_AR, bits [27:24]

Indicates the implemented A and R-profile instructions to manipulate the PSR. Defined values are:

PSR_AR	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

MultU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

MultU	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the UMULL and UMLAL instructions.
`0b0010`	As for `0b0001`, and adds the UMAAL instruction.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0010`.

MultS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions. Defined values are:

MultS	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the SMULL and SMLAL instructions.
`0b0010`	As for `0b0001`, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
`0b0011`	As for `0b0010`, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0011`.

Mult, bits [15:12]

Indicates the implemented additional Multiply instructions. Defined values are:

Mult	Meaning
`0b0000`	No additional instructions implemented. This means only MUL is implemented.
`0b0001`	Adds the MLA instruction.
`0b0010`	As for `0b0001`, and adds the MLS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0010`.

MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions. Defined values are:

MultiAccessInt	Meaning
`0b0000`	No support. This means the LDM and STM instructions are not interruptible.
`0b0001`	LDM and STM instructions are restartable.
`0b0010`	LDM and STM instructions are continuable.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:

MemHint	Meaning
0b0000	None implemented.
0b0001	Adds the PLD instruction.
0b0010	Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)
0b0011	As for 0b0001 (or 0b0010), and adds the PLI instruction.
0b0100	As for 0b0011, and adds the PLDW instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

LoadStore	Meaning
0b0000	No additional load/store instructions implemented.
0b0001	Adds the LDRD and STRD instructions.
0b0010	As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Accessing ID_ISAR2

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;

ID_ISAR3, Instruction Set Attribute Register 3

The ID_ISAR3 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR3 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR3_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_ISAR3 are UNDEFINED.

Attributes

ID_ISAR3 is a 32-bit register.

Field descriptions

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
T32EE	TrueNOP	T32Copy	TabBranch	SynchPrim	SVC	SIMD	Saturate

T32EE, bits [31:28]

Indicates the implemented T32EE instructions. Defined values are:

T32EE	Meaning
0b0000	None implemented.
0b0001	Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions. Defined values are:

TrueNOP	Meaning
0b0000	None implemented. This means there are no NOP instructions that do not have any register dependencies.
0b0001	Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

T32Copy	Meaning
0b0000	Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.
0b0001	Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

TabBranch	Meaning
0b0000	None implemented.
0b0001	Adds the TBB and TBH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

SynchPrim	Meaning
0b0000	If SynchPrim_frac == 0b000, no Synchronization Primitives implemented.
0b0001	If SynchPrim_frac == 0b000, adds the LDREX and STREX instructions. If SynchPrim_frac == 0b011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.
0b0010	If SynchPrim_frac == 0b000, as for [0b001, 0b011] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

SVC	Meaning
0b0000	Not implemented.
0b0001	Adds the SVC instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:

SIMD	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
`0b0011`	As for `0b0001`, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0011`.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports Advanced SIMD and floating-point instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

Saturate	Meaning
`0b0000`	None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
`0b0001`	Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Accessing ID_ISAR3

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b011

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_ISAR3;
elsif PSTATE.EL == EL2 then
    return ID_ISAR3;
elsif PSTATE.EL == EL3 then
    return ID_ISAR3;
```

ID_ISAR4, Instruction Set Attribute Register 4

The ID_ISAR4 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR5.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR4 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR4_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_ISAR4 are UNDEFINED.

Attributes

ID_ISAR4 is a 32-bit register.

Field descriptions

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
SWP_frac	PSR_M	SynchPrim_frac	Barrier	SMC	Writeback	WithShifts	Unpriv

SWP_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

SWP_frac	Meaning
0b0000	SWP or SWPB instructions not implemented.
0b0001	SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if ID_ISAR0.Swap is 0b0000.

In Armv8-A, the only permitted value is 0b0000.

PSR_M, bits [27:24]

Indicates the implemented M-profile instructions to modify the PSRs. Defined values are:

PSR_M	Meaning
0b0000	None implemented.
0b0001	Adds the M-profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

SynchPrim_frac, bits [23:20]

Used in conjunction with ID_ISAR3.SynchPrim to indicate the implemented Synchronization Primitive instructions. Possible values are:

SynchPrim_frac	Meaning
`0b0000`	If SynchPrim == `0b0000`, no Synchronization Primitives implemented. If SynchPrim == `0b0001`, adds the LDREX and STREX instructions. If SynchPrim == `0b0010`, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.
`0b0011`	If SynchPrim == `0b0001`, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is `0b0000`.

Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

Barrier	Meaning
`0b0000`	None implemented. Barrier operations are provided only as System instructions in the (coproc==`0b1111`) encoding space.
`0b0001`	Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

SMC, bits [15:12]

Indicates the implemented SMC instructions. Defined values are:

SMC	Meaning
`0b0000`	None implemented.
`0b0001`	Adds the SMC instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

- If EL3 is implemented, the only permitted value is `0b0001`.
- If neither EL3 nor EL2 is implemented, the only permitted value is `0b0000`.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes. Defined values are:

Writeback	Meaning
`0b0000`	Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.
`0b0001`	Adds support for all of the writeback addressing modes.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

WithShifts	Meaning
0b0000	Nonzero shifts supported only in MOV and shift instructions.
0b0001	Adds support for shifts of loads and stores over the range LSL 0-3.
0b0011	As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.
0b0100	As for 0b0011, and adds support for register-controlled shift options.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

Unpriv	Meaning
0b0000	None implemented. No T variant instructions are implemented.
0b0001	Adds the LDRBT, LDRT, STRBT, and STRT instructions.
0b0010	As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Accessing ID_ISAR4

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);

ID_ISAR5, Instruction Set Attribute Register 5

The ID_ISAR5 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, and ID_ISAR4.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR5 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR5_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_ISAR5 are UNDEFINED.

Attributes

ID_ISAR5 is a 32-bit register.

Field descriptions

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
VCMA	RDM	RES0	CRC32	SHA2	SHA1	AES	SEVL

VCMA, bits [31:28]

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

VCMA	Meaning
0b0000	The VCMLA and VCADD instructions are not implemented in AArch32.
0b0001	The VCMLA and VCADD instructions are implemented in AArch32.

All other values are reserved.

FEAT_FCMA implements the functionality identified by `0b0001`.

From Armv8.3, the only permitted value is `0b0001`.

RDM, bits [27:24]

Indicates support for the VQRDMLAH and VQRDMLSH instructions in AArch32 state. Defined values are:

RDM	Meaning
0b0000	No VQRDMLAH and VQRDMLSH instructions implemented.
0b0001	VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

FEAT_RDM implements the functionality identified by the value `0b0001`.

From Armv8.1, the only permitted value is `0b0001`.

Bits [23:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates support for the CRC32 instructions in AArch32 state. Defined values are:

CRC32	Meaning
0b0000	No CRC32 instructions implemented.
0b0001	CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented.

All other values are reserved.

In Armv8.0, the permitted values are `0b0000` and `0b0001`.

From Armv8.1, the only permitted value is `0b0001`.

SHA2, bits [15:12]

Indicates support for the SHA2 instructions in AArch32 state.

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

SHA1, bits [11:8]

Indicates support for the SHA1 instructions are implemented in AArch32 state. Defined values are:

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

AES, bits [7:4]

Indicates support for the AES instructions in AArch32 state. Defined values are:

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC implemented.
0b0010	As for `0b0001`, plus VMULL (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0010`.

SEVL, bits [3:0]

Indicates support for the SEVL instruction in AArch32 state. Defined values are:

SEVL	Meaning
0b0000	SEVL is implemented as a NOP.
0b0001	SEVL is implemented as Send Event Local.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Accessing ID_ISAR5

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_ISAR5;
elsif PSTATE.EL == EL2 then
    return ID_ISAR5;
elsif PSTATE.EL == EL3 then
    return ID_ISAR5;
```

ID_ISAR6, Instruction Set Attribute Register 6

The ID_ISAR6 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_ISAR6 bits [31:0] are architecturally mapped to AArch64 System register ID_ISAR6_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_ISAR6 are UNDEFINED.

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_ISAR6 is a 32-bit register.

Field descriptions

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
RES0	I8MM	BF16	SPECRES	SB	FHM	DP	JSCVT

Bits [31:28]

Reserved, RES0.

I8MM, bits [27:24]

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values are:

I8MM	Meaning
`0b0000`	Int8 matrix multiplication instructions are not implemented.
`0b0001`	VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented.

All other values are reserved.

FEAT_AA32I8MM implements the functionality identified by `0b0001`.

From Armv8.2, the permitted values are `0b0000` and `0b0001`.

BF16, bits [23:20]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	VCVT, VCVTB, VCVTT, VDOT, VFMAB, VFMAT, and VMMLA instructions with BF16 operand or result types are implemented.

All other values are reserved.

FEAT_AA32BF16 implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

SPECRES, bits [19:16]

Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:

SPECRES	Meaning
0b0000	CFPRCTX, DVPRCTX, and CPPRCTX instructions are not implemented.
0b0001	CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [15:12]

Indicates support for SB instruction in AArch32 state. Defined values are:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

From Armv8.5, the only permitted value is 0b0001.

FHM, bits [11:8]

Indicates support for Advanced SIMD and floating-point VFMAL and VFMSL instructions in AArch32 state. Defined values are:

FHM	Meaning
0b0000	VFMAL and VMFSL instructions not implemented.
0b0001	VFMAL and VMFSL instructions implemented.

FEAT_FHM implements the functionality identified by the value 0b0001.

DP, bits [7:4]

Indicates support for dot product instructions in AArch32 state. Defined values are:

DP	Meaning
0b0000	No dot product instructions implemented.
0b0001	VUDOT and VSDOT instructions implemented.

All other values are reserved.

FEAT_DotProd implements the functionality identified by the value 0b0001.

JSCVT, bits [3:0]

Indicates support for the Javascript conversion instruction in AArch32 state. Defined values are:

JSCVT	Meaning
0b0000	The VJCVT instruction is not implemented.
0b0001	The VJCVT instruction is implemented.

All other values are reserved.

In Armv8.0, the only permitted value is `0b0000`.

FEAT_JSCVT implements the functionality identified by `0b0001`.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is `0b0001`.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is `0b0000`.

Accessing ID_ISAR6

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ID_MMFR0, Memory Model Feature Register 0

The ID_MMFR0 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_MMFR0 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR0_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_MMFR0 are UNDEFINED.

Attributes

ID_MMFR0 is a 32-bit register.

Field descriptions

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
InnerShr	FCSE	AuxReg	TCM	ShareLvl	OuterShr	PMSA	VMSA

InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

InnerShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000`, `0b0001`, and `0b1111`.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0.ShareLvl having the value `0b0001`.

When ID_MMFR0.ShareLvl is zero, this field is UNKNOWN.

FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE. Defined values are:

FCSE	Meaning
0b0000	Not supported.
0b0001	Support for FCSE.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

AuxReg	Meaning
0b0000	None supported.
0b0001	Support for Auxiliary Control Register only.
0b0010	Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0010`.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

TCM	Meaning
0b0000	Not supported.
0b0001	Support is IMPLEMENTATION DEFINED. Armv7 requires this setting.
0b0010	Support for TCM only, Armv6 implementation.
0b0011	Support for TCM and DMA, Armv6 implementation.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

ShareLvl	Meaning
0b0000	One level of shareability implemented.
0b0001	Two levels of shareability implemented.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

OuterShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000`, `0b0001`, and `0b1111`.

PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

PMSA	Meaning
`0b0000`	Not supported.
`0b0001`	Support for IMPLEMENTATION DEFINED PMSA.
`0b0010`	Support for PMSAv6, with a Cache Type Register implemented.
`0b0011`	Support for PMSAv7, with support for memory subsections. Armv7-R profile.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

VMSA	Meaning
`0b0000`	Not supported.
`0b0001`	Support for IMPLEMENTATION DEFINED VMSA.
`0b0010`	Support for VMSAv6, with Cache and TLB Type Registers implemented.
`0b0011`	Support for VMSAv7, with support for remapping and the Access flag. ARMv7-A profile.
`0b0100`	As for `0b0011`, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
`0b0101`	As for `0b0100`, and adds support for the Long-descriptor translation table format.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0101`.

Accessing ID_MMFR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b100

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_MMFR0;
elsif PSTATE.EL == EL2 then
    return ID_MMFR0;
elsif PSTATE.EL == EL3 then
    return ID_MMFR0;
```

ID_MMFR1, Memory Model Feature Register 1

The ID_MMFR1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_MMFR1 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR1_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_MMFR1 are UNDEFINED.

Attributes

ID_MMFR1 is a 32-bit register.

Field descriptions

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
BPred	L1TstCln	L1Uni	L1Hvd	L1UniSW	L1HvdSW	L1UniVA	L1HvdVA

BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

BPred	Meaning
`0b0000`	No branch predictor, or no MMU present. Implies a fixed MPU configuration.
`0b0001`	Branch predictor requires flushing on: • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Changes to the TTBR0, TTBR1, or TTBCR registers. • Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.
`0b0010`	Branch predictor requires flushing on: • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.
`0b0011`	Branch predictor requires flushing only on writing new data to instruction locations.
`0b0100`	For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In Armv8-A, the permitted values are `0b0010`, `0b0011`, or `0b0100`. For values other than `0b0000` and `0b0100`, the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

L1TstCln	Meaning
0b0000	None supported.
0b0001	Supported Level 1 data cache test and clean operations are: • Test and clean data cache.
0b0010	As for 0b0001, and adds: • Test, clean, and invalidate data cache.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

L1Uni	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: • Invalidate cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
0b0010	As for 0b0001, and adds: • Clean cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

L1Hvd	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: • Invalidate instruction cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
0b0010	As for 0b0001, and adds: • Invalidate data cache. • Invalidate data cache and instruction cache, including branch predictor if appropriate.
0b0011	As for 0b0010, and adds: • Clean data cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

L1UniSW	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by set/way are: • Clean cache line by set/way.
0b0010	As for 0b0001, and adds: • Clean and invalidate cache line by set/way.
0b0011	As for 0b0010, and adds: • Invalidate cache line by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

L1HvdSW	Meaning
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by set/way are: • Clean data cache line by set/way. • Clean and invalidate data cache line by set/way.
0b0010	As for 0b0001, and adds: • Invalidate data cache line by set/way.
0b0011	As for 0b0010, and adds: • Invalidate instruction cache line by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

L1UniVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by VA are: • Clean cache line by VA. • Invalidate cache line by VA. • Clean and invalidate cache line by VA.
0b0010	As for 0b0001, and adds: • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

L1HvdVA	Meaning
`0b0000`	None supported.
`0b0001`	Supported Level 1 Harvard cache line maintenance operations by VA are: • Clean data cache line by VA. • Invalidate data cache line by VA. • Clean and invalidate data cache line by VA. • Clean instruction cache line by VA.
`0b0010`	As for `0b0001`, and adds: • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

Accessing ID_MMFR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_MMFR1;
elsif PSTATE.EL == EL2 then
    return ID_MMFR1;
elsif PSTATE.EL == EL3 then
    return ID_MMFR1;
```

ID_MMFR2, Memory Model Feature Register 2

The ID_MMFR2 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_MMFR2 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR2_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_MMFR2 are UNDEFINED.

Attributes

ID_MMFR2 is a 32-bit register.

Field descriptions

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
HWAccFlg	WFIStall	MemBarr	UniTLB	HvdTLB	L1HvdRng	L1HvdBG	L1HvdFG

HWAccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

HWAccFlg	Meaning
0b0000	Not supported.
0b0001	Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

WFIStall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

WFIStall	Meaning
0b0000	Not supported.
0b0001	Support for WFI stalling.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc == 1111) encoding space. Defined values are:

MemBarr	Meaning
0b0000	None supported.
0b0001	Supported memory barrier System instructions are: • Data Synchronization Barrier (DSB).
0b0010	As for 0b0001, and adds: • Instruction Synchronization Barrier (ISB). • Data Memory Barrier (DMB).

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Arm deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

UniTLB	Meaning
0b0000	Not supported.
0b0001	Supported unified TLB maintenance operations are: • Invalidate all entries in the TLB. • Invalidate TLB entry by VA.
0b0010	As for 0b0001, and adds: • Invalidate TLB entries by ASID match.
0b0011	As for 0b0010, and adds: • Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation
0b0100	As for 0b0011, and adds: • Invalidate Hyp mode unified TLB entry by VA. • Invalidate entire Non-secure PL1&0 unified TLB. • Invalidate entire Hyp mode unified TLB.
0b0101	As for 0b0100, and adds the following operations: TLBIMVALIS, TLBIMVAALIS, TLBIMVALHIS, TLBIMVAL, TLBIMVAAL,TLBIMVALH.
0b0110	As for 0b0101, and adds the following operations: TLBIIPAS2IS, TLBIIPAS2LIS, TLBIIPAS2, TLBIIPAS2L.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0110.

HvdTLB, bits [15:12]

If the value of ID_MMFR2.UniTLB is not 0b0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

L1HvdRng	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache maintenance range operations are: • Invalidate data cache range by VA. • Invalidate instruction cache range by VA. • Clean data cache range by VA. • Clean and invalidate data cache range by VA.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

L1HvdBG	Meaning
`0b0000`	Not supported.
`0b0001`	Supported Level 1 Harvard cache background fetch operations are: • Fetch instruction cache range by VA. • Fetch data cache range by VA.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

L1HvdFG	Meaning
`0b0000`	Not supported.
`0b0001`	Supported Level 1 Harvard cache foreground fetch operations are: • Fetch instruction cache range by VA. • Fetch data cache range by VA.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

Accessing ID_MMFR2

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b110

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_MMFR2;
elsif PSTATE.EL == EL2 then
    return ID_MMFR2;
elsif PSTATE.EL == EL3 then
    return ID_MMFR2;
```

ID_MMFR3, Memory Model Feature Register 3

The ID_MMFR3 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_MMFR3 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR3_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_MMFR3 are UNDEFINED.

Attributes

ID_MMFR3 is a 32-bit register.

Field descriptions

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
Supersec	CMemSz	CohWalk	PAN	MaintBcst	BPMaint	CMaintSW	CMaintVA

Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

Supersec	Meaning
0b0000	Supersections supported.
0b1111	Supersections not supported.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b1111`.

CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

CMemSz	Meaning
0b0000	4GB, corresponding to a 32-bit physical address range.
0b0001	64GB, corresponding to a 36-bit physical address range.
0b0010	1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000`, `0b0001`, and `0b0010`.

CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

CohWalk	Meaning
0b0000	Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.
0b0001	Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

PAN, bits [19:16]

Privileged Access Never. Indicates support for the PAN bit in CPSR, SPSR, and DSPSR in AArch32 state. Defined values are:

PAN	Meaning
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and ATS1CPRP and ATS1CPWP instructions supported.

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

In Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the only permitted value is 0b0010.

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

MaintBcst	Meaning
0b0000	Cache, TLB, and branch predictor operations only affect local structures.
0b0001	Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.
0b0010	Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

BPMaint	Meaning
0b0000	None supported.
0b0001	Supported branch predictor maintenance operations are: • Invalidate all branch predictors.
0b0010	As for 0b0001, and adds: • Invalidate branch predictors by VA.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

CMaintSW	Meaning
`0b0000`	None supported.
`0b0001`	Supported hierarchical cache maintenance instructions by set/way are: • Invalidate data cache by set/way. • Clean data cache by set/way. • Clean and invalidate data cache by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

CMaintVA	Meaning
`0b0000`	None supported.
`0b0001`	Supported hierarchical cache maintenance operations by VA are: • Invalidate data cache by VA. • Clean data cache by VA. • Clean and invalidate data cache by VA. • Invalidate instruction cache by VA. • Invalidate all instruction cache entries.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Accessing ID_MMFR3

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

ID_MMFR4, Memory Model Feature Register 4

The ID_MMFR4 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_MMFR4 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR4_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_MMFR4 are UNDEFINED.

Attributes

ID_MMFR4 is a 32-bit register.

Field descriptions

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
EVT	CCIDX	LSM	HPDS	CnP	XNX	AC2	SpecSEI

EVT, bits [31:28]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR2.{TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

EVT	Meaning
`0b0000`	HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are not supported.
`0b0001`	HCR2.{TOCU, TICAB, TID4} traps are supported. HCR2.TTLBIS trap is not supported.
`0b0010`	HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are supported.

All other values are reserved.

FEAT_EVT implements the functionality identified by the values `0b0001` and `0b0010`.

If EL2 is not implemented supporting AArch32, the only permitted value is `0b0000`.

In Armv8.2, the permitted values are `0b0000`, `0b0001`, and `0b0010`.

From Armv8.5, the permitted values are:

- `0b0000` when EL2 is not implemented or does not support AArch32.
- `0b0010` when EL2 is implemented and supports AArch32.

CCIDX, bits [27:24]

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.
0b0001	64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.

All other values are reserved.

FEAT_CCIDX implements the functionality identified by `0b0001`.

From Armv8.3, the permitted values are `0b0000` and `0b0001`.

LSM, bits [23:20]

Indicates support for LSMAOE and nTLSMD bits in HSCTLR and SCTLR. Defined values are:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value `0b0001`.

From Armv8.2, the permitted values are `0b0000` and `0b0001`.

HPDS, bits [19:16]

Hierarchical permission disables bits in translation tables. Defined values are:

HPDS	Meaning
0b0000	Disabling of hierarchical controls not supported.
0b0001	Supports disabling of hierarchical controls using the TTBCR2.HPD0, TTBCR2.HPD1, and HTCR.HPD bits.
0b0010	As for value `0b0001`, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

FEAT_AA32HPD implements the functionality identified by the value `0b0001`.

FEAT_HPDS2 implements the functionality added by the value `0b0010`.

Note

The value `0b0000` implies that the encoding for TTBCR2 is UNDEFINED.

CnP, bits [15:12]

Common not Private translations. Defined values are:

CnP	Meaning
0b0000	Common not Private translations not supported.
0b0001	Common not Private translations supported.

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value `0b0001`.

From Armv8.2, the only permitted value is `0b0001`.

XNX, bits [11:8]

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

When FEAT_XNX is implemented:

- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4.XNX is 0b0000 or 0b0001:
  - ID_AA64MMFR1_EL1.XNX ==1.
  - EL2 cannot use AArch32.
  - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0b0001.

AC2, bits [7:4]

Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2. Defined values are:

AC2	Meaning
0b0000	ACTLR2 and HACTLR2 are not implemented.
0b0001	ACTLR2 and HACTLR2 are implemented.

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [3:0]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

SpecSEI	Meaning
0b0000	The PE never generates an SError interrupt due to an External abort on a speculative read.
0b0001	The PE might generate an SError interrupt due to an External abort on a speculative read.

All other values are reserved.

Accessing ID_MMFR4

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0010	0b110

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!IsZero(ID_MMFR4) || boolean
IMPLEMENTATION_DEFINED "ID_MMFR4 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && (!IsZero(ID_MMFR4) || boolean
IMPLEMENTATION_DEFINED "ID_MMFR4 trapped by HCR.TID3") && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_MMFR4;
elsif PSTATE.EL == EL2 then
    return ID_MMFR4;
elsif PSTATE.EL == EL3 then
    return ID_MMFR4;
```

ID_MMFR5, Memory Model Feature Register 5

The ID_MMFR5 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_MMFR5 bits [31:0] are architecturally mapped to AArch64 System register ID_MMFR5_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_MMFR5 are UNDEFINED.

Attributes

ID_MMFR5 is a 32-bit register.

Field descriptions

31–8	7–4	3–0
RES0	nTLBPA	ETS

Bits [31:8]

Reserved, RES0.

nTLBPA, bits [7:4]

Indicates support for intermediate caching of translation table walks. Defined values are:

nTLBPA	Meaning
`0b0000`	The intermediate caching of translation table walks might include non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE where either: • The caching is indexed by the physical address of the location holding the translation table entry. • The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.
`0b0001`	The intermediate caching of translation table walks does not include non-coherent caches of previous valid translation table entries since the last completed TLBI applicable to the PE where either: • The caching is indexed by the physical address of the location holding the translation table entry. • The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.

All other values are reserved.

FEAT_nTLBPA implements the functionality identified by the value `0b0001`.

From Armv8.0, the permitted values are `0b0000` and `0b0001`.

ETS, bits [3:0]

Indicates support for Enhanced Translation Synchronization. Defined values are:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is supported.

All other values are reserved.

FEAT_ETS implements the functionality identified by the value `0b0001`.

From Armv8.0, the permitted values are `0b0000` and `0b0001`.

From Armv8.7, the only permitted value is `0b0001`.

Accessing ID_MMFR5

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0011	0b110

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && (!IsZero(ID_MMFR5) || boolean
IMPLEMENTATION_DEFINED "ID_MMFR5 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then

ID_PFR0, Processor Feature Register 0

The ID_PFR0 characteristics are:

Purpose

Gives top-level information about the instruction sets and other features supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_PFR0 bits [31:0] are architecturally mapped to AArch64 System register ID_PFR0_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_PFR0 are UNDEFINED.

Attributes

ID_PFR0 is a 32-bit register.

Field descriptions

31–28	27–24	23–20	19–16	15–12	11–8	7–4	3–0
RAS	DIT	AMU	CSV2	State3	State2	State1	State0

RAS, bits [31:28]

RAS Extension version. Defined values are:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	RAS Extension implemented.
0b0010	FEAT_RASv1p1 implemented. As 0b0001, and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT_DoubleFault is not implemented, and ERRIDR.NUM is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

Note

When the value of this field is 0b0001, ID_PFR2.RAS_frac indicates whether FEAT_RASv1p1 is implemented.

DIT, bits [27:24]

Data Independent Timing. Defined values are:

DIT	Meaning
0b0000	AArch32 does not guarantee constant execution time of any instructions.
0b0001	AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [23:20]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

CSV2, bits [19:16]

Speculative use of out of context branch targets. Defined values are:

CSV2	Meaning
0b0000	This PE does not disclose whether branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context.
0b0001	Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way.
0b0010	Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Within a hardware-described context, branch targets trained for branches situated at one address can control speculative execution of branches situated at different addresses only in a hard-to-determine way.

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.5, the permitted values are `0b0001` and `0b0010`.

State3, bits [15:12]

T32EE instruction set support. Defined values are:

State3	Meaning
`0b0000`	Not implemented.
`0b0001`	T32EE instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

State2, bits [11:8]

Jazelle extension support. Defined values are:

State2	Meaning
`0b0000`	Not implemented.
`0b0001`	Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.
`0b0010`	Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

State1, bits [7:4]

T32 instruction set support. Defined values are:

State1	Meaning
`0b0000`	T32 instruction set not implemented.
`0b0001`	T32 encodings before the introduction of Thumb-2 technology implemented: • All instructions are 16-bit. • A BL or BLX is a pair of 16-bit instructions. • 32-bit instructions other than BL and BLX cannot be encoded.
`0b0011`	T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0011`.

State0, bits [3:0]

A32 instruction set support. Defined values are:

State0	Meaning
`0b0000`	A32 instruction set not implemented.
`0b0001`	A32 instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Accessing ID_PFR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_PFR0;
elsif PSTATE.EL == EL2 then
    return ID_PFR0;
elsif PSTATE.EL == EL3 then
    return ID_PFR0;
```

ID_PFR1, Processor Feature Register 1

The ID_PFR1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_PFR1 bits [31:0] are architecturally mapped to AArch64 System register ID_PFR1_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_PFR1 are UNDEFINED.

Attributes

ID_PFR1 is a 32-bit register.

Field descriptions

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
GIC	Virt_frac	Sec_frac	GenTimer	Virtualization	MProgMod	Security	ProgMod

GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is `0b0000`, determines the support for Virtualization Extensions. Defined values are:

Virt_frac	Meaning
0b0000	No Virtualization Extensions are implemented.
0b0001	The following Virtualization Extensions are implemented: • The SCR.SIF bit, if EL3 is implemented. • The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented. • The MSR (banked register) and MRS (banked register) instructions. • The ERET instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

- `0b0000` when EL2 is implemented.
- `0b0001` when EL2 is not implemented.

This field is valid only when the value of ID_PFR1.Virtualization is 0, otherwise it holds the value `0b0000`.

Note

The ID_ISAR registers do not identify whether the instructions added by the Virtualization Extensions are implemented.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is `0b0000`, determines the support for Security Extensions. Defined values are:

Sec_frac	Meaning
`0b0000`	No Security Extensions are implemented.
`0b0001`	The following Security Extensions are implemented: • The VBAR register. • The TTBCR.PD0 and TTBCR.PD1 bits.
`0b0010`	As for `0b0001`, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In Armv8-A, the permitted values are:

- `0b0000` when EL3 is implemented.
- `0b0001` or `0b0010` when EL3 is not implemented.

This field is valid only when the value of ID_PFR1.Security is 0, otherwise it holds the value `0b0000`.

GenTimer, bits [19:16]

Generic Timer support. Defined values are:

GenTimer	Meaning
`0b0000`	Generic Timer is not implemented.
`0b0001`	Generic Timer is implemented.
`0b0010`	Generic Timer is implemented, and also includes support for CNTHCTL.EVNTIS and CNTKCTL.EVNTIS fields, and CNTPCTSS and CNTVCTSS counter views.

All other values are reserved.

FEAT_ECV implements the functionality identified by the value `0b0010`.

In Armv8.0, the only permitted value is `0b0001`.

From Armv8.6, the only permitted value is `0b0010`.

Virtualization, bits [15:12]

Virtualization support. Defined values are:

Virtualization	Meaning
`0b0000`	EL2, Hyp mode, and the HVC instruction not implemented.
`0b0001`	EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == `0b0001` implemented.

All other values are reserved.

In Armv8-A, the permitted values are:

- `0b0000` when EL2 is not implemented.
- `0b0001` when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value `0b0001`.

Note

The ID_ISARs do not identify whether the HVC instruction is implemented.

MProgMod, bits [11:8]

M-profile programmers' model support. Defined values are:

MProgMod	Meaning
`0b0000`	Not supported.
`0b0010`	Support for two-stack programmers' model.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

Security, bits [7:4]

Security support. Defined values are:

Security	Meaning
`0b0000`	EL3, Monitor mode, and the SMC instruction not implemented.
`0b0001`	EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == `0b0001` implemented.
`0b0010`	As for `0b0001`, and adds the ability to set the NSACR.RFR bit. Not permitted in Armv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In Armv8-A, the permitted values are:

- `0b0000` when EL3 is not implemented.
- `0b0001` when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value `0b0001`.

ProgMod, bits [3:0]

Support for the standard programmers' model for ARMv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

ProgMod	Meaning
`0b0000`	Not supported.
`0b0001`	Supported.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0001`.

Accessing ID_PFR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0001	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID3 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID3 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ID_PFR1;
elsif PSTATE.EL == EL2 then
    return ID_PFR1;
elsif PSTATE.EL == EL3 then
    return ID_PFR1;
```

ID_PFR2, Processor Feature Register 2

The ID_PFR2 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0 and ID_PFR1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register ID_PFR2 bits [31:0] are architecturally mapped to AArch64 System register ID_PFR2_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ID_PFR2 are UNDEFINED.

Attributes

ID_PFR2 is a 32-bit register.

Field descriptions

31–12	11–8	7–4	3–0
RES0	RAS_frac	SSBS	CSV3

Bits [31:12]

Reserved, RES0.

RAS_frac, bits [11:8]

RAS Extension fractional field.

RAS_frac	Meaning
0b0000	If ID_PFR0.RAS == 0b0001, RAS Extension implemented.
0b0001	If ID_PFR0.RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

This field is valid only if ID_PFR0.RAS == 0b0001.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

SSBS	Meaning
0b0000	AArch32 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.

In Armv8.0, the permitted values are `0b0000` and `0b0001`.

From Armv8.5, the only permitted value is `0b0001`.

All other values are reserved.

CSV3, bits [3:0]

Speculative use of faulting data. Defined values are:

CSV3	Meaning
0b0000	This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence.
0b0001	Data loaded under speculation with a permission or domain fault cannot be used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence. The execution timing of any other instructions in the speculative sequence is not a function of the data loaded under speculation.

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value `0b0001`.

In Armv8.0, the permitted values are `0b0000` and `0b0001`.

From Armv8.5, the only permitted value is `0b0001`.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

Accessing ID_PFR2

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

IFAR, Instruction Fault Address Register

The IFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Prefetch Abort exception.

Configuration

AArch32 System register IFAR bits [31:0] are architecturally mapped to AArch64 System register FAR_EL1[63:32].

AArch32 System register IFAR bits [31:0] (S) are architecturally mapped to AArch32 System register HIFAR[31:0] when EL2 is implemented, EL3 is implemented and the implementation only supports execution in AArch32 state.

AArch32 System register IFAR bits [31:0] (S) are architecturally mapped to AArch64 System register FAR_EL2[63:32] when EL2 is implemented.

This register is present only when AArch32 is supported. Otherwise, direct accesses to IFAR are UNDEFINED.

Attributes

IFAR is a 32-bit register.

Field descriptions

IFSR, Instruction Fault Status Register

The IFSR characteristics are:

Purpose

Holds status information about the last instruction fault.

Configuration

AArch32 System register IFSR bits [31:0] are architecturally mapped to AArch64 System register IFSR32_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to IFSR are UNDEFINED.

The current translation table format determines which format of the register is used.

Attributes

IFSR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17	16	15 14 13	12	11	10	9	8 7 6 5 4	3 2 1 0
RES0	FnV	RES0	ExT	RES0	FS[4]	LPAE	RES0	FS[3:0]

Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
`0b0`	IFAR is valid.
`0b1`	IFAR is not valid, and holds an UNKNOWN value.

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault Status bits. Bits [10] and [3:0] are interpreted together.

FS	Meaning	Applies when
0b00001	PC alignment fault.	
0b00010	Debug exception.	
0b00011	Access flag fault, level 1.	
0b00101	Translation fault, level 1.	
0b00110	Access flag fault, level 2.	
0b00111	Translation fault, level 2.	
0b01000	Synchronous External abort, not on translation table walk.	
0b01001	Domain fault, level 1.	
0b01011	Domain fault, level 2.	
0b01100	Synchronous External abort, on translation table walk, level 1.	
0b01101	Permission fault, level 1.	
0b01110	Synchronous External abort, on translation table walk, level 2.	
0b01111	Permission fault, level 2.	
0b10000	TLB conflict abort.	
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault).	
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b11100	Synchronous parity or ECC error on translation table walk, level 1.	When FEAT_RAS is not implemented
0b11110	Synchronous parity or ECC error on translation table walk, level 2.	When FEAT_RAS is not implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is IFSR[10].
- FS[3:0] is IFSR[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == 1:

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17	16	15 14 13	12	11 10	9	8 7 6	5 4 3 2 1 0
RES0	FnV	RES0	ExT	RES0	LPAE	RES0	STATUS

Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	IFAR is valid.
0b1	IFAR is not valid, and holds an UNKNOWN value.

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

STATUS	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100001	PC alignment fault.	
0b100010	Debug exception.	
0b110000	TLB conflict abort.	

All other values are reserved.

When FEAT_RAS is implemented, `0b011000`, `0b011101`, `0b011110`, and `0b011111` are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing IFSR

Accesses to this register use the following encodings in the System register encoding space:

ISR, Interrupt Status Register

The ISR characteristics are:

Purpose

Shows the pending status of the IRQ, FIQ, or SError.

When executing at EL2, EL3, or Secure EL1, when SCR_EL3.EEL2 == `0b0`, this shows the pending status of the physical interrupts.

When executing at Non-secure EL1, or at Secure EL1, when SCR_EL3.EEL2 == `0b01`:

- If the HCR.{IMO,FMO,AMO} bit has a value of 1, the corresponding ISR.{I,F,A} bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the HCR.{IMO,FMO,AMO} bit has a value of 0, the corresponding ISR.{I,F,A} bit shows the pending status of the physical IRQ, FIQ, or SError.

Configuration

AArch32 System register ISR bits [31:0] are architecturally mapped to AArch64 System register ISR_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to ISR are UNDEFINED.

Attributes

ISR is a 32-bit register.

Field descriptions

31–9	8	7	6	5–0
RES0	A	I	F	RES0

Bits [31:9]

Reserved, RES0.

A, bit [8]

SError interrupt pending bit:

A	Meaning
`0b0`	No pending SError interrupt.
`0b1`	An SError interrupt is pending.

If the SError interrupt is edge-triggered, this field is cleared to zero when the physical SError interrupt is taken.

I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending:

I	Meaning
`0b0`	No pending IRQ.
`0b1`	An IRQ interrupt is pending.

F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

F	Meaning
`0b0`	No pending FIQ.
`0b1`	An FIQ interrupt is pending.

Bits [5:0]

Reserved, RES0.

Accessing ISR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0001	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return ISR;
elsif PSTATE.EL == EL2 then

ITLBIALL, Instruction TLB Invalidate All

The ITLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ITLBIALL are UNDEFINED.

Attributes

ITLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the ITLBIALL instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0101	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;

ITLBIASID, Instruction TLB Invalidate by ASID match

The ITLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
    - Is from a level of lookup above the final level.
    - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ITLBIASID are UNDEFINED.

Attributes

ITLBIASID is a 32-bit System instruction.

Field descriptions

31:8	7:0
RES0	ASID

Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing the ITLBIASID instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

0b1111	0b000	0b1000	0b0101	0b010

```

ITLBIMVA, Instruction TLB Invalidate by VA

The ITLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from instruction TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
    - The entry is from a level of lookup above the final level and matches the specified ASID.
    - The entry is a global entry from the final level of lookup.
    - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ITLBIMVA are UNDEFINED.

Attributes

ITLBIMVA is a 32-bit System instruction.

Field descriptions

31:12	11:8	7:0
VA	RES0	ASID

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this operation, regardless of the value of the ASID field.

Executing the ITLBIMVA instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

MAIR0, Memory Attribute Indirection Register 0

The MAIR0 characteristics are:

Purpose

Along with MAIR1, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIndx[2] indicates the MAIR register to be used:

- When AttrIndx[2] is 0, MAIR0 is used.
- When AttrIndx[2] is 1, MAIR1 is used.

Configuration

AArch32 System register MAIR0 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR0 bits [31:0] are architecturally mapped to AArch32 System register PRRR[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR0 bits [31:0] (MAIR0_NS) are architecturally mapped to AArch32 System register PRRR[31:0] (PRRR_NS) when EL3 is using AArch32.

AArch32 System register MAIR0 bits [31:0] (MAIR0_S) are architecturally mapped to AArch32 System register PRRR[31:0] (PRRR_S) when EL3 is using AArch32.

This register is present only when AArch32 is supported. Otherwise, direct accesses to MAIR0 are UNDEFINED.

MAIR0 and PRRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in MAIR0.

When EL3 is using AArch32, write access to MAIR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Attributes

MAIR0 is a 32-bit register.

Field descriptions

When TTBCR.EAE == 1:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Attr3								Attr2								Attr1								Attr0							

Attr<n>, bits [8n+7:8n], for n = 3 to 0

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
0b0000	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not 0b00	Normal memory, Outer Write-Through Transient.
0b0100	Normal memory, Outer Non-cacheable.
0b01RW, RW not 0b00	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is 0b0000	Meaning when Attr<n>[7:4] is not 0b0000
0b0000	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
0b0100	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
0b1000	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=0b00)
0b10RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
0b1100	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=0b00)
0b11RW, RW not 0b00	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
0b0	No Allocate
0b1	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

MAIR1, Memory Attribute Indirection Register 1

The MAIR1 characteristics are:

Purpose

Along with MAIR0, provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations.

AttrIndx[2] indicates the MAIR register to be used:

- When AttrIndx[2] is 0, MAIR0 is used.
- When AttrIndx[2] is 1, MAIR1 is used.

Configuration

AArch32 System register MAIR1 bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[63:32] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR1 bits [31:0] are architecturally mapped to AArch32 System register NMRR[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register MAIR1 bits [31:0] (MAIR1_NS) are architecturally mapped to AArch32 System register NMRR[31:0] (NMRR_NS) when EL3 is using AArch32.

AArch32 System register MAIR1 bits [31:0] (MAIR1_S) are architecturally mapped to AArch32 System register NMRR[31:0] (NMRR_S) when EL3 is using AArch32.

This register is present only when AArch32 is supported. Otherwise, direct accesses to MAIR1 are UNDEFINED.

MAIR1 and NMRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in MAIR1.

When EL3 is using AArch32, write access to MAIR1(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Attributes

MAIR1 is a 32-bit register.

Field descriptions

When TTBCR.EAE == 1:

31–24	23–16	15–8	7–0
Attr7	Attr6	Attr5	Attr4

Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 7 to 4

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

Attr<n>[7:4]	Meaning
`0b0000`	Device memory. See encoding of Attr<n>[3:0] for the type of Device memory.
0b00RW, RW not `0b00`	Normal memory, Outer Write-Through Transient.
`0b0100`	Normal memory, Outer Non-cacheable.
0b01RW, RW not `0b00`	Normal memory, Outer Write-Back Transient.
0b10RW	Normal memory, Outer Write-Through Non-transient.
0b11RW	Normal memory, Outer Write-Back Non-transient.

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

Attr<n>[3:0]	Meaning when Attr<n>[7:4] is `0b0000`	Meaning when Attr<n>[7:4] is not `0b0000`
`0b0000`	Device-nGnRnE memory	UNPREDICTABLE
0b00RW, RW not `0b00`	UNPREDICTABLE	Normal memory, Inner Write-Through Transient
`0b0100`	Device-nGnRE memory	Normal memory, Inner Non-cacheable
0b01RW, RW not `0b00`	UNPREDICTABLE	Normal memory, Inner Write-Back Transient
`0b1000`	Device-nGRE memory	Normal memory, Inner Write-Through Non-transient (RW=`0b00`)
0b10RW, RW not `0b00`	UNPREDICTABLE	Normal memory, Inner Write-Through Non-transient
`0b1100`	Device-GRE memory	Normal memory, Inner Write-Back Non-transient (RW=`0b00`)
0b11RW, RW not `0b00`	UNPREDICTABLE	Normal memory, Inner Write-Back Non-transient

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

R or W	Meaning
`0b0`	No Allocate
`0b1`	Allocate

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR1

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0010	0b001

```

MIDR, Main ID Register

The MIDR characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

AArch32 System register MIDR bits [31:0] are architecturally mapped to AArch64 System register MIDR_EL1[31:0].

AArch32 System register MIDR bits [31:0] are architecturally mapped to External register MIDR_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to MIDR are UNDEFINED.

Some fields of the MIDR are IMPLEMENTATION DEFINED. For more information about the values of these fields for a particular Armv8 implementation, and any implementation-specific significance of these values, see the product documentation.

Attributes

MIDR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12 11 10 9 8 7 6 5 4	3 2 1 0
Implementer	Variant	Architecture	PartNum	Revision

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is **RO**.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture, bits [19:16]

Architecture version. Defined values are:

Architecture	Meaning
`0b0001`	Armv4.
`0b0010`	Armv4T.
`0b0011`	Armv5 (obsolete).
`0b0100`	Armv5T.
`0b0101`	Armv5TE.
`0b0110`	Armv5TEJ.
`0b0111`	Armv6.
`0b1111`	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

Access to this field is **RO**.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are `0x0` or `0x7`, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing MIDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) then
        return VPIDR_EL2<31:0>;
    elsif EL2Enabled() && ELUsingAArch32(EL2) then
        return VPIDR;
    else
        return MIDR;
elsif PSTATE.EL == EL2 then
    return MIDR;
elsif PSTATE.EL == EL3 then
    return MIDR;
```

MPIDR, Multiprocessor Affinity Register

The MPIDR characteristics are:

Purpose

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

Configuration

AArch32 System register MPIDR bits [31:0] are architecturally mapped to AArch64 System register MPIDR_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to MPIDR are UNDEFINED.

In a uniprocessor system, Arm recommends that each Aff<n> field of this register returns a value of 0.

Attributes

MPIDR is a 32-bit register.

Field descriptions

31	30	29:25	24	23:16	15:8	7:0
M	U	RES0	MT	Aff2	Aff1	Aff0

M, bit [31]

Indicates whether this implementation includes the functionality introduced by the Armv7 Multiprocessing Extensions.

M	Meaning
0b0	This implementation does not include the Armv7 Multiprocessing Extensions functionality.
0b1	This implementation includes the Armv7 Multiprocessing Extensions functionality.

Access to this field is **RAO/WI**.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels.

MT	Meaning
`0b0`	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
`0b1`	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

Accessing MPIDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) then
        return VMPIDR_EL2<31:0>;
    elsif EL2Enabled() && ELUsingAArch32(EL2) then
        return VMPIDR;
    else
        return MPIDR;
elsif PSTATE.EL == EL2 then
    return MPIDR;
elsif PSTATE.EL == EL3 then
    return MPIDR;
```

MVBAR, Monitor Vector Base Address Register

The MVBAR characteristics are:

Purpose

When EL3 is implemented and can use AArch32, holds the vector base address for any exception that is taken to Monitor mode.

Secure software must program the MVBAR with the required initial value as part of the PE boot sequence.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to MVBAR are UNDEFINED.

It is IMPLEMENTATION DEFINED whether MVBAR[0] has a fixed value and ignored writes, or takes the last value written to it.

On a Warm reset into EL3 using AArch32, the reset value of MVBAR is an IMPLEMENTATION DEFINED choice between the following:

- MVBAR[31:5] = an IMPLEMENTATION DEFINED value, which might be UNKNOWN, MVBAR[4:1] = RES0, and MVBAR[0] = 0.
- MVBAR[31:1] = an IMPLEMENTATION DEFINED value that is bits[31:1] of the AArch32 reset address, and MVBAR[0] = 1.

Attributes

MVBAR is a 32-bit register.

Field descriptions

When programmed with a vector base address:

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5	4 3 2 1 0
Vector Base Address	Reserved

Bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

Reserved, bits [4:0]

Reserved, see Configurations.

Accessing MVBAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

MVFR0, Media and VFP Feature Register 0

The MVFR0 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR1 and MVFR2.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register MVFR0 bits [31:0] are architecturally mapped to AArch64 System register MVFR0_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to MVFR0 are UNDEFINED.

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

Attributes

MVFR0 is a 32-bit register.

Field descriptions

31:28	27:24	23:20	19:16	15:12	11:8	7:4	3:0
FPRound	FPShVec	FPSqrt	FPDivide	FPTrap	FPDP	FPSP	SIMDReg

FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

FPRound	Meaning
0b0000	Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.
0b0001	All rounding modes supported.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

FPShVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

FPShVec	Meaning
0b0000	Short vectors not supported.
0b0001	Short vector operation supported.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

FPSqrt	Meaning
`0b0000`	Not supported in hardware.
`0b0001`	Supported.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

FPDivide	Meaning
`0b0000`	Not supported in hardware.
`0b0001`	Supported.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

FPTrap	Meaning
`0b0000`	Not supported.
`0b0001`	Supported.

All other values are reserved.

A value of `0b0001` indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

FPDP, bits [11:8]

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:

FPDP	Meaning
`0b0000`	Not supported in hardware.
`0b0001`	Supported, VFPv2.
`0b0010`	Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0010`.

A value of `0b0001` or `0b0010` indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is `0b0001`.

- VDIV.F64 is only available if the Divide field is `0b0001`.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

FPSP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

FPSP	Meaning
`0b0000`	Not supported in hardware.
`0b0001`	Supported, VFPv2.
`0b0010`	Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0010`.

A value of `0b0001` or `0b0010` indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is `0b0001`.
- VDIV.F32 is only available if the Divide field is `0b0001`.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

SIMDReg	Meaning
`0b0000`	The implementation has no Advanced SIMD and floating-point support.
`0b0001`	The implementation includes floating-point support with 16 x 64-bit registers.
`0b0010`	The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0010`.

Accessing MVFR0

Accesses to this register use the following encodings in the System register encoding space:

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

reg
0b0111

```
if PSTATE.EL == EL0 then

MVFR1, Media and VFP Feature Register 1

The MVFR1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR0 and MVFR2.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register MVFR1 bits [31:0] are architecturally mapped to AArch64 System register MVFR1_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to MVFR1 are UNDEFINED.

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

Attributes

MVFR1 is a 32-bit register.

Field descriptions

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
SIMDFMAC	FPHP	SIMDHP	SIMDSP	SIMDInt	SIMDLS	FPDNaN	FPFtZ

SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

SIMDFMAC	Meaning
`0b0000`	Not implemented.
`0b0001`	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

FPHP, bits [27:24]

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

FPHP	Meaning
0b0000	Not supported.
0b0001	Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds instructions for conversion between double-precision and half-precision.
0b0011	As for 0b0010, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- 0b0011 in an implementation with floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

Half Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

SIMDHP, bits [23:20]

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

SIMDHP	Meaning
0b0000	Not supported.
0b0001	SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0001 in an implementation with SIMD floating-point support that does not include the FEAT_FP16 extension.
- 0b0010 in an implementation with SIMD floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

Half Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

SIMDSP, bits [19:16]

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

SIMDSP	Meaning
0b0000	Not implemented.
0b0001	Implemented. This value is permitted only if the SIMDInt field is 0b0001.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SIMDInt, bits [15:12]

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

SIMDInt	Meaning
`0b0000`	Not implemented.
`0b0001`	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

SIMDLS, bits [11:8]

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

SIMDLS	Meaning
`0b0000`	Not implemented.
`0b0001`	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

FPDNaN, bits [7:4]

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

FPDNaN	Meaning
`0b0000`	Not implemented, or hardware supports only the Default NaN mode.
`0b0001`	Hardware supports propagation of NaN values.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

FPFtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

FPFtZ	Meaning
`0b0000`	Not implemented, or hardware supports only the Flush-to-Zero mode of operation.
`0b0001`	Hardware supports full denormalized number arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0001`.

Accessing MVFR1

Accesses to this register use the following encodings in the System register encoding space:

MVFR2, Media and VFP Feature Register 2

The MVFR2 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with MVFR0 and MVFR1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch32 System register MVFR2 bits [31:0] are architecturally mapped to AArch64 System register MVFR2_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to MVFR2 are UNDEFINED.

Implemented only if the implementation includes Advanced SIMD and floating-point instructions.

Attributes

MVFR2 is a 32-bit register.

Field descriptions

31–8	7–4	3–0
RES0	FPMisc	SIMDMisc

Bits [31:8]

Reserved, RES0.

FPMisc, bits [7:4]

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

FPMisc	Meaning
`0b0000`	Not implemented, or no support for miscellaneous features.
`0b0001`	Support for Floating-point selection.
`0b0010`	As `0b0001`, and Floating-point Conversion to Integer with Directed Rounding modes.
`0b0011`	As `0b0010`, and Floating-point Round to Integer Floating-point.
`0b0100`	As `0b0011`, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0100`.

SIMDMisc, bits [3:0]

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

SIMDMisc	Meaning
`0b0000`	Not implemented, or no support for miscellaneous features.
`0b0001`	Floating-point Conversion to Integer with Directed Rounding modes.
`0b0010`	As `0b0001`, and Floating-point Round to Integer Floating-point.
`0b0011`	As `0b0010`, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are `0b0000` and `0b0011`.

NMRR, Normal Memory Remap Register

The NMRR characteristics are:

Purpose

Provides additional mapping controls for memory regions that are mapped as Normal memory by their entry in the PRRR.

Used in conjunction with the PRRR.

Configuration

AArch32 System register NMRR bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[63:32] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register NMRR bits [31:0] are architecturally mapped to AArch32 System register MAIR1[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register NMRR bits [31:0] (NMRR_S) are architecturally mapped to AArch32 System register MAIR1[31:0] (MAIR1_S) when EL3 is using AArch32.

AArch32 System register NMRR bits [31:0] (NMRR_NS) are architecturally mapped to AArch32 System register MAIR1[31:0] (MAIR1_NS) when EL3 is using AArch32.

This register is present only when AArch32 is supported. Otherwise, direct accesses to NMRR are UNDEFINED.

MAIR1 and NMRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in NMRR.
- When it is set to 1, the register is as described in MAIR1.

Attributes

NMRR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

31 30	29 28	27 26	25 24	23 22	21 20	19 18	17 16	15 14	13 12	11 10	9 8	7 6	5 4	3 2	1 0
OR7	OR6	OR5	OR4	OR3	OR2	OR1	OR0	IR7	IR6	IR5	IR4	IR3	IR2	IR1	IR0

OR<n>, bits [2n+17:2n+16], for n = 7 to 0

Outer Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the PRRR.TR<n> entry. n is the value of the TEX[0], C, and B bits concatenated.

OR<n>	Meaning
0b00	Region is Non-cacheable.
0b01	Region is Write-Back, Write-Allocate.
0b10	Region is Write-Through, no Write-Allocate.
0b11	Region is Write-Back, no Write-Allocate.

The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.

When FEAT_XS is implemented, stage 1 Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IR<n>, bits [2n+1:2n], for n = 7 to 0

Inner Cacheable property mapping for memory attributes n, if the region is mapped as Normal memory by the PRRR.TR<n> entry. n is the value of the TEX[0], C, and B bits concatenated.

IR<n>	Meaning
0b00	Region is Non-cacheable.
0b01	Region is Write-Back, Write-Allocate.
0b10	Region is Write-Through, no Write-Allocate.
0b11	Region is Write-Back, no Write-Allocate.

The meaning of the field with n = 6 is IMPLEMENTATION DEFINED and might differ from the meaning given here. This is because the meaning of the attribute combination {TEX[0] = 1, C = 1, B = 0} is IMPLEMENTATION DEFINED.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing NMRR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1010	0b0010	0b001

```
if PSTATE.EL == EL0 then

NSACR, Non-Secure Access Control Register

The NSACR characteristics are:

Purpose

When EL3 is implemented and can use AArch32, defines the Non-secure access permissions to Trace, Advanced SIMD and floating-point functionality. Also includes IMPLEMENTATION DEFINED bits that can define Non-secure access permissions for IMPLEMENTATION DEFINED functionality.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to NSACR are UNDEFINED.

Note

In AArch64 state, the NSACR controls are replaced by controls in CPTR_EL3.

Attributes

NSACR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21	20	19	18 17 16	15	14 13 12	11	10	9 8 7 6 5 4 3 2 1 0
RES0	NSTRCDIS	RES0	IMPLEMENTATION DEFINED	NSASEDIS	RES0	cp11	cp10	RES0

If EL3 is implemented and is using AArch64 then:

- Any read of the NSACR from Non-secure EL2 or Non-secure EL1 returns a value of `0x00000C00`.
- Any read or write to NSACR from Secure EL1 is trapped as an exception to EL3.

If EL3 is not implemented, then any read of the NSACR from EL2 or EL1 returns a value of `0x00000C00`.

Bits [31:21]

Reserved, RES0.

NSTRCDIS, bit [20]

Disables Non-secure System register accesses to all implemented trace registers.

NSTRCDIS	Meaning
`0b0`	This control has no effect on: • System register access to implemented trace registers. • The behavior of CPACR.TRCDIS and HCPTR.TTA.
`0b1`	Non-secure System register accesses to all implemented trace registers are disabled, meaning: • CPACR.TRCDIS behaves as RAO/WI in Non-secure state, regardless of its actual value. • HCPTR.TTA behaves as RAO/WI, regardless of its actual value.

The implementation of this field must correspond to the implementation of the CPACR.TRCDIS field:

- If CPACR.TRCDIS is RAZ/WI, this field is RAZ/WI.

- If CPACR.TRCDIS is RW, this field is RW.

Note

- The ETMv4 architecture does not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4, EL0 accesses to the trace registers are UNDEFINED.
- The architecture does not provide Non-secure access controls on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

Bit [19]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [18:16]

IMPLEMENTATION DEFINED.

NSASEDIS, bit [15]

Disables Non-secure access to the Advanced SIMD functionality.

NSASEDIS	Meaning
`0b0`	This control has no effect on: • Non-secure access to Advanced SIMD functionality. • The behavior of CPACR.ASEDIS and HCPTR.TASE.
`0b1`	Non-secure access to the Advanced SIMD functionality is disabled, meaning: • CPACR.ASEDIS behaves as RAO/WI in Non-secure state, regardless of its actual value. • HCPTR.TASE behaves as RAO/WI, regardless of its actual value.

The implementation of this field must correspond to the implementation of the CPACR.ASEDIS field:

- If CPACR.ASEDIS is RES0, this field is RES0. If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.
- If CPACR.ASEDIS is RAZ/WI, this field is RAZ/WI.
- If CPACR.ASEDIS is RW, this field is RW.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

Bits [14:12]

Reserved, RES0.

cp11, bit [11]

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the NSACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

cp10, bit [10]

Enable Non-secure access to the Advanced SIMD and floating-point features. Possible values of the fields are:

cp10	Meaning
`0b0`	Advanced SIMD and floating-point features can be accessed only from Secure state. Any attempt to access this functionality from Non-secure state is UNDEFINED. When the PE is in Non-secure state: • The CPACR.{cp11, cp10} fields ignore writes and read as `0b00`, access denied. • The HCPTR.{TCP11, TCP10} fields behave as RAO/WI, regardless of their actual values.
`0b1`	Advanced SIMD and floating-point features can be accessed from both Security states.

If Non-secure access to the Advanced SIMD and floating-point functionality is enabled, the CPACR must be checked to determine the level of access that is permitted.

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the FPSCR, FPSID, MVFR0, MVFR1, MVFR2, or FPEXC System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing NSACR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

PAR, Physical Address Register

The PAR characteristics are:

Purpose

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

Configuration

AArch32 System register PAR bits [63:0] are architecturally mapped to AArch64 System register PAR_EL1[63:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to PAR are UNDEFINED.

PAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits[31:0] and do not modify bits[63:32].

The Configurations section specifies the cases where each PAR format is used.

PAR is accessed as a 32-bit value:

- When the PE is not in Hyp mode and is using the Short-descriptor translation table format.
- When the PE is in Hyp mode and executes an ATS12NSOPR, ATS12NSOPW, ATS12NSOUR, or ATS12NSOUW instruction and the value of HCR.VM is 0 and the value of TTBCR.EAE is 0.

In these cases, PAR[63:32] is RES0.

Otherwise, the PAR is accessed as a 64-bit value, if any of the following is true:

- When using the Long-descriptor translation table format.
- If the stage 1 address translation is disabled and TTBCR.EAE is set to 1.
- In an implementation that includes EL2, for the result of an ATS1Cxx instruction performed from Hyp mode.

For PL1&0 stage 1 translations, TTBCR.EAE selects the translation table format.

Attributes

PAR is a 64-bit register.

Field descriptions

When the instruction returned a 32-bit value to the PAR, PAR.F==0:

63:32
RES0

31:12	11	10	9	8	7	6:4	3:2	1	0
PA	LPAE	NOS	NS	IMPLEMENTATION DEFINED	SH	Inner[2:0]	Outer[1:0]	SS	F

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies to the NOS, SH, Inner, and Outer fields.
- See the NS bit description for constraints on the value it returns.

Bits [63:32]

Reserved, RES0.

PA, bits [31:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[31:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

LPAE	Meaning
0b0	Short-descriptor translation table format used. This means the PAR returned a 32-bit value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [10]

Not Outer Shareable. When the returned value of PAR.SH is 1, indicates the Shareability attribute for the physical memory region:

NOS	Meaning
0b0	Memory region is Outer Shareable.
0b1	Memory region is Inner Shareable.

When the returned value of PAR.SH is 0 the value returned to this field is UNKNOWN.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bit [8]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bit [7]

Shareability. Indicates whether the physical memory region is Non-shareable:

SH	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is shareable, and PAR.NOS indicates whether the region is Outer Shareable or Inner Shareable.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Inner[2:0], bits [6:4]

Inner cacheability attribute for the region. Permitted values are:

Inner[2:0]	Meaning
0b000	Non-cacheable.
0b001	Device-nGnRnE.
0b011	Device-nGnRE.
0b101	Write-Back, Write-Allocate.
0b110	Write-Through.
0b111	Write-Back, no Write-Allocate.

The values 0b010 and 0b100 are reserved.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Outer[1:0], bits [3:2]

Outer cacheability attribute for the region. Permitted values are:

Outer[1:0]	Meaning
0b00	Non-cacheable.
0b01	Write-Back, Write-Allocate.
0b10	Write-Through, no Write-Allocate.
0b11	Write-Back, no Write-Allocate.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [1]

Supersection. Used to indicate if the result is a Supersection:

SS	Meaning
0b0	Result is not a Supersection. PAR[31:12] contains OA[31:12].
0b1	Result is a Supersection, and: • PAR[31:24] contains OA[31:24]. • PAR[23:16] contains OA[39:32]. • PAR[15:12] contains 0b0000. If an implementation supports less than 40 bits of physical address, the bits in the PAR field that correspond to physical address bits that are not implemented are UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
`0b0`	Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the instruction returned a 32-bit value to the PAR, PAR.F==1:

63–32
RES0

31–16	15–12	11	10–7	6	5–1	0
IMPLEMENTATION DEFINED	RES0	LPAE	RES0	FS[5]	FS[4:0]	F

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:16]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

LPAE	Meaning
`0b0`	Short-descriptor translation table format used. This means the PAR returned a 32-bit value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:7]

Reserved, RES0.

FS[5], bit [6]

Fault status bits, External abort type. Provides an IMPLEMENTATION DEFINED classification of an External abort. Values are as in the DFSR.ExT field when using the Short-descriptor translation table format.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FS[4:0], bits [5:1]

Fault status bits. Values are as in the DFSR.FS field when using the Short-descriptor translation table format.

FS[4:0]	Meaning	Applies when
0b00001	Alignment fault.	
0b00011	Access flag fault, level 1.	
0b00100	Fault on instruction cache maintenance.	
0b00101	Translation fault, level 1.	
0b00110	Access flag fault, level 2.	
0b00111	Translation fault, level 2.	
0b01001	Domain fault, level 1.	
0b01011	Domain fault, level 2.	
0b01100	Synchronous External abort, on translation table walk, level 1.	
0b01101	Permission fault, level 1.	
0b01110	Synchronous External abort, on translation table walk, level 2.	
0b01111	Permission fault, level 2.	
0b10000	TLB conflict abort.	
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b11100	Synchronous parity or ECC error on translation table walk, level 1.	When FEAT_RAS is not implemented
0b11110	Synchronous parity or ECC error on translation table walk, level 2.	When FEAT_RAS is not implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the instruction returned a 64-bit value to the PAR, PAR.F==0:

Bits	63:56	55:40	39:32
Field	ATTR	RES0	PA

Bits	31:12	11	10	9	8:7	6:1	0
Field	PA	LPAE	IMPLEMENTATION DEFINED	NS	SH	RES0	F

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- Memory attribute fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors. This applies to the ATTR and SH fields.
- See the NS bit description for constraints on the value it returns.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR0 and MAIR1.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [55:40]

Reserved, RES0.

PA, bits [39:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[39:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

LPAE	Meaning
`0b1`	Long-descriptor translation table format used. This means the PAR returned a 64-bit value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address. Permitted values are:

SH	Meaning
`0b00`	Non-shareable.
`0b10`	Outer Shareable.
`0b11`	Inner Shareable.

The value `0b01` is reserved.

> **Note**
>
> This field returns the value `0b10` for:
>
> - Any type of Device memory.
> - Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
`0b0`	Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the instruction returned a 64-bit value to the PAR, PAR.F==1:

63:56	55:52	51:48	47:32
IMPLEMENTATION DEFINED	IMPLEMENTATION DEFINED	IMPLEMENTATION DEFINED	RES0

31:12	11	10	9	8	7	6:1	0
RES0	LPAE	RES0	FSTAGE	S2WLK	RES0	FST	F

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:12]

Reserved, RES0.

LPAE, bit [11]

When updating the PAR with the result of the translation operation, this bit is set as follows:

LPAE	Meaning
`0b1`	Long-descriptor translation table format used. This means the PAR returned a 64-bit value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [10]

Reserved, RES0.

FSTAGE, bit [9]

Indicates the translation stage at which the translation aborted:

FSTAGE	Meaning
`0b0`	Translation aborted because of a fault in the stage 1 translation.
`0b1`	Translation aborted because of a fault in the stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S2WLK, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status field. Values are as in the DFSR.STATUS and IFSR.STATUS fields when using the Long-descriptor translation table format.

FST	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b110000	TLB conflict abort.	

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

PMCCFILTR, Performance Monitors Cycle Count Filter Register

The PMCCFILTR characteristics are:

Purpose

Determines the modes in which the Cycle Counter, PMCCNTR, increments.

Configuration

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to AArch64 System register PMCCFILTR_EL0[31:0].

AArch32 System register PMCCFILTR bits [31:0] are architecturally mapped to External register PMCCFILTR_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR are UNDEFINED.

Attributes

PMCCFILTR is a 32-bit register.

Field descriptions

31	30	29	28	27	26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
P	U	NSK	NSU	NSH	RES0

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR.NSK bit.

P	Meaning
0b0	Count cycles in EL1.
0b1	Do not count cycles in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR.NSU bit.

U	Meaning
0b0	Count cycles in EL0.
0b1	Do not count cycles in EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

NSK, bit [29]
When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMCCFILTR.P, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

NSU, bit [28]
When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of PMCCFILTR.U, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

NSH, bit [27]
When EL2 is implemented:

EL2 (Hyp mode) filtering bit. Controls counting in EL2.

NSH	Meaning
`0b0`	Do not count cycles in EL2.
`0b1`	Count cycles in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bits [26:0]

Reserved, RES0.

Accessing PMCCFILTR

PMCCFILTR can also be accessed by using PMXEVTYPER with PMSELR.SEL set to `0b11111`.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b1111	0b111

```

PMCCNTR, Performance Monitors Cycle Count Register

The PMCCNTR characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' for more information.

PMCCFILTR determines the modes and states in which the PMCCNTR can increment.

Configuration

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0].

AArch32 System register PMCCNTR bits [63:0] are architecturally mapped to External register PMCCNTR_EL0[63:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR are UNDEFINED.

PMCCNTR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR continues to increment when clocks are stopped by WFI and WFE instructions.

Attributes

PMCCNTR is a 64-bit register.

Field descriptions

63–32
CCNT

31–0
CCNT

CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR.C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1101	0b000

```

PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range `0x0000` to `0x001F`.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Configuration

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[31:0].

AArch32 System register PMCEID0 bits [31:0] are architecturally mapped to External register PMCEID0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0 are UNDEFINED.

Attributes

PMCEID0 is a 32-bit register.

ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

ID<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

> **Note**
>
> Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

> **Note**
>
> Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU

features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b110

```

PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range `0x0020` to `0x003F`.

For more information about the Common events and the use of the PMCEIDn registers see 'The PMU event number space and common events'.

Configuration

AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[31:0].

AArch32 System register PMCEID1 bits [31:0] are architecturally mapped to External register PMCEID1[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID1 are UNDEFINED.

Attributes

PMCEID1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event (`0x0020` + n).

For each bit:

ID<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU

features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range `0x4020` to `0x403F`.

For more information about the Common events and the use of the PMCEIDn registers see 'The PMU event number space and common events'.

Configuration

AArch32 System register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[63:32].

AArch32 System register PMCEID3 bits [31:0] are architecturally mapped to External register PMCEID3[63:32].

This register is present only when AArch32 is supported and FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are UNDEFINED.

Attributes

PMCEID3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	
IDhi31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16	IDhi15	ID

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to Common event (`0x4020` + n).

For each bit:

IDhi<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU

features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID3

Accesses to this register use the following encodings in the System register encoding space:

```

PMCNTENCLR, Performance Monitors Count Enable Clear register

The PMCNTENCLR characteristics are:

Purpose

Disables the Cycle Count Register, PMCCNTR, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

PMCNTENCLR is used in conjunction with the PMCNTENSET register.

Configuration

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0].

AArch32 System register PMCNTENCLR bits [31:0] are architecturally mapped to External register PMCNTENCLR_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR are UNDEFINED.

Attributes

PMCNTENCLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

PMCCNTR disable bit. Disables the cycle counter register.

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, disables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

P<n>	Meaning
`0b0`	When read, means that PMEVCNTR<n> is disabled. When written, has no effect.
`0b1`	When read, means that PMEVCNTR<n> is enabled. When written, disables PMEVCNTR<n>.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMCNTENSET, Performance Monitors Count Enable Set register

The PMCNTENSET characteristics are:

Purpose

Enables the Cycle Count Register, PMCCNTR, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

PMCNTENSET is used in conjunction with the PMCNTENCLR register.

Configuration

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[31:0].

AArch32 System register PMCNTENSET bits [31:0] are architecturally mapped to External register PMCNTENSET_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENSET are UNDEFINED.

Attributes

PMCNTENSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

PMCCNTR enable bit. Enables the cycle counter register.

C	Meaning
0b0	When read, means the cycle counter is disabled. When written, has no effect.
0b1	When read, means the cycle counter is enabled. When written, enables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter enable bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

P<n>	Meaning
`0b0`	When read, means that PMEVCNTR<n> is disabled. When written, has no effect.
`0b1`	When read, means that PMEVCNTR<n> event counter is enabled. When written, enables PMEVCNTR<n>.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMCR, Performance Monitors Control Register

The PMCR characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

AArch32 System register PMCR bits [31:0] are architecturally mapped to AArch64 System register PMCR_EL0[31:0].

AArch32 System register PMCR bits [7:0] are architecturally mapped to External register PMCR_EL0[7:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR are UNDEFINED.

Attributes

PMCR is a 32-bit register.

Field descriptions

31-24	23-16	15-11	10	9	8	7	6	5	4	3	2	1	0
IMP	IDCODE	N	RES0	FZO	RES0	LP	LC	DP	X	D	C	P	E

IMP, bits [31:24]

When FEAT_PMUv3p7 is not implemented:

Implementer code.

If this field is zero, then PMCR.IDCODE is RES0 and software must use MIDR to identify the PE.

Otherwise, this field and PMCR.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as MIDR.Implementer.

Use of this field is deprecated.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

IDCODE, bits [23:16]

When PMCR.IMP != 0b00000000:

Identification code. Use of this field is deprecated.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of `0b00000`-`0b11111`. If the value is `0b00000`, then only PMCCNTR is implemented. If the value is `0b11111`, then PMCCNTR and 31 event counters are implemented.

In an implementation that includes EL2:

- If EL2 is using AArch32, reads of this field from Non-secure EL1 and Non-secure EL0 return the value of HDCR.HPMN.
- If EL2 is using AArch64 and is enabled in the current Security state, reads of this field from EL1 and EL0 return the value of MDCR_EL2.HPMN.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [10]

Reserved, RES0.

FZO, bit [9]
When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
- If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

FZO	Meaning
`0b0`	Do not freeze on overflow.
`0b1`	Event counter PMEVCNTR<n> does not count when PMOVSR[(PMN-1):0] is nonzero and n is in the range of affected event counters.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and PMCCNTR

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
- If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

LP	Meaning
`0b0`	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>[31:0].
`0b1`	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>[63:0].

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is RW or RAZ/WI.

If PMN is not 0, this bit affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and PMCCNTR.

PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

LC, bit [6]

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

LC	Meaning
`0b0`	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR[31:0].
`0b1`	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR[63:0].

Arm deprecates use of PMCR.LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DP, bit [5]

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by PMCCNTR is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR is disabled in prohibited regions: • If FEAT_PMUv3p1 is implemented, EL2 is implemented, and HDCR.HPMD is 1, then cycle counting by PMCCNTR is disabled at EL2. • If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR is disabled at EL3. • If EL3 is implemented, MDCR_EL3.SPME or SDCR.SPME is 0, and either FEAT_PMUv3p7 is not implemented, EL3 is using AArch32, or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR is disabled at EL3 and in Secure state. If HDCR.HPMN is not 0, this is when event counting by event counters in the range [0..(HDCR.HPMN-1)] is prohibited.

For more information see 'Prohibiting event counting'

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR counts every clock cycle.
0b1	When enabled, PMCCNTR counts once every 64 clock cycles.

If PMCR.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR.D = 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

C	Meaning
`0b0`	No action.
`0b1`	Reset PMCCNTR to zero.

Note

Resetting PMCCNTR does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is **WO/RAZ**.

P, bit [1]

Event counter reset.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
- If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

P	Meaning
`0b0`	No action.
`0b1`	If n is in the range of affected event counters, resets each event counter PMEVCNTR<n> to zero.

The effects of writing to this bit are:

- If EL2 is implemented and enabled in the current Security state, in EL0 and EL1, if PMN is not 0, a write of 1 to this bit resets event counters in the range [0 .. (PMN-1)].
- If EL2 is disabled in the current Security state, a write of 1 to this bit resets all the event counters.
- In EL2 and EL3, a write of 1 to this bit resets all the event counters.
- This field does not affect the operation of other event counters and PMCCNTR.

Note

Resetting the event counters does not change the event counter overflow bits.

If FEAT_PMUv3p5 is implemented, the values of HDCR.HLP and PMCR.LP are ignored and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

E, bit [0]

Enable.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
- If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
- If EL2 is not implemented, PMN is PMCR.N.

E	Meaning
`0b0`	PMCCNTR is disabled and event counters PMEVCNTR<n>, where n is in the range of affected event counters, are disabled.
`0b1`	PMCCNTR and event counters PMEVCNTR<n> where n is in the range of affected event counters, are enabled by PMCNTENSET.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing PMCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b000

```

PMEVCNTR<n>, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n> characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to AArch64 System register PMEVCNTR<n>_EL0[31:0].

AArch32 System register PMEVCNTR<n> bits [31:0] are architecturally mapped to External register PMEVCNTR<n>_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n> are UNDEFINED.

Attributes

PMEVCNTR<n> is a 32-bit register.

Field descriptions

31 ... 0
Event counter n

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If FEAT_PMUv3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMEVCNTR<n> return bits [31:0] of the counter.
- Writes to PMEVCNTR<n> update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64, bits [63:32] are not required to be implemented.

If FEAT_PMUv3p5 is not implemented, the event counter is 32 bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>

PMEVCNTR<n> can also be accessed by using PMXEVCNTR with PMSELR.SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMEVCNTR<n> is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of PMEVCNTR<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a `NOP`.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR.{ER,EN} or PMUSERENR_EL0.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see HDCR.HPMN and MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b10:n[4:3]	n[2:0]

```

PMEVTYPER<n>, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n> characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0[31:0].

AArch32 System register PMEVTYPER<n> bits [31:0] are architecturally mapped to External register PMEVTYPER<n>_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n> are UNDEFINED.

Attributes

PMEVTYPER<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24 23 22 21 20 19 18 17 16	15 14 13 12 11 10	9 8 7 6 5 4 3 2 1 0
P	U	NSK	NSU	NSH	RES0	MT	RES0	evtCount[15:10]	evtCount[9:0]

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>.NSK bit.

P	Meaning
`0b0`	Count events in EL1.
`0b1`	Do not count events in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>.NSU bit.

U	Meaning
`0b0`	Count events in EL0.
`0b1`	Do not count events in EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of PMEVTYPER<n>.P, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of PMEVTYPER<n>.U, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 (Hyp mode) filtering bit. Controls counting in EL2.

NSH	Meaning
`0b0`	Do not count events in EL2.
`0b1`	Count events in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

MT, bit [25]

When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this bit is RES0. See ID_DFR1.MTPMU.

This bit is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and Disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]
When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter PMEVCNTR<n>.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<n>.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.

Otherwise, if PMEVTYPER<n>.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range `0x0000` to `0x003F`, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range `0x4000` to `0x403F`, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that for all values that represent reserved or unsupported events, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>

PMEVTYPER<n> can also be accessed by using PMXEVTYPER with PMSELR.SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMEVTYPER<n> is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of PMEVTYPER<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a `NOP`.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR.EN or PMUSERENR_EL0.EN.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see HDCR.HPMN and MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1110	0b11:n[4:3]	n[2:0]

```

PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR, and the event counters PMEVCNTR<n>. Reading the register shows which overflow interrupt requests are enabled.

PMINTENCLR is used in conjunction with the PMINTENSET register.

Configuration

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0].

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR are UNDEFINED.

Attributes

PMINTENCLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

PMCCNTR overflow interrupt request disable bit.

C	Meaning
`0b0`	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
`0b1`	When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

P<n>	Meaning
0b0	When read, means that the PMEVCNTR<n> event counter interrupt request is disabled. When written, has no effect.
0b1	When read, means that the PMEVCNTR<n> event counter interrupt request is enabled. When written, disables the PMEVCNTR<n> interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMINTENSET, Performance Monitors Interrupt Enable Set register

The PMINTENSET characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR, and the event counters PMEVCNTR<n>. Reading the register shows which overflow interrupt requests are enabled.

PMINTENSET is used in conjunction with the PMINTENCLR register.

Configuration

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[31:0].

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to External register PMINTENSET_EL1[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENSET are UNDEFINED.

Attributes

PMINTENSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

C, bit [31]

PMCCNTR overflow interrupt request enable bit.

C	Meaning
`0b0`	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
`0b1`	When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request enable bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

P<n>	Meaning
`0b0`	When read, means that the PMEVCNTR<n> event counter interrupt request is disabled. When written, has no effect.
`0b1`	When read, means that the PMEVCNTR<n> event counter interrupt request is enabled. When written, enables the PMEVCNTR<n> interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation to software.

Configuration

This register is present only when AArch32 is supported and FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are UNDEFINED.

Attributes

PMMIR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								THWIDTH				BUS_WIDTH				BUS_SLOTS								SLOTS							

Bits [31:24]

Reserved, RES0.

THWIDTH, bits [23:20]

PMEVTYPER<n>_EL0.TH width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the PMEVTYPER<n>_EL0.TH field.

THWIDTH	Meaning
0b0000	FEAT_PMUv3_TH is not implemented.
0b0001	1 bit. PMEVTYPER<n>_EL0.TH[11:1] are RES0.
0b0010	2 bits. PMEVTYPER<n>_EL0.TH[11:2] are RES0.
0b0011	3 bits. PMEVTYPER<n>_EL0.TH[11:3] are RES0.
0b0100	4 bits. PMEVTYPER<n>_EL0.TH[11:4] are RES0.
0b0101	5 bits. PMEVTYPER<n>_EL0.TH[11:5] are RES0.
0b0110	6 bits. PMEVTYPER<n>_EL0.TH[11:6] are RES0.
0b0111	7 bits. PMEVTYPER<n>_EL0.TH[11:7] are RES0.
0b1000	8 bits. PMEVTYPER<n>_EL0.TH[11:8] are RES0.
0b1001	9 bits. PMEVTYPER<n>_EL0.TH[11:9] are RES0.
0b1010	10 bits. PMEVTYPER<n>_EL0.TH[11:10] are RES0.
0b1011	11 bits. PMEVTYPER<n>_EL0.TH[11] is RES0.
0b1100	12 bits.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to PMEVTYPER<n>_EL0.TH is $2^{(\text{PMMIR.THWIDTH})}$ minus one.

Note

PMEVTYPER<n>_EL0.TH cannot be accessed through PMEVTYPER<n>.

Access to this field is **RO**.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as Log_2(number of bytes), plus one. Defined values are:

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

Access to this field is **RO**.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment by in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMMIR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b110

```
if PSTATE.EL == EL0 then

PMOVSR, Performance Monitors Overflow Flag Status Register

The PMOVSR characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR, and each of the implemented event counters PMEVCNTR<n>. Writing to this register clears these bits.

Configuration

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0].

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to External register PMOVSCLR_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSR are UNDEFINED.

Attributes

PMOVSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Cycle counter overflow clear bit. Possible values are:

C	Meaning
`0b0`	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
`0b1`	When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

PMCR.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR[31:0] or unsigned overflow of PMCCNTR[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow clear bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

P<n>	Meaning
`0b0`	When read, means that PMEVCNTR<n> has not overflowed since this bit was last cleared. When written, has no effect.
`0b1`	When read, means that PMEVCNTR<n> has overflowed since this bit was last cleared. When written, clears the PMEVCNTR<n> overflow bit to 0.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP, HDCR.HLP, and PMCR.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>[31:0] or unsigned overflow of PMEVCNTR<n>[63:0]. PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR, and each of the implemented event counters PMEVCNTR<n>.

Configuration

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0].

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to External register PMOVSSET_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET are UNDEFINED.

Attributes

PMOVSSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Cycle counter overflow set bit.

C	Meaning
`0b0`	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
`0b1`	When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

PMCR.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR[31:0] or unsigned overflow of PMCCNTR[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow set bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n> has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMEVCNTR<n> has overflowed since this bit was last . When written, sets the PMEVCNTR<n> overflow bit to 1.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP, HDCR.HLP, and PMCR.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>[31:0] or unsigned overflow of PMEVCNTR<n>[63:0]. PMEVCNTR<n>[63:32] cannot be accessed directly in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

Purpose

Selects the current event counter PMEVCNTR<n> or the cycle counter, CCNT.

PMSELR is used in conjunction with PMXEVTYPER to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with PMXEVCNTR, to determine the value of a selected event counter.

Configuration

AArch32 System register PMSELR bits [31:0] are architecturally mapped to AArch64 System register PMSELR_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSELR are UNDEFINED.

Attributes

PMSELR is a 32-bit register.

Field descriptions

31–5	4–0
RES0	SEL

Bits [31:5]

Reserved, RES0.

SEL, bits [4:0]

Selects event counter, PMEVCNTR<n>, where n is the value held in this field. This value identifies which event counter is accessed when a subsequent access to PMXEVTYPER or PMXEVCNTR occurs.

This field can take any value from 0 (`0b00000`) to (PMCR.N)-1, or 31 (`0b11111`).

When PMSELR.SEL is `0b11111`, it selects the cycle counter and:

- A read of the PMXEVTYPER returns the value of PMCCFILTR.
- A write of the PMXEVTYPER writes to PMCCFILTR.
- A read or write of PMXEVCNTR has CONSTRAINED UNPREDICTABLE effects. For more information, see PMXEVCNTR.

For more information about the results of accesses to event counters, see PMXEVTYPER and PMXEVCNTR.

For more information about the number of counters accessible at each Exception level, see HDCR.HPMN and MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSELR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b101

```

PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event `0x00`. For more information, see 'SW_INCR'.

Configuration

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to AArch64 System register PMSWINC_EL0[31:0].

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to External register PMSWINC_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC are UNDEFINED.

Attributes

PMSWINC is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bit [31]

Reserved, RES0.

P<n>, bit [n], for n = 30 to 0

Event counter software increment bit for PMEVCNTR<n>.

If N is less than 31, then bits [30:N] are WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in MDCR_EL2.HPMN if EL2 is using AArch64, or in HDCR.HPMN if EL2 is using AArch32. Otherwise, N is the value in PMCR.N.

P<n>	Meaning
`0b0`	No action. The write to this bit is ignored.
`0b1`	If PMEVCNTR<n> is enabled and configured to count the software increment event, increments PMEVCNTR<n> by 1. If PMEVCNTR<n> is disabled, or not configured to count the software increment event, the write to this bit is ignored.

Accessing PMSWINC

Accesses to this register use the following encodings in the System register encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

Purpose

Enables or disables User mode access to the Performance Monitors.

Configuration

AArch32 System register PMUSERENR bits [31:0] are architecturally mapped to AArch64 System register PMUSERENR_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR are UNDEFINED.

Attributes

PMUSERENR is a 32-bit register.

Field descriptions

31:4	3	2	1	0
RES0	ER	CR	SW	EN

Bits [31:4]

Reserved, RES0.

ER, bit [3]

Event counter read trap control:

ER	Meaning
`0b0`	EL0 reads of the PMXEVCNTR and PMEVCNTR<n>, and EL0 RW access to the PMSELR, are trapped to Undefined mode if PMUSERENR.EN is also 0.
`0b1`	Overrides PMUSERENR.EN and enables RO access to PMXEVCNTR and PMEVCNTR<n>, and RW access to PMSELR.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

CR, bit [2]

Cycle counter read trap control:

CR	Meaning
`0b0`	EL0 reads of the PMCCNTR are trapped to Undefined mode if PMUSERENR.EN is also 0.
`0b1`	Overrides PMUSERENR.EN and enables access to PMCCNTR.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

SW, bit [1]

Software increment write trap control:

SW	Meaning
`0b0`	EL0 writes to the PMSWINC are trapped to Undefined mode if PMUSERENR.EN is also 0.
`0b1`	Overrides PMUSERENR.EN and enables access to PMSWINC.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

EN, bit [0]

Traps EL0 accesses to the Performance Monitors registers to Undefined mode, as follows:

- PMCR, PMOVSR, PMSELR, PMCEID0, PMCEID1, PMCCNTR, PMXEVTYPER, PMXEVCNTR, PMCNTENSET, PMCNTENCLR, PMOVSSET, PMEVCNTR<n>, PMEVTYPER<n>, PMCCFILTR, PMSWINC.
- If FEAT_PMUv3p1 is implemented, PMCEID2, and PMCEID3.
- If FEAT_PMUv3p4 is implemented, PMMIR.

EN	Meaning
`0b0`	While at EL0, accesses to the specified registers at EL0 are trapped to Undefined mode, unless overridden by one of PMUSERENR.{ER, CR, SW}.
`0b1`	While at EL0, software can access all of the specified registers.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing PMUSERENR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

PMXEVCNTR, Performance Monitors Selected Event Count Register

The PMXEVCNTR characteristics are:

Purpose

Reads or writes the value of the selected event counter, PMEVCNTR<n>. PMSELR.SEL determines which event counter is selected.

Configuration

AArch32 System register PMXEVCNTR bits [31:0] are architecturally mapped to AArch64 System register PMXEVCNTR_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVCNTR are UNDEFINED.

Attributes

PMXEVCNTR is a 32-bit register.

Field descriptions

31 … 0
PMEVCNTR<n>

PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, PMEVCNTR<n>, where n is the value stored in PMSELR.SEL.

If FEAT_PMUv3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMXEVCNTR return bits [31:0] of the counter.
- Writes to PMXEVCNTR update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64, bits [63:32] are not required to be implemented.

If FEAT_PMUv3p5 is not implemented, the event counter is 32 bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVCNTR

If FEAT_FGT is implemented and PMSELR.SEL is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMXEVCNTR is as follows:

- If PMSELR.SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and PMSELR.SEL is greater than or equal to the number of accessible event counters, then reads and writes of PMXEVCNTR are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if PMSELR.SEL has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and PMSELR.SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR.{ER,EN} or PMUSERENR_EL0.{ER,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see HDCR.HPMN and MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1101	0b010

PMXEVTYPER, Performance Monitors Selected Event Type Register

The PMXEVTYPER characteristics are:

Purpose

When PMSELR.SEL selects an event counter, this accesses a PMEVTYPER<n> register. When PMSELR.SEL selects the cycle counter, this accesses PMCCFILTR.

Configuration

AArch32 System register PMXEVTYPER bits [31:0] are architecturally mapped to AArch64 System register PMXEVTYPER_EL0[31:0].

This register is present only when AArch32 is supported and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER are UNDEFINED.

Attributes

PMXEVTYPER is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Event type register or PMCCFILTR																															

Bits [31:0]

Event type register or PMCCFILTR.

When PMSELR.SEL == 31, this register accesses PMCCFILTR.

Otherwise, this register accesses PMEVTYPER<n> where n is the value in PMSELR.SEL.

Accessing PMXEVTYPER

If FEAT_FGT is implemented, and PMSELR.SEL is not 31 and is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMXEVTYPER is as follows:

- If PMSELR.SEL selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented, and PMSELR.SEL is not 31 and is greater than or equal to the number of accessible event counters, then reads and writes of PMXEVTYPER are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a `NOP`
- Accesses to the register behave as if PMSELR.SEL has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR.SEL is 31.
- If EL2 is implemented and enabled in the current Security state, and PMSELR.SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR.EN or PMUSERENR_EL0.EN.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see HDCR.HPMN and MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

PRRR, Primary Region Remap Register

The PRRR characteristics are:

Purpose

Controls the top level mapping of the TEX[0], C, and B memory region attributes.

Configuration

AArch32 System register PRRR bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register PRRR bits [31:0] are architecturally mapped to AArch32 System register MAIR0[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register PRRR bits [31:0] (PRRR_S) are architecturally mapped to AArch32 System register MAIR0[31:0] (MAIR0_S) when EL3 is using AArch32.

AArch32 System register PRRR bits [31:0] (PRRR_NS) are architecturally mapped to AArch32 System register MAIR0[31:0] (MAIR0_NS) when EL3 is using AArch32.

This register is present only when AArch32 is supported. Otherwise, direct accesses to PRRR are UNDEFINED.

MAIR0 and PRRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in MAIR0.

Attributes

PRRR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

31	30	29	28	27	26	25	24	23 22 21 20	19	18	17	16	15 14	13 12	11 10	9 8	7 6	5 4	3 2	1 0
NOS7	NOS6	NOS5	NOS4	NOS3	NOS2	NOS1	NOS0	RES0	NS1	NS0	DS1	DS0	TR7	TR6	TR5	TR4	TR3	TR2	TR1	TR0

NOS<n>, bit [n+24], for n = 7 to 0

Not Outer Shareable. NOS<n> is the Outer Shareable property for memory attributes n, if the region is mapped as Normal memory that is not Inner Non-cacheable, Outer Non-cacheable, and the appropriate PRRR.{NS0, NS1} field identifies the region as shareable. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values of each NOS<n> field other than NOS6 are:

NOS<n>	Meaning
`0b0`	Memory region is Outer Shareable.
`0b1`	Memory region is Inner Shareable.

The value of this bit is ignored if the region is:

- Device memory
- Normal memory that is at least one of:
  - Inner Non-cacheable, Outer Non-cacheable.
  - Identified by the appropriate PRRR.{NS0, NS1} field as Non-shareable.

The meaning of the NOS6 field is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:20]

Reserved, RES0.

NS1, bit [19]

Mapping of S = 1 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 1.

NS1	Meaning
0b0	Region is Non-shareable.
0b1	Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS0, bit [18]

Mapping of S = 0 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the translation table descriptor set to 0.

NS0	Meaning
0b0	Region is Non-shareable.
0b1	Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DS1, bit [17]

Mapping of S = 1 attribute for Device memory. From Armv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DS0, bit [16]

Mapping of S = 0 attribute for Device memory. From Armv8, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TR<n>, bits [2n+1:2n], for n = 7 to 0

TR<n> is the primary TEX mapping for memory attributes n, and defines the mapped memory type for a region with attributes n. n is the value of the concatenation of the {TEX[0], C, B} bits from the translation table descriptor. The possible values for each field other than TR6 are:

TR<n>	Meaning
`0b00`	Device-nGnRnE memory
`0b01`	Device-nGnRE memory
`0b10`	Normal memory

The value `0b11` is reserved. The effect of programming a field to `0b11` is CONSTRAINED UNPREDICTABLE.

The meaning of the TR6 field is IMPLEMENTATION DEFINED.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PRRR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

REVIDR, Revision ID Register

The REVIDR characteristics are:

Purpose

Provides implementation-specific minor revision information.

Configuration

AArch32 System register REVIDR bits [31:0] are architecturally mapped to AArch64 System register REVIDR_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to REVIDR are UNDEFINED.

If REVIDR has the same value as MIDR, then its contents have no significance.

Attributes

REVIDR is a 32-bit register.

Field descriptions

31 ... 0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [31:0]

RMR, Reset Management Register

The RMR characteristics are:

Purpose

If EL1 or EL3 is the highest implemented Exception level and this register is implemented:

- A write to the register at the highest implemented Exception level can request a Warm reset.
- If the highest implemented Exception level can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch32 System register RMR bits [31:0] are architecturally mapped to AArch64 System register RMR_EL1[31:0] when the highest implemented Exception level is EL1.

AArch32 System register RMR bits [31:0] are architecturally mapped to AArch64 System register RMR_EL3[31:0] when EL3 is implemented.

This register is present only when AArch32 is supported. Otherwise, direct accesses to RMR are UNDEFINED.

Only implemented if EL1 or EL3 is the highest implemented Exception level. In this case:

- If the highest implemented Exception level can use AArch32 and AArch64 then this register must be implemented.
- If the highest implemented Exception level cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Attributes

RMR is a 32-bit register.

Field descriptions

<table>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td colspan="30">RES0</td><td>RR</td><td>AA64</td></tr>
</table>

Bits [31:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

AA64, bit [0]

When the highest implemented Exception level can use AArch64, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
`0b0`	AArch32.
`0b1`	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If the highest implemented Exception level cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.

Accessing RMR

When EL3 is implemented, Arm deprecates accessing this register from any PE mode other than Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0000	0b010

```
if PSTATE.EL IN {EL1, EL3} && IsHighestEL(PSTATE.EL) then
    return RMR;
else
    UNDEFINED;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0000	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if IsHighestEL(EL1) then
        RMR = R[t];
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    if CP15SDISABLE == HIGH then
        UNDEFINED;
    elsif CP15SDISABLE2 == HIGH then
        UNDEFINED;
    else
        RMR = R[t];
```

RVBAR, Reset Vector Base Address Register

The RVBAR characteristics are:

Purpose

If EL3 is not implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch32 state.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to RVBAR are UNDEFINED.

This register is only implemented if the highest Exception level implemented is capable of using AArch32, and is not EL3.

Attributes

RVBAR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1	0
ResetAddress	RES1

ResetAddress, bits [31:1]

Bits [31:1] of the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 32-bit state.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [0]

Reserved, RES1.

Accessing RVBAR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0000	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if IsHighestEL(EL1) then
        return RVBAR;
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif !ELUsingAArch32(EL2) && SCR_EL3.<NS,EEL2> == '01' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif !ELUsingAArch32(EL3) && SCR_EL3.NS == '0' then
        AArch64.AArch32SystemAccessTrap(EL3, 0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if IsHighestEL(EL2) then
        return RVBAR;
    else
        UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MVBAR;
```

SCR, Secure Configuration Register

The SCR characteristics are:

Purpose

When EL3 is implemented and can use AArch32, defines the configuration of the current Security state. It specifies:

- The Security state, either Secure or Non-secure.
- What mode the PE branches to if an IRQ, FIQ, or External abort occurs.
- Whether the PSTATE.F or PSTATE.A bits can be modified when SCR.NS==1.

Configuration

AArch32 System register SCR bits [31:0] can be mapped to AArch64 System register SCR_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported. Otherwise, direct accesses to SCR are UNDEFINED.

Attributes

SCR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16	15	14	13	12	11 10	9	8	7	6	5	4	3	2	1	0
RES0	TERR	RES0	TWE	TWI	RES0	SIF	HCE	SCD	nET	AW	FW	EA	FIQ	IRQ	NS

Bits [31:16]

Reserved, RES0.

TERR, bit [15]
When FEAT_RAS is implemented:

Trap Error record accesses. Generate a Monitor Trap exception on accesses to the following registers from modes other than Monitor mode:

ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXFR, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS. When FEAT_RASv1p1 is implemented, ERXMISC4, ERXMISC5, ERXMISC6, ERXMISC7.

TERR	Meaning
`0b0`	This control does not cause any instructions to be trapped.
`0b1`	Accesses to the specified registers from modes other than Monitor mode generate a Monitor Trap exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bit [14]

Reserved, RES0.

TWE, bit [13]

Traps WFE instructions to Monitor mode.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by SCTLR.nTWE or HCR.TWE. Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

TWI, bit [12]

Traps WFI instructions to Monitor mode.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by SCTLR.nTWI or HCR.TWI. Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

Bits [11:10]

Reserved, RES0.

SIF, bit [9]

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory.

SIF	Meaning
`0b0`	Secure state instruction fetches from Non-secure memory are permitted.
`0b1`	Secure state instruction fetches from Non-secure memory are not permitted.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

HCE, bit [8]

Hypervisor Call instruction enable. If EL2 is implemented, enables execution of HVC instructions at Non-secure EL1 and EL2.

HCE	Meaning
`0b0`	HVC instructions are: • UNDEFINED at Non-secure EL1. The Undefined Instruction exception is taken from PL1 to PL1. • UNPREDICTABLE at EL2. Behavior is one of the following: ◦ The instruction is UNDEFINED. ◦ The instruction executes as a NOP.
`0b1`	HVC instructions are enabled at Non-secure EL1 and EL2.

Note

HVC instructions are always UNDEFINED at EL0 and in Secure state.

If EL2 is not implemented, this bit is RES0 and HVC is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

SCD, bit [7]

Secure Monitor Call disable. Disables SMC instructions.

SCD	Meaning
`0b0`	SMC instructions are enabled.
`0b1`	In Non-secure state, SMC instructions are UNDEFINED. The Undefined Instruction exception is taken from the current Exception level to the current Exception level. In Secure state, behavior is one of the following: • The instruction is UNDEFINED. • The instruction executes as a NOP.

Note

SMC instructions are always UNDEFINED at PL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

nET, bit [6]

Not Early Termination. This bit disables early termination.

nET	Meaning
0b0	Early termination permitted. Execution time of data operations can depend on the data values.
0b1	Disable early termination. The number of cycles required for data operations is forced to be independent of the data values.

This IMPLEMENTATION DEFINED mechanism can disable data dependent timing optimizations from multiplies and data operations. It can provide system support against information leakage that might be exploited by timing correlation types of attack.

On implementations that do not support early termination or do not support disabling early termination, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

AW, bit [5]

When the value of SCR.EA is 1 and the value of HCR.AMO is 0, this bit controls whether PSTATE.A masks an External abort taken from Non-secure state.

AW	Meaning
0b0	External aborts taken from Non-secure state are not masked by PSTATE.A, and are taken to EL3. External aborts taken from Secure state are masked by PSTATE.A.
0b1	External aborts taken from either Security state are masked by PSTATE.A. When PSTATE.A is 0, the abort is taken to EL3.

When SCR.EA is 0 or HCR.AMO is 1, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

FW, bit [4]

When the value of SCR.FIQ is 1 and the value of HCR.FMO is 0, this bit controls whether PSTATE.F masks an FIQ interrupt taken from Non-secure state.

FW	Meaning
0b0	An FIQ taken from Non-secure state is not masked by PSTATE.F, and is taken to EL3. An FIQ taken from Secure state is masked by PSTATE.F.
0b1	An FIQ taken from either Security state is masked by PSTATE.F. When PSTATE.F is 0, the FIQ is taken to EL3.

When SCR.FIQ is 0 or HCR.FMO is 1, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

EA, bit [3]

External Abort handler. This bit controls which mode takes External aborts and SError interrupt exceptions.

EA	Meaning
0b0	External aborts taken to Abort mode.
0b1	External aborts taken to Monitor mode.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

FIQ, bit [2]

FIQ handler. This bit controls which mode takes FIQ exceptions.

FIQ	Meaning
`0b0`	FIQs taken to FIQ mode.
`0b1`	FIQs taken to Monitor mode.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

IRQ, bit [1]

IRQ handler. This bit controls which mode takes IRQ exceptions.

IRQ	Meaning
`0b0`	IRQs taken to IRQ mode.
`0b1`	IRQs taken to Monitor mode.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

NS, bit [0]

Non-secure bit. Except when the PE is in Monitor mode, this bit determines the Security state of the PE:

NS	Meaning
`0b0`	PE is in Secure state.
`0b1`	PE is in Non-secure state.

If the HCR.TGE bit is set, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing the SCR.NS bit from 0 to 1 results in the SCR.NS bit remaining as 0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

Accessing SCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

SCTLR, System Control Register

The SCTLR characteristics are:

Purpose

Provides the top level control of the system, including its memory system.

Configuration

AArch32 System register SCTLR bits [31:0] are architecturally mapped to AArch64 System register SCTLR_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to SCTLR are UNDEFINED.

Some bits in the register are read-only. These bits relate to non-configurable features of an implementation, and are provided for compatibility with previous versions of the architecture.

Attributes

SCTLR is a 32-bit register.

Field descriptions

31	30	29	28	27 26	25	24	23	22	21	20	19	18	17	16	15 14	13	12	11	10	9	8	7	6
DSSBS	TE	AFE	TRE	RES0	EE	RES0	SPAN	RES1	RES0	UWXN	WXN	nTWE	RES0	nTWI	RES0	V	I	RES1	EnRCTX	RES0	SED	ITD	UNK

DSSBS, bit [31]

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to any mode in this security state except Hyp mode
0b1	PSTATE.SSBS is set to 1 on an exception to any mode in this security state except Hyp mode

Note

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to an Exception level that is executing at PL1 are taken to A32 or T32 state:

TE	Meaning
0b0	Exceptions, including reset, taken to A32 state.
0b1	Exceptions, including reset, taken to T32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

AFE, bit [29]

Access Flag Enable. When using the Short-descriptor translation table format for the PL1&0 translation regime, this bit enables use of the AP[0] bit in the translation descriptors as the Access flag, and restricts access permissions in the translation descriptors to the simplified model.

AFE	Meaning
0b0	In the translation table descriptors, AP[0] is an access permissions bit. The full range of access permissions is supported. No Access flag is implemented.
0b1	In the translation table descriptors, AP[0] is the Access flag. Only the simplified model for access permissions is supported.

When using the Long-descriptor translation table format, the VMSA behaves as if this bit is set to 1, regardless of the value of this bit.

The AFE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TRE, bit [28]

TEX remap enable. This bit enables remapping of the TEX[2:1] bits in the PL1&0 translation regime for use as two translation table bits that can be managed by the operating system. Enabling this remapping also changes the scheme used to describe the memory region attributes in the VMSA.

TRE	Meaning
0b0	TEX remap disabled. TEX[2:0] are used, with the C and B bits, to describe the memory region attributes.
0b1	TEX remap enabled. TEX[2:1] are reassigned for use as bits managed by the operating system. The TEX[0], C, and B bits are used to describe the memory region attributes, with the MMU remap registers.

When the value of TTBCR.EAE is 1, this bit is RES1.

The TRE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [27:26]

Reserved, RES0.

EE, bit [25]

The value of the PSTATE.E bit on branch to an exception vector or coming out of reset, and the endianness of stage 1 translation table walks in the PL1&0 translation regime.

EE	Meaning
0b0	Little-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are little-endian.
0b1	Big-endian. PSTATE.E is set to 1 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support for data accesses at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support for data accesses at Exception levels higher than EL0, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

SPAN, bit [23]

When FEAT_PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1 from either Secure or Non-secure state, or to EL3 from Secure state when EL3 is using AArch32.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 in the following situations: • In Non-secure state, on taking an exception to EL1. • In Secure state, when EL3 is using AArch64, on taking an exception to EL1. • In Secure state, when EL3 is using AArch32, on taking an exception to EL3.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [22]

Reserved, RES1.

Bit [21]

Reserved, RES0.

UWXN, bit [20]

Unprivileged write permission implies PL1 XN (Execute-never). This bit can force all memory regions that are writable at PL0 to be treated as XN for accesses from software executing at PL1.

UWXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable at PL0 forced to XN for accesses from software executing at PL1.

The UWXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

WXN, bit [19]

Write permission implies XN (Execute-never). For the PL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

WXN	Meaning
`0b0`	This control has no effect on memory access permissions.
`0b1`	Any region that is writable in the PL1&0 translation regime is forced to XN for accesses from software executing at PL1 or PL0.

This bit applies only when SCTLR.M bit is set.

The WXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to Undefined mode.

nTWE	Meaning
`0b0`	Any attempt to execute a WFE instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
`0b1`	This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to `1`.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to Undefined mode.

nTWI	Meaning
`0b0`	Any attempt to execute a WFI instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
`0b1`	This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Bits [15:14]

Reserved, RES0.

V, bit [13]

Vectors bit. This bit selects the base address of the exception vectors for exceptions taken to a PE mode other than Monitor mode or Hyp mode:

V	Meaning
`0b0`	Normal exception vectors. Base address is held in VBAR.
`0b1`	High exception vectors (Hivecs), base address `0xFFFF0000`. This base address cannot be remapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

I, bit [12]

Instruction access Cacheability control, for accesses at EL1 and EL0:

I	Meaning
`0b0`	All instruction access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
`0b1`	All instruction access to Normal memory from PL1 and PL0 can be cached at all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

Instruction accesses to Normal memory from EL1 and EL0 are Cacheable regardless of the value of the SCTLR.I bit if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR_EL2.DC is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Bit [11]

Reserved, RES1.

EnRCTX, bit [10]
When FEAT_SPECRES is implemented:

Enable EL0 access to the AArch32 CFPRCTX, DVPRCTX, and CPPRCTX instructions.

EnRCTX	Meaning
`0b0`	EL0 access to these instructions is disabled, and these instructions are trapped to EL1.
`0b1`	EL0 access to these instructions is enabled.

Note

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.

SED	Meaning
`0b0`	SETEND instruction execution is enabled at PL0 and PL1.
`0b1`	SETEND instructions are UNDEFINED at PL0 and PL1.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at PL1 and PL0.

<table>
<tr><th>ITD</th><th>Meaning</th></tr>
<tr><td><code>0b0</code></td><td>All IT instruction functionality is enabled at PL1 and PL0.</td></tr>
<tr><td><code>0b1</code></td><td>Any attempt at PL1 or PL0 to execute any of the following is UNDEFINED:

All encodings of the IT instruction with hw1[3:0]!=1000.
All encodings of the subsequent instruction with the following values for hw1:

11xxxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM.
1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'.
10100xxxxxxxxxxx: ADD Rd, PC, #imm
01001xxxxxxxxxxx: LDR Rd, [PC, #imm]
0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC.
010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn.

These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.
It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:

A 16-bit instruction, that can only be followed by another 16-bit instruction.
The first half of a 32-bit instruction.

This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.
An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.</td></tr>
</table>

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1, SCTLR_EL2, and HSCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

UNK, bit [6]

Writes to this bit are IGNORED. Reads of this bit return an UNKNOWN value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==`0b1111`) encoding space from PL1 and PL0:

CP15BEN	Meaning
`0b0`	PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.
`0b1`	PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR then it must also be implemented in the SCTLR_EL1, SCTLR_EL2, and HSCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

When an implementation does not implement CP15BEN, access to this field is **RAO/WI**.

LSMAOE, bit [4]

When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL1 or EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Otherwise:

Reserved, RES1.

nTLSMD, bit [3]

When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Otherwise:

Reserved, RES1.

C, bit [2]

Cacheability control, for data accesses at EL1 and EL0:

C	Meaning
0b0	All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, can be cached at all levels of data and unified cache.

The PE ignores SCTLR.C for Non-secure state and data accesses to Normal memory from EL1 and EL0 are Cacheable if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR_EL2.DC is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

A	Meaning
0b0	Alignment fault checking disabled when executing at PL1 or PL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at PL1 or PL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

M, bit [0]

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL1 and EL0 stage 1 address translation disabled. See the SCTLR.I field for the behavior of instruction accesses to Normal memory.
0b1	EL1 and EL0 stage 1 address translation enabled.

In the Non-secure state the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of the field if either:

- EL2 is using AArch32 and the value of HCR.{DC, TGE} is not {0, 0}.
- EL2 is using AArch64 and the value of HCR_EL2.{DC, TGE} is not {0, 0}.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing SCTLR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;

SDCR, Secure Debug Control Register

The SDCR characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug, trace, and the Performance Monitors Extension.

Configuration

AArch32 System register SDCR bits [31:0] can be mapped to AArch64 System register MDCR_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported. Otherwise, direct accesses to SDCR are UNDEFINED.

Attributes

SDCR is a 32-bit register.

Field descriptions

31 30 29	28	27	26 25 24	23	22	21	20	19	18	17	16	15 14	13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	MTPME	TDCC	RES0	SCCD	RES0	EPMAD	EDAD	TTRF	STE	SPME	RES0	SPD	RES0

Bits [31:29]

Reserved, RES0.

MTPME, bit [28]
When FEAT_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>.MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>.MT is 0.
0b1	PMEVTYPER<n>.MT bits not affected by this bit.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0.

The reset behavior of this field is:

- On a Cold reset, in a system where the PE resets into EL3, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]
When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel in modes other than Monitor mode to Monitor mode.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	Accesses to the DCC registers in modes other than Monitor mode generate a Monitor Trap exception, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

- DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

When the PE is in Debug state, SDCR.TDCC does not trap any accesses to:

- DBGDTRRXint and DBGDTRTXint.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [26:24]

Reserved, RES0.

SCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

Secure Cycle Counter Disable. Prohibits PMCCNTR from counting in Secure state.

SCCD	Meaning
0b0	Cycle counting by PMCCNTR is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR is prohibited in Secure state.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bit [22]

Reserved, RES0.

EPMAD, bit [21]

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Non-secure access disable. Controls Non-secure access to Performance Monitors registers by an external debugger.

EPMAD	Meaning
0b0	Non-secure access to the Performance Monitors registers from an external debugger is permitted.
0b1	Non-secure access to the Performance Monitors registers from an external debugger is not permitted.

If the Performance Monitors Extension does not support external debug interface accesses, this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

When FEAT_PMUv3 is implemented:

External Performance Monitors access disable. Controls access to Performance Monitors registers by an external debugger.

EPMAD	Meaning
0b0	Access to Performance Monitors registers from an external debugger is permitted.
0b1	Access to Performance Monitors registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If the Performance Monitors Extension does not support external debug interface accesses, this bit is RES0.

Otherwise, if EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

EDAD, bit [20]

When FEAT_Debugv8p4 is implemented:

External debug Non-secure access disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
0b0	Non-secure access to debug registers from an external debugger is permitted.
0b1	Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 from an external debugger is not permitted.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

When FEAT_Debugv8p2 is implemented:

External debug access disable. Controls access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers from an external debugger is permitted.
0b1	Access to breakpoint registers, watchpoint registers, and OSLAR_EL1 from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

Otherwise:

External debug access disable. Controls access to breakpoint, watchpoint, and optionally OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
0b0	Access to debug registers from an external debugger is permitted.
0b1	Access to breakpoint registers and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

TTRF, bit [19]

When FEAT_TRF is implemented:

Trap Trace Filter controls. Controls whether accesses in modes other than Monitor mode to the trace filter control registers generate a Monitor Trap exception.

TTRF	Meaning
0b0	Accesses to HTRFCR and TRFCR are not affected by this control bit.
0b1	When not in Monitor mode, accesses to HTRFCR and TRFCR generate a Monitor Trap exception, unless the access generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

Otherwise:

Reserved, RES0.

STE, bit [18]

When FEAT_TRF is implemented:

Secure Trace Enable. This bit enables tracing in Secure state and controls the level of authentication required by an external debugger to enable external tracing.

STE	Meaning
0b0	Trace is prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Secure state is not affected by this bit.

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of SCR.NS is 0, the PE behaves as if this bit is set to 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

Otherwise:

Reserved, RES0.

SPME, bit [17]

When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
0b0	Event counting is prohibited in Secure state. If PMCR.DP is 1, PMCCNTR is disabled in Secure state. Otherwise, PMCCNTR is not affected by this mechanism.
0b1	Event counting and PMCCNTR are not affected by this mechanism.

This field affects the operation of all event counters in Secure state, and if PMCR.DP is 1, the operation of PMCCNTR in Secure state. When PMCR.DP is 0, PMCCNTR is not affected by this field.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

When FEAT_PMUv3 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
0b0	If `ExternalSecureNoninvasiveDebugEnabled()` is FALSE, event counting is prohibited in Secure state, and if PMCR.DP is 1, PMCCNTR is disabled in Secure state.
0b1	Event counting and PMCCNTR are not affected by this mechanism.

If `ExternalSecureNoninvasiveDebugEnabled()` is TRUE, the event counters and PMCCNTR are not affected by this field.

Otherwise, this field affects the operation of all event counters in Secure state, and if PMCR.DP is 1, the operation of PMCCNTR in Secure state. When PMCR.DP is 0, PMCCNTR is not affected by this field.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

Otherwise:

Reserved, RES0.

Bit [16]

Reserved, RES0.

SPD, bits [15:14]

AArch32 Secure self-hosted Privileged Debug. Enables or disables debug exceptions from EL3, other than Breakpoint Instruction exceptions.

SPD	Meaning
`0b00`	Legacy mode. Debug exceptions from EL3 are enabled by the authentication interface.
`0b10`	Secure privileged debug disabled. Debug exceptions from EL3 are disabled.
`0b11`	Secure privileged debug enabled. Debug exceptions from EL3 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as `0b00`. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored in Non-secure state.

If debug exceptions from EL3 are enabled, then debug exceptions from Secure EL0 are also enabled.

Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER.SUIDEN is 1.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is `0b11`.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to `0`.

Bits [13:0]

Reserved, RES0.

Accessing SDCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0011	0b001

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif !ELUsingAArch32(EL2) && SCR_EL3.<NS,EEL2> == '01' then

SDER, Secure Debug Enable Register

The SDER characteristics are:

Purpose

Controls invasive and non-invasive debug in the Secure EL0 mode.

Configuration

AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register SDER32_EL2[31:0] when EL2 is implemented and FEAT_SEL2 is implemented.

AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register SDER32_EL3[31:0] when EL3 is implemented.

This register is present only when (EL3 is implemented and EL3 is capable of using AArch32) or (EL1 is capable of using AArch32 and Secure EL1 is implemented). Otherwise, direct accesses to SDER are UNDEFINED.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

Attributes

SDER is a 32-bit register.

Field descriptions

31–2	1	0
RES0	SUNIDEN	SUIDEN

Bits [31:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable.

SUNIDEN	Meaning
0b0	This bit does not affect Performance Monitors event counting at Secure EL0
0b1	If EL3 or EL1 is using AArch32, Performance Monitors event counting is allowed in Secure EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SUIDEN, bit [0]

Secure User Invasive Debug Enable.

SUIDEN	Meaning
0b0	This bit does not affect the generation of debug exceptions at Secure EL0.
0b1	If EL3 or EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing SDER

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

SPSR, Saved Program Status Register

The SPSR characteristics are:

Purpose

Holds the saved process state for the current mode.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR are UNDEFINED.

Attributes

SPSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]		J	SSBS	PAN	DIT	IL	GE				IT[7:2]						E	A	I	F	T	M[4:0]				

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to the current mode, and copied to PSTATE.N on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to the current mode, and copied to PSTATE.Z on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to the current mode, and copied to PSTATE.C on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to the current mode, and copied to PSTATE.V on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to the current mode, and copied to PSTATE.Q on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to the current mode, and copied to PSTATE.IT on executing an exception return operation in the current mode.

SPSR.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR[26:25].
- IT[7:2] is SPSR[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to the current mode, and copied to PSTATE.SSBS on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to the current mode, and copied to PSTATE.PAN on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to the current mode, and copied to PSTATE.DIT on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to the current mode, and copied to PSTATE.IL on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to the current mode, and copied to PSTATE.GE on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to the current mode, and copied to PSTATE.E on executing an exception return operation in the current mode.

If the implementation does not support big-endian operation, SPSR.E is RES0. If the implementation does not support little-endian operation, SPSR.E is RES1. On executing an exception return operation in the current mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to the current mode, and copied to PSTATE.A on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to the current mode, and copied to PSTATE.I on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to the current mode, and copied to PSTATE.F on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to the current mode, and copied to PSTATE.T on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to the current mode, and copied to PSTATE.M[4:0] on executing an exception return operation in the current mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10110	Monitor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in the current mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR

SPSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

Purpose

Holds the saved process state when an exception is taken to Abort mode.

Configuration

AArch32 System register SPSR_abt bits [31:0] are architecturally mapped to AArch64 System register SPSR_abt[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR_abt are UNDEFINED.

Attributes

SPSR_abt is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]		J	SSBS	PAN	DIT	IL	GE				IT[7:2]						E	A	I	F	T	M[4:0]				

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Abort mode, and copied to PSTATE.IT on executing an exception return operation in Abort mode.

SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_abt[26:25].
- IT[7:2] is SPSR_abt[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

M[4:0]	Meaning
`0b10000`	User.
`0b10001`	FIQ.
`0b10010`	IRQ.
`0b10011`	Supervisor.
`0b10111`	Abort.
`0b11011`	Undefined.
`0b11111`	System.

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_abt

SPSR_abt is accessible in all modes other than User mode and Abort mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, SPSR_abt
```

R	M	M1
0b1	0b1	0b0100

```
MSR{<c>}{<q>} SPSR_abt, <Rn>
```

R	M	M1
0b1	0b1	0b0100

SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

Purpose

Holds the saved process state when an exception is taken to FIQ mode.

Configuration

AArch32 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch64 System register SPSR_fiq[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR_fiq are UNDEFINED.

Attributes

SPSR_fiq is a 32-bit register.

Field descriptions

31	30	29	28	27	26 25	24	23	22	21	20	19 18 17 16	15 14 13 12 11 10	9	8	7	6	5	4 3 2 1 0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL	GE	IT[7:2]	E	A	I	F	T	M[4:0]

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to FIQ mode, and copied to PSTATE.IT on executing an exception return operation in FIQ mode.

SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_fiq[26:25].
- IT[7:2] is SPSR_fiq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

M[4:0]	Meaning
`0b10000`	User.
`0b10001`	FIQ.
`0b10010`	IRQ.
`0b10011`	Supervisor.
`0b10111`	Abort.
`0b11011`	Undefined.
`0b11111`	System.

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_fiq

SPSR_fiq is accessible in all modes other than User mode and FIQ mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, SPSR_fiq
```

R	M	M1
0b1	0b0	0b1110

```
MSR{<c>}{<q>} SPSR_fiq, <Rn>
```

R	M	M1
0b1	0b0	0b1110

SPSR_hyp, Saved Program Status Register (Hyp mode)

The SPSR_hyp characteristics are:

Purpose

Holds the saved process state when an exception is taken to Hyp mode.

Configuration

AArch32 System register SPSR_hyp bits [31:0] are architecturally mapped to AArch64 System register SPSR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR_hyp are UNDEFINED.

Attributes

SPSR_hyp is a 32-bit register.

Field descriptions

31	30	29	28	27	26 25	24	23	22	21	20	19 18 17 16	15 14 13 12 11 10	9	8	7	6	5	4 3 2 1 0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL	GE	IT[7:2]	E	A	I	F	T	M[4:0]

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Hyp mode, and copied to PSTATE.N on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Hyp mode, and copied to PSTATE.Z on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Hyp mode, and copied to PSTATE.C on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Hyp mode, and copied to PSTATE.V on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Hyp mode, and copied to PSTATE.Q on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Hyp mode, and copied to PSTATE.IT on executing an exception return operation in Hyp mode.

SPSR_hyp.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_hyp[26:25].
- IT[7:2] is SPSR_hyp[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Hyp mode, and copied to PSTATE.SSBS on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Hyp mode, and copied to PSTATE.PAN on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Hyp mode, and copied to PSTATE.DIT on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Hyp mode, and copied to PSTATE.IL on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Hyp mode, and copied to PSTATE.GE on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Hyp mode, and copied to PSTATE.E on executing an exception return operation in Hyp mode.

If the implementation does not support big-endian operation, SPSR_hyp.E is RES0. If the implementation does not support little-endian operation, SPSR_hyp.E is RES1. On executing an exception return operation in Hyp mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_hyp.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_hyp.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Hyp mode, and copied to PSTATE.A on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Hyp mode, and copied to PSTATE.I on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Hyp mode, and copied to PSTATE.F on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Hyp mode, and copied to PSTATE.T on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Hyp mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Hyp mode.

M[4:0]	Meaning
`0b10000`	User.
`0b10001`	FIQ.
`0b10010`	IRQ.
`0b10011`	Supervisor.
`0b10111`	Abort.
`0b11010`	Hyp.
`0b11011`	Undefined.
`0b11111`	System.

Other values are reserved. If SPSR_hyp.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Hyp mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_hyp

SPSR_hyp is accessible only in Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, SPSR_hyp
```

R	M	M1
0b1	0b1	0b1110

```
MSR{<c>}{<q>} SPSR_hyp, <Rn>
```

SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

Purpose

Holds the saved process state when an exception is taken to IRQ mode.

Configuration

AArch32 System register SPSR_irq bits [31:0] are architecturally mapped to AArch64 System register SPSR_irq[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR_irq are UNDEFINED.

Attributes

SPSR_irq is a 32-bit register.

Field descriptions

31	30	29	28	27	26-25	24	23	22	21	20	19-16	15-10	9	8	7	6	5	4-0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL	GE	IT[7:2]	E	A	I	F	T	M[4:0]

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to IRQ mode, and copied to PSTATE.IT on executing an exception return operation in IRQ mode.

SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_irq[26:25].
- IT[7:2] is SPSR_irq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

M[4:0]	Meaning
`0b10000`	User.
`0b10001`	FIQ.
`0b10010`	IRQ.
`0b10011`	Supervisor.
`0b10111`	Abort.
`0b11011`	Undefined.
`0b11111`	System.

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_irq

SPSR_irq is accessible in all modes other than User mode and IRQ mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, SPSR_irq
```

R	M	M1
0b1	0b1	0b0000

```
MSR{<c>}{<q>} SPSR_irq, <Rn>
```

R	M	M1
0b1	0b1	0b0000

SPSR_mon, Saved Program Status Register (Monitor mode)

The SPSR_mon characteristics are:

Purpose

Holds the saved process state when an exception is taken to Monitor mode.

Configuration

AArch32 System register SPSR_mon bits [31:0] can be mapped to AArch64 System register SPSR_EL3[31:0], but this is not architecturally mandated.

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR_mon are UNDEFINED.

Attributes

SPSR_mon is a 32-bit register.

Field descriptions

31	30	29	28	27	26 25	24	23	22	21	20	19 18 17 16	15 14 13 12 11 10	9	8	7	6	5	4 3 2 1 0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL	GE	IT[7:2]	E	A	I	F	T	M[4:0]

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Monitor mode, and copied to PSTATE.N on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Monitor mode, and copied to PSTATE.Z on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Monitor mode, and copied to PSTATE.C on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Monitor mode, and copied to PSTATE.V on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Monitor mode, and copied to PSTATE.Q on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Monitor mode, and copied to PSTATE.IT on executing an exception return operation in Monitor mode.

SPSR_mon.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_mon[26:25].
- IT[7:2] is SPSR_mon[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Monitor mode, and copied to PSTATE.SSBS on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Monitor mode, and copied to PSTATE.PAN on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Monitor mode, and copied to PSTATE.DIT on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Monitor mode, and copied to PSTATE.IL on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Monitor mode, and copied to PSTATE.GE on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Monitor mode, and copied to PSTATE.E on executing an exception return operation in Monitor mode.

If the implementation does not support big-endian operation, SPSR_mon.E is RES0. If the implementation does not support little-endian operation, SPSR_mon.E is RES1. On executing an exception return operation in Monitor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_mon.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_mon.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Monitor mode, and copied to PSTATE.A on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Monitor mode, and copied to PSTATE.I on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Monitor mode, and copied to PSTATE.F on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Monitor mode, and copied to PSTATE.T on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Monitor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Monitor mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10110	Monitor.
0b10111	Abort.
0b11010	Hyp.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_mon.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Monitor mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_mon

SPSR_mon is only accessible in EL3 modes other than Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, SPSR_mon
```

R	M	M1
0b1	0b1	0b1100

```
MSR{<c>}{<q>} SPSR_mon, <Rn>
```

R	M	M1
0b1	0b1	0b1100

SPSR_svc, Saved Program Status Register (Supervisor mode)

The SPSR_svc characteristics are:

Purpose

Holds the saved process state when an exception is taken to Supervisor mode.

Configuration

AArch32 System register SPSR_svc bits [31:0] are architecturally mapped to AArch64 System register SPSR_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR_svc are UNDEFINED.

Attributes

SPSR_svc is a 32-bit register.

Field descriptions

31	30	29	28	27	26 25	24	23	22	21	20	19 18 17 16	15 14 13 12 11 10	9	8	7	6	5	4 3 2 1 0
N	Z	C	V	Q	IT[1:0]	J	SSBS	PAN	DIT	IL	GE	IT[7:2]	E	A	I	F	T	M[4:0]

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Supervisor mode, and copied to PSTATE.N on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Supervisor mode, and copied to PSTATE.Z on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Supervisor mode, and copied to PSTATE.C on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Supervisor mode, and copied to PSTATE.V on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Supervisor mode, and copied to PSTATE.Q on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Supervisor mode, and copied to PSTATE.IT on executing an exception return operation in Supervisor mode.

SPSR_svc.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_svc[26:25].
- IT[7:2] is SPSR_svc[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Supervisor mode, and copied to PSTATE.SSBS on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Supervisor mode, and copied to PSTATE.PAN on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Supervisor mode, and copied to PSTATE.DIT on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Supervisor mode, and copied to PSTATE.IL on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Supervisor mode, and copied to PSTATE.GE on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Supervisor mode, and copied to PSTATE.E on executing an exception return operation in Supervisor mode.

If the implementation does not support big-endian operation, SPSR_svc.E is RES0. If the implementation does not support little-endian operation, SPSR_svc.E is RES1. On executing an exception return operation in Supervisor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_svc.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_svc.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Supervisor mode, and copied to PSTATE.A on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Supervisor mode, and copied to PSTATE.I on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Supervisor mode, and copied to PSTATE.F on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Supervisor mode, and copied to PSTATE.T on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Supervisor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Supervisor mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_svc.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Supervisor mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_svc

SPSR_svc is accessible in all modes other than User mode and Supervisor mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, SPSR_svc
```

R	M	M1
0b1	0b1	0b0010

```
MSR{<c>}{<q>} SPSR_svc, <Rn>
```

SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

Purpose

Holds the saved process state when an exception is taken to Undefined mode.

Configuration

AArch32 System register SPSR_und bits [31:0] are architecturally mapped to AArch64 System register SPSR_und[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to SPSR_und are UNDEFINED.

Attributes

SPSR_und is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
N	Z	C	V	Q	IT[1:0]		J	SSBS	PAN	DIT	IL	GE				IT[7:2]						E	A	I	F	T	M[4:0]				

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Undefined mode, and copied to PSTATE.IT on executing an exception return operation in Undefined mode.

SPSR_und.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_und[26:25].
- IT[7:2] is SPSR_und[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

M[4:0]	Meaning
`0b10000`	User.
`0b10001`	FIQ.
`0b10010`	IRQ.
`0b10011`	Supervisor.
`0b10111`	Abort.
`0b11011`	Undefined.
`0b11111`	System.

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_und

SPSR_und is accessible in all modes other than User mode and Undefined mode.

Accesses to this register use the following encodings in the System register encoding space:

```
MRS{<c>}{<q>} <Rd>, SPSR_und
```

R	M	M1
0b1	0b1	0b0110

```
MSR{<c>}{<q>} SPSR_und, <Rn>

TCMTR, TCM Type Register

The TCMTR characteristics are:

Purpose

Provides information about the implementation of the TCM.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to TCMTR are UNDEFINED.

If EL1 or above can use AArch32 then this register must be implemented.

Attributes

TCMTR is a 32-bit register.

Field descriptions

31–0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing TCMTR

Accesses to this register use the following encodings in the System register encoding space:

```

TLBIALL, TLB Invalidate All

The TLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIALL are UNDEFINED.

Attributes

TLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the TLBIALL instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TTLB == '1' then

TLBIALLH, TLB Invalidate All, Hyp mode

The TLBIALLH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIALLH are UNDEFINED.

Attributes

TLBIALLH is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the TLBIALLH instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0111	0b000

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then

TLBIALLHIS, TLB Invalidate All, Hyp mode, Inner Shareable

The TLBIALLHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIALLHIS are UNDEFINED.

Attributes

TLBIALLHIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the TLBIALLHIS instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

TLBIALLIS, TLB Invalidate All, Inner Shareable

The TLBIALLIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIALLIS are UNDEFINED.

Attributes

TLBIALLIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the TLBIALLIS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```

TLBIALLNSNH, TLB Invalidate All, Non-Secure Non-Hyp

The TLBIALLNSNH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIALLNSNH are UNDEFINED.

Attributes

TLBIALLNSNH is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the TLBIALLNSNH instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIASID are UNDEFINED.

Attributes

TLBIASID is a 32-bit System instruction.

Field descriptions

31–8	7–0
RES0	ASID

Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing the TLBIASID instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

TLBIASIDIS, TLB Invalidate by ASID match, Inner Shareable

The TLBIASIDIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
    - Is from a level of lookup above the final level.
    - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIASIDIS are UNDEFINED.

Attributes

TLBIASIDIS is a 32-bit System instruction.

TLBIIPAS2, TLB Invalidate by Intermediate Physical Address, Stage 2

The TLBIIPAS2 characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIIPAS2 are UNDEFINED.

Note

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIIPAS2 is a 32-bit System instruction.

Field descriptions

31:28	27:0
RES0	IPA[39:12]

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing the TLBIIPAS2 instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIIPAS2IS, TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable

The TLBIIPAS2IS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIIPAS2IS are UNDEFINED.

Note

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIIPAS2IS is a 32-bit System instruction.

Field descriptions

31–28	27–0
RES0	IPA[39:12]

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing the TLBIIPAS2IS instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0000	0b001

```
if PSTATE.EL == EL0 then

TLBIIPAS2L, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level

The TLBIIPAS2L characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIIPAS2L are UNDEFINED.

Note

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIIPAS2L is a 32-bit System instruction.

Field descriptions

31–28	27–0
RES0	IPA[39:12]

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing the TLBIIPAS2L instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
    - The entry is from a level of lookup above the final level and matches the specified ASID.
    - The entry is a global entry from the final level of lookup.
    - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVA are UNDEFINED.

Attributes

TLBIMVA is a 32-bit System instruction.

Field descriptions

31:12	11:8	7:0
VA	RES0	ASID

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing the TLBIMVA instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

TLBIMVAA, TLB Invalidate by VA, All ASID

The TLBIMVAA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVAA are UNDEFINED.

Attributes

TLBIMVAA is a 32-bit System instruction.

Field descriptions

31–12	11–0

TLBIMVAAL, TLB Invalidate by VA, All ASID, Last level

The TLBIMVAAL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVAAL are UNDEFINED.

Note

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVAAL is a 32-bit System instruction.

Field descriptions

31–12	11–0
VA	RES0

VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVAAL instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b111

```

TLBIMVAALIS, TLB Invalidate by VA, All ASID, Last level, Inner Shareable

The TLBIMVAALIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVAALIS are UNDEFINED.

Note

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVAALIS is a 32-bit System instruction.

Field descriptions

31–12	11–0
VA	RES0

VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

TLBIMVAH, TLB Invalidate by VA, Hyp mode

The TLBIMVAH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVAH are UNDEFINED.

Attributes

TLBIMVAH is a 32-bit System instruction.

Field descriptions

31–12	11–0
VA	RES0

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVAH instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

TLBIMVAIS, TLB Invalidate by VA, Inner Shareable

The TLBIMVAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVAIS are UNDEFINED.

Attributes

TLBIMVAIS is a 32-bit System instruction.

Field descriptions

31–12	11–8	7–0
VA	RES0	ASID

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing the TLBIMVAIS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

TLBIMVALHIS, TLB Invalidate by VA, Last level, Hyp mode, Inner Shareable

The TLBIMVALHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from the final level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVALHIS are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVALHIS is a 32-bit System instruction.

Field descriptions

31–12	11–0
VA	RES0

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing the TLBIMVALHIS instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0011	0b101

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    AArch32.TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID_NONE, Shareability_ISH,
TLBILevel_Last, TLBI_AllAttr, R[t]);
elsif PSTATE.EL == EL3 then
    if !HaveEL(EL2) then
        UNDEFINED;
    else
        AArch32.TLBI_VA(SS_NonSecure, Regime_EL2, VMID[], Shareability_ISH, TLBILevel_Last,
TLBI_AllAttr, R[t]);
```

TLBIMVALIS, TLB Invalidate by VA, Last level, Inner Shareable

The TLBIMVALIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
    - The entry is a global entry from the final level of lookup.
    - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to TLBIMVALIS are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVALIS is a 32-bit System instruction.

Field descriptions

31–12	11–8	7–0
VA	RES0	ASID

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing the TLBIMVALIS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0011	0b101

TLBTR, TLB Type Register

The TLBTR characteristics are:

Purpose

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to TLBTR are UNDEFINED.

Attributes

TLBTR is a 32-bit register.

Field descriptions

31–1	0
IMPLEMENTATION DEFINED	nU

IMPLEMENTATION DEFINED, bits [31:1]

IMPLEMENTATION DEFINED.

nU, bit [0]

Not Unified TLB. Indicates whether the implementation has a unified TLB:

nU	Meaning
`0b0`	Unified TLB.
`0b1`	Separate Instruction and Data TLBs.

Accessing TLBTR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b011

```

TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configuration

AArch32 System register TPIDRPRW bits [31:0] are architecturally mapped to AArch64 System register TPIDR_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to TPIDRPRW are UNDEFINED.

Note

The PE never updates this register.

Attributes

TPIDRPRW is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
Thread ID

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRPRW

Accesses to this register use the following encodings in the System register encoding space:

TRFCR, Trace Filter Control Register

The TRFCR characteristics are:

Purpose

Provides EL1 controls for Trace.

Configuration

AArch32 System register TRFCR bits [31:0] are architecturally mapped to AArch64 System register TRFCR_EL1[31:0].

This register is present only when AArch32 is supported and FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR are UNDEFINED.

Attributes

TRFCR is a 32-bit register.

Field descriptions

31:7	6:5	4:2	1	0
RES0	TS	RES0	E1TRE	E0TRE

Bits [31:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

TS	Meaning	Applies when
`0b01`	Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF.	
`0b10`	Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2: • EL3 is implemented and is using AArch32. • EL3 is implemented, using AArch64, and SCR_EL3.ECVEn == `0b0`. • EL2 is using AArch32. • EL2 is using AArch64 and CNTHCTL_EL2.ECV == `0b0`.	When FEAT_ECV is implemented
`0b11`	Physical timestamp. The traced timestamp is the physical counter value.	

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- EL2 is implemented and HTRFCR.TS != `0b00`.
- `SelfHostedTraceEnabled()` == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

E1TRE	Meaning
`0b0`	Tracing is prohibited in PL1 modes.
`0b1`	Tracing is allowed in PL1 modes.

This field is ignored if `SelfHostedTraceEnabled()` == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

E0TRE, bit [0]

EL0 Trace Enable.

E0TRE	Meaning
`0b0`	Tracing is prohibited at EL0.
`0b1`	Tracing is allowed at EL0.

This field is ignored if any of the following are true:

- `SelfHostedTraceEnabled()` == FALSE.
- EL2 is implemented and enabled in the current security state and HCR.TGE == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing TRFCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

Purpose

The control register for stage 1 of the PL1&0 translation regime. Its controls include:

- Where the VA range is split between addresses translated using TTBR0 and addresses translated using TTBR1.
- The translation table format used by this stage of translation.

From Armv8.2, when the value of TTBCR.{EAE, T2E} is {1, 1}, TTBCR is used with TTBCR2.

Configuration

AArch32 System register TTBCR bits [31:0] are architecturally mapped to AArch64 System register TCR_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to TTBCR are UNDEFINED.

The current translation table format determines which format of the register is used.

Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32 then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

Attributes

TTBCR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

31	30–6	5	4	3	2–0
EAE	RES0	PD1	PD0	RES0	N

EAE, bit [31]

Extended Address Enable.

EAE	Meaning
`0b0`	Use the VMSAv8-32 translation system with the Short-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Bits [30:6]

Reserved, RES0.

PD1, bit [5]

Translation table walk disable for translations using TTBR1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1.

PD1	Meaning
`0b0`	Perform translation table walks using TTBR1.
`0b1`	A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

PD0, bit [4]

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using TTBR0.

PD0	Meaning
`0b0`	Perform translation table walks using TTBR0.
`0b1`	A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Bit [3]

Reserved, RES0.

N, bits [2:0]

Indicate the width of the base address held in TTBR0. In TTBR0, the base address field is bits[31:14-N]. The value of N also determines:

- Whether TTBR0 or TTBR1 is used as the base address for translation table walks.
- The size of the translation table pointed to by TTBR0.

N can take any value from 0 to 7, that is, from `0b000` to `0b111`.

When N has its reset value of 0, the translation table base is compatible with Armv5 and Armv6.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

When TTBCR.EAE == 1:

31	30	29 28	27 26	25 24	23	22	21 20 19	18 17 16	15 14	13 12	11 10	9 8	7	6	5 4 3	2 1 0
EAE	IMPLEMENTATION DEFINED	SH1	ORGN1	IRGN1	EPD1	A1	RES0	T1SZ	RES0	SH0	ORGN0	IRGN0	EPD0	T2E	RES0	T0SZ

EAE, bit [31]

Extended Address Enable.

EAE	Meaning
`0b1`	Use the VMSAv8-32 translation system with the Long-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

IMPLEMENTATION DEFINED, bit [30]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1.

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using TTBR1.

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using TTBR1.

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EPD1, bit [23]

Translation table walk disable for translations using TTBR1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1.

EPD1	Meaning
0b0	Perform translation table walks using TTBR1.
0b1	A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

A1, bit [22]

Selects whether TTBR0 or TTBR1 defines the ASID.

A1	Meaning
0b0	TTBR0.ASID defines the ASID.
0b1	TTBR1.ASID defines the ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [21:19]

Reserved, RES0.

T1SZ, bits [18:16]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [15:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0.

SH0	Meaning
0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

EPD0, bit [7]

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0.

EPD0	Meaning
0b0	Perform translation table walks using TTBR0.
0b1	A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

T2E, bit [6]
When FEAT_AA32HPD is implemented:

TTBCR2 Enable.

T2E	Meaning
0b0	TTBCR2 is disabled. The contents of TTBCR2 are treated as 0 for all purposes other than reading or writing the register.
0b1	TTBCR2 is enabled.

If TTBCR.EAE==0, then the behavior is as if the bit is 0.

Otherwise:

Reserved, RAZ/WI.

Bits [5:3]

Reserved, RES0.

T0SZ, bits [2:0]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing TTBCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

TTBCR2, Translation Table Base Control Register 2

The TTBCR2 characteristics are:

Purpose

The second control register for stage 1 of the PL1&0 translation regime.

If FEAT_AA32HPD is not implemented then this register is not implemented and its encoding is UNDEFINED. Otherwise:

- When the value of TTBCR.{EAE, T2E} is not {1, 1} the contents of TTBCR2 are treated as zero for all purposes other than reading or writing the register.
- When the value of TTBCR.{EAE, T2E} is {1, 1} TTBCR2 is used with TTBCR.

Configuration

AArch32 System register TTBCR2 bits [31:0] are architecturally mapped to AArch64 System register TCR_EL1[63:32].

This register is present only when AArch32 is supported and FEAT_AA32HPD is implemented. Otherwise, direct accesses to TTBCR2 are UNDEFINED.

Attributes

TTBCR2 is a 32-bit register.

Field descriptions

31302928272625242322212019	18	17	16	15	14	13	12	11	10	9	87654
RES0	HWU162	HWU161	HWU160	HWU159	HWU062	HWU061	HWU060	HWU059	HPD1	HPD0	RE

Bits [31:19]

Reserved, RES0.

HWU162, bit [18]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1.

HWU162	Meaning
0b0	For translations using TTBR1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU161, bit [17]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR1.

HWU161	Meaning
0b0	For translations using TTBR1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU160, bit [16]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR1.

HWU160	Meaning
0b0	For translations using TTBR1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU159, bit [15]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1.

HWU159	Meaning
0b0	For translations using TTBR1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU062, bit [14]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0.

HWU062	Meaning
0b0	For translations using TTBR0, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU061, bit [13]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0.

HWU061	Meaning
0b0	For translations using TTBR0, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU060, bit [12]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0.

HWU060	Meaning
0b0	For translations using TTBR0, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU059, bit [11]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0.

HWU059	Meaning
0b0	For translations using TTBR0, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HPD1, bit [10]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by TTBR1.

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled if TTBCR.T2E == 1.

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPD0, bit [9]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by TTBR0.

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled if TTBCR.T2E ==1.

When disabled, the permissions are treated is as if the bits are 0.

The Effective value of this field is 0 if the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:0]

Reserved, RES0.

Accessing TTBCR2

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register TTBR0 bits [63:0] are architecturally mapped to AArch64 System register TTBR0_EL1[63:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to TTBR0 are UNDEFINED.

TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

TTBCR.EAE determines which TTBR0 format is used:

- TTBCR.EAE == `0b0`: 32-bit format is used. TTBR0[63:32] are ignored.
- TTBCR.EAE == `0b1`: 64-bit format is used.

When EL3 is using AArch32, write access to TTBR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Used in conjunction with the TTBCR. When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR0.

Attributes

TTBR0 is a 64-bit register.

Field descriptions

When TTBCR.EAE == 0:

Bits	63:32						
Field	RES0						
Bits	31:7	6	5	4:3	2	1	0
Field	TTB0	IRGN[0]	NOS	RGN	IMP	S	IRGN[1]

Bits [63:32]

Reserved, RES0.

TTB0, bits [31:7]

Translation table base address, bits[31:x], where x is 14-(TTBCR.N). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [0, 6]

Inner region bits. Bits [0,6] of this register together indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

IRGN	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Cacheable.
0b11	Normal memory, Inner Write-Back no Write-Allocate Cacheable.

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[0] is TTBR0[6].
- IRGN[1] is TTBR0[0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR0.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

NOS	Meaning
0b0	Memory is Outer Shareable.
0b1	Memory is Inner Shareable.

This bit is ignored when the value of TTBR0.S is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

RGN	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Cacheable.
0b11	Normal memory, Outer Write-Back no Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Shareable:

S	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is Shareable. The TTBR0.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

63:56	55:48	47:32
RES0	ASID	BADDR

31:1	0
BADDR	CnP

Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T0SZ as follows:

- If TTBCR.T0SZ is 0 or 1, x = 5 - TTBCR.T0SZ.
- If TTBCR.T0SZ is greater than 1, x = 14 - TTBCR.T0SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. When TTBCR.EAE ==1, this bit indicates whether each entry that is pointed to by TTBR0 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by this instance of TTBR0, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR0 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR0.CnP on those other PEs. • The value of TTBCR.EAE on those other PEs. • The value of the current ASID or, for the Non-secure instance of TTBR0, the value of the current VMID.
0b1	The translation table entries pointed to by this instance of TTBR0 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1 for this instance of TTBR0 and all of the following apply: • The translation table entries are pointed to by this instance of TTBR0. • The value of the applicable TTBCR.EAE field is 1. • The ASID is the same as the current ASID. • For the Non-secure instance of TTBR0, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register TTBR1 bits [63:0] are architecturally mapped to AArch64 System register TTBR1_EL1[63:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to TTBR1 are UNDEFINED.

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

TTBCR.EAE determines which TTBR1 format is used:

- TTBCR.EAE == `0b0`: 32-bit format is used. TTBR1[63:32] are ignored.
- TTBCR.EAE == `0b1`: 64-bit format is used.

Used in conjunction with the TTBCR. When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR1.

Attributes

TTBR1 is a 64-bit register.

Field descriptions

When TTBCR.EAE == 0:

63–32
RES0

31–7	6	5	4–3	2	1	0
TTB1	IRGN[1]	NOS	RGN	IMP	S	IRGN[0]

Bits [63:32]

Reserved, RES0.

TTB1, bits [31:7]

Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [6, 0]

Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

IRGN	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Cacheable.
0b11	Normal memory, Inner Write-Back no Write-Allocate Cacheable.

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for Armv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[1] is TTBR1[6].
- IRGN[0] is TTBR1[0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR1.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

NOS	Meaning
0b0	Memory is Outer Shareable.
0b1	Memory is Inner Shareable.

This bit is ignored when the value of TTBR1.S is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

RGN	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Cacheable.
0b11	Normal memory, Outer Write-Back no Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

Shareable. Indicates whether the memory associated with the translation table walks is Shareable:

S	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is Shareable. The TTBR1.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

63:56	55:48	47:32
RES0	ASID	BADDR

31:1	0
BADDR	CnP

Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T1SZ as follows:

- If TTBCR.T1SZ is 0 or 1, x = 5 - TTBCR.T1SZ.
- If TTBCR.T1SZ is greater than 1, x = 14 - TTBCR.T1SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. When TTBCR.EAE ==1, this bit indicates whether each entry that is pointed to by TTBR1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by this instance of TTBR1, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR1 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR1.CnP on those other PEs. • The value of TTBCR.EAE on those other PEs. • The value of the current ASID or, for the Non-secure instance of TTBR1, the value of the current VMID.
0b1	The translation table entries pointed to by this instance of TTBR1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1 for this instance of TTBR1 and all of the following apply: • The translation table entries are pointed to by this instance of TTBR1. • The value of the applicable TTBCR.EAE field is 1. • The ASID is the same as the current ASID. • For the Non-secure instance of TTBR1, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR1

VBAR, Vector Base Address Register

The VBAR characteristics are:

Purpose

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

Configuration

AArch32 System register VBAR bits [31:0] are architecturally mapped to AArch64 System register VBAR_EL1[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to VBAR are UNDEFINED.

Attributes

VBAR is a 32-bit register.

Field descriptions

31 … 5	4 … 0
Vector Base Address	RES0

Bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [4:0]

Reserved, RES0.

Accessing VBAR

Accesses to this register use the following encodings in the System register encoding space:

```

VDFSR, Virtual SError Exception Syndrome Register

The VDFSR characteristics are:

Purpose

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When the virtual SError interrupt injected using HCR.VA is taken to EL1 using AArch32, then the syndrome value is reported in DFSR.{AET, ExT} and the remainder of DFSR is set as defined by VMSAv8-32. For more information, see The AArch32 Virtual Memory System Architecture.

If the virtual SError interrupt injected using HCR.VA is deferred by an ESB instruction, then the syndrome value is written to VDISR.

Configuration

AArch32 System register VDFSR bits [31:0] are architecturally mapped to AArch64 System register VSESR_EL2[31:0] when the highest implemented Exception level is using AArch64.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDFSR are UNDEFINED.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when SCR.NS == 1.

Attributes

VDFSR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16	15 14	13	12	11 10 9 8 7 6 5 4 3 2 1 0
RES0	AET	RES0	ExT	RES0

Bits [31:16]

Reserved, RES0.

AET, bits [15:14]

When a virtual SError interrupt is taken to EL1 using AArch32, DFSR[15:4] is set to VDFSR.AET.

When a virtual SError interrupt is deferred by an ESB instruction, VDISR[15:4] is set to VDFSR.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

When a virtual SError interrupt is taken to EL1 using AArch32, DFSR[12] is set to VDFSR.ExT.

When a virtual SError interrupt is deferred by an ESB instruction, VDISR[12] is set to VDFSR.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing VDFSR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when SCR.NS == 1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

VDISR, Virtual Deferred Interrupt Status Register

The VDISR characteristics are:

Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

Configuration

AArch32 System register VDISR bits [31:0] are architecturally mapped to AArch64 System register VDISR_EL2[31:0].

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDISR are UNDEFINED.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Attributes

VDISR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

31	30 29 28 27 26 25 24 23 22 21 20 19 18 17 16	15 14	13	12	11	10	9	8 7 6 5 4	3 2 1 0
A	RES0	AET	RES0	ExT	RES0	FS[4]	LPAE	RES0	FS[3:0]

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VDFSR.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VDFSR.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault status code. Set to `0b10110` when an `ESB` instruction defers a virtual SError interrupt.

FS	Meaning
`0b10110`	Asynchronous SError interrupt.

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR[10].
- FS[3:0] is VDISR[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to TTBCR.EAE when an `ESB` instruction defers a virtual SError interrupt.

LPAE	Meaning
`0b0`	Using the Short-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == 1:

31	30–16	15–14	13	12	11–10	9	8–6	5–0
A	RES0	AET	RES0	ExT	RES0	LPAE	RES0	STATUS

A, bit [31]

Set to 1 when an `ESB` instruction defers a virtual SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VDFSR.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VDFSR.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

Set to TTBCR.EAE when an ESB instruction defers a virtual SError interrupt.

LPAE	Meaning
0b1	Using the Long-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.

STATUS	Meaning
0b010001	Asynchronous SError interrupt.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VDISR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

An indirect write to VDISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1100	0b0001	0b001

```
if PSTATE.EL == EL0 then

VMPIDR, Virtualization Multiprocessor ID Register

The VMPIDR characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of MPIDR.

Configuration

AArch32 System register VMPIDR bits [31:0] are architecturally mapped to AArch64 System register VMPIDR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to VMPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MPIDR.

Attributes

VMPIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
M	U	RES0					MT	Aff2								Aff1								Aff0							

M, bit [31]

Indicates whether this implementation includes the functionality introduced by the Armv7 Multiprocessing Extensions.

M	Meaning
0b0	This implementation does not include the Armv7 Multiprocessing Extensions functionality.
0b1	This implementation includes the Armv7 Multiprocessing Extensions functionality.

Access to this field is **RES1**.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.U.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels.

MT	Meaning
`0b0`	Performance of PEs at the lowest affinity level is largely independent.
`0b1`	Performance of PEs at the lowest affinity level is very interdependent.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.MT.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.Aff2.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.Aff1.

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MPIDR.Aff0.

Accessing VMPIDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

VPIDR, Virtualization Processor ID Register

The VPIDR characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of MIDR.

Configuration

AArch32 System register VPIDR bits [31:0] are architecturally mapped to AArch64 System register VPIDR_EL2[31:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to VPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MIDR.

Attributes

VPIDR is a 32-bit register.

Field descriptions

31–24	23–20	19–16	15–4	3–0
Implementer	Variant	Architecture	PartNum	Revision

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Implementer.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Variant.

Architecture, bits [19:16]

Architecture version. Defined values are:

Architecture	Meaning
`0b0001`	Armv4.
`0b0010`	Armv4T.
`0b0011`	Armv5 (obsolete).
`0b0100`	Armv5T.
`0b0101`	Armv5TE.
`0b0110`	Armv5TEJ.
`0b0111`	Armv6.
`0b1111`	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Architecture.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are `0x0` or `0x7`, the variant and architecture are encoded differently.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.PartNum.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in MIDR.Revision.

Accessing VPIDR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2

VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

Purpose

The control register for stage 2 of the Non-secure PL1&0 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configuration

AArch32 System register VTCR bits [31:0] are architecturally mapped to AArch64 System register [VTCR_EL2[31:0]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to VTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

VTCR is a 32-bit register.

Field descriptions

31	30 29	28	27	26	25	24 23 22 21 20 19 18 17 16 15 14	13 12	11 10	9 8	7 6	5	4	3 2 1 0
RES1	RES0	HWU62	HWU61	HWU60	HWU59	RES0	SH0	ORGN0	IRGN0	SL0	RES0	S	T0SZ

Bit [31]

Reserved, RES1.

Bits [30:29]

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

HWU62	Meaning
`0b0`	Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
`0b1`	Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU61, bit [27]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU60, bit [26]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU59, bit [25]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [24:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using VTTBR.

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using VTTBR.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using VTTBR.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]

Starting level for translation table walks using VTTBR.

SL0	Meaning
0b00	Start at level 2
0b01	Start at level 1

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of T0SZ, then a stage 2 level 1 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

S, bit [4]

Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the stage 2 T0SZ value is treated as an UNKNOWN value

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [3:0]

The size offset of the memory region addressed by VTTBR. The region size is $2^{(32\text{-T0SZ})}$ bytes.

This field holds a four-bit signed integer value, meaning it supports values from -8 to 7.

Note

This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 1 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VTCR

Accesses to this register use the following encodings in the System register encoding space:

```
MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0010	0b0001	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T2 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T2 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return VTCR;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return VTCR;
```

```
MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}
```

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0010	0b0001	0b010

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T2 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T2 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    VTCR = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        VTCR = R[t];
```

VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register VTTBR bits [63:0] are architecturally mapped to AArch64 System register VTTBR_EL2[63:0].

This register is present only when AArch32 is supported. Otherwise, direct accesses to VTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

VTTBR is a 64-bit register.

Field descriptions

63:56	55:48	47:32
RES0	VMID	BADDR

31:1	0
BADDR	CnP

Bits [63:56]

Reserved, RES0.

VMID, bits [55:48]

The VMID for the translation table.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to `0`.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of VTCR.SL0 and VTCR.T0SZ as follows:

- If VTCR.SL0 is `0b00`, meaning that lookup starts at level 2, then x is 14 - VTCR.T0SZ.
- If VTCR.SL0 is `0b01`, meaning that lookup starts at level 1, then x is 5 - VTCR.T0SZ.
- If VTCR.SL0 is either `0b10` or `0b11` then a stage 2 level 1 Translation fault is generated.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VTTBR are permitted to differ from the entries for VTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VTTBR are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1 and the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the VTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBRs do not point to the same translation table entries when the VMID value is the same as the current VMID, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing VTTBR

Accesses to this register use the following encodings in the System register encoding space:

```
MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>
```

coproc	CRm	opc1
0b1111	0b0010	0b0110

```

System Register index by instruction and encoding

Below are indexes for registers and operations accessed in the following ways:

For AArch32

- MCR/MRC
- MCRR/MRRC
- MRS/MSR
- VMRS/VMSR

For AArch64

- AT
- CFP
- CPP
- DC
- DVP
- IC
- MRS/MSR
- TLBI

Registers and operations in AArch32

System Register index by functional group

Below are indexes for registers with the following main functional groups:

- ID
- Memory
- Other
- Exception
- Special
- PSTATE
- Cache
- Address
- TLB
- PMU
- Reset
- Thread
- IMP DEF
- Timer
- Debug
- CTI
- Virt
- Secure
- Float
- Legacy
- GIC
- GICD
- GICR
- GICC
- GICV
- GICH
- GITS
- RAS
- MPAM
- Pointer authentication
- AMU
- GIC ITS registers

In the ID functional group:

AArch64	AFSR1_EL3	Auxiliary Fault Status Register 1 (EL3)
AArch64	ESR_EL1	Exception Syndrome Register (EL1)
AArch64	ESR_EL2	Exception Syndrome Register (EL2)
AArch64	ESR_EL3	Exception Syndrome Register (EL3)
AArch64	FAR_EL1	Fault Address Register (EL1)
AArch64	FAR_EL2	Fault Address Register (EL2)
AArch64	FAR_EL3	Fault Address Register (EL3)
AArch64	HPFAR_EL2	Hypervisor IPA Fault Address Register
AArch64	IFSR32_EL2	Instruction Fault Status Register (EL2)
AArch64	ISR_EL1	Interrupt Status Register
AArch64	VBAR_EL1	Vector Base Address Register (EL1)
AArch64	VBAR_EL2	Vector Base Address Register (EL2)
AArch64	VBAR_EL3	Vector Base Address Register (EL3)

In the Special functional group:

Exec state	Name	Description
AArch32	DLR	Debug Link Register
AArch32	DSPSR	Debug Saved Program Status Register
AArch32	ELR_hyp	Exception Link Register (Hyp mode)
AArch32	SPSR	Saved Program Status Register
AArch32	SPSR_abt	Saved Program Status Register (Abort mode)
AArch32	SPSR_fiq	Saved Program Status Register (FIQ mode)
AArch32	SPSR_hyp	Saved Program Status Register (Hyp mode)
AArch32	SPSR_irq	Saved Program Status Register (IRQ mode)
AArch32	SPSR_mon	Saved Program Status Register (Monitor mode)
AArch32	SPSR_svc	Saved Program Status Register (Supervisor mode)
AArch32	SPSR_und	Saved Program Status Register (Undefined mode)
AArch64	ELR_EL1	Exception Link Register (EL1)
AArch64	ELR_EL2	Exception Link Register (EL2)
AArch64	ELR_EL3	Exception Link Register (EL3)
AArch64	SPSR_EL1	Saved Program Status Register (EL1)
AArch64	SPSR_EL2	Saved Program Status Register (EL2)
AArch64	SPSR_EL3	Saved Program Status Register (EL3)
AArch64	SPSR_abt	Saved Program Status Register (Abort mode)
AArch64	SPSR_fiq	Saved Program Status Register (FIQ mode)
AArch64	SPSR_irq	Saved Program Status Register (IRQ mode)
AArch64	SPSR_und	Saved Program Status Register (Undefined mode)
AArch64	SP_EL0	Stack Pointer (EL0)
AArch64	SP_EL1	Stack Pointer (EL1)
AArch64	SP_EL2	Stack Pointer (EL2)
AArch64	SP_EL3	Stack Pointer (EL3)

In the PSTATE functional group:

Exec state	Name	Description
AArch32	APSR	Application Program Status Register
AArch32	CPSR	Current Program Status Register
AArch64	ALLINT	All Interrupt Mask Bit
AArch64	CurrentEL	Current Exception Level

Exec state	Name	Description
AArch64	DAIF	Interrupt Mask Bits
AArch64	DIT	Data Independent Timing
AArch64	NZCV	Condition Flags
AArch64	PAN	Privileged Access Never
AArch64	SPSel	Stack Pointer Select
AArch64	SSBS	Speculative Store Bypass Safe
AArch64	TCO	Tag Check Override
AArch64	UAO	User Access Override

In the Cache functional group:

Exec state	Name	Description
AArch32	BPIALL	Branch Predictor Invalidate All
AArch32	BPIALLIS	Branch Predictor Invalidate All, Inner Shareable
AArch32	BPIMVA	Branch Predictor Invalidate by VA
AArch32	DCCIMVAC	Data Cache line Clean and Invalidate by VA to PoC
AArch32	DCCISW	Data Cache line Clean and Invalidate by Set/Way
AArch32	DCCMVAC	Data Cache line Clean by VA to PoC
AArch32	DCCMVAU	Data Cache line Clean by VA to PoU
AArch32	DCCSW	Data Cache line Clean by Set/Way
AArch32	DCIMVAC	Data Cache line Invalidate by VA to PoC
AArch32	DCISW	Data Cache line Invalidate by Set/Way
AArch32	ICIALLU	Instruction Cache Invalidate All to PoU
AArch32	ICIALLUIS	Instruction Cache Invalidate All to PoU, Inner Shareable
AArch32	ICIMVAU	Instruction Cache line Invalidate by VA to PoU
AArch64	DC CGDSW	Clean of Data and Allocation Tags by Set/Way
AArch64	DC CGDVAC	Clean of Data and Allocation Tags by VA to PoC
AArch64	DC CGDVADP	Clean of Data and Allocation Tags by VA to PoDP
AArch64	DC CGDVAP	Clean of Data and Allocation Tags by VA to PoP
AArch64	DC CGSW	Clean of Allocation Tags by Set/Way
AArch64	DC CGVAC	Clean of Allocation Tags by VA to PoC
AArch64	DC CGVADP	Clean of Allocation Tags by VA to PoDP
AArch64	DC CGVAP	Clean of Allocation Tags by VA to PoP
AArch64	DC CIGDSW	Clean and Invalidate of Data and Allocation Tags by Set/Way
AArch64	DC CIGDVAC	Clean and Invalidate of Data and Allocation Tags by VA to PoC
AArch64	DC CIGSW	Clean and Invalidate of Allocation Tags by Set/Way
AArch64	DC CIGVAC	Clean and Invalidate of Allocation Tags by VA to PoC
AArch64	DC CISW	Data or unified Cache line Clean and Invalidate by Set/Way
AArch64	DC CIVAC	Data or unified Cache line Clean and Invalidate by VA to PoC
AArch64	DC CSW	Data or unified Cache line Clean by Set/Way
AArch64	DC CVAC	Data or unified Cache line Clean by VA to PoC
AArch64	DC CVADP	Data or unified Cache line Clean by VA to PoDP
AArch64	DC CVAP	Data or unified Cache line Clean by VA to PoP
AArch64	DC CVAU	Data or unified Cache line Clean by VA to PoU
AArch64	DC GVA	Data Cache set Allocation Tag by VA
AArch64	DC GZVA	Data Cache set Allocation Tags and Zero by VA
AArch64	DC IGDSW	Invalidate of Data and Allocation Tags by Set/Way
AArch64	DC IGDVAC	Invalidate of Data and Allocation Tags by VA to PoC
AArch64	DC IGSW	Invalidate of Allocation Tags by Set/Way
AArch64	DC IGVAC	Invalidate of Allocation Tags by VA to PoC
AArch64	DC ISW	Data or unified Cache line Invalidate by Set/Way
AArch64	DC IVAC	Data or unified Cache line Invalidate by VA to PoC
AArch64	DC ZVA	Data Cache Zero by VA
AArch64	IC IALLU	Instruction Cache Invalidate All to PoU
AArch64	IC IALLUIS	Instruction Cache Invalidate All to PoU, Inner Shareable
AArch64	IC IVAU	Instruction Cache line Invalidate by VA to PoU

In the Address functional group:

Exec state	Name	Description
AArch32	ATS12NSOPR	Address Translate Stages 1 and 2 Non-secure Only PL1 Read
AArch32	ATS12NSOPW	Address Translate Stages 1 and 2 Non-secure Only PL1 Write

Exec state	Name	Description
AArch32	ATS12NSOUR	Address Translate Stages 1 and 2 Non-secure Only Unprivileged Read
AArch32	ATS12NSOUW	Address Translate Stages 1 and 2 Non-secure Only Unprivileged Write
AArch32	ATS1CPR	Address Translate Stage 1 Current state PL1 Read
AArch32	ATS1CPRP	Address Translate Stage 1 Current state PL1 Read PAN
AArch32	ATS1CPW	Address Translate Stage 1 Current state PL1 Write
AArch32	ATS1CPWP	Address Translate Stage 1 Current state PL1 Write PAN
AArch32	ATS1CUR	Address Translate Stage 1 Current state Unprivileged Read
AArch32	ATS1CUW	Address Translate Stage 1 Current state Unprivileged Write
AArch32	ATS1HR	Address Translate Stage 1 Hyp mode Read
AArch32	ATS1HW	Address Translate Stage 1 Hyp mode Write
AArch32	PAR	Physical Address Register
AArch64	AT S12E0R	Address Translate Stages 1 and 2 EL0 Read
AArch64	AT S12E0W	Address Translate Stages 1 and 2 EL0 Write
AArch64	AT S12E1R	Address Translate Stages 1 and 2 EL1 Read
AArch64	AT S12E1W	Address Translate Stages 1 and 2 EL1 Write
AArch64	AT S1E0R	Address Translate Stage 1 EL0 Read
AArch64	AT S1E0W	Address Translate Stage 1 EL0 Write
AArch64	AT S1E1R	Address Translate Stage 1 EL1 Read
AArch64	AT S1E1RP	Address Translate Stage 1 EL1 Read PAN
AArch64	AT S1E1W	Address Translate Stage 1 EL1 Write
AArch64	AT S1E1WP	Address Translate Stage 1 EL1 Write PAN
AArch64	AT S1E2R	Address Translate Stage 1 EL2 Read
AArch64	AT S1E2W	Address Translate Stage 1 EL2 Write
AArch64	AT S1E3R	Address Translate Stage 1 EL3 Read
AArch64	AT S1E3W	Address Translate Stage 1 EL3 Write
AArch64	PAR_EL1	Physical Address Register

In the TLB functional group:

Exec state	Name	Description
AArch32	CFPRCTX	Control Flow Prediction Restriction by Context
AArch32	CPPRCTX	Cache Prefetch Prediction Restriction by Context
AArch32	DTLBIALL	Data TLB Invalidate All
AArch32	DTLBIASID	Data TLB Invalidate by ASID match
AArch32	DTLBIMVA	Data TLB Invalidate by VA
AArch32	DVPRCTX	Data Value Prediction Restriction by Context
AArch32	ITLBIALL	Instruction TLB Invalidate All
AArch32	ITLBIASID	Instruction TLB Invalidate by ASID match
AArch32	ITLBIMVA	Instruction TLB Invalidate by VA
AArch32	TLBIALL	TLB Invalidate All
AArch32	TLBIALLH	TLB Invalidate All, Hyp mode
AArch32	TLBIALLHIS	TLB Invalidate All, Hyp mode, Inner Shareable
AArch32	TLBIALLIS	TLB Invalidate All, Inner Shareable
AArch32	TLBIALLNSNH	TLB Invalidate All, Non-Secure Non-Hyp
AArch32	TLBIALLNSNHIS	TLB Invalidate All, Non-Secure Non-Hyp, Inner Shareable
AArch32	TLBIASID	TLB Invalidate by ASID match
AArch32	TLBIASIDIS	TLB Invalidate by ASID match, Inner Shareable
AArch32	TLBIIPAS2	TLB Invalidate by Intermediate Physical Address, Stage 2
AArch32	TLBIIPAS2IS	TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable
AArch32	TLBIIPAS2L	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level
AArch32	TLBIIPAS2LIS	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, Inner Shareable

AArch64	CPTR_EL3	Architectural Feature Trap Register (EL3)
AArch64	ICC_CTLR_EL3	Interrupt Controller Control Register (EL3)
AArch64	ICC_SRE_EL3	Interrupt Controller System Register Enable register (EL3)
AArch64	MDCR_EL3	Monitor Debug Configuration Register (EL3)
AArch64	SCR_EL3	Secure Configuration Register
AArch64	SDER32_EL3	AArch32 Secure Debug Enable Register
AArch64	VBAR_EL3	Vector Base Address Register (EL3)

In the Float functional group:

Exec state	Name	Description
AArch32	FPEXC	Floating-Point Exception Control register
AArch32	FPSCR	Floating-Point Status and Control Register
AArch32	FPSID	Floating-Point System ID register
AArch32	MVFR0	Media and VFP Feature Register 0
AArch32	MVFR1	Media and VFP Feature Register 1
AArch32	MVFR2	Media and VFP Feature Register 2
AArch64	FPCR	Floating-point Control Register
AArch64	FPEXC32_EL2	Floating-Point Exception Control register
AArch64	FPSR	Floating-point Status Register
AArch64	MVFR0_EL1	AArch32 Media and VFP Feature Register 0
AArch64	MVFR1_EL1	AArch32 Media and VFP Feature Register 1
AArch64	MVFR2_EL1	AArch32 Media and VFP Feature Register 2

In the Legacy functional group:

Exec state	Name	Description
AArch32	CP15DMB	Data Memory Barrier System instruction
AArch32	CP15DSB	Data Synchronization Barrier System instruction
AArch32	CP15ISB	Instruction Synchronization Barrier System instruction
AArch32	FCSEIDR	FCSE Process ID register
AArch32	JIDR	Jazelle ID Register
AArch32	JMCR	Jazelle Main Configuration Register
AArch32	JOSCR	Jazelle OS Control Register

In the GIC functional group:

Exec state	Name	Description
AArch32	ICC_AP0R<n>	Interrupt Controller Active Priorities Group 0 Registers
AArch32	ICC_AP1R<n>	Interrupt Controller Active Priorities Group 1 Registers
AArch32	ICC_ASGI1R	Interrupt Controller Alias Software Generated Interrupt Group 1 Register

Exec state	Name	Description
AArch32	ICC_BPR0	Interrupt Controller Binary Point Register 0
AArch32	ICC_BPR1	Interrupt Controller Binary Point Register 1
AArch32	ICC_CTLR	Interrupt Controller Control Register
AArch32	ICC_DIR	Interrupt Controller Deactivate Interrupt Register
AArch32	ICC_EOIR0	Interrupt Controller End Of Interrupt Register 0
AArch32	ICC_EOIR1	Interrupt Controller End Of Interrupt Register 1
AArch32	ICC_HPPIR0	Interrupt Controller Highest Priority Pending Interrupt Register 0
AArch32	ICC_HPPIR1	Interrupt Controller Highest Priority Pending Interrupt Register 1
AArch32	ICC_HSRE	Interrupt Controller Hyp System Register Enable register
AArch32	ICC_IAR0	Interrupt Controller Interrupt Acknowledge Register 0
AArch32	ICC_IAR1	Interrupt Controller Interrupt Acknowledge Register 1
AArch32	ICC_IGRPEN0	Interrupt Controller Interrupt Group 0 Enable register
AArch32	ICC_IGRPEN1	Interrupt Controller Interrupt Group 1 Enable register
AArch32	ICC_MCTLR	Interrupt Controller Monitor Control Register

External register index by offset

Below are indexes for external registers in the following blocks:

- GIC Distributor
- Debug
- GIC Virtual interface control
- PMU
- GIC Redistributor
- GIC Virtual CPU interface
- CTI
- GIC ITS control
- GIC CPU interface
- Timer
- GIC ITS translation
- AMU
- MPAM
- RAS

In the GIC Distributor block:

Frame	Offset	Name	Description
Dist_base	0x0000	GICD_CTLR	Distributor Control Register
Dist_base	0x0004	GICD_TYPER	Interrupt Controller Type Register
Dist_base	0x0008	GICD_IIDR	Distributor Implementer Identification Register
Dist_base	0x000C	GICD_TYPER2	Interrupt Controller Type Register 2
Dist_base	0x0010	GICD_STATUSR	Error Reporting Status Register
Dist_base	0x0010	GICD_STATUSR	Error Reporting Status Register
Dist_base	0x0040	GICD_SETSPI_NSR	Set Non-secure SPI Pending Register
Dist_base	0x0048	GICD_CLRSPI_NSR	Clear Non-secure SPI Pending Register
Dist_base	0x0050	GICD_SETSPI_SR	Set Secure SPI Pending Register
Dist_base	0x0058	GICD_CLRSPI_SR	Clear Secure SPI Pending Register
Dist_base	0x0080 + (4 * n)	GICD_IGROUPR<n>	Interrupt Group Registers
Dist_base	0x0100 + (4 * n)	GICD_ISENABLER<n>	Interrupt Set-Enable Registers
Dist_base	0x0180 + (4 * n)	GICD_ICENABLER<n>	Interrupt Clear-Enable Registers
Dist_base	0x0200 + (4 * n)	GICD_ISPENDR<n>	Interrupt Set-Pending Registers
Dist_base	0x0280 + (4 * n)	GICD_ICPENDR<n>	Interrupt Clear-Pending Registers

AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

Configuration

External register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register AMCFGR_EL0[31:0].

External register AMCFGR bits [31:0] are architecturally mapped to AArch32 System register AMCFGR[31:0].

The power domain of AMCFGR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are RES0.

Attributes

AMCFGR is a 32-bit register.

Field descriptions

31:28	27:25	24	23:14	13:8	7:0
NCG	RES0	HDBG	RAZ	SIZE	N

NCG, bits [31:28]

Defines the number of counter groups.

The number of implemented counter groups is [AMCFGR.NCG + 1].

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of `0b0000`. Otherwise, this field has a value of `0b0001`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

This feature must be supported, and so this bit is `0b1`.

HDBG	Meaning
`0b0`	AMCR.HDBG is RES0.
`0b1`	AMCR.HDBG is read/write.

Access to this field is **RO**.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is [AMCFGR.SIZE + 1].

The counters are 64-bit.

> **Note**
>
> Software also uses this field to determine the spacing of counters in the memory-map. The counters are at doubleword-aligned addresses.

Reads as `0b111111`.

Access to this field is **RO**.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is [AMCFGR.N + 1].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMCFGR

AMCFGR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0xE00`	AMCFGR

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMCGCR, Activity Monitors Counter Group Configuration Register

The AMCGCR characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configuration

External register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register AMCGCR_EL0[31:0].

External register AMCGCR bits [31:0] are architecturally mapped to AArch32 System register AMCGCR[31:0].

The power domain of AMCGCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are RES0.

Attributes

AMCGCR is a 32-bit register.

Field descriptions

31–16	15–8	7–0
RES0	CG1NC	CG0NC

Bits [31:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is 0 to 16.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

Reads as `0x04`.

Access to this field is **RO**.

Accessing AMCGCR

AMCGCR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance

AMU	`0xCE0`	AMCGCR

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMCIDR0, Activity Monitors Component Identification Register 0

The AMCIDR0 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

The power domain of AMCIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR0 is a 32-bit register.

Field descriptions

31–8	7–0
RES0	PRMBL_0

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as `0x0D`.

Access to this field is **RO**.

Accessing AMCIDR0

AMCIDR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0xFF0`	AMCIDR0

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMCIDR1, Activity Monitors Component Identification Register 1

The AMCIDR1 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

The power domain of AMCIDR1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR1 is a 32-bit register.

Field descriptions

31:8	7:4	3:0
RES0	CLASS	PRMBL_1

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
`0b1001`	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as `0x9`.

PRMBL_1, bits [3:0]

Preamble.

Reads as `0b0000`.

Access to this field is **RO**.

Accessing AMCIDR1

AMCIDR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFF4	AMCIDR1

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMCIDR2, Activity Monitors Component Identification Register 2

The AMCIDR2 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

The power domain of AMCIDR2 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR2 is a 32-bit register.

Field descriptions

31:8	7:0
RES0	PRMBL_2

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as `0x05`.

Access to this field is **RO**.

Accessing AMCIDR2

AMCIDR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0xFF8`	AMCIDR2

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMCIDR3, Activity Monitors Component Identification Register 3

The AMCIDR3 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

The power domain of AMCIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMCIDR3 is a 32-bit register.

Field descriptions

31–8	7–0
RES0	PRMBL_3

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as `0xB1`.

Access to this field is **RO**.

Accessing AMCIDR3

AMCIDR3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0xFFC`	AMCIDR3

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

Purpose

Disable control bits for the architected activity monitors event counters, AMEVCNTR0<n>.

Configuration

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR0_EL0[31:0].

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR0[31:0].

The power domain of AMCNTENCLR0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are RES0.

Attributes

AMCNTENCLR0 is a 32-bit register.

Field descriptions

31 … 16	15 … 4	3	2	1	0
RES0	RAZ/WI	P3	P2	P1	P0

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for AMEVCNTR0<n>.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P<n>	Meaning
`0b0`	When read, means that AMEVCNTR0<n> is disabled.
`0b1`	When read, means that AMEVCNTR0<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to `0`.

Accessing AMCNTENCLR0

AMCNTENCLR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0xC20`	AMCNTENCLR0

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>.

Configuration

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR1_EL0[31:0].

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR1[31:0].

The power domain of AMCNTENCLR1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENCLR1 are RES0.

Attributes

AMCNTENCLR1 is a 32-bit register.

Field descriptions

31:16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter disable bit for AMEVCNTR1<n>.

When N is less than 16, bits [15:N] are RAZ, where N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

P<n>	Meaning
`0b0`	When read, means that AMEVCNTR1<n> is disabled.
`0b1`	When read, means that AMEVCNTR1<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to `0`.

Accessing AMCNTENCLR1

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENCLR1 are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

The number of auxiliary activity monitor event counters implemented is zero exactly when AMCFGR.NCG == `0b0000`.

AMCNTENCLR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0xC24`	AMCNTENCLR1

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

Purpose

Enable control bits for the architected activity monitors event counters, AMEVCNTR0<n>.

Configuration

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET0_EL0[31:0].

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENSET0[31:0].

The power domain of AMCNTENSET0 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are RES0.

Attributes

AMCNTENSET0 is a 32-bit register.

Field descriptions

31–16	15–4	3	2	1	0
RES0	RAZ/WI	P3	P2	P1	P0

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter enable bit for AMEVCNTR0<n>.

> **Note**
>
> AMCGCR.CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR0<n> is disabled.
0b1	When read, means that AMEVCNTR0<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENSET0

AMCNTENSET0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xC00	AMCNTENSET0

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

Purpose

Enable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>.

Configuration

External register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET1_EL0[31:0].

External register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENSET1[31:0].

The power domain of AMCNTENSET1 is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are RES0.

Attributes

AMCNTENSET1 is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter enable bit for AMEVCNTR1<n>.

When N is less than 16, bits [15:N] are RAZ, where N is the value in AMCGCR.CG1NC.

Possible values of each bit are:

P<n>	Meaning
`0b0`	When read, means that AMEVCNTR1<n> is disabled.
`0b1`	When read, means that AMEVCNTR1<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to `0`.

Accessing AMCNTENSET1

If the number of auxiliary activity monitor event counters implemented is zero, reads of AMCNTENSET1 are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

The number of auxiliary activity monitor counters implemented is zero exactly when AMCFGR.NCG == `0b0000`.

AMCNTENSET1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0xC04`	AMCNTENSET1

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMCR, Activity Monitors Control Register

The AMCR characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

Configuration

External register AMCR bits [31:0] are architecturally mapped to AArch64 System register AMCR_EL0[31:0].

External register AMCR bits [31:0] are architecturally mapped to AArch32 System register AMCR[31:0].

The power domain of AMCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCR are RES0.

Attributes

AMCR is a 32-bit register.

Field descriptions

31:11	10	9:0
RES0	HDBG	RES0

Bits [31:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

HDBG	Meaning
`0b0`	Activity monitors do not halt counting when the PE is halted in Debug state.
`0b1`	Activity monitors halt counting when the PE is halted in Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing AMCR

AMCR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0xE04`	AMCR

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMDEVAFF0, Activity Monitors Device Affinity Register 0

The AMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Configuration

The power domain of AMDEVAFF0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVAFF0 is a 32-bit register.

Field descriptions

31–0
MPIDR_EL1lo

MPIDR_EL1lo, bits [31:0]

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing AMDEVAFF0

AMDEVAFF0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFA8	AMDEVAFF0

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMDEVAFF1, Activity Monitors Device Affinity Register 1

The AMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Configuration

The power domain of AMDEVAFF1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVAFF1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MPIDR_EL1hi																															

MPIDR_EL1hi, bits [31:0]

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing AMDEVAFF1

AMDEVAFF1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFAC	AMDEVAFF1

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMDEVARCH, Activity Monitors Device Architecture Register

The AMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the AMU component.

Configuration

The power domain of AMDEVARCH is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVARCH is a 32-bit register.

Field descriptions

31:21	20	19:16	15:0
ARCHITECT	PRESENT	REVISION	ARCHID

ARCHITECT, bits [31:21]

Defines the architecture of the component. For AMU, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, `0x4`.

Bits [27:21] are the JEP106 ID code, `0x3B`.

Reads as `0b01000111011`.

Access to this field is **RO**.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as `0b1`.

Access to this field is **RO**.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

All other values are reserved.

Reads as `0b0000`.

Access to this field is **RO**.

ARCHID, bits [15:0]

Defines this part to be an AMU component. For architectures defined by Arm this is further subdivided.

For AMU:

- Bits [15:12] are the architecture version, `0x0`.
- Bits [11:0] are the architecture part number, `0xA66`.

This corresponds to AMU architecture version AMUv1.

Reads as `0x0A66`.

Access to this field is **RO**.

Accessing AMDEVARCH

AMDEVARCH can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0xFBC`	AMDEVARCH

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMDEVTYPE, Activity Monitors Device Type Register

The AMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's performance monitor interface.

Configuration

The power domain of AMDEVTYPE is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMDEVTYPE is a 32-bit register.

Field descriptions

31–8	7–4	3–0
RES0	SUB	MAJOR

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype.

Reads as `0b0001`.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type.

Reads as `0b0110`.

Access to this field is **RO**.

Accessing AMDEVTYPE

AMDEVTYPE can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0xFCC`	AMDEVTYPE

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMEVCNTR0<n>, Activity Monitors Event Counter Registers 0, n = 0 - 3

The AMEVCNTR0<n> characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configuration

External register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR0<n>_EL0[63:0].

External register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch32 System register AMEVCNTR0<n>[63:0].

The power domain of AMEVCNTR0<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR0<n> are RES0.

Attributes

AMEVCNTR0<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
ACNT																															
ACNT																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 3.

The reset behavior of this field is:

- On an AMU reset, this field resets to `0`.

Accessing AMEVCNTR0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads of AMEVCNTR0<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

AMEVCNTR0<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance	Range
AMU	`0x000` + (8 * n)	AMEVCNTR0<n>	31:0

Accesses on this interface are **RO**.

Component	Offset	Instance	Range
AMU	`0x004` + (8 * n)	AMEVCNTR0<n>	63:32

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMEVCNTR1<n>, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Configuration

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR1<n>_EL0[63:0].

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch32 System register AMEVCNTR1<n>[63:0].

The power domain of AMEVCNTR1<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are RES0.

Attributes

AMEVCNTR1<n> is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32

ACNT

ACNT

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

The reset behavior of this field is:

- On an AMU reset, this field resets to `0`.

Accessing AMEVCNTR1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVCNTR1<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

AMEVCNTR1<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance	Range
AMU	`0x100` + (8 * n)	AMEVCNTR1<n>	31:0

Accesses on this interface are **RO**.

Component	Offset	Instance	Range
AMU	`0x104` + (8 * n)	AMEVCNTR1<n>	63:32

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMEVTYPER0<n>, Activity Monitors Event Type Registers 0, n = 0 - 3

The AMEVTYPER0<n> characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter AMEVCNTR0<n> counts.

Configuration

External register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER0<n>_EL0[31:0].

External register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPER0<n>[31:0].

The power domain of AMEVTYPER0<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n> are RES0.

Attributes

AMEVTYPER0<n> is a 32-bit register.

Field descriptions

31–16	15–0
RES0	evtCount

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

evtCount	Meaning	Applies when
`0x0011`	Processor frequency cycles	When n == 0
`0x4004`	Constant frequency cycles	When n == 1
`0x0008`	Instructions retired	When n == 2
`0x4005`	Memory stall cycles	When n == 3

Accessing AMEVTYPER0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads of AMEVTYPER0<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

AMEVTYPER0<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0x400` + (4 * n)	AMEVTYPER0<n>

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMEVTYPER1<n>, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n> characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter AMEVCNTR1<n> counts.

Configuration

External register AMEVTYPER1<n> bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER1<n>_EL0[31:0].

External register AMEVTYPER1<n> bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPER1<n>[31:0].

The power domain of AMEVTYPER1<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER1<n> are RES0.

Attributes

AMEVTYPER1<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																evtCount															

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCNTR1<n>.

It is IMPLEMENTATION DEFINED what values are supported by each counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMEVTYPER1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVTYPER1<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

AMEVTYPER1<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0x480` + (4 * n)	AMEVTYPER1<n>

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMIIDR, Activity Monitors Implementation Identification Register

The AMIIDR characteristics are:

Purpose

Defines the implementer and revisions of the AMU.

Configuration

The power domain of AMIIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMIIDR are RES0.

Attributes

AMIIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ProductID												Variant				Revision				Implementer											

ProductID, bits [31:20]

This field is an AMU part identifier.

If AMPIDR0 is implemented, AMPIDR0.PART_0 matches bits [27:20] of this field.

If AMPIDR1 is implemented, AMPIDR1.PART_1 matches bits [31:28] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [19:16]

This field distinguishes product variants or major revisions of the product.

If AMPIDR2 is implemented, AMPIDR2.REVISION matches AMIIDR.Variant.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

This field distinguishes minor revisions of the product.

If AMPIDR3 is implemented, AMPIDR3.REVAND matches AMIIDR.Revision.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the AMU.

For an Arm implementation, this field reads as `0x43B`.

Bits [11:8] contain the JEP106 continuation code of the implementer.

Bit 7 is RES0

Bits [6:0] contain the JEP106 identity code of the implementer.

If AMPIDR4 is implemented, AMPIDR4.DES_2 matches bits [11:8] of this field.

If AMPIDR2 is implemented, AMPIDR2.DES_1 matches bits [6:4] of this field.

If AMPIDR1 is implemented, AMPIDR1.DES_0 matches bits [3:0] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMIIDR

AMIIDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0xE08`	AMIIDR

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMPIDR0, Activity Monitors Peripheral Identification Register 0

The AMPIDR0 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR0 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR0 is a 32-bit register.

Field descriptions

31–8	7–0
RES0	PART_0

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMPIDR0

AMPIDR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0xFE0`	AMPIDR0

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMPIDR1, Activity Monitors Peripheral Identification Register 1

The AMPIDR1 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR1 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								DES_0				PART_1			

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code.

For Arm Limited, this field is `0b1011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMPIDR1

AMPIDR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance

AMU	0xFE4	AMPIDR1

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMPIDR2, Activity Monitors Peripheral Identification Register 2

The AMPIDR2 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR2 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR2 is a 32-bit register.

Field descriptions

31:8	7:4	3	2:0
RES0	REVISION	JEDEC	DES_1

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as `0b1`.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code.

For Arm Limited, this field is `0b011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMPIDR2

AMPIDR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0xFE8`	AMPIDR2

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

AMPIDR3, Activity Monitors Peripheral Identification Register 3

The AMPIDR3 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR3 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																								REVAND				CMOD			

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using AMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMPIDR3

AMPIDR3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	`0xFEC`	AMPIDR3

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

AMPIDR4, Activity Monitors Peripheral Identification Register 4

The AMPIDR4 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

The power domain of AMPIDR4 is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

This register is present only when FEAT_AMUv1 is implemented.

Attributes

AMPIDR4 is a 32-bit register.

Field descriptions

31:8	7:4	3:0
RES0	SIZE	DES_2

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. $\log_2$ of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as `0b0000`.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer. JEP106 continuation code, least significant nibble.

For Arm Limited, this field is `0b0100`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMPIDR4

AMPIDR4 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
AMU	0xFD0	AMPIDR4

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

Purpose

Can be used to provide IMPLEMENTATION DEFINED controls for the CTI. For example, the register might be used to control multiplexors for additional IMPLEMENTATION DEFINED triggers. The IMPLEMENTATION DEFINED controls provided by this register might modify the architecturally defined behavior of the CTI.

Note

The architecturally-defined triggers must not be multiplexed.

Configuration

It is IMPLEMENTATION DEFINED whether ASICCTL is implemented in the Core power domain or in the Debug power domain.

If it is implemented in the Core power domain then it is IMPLEMENTATION DEFINED whether it is in the Cold reset domain or the Warm reset domain.

This register must reset to a value that supports the architecturally-defined behavior of the CTI. Changing the value of the register from its reset value causes IMPLEMENTATION DEFINED behavior that might differ from the architecturally-defined behavior of the CTI.

Other than the requirements listed in this register description, all aspects of the reset behavior of the ASICCTL are IMPLEMENTATION DEFINED.

Attributes

ASICCTL is a 32-bit register.

Field descriptions

<table>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td colspan="32">IMPLEMENTATION DEFINED</td></tr>
</table>

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ASICCTL

ASICCTL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0x144`	ASICCTL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

Purpose

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- CNTNSAR controls whether CNTACR<n> is accessible by Non-secure accesses.
- If frame CNTEL0BaseN is implemented, the CNTEL0ACR in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

Configuration

The power domain of CNTACR<n> is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Implemented only if the value of CNTTIDR.Frame<n> is 1.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

Attributes

CNTACR<n> is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6	5	4	3	2	1	0
RES0	RWPT	RWVT	RVOFF	RFRQ	RVCT	RPCT

Bits [31:6]

Reserved, RES0.

RWPT, bit [5]

Read/write access to the EL1 Physical Timer registers CNTP_CVAL, CNTP_TVAL, and CNTP_CTL, in frame <n>.

RWPT	Meaning
0b0	No access to the EL1 Physical Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the EL1 Physical Timer registers in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RWVT, bit [4]

Read/write access to the Virtual Timer register CNTV_CVAL, CNTV_TVAL, and CNTV_CTL, in frame <n>.

RWVT	Meaning
0b0	No access to the Virtual Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the Virtual Timer registers in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVOFF, bit [3]

Read-only access to CNTVOFF, in frame <n>.

RVOFF	Meaning
0b0	No access to CNTVOFF in frame <n>. The register is RES0.
0b1	Read-only access to CNTVOFF in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RFRQ, bit [2]

Read-only access to CNTFRQ, in frame <n>.

RFRQ	Meaning
0b0	No access to CNTFRQ in frame <n>. The register is RES0.
0b1	Read-only access to CNTFRQ in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVCT, bit [1]

Read-only access to CNTVCT, in frame <n>.

RVCT	Meaning
0b0	No access to CNTVCT in frame <n>. The register is RES0.
0b1	Read-only access to CNTVCT in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RPCT, bit [0]

Read-only access to CNTPCT, in frame <n>.

RPCT	Meaning
0b0	No access to CNTPCT in frame <n>. The register is RES0.
0b1	Read-only access to CNTPCT in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTACR<n>

In a system that recognizes two Security states:

- CNTACR<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTACR<n> is accessible by Non-secure accesses.

CNTACR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	`0x040` + (4 * n)	CNTACR<n>

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTCR, Counter Control Register

The CNTCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Configuration

The power domain of CNTCR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTCR is a 32-bit register.

Field descriptions

31:18	17:8	7:3	2	1	0
RES0	FCREQ	RES0	SCEN	HDBG	EN

Bits [31:18]

Reserved, RES0.

FCREQ, bits [17:8]

Frequency change request. Indicates the number of the entry in the Frequency modes table to select.

Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is IMPLEMENTATION DEFINED up to a maximum of 1004 entries, see 'The Frequency modes table'. An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

The reset behavior of this field is:

- On a Timer reset, this field resets to `0`.

Bits [7:3]

Reserved, RES0.

SCEN, bit [2]
When FEAT_CNTSC is implemented:

Scale Enable.

SCEN	Meaning
`0b0`	Scaling is not enabled. The counter value is incremented by `0x1.0000000` for each counter tick.
`0b1`	Scaling is enabled. The counter is incremented by CNTSCR.ScaleVal for each counter tick.

The SCEN bit can only be changed when the counter is disabled, when CNTCR.EN == 0.

If the value of CNTCR.SCEN changes when CNTCR.EN == 1 then:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

When the CNTCV register in the CNTControlBase frame of the memory mapped counter module is written to, the accumulated fraction information is reset to zero.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HDBG, bit [1]

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

HDBG	Meaning
`0b0`	System counter ignores Halt-on-debug.
`0b1`	Asserted Halt-on-debug signal halts system counter update.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enables the counter:

EN	Meaning
`0b0`	System counter disabled.
`0b1`	System counter enabled.

The reset behavior of this field is:

- On a Timer reset, this field resets to `0`.

Accessing CNTCR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	`0x000`	CNTCR

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTCV, Counter Count Value register

The CNTCV characteristics are:

Purpose

Indicates the current count value.

Configuration

The power domain of CNTCV is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTCV is a 64-bit register.

Field descriptions

63–32
CountValue

31–0
CountValue

CountValue, bits [63:0]

Indicates the counter value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTCV

Frame	Accessibility
CNTControlBase	RW
CNTReadBase	RO

A write to CNTCV must be visible in the CNTPCT register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports Secure and Non-secure memory maps, the CNTControlBase frame, and therefore this register instance, is implemented only in the Secure memory map.
- If the counter is enabled, the effect of writing to the register is UNKNOWN.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

CNTCV can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTControlBase	`0x008`	CNTCV	63:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTReadBase	0x000	CNTCV	63:0

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTEL0ACR, Counter-timer EL0 Access Control Register

The CNTEL0ACR characteristics are:

Purpose

An implementation of CNTEL0ACR in the frame at CNTBaseN controls whether the CNTPCT, CNTVCT, CNTFRQ, EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTEL0BaseN.

Configuration

The power domain of CNTEL0ACR is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTEL0ACR is a 32-bit register.

Field descriptions

31:10	9	8	7:2	1	0
RES0	EL0PTEN	EL0VTEN	RES0	EL0VCTEN	EL0PCTEN

Bits [31:10]

Reserved, RES0.

EL0PTEN, bit [9]

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the CNTP_CVAL, CNTP_TVAL, and CNTP_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame.

EL0PTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

Second view read/write access control for the Virtual Timer registers. This bit controls whether the CNTV_CVAL, CNTV_TVAL, and CNTV_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame.

EL0VTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame then they are accessible in the second view.

The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL0VCTEN, bit [1]

Second view read access control for CNTVCT and CNTFRQ.

EL0VCTEN	Meaning
0b0	CNTVCT is not visible in the second view. If EL0PCTEN is set to 0, CNTFRQ is not visible in the second view.
0b1	Access permitted. If CNTVCT and CNTFRQ are visible in the current frame then they are visible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Second view read access control for CNTPCT and CNTFRQ.

EL0PCTEN	Meaning
0b0	CNTPCT is not visible in the second view. If EL0VCTEN is set to 0, CNTFRQ is not visible in the second view.
0b1	Access permitted. If CNTPCT and CNTFRQ are visible in the current frame then they are visible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTEL0ACR

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

- The register location in that frame is RAZ/WI.

- If the corresponding CNTEL0BaseN frame is implemented, the registers CNTFRQ, CNTP_CTL, CNTP_CVAL, CNTP_TVAL, CNTPCT, CNTV_CTL, CNTV_CVAL, CNTV_TVAL, and CNTVCT are not visible in that frame.

CNTEL0ACR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	`0x014`	CNTEL0ACR

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

Purpose

Indicates the base frequency of the system counter.

Configuration

The power domain of CNTFID0 is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information, see 'The Frequency modes table'.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Frequency																															

Frequency, bits [31:0]

The base frequency of the system counter, in Hz.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFID0

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTFID0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	`0x020`	CNTFID0

Accesses on this interface are **RO or RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTFID<n>, Counter Frequency IDs, n > 0, n = 1 - 1003

The CNTFID<n> characteristics are:

Purpose

Indicates alternative system counter update frequencies.

Configuration

The power domain of CNTFID<n> is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0, see 'The Frequency modes table'.

The number of CNTFID<n> registers is IMPLEMENTATION DEFINED, and the only required CNTFID<n> register is CNTFID0.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED up to this limit. For an implementation that includes registers in the IMPLEMENTATION DEFINED register space `0x0C0`-`0x0FC`, the maximum number of entries in the Frequency modes table is 40, including the zero-word end marker.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID<n> is a 32-bit register.

Field descriptions

31 … 0
Frequency

Frequency, bits [31:0]

A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. Arm strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

increment = (base frequency) / (selected frequency)

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFID<n>

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes these registers, is implemented only in the Secure memory map.

CNTFID<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020 + (4 * n)	CNTFID<n>

Accesses on this interface are **RO or RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. The instance of the register in the CNTCTLBase frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configuration

The power domain of CNTFRQ is IMPLEMENTATION DEFINED.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTFRQ is a 32-bit register.

Field descriptions

<table>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td colspan="32">Clock frequency</td></tr>
</table>

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFRQ

CNTFRQ must be implemented as an RW register in the CNTCTLBase frame.

In a system that recognizes two Security states, the instance of the register in the CNTCTLBase frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of CNTACR<n>.RFRQ is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTFRQ is accessible as a RO register in that frame if both:
    - CNTFRQ is accessible in the corresponding CNTBaseN frame.

    - Either the value of CNTEL0ACR.EL0VCTEN is 1 or the value of CNTEL0ACR.EL0PCTEN is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

CNTFRQ can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	`0x010`	CNTFRQ

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	`0x010`	CNTFRQ

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTCTLBase	`0x000`	CNTFRQ

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTID, Counter Identification Register

The CNTID characteristics are:

Purpose

Indicates whether counter scaling is implemented.

Configuration

The power domain of CNTID is IMPLEMENTATION DEFINED.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTID are RES0.

Attributes

CNTID is a 32-bit register.

Field descriptions

31–4	3–0
RES0	CNTSC

Bits [31:4]

Reserved, RES0.

CNTSC, bits [3:0]

Indicates whether Counter Scaling is implemented

CNTSC	Meaning
`0b0000`	Counter scaling is not implemented.
`0b0001`	Counter scaling is implemented.

All other values are reserved.

Accessing CNTID

In a system that supports Secure and Non-secure memory maps, the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTID can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	`0x1C`	CNTID

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

Purpose

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

Configuration

The power domain of CNTNSAR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTNSAR is a 32-bit register.

Field descriptions

31:8	7	6	5	4	3	2	1	0
RES0	NS7	NS6	NS5	NS4	NS3	NS2	NS1	NS0

Bits [31:8]

Reserved, RES0.

NS<n>, bit [n], for n = 7 to 0

Non-secure access to frame n.

NS<n>	Meaning
0b0	Secure access only. Behaves as RES0 to Non-secure accesses.
0b1	Secure and Non-secure accesses permitted.

This bit also determines whether, in the CNTCTLBase frame, CNTACR<n> and CNTVOFF<n> are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTNSAR

In a system that recognizes two Security states, this register is only accessible by Secure accesses.

CNTNSAR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	`0x004`	CNTNSAR

Accesses on this interface are **RW**.

CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Configuration

The power domain of CNTP_CTL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_CTL is a 32-bit register.

Field descriptions

31 … 3	2	1	0
RES0	ISTATUS	IMASK	ENABLE

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CTL

CNTP_CTL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CTL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CTL is accessible in that frame if both:
  - CNTP_CTL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

CNTP_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x02C	CNTP_CTL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x02C	CNTP_CTL

Accesses on this interface are **RW**.

CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the EL1 physical timer.

Configuration

The power domain of CNTP_CVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_CVAL is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTP_CTL.IMASK is 0.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL

CNTP_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.

- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CVAL is accessible in that frame if both:
  - CNTP_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

CNTP_CVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	`0x020`	CNTP_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	`0x024`	CNTP_CVAL	63:32

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	`0x020`	CNTP_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	`0x024`	CNTP_CVAL	63:32

Accesses on this interface are **RW**.

CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configuration

The power domain of CNTP_TVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_TVAL is a 32-bit register.

Field descriptions

31 – 0
TimerValue

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL.ENABLE is 1, the value returned is (CompareValue - CNTPCT).

On a write of this register, CompareValue is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_TVAL

CNTP_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTP_TVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_TVAL is accessible in that frame if both:
  - CNTP_TVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

CNTP_TVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x028	CNTP_TVAL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x028	CNTP_TVAL

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

The power domain of CNTPCT is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTPCT is a 64-bit register.

Field descriptions

63:32
Physical count value

31:0
Physical count value

Bits [63:0]

Physical count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPCT

CNTPCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTPCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RPCT is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTPCT is accessible in that frame if both:
  - CNTPCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0PCTEN is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

CNTPCT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	`0x000`	CNTPCT	31:0

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	`0x004`	CNTPCT	63:32

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	`0x000`	CNTPCT	31:0

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	`0x004`	CNTPCT	63:32

Accesses on this interface are **RO**.

CNTSCR, Counter Scale Register

The CNTSCR characteristics are:

Purpose

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

Configuration

The power domain of CNTSCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTSCR are RES0.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTSCR is a 32-bit register.

Field descriptions

31 ... 0
ScaleVal

ScaleVal, bits [31:0]

Scale Value

When counter scaling is enabled, ScaleVal is the amount added to the counter value for every counter tick.

Counter tick is defined as one period of the current operating frequency of the Generic counter.

ScaleVal is expressed as an unsigned fixed point number with an 8-bit integer value and a 24-bit fractional value.

CNTSCR.ScaleVal can only be changed when CNTCR.EN == 0. If the value of this field is changed when CNTCR.EN == 1:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTSCR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x10	CNTSCR

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTSR, Counter Status Register

The CNTSR characteristics are:

Purpose

Provides counter frequency status information.

Configuration

The power domain of CNTSR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTSR is a 32-bit register.

Field descriptions

31:18	17:8	7:2	1	0
RES0	FCACK	RES0	DBGH	RES0

Bits [31:18]

Reserved, RES0.

FCACK, bits [17:8]

Frequency Change Acknowledge. Indicates the currently selected entry in the Frequency modes table, see 'The Frequency modes table'.

The reset behavior of this field is:

- On a Timer reset, this field resets to `0`.

Bits [7:2]

Reserved, RES0.

DBGH, bit [1]

Indicates whether the counter is halted because the Halt-on-debug signal is asserted:

DBGH	Meaning
`0b0`	Counter is not halted.
`0b1`	Counter is halted.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing CNTSR

In a system that supports Secure and Non-secure memory maps the CNTControlBase frame, that includes this register, is implemented only in the Secure memory map.

CNTSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	`0x004`	CNTSR

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

Purpose

Indicates the implemented timers in the memory map, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTEL0BaseN.
- Frame CNTBaseN has a virtual timer capability.

Configuration

The power domain of CNTTIDR is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTTIDR is a 32-bit register.

Field descriptions

31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0
Frame7	Frame6	Frame5	Frame4	Frame3	Frame2	Frame1	Frame0

Frame<n>, bits [4n+3:4n], for n = 7 to 0

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2], the FEL0 subfield, indicates whether frame CNTBase<n> has a second view, CNTEL0Base<n>. The possible values of this bit are:

Bit[2]	Meaning
`0b0`	Frame<n> does not have a second view. The CNTEL0ACR register in the first view of the frame isRES0
`0b1`	Frame<n> has a second view, CNTEL0Base<n>.

If bit[0] is 0, bit[2] is RES0.

Bit[1], the FVI subfield, indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers CNTV_CVAL, CNTV_TVAL, and CNTV_CTL.
- This CNTCTLBase frame implements the virtual timer offset register CNTVOFF<n>.

The possible values of bit[1] are:

Bit[1]	Meaning
`0b0`	Frame<n> does not have virtual capability. The virtual time and offset registers areRES0.
`0b1`	Frame<n> has virtual capability. The virtual time and offset registers are implemented

If bit[0] is 0, bit[1] is RES0.

Bit[0], the FI subfield, indicates whether frame CNTBase<n> is implemented. The possible values of this bit are:

Bit[0]	Meaning
`0b0`	Frame<n> is not implemented. All registers associated with the frame areRES0.
`0b1`	Frame<n> is implemented

Accessing CNTTIDR

In a system that recognizes two Security states this register is accessible by both Secure and Non-secure accesses.

CNTTIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	`0x008`	CNTTIDR

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Configuration

The power domain of CNTV_CTL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions

31–3	2	1	0
RES0	ISTATUS	IMASK	ENABLE

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CTL

CNTV_CTL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CTL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CTL is accessible in that frame if both:
  - CNTV_CTL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

CNTV_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x03C	CNTV_CTL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x03C	CNTV_CTL

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTV_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the virtual timer.

Configuration

The power domain of CNTV_CVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_CVAL is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
CompareValue																															
CompareValue																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CompareValue, bits [63:0]

Holds the virtual timer CompareValue.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTV_CTL.IMASK is 0.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CVAL

CNTV_CVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.

- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CVAL is accessible in that frame if both:
  - CNTV_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

CNTV_CVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	`0x030`	CNTV_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	`0x034`	CNTV_CVAL	63:32

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	`0x030`	CNTV_CVAL	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	`0x034`	CNTV_CVAL	63:32

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configuration

The power domain of CNTV_TVAL is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TimerValue																															

TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If CNTV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL.ENABLE is 1, the value returned is (CompareValue - CNTVCT).

On a write of this register, CompareValue is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_TVAL

CNTV_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_TVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_TVAL is accessible in that frame if both:
  - CNTV_TVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

CNTV_TVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	`0x038`	CNTV_TVAL

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	`0x038`	CNTV_TVAL

Accesses on this interface are **RW**.

CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value.

Configuration

The power domain of CNTVCT is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVCT is a 64-bit register.

Field descriptions

63–32
Virtual count value

31–0
Virtual count value

Bits [63:0]

Virtual count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCT

CNTVCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame:

- CNTVCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVCT is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTVCT is accessible in that frame if both:
    - CNTVCT is accessible in the corresponding CNTBaseN frame.
    - The value of CNTEL0ACR.EL0VCTEN is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTVCT register must be accessible as an atomic 64-bit value.

CNTVCT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	`0x008`	CNTVCT	31:0

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	`0x00C`	CNTVCT	63:32

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	`0x008`	CNTVCT	31:0

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	`0x00C`	CNTVCT	63:32

Accesses on this interface are **RO**.

CNTVOFF, Counter-timer Virtual Offset

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset for a CNTBaseN frame that has virtual timer capability. This is the offset between real time and virtual time.

Configuration

The power domain of CNTVOFF is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVOFF is a 64-bit register.

Field descriptions

Bits	Field
63:32	Virtual offset
31:0	Virtual offset

Bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF

CNTVOFF is implemented, as a RO register, in any implemented CNTBaseN frame that has virtual timer capability.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTVOFF is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVOFF is 1.
- Otherwise, the CNTVOFF address in that frame is RAZ/WI.

Note

CNTVOFF is never visible in any CNTEL0BaseN frame. This means that the CNTVOFF address in any implemented CNTEL0BaseN frame is RAZ/WI.

In an implementation that supports 64-bit atomic accesses, a CNTVOFF{<n>} register must be accessible as an atomic 64-bit value.

CNTVOFF can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Range
Timer	CNTBaseN	`0x018`	31:0

Accesses on this interface are **RO**.

Component	Frame	Offset	Range
Timer	CNTBaseN	`0x01C`	63:32

Accesses on this interface are **RO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CNTVOFF<n>, Counter-timer Virtual Offsets, n = 0 - 7

The CNTVOFF<n> characteristics are:

Purpose

Holds the 64-bit virtual offset for frame CNTBase<n>. This is the offset between real time and virtual time.

Configuration

The power domain of CNTVOFF<n> is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVOFF<n> is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
Virtual offset
Virtual offset
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF<n>

In the CNTCTLBase frame a CNTVOFF<n> register must be implemented, as a RW register, for each CNTBaseN frame that has virtual timer capability. For more information, see 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames'.

Note

The value of <n> in an instance of CNTVOFF<n> specifies the value of N for the associated CNTBaseN frame.

In a system that recognizes two Security states, for any CNTVOFF<n> register in the CNTCTLBase frame:

- CNTVOFF<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTVOFF<n> is accessible by Non-secure accesses.

The register location of any unimplemented CNTVOFF<n> register in the CNTCTLBase frame is RAZ/WI.

The CNTVOFF<n> register is accessible in the CNTBaseN frame using CNTVOFF.

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF<n> registers must be accessible as atomic 64-bit values.

CNTVOFF<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Range
Timer	CNTCTLBase	`0x080` + (8 * n)	31:0

Accesses on this interface are **RW**.

Component	Frame	Offset	Range
Timer	CNTCTLBase	`0x084` + (8 * n)	63:32

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CounterID<n>, Counter ID registers, n = 0 - 11

The CounterID<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

Configuration

The power domain of CounterID<n> is IMPLEMENTATION DEFINED.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

These registers are implemented independently in each of the implemented Generic Timer memory-mapped frames.

If the implementation of the Counter ID registers requires an architecture version, the value for this version of the Arm Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of `0xF`.

Attributes

CounterID<n> is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing CounterID<n>

These registers must be implemented, as RO registers, in every implemented Generic Timer memory-mapped frame.

For the CNTCTLBase frame, in a system that recognizes two Security states these registers are accessible by both Secure and Non-secure accesses.

For the CNTControlBase frame, in a system that supports Secure and Non-secure memory maps the frame is implemented only in the Secure memory map, meaning these registers are implemented only in the Secure memory map.

For the CNTBaseN frames, 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses.

CounterID<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

Timer	CNTControlBase	`0xFD0` + (4 * n)	CounterID<n>

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTReadBase	`0xFD0` + (4 * n)	CounterID<n>

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTBaseN	`0xFD0` + (4 * n)	CounterID<n>

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	`0xFD0` + (4 * n)	CounterID<n>

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
Timer	CNTCTLBase	`0xFD0` + (4 * n)	CounterID<n>

Accesses on this interface are **RO**.

CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

Purpose

Clears bits of the Application Trigger register.

Configuration

CTIAPPCLEAR is in the Debug power domain.

Attributes

CTIAPPCLEAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23
APPCLEAR31	APPCLEAR30	APPCLEAR29	APPCLEAR28	APPCLEAR27	APPCLEAR26	APPCLEAR25	APPCLEAR24	APPCLEAR2

APPCLEAR<x>, bit [x], for x = 31 to 0

Application trigger <x> disable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Writing to this bit has the following effect:

APPCLEAR<x>	Meaning
`0b0`	No effect.
`0b1`	Clear corresponding bit in CTIAPPTRIG to 0 and clear the corresponding channel event.

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use CTIAPPPULSE.

Accessing CTIAPPCLEAR

CTIAPPCLEAR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0x018`	CTIAPPCLEAR

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **WI**.
- When !SoftwareLockStatus() accesses to this register are **WO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIAPPPULSE, CTI Application Pulse register

The CTIAPPPULSE characteristics are:

Purpose

Causes event pulses to be generated on ECT channels.

Configuration

CTIAPPPULSE is in the Debug power domain.

Attributes

CTIAPPPULSE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23
APPPULSE31	APPPULSE30	APPPULSE29	APPPULSE28	APPPULSE27	APPPULSE26	APPPULSE25	APPPULSE24	APPPULSE23

APPPULSE<x>, bit [x], for x = 31 to 0

Generate event pulse on ECT channel <x>.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Writing to this bit has the following effect:

APPPULSE<x>	Meaning
0b0	No effect.
0b1	Channel <x> event pulse generated.

Note

- The CTIAPPPULSE operation does not affect the state of the Application Trigger register, CTIAPPTRIG. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

Accessing CTIAPPPULSE

It is CONSTRAINED UNPREDICTABLE whether a write to CTIAPPPULSE generates an event on a channel if CTICONTROL.GLBEN is 0.

CTIAPPPULSE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x01C	CTIAPPPULSE

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **WI**.
- When !SoftwareLockStatus() accesses to this register are **WO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

Purpose

Sets bits of the Application Trigger register.

Configuration

CTIAPPSET is in the Debug power domain.

Attributes

CTIAPPSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	
APPSET31	APPSET30	APPSET29	APPSET28	APPSET27	APPSET26	APPSET25	APPSET24	APPSET23	APPSET22	APPSET21	AP

APPSET<x>, bit [x], for x = 31 to 0

Application trigger <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

APPSET<x>	Meaning
`0b0`	Reading this means the application trigger is inactive. Writing this has no effect.
`0b1`	Reading this means the application trigger is active. Writing this sets the corresponding bit in CTIAPPTRIG to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use CTIAPPPULSE.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing CTIAPPSET

CTIAPPSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0x014`	CTIAPPSET

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

Configuration

CTIAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance.

Attributes

CTIAUTHSTATUS is a 32-bit register.

Field descriptions

31–8	7–4	3–2	1–0
RES0	RAZ	NSNID	NSID

Bits [31:8]

Reserved, RES0.

Bits [7:4]

Reserved, RAZ.

NSNID, bits [3:2]

If EL3 is implemented, this field holds the same value as DBGAUTHSTATUS_EL1.NSNID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as DBGAUTHSTATUS_EL1.SNID.

NSID, bits [1:0]

If EL3 is implemented, this field holds the same value as DBGAUTHSTATUS_EL1.NSID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as DBGAUTHSTATUS_EL1.SID.

Accessing CTIAUTHSTATUS

CTIAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFB8`	CTIAUTHSTATUS

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

Purpose

Provides the raw status of the ECT channel inputs to the CTI.

Configuration

CTICHINSTATUS is in the Debug power domain.

Attributes

CTICHINSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17
CHIN31	CHIN30	CHIN29	CHIN28	CHIN27	CHIN26	CHIN25	CHIN24	CHIN23	CHIN22	CHIN21	CHIN20	CHIN19	CHIN18	CHIN17

CHIN<n>, bit [n], for n = 31 to 0

Input channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

CHIN<n>	Meaning
0b0	Input channel <n> is inactive.
0b1	Input channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

Accessing CTICHINSTATUS

CTICHINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x138	CTICHINSTATUS

Accesses on this interface are **RO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

Purpose

Provides the status of the ECT channel outputs from the CTI.

Configuration

CTICHOUTSTATUS is in the Debug power domain.

Attributes

CTICHOUTSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
CHOUT31	CHOUT30	CHOUT29	CHOUT28	CHOUT27	CHOUT26	CHOUT25	CHOUT24	CHOUT23	CHOUT22	CHOUT21	CHOUT

CHOUT<n>, bit [n], for n = 31 to 0

Output channel <n> status.

Bits [31:N] are RAZ. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

CHOUT<n>	Meaning
`0b0`	Output channel <n> is inactive.
`0b1`	Output channel <n> is active.

If the ECT channels do not support multicycle events then it is IMPLEMENTATION DEFINED whether an output channel can be observed as active.

Note

The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see CTIGATE.

Accessing CTICHOUTSTATUS

CTICHOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0x13C`	CTICHOUTSTATUS

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR0 is a 32-bit register.

Field descriptions

31–8	7–0
RES0	PRMBL_0

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as `0x0D`.

Access to this field is **RO**.

Accessing CTICIDR0

CTICIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFF0`	CTICIDR0

Accesses on this interface are **RO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR1 is a 32-bit register.

Field descriptions

31–8	7–4	3–0
RES0	CLASS	PRMBL_1

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
`0b1001`	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as `0x9`.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Reads as `0b0000`.

Access to this field is **RO**.

Accessing CTICIDR1

CTICIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFF4`	CTICIDR1

Accesses on this interface are **RO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR2 is a 32-bit register.

Field descriptions

31:8	7:0
RES0	PRMBL_2

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as `0x05`.

Access to this field is **RO**.

Accessing CTICIDR2

CTICIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFF8`	CTICIDR2

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR3 is a 32-bit register.

Field descriptions

31 … 8	7 … 0
RES0	PRMBL_3

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as `0xB1`.

Access to this field is **RO**.

Accessing CTICIDR3

CTICIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFFC`	CTICIDR3

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICLAIMCLR, CTI CLAIM Tag Clear register

The CTICLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM bits, and to clear CLAIM tag bits to 0.

Configuration

CTICLAIMCLR is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMCLR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19
CLAIM31	CLAIM30	CLAIM29	CLAIM28	CLAIM27	CLAIM26	CLAIM25	CLAIM24	CLAIM23	CLAIM22	CLAIM21	CLAIM20	CLAIM1

CLAIM<x>, bit [x], for x = 31 to 0

CLAIM tag clear bit.

Reads return the value of CLAIM<x>, writes have the following behavior:

CLAIM<x>	Meaning
0b0	No action.
0b1	Indirectly clear CLAIM<x> to 0.

A single write to CTICLAIMCLR can clear multiple tags to 0.

If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/WI.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing CTICLAIMCLR

CTICLAIMCLR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA4	CTICLAIMCLR

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICLAIMSET, CTI CLAIM Tag Set register

The CTICLAIMSET characteristics are:

Purpose

Used by software to set CLAIM bits to 1.

Configuration

CTICLAIMSET is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19
CLAIM31	CLAIM30	CLAIM29	CLAIM28	CLAIM27	CLAIM26	CLAIM25	CLAIM24	CLAIM23	CLAIM22	CLAIM21	CLAIM20	CLAIM1

CLAIM<x>, bit [x], for x = 31 to 0

CLAIM tag set bit.

If x is less than the IMPLEMENTATION DEFINED number of CLAIM tags, this field is RAO and the behavior on writes is:

CLAIM<x>	Meaning
`0b0`	No action.
`0b1`	Indirectly set CLAIM<x> tag to 1.

A single write to CTICLAIMSET can set multiple tags to 1.

If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/WI.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing CTICLAIMSET

CTICLAIMSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFA0`	CTICLAIMSET

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

Purpose

Controls whether the CTI is enabled.

Configuration

CTICONTROL is in the Debug power domain.

Attributes

CTICONTROL is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1	0
RES0	GLBEN

Bits [31:1]

Reserved, RES0.

GLBEN, bit [0]

Enables or disables the CTI mapping functions. Possible values of this field are:

GLBEN	Meaning
`0b0`	CTI mapping functions and application trigger disabled.
`0b1`	CTI mapping functions and application trigger enabled.

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it is CONSTRAINED UNPREDICTABLE which of the following occurs:

- The output trigger remains asserted after the mapping functions are disabled.
- The output trigger is deasserted after the mapping functions are disabled.

All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On an External debug reset, this field resets to `0`.

Accessing CTICONTROL

CTICONTROL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0x000`	CTICONTROL

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF0 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then CTIDEVAFF1 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF0 is a 32-bit register.

Field descriptions

31–0
MPIDR_EL1lo

MPIDR_EL1lo, bits [31:0]

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIDEVAFF0

CTIDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA8	CTIDEVAFF0

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF1 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then CTIDEVAFF0 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF1 is a 32-bit register.

Field descriptions

31–0
MPIDR_EL1hi

MPIDR_EL1hi, bits [31:0]

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIDEVAFF1

CTIDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFAC	CTIDEVAFF1

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the CTI component.

Configuration

CTIDEVARCH is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is not implemented, CTIDEVAFF0 and CTIDEVAFF1 are also not implemented.

Attributes

CTIDEVARCH is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21	20	19 18 17 16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
ARCHITECT	PRESENT	REVISION	ARCHID

ARCHITECT, bits [31:21]

Defines the architecture of the component. For CTI, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, `0x4`.

Bits [27:21] are the JEP106 ID code, `0x3B`.

Reads as `0b01000111011`.

Access to this field is **RO**.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as `0b1`.

Access to this field is **RO**.

REVISION, bits [19:16]

When FEAT_DoPD is implemented:

Revision.

Defines the architecture revision of the component.

REVISION	Meaning
`0b0000`	First revision.
`0b0001`	As `0b0000`, and also adds support for CTIDEVCTL.

All other values are reserved.

Access to this field is **RO**.

Otherwise:

Revision.

Defines the architecture revision of the component.

All other values are reserved.

Reads as `0b0000`.

Access to this field is **RO**.

ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, `0x1`.
- Bits [11:0] are the architecture part number, `0xA14`.

This corresponds to CTI architecture version CTIv2.

Reads as `0x1A14`.

Access to this field is **RO**.

Accessing CTIDEVARCH

CTIDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFBC`	CTIDEVARCH

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVCTL, CTI Device Control register

The CTIDEVCTL characteristics are:

Purpose

Provides target-specific device controls

Configuration

CTIDEVCTL is in the Debug power domain.

This register is present only when FEAT_DoPD is implemented. Otherwise, direct accesses to CTIDEVCTL are RES0.

Attributes

CTIDEVCTL is a 32-bit register.

Field descriptions

31–2	1	0
RES0	RCE	OSUCE

Bits [31:2]

Reserved, RES0.

RCE, bit [1]

Reset Catch Enable.

RCE	Meaning
0b0	Reset Catch debug event disabled.
0b1	Reset Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

OSUCE, bit [0]

OS Unlock Catch Enable

OSUCE	Meaning
0b0	OS Unlock Catch debug event disabled.
0b1	OS Unlock Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Accessing CTIDEVCTL

CTIDEVCTL can be accessed through the external debug interface:

Component	Offset	Instance

CTI	`0x150`	CTIDEVCTL

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

Purpose

Describes the CTI component to the debugger.

Configuration

CTIDEVID is in the Debug power domain.

Attributes

CTIDEVID is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0						INOUT		RES0		NUMCHAN						RES0		NUMTRIG						RES0			EXTMUXNUM				

Bits [31:26]

Reserved, RES0.

INOUT, bits [25:24]

Input/output options. Indicates presence of the input gate. If the CTM is not implemented or CTIv2 is not implemented, this field is RAZ.

INOUT	Meaning
`0b00`	CTIGATE does not mask propagation of input events from external channels.
`0b01`	CTIGATE masks propagation of input events from external channels.

All other values are reserved.

Bits [23:22]

Reserved, RES0.

NUMCHAN, bits [21:16]

Number of ECT channels implemented. For Armv8, valid values are:

- `0b000011` 3 channels (0..2) implemented.
- `0b000100` 4 channels (0..3) implemented.
- `0b000101` 5 channels (0..4) implemented.
- `0b000110` 6 channels (0..5) implemented.

and so on up to `0b100000`, 32 channels (0..31) implemented.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [15:14]

Reserved, RES0.

NUMTRIG, bits [13:8]

Number of triggers implemented. This is one more than the index of the largest trigger, rather than the actual number of triggers. For Armv8, valid values are:

- `0b000011` Up to 3 triggers (0..2) implemented.
- `0b001000` Up to 8 triggers (0..7) implemented.
- `0b001001` Up to 9 triggers (0..8) implemented.
- `0b001010` Up to 10 triggers (0..9) implemented.

and so on up to `0b100000`, 32 triggers (0..31) implemented.

All other values are reserved. If the PE contains a Trace extension, this field must be at least `0b001000`. There is no guarantee that any of the implemented triggers, including the highest numbered, are connected to any components.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [7:5]

Reserved, RES0.

EXTMUXNUM, bits [4:0]

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, ASICCTL.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIDEVID

CTIDEVID can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFC8`	CTIDEVID

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

Configuration

CTIDEVID1 is in the Debug power domain.

Attributes

CTIDEVID1 is a 32-bit register.

Field descriptions

31-0
RES0

Bits [31:0]

Reserved, RES0.

Accessing CTIDEVID1

CTIDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFC4`	CTIDEVID1

Accesses on this interface are **RO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

Configuration

CTIDEVID2 is in the Debug power domain.

Attributes

CTIDEVID2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															

Bits [31:0]

Reserved, RES0.

Accessing CTIDEVID2

CTIDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFC0`	CTIDEVID2

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PEs cross-trigger interface.

Configuration

CTIDEVTYPE is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIDEVTYPE is a 32-bit register.

Field descriptions

31:8	7:4	3:0
RES0	SUB	MAJOR

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as `0b0001`.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type. Indicates this is a cross-trigger component.

Reads as `0b0100`.

Access to this field is **RO**.

Accessing CTIDEVTYPE

CTIDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFCC`	CTIDEVTYPE

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

Purpose

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

Configuration

CTIGATE is in the Debug power domain.

Attributes

CTIGATE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	1
GATE31	GATE30	GATE29	GATE28	GATE27	GATE26	GATE25	GATE24	GATE23	GATE22	GATE21	GATE20	GATE19	GATE18	GAT

GATE<x>, bit [x], for x = 31 to 0

Channel <x> gate enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

GATE<x>	Meaning
`0b0`	Disable output and, if CTIDEVID.INOUT == `0b01`, input channel <x> propagation.
`0b1`	Enable output and, if CTIDEVID.INOUT == `0b01`, input channel <x> propagation.

If GATE<x> is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing CTIGATE

CTIGATE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0x140`	CTIGATE

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

Purpose

Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

Configuration

CTIINEN<n> is in the Debug power domain.

If input trigger n is not connected, the behavior of CTIINEN<n> is IMPLEMENTATION DEFINED.

Attributes

CTIINEN<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	
INEN31	INEN30	INEN29	INEN28	INEN27	INEN26	INEN25	INEN24	INEN23	INEN22	INEN21	INEN20	INEN19	INEN18	INEN17	IN

INEN<x>, bit [x], for x = 31 to 0

Input trigger <n> to output channel <x> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

INEN<x>	Meaning
`0b0`	Input trigger <n> will not generate an event on output channel <x>.
`0b1`	Input trigger <n> will generate an event on output channel <x>.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing CTIINEN<n>

CTIINEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0x020` + (4 * n)	CTIINEN<n>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

Purpose

Can be used to deactivate the output triggers.

Configuration

CTIINTACK is in the Debug power domain.

Attributes

CTIINTACK is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15
ACK31	ACK30	ACK29	ACK28	ACK27	ACK26	ACK25	ACK24	ACK23	ACK22	ACK21	ACK20	ACK19	ACK18	ACK17	ACK16	ACK15

ACK<n>, bit [n], for n = 31 to 0

Acknowledge for output trigger <n>.

Bits [31:N] are RAZ/WI. N is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.

If any of the following is true, writes to ACK<n> are ignored:

- n >= CTIDEVID.NUMTRIG, the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by CTIOUTEN<n>, is still active.

Otherwise, if any of the following are true, it is IMPLEMENTATION DEFINED whether writes to ACK<n> are ignored:

- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

ACK<n>	Meaning
`0b0`	No effect
`0b1`	Deactivate the trigger.

Accessing CTIINTACK

A debugger must read CTITRIGOUTSTATUS to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPPULSE to activate another trigger.

CTIINTACK can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0x010`	CTIINTACK

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **WI**.
- When !SoftwareLockStatus() accesses to this register are **WO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

Purpose

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

It is IMPLEMENTATION DEFINED whether CTIITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIITCTRL is a 32-bit register.

Field descriptions

31–1	0
RES0	IME

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

IME	Meaning
`0b0`	Normal operation.
`0b1`	Integration mode enabled.

The following resets apply:

- If the register is implemented in the Core power domain:
    - On a Cold reset, this field resets to 0.
    - On an External debug reset, the value of this field is unchanged.
    - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
    - On a Cold reset, the value of this field is unchanged.
    - On an External debug reset, this field resets to 0.
    - On a Warm reset, the value of this field is unchanged.

Accessing CTIITCTRL

CTIITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xF00`	CTIITCTRL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

Purpose

Allows or disallows access to the CTI registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILAR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILAR is a 32-bit register.

Field descriptions

When Software Lock is implemented:

31–0
KEY

KEY, bits [31:0]

Lock Access control. Writing the key value `0xC5ACCE55` to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

31–0
RES0

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing CTILAR

CTILAR can be accessed through a memory-mapped access to the external debug interface:

Component	Offset	Instance

CTI	`0xFB0`	CTILAR

Accesses on this interface are **WO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

Purpose

Indicates the current status of the Software Lock for CTI registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILSR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILSR is a 32-bit register.

Field descriptions

31–3	2	1	0
RES0	nTT	SLK	SLI

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

When Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

SLK	Meaning
`0b0`	Lock clear. Writes are permitted to this component's registers.
`0b1`	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On an External debug reset, this field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Accessing CTILSR

CTILSR can be accessed through a memory-mapped access to the external debug interface:

Component	Offset	Instance
CTI	0xFB4	CTILSR

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

Purpose

Defines which input channels generate output trigger n.

Configuration

CTIOUTEN<n> is in the Debug power domain.

If output trigger n is not connected, the behavior of CTIOUTEN<n> is IMPLEMENTATION DEFINED.

Attributes

CTIOUTEN<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
OUTEN31	OUTEN30	OUTEN29	OUTEN28	OUTEN27	OUTEN26	OUTEN25	OUTEN24	OUTEN23	OUTEN22	OUTEN21	OUTEN2

OUTEN<x>, bit [x], for x = 31 to 0

Input channel <x> to output trigger <n> enable.

Bits [31:N] are RAZ/WI. N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Possible values of this bit are:

OUTEN<x>	Meaning
`0b0`	An event on input channel <x> will not cause output trigger <n> to be asserted.
`0b1`	An event on input channel <x> will cause output trigger <n> to be asserted.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing CTIOUTEN<n>

CTIOUTEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0x0A0` + (4 * n)	CTIOUTEN<n>

This interface is accessible as follows:

- When SoftwareLockStatus() accesses to this register are **RO**.
- When !SoftwareLockStatus() accesses to this register are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR0 is a 32-bit register.

Field descriptions

31–8	7–0
RES0	PART_0

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR0

CTIPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE0	CTIPIDR0

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIPIDR1, CTI Peripheral Identification Register 1

The CTIPIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR1 is a 32-bit register.

Field descriptions

31:8	7:4	3:0
RES0	DES_0	PART_1

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is `0b1011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR1

CTIPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFE4`	CTIPIDR1

Accesses on this interface are **RO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIPIDR2, CTI Peripheral Identification Register 2

The CTIPIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR2 is a 32-bit register.

Field descriptions

31:8	7:4	3	2:0
RES0	REVISION	JEDEC	DES_1

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as `0b1`.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is `0b011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR2

CTIPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFE8`	CTIPIDR2

Accesses on this interface are **RO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR3 is a 32-bit register.

Field descriptions

31:8	7:4	3:0
RES0	REVAND	CMOD

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using CTIPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR3

CTIPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFEC	CTIPIDR3

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR4 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR4 is a 32-bit register.

Field descriptions

31–8	7–4	3–0
RES0	SIZE	DES_2

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as `0b0000`.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is `0b0100`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing CTIPIDR4

CTIPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0xFD0`	CTIPIDR4

Accesses on this interface are **RO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

Purpose

Provides the status of the trigger inputs.

Configuration

CTITRIGINSTATUS is in the Debug power domain.

Attributes

CTITRIGINSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TRIN31	TRIN30	TRIN29	TRIN28	TRIN27	TRIN26	TRIN25	TRIN24	TRIN23	TRIN22	TRIN21	TRIN20	TRIN19	TRIN18	TRIN17	TRIN

TRIN<n>, bit [n], for n = 31 to 0

Trigger input <n> status.

Bits [31:N] are RAZ. N is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.

TRIN<n>	Meaning
`0b0`	Input trigger n is inactive.
`0b1`	Input trigger n is active.

Not implemented and not-connected input triggers are always inactive.

It is IMPLEMENTATION DEFINED whether an input trigger that does not support multicycle events can be observed as active.

Accessing CTITRIGINSTATUS

CTITRIGINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0x130`	CTITRIGINSTATUS

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

Purpose

Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicycle channel events.

Configuration

CTITRIGOUTSTATUS is in the Debug power domain.

Attributes

CTITRIGOUTSTATUS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
TROUT31	TROUT30	TROUT29	TROUT28	TROUT27	TROUT26	TROUT25	TROUT24	TROUT23	TROUT22	TROUT21	TROUT20

TROUT<n>, bit [n], for n = 31 to 0

Trigger output <n> status.

Bits [31:N] are RAZ. N is the value in CTIDEVID.NUMTRIG.

If n < N, and output trigger <n> is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicycle channel events, then permitted values for TROUT<n> are:

TROUT<n>	Meaning
`0b0`	Output trigger n is inactive.
`0b1`	Output trigger n is active.

Otherwise when n < N it is IMPLEMENTATION DEFINED whether TROUT<n> behaves as described here or is RAZ.

Accessing CTITRIGOUTSTATUS

CTITRIGOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	`0x134`	CTITRIGOUTSTATUS

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DBGAUTHSTATUS_EL1, Debug Authentication Status register

The DBGAUTHSTATUS_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configuration

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGAUTHSTATUS_EL1[31:0].

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGAUTHSTATUS[31:0].

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

DBGAUTHSTATUS_EL1 is a 32-bit register.

Field descriptions

31:8	7:6	5:4	3:2	1:0
RES0	SNID	SID	NSNID	NSID

Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

When FEAT_Debugv8p4 is implemented:

Secure non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

Secure non-invasive debug.

SNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.
0b10	Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

SID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 1.
0b10	Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSNID, bits [3:2]

When FEAT_Debugv8p4 is implemented:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

If the Effective value of SCR_EL3.NS is 1, or if EL3 is implemented and EL2 is not implemented, this field reads as 0b11.

All other values are reserved.

Otherwise:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b10	Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

NSID	Meaning
0b00	Not implemented. EL3 is not implemented and the Effective value of SCR_EL3.NS is 0.
0b10	Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

Accessing DBGAUTHSTATUS_EL1

DBGAUTHSTATUS_EL1 can be accessed through the external debug interface:

Component	Offset	Instance

Debug	`0xFB8`	DBGAUTHSTATUS_EL1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>_EL1.

Configuration

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGBCR<n>_EL1[31:0].

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBCR<n>[31:0].

DBGBCR<n>_EL1 is in the Core power domain.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBCR<n>_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								BT				LBN				SSC		HMC	RES0				BAS				RES0		PMC		E

When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

BT	Meaning
0b0000	Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.
0b0001	As 0b0000 but linked to a Context matching breakpoint.
0b0010	Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>_EL1.ContextID must match the CONTEXTIDR_EL1 value.
0b0011	As 0b0010, with linking enabled.
0b0100	Unlinked instruction address mismatch. DBGBVR<n>_EL1 is the address of an instruction to be stepped.
0b0101	As 0b0100, with linking enabled.
0b0110	Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1.
0b0111	As 0b0110, with linking enabled.
0b1000	Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.
0b1001	As 0b1000, with linking enabled.
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.
0b1011	As 0b1010, with linking enabled.
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBVR<n>_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2.
0b1101	As 0b1100, with linking enabled.
0b1110	Unlinked Full Context ID match. DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.ContextID2 is compared against CONTEXTIDR_EL2.
0b1111	As 0b1110, with linking enabled.

Constraints on breakpoint programming mean some values are reserved under certain conditions.

For more information on the operation of the SSC, HMC, and PMC fields, and on the effect of programming this field to a reserved value, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved DBGBCR<n>_EL1.BT values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>_EL1.E is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values'.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see DBGBCR<n>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

When AArch32 is supported:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions

All other values are reserved.

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint
0b0011	DBGBVR<n>_EL1	Use for stepping T32 instructions
0b1100	DBGBVR<n>_EL1 + 2	Use for stepping T32 instructions
0b1111	DBGBVR<n>_EL1	Use for stepping A64 and A32 instructions

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint DBGBVR<n>_EL1. Possible values are:

E	Meaning
0b0	Breakpoint disabled.
0b1	Breakpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGBCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x408 + (16 * n)	DBGBCR<n>_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 15

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n>_EL1.

Configuration

External register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register DBGBVR<n>_EL1[63:0].

External register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBVR<n>[31:0].

External register DBGBVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register DBGBXVR<n>[31:0].

DBGBVR<n>_EL1 is in the Core power domain.

How this register is interpreted depends on the value of DBGBCR<n>_EL1.BT.

- When DBGBCR<n>_EL1.BT is `0b0x0x`, this register holds a virtual address.
- When DBGBCR<n>_EL1.BT is `0b001x`, `0b011x`, or `0b110x`, this register holds a Context ID.
- When DBGBCR<n>_EL1.BT is `0b100x`, this register holds a VMID.
- When DBGBCR<n>_EL1.BT is `0b101x`, this register holds a VMID and a Context ID.
- When DBGBCR<n>_EL1.BT is `0b111x`, this register holds two Context ID values.

For other values of DBGBCR<n>_EL1.BT, this register is RES0.

If breakpoint n is not implemented then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBVR<n>_EL1 is a 64-bit register.

Field descriptions

When DBGBCR<n>_EL1.BT == 0b0x0x:

63-53	52-49	48-32
RESS[14:4]	Bits[52:49]	VA[48:2]

31-2	1-0
VA[48:2]	RES0

RESS[14:4], bits [63:53]

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

VA[52:49], bits [52:49]

When FEAT_LVA is implemented:

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Extension to RESS[14:4]. For more information, see RESS[14:4].

VA[48:2], bits [48:2]

If the address is being matched in an AArch64 stage 1 translation regime:

- This field contains bits[48:2] of the address for comparison.
- When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b001x:

Bits	Field
63:32	RES0
31:0	ContextID

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented), EL2 is using AArch64, HCR_EL2.E2H is 1, and either:

- The PE is executing at EL2.
- HCR_EL2.TGE is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against the following:

- CONTEXTIDR when the PE is executing at AArch32.
- CONTEXTIDR_EL1 when the PE is executing at AArch64.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b011x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

63-32
RES0

31-0
ContextID

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b100x and EL2 is implemented:

63-48	47-40	39-32
RES0	VMID[15:8]	VMID[7:0]

31-0
RES0

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VHE is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. For more information, see DBGBVR<n>_EL1.VMID[7:0].

If EL2 is using AArch32, this field is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b101x and EL2 is implemented:

63:48	47:40	39:32
RES0	VMID[15:8]	VMID[7:0]

31:0
ContextID

Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]

When FEAT_VMID16 is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. For more information, see DBGBVR<n>_EL1.VMID[7:0].

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT == 0b110x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

63:32
ContextID2

31:0
RES0

ContextID2, bits [63:32]

Context ID value for comparison against CONTEXTIDR_EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT == 0b111x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

63 … 32
ContextID2
ContextID
31 … 0

ContextID2, bits [63:32]

Context ID value for comparison against CONTEXTIDR_EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBVR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGBVR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	`0x400` + (16 * n)	DBGBVR<n>_EL1	63:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMSET_EL1 register.

Configuration

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0].

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].

DBGCLAIMCLR_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RAZ/WI																								CLAIM							

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Accessing DBGCLAIMCLR_EL1

DBGCLAIMCLR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFA4`	DBGCLAIMCLR_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DBGCLAIMSET_EL1, Debug CLAIM Tag Set register

The DBGCLAIMSET_EL1 characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMCLR_EL1 register.

Configuration

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[31:0].

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].

DBGCLAIMSET_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMSET_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RAZ/WI																								CLAIM							

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Set CLAIM tag bits.

This field is RAO.

Writing a 1 to one of these bits sets the corresponding CLAIM tag bit to 1. This is an indirect write to the CLAIM tag bits. A single write operation can set multiple CLAIM tag bits to 1.

Writing 0 to one of these bits has no effect.

Accessing DBGCLAIMSET_EL1

DBGCLAIMSET_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA0	DBGCLAIMSET_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

Configuration

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0].

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0].

DBGDTRRX_EL0 is in the Core power domain.

Attributes

DBGDTRRX_EL0 is a 32-bit register.

Field descriptions

31 ... 0
Update DTRRX

Bits [31:0]

Update DTRRX.

Writes to this register:

- If RXfull is set to 1, set DTRRX to UNKNOWN.
- If RXfull is set to 0, update the value in DTRRX.

After the write, RXfull is set to 1.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRX_EL0

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRRX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x080`	DBGDTRRX_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

Configuration

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0].

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0].

DBGDTRTX_EL0 is in the Core power domain.

Attributes

DBGDTRTX_EL0 is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
Return DTRTX

Bits [31:0]

Return DTRTX.

Reads of this register:

- If TXfull is set to 1, return the last value written to DTRTX.
- If TXfull is set to 0, return an UNKNOWN value.

After the read, TXfull is cleared to 0.

Writes to this register:

- If TXfull is set to 1, set DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull remains unchanged.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTX_EL0

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRTX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x08C`	DBGDTRTX_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n>_EL1 characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

Configuration

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGWCR<n>_EL1[31:0].

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWCR<n>[31:0].

DBGWCR<n>_EL1 is in the Core power domain.

If watchpoint n is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

Attributes

DBGWCR<n>_EL1 is a 32-bit register.

Field descriptions

31 30 29	28 27 26 25 24	23 22 21	20	19 18 17 16	15 14	13	12 11 10 9 8 7 6 5	4 3	2 1	0
RES0	MASK	RES0	WT	LBN	SSC	HMC	BAS	LSC	PAC	E

When the E field is zero, all the other fields in the register are ignored.

Bits [31:29]

Reserved, RES0.

MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

MASK	Meaning
`0b00000`	No mask.
`0b00001`	Reserved.
`0b00010`	Reserved.

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from `0b00011` masking 3 address bits (`0x00000007` mask for address) to `0b11111` masking 31 address bits (`0x7FFFFFFF` mask for address).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>_EL1 is being watched.

BAS	Description
xxxxxxx1	Match byte at DBGWVR<n>_EL1
xxxxxx1x	Match byte at DBGWVR<n>_EL1 + 1
xxxxx1xx	Match byte at DBGWVR<n>_EL1 + 2
xxxx1xxx	Match byte at DBGWVR<n>_EL1 + 3

In cases where DBGWVR<n>_EL1 addresses a double-word:

BAS	Description, if DBGWVR<n>_EL1[2] == 0
xxx1xxxx	Match byte at DBGWVR<n>_EL1 + 4
xx1xxxxx	Match byte at DBGWVR<n>_EL1 + 5
x1xxxxxx	Match byte at DBGWVR<n>_EL1 + 6
1xxxxxxx	Match byte at DBGWVR<n>_EL1 + 7

If DBGWVR<n>_EL1[2] == 1, only BAS[3:0] is used. Arm deprecates setting DBGWVR<n>_EL1[2] == 1.

The valid values for BAS are non-zero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>.BAS values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
`0b01`	Match instructions that load from a watchpointed address.
`0b10`	Match instructions that store to a watchpointed address.
`0b11`	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n. Possible values are:

E	Meaning
`0b0`	Watchpoint disabled.
`0b1`	Watchpoint enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGWCR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGWCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x808 + (16 * n)	DBGWCR<n>_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1.

Configuration

External register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register DBGWVR<n>_EL1[63:0].

External register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWVR<n>[31:0].

DBGWVR<n>_EL1 is in the Core power domain.

If watchpoint n is not implemented then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53	52 51 50 49	48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
RESS[14:4]	Bits[52:49]	VA[48:2]

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2	1 0
VA[48:2]	RES0

RESS[14:4], bits [63:53]

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

VA[52:49], bits [52:49]

When FEAT_LVA is implemented:

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Extension to RESS[14:4]. For more information, see RESS[14:4].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. Otherwise, VA[52:49] are RESS.

Arm deprecates setting DBGWVR<n>_EL1[2] == 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGWVR<n>_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

DBGWVR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	`0x800` + (16 * n)	DBGWVR<n>_EL1	63:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDAA32PFR, External Debug Auxiliary Processor Feature Register

The EDAA32PFR characteristics are:

Purpose

Provides information about implemented PE features.

Note

The register mnemonic, EDAA32PFR, is derived from previous definitions of this register that defined this register only when AArch64 was not supported.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

It is IMPLEMENTATION DEFINED whether EDAA32PFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDAA32PFR is a 64-bit register.

Field descriptions

63–32
RES0

31–20	19–16	15–12	11–8	7–4	3–0
RES0	MSA_frac	EL3	EL2	PMSA	VMSA

Bits [63:20]

Reserved, RES0.

MSA_frac, bits [19:16]

When EDAA32PFR.PMSA == 0b0000 and EDAA32PFR.VMSA == 0b1111:

Memory System Architecture fractional field. This holds the information on additional Memory System Architectures supported. Defined values are:

MSA_frac	Meaning
0b0001	PMSAv8-64 supported in all translation regimes. VMSAv8-64 not supported.
0b0010	PMSAv8-64 supported in all translation regimes. In addition to PMSAv8-64, stage 1 EL1&0 translation regime also supports VMSAv8-64.

All other values are reserved.

Otherwise:

Reserved, RES0.

EL3, bits [15:12]
When EDPFR.EL3 == 0b0000:

AArch32 EL3 Exception level handling. Defined values are:

EL3	Meaning
0b0000	EL3 is not implemented or can be executed in AArch64 state.
0b0001	EL3 can be executed in AArch32 state only.

All other values are reserved.

Note

EDPFR.{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Otherwise:

Reserved, RAZ.

EL2, bits [11:8]
When EDPFR.EL2 == 0b0000:

AArch32 EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented or can be executed in AArch64 state.
0b0001	EL2 can be executed in AArch32 state only.

All other values are reserved.

Note

EDPFR.{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Otherwise:

Reserved, RAZ.

PMSA, bits [7:4]

Indicates support for a 32-bit PMSA. Defined values are:

PMSA	Meaning
0b0000	PMSA-32 not supported.
0b0100	PMSAv8-32 supported.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

VMSA, bits [3:0]
When EDAA32PFR.PMSA != 0b0000:

Indicates support for a VMSA in addition to a 32-bit PMSA Defined values are:

VMSA	Meaning
`0b0000`	VMSA not supported.

All other values are reserved.

When EDAA32PFR.PMSA == 0b0000:

Defined values are:

VMSA	Meaning
`0b0000`	VMSAv8-64 supported.
`0b1111`	Memory system architecture described by EDAA32PFR.MSA_frac.

All other values are reserved.

In Armv8-A, the only permitted value is `0b0000`.

Otherwise:

Reserved, RAZ.

Accessing EDAA32PFR

EDAA32PFR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xD60`	EDAA32PFR

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

Purpose

Allows implementations to support IMPLEMENTATION DEFINED controls.

Configuration

It is IMPLEMENTATION DEFINED whether EDACR is implemented in the Core power domain or in the Debug power domain.

If FEAT_DoPD is implemented, this register is implemented in the Core power domain.

If FEAT_DoPD is not implemented, the power domain that this register is implemented in is IMPLEMENTATION DEFINED.

Changing this register from its reset value causes IMPLEMENTATION DEFINED behavior, including possible deviation from the architecturally-defined behavior.

If the EDACR contains any control bits that must be preserved over power down, then these bits must be accessible by the external debug interface when the OS Lock is locked, OSLSR_EL1.OSLK == 1, and when the Core is powered off.

Attributes

EDACR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The following resets apply:

- If the register is implemented in the Core power domain:
  - On a Cold reset, this field resets to an architecturally UNKNOWN value.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to an architecturally UNKNOWN value.
  - On a Warm reset, the value of this field is unchanged.

Accessing EDACR

EDACR can be accessed through the external debug interface:

Component	Offset	Instance

Debug	`0x094`	EDACR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR0 is a 32-bit register.

Field descriptions

31–8	7–0
RES0	PRMBL_0

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as `0x0D`.

Access to this field is **RO**.

Accessing EDCIDR0

EDCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFF0`	EDCIDR0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR1 is a 32-bit register.

Field descriptions

31:8	7:4	3:0
RES0	CLASS	PRMBL_1

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
`0b1001`	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as `0x9`.

PRMBL_1, bits [3:0]

Preamble.

Reads as `0b0000`.

Access to this field is **RO**.

Accessing EDCIDR1

EDCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFF4`	EDCIDR1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR2 is a 32-bit register.

Field descriptions

31:8	7:0
RES0	PRMBL_2

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as `0x05`.

Access to this field is **RO**.

Accessing EDCIDR2

EDCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFF8`	EDCIDR2

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDCIDR3, External Debug Component Identification Register 3

The EDCIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDCIDR3 is a 32-bit register.

Field descriptions

31–8	7–0
RES0	PRMBL_3

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as `0xB1`.

Access to this field is **RO**.

Accessing EDCIDR3

EDCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFFC`	EDCIDR3

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDCIDSR, External Debug Context ID Sample Register

The EDCIDSR characteristics are:

Purpose

Contains the sampled value of the Context ID, captured on reading EDPCSR[31:0].

Configuration

EDCIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDCIDSR are RES0.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDCIDSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CONTEXTIDR																															

CONTEXTIDR, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent EDPCSR sample. When the most recent EDPCSR sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR.
- If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register, and EDCIDSR samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent EDPCSR sample.

Because the value written to EDCIDSR is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether EDCIDSR is set to the original or new value if EDPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDCIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

EDCIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x0A4`	EDCIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVAFF0 is a 32-bit register.

Field descriptions

31–0
MPIDR_EL1lo

MPIDR_EL1lo, bits [31:0]

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing EDDEVAFF0

EDDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFA8`	EDDEVAFF0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVAFF1 is a 32-bit register.

Field descriptions

31–0
MPIDR_EL1hi

MPIDR_EL1hi, bits [31:0]

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing EDDEVAFF1

EDDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFAC`	EDDEVAFF1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVARCH, External Debug Device Architecture register

The EDDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the external debug component.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVARCH is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21	20	19 18 17 16	15 14 13 12	11 10 9 8 7 6 5 4 3 2 1 0
ARCHITECT	PRESENT	REVISION	ARCHVER	ARCHPART

ARCHITECT, bits [31:21]

Defines the architecture of the component. For debug, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, `0x4`.

Bits [27:21] are the JEP106 ID code, `0x3B`.

Reads as `0b01000111011`.

Access to this field is **RO**.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as `0b1`.

Access to this field is **RO**.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For debug, the revision defined by Armv8 is `0x0`.

All other values are reserved.

Reads as `0b0000`.

Access to this field is **RO**.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component. Defined values are:

ARCHVER	Meaning
`0b0110`	Armv8 debug architecture.
`0b0111`	Armv8 debug architecture with Virtualization Host Extensions.
`0b1000`	Armv8.2 debug architecture, FEAT_Debugv8p2.
`0b1001`	Armv8.4 debug architecture, FEAT_Debugv8p4.
`0b1010`	Armv8.8 debug architecture, FEAT_Debugv8p8.

EDDEVARCH.ARCHVER and EDDEVARCH.ARCHPART are also defined as a single field, EDDEVARCH.ARCHID, so that EDDEVARCH.ARCHVER is EDDEVARCH.ARCHID[15:12].

FEAT_VHE adds the functionality identified by the value `0b0111`.

FEAT_Debugv8p2 adds the functionality identified by the value `0b1000`.

FEAT_Debugv8p4 adds the functionality identified by the value `0b1001`.

FEAT_Debugv8p8 adds the functionality identified by the value `0b1010`.

From Armv8.1, when FEAT_VHE is implemented the value `0b0110` is not permitted.

From Armv8.2, the values `0b0110` and `0b0111` are not permitted.

From Armv8.4, the value `0b1000` is not permitted.

From Armv8.8, the value `0b1001` is not permitted.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

EDDEVARCH.ARCHVER and EDDEVARCH.ARCHPART are also defined as a single field, EDDEVARCH.ARCHID, so that EDDEVARCH.ARCHPART is EDDEVARCH.ARCHID[11:0].

Armv8-A debug architecture.

Reads as `0xA15`.

Access to this field is **RO**.

Accessing EDDEVARCH

EDDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFBC`	EDDEVARCH

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID is a 32-bit register.

Field descriptions

31:28	27:24	23:8	7:4	3:0
RES0	AuxRegs	RES0	DebugPower	PCSample

Bits [31:28]

Reserved, RES0.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Defined values are:

AuxRegs	Meaning
`0b0000`	None supported.
`0b0001`	Support for External Debug Auxiliary Control Register, EDACR.

All other values are reserved.

Bits [23:8]

Reserved, RES0.

DebugPower, bits [7:4]

Indicates support for the FEAT_DoPD feature. Defined values are:

DebugPower	Meaning
`0b0000`	FEAT_DoPD not implemented. Registers in the external debug interface register map are implemented in a mix of the Debug and Core power domains.
`0b0001`	FEAT_DoPD implemented. All registers in the external debug interface register map are implemented in the Core power domain.

FEAT_DoPD implements the functionality added by the value `0b0001`.

All other values are reserved.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Defined values are:

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the external debug registers space.
0b0010	Only EDPCSR and EDCIDSR are implemented. This option is only permitted if EL3 and EL2 are not implemented.
0b0011	EDPCSR, EDCIDSR, and EDVIDSR are implemented.

All other values are reserved.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

Accessing EDDEVID

EDDEVID can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC8	EDDEVID

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVID1, External Debug Device ID register 1

The EDDEVID1 characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID1 is a 32-bit register.

Field descriptions

31–4	3–0
RES0	PCSROffset

Bits [31:4]

Reserved, RES0.

PCSROffset, bits [3:0]

This field indicates the offset applied to PC samples returned by reads of EDPCSR. Permitted values of this field in Armv8 are:

PCSROffset	Meaning
`0b0000`	EDPCSR not implemented.
`0b0010`	EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.

When FEAT_PCSRv8p2 is implemented, the only permitted value is `0b0000`.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

Accessing EDDEVID1

EDDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFC4`	EDDEVID1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

Purpose

Reserved for future descriptions of features of the debug implementation.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVID2 is a 32-bit register.

Field descriptions

31–0
RES0

Bits [31:0]

Reserved, RES0.

Accessing EDDEVID2

EDDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFC0`	EDDEVID2

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDEVTYPE, External Debug Device Type register

The EDDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PEs debug logic.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDDEVTYPE is a 32-bit register.

Field descriptions

31 ... 8	7 ... 4	3 ... 0
RES0	SUB	MAJOR

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as `0b0001`.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type. Indicates this is a debug logic component.

Reads as `0b0101`.

Access to this field is **RO**.

Accessing EDDEVTYPE

EDDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFCC`	EDDEVTYPE

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDDFR, External Debug Feature Register

The EDDFR characteristics are:

Purpose

Provides top level information about the debug system.

Note

Debuggers must use EDDEVARCH to determine the Debug architecture version.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

It is IMPLEMENTATION DEFINED whether EDDFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDDFR is a 64-bit register.

Field descriptions

63–44	43–40	39–32
RES0	TraceFilt	UNKNOWN

31–28	27–24	23–20	19–16	15–12	11–8	7–4	3–0
CTX_CMPs	RES0	WRPs	RES0	BRPs	PMUVer	TraceVer	UNKNOWN

Bits [63:44]

Reserved, RES0.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension is not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension is implemented.

All other values are reserved.

FEAT_TRF implements the functionality added by 0b0001.

From Armv8.4, the permitted values are 0b0000 and 0b0001.

Bits [39:32]

Reserved, UNKNOWN.

CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64DFR0_EL1.CTX_CMPs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of `0b0000` is reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64DFR0_EL1.WRPs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of `0b0000` is reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64DFR0_EL1.BRPs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and adds support for: • Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. • If EL2 is implemented, the MDCR_EL2.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR_EL1 register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: • 64-bit event counters. • If EL2 is implemented, the MDCR_EL2.HCCD control. • If EL3 is implemented, the MDCR_EL3.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: • The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO controls. • If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: • Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. • Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

TraceVer	Meaning
0b0000	PE trace unit System registers not implemented.
0b0001	PE trace unit System registers implemented.

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a PE trace unit is implemented. A PE trace unit might nevertheless be implemented without a System register interface.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64DFR0_EL1.TraceVer.

Bits [3:0]

Reserved, UNKNOWN.

Accessing EDDFR

EDDFR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	`0xD28`	EDDFR	31:0

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

Component	Offset	Instance	Range
Debug	`0xD2C`	EDDFR	63:32

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

Purpose

Controls Exception Catch debug events. For more information, see 'Summary of Exception Catch debug event control'.

Configuration

External register EDECCR bits [31:0] are architecturally mapped to AArch64 System register OSECCR_EL1[31:0].

External register EDECCR bits [31:0] are architecturally mapped to AArch32 System register DBGOSECCR[31:0].

EDECCR is in the Core power domain.

Attributes

EDECCR is a 32-bit register.

Field descriptions

31:17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	RLE0	NSR3	NSR2	NSR1	NSR0	SR3	SR2	SR1	SR0	NSE3	NSE2	NSE1	NSE0	SE3	SE2	SE1	SE0

Bits [31:17]

Reserved, RES0.

RLE0, bit [16]

Access to this field is **RES0**.

NSR3, bit [15]

Access to this field is **RES0**.

NSR2, bit [14]

When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:

Controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSE2.

NSR2	Meaning
`0b0`	If EDECCR.NSE2 is 0, then Exception Catch debug events are disabled for Non-secure EL2. If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2.
`0b1`	If EDECCR.NSE2 is 0, then Exception Catch debug events are enabled for exception returns to Non-secure EL2. If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSR1, bit [13]

When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:

Controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSE1.

NSR1	Meaning
0b0	If EDECCR.NSE1 is 0, then Exception Catch debug events are disabled for Non-secure EL1. If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1.
0b1	If EDECCR.NSE1 is 0, then Exception Catch debug events are enabled for exception returns to Non-secure EL1. If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

NSR0, bit [12]

When FEAT_Debugv8p2 is implemented and Non-secure EL0 is implemented:

Controls exception catch on exception return to Non-secure EL0.

NSR0	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL0.
0b1	Exception Catch debug events are enabled for exception returns to Non-secure EL0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SR3, bit [11]

When FEAT_Debugv8p2 is implemented and EL3 is implemented:

Controls exception catch on exception return to EL3 in conjunction with EDECCR.SE3.

SR3	Meaning
0b0	If EDECCR.SE3 is 0, then Exception Catch debug events are disabled for EL3. If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3.
0b1	If EDECCR.SE3 is 0, then Exception Catch debug events are enabled for exception returns to EL3. If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

SR2, bit [10]

When FEAT_Debugv8p2 is implemented and FEAT_SEL2 is implemented:

Controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SE2.

SR2	Meaning
0b0	If EDECCR.SE2 is 0, then Exception Catch debug events are disabled for Secure EL2. If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2.
0b1	If EDECCR.SE2 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL2. If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

SR1, bit [9]

When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

Controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SE1.

SR1	Meaning
0b0	If EDECCR.SE1 is 0, then Exception Catch debug events are disabled for Secure EL1. If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1.
0b1	If EDECCR.SE1 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL1. If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

SR0, bit [8]
When FEAT_Debugv8p2 is implemented and Secure EL0 is implemented:

Controls exception catch on exception return to Secure EL0.

SR0	Meaning
0b0	Exception Catch debug events are disabled for Secure EL0.
0b1	Exception Catch debug events are enabled for exception returns to Secure EL0.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

NSE3, bit [7]

Access to this field is **RES0**.

NSE2, bit [6]
When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:

Controls exception catch on exception entry to Non-secure EL2. Also controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSR2.

NSE2	Meaning
0b0	If EDECCR.NSR2 is 0, then Exception Catch debug events are disabled for Non-secure EL2. If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL2.
0b1	If EDECCR.NSR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2. If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL2.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

When Non-secure EL2 is implemented:

Coarse-grained exception catch for Non-secure EL2. Controls Exception Catch debug events for Non-secure EL2.

NSE2	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL2.
0b1	Exception Catch debug events are enabled for Non-secure EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

NSE1, bit [5]

When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:

Controls exception catch on exception entry to Non-secure EL1. Also controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSR1.

NSE1	Meaning
0b0	If EDECCR.NSR1 is 0, then Exception Catch debug events are disabled for Non-secure EL1. If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL1.
0b1	If EDECCR.NSR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1. If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

When Non-secure EL1 is implemented:

Coarse-grained exception catch for Non-secure EL1. Controls Exception Catch debug events for Non-secure EL1.

NSE1	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL1.
0b1	Exception Catch debug events are enabled for Non-secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

NSE0, bit [4]

Access to this field is **RES0**.

SE3, bit [3]

When FEAT_Debugv8p2 is implemented and EL3 is implemented:

Controls exception catch on exception entry to EL3. Also controls exception catch on exception return to EL3 in conjunction with EDECCR.SR3.

SE3	Meaning
`0b0`	If EDECCR.SR3 is 0, then Exception Catch debug events are disabled for EL3. If EDECCR.SR3 is 1, then Exception Catch debug events are enabled for exception returns to EL3.
`0b1`	If EDECCR.SR3 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3. If EDECCR.SR3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

When FEAT_Debugv8p2 is not implemented and EL3 is implemented:

Coarse-grained exception catch for EL3. Controls Exception Catch debug events for EL3.

SE3	Meaning
`0b0`	Exception Catch debug events are disabled for EL3.
`0b1`	Exception Catch debug events are enabled for EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

SE2, bit [2]

When FEAT_Debugv8p2 is implemented and FEAT_SEL2 is implemented:

Controls exception catch on exception entry to Secure EL2. Also controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SR2.

SE2	Meaning
`0b0`	If EDECCR.SR2 is 0, then Exception Catch debug events are disabled for Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL2.
`0b1`	If EDECCR.SR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

SE1, bit [1]

When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

Controls exception catch on exception entry to Secure EL1. Also controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SR1.

SE1	Meaning
`0b0`	If EDECCR.SR1 is 0, then Exception Catch debug events are disabled for Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL1.
`0b1`	If EDECCR.SR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

When Secure EL1 is implemented:

Coarse-grained exception catch for Secure EL1. Controls Exception Catch debug events for Secure EL1.

SE1	Meaning
`0b0`	Exception Catch debug events are disabled for Secure EL1.
`0b1`	Exception Catch debug events are enabled for Secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

SE0, bit [0]

Access to this field is **RES0**.

Accessing EDECCR

EDECCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x098`	EDECCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDECR, External Debug Execution Control Register

The EDECR characteristics are:

Purpose

Controls Halting debug events.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

EDECR is a 32-bit register.

Field descriptions

31:3	2	1	0
RES0	SS	RCE	OSUCE

Bits [31:3]

Reserved, RES0.

SS, bit [2]

Halting step enable. Possible values of this field are:

SS	Meaning
`0b0`	Halting step debug event disabled.
`0b1`	Halting step debug event enabled.

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is CONSTRAINED UNPREDICTABLE as described in 'Changing the value of EDECR.SS when not in Debug state'.

The reset behavior of this field is:

- On a Cold reset, when FEAT_DoPD is implemented, this field resets to `0`.
- On an External debug reset, when FEAT_DoPD is not implemented, this field resets to `0`.

RCE, bit [1]
When FEAT_DoPD is not implemented:

Reset Catch Enable.

RCE	Meaning
`0b0`	Reset Catch debug event disabled.
`0b1`	Reset Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

OSUCE, bit [0]

When FEAT_DoPD is not implemented:

OS Unlock Catch Enable.

OSUCE	Meaning
`0b0`	OS Unlock Catch debug event disabled.
`0b1`	OS Unlock Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

Accessing EDECR

EDECR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x024`	EDECR

This interface is accessible as follows:

- When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are **RO**.
- When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDESR, External Debug Event Status Register

The EDESR characteristics are:

Purpose

Indicates the status of internally pending Halting debug events.

Configuration

EDESR is in the Core power domain.

Attributes

EDESR is a 32-bit register.

Field descriptions

31:4	3	2	1	0
RES0	EC	SS	RC	OSUC

Bits [31:4]

Reserved, RES0.

EC, bit [3]
When FEAT_Debugv8p8 is implemented:

Exception Catch debug event pending.

EC	Meaning
`0b0`	Exception Catch debug event is not pending.
`0b1`	Exception Catch debug event is pending.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

SS, bit [2]
When FEAT_DoPD is implemented:

Halting step debug event pending. Possible values of this field are:

SS	Meaning
`0b0`	Reading this means that a Halting step debug event is not pending. Writing this means no action.
`0b1`	Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Otherwise:

Halting step debug event pending. Possible values of this field are:

SS	Meaning
`0b0`	Reading this means that a Halting step debug event is not pending. Writing this means no action.
`0b1`	Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in EDECR.SS.

RC, bit [1]

Reset Catch debug event pending. Possible values of this field are:

RC	Meaning
`0b0`	Reading this means that a Reset Catch debug event is not pending. Writing this means no action.
`0b1`	Reading this means that a Reset Catch debug event is pending. Writing this clears the pending Reset Catch debug event.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_DoPD is implemented, this field resets to the value in CTIDEVCTL.RCE.
  - When FEAT_DoPD is not implemented, this field resets to the value in EDECR.RCE.

OSUC, bit [0]

OS Unlock Catch debug event pending. Possible values of this field are:

OSUC	Meaning
`0b0`	Reading this means that an OS Unlock Catch debug event is not pending. Writing this means no action.
`0b1`	Reading this means that an OS Unlock Catch debug event is pending. Writing this clears the pending OS Unlock Catch debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing EDESR

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is CONSTRAINED UNPREDICTABLE whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it might become pending again when the Core is powered back on and Cold reset.

EDESR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x020`	EDESR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.

- When IsCorePowered(), !DoubleLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDITCTRL, External Debug Integration mode Control register

The EDITCTRL characteristics are:

Purpose

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

It is IMPLEMENTATION DEFINED whether EDITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

EDITCTRL is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1	0
RES0	IME

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

IME	Meaning
`0b0`	Normal operation.
`0b1`	Integration mode enabled.

The following resets apply:

- Whichever power domain the register is implemented in, this field resets to 0.
- Otherwise, the value of this field is unchanged.

Accessing EDITCTRL

EDITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xF00`	EDITCTRL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

Purpose

Used in Debug state for passing instructions to the PE for execution.

Configuration

EDITR is in the Core power domain.

Attributes

EDITR is a 32-bit register.

Field descriptions

When AArch32 is supported and in AArch32 state:

31–16	15–0
hw2	hw1

hw2, bits [31:16]

Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information, see 'Behavior in Debug state'.

> **Note**
>
> The hw2 field is displayed on the left. This is not the usual convention for display of T32 instruction halfwords.

hw1, bits [15:0]

First halfword of the T32 instruction to be executed on the PE.

> **Note**
>
> The hw1 field is displayed on the right. This is not the usual convention for display of T32 instruction halfwords.

When AArch64 is supported and in AArch64 state:

31–0
A64 instruction to be executed on the PE

Bits [31:0]

A64 instruction to be executed on the PE.

Accessing EDITR

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

EDITR ignores writes if the PE is in Non-debug state.

EDITR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x084`	EDITR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

Purpose

Allows or disallows access to the external debug registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLAR is a 32-bit register.

Field descriptions

When Software Lock is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
KEY																															

KEY, bits [31:0]

Lock Access control. Writing the key value `0xC5ACCE55` to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing EDLAR

EDLAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
Debug	`0xFB0`	EDLAR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

Purpose

Indicates the current status of the software lock for external debug registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLSR is a 32-bit register.

Field descriptions

31–3	2	1	0
RES0	nTT	SLK	SLI

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

SLK, bit [1]

When Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

SLK	Meaning
`0b0`	Lock clear. Writes are permitted to this component's registers.
`0b1`	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On a Cold reset, when FEAT_DoPD is implemented, this field resets to 1.
- On an External debug reset, when FEAT_DoPD is not implemented, this field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

SLI	Meaning
`0b0`	Software Lock not implemented or not memory-mapped access.
`0b1`	Software Lock implemented and memory-mapped access.

Accessing EDLSR

EDLSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
Debug	`0xFB4`	EDLSR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configuration

EDPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDPCSR are RES0.

EDPCSR[63:32] and EDPCSR[31:0] are accessed at 32-bit memory mapped addresses that are not contiguous.

If FEAT_VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDPCSR is a 64-bit register.

Field descriptions

When FEAT_VHE is not implemented or EDSCR.SC2 == 0:

Bits	Field
63:32	PC Sample high word, EDPCSRhi
31:0	PC Sample low word

Bits [63:32]

PC Sample high word, EDPCSRhi. If EDVIDSR.HV == 0 then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as `0xFFFFFFFF` when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of EDPCSR[31:0] is permitted but not required to return `0xFFFFFFFF`.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns `0xFFFFFFFF` or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_VHE is implemented and EDSCR.SC2 == 1:

63	62:61	60:56	55:32
NS	EL	RES0	PC Sample high word, EDPCSRhi

31:0
PC Sample low word

NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
`0b0`	Sample is from Secure state.
`0b1`	Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

EL	Meaning
`0b00`	Sample is from EL0.
`0b01`	Sample is from EL1.
`0b10`	Sample is from EL2.
`0b11`	Sample is from EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [60:56]

Reserved, RES0.

Bits [55:32]

PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as `0xFFFFFFFF` when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of EDPCSR[31:0] is permitted but not required to return `0xFFFFFFFF`.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns `0xFFFFFFFF` or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'

EDPCSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance	Range
Debug	`0x0A0`	EDPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
Debug	`0x0AC`	EDPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

Purpose

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

It is IMPLEMENTATION DEFINED whether EDPFR is implemented in the Core power domain or in the Debug power domain.

Attributes

EDPFR is a 64-bit register.

Field descriptions

63 62 61 60	59 58 57 56	55 54 53 52	51 50 49 48	47 46 45 44	43 42 41 40	39 38 37 36	35 34 33 32
UNKNOWN	UNKNOWN	RES0	UNKNOWN	AMU	UNKNOWN	SEL2	SVE
UNKNOWN	GIC	AdvSIMD	FP	EL3	EL2	EL1	EL0
31 30 29 28	27 26 25 24	23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8	7 6 5 4	3 2 1 0

Bits [63:60]

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

Bits [59:56]

From Armv8.5:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

Bits [55:52]

Reserved, RES0.

Bits [51:48]

From Armv8.4:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension. Defined values are:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

Bits [43:40]

From Armv8.2:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

SEL2, bits [39:36]

Secure EL2. Defined values are:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

All other values are reserved.

SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

SVE	Meaning
0b0000	SVE is not implemented.
0b0001	SVE is implemented.

All other values are reserved.

Bits [31:28]

From Armv8.2:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

GIC, bits [27:24]

System register GIC interface support. Defined values are:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.GIC.

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following SISD and SIMD operations: • Integer byte, halfword, word and doubleword element operations. • Single-precision and double-precision floating-point arithmetic. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for `0b0000`, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- `0b0000` in an implementation with Advanced SIMD support, that does not include the FEAT_FP16 extension.
- `0b0001` in an implementation with Advanced SIMD support, that includes the FEAT_FP16 extension.
- `0b1111` in an implementation without Advanced SIMD support.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.AdvSIMD.

FP, bits [19:16]

Floating-point. Defined values are:

FP	Meaning
0b0000	Floating-point is implemented, and includes support for: • Single-precision and double-precision floating-point types. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for `0b0000`, and also includes support for half-precision floating-point arithmetic.
0b1111	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- `0b0000` in an implementation with floating-point support, that does not include the FEAT_FP16 extension.
- `0b0001` in an implementation with floating-point support, that includes the FEAT_FP16 extension.
- `0b1111` in an implementation without floating-point support.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.FP.

EL3, bits [15:12]

AArch64 EL3 Exception level handling. Defined values are:

EL3	Meaning
0b0000	EL3 is not implemented or cannot be executed in AArch64 state.
0b0001	EL3 can be executed in AArch64 state only.
0b0010	EL3 can be executed in both Execution states.

When the value of EDAA32PFR.EL3 is non-zero, this field must be `0b0000`.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL3.

EL2, bits [11:8]

AArch64 EL2 Exception level handling. Defined values are:

EL2	Meaning
0b0000	EL2 is not implemented or cannot be executed in AArch64 state.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in both Execution states.

When the value of EDAA32PFR.EL2 is non-zero, this field must be `0b0000`.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL2.

EL1, bits [7:4]

AArch64 EL1 Exception level handling. Defined values are:

EL1	Meaning
0b0000	EL1 cannot be executed in AArch64 state. EL1 can be executed in AArch32 state only.
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL1.

EL0, bits [3:0]

AArch64 EL0 Exception level handling. Defined values are:

EL0	Meaning
0b0000	EL0 cannot be executed in AArch64 state. EL0 can be executed in AArch32 state only.
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL0.

Accessing EDPFR

EDPFR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	`0xD20`	EDPFR	31:0

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

Component	Offset	Instance	Range
Debug	`0xD24`	EDPFR	63:32

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR0, External Debug Peripheral Identification Register 0

The EDPIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR0 is a 32-bit register.

Field descriptions

31 ... 8	7 ... 0
RES0	PART_0

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR0

EDPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFE0`	EDPIDR0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR1, External Debug Peripheral Identification Register 1

The EDPIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR1 is a 32-bit register.

Field descriptions

31–8	7–4	3–0
RES0	DES_0	PART_1

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is `0b1011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR1

EDPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0xFE4`	EDPIDR1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR2 is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8	7 6 5 4	3	2 1 0
RES0	REVISION	JEDEC	DES_1

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as `0b1`.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is `0b011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR2

EDPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE8	EDPIDR2

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR3 is a 32-bit register.

Field descriptions

31 … 8	7 … 4	3 … 0
RES0	REVAND	CMOD

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using EDPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR3

EDPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance

Debug	`0xFEC`	EDPIDR3

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

EDPIDR4 is a 32-bit register.

Field descriptions

31:8	7:4	3:0
RES0	SIZE	DES_2

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as `0b0000`.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is `0b0100`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing EDPIDR4

EDPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance

Debug	`0xFD0`	EDPIDR4

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

Purpose

Controls the PE functionality related to powerup, reset, and powerdown.

Configuration

EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT_DoPD is implemented then all fields in this register are in the Core power domain.

CORENPDRQ is the only field that is mapped between the EDPRCR and DBGPRCR and DBGPRCR_EL1.

Attributes

EDPRCR is a 32-bit register.

Field descriptions

When FEAT_DoPD is implemented:

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2	1	0
RES0	CWRR	CORENPDRQ

Bits [31:2]

Reserved, RES0.

CWRR, bit [1]

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

CWRR	Meaning
0b0	No action.
0b1	Request Warm reset.

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing this field has the following behavior:

- **RAZ/WI** if any of the following are true:
    - OSLockStatus()
    - SoftwareLockStatus()
- Otherwise, access to this field is **WO/RAZ**.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
`0b0`	If the system responds to a powerdown request, it powers down Core power domain.
`0b1`	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the DBGPRCR.CORENPDRQ and DBGPRCR_EL1.CORENPDRQ fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Accessing this field has the following behavior:

- When OSLockStatus(), access to this field is **UNKNOWN/WI**.
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Otherwise:

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4	3	2	1	0
RES0	COREPURQ	RES0	CWRR	CORENPDRQ

Bits [31:4]

Reserved, RES0.

COREPURQ, bit [3]

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain, and that the power controller emulates powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

COREPURQ	Meaning
0b0	Do not request power up of the Core power domain.
0b1	Request power up of the Core power domain, and emulation of powerdown.

In an implementation that includes the recommended external debug interface, this bit drives the DBGPWRUPREQ signal.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On an External debug reset, this field resets to 0.

Accessing this field has the following behavior:

- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Bit [2]

Reserved, RES0.

CWRR, bit [1]

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

CWRR	Meaning
0b0	No action.
0b1	Request Warm reset.

This field is in the Core power domain

The PE ignores writes to this bit if any of the following are true:

- ExternalInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Non-secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE, EL3 is not implemented, and the implemented Security state is Secure state.
- ExternalSecureInvasiveDebugEnabled() == FALSE and EL3 is implemented.

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing this field has the following behavior:

- **RAZ/WI** if any of the following are true:
  - !IsCorePowered()
  - DoubleLockStatus()
  - OSLockStatus()
  - SoftwareLockStatus()
- Otherwise, access to this field is **WO/RAZ**.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
`0b0`	If the system responds to a powerdown request, it powers down Core power domain.
`0b1`	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the DBGPRCR.CORENPDRQ and DBGPRCR_EL1.CORENPDRQ fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in EDPRCR.COREPURQ.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
  - !IsCorePowered()
  - DoubleLockStatus()
  - OSLockStatus()
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RW**.

Accessing EDPRCR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

EDPRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x310`	EDPRCR

This interface is accessible as follows:

- When (FEAT_DoPD is not implemented or IsCorePowered()) and SoftwareLockStatus() accesses to this register are **RO**.
- When (FEAT_DoPD is not implemented or IsCorePowered()) and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

Purpose

Holds information about the reset and powerdown state of the PE.

Configuration

EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT_DoPD is implemented then all fields in this register are in the Core power domain.

Attributes

EDPRSR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	SDR	SPMAD	EPMAD	SDAD	EDAD	DLK	OSLK	HALTED	SR	R	SPD	PU

Bits [31:12]

Reserved, RES0.

SDR, bit [11]

Sticky Debug Restart. Set to 1 when the PE exits Debug state.

Permitted values are:

SDR	Meaning
`0b0`	The PE has not restarted since EDPRSR was last read.
`0b1`	The PE has restarted since EDPRSR was last read.

Note

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is UNKNOWN on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If The Core power domain is powered up, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
    - (FEAT_DoPD is not implemented and !IsCorePowered())

- DoubleLockStatus()
- EDPRSR.R == 1
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

SPMAD, bit [10]

When FEAT_Debugv8p4 is implemented:

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because `AllowExternalPMUAccess()` == FALSE.

Permitted values are:

SPMAD	Meaning
`0b0`	No Non-secure external debug interface accesses to the external Performance Monitors registers have failed because `AllowExternalPMUAccess()` == FALSE for the access since EDPRSR was last read.
`0b1`	At least one Non-secure external debug interface access to the external Performance Monitors register has failed and returned an error because `AllowExternalPMUAccess()` == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
  - (FEAT_DoPD is not implemented and !IsCorePowered())
  - DoubleLockStatus()
  - EDPRSR.R == 1
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

Otherwise:

Sticky EPMAD error.

SPMAD	Meaning
`0b0`	No external debug interface accesses to the Performance Monitors registers have failed because `AllowExternalPMUAccess()` == FALSE since EDPRSR was last read.
`0b1`	At least one external debug interface access to the Performance Monitors registers has failed and returned an error because `AllowExternalPMUAccess()` == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
  - (FEAT_DoPD is not implemented and !IsCorePowered())
  - OSLockStatus()
  - DoubleLockStatus()
  - EDPRSR.R == 1
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

EPMAD, bit [9]

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3 is implemented:

External Performance Monitors Non-secure Access Disable status.

EPMAD	Meaning
`0b0`	External Non-secure Performance Monitors access enabled. `AllowExternalPMUAccess()` == TRUE for a Non-secure access.
`0b1`	External Non-secure Performance Monitors access disabled. `AllowExternalPMUAccess()` == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
  - (FEAT_DoPD is not implemented and !IsCorePowered())
  - DoubleLockStatus()
  - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

When FEAT_PMUv3 is implemented:

External Performance Monitors access disable status.

EPMAD	Meaning
`0b0`	External Performance Monitors access enabled. `AllowExternalPMUAccess()` == TRUE.
`0b1`	External Performance Monitors access disabled. `AllowExternalPMUAccess()` == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
  - (FEAT_DoPD is not implemented and !IsCorePowered())
  - OSLockStatus()
  - DoubleLockStatus()
  - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

SDAD, bit [8]

When FEAT_Debugv8p4 is implemented:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because `AllowExternalDebugAccess()` == FALSE.

SDAD	Meaning
`0b0`	No Non-secure external debug interface accesses to the debug registers have failed because `AllowExternalDebugAccess()` == FALSE for the access since EDPRSR was last read.
`0b1`	At least one Non-secure external debug interface access to the debug registers has failed and returned an error because `AllowExternalDebugAccess()` == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
  - (FEAT_DoPD is not implemented and !IsCorePowered())
  - DoubleLockStatus()
  - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

Otherwise:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because `AllowExternalDebugAccess()` == FALSE.

SDAD	Meaning
`0b0`	No external debug interface accesses to the debug registers have failed because `AllowExternalDebugAccess()` == FALSE since EDPRSR was last read.
`0b1`	At least one external debug interface access to the debug registers has failed and returned an error because `AllowExternalDebugAccess()` == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This bit is UNKNOWN on reads if `OSLockStatus()` == TRUE and external debug writes to OSLAR_EL1 do not return an error when `AllowExternalDebugAccess()` == FALSE.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:

- (FEAT_DoPD is not implemented and !IsCorePowered())
- DoubleLockStatus()
- EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

EDAD, bit [7]

When FEAT_Debugv8p4 is implemented:

External Debug Access Disable status.

EDAD	Meaning
`0b0`	External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. `AllowExternalDebugAccess()` == TRUE for a Non-secure access.
`0b1`	External Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. `AllowExternalDebugAccess()` == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
  - (FEAT_DoPD is not implemented and !IsCorePowered())
  - DoubleLockStatus()
  - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable status.

EDAD	Meaning
`0b0`	External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. `AllowExternalDebugAccess()` == TRUE.
`0b1`	External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 disabled. `AllowExternalDebugAccess()` == FALSE.

This bit is not valid and reads UNKNOWN if `OSLockStatus()` == TRUE and external debug writes to OSLAR_EL1 do not return an error when `AllowExternalDebugAccess()` == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
  - (FEAT_DoPD is not implemented and !IsCorePowered())
  - DoubleLockStatus()
  - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

Otherwise:

External Debug Access Disable status.

EDAD	Meaning
0b0	External access to breakpoint registers, watchpoint registers, and OSLAR_EL1 enabled. `AllowExternalDebugAccess() ==` TRUE.
0b1	External access to breakpoint registers, watchpoint registers disabled. It is IMPLEMENTATION DEFINED whether accesses to OSLAR_EL1 are enabled or disabled. `AllowExternalDebugAccess()` == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
  - (FEAT_DoPD is not implemented and !IsCorePowered())
  - DoubleLockStatus()
  - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

DLK, bit [6]

When FEAT_Debugv8p4 is implemented:

This field is RES0.

When FEAT_Debugv8p2 is implemented and FEAT_DoubleLock is implemented:

Double Lock.

From Armv8.2, this field is deprecated.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **RAZ/WI** if all of the following are true:
  - IsCorePowered()
  - !DoubleLockStatus()
- Otherwise, access to this field is **UNKNOWN/WI**.

When FEAT_DoubleLock is implemented:

Double Lock.

This field returns the result of the pseudocode function `DoubleLockStatus()`.

If the Core power domain is powered up and `DoubleLockStatus()` == TRUE, it is IMPLEMENTATION DEFINED whether:

- EDPRSR.PU reads as 1, EDPRSR.DLK reads as 1, and EDPRSR.SPD is UNKNOWN.
- EDPRSR.PU reads as 0, EDPRSR.DLK is UNKNOWN, and EDPRSR.SPD reads as 0.

This field is in the Core power domain.

DLK	Meaning
0b0	`DoubleLockStatus()` returns FALSE.
0b1	`DoubleLockStatus()` returns TRUE and the Core power domain is powered up.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
  - FEAT_DoPD is not implemented
  - !IsCorePowered()
- Otherwise, access to this field is **RO**.

Otherwise:

Reserved, RES0.

OSLK, bit [5]

OS Lock status bit.

A read of this bit returns the value of OSLSR_EL1.OSLK.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
    - (FEAT_DoPD is not implemented and !IsCorePowered())
    - DoubleLockStatus()
    - EDPRSR.R == 1
- Otherwise, access to this field is **RO**.

HALTED, bit [4]

Halted status bit.

HALTED	Meaning
`0b0`	PE is in Non-debug state.
`0b1`	PE is in Debug state.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
    - FEAT_DoPD is not implemented
    - !IsCorePowered()
- Otherwise, access to this field is **RO**.

SR, bit [3]

Sticky core Reset status bit.

Permitted values are:

SR	Meaning
`0b0`	The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read.
`0b1`	The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read.

If EDPRSR.PU reads as 1 and EDPRSR.R reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, it is UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
    - (FEAT_DoPD is not implemented and !IsCorePowered())

  - DoubleLockStatus()
- When SoftwareLockStatus(), access to this field is **RO**.
- Otherwise, access to this field is **RC/WI**.

R, bit [2]

PE Reset status bit.

Permitted values are:

R	Meaning
`0b0`	The non-debug logic of the PE is not in reset state.
`0b1`	The non-debug logic of the PE is in reset state.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'.

This field is in the Core power domain.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
  - (FEAT_DoPD is not implemented and !IsCorePowered())
  - DoubleLockStatus()
- Otherwise, access to this field is **RO**.

SPD, bit [1]

Sticky core Powerdown status bit.

If FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, then:

- If FEAT_Debugv8p2 is implemented, this bit reads as 0.
- If FEAT_Debugv8p2 is not implemented, this bit might read as 0 or 1.

For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

SPD	Meaning
`0b0`	If EDPRSR.PU is 0, it is not known whether the state of the debug registers in the Core power domain is lost. If EDPRSR.PU is 1, the state of the debug registers in the Core power domain has not been lost.
`0b1`	The state of the debug registers in the Core power domain has been lost.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE this bit clears to 0.
- If FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

When FEAT_DoPD is not implemented and the Core power domain is in either retention or powerdown state, the value of EDPRSR.SPD is IMPLEMENTATION DEFINED. For more information, see 'EDPRSR.SPD when the Core domain is in either retention or powerdown state'.

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Accessing this field has the following behavior:

- **RAZ/WI** if all of the following are true:

    - FEAT_DoPD is not implemented
    - !IsCorePowered()
- **UNKNOWN/WI** if all of the following are true:
    - IsCorePowered()
    - DoubleLockStatus()
- Otherwise, access to this field is **RO**.

PU, bit [0]

When FEAT_DoPD is implemented:

Core powerup status bit.

Access to this field is **RAO/WI**.

When FEAT_Debugv8p2 is implemented:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

PU	Meaning
`0b0`	Either the Core power domain is in a low-power or powerdown state, or FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, meaning the debug registers in the Core power domain cannot be accessed.
`0b1`	The Core power domain is in a powerup state, and either FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE, meaning the debug registers in the Core power domain can be accessed.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'

Access to this field is **RO**.

Otherwise:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

When the Core power domain is powered-up and `DoubleLockStatus()` == TRUE, then the value of EDPRSR.PU is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.

Otherwise, permitted values are:

PU	Meaning
`0b0`	Core power domain is in a low-power or powerdown state where the debug registers in the Core power domain cannot be accessed.
`0b1`	Core power domain is in a powerup state where the debug registers in the Core power domain can be accessed.

If FEAT_DoubleLock is implemented, the Core power domain is powered up, and `DoubleLockStatus()` == TRUE, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

Access to this field is **RO**.

Accessing EDPRSR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or `DoubleLockStatus()` == FALSE, then:
    - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
    - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).
- If FEAT_DoubleLock is implemented and `DoubleLockStatus()` == TRUE, it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If FEAT_DoPD is not implemented and the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

EDPRSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x314`	EDPRSR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDRCR, External Debug Reserve Control Register

The EDRCR characteristics are:

Purpose

This register is used to allow imprecise entry to Debug state and clear sticky bits in EDSCR.

Configuration

EDRCR is in the Core power domain.

Attributes

EDRCR is a 32-bit register.

Field descriptions

31–5	4	3	2	1–0
RES0	CBRRQ	CSPA	CSE	RES0

Bits [31:5]

Reserved, RES0.

CBRRQ, bit [4]

Allow imprecise entry to Debug state. The actions on writing to this bit are:

CBRRQ	Meaning
`0b0`	No action.
`0b1`	Allow imprecise entry to Debug state, for example by canceling pending bus accesses.

Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1.

This feature is optional. If this feature is not implemented, writes to this bit are ignored.

CSPA, bit [3]

Clear Sticky Pipeline Advance. This bit is used to clear the EDSCR.PipeAdv bit to 0. The actions on writing to this bit are:

CSPA	Meaning
`0b0`	No action.
`0b1`	Clear the EDSCR.PipeAdv bit to 0.

CSE, bit [2]

Clear Sticky Error. Used to clear the EDSCR cumulative error bits to 0. The actions on writing to this bit are:

CSE	Meaning
`0b0`	No action.
`0b1`	Clear the EDSCR.{TXU, RXO, ERR} bits, and, if the PE is in Debug state, the EDSCR.ITO bit, to 0.

Bits [1:0]

Reserved, RES0.

Accessing EDRCR

EDRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x090`	EDRCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

External register EDSCR bits [30:29] are architecturally mapped to AArch64 System register MDCCSR_EL0[30:29].

EDSCR is in the Core power domain.

Attributes

EDSCR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23 22	21	20	19	18	17	16	15	14	13 12 11 10	9 8	7	6	5 4 3 2 1 0
TFO	RXfull	TXfull	ITO	RXO	TXU	PipeAdv	ITE	INTdis	TDA	MA	SC2	NS	RES0	SDD	RES0	HDE	RW	EL	A	ERR	STATUS

TFO, bit [31]

When FEAT_TRF is implemented:

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

TFO	Meaning
`0b0`	Trace Filter controls are not affected.
`0b1`	Trace Filter controls in TRFCR_EL1 and TRFCR_EL2 are ignored. Trace Filter controls TRFCR and HTRFCR are ignored.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through the MDSCR_EL1 and DBGDSCRext System registers.

This bit is ignored by the PE when ExternalSecureNoninvasiveDebugEnabled() is FALSE and the Effective value of MDCR_EL3.STE is 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

DTRRX full.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Access to this field is **RO**.

TXfull, bit [29]

DTRTX full.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Access to this field is **RO**.

ITO, bit [28]

ITR overrun. Set to 0 on entry to Debug state.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

RXO, bit [27]

DTRRX overrun.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Access to this field is **RO**.

TXU, bit [26]

DTRTX underrun.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Access to this field is **RO**.

PipeAdv, bit [25]

Pipeline Advance. Indicates that software execution is progressing.

PipeAdv	Meaning
`0b0`	No progress has been made by the PE since the last time this field was cleared to zero by writing 1 to EDRCR.CSPA.
`0b1`	Progress has been made by the PE since the last time this field was cleared to zero by writing 1 to EDRCR.CSPA.

The architecture does not define precisely when this field is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing. For example, a PE might set this field to 1 each time the PE retires one or more instructions, or at periodic intervals during the progression of an instruction.

When FEAT_MOPS is implemented, `CPY`, `CPYF`, `SET`, and `SETG` Memory Set and Copy instructions are examples of instructions that periodically make forward progress.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

ITE, bit [24]

ITR empty.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

INTdis, bits [23:22]

When FEAT_Debugv8p4 is implemented:

Interrupt disable. Disables taking interrupts in Non-debug state.

INTdis	Meaning
0b00	Masking of interrupts is controlled by PSTATE and interrupt routing controls.
0b01	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked.

Note

All interrupts includes virtual and SError interrupts.

When OSLSR_EL1.OSLK is 1, this field can be indirectly read and written through the MDSCR_EL1 and DBGDSCRext System registers.

The Effective value of this field is `0b00` when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_Debugv8p4 is implemented, bit[23] of this register is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Otherwise:

Interrupt disable. Disables taking interrupts in Non-debug state.

INTdis	Meaning
0b00	Masking of interrupts is controlled by PSTATE and interrupt routing controls.
0b01	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure EL1 are masked.
0b10	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure EL1 are masked.
0b11	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts taken to Secure state are masked.

Note

All interrupts includes virtual and SError interrupts.

When OSLSR_EL1.OSLK is 1, this field can be indirectly read and written through the MDSCR_EL1 and DBGDSCRext System registers.

The Effective value of this field is `0b00` when ExternalInvasiveDebugEnabled() is FALSE.

Support for the values `0b01` and `0b10` is IMPLEMENTATION DEFINED. If these values are not supported, they are reserved. If programmed with a reserved value, the PE behaves as if INTdis has been programmed with a defined value, other than for a direct read of EDSCR, and the value returned by a read of EDSCR.INTdis is UNKNOWN.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

TDA, bit [21]

Traps accesses to the following debug System registers:

- AArch64: DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, DBGWVR<n>_EL1.
- AArch32: DBGBCR<n>, DBGBVR<n>, DBGBXVR<n>, DBGWCR<n>, DBGWVR<n>.

TDA	Meaning
`0b0`	Accesses to debug System registers do not generate a Software Access Debug event.
`0b1`	Accesses to debug System registers generate a Software Access Debug event, if OSLSR_EL1.OSLK is 0 and if halting is allowed.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

MA, bit [20]

Memory access mode. Controls the use of memory-access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

MA	Meaning
`0b0`	Normal access mode.
`0b1`	Memory access mode.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and FEAT_PCSRv8p2 is not implemented:

Sample CONTEXTIDR_EL2. Controls whether the PC Sample-based Profiling Extension samples CONTEXTIDR_EL2 or VTTBR_EL2.VMID.

SC2	Meaning
`0b0`	Sample VTTBR_EL2.VMID.
`0b1`	Sample CONTEXTIDR_EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

NS, bit [18]

Non-secure status. In Debug state, gives the current Security state:

NS	Meaning
`0b0`	Secure state.
`0b1`	Non-secure state.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.

- Otherwise, access to this field is **RO**.

Bit [17]

Reserved, RES0.

SDD, bit [16]

Secure debug disabled.

On entry to Debug state:

- If entering in Secure state, SDD is set to 0.
- If entering in Non-secure state, SDD is set to the inverse of `ExternalSecureInvasiveDebugEnabled()`.

In Debug state, the value of the SDD bit does not change, even if `ExternalSecureInvasiveDebugEnabled()` changes.

In Non-debug state:

- SDD returns the inverse of `ExternalSecureInvasiveDebugEnabled()`. If the authentication signals that control `ExternalSecureInvasiveDebugEnabled()` change, a context synchronization event is required to guarantee their effect.
- This bit is unaffected by the Security state of the PE.

If EL3 is not implemented and the implementation is Non-secure, this bit is RES1.

Access to this field is **RO**.

Bit [15]

Reserved, RES0.

HDE, bit [14]

Halting debug enable.

HDE	Meaning
`0b0`	Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.
`0b1`	Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

RW, bits [13:10]

Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level.

RW	Meaning	Applies when
`0b1111`	Any of the following: • The PE is in Non-debug state. • The PE is at EL0 using AArch64. • The PE is not at EL0, and EL1, EL2, and EL3 are using AArch64.	
`0b1110`	The PE is in Debug state at EL0. EL0 is using AArch32. EL1, EL2, and EL3 are using AArch64.	When AArch32 is supported
`0b110x`	The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is enabled in the current Security state and is using AArch64. If implemented, EL3 is using AArch64.	When AArch32 is supported and EL2 is implemented
`0b10xx`	The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is not implemented, disabled in the current Security state, or using AArch32. EL3 is using AArch64.	When AArch32 is supported and EL3 is implemented
`0b0xxx`	The PE is in Debug state. All Exception levels are using AArch32.	When AArch32 is supported

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **RAO/WI**.
- Otherwise, access to this field is **RO**.

EL, bits [9:8]

Exception level. In Debug state, gives the current Exception level of the PE.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

A, bit [7]

SError interrupt pending. In Debug state, indicates whether an SError interrupt is pending:

- If HCR_EL2.{AMO, TGE} = {1, 0}, EL2 is enabled in the current Security state, and the PE is executing at EL0 or EL1, a virtual SError interrupt.
- Otherwise, a physical SError interrupt.

A	Meaning
`0b0`	No SError interrupt pending.
`0b1`	SError interrupt pending.

A debugger can read EDSCR to check whether an SError interrupt is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

ERR, bit [6]

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Access to this field is **RO**.

STATUS, bits [5:0]

Debug status flags.

STATUS	Meaning
0b000001	PE is restarting, exiting Debug state.
0b000010	PE is in Non-debug state.
0b000111	Breakpoint.
0b010011	External debug request.
0b011011	Halting step, normal.
0b011111	Halting step, exclusive.
0b100011	OS Unlock Catch.
0b100111	Reset Catch.
0b101011	Watchpoint.
0b101111	HLT instruction.
0b110011	Software access to debug register.
0b110111	Exception Catch.
0b111011	Halting step, no syndrome.

All other values of STATUS are reserved.

Access to this field is **RO**.

Accessing EDSCR

EDSCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x088	EDSCR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

Purpose

Contains sampled values captured on reading EDPCSR[31:0].

Configuration

EDVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDVIDSR are RES0.

If FEAT_VHE is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

When the PC Sample-based Profiling Extension is implemented in the external debug registers space, if EL2 is not implemented and EL3 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDVIDSR is a 32-bit register.

Field descriptions

When FEAT_VHE is not implemented or EDSCR.SC2 == 0:

31	30	29	28	27-16	15-8	7-0
NS	E2	E3	HV	RES0	VMID[15:8]	VMID

This format applies in all Armv8.0 implementations.

NS, bit [31]

Non-secure state sample. Indicates the Security state associated with the most recent EDPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E2, bit [30]
When EL2 is implemented:

Exception level 2 status sample. Indicates whether the most recent EDPCSR sample was associated with EL2.

E2	Meaning
0b0	Sample is not from EL2.
0b1	Sample is from EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [29]
When EL3 is implemented and AArch64 is supported:

Exception level 3 status sample. Indicates whether the most recent EDPCSR sample was associated with EL3 using AArch64.

E3	Meaning
0b0	Sample is not from EL3 using AArch64.
0b1	Sample is from EL3 using AArch64.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HV, bit [28]

EDPCSRhi (EDPCSR[63:32]) valid. Indicates whether bits [63:32] of the most recent EDPCSR sample might be nonzero:

HV	Meaning
0b0	Bits[63:32] of the most recent EDPCSR sample are zero.
0b1	Bits[63:32] of the most recent EDPCSR sample might be nonzero.

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi (EDPCSR[63:32]) does not need to be read.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [27:16]

Reserved, RES0.

VMID[15:8], bits [15:8]
When FEAT_VMID16 is implemented and EL2 is implemented:

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]

When EL2 is implemented:

VMID sample. The VMID associated with the most recent EDPCSRlo (EDPCSR[31:0]) sample. When the most recent EDPCSR sample was generated:

- This field is RES0 if any of the following apply:
  - The PE is executing in Secure state.
  - The PE is executing at EL2.
- Otherwise:
  - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
  - If EL2 is using AArch64, FEAT_VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
  - If EL2 is using AArch32, this field is set to VTTBR.VMID.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented) and EDSCR.SC2 == 1:

31–0
CONTEXTIDR_EL2

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent EDPCSR sample. When the most recent EDPCSR sample is generated:

- If the PE is not executing at EL3, EL2 is using AArch64, and EL2 is enabled in the current Security state, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- Otherwise, this field is set to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

EDVIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x0A8`	EDVIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

Purpose

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

Configuration

EDWAR is in the Core power domain.

Attributes

EDWAR is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
Watchpoint address
Watchpoint address
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bits [63:0]

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the DC ZVA block size.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The value of EDWAR[63:32] is UNKNOWN if Debug state was entered for a Watchpoint debug event taken from AArch32 state.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See 'Determining the memory location that caused a Watchpoint exception'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDWAR

EDWAR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	`0x030`	EDWAR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
Debug	`0x034`	EDWAR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRCIDR0, Component Identification Register 0

The ERRCIDR0 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRCIDR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR0 is a 32-bit register.

Field descriptions

31–8	7–0
RES0	PRMBL_0

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Component identification preamble, segment 0.

Reads as `0x0D`.

Access to this field is **RO**.

Accessing ERRCIDR0

ERRCIDR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xFF0`	ERRCIDR0

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRCIDR1, Component Identification Register 1

The ERRCIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRCIDR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR1 is a 32-bit register.

Field descriptions

31:8	7:4	3:0
RES0	CLASS	PRMBL_1

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
`0b1111`	Generic peripheral with IMPLEMENTATION DEFINED register layout.

Other values are defined by the CoreSight Architecture.

This field reads as `0xF`.

PRMBL_1, bits [3:0]

Component identification preamble, segment 1.

Reads as `0b0000`.

Access to this field is **RO**.

Accessing ERRCIDR1

ERRCIDR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xFF4`	ERRCIDR1

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRCIDR2, Component Identification Register 2

The ERRCIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRCIDR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR2 is a 32-bit register.

Field descriptions

31–8	7–0
RES0	PRMBL_2

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Component identification preamble, segment 2.

Reads as `0x05`.

Access to this field is **RO**.

Accessing ERRCIDR2

ERRCIDR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xFF8`	ERRCIDR2

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRCIDR3, Component Identification Register 3

The ERRCIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRCIDR3 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR3 is a 32-bit register.

Field descriptions

31 … 8	7 … 0
RES0	PRMBL_3

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Component identification preamble, segment 3.

Reads as `0xB1`.

Access to this field is **RO**.

Accessing ERRCIDR3

ERRCIDR3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xFFC`	ERRCIDR3

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRCRICR0, Critical Error Interrupt Configuration Register 0

The ERRCRICR0 characteristics are:

Purpose

Critical Error Interrupt configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR0 are RES0.

ERRCRICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR0 is a 64-bit register.

Field descriptions

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

<table>
<tr><td>63</td><td>62</td><td>61</td><td>60</td><td>59</td><td>58</td><td>57</td><td>56</td><td>55</td><td>54</td><td>53</td><td>52</td><td>51</td><td>50</td><td>49</td><td>48</td><td>47</td><td>46</td><td>45</td><td>44</td><td>43</td><td>42</td><td>41</td><td>40</td><td>39</td><td>38</td><td>37</td><td>36</td><td>35</td><td>34</td><td>33</td><td>32</td></tr>
<tr><td colspan="8">RES0</td><td colspan="24">ADDR</td></tr>
<tr><td colspan="30">ADDR</td><td colspan="2">RES0</td></tr>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
</table>

Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRCRICR0.ADDR << 2) is the address that the component writes to when signaling the Critical Error Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

63–32
IMPLEMENTATION DEFINED

31–0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRCRICR0

ERRCRICR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xEA0`	ERRCRICR0

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRCRICR1, Critical Error Interrupt Configuration Register 1

The ERRCRICR1 characteristics are:

Purpose

Critical Error Interrupt configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR1 are RES0.

ERRCRICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR1 is a 32-bit register.

Field descriptions

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATA																															

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRCRICR1

ERRCRICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xEA8`	ERRCRICR1

Accesses on this interface are **RW**.

ERRCRICR2, Critical Error Interrupt Configuration Register 2

The ERRCRICR2 characteristics are:

Purpose

Critical Error Interrupt control and configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR2 are RES0.

ERRCRICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR2 is a 32-bit register.

Field descriptions

When the Critical Error Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

31–8	7	6	5–4	3–0
RES0	IRQEN	NSMSI	SH	MemAttr

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

IRQEN	Meaning
`0b0`	Disabled.
`0b1`	Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRCRICR2:

Security attribute. Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
`0b0`	Secure.
`0b1`	Non-secure.

The reset behavior of this field is:

- On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRCRICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

SH	Meaning
`0b00`	Not shared.
`0b10`	Outer Shareable.
`0b11`	Inner Shareable.

All other values are reserved.

This field is ignored when ERRCRICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

MemAttr	Meaning
0b0000	Device-nGnRnE memory.
0b0001	Device-nGnRE memory.
0b0010	Device-nGRE memory.
0b0011	Device-GRE memory.
0b0101	Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111	Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001	Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010	Normal memory, Inner Write-Through, Outer Write-Through.
0b1011	Normal memory, Inner Write-Back, Outer Write-Through.
0b1101	Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110	Normal memory, Inner Write-Through, Outer Write-Back.
0b1111	Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

31–0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRCRICR2

ERRCRICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEAC	ERRCRICR2

Accesses on this interface are **RW**.

ERRDEVAFF, Device Affinity Register

The ERRDEVAFF characteristics are:

Purpose

For a group of error records that has affinity with a single PE or a group of PEs, ERRDEVAFF is a copy of MPIDR_EL1 or part of MPIDR_EL1:

- If the group of error records has affinity with a single PE, the affinity level is 0, ERRDEVAFF reads the same value as MPIDR_EL1, and ERRDEVAFF.F0V reads-as-one to indicate affinity level 0.
- If the group of error records has affinity with a group of PEs, the affinity level is 1, 2, or 3, parts of ERRDEVAFF reads the same value as parts of MPIDR_EL1, and the rest of ERRDEVAFF indicates the level.

For example, if the group of PEs is a subset of the PEs at affinity level 1 then all of the following are true:

- All the PEs in the group have the same values in MPIDR_EL1.{Aff3,Aff2}, and these values are equal to ERRDEVAFF.{Aff3,Aff2}.
- ERRDEVAFF.Aff1 is nonzero and not `0x80`, and ERRDEVAFF.{Aff0,F0V} read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the group of error records has affinity with is indicated by the least-significant set bit in ERRDEVAFF.Aff1. In this example, if ERRDEVAFF.Aff1[2:0] is `0b100`, then the group of error records has affinity with the up-to 8 PEs that have MPIDR_EL1.Aff1[7:3] == ERRDEVAFF.Aff1[7:3].

If RAS System Architecture v1.1 is not implemented, ERRDEVAFF can only describe a group of error records that is affine with a single PE or all the PEs at an affinity level.

Configuration

This register is present only when the group of error records has affinity with a PE or cluster of PEs. Otherwise, direct accesses to ERRDEVAFF are RES0.

ERRDEVAFF is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVAFF is a 64-bit register.

Field descriptions

63:40	39:32
RES0	Aff3

31	30	29:25	24	23:16	15:8	7:0
F0V	U	RES0	MT	Aff2	Aff1	Aff0

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

PE affinity level 3. The MPIDR_EL1.Aff3 field, viewed from the highest Exception level of the associated PE or PEs.

F0V, bit [31]

Indicates that the ERRDEVAFF.Aff0 field is valid.

FOV	Meaning
0b0	ERRDEVAFF.Aff0 is not valid, and the PE affinity is above level 0 or a subset of level 0.
0b1	ERRDEVAFF.Aff0 is valid, and the PE affinity is at level 0.

U, bit [30]

When ERRDEVAFF.F0V == 1:

Uniprocessor. The MPIDR_EL1.U field, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

When ERRDEVAFF.F0V == 1:

Multithreaded. The MPIDR_EL1.MT field, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Aff2, bits [23:16]

When affine with a PE or PEs at affinity level 2 or below:

PE affinity level 2. The MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PE or PEs.

When affine with a sub-set of PEs at affinity level 2:

PE affinity level 2. Defines part of the MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PEs.

Aff2	Meaning
0bxxxxxxx1	ERRDEVAFF.Aff2[7:1] is the value of MPIDR_EL1.Aff2[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	ERRDEVAFF.Aff2[7:2] is the value of MPIDR_EL1.Aff2[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	ERRDEVAFF.Aff2[7:3] is the value of MPIDR_EL1.Aff2[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	ERRDEVAFF.Aff2[7:4] is the value of MPIDR_EL1.Aff2[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	ERRDEVAFF.Aff2[7:5] is the value of MPIDR_EL1.Aff2[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	ERRDEVAFF.Aff2[7:6] is the value of MPIDR_EL1.Aff2[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	ERRDEVAFF.Aff2[7] is the value of MPIDR_EL1.Aff2[7], viewed from the highest Exception level of the associated PEs.

Otherwise:

PE affinity level 2. Indicates whether the PE affinity is at level 3.

Aff2	Meaning
0x80	PE affinity is at level 3.

All other values are reserved.

Aff1, bits [15:8]

When affine with a PE or PEs at affinity level 1 or below:

PE affinity level 1. The MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PE or PEs.

When affine with a sub-set of PEs at affinity level 1:

PE affinity level 1. Defines part of the MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PEs.

Aff1	Meaning
0bxxxxxxx1	ERRDEVAFF.Aff1[7:1] is the value of MPIDR_EL1.Aff1[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	ERRDEVAFF.Aff1[7:2] is the value of MPIDR_EL1.Aff1[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	ERRDEVAFF.Aff1[7:3] is the value of MPIDR_EL1.Aff1[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	ERRDEVAFF.Aff1[7:4] is the value of MPIDR_EL1.Aff1[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	ERRDEVAFF.Aff1[7:5] is the value of MPIDR_EL1.Aff1[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	ERRDEVAFF.Aff1[7:6] is the value of MPIDR_EL1.Aff1[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	ERRDEVAFF.Aff1[7] is the value of MPIDR_EL1.Aff1[7], viewed from the highest Exception level of the associated PEs.

Otherwise:

PE affinity level 1. Indicates whether the PE affinity is at level 2.

Aff1	Meaning
0x00	PE affinity is above level 2 or a subset of level 2.
0x80	PE affinity is at level 2.

Aff0, bits [7:0]

When affine with a PE at affinity level 0:

PE affinity level 0. The MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PE.

When affine with a sub-set of PEs at affinity level 0:

PE affinity level 0. Defines part of the MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PEs.

Aff0	Meaning
`0bxxxxxxx1`	ERRDEVAFF.Aff0[7:1] is the value of MPIDR_EL1.Aff0[7:1], viewed from the highest Exception level of the associated PEs.
`0bxxxxxx10`	ERRDEVAFF.Aff0[7:2] is the value of MPIDR_EL1.Aff0[7:2], viewed from the highest Exception level of the associated PEs.
`0bxxxxx100`	ERRDEVAFF.Aff0[7:3] is the value of MPIDR_EL1.Aff0[7:3], viewed from the highest Exception level of the associated PEs.
`0bxxxx1000`	ERRDEVAFF.Aff0[7:4] is the value of MPIDR_EL1.Aff0[7:4], viewed from the highest Exception level of the associated PEs.
`0bxxx10000`	ERRDEVAFF.Aff0[7:5] is the value of MPIDR_EL1.Aff0[7:5], viewed from the highest Exception level of the associated PEs.
`0bxx100000`	ERRDEVAFF.Aff0[7:6] is the value of MPIDR_EL1.Aff0[7:6], viewed from the highest Exception level of the associated PEs.
`0bx1000000`	ERRDEVAFF.Aff0[7] is the value of MPIDR_EL1.Aff0[7], viewed from the highest Exception level of the associated PEs.

Otherwise:

PE affinity level 0. Indicates whether the PE affinity is at level 1.

Aff0	Meaning
`0x00`	PE affinity is above level 1 or a subset of level 1.
`0x80`	PE affinity is at level 1.

Accessing ERRDEVAFF

ERRDEVAFF can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xFA8`	ERRDEVAFF

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRDEVARCH, Device Architecture Register

The ERRDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

Configuration

ERRDEVARCH is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVARCH is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21	20	19 18 17 16	15 14 13 12	11 10 9 8 7 6 5 4 3 2 1 0
ARCHITECT	PRESENT	REVISION	ARCHVER	ARCHPART

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

ARCHITECT	Meaning
`0b01000111011`	JEP106 continuation code `0x4`, ID code `0x3B`. Arm Limited.

Other values are defined by the JEDEC JEP106 standard.

This field reads as `0x23B`.

PRESENT, bit [20]

DEVARCH Present. Defines that the DEVARCH register is present.

PRESENT	Meaning
`0b0`	Device Architecture information not present.
`0b1`	Device Architecture information present.

This field reads as 1.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

REVISION	Meaning
`0b0000`	RAS System Architecture v1.0.
`0b0001`	RAS System Architecture v1.1. As `0b0000` and also: • Simplifies ERR<n>STATUS. • Adds support for additional ERR<n>MISC<m> registers. • Adds support for the optional RAS Timestamp Extension. • Adds support for the optional Common Fault Injection Model Extension.

All other values are reserved.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
`0b0000`	RAS System Architecture v1.

All other values are reserved.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as `0b0000`.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
`0xA00`	RAS System Architecture.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as `0xA00`.

Accessing ERRDEVARCH

ERRDEVARCH can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xFBC`	ERRDEVARCH

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRDEVID, Device Configuration Register

The ERRDEVID characteristics are:

Purpose

Provides discovery information for the component.

Configuration

ERRDEVID is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVID is a 32-bit register.

Field descriptions

31–16	15–0
RES0	NUM

Bits [31:16]

Reserved, RES0.

NUM, bits [15:0]

Highest numbered index of the error records in this group, plus one. Each implemented record is owned by a node. A node might own multiple records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRDEVID

ERRDEVID can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xFC8`	ERRDEVID

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRERICR0, Error Recovery Interrupt Configuration Register 0

The ERRERICR0 characteristics are:

Purpose

Error Recovery Interrupt configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR0 are RES0.

ERRERICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR0 is a 64-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

63:56	55:32
RES0	ADDR

31:2	1:0
ADDR	RES0

Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRERICR0.ADDR << 2) is the address that the component writes to when signaling the Error Recovery Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

63–32
IMPLEMENTATION DEFINED

31–0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR0

ERRERICR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xE90`	ERRERICR0

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRERICR1, Error Recovery Interrupt Configuration Register 1

The ERRERICR1 characteristics are:

Purpose

Error Recovery Interrupt configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR1 are RES0.

ERRERICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR1 is a 32-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

<table><tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td colspan="32">DATA</td></tr></table>

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

<table><tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td colspan="32">IMPLEMENTATION DEFINED</td></tr></table>

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR1

ERRERICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xE98`	ERRERICR1

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

ERRERICR2, Error Recovery Interrupt Configuration Register 2

The ERRERICR2 characteristics are:

Purpose

Error Recovery Interrupt control and configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR2 are RES0.

ERRERICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR2 is a 32-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

31–8	7	6	5–4	3–0
RES0	IRQEN	NSMSI	SH	MemAttr

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRERICR2:

Security attribute. Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Secure.
0b1	Non-secure.

The reset behavior of this field is:

- On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRERICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Not shared.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when ERRERICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]

When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

MemAttr	Meaning
0b0000	Device-nGnRnE memory.
0b0001	Device-nGnRE memory.
0b0010	Device-nGRE memory.
0b0011	Device-GRE memory.
0b0101	Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111	Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001	Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010	Normal memory, Inner Write-Through, Outer Write-Through.
0b1011	Normal memory, Inner Write-Back, Outer Write-Through.
0b1101	Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110	Normal memory, Inner Write-Through, Outer Write-Back.
0b1111	Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR2

ERRERICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE9C	ERRERICR2

Accesses on this interface are **RW**.

ERRFHICR0, Fault Handling Interrupt Configuration Register 0

The ERRFHICR0 characteristics are:

Purpose

Fault Handling Interrupt configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR0 are RES0.

ERRFHICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR0 is a 64-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

63:56	55:32
RES0	ADDR

31:2	1:0
ADDR	RES0

Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRFHICR0.ADDR << 2) is the address that the component writes to when signaling the Fault Handling Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
IMPLEMENTATION DEFINED
IMPLEMENTATION DEFINED
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR0

ERRFHICR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xE80`	ERRFHICR0

Accesses on this interface are **RW**.

ERRFHICR1, Fault Handling Interrupt Configuration Register 1

The ERRFHICR1 characteristics are:

Purpose

Fault Handling Interrupt configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR1 are RES0.

ERRFHICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR1 is a 32-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATA																															

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR1

ERRFHICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xE88`	ERRFHICR1

Accesses on this interface are **RW**.

ERRFHICR2, Fault Handling Interrupt Configuration Register 2

The ERRFHICR2 characteristics are:

Purpose

Fault Handling Interrupt control and configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR<n> registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR2 are RES0.

ERRFHICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR2 is a 32-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented and the implementation uses the recommended layout for the ERRIRQCR<n> registers:

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8	7	6	5 4	3 2 1 0
RES0	IRQEN	NSMSI	SH	MemAttr

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

IRQEN	Meaning
`0b0`	Disabled.
`0b1`	Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

Message signaled interrupt enable.

Message signaled interrupts are always enabled.

NSMSI, bit [6]

When the component supports configuring the Security attribute for message signaled interrupts and the component does not allow Non-secure writes to ERRFHICR2:

Security attribute. Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
`0b0`	Secure.
`0b1`	Non-secure.

The reset behavior of this field is:

- On a Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

When the component allows Non-secure writes to ERRFHICR2:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute used for message signaled interrupts is Non-secure.

Otherwise:

Reserved, RES0.

Security attribute. Defines the physical address space for message signaled interrupts.

The Security attribute for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]

When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

SH	Meaning
`0b00`	Not shared.
`0b10`	Outer Shareable.
`0b11`	Inner Shareable.

All other values are reserved.

This field is ignored when ERRFHICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Shareability.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]
When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

MemAttr	Meaning
0b0000	Device-nGnRnE memory.
0b0001	Device-nGnRE memory.
0b0010	Device-nGRE memory.
0b0011	Device-GRE memory.
0b0101	Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111	Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001	Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010	Normal memory, Inner Write-Through, Outer Write-Through.
0b1011	Normal memory, Inner Write-Back, Outer Write-Through.
0b1101	Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110	Normal memory, Inner Write-Through, Outer Write-Back.
0b1111	Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Memory type.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR2

ERRFHICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE8C	ERRFHICR2

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

ERRGSR, Error Group Status Register

The ERRGSR characteristics are:

Purpose

Shows the status for the records in the group.

Configuration

ERRGSR is implemented only as part of a memory-mapped group of error records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

Attributes

ERRGSR is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35
RES0								S55	S54	S53	S52	S51	S50	S49	S48	S47	S46	S45	S44	S43	S42	S41	S40	S39	S38	S37	S36	S35
S31	S30	S29	S28	S27	S26	S25	S24	S23	S22	S21	S20	S19	S18	S17	S16	S15	S14	S13	S12	S11	S10	S9	S8	S7	S6	S5	S4	S3
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3

Bits [63:56]

Reserved, RES0.

S<m>, bit [m], for m = 55 to 0

When error record <m> is implemented and error record <m> supports this type of reporting:

The status for error record <m>. A read-only copy of ERR<m>STATUS.V.

S<m>	Meaning
`0b0`	No error.
`0b1`	One or more errors.

If the Common Fault Injection Model is implemented, up-to 24 records can be implemented meaning bits [55:24] are RES0.

Otherwise:

Reserved, RES0.

Accessing ERRGSR

ERRGSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xE00`	ERRGSR

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

ERRIIDR, Implementation Identification Register

The ERRIIDR characteristics are:

Purpose

Defines the implementer of the component.

Configuration

Implementation of this register is OPTIONAL.

This register is present only when RAS System Architecture v1.1 is implemented.

Attributes

ERRIIDR is a 32-bit register.

Field descriptions

31:20	19:16	15:12	11:0
ProductID	Variant	Revision	Implementer

ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

If ERRPIDR0 and ERRPIDR1 are implemented, ERRPIDR0.PART_0 matches bits [7:0] of ERRIIDR.ProductID and ERRPIDR1.PART_1 matches bits [11:8] of ERRIIDR.ProductID.

Variant, bits [19:16]

Component major revision.

This field distinguishes product variants or major revisions of the product.

If ERRPIDR2 is implemented, ERRPIDR2.REVISION matches ERRIIDR.Variant.

Revision, bits [15:12]

Component minor revision.

This field distinguishes minor revisions of the product.

If ERRPIDR3 is implemented, ERRPIDR3.REVAND matches ERRIIDR.Revision.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the RAS component. For an Arm implementation, this field has the value `0x43B`.

Bits [11:8] contain the JEP106 continuation code of the implementer, and bits [6:0] contain the JEP106 identity code of the implementer. Bit 7 is RES0.

If ERRPIDR4 is implemented, ERRPIDR2 is implemented, and ERRPIDR1 is implemented, ERRPIDR4.DES_2 matches bits [11:8] of ERRIIDR.Implementer, ERRPIDR2.DES_1 matches bits [6:4] of ERRIIDR.Implementer, and ERRPIDR1.DES_0 matches bits [3:0] of ERRIIDR.Implementer.

Accessing ERRIIDR

ERRIIDR can be accessed through the memory-mapped interfaces:

Component	Offset
RAS	`0xE10`

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

ERRIMPDEF<n>, IMPLEMENTATION DEFINED Register <n>, n = 0 - 191

The ERRIMPDEF<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED RAS extensions.

Configuration

This register is present only when the Common Fault Injection Model Extension is not implemented, ERRDEVID.NUM <= 32 and an implementation implements ERRIMPDEF<n>. Otherwise, direct accesses to ERRIMPDEF<n> are RES0.

Attributes

ERRIMPDEF<n> is a 64-bit register.

Field descriptions

63–32
IMPLEMENTATION DEFINED

31–0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRIMPDEF<n>

ERRIMPDEF<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x800` + (8 * n)	ERRIMPDEF<n>

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRIRQCR<n>, Generic Error Interrupt Configuration Register, n = 0 - 15

The ERRIRQCR<n> characteristics are:

Purpose

The ERRIRQCR<n> registers are reserved for IMPLEMENTATION DEFINED interrupt configuration registers.

The architecture provides a recommended layout for the ERRIRQCR<n> registers. These registers are named:

- ERRFHICR0, ERRFHICR1, and ERRFHICR2 for the fault handling interrupt controls.
- ERRERICR0, ERRERICR1, and ERRERICR2 for the error recovery interrupt controls.
- ERRCRICR0, ERRCRICR1, and ERRCRICR2 for the critical error interrupt controls.
- ERRIRQSR for the status register.

This section describes the generic, IMPLEMENTATION DEFINED, format.

Configuration

This register is present only when the interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQCR<n> are RES0.

ERRIRQCR<n> is implemented only as part of a memory-mapped group of error records.

Attributes

ERRIRQCR<n> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																															
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED controls. The content of these registers is IMPLEMENTATION DEFINED.

Accessing ERRIRQCR<n>

ERRIRQCR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xE80` + (8 * n)	ERRIRQCR<n>

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRIRQSR, Error Interrupt Status Register

The ERRIRQSR characteristics are:

Purpose

Interrupt status register.

Configuration

This register is present only when interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQSR are RES0.

ERRIRQSR is implemented only as part of a memory-mapped group of error records.

Attributes

ERRIRQSR is a 64-bit register.

Field descriptions

When the implementation uses the recommended layout for the ERRIRQCR<n> registers:

63:32
RES0

31:6	5	4	3	2	1	0
RES0	CRIERR	CRI	ERIERR	ERI	FHIERR	FHI

Bits [63:6]

Reserved, RES0.

CRIERR, bit [5]

When the Critical Error Interrupt is implemented:

Critical Error Interrupt Error.

CRIERR	Meaning
`0b0`	Critical Error Interrupt write has not returned an error since this field was last cleared to zero.
`0b1`	Critical Error Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CRI, bit [4]

When the Critical Error Interrupt is implemented:

Critical Error Interrupt write in progress.

CRI	Meaning
0b0	Critical Error Interrupt write not in progress.
0b1	Critical Error Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

ERIERR, bit [3]

When the Error Recovery Interrupt is implemented:

Error Recovery Interrupt Error.

ERIERR	Meaning
0b0	Error Recovery Interrupt write has not returned an error since this field was last cleared to zero.
0b1	Error Recovery Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

ERI, bit [2]

When the Error Recovery Interrupt is implemented:

Error Recovery Interrupt write in progress.

ERI	Meaning
0b0	Error Recovery Interrupt write not in progress.
0b1	Error Recovery Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

FHIERR, bit [1]
When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt Error.

FHIERR	Meaning
`0b0`	Fault Handling Interrupt write has not returned an error since this field was last cleared to zero.
`0b1`	Fault Handling Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

FHI, bit [0]
When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt write in progress.

FHI	Meaning
`0b0`	Fault Handling Interrupt write not in progress.
`0b1`	Fault Handling Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR<n> registers:

63 … 32
IMPLEMENTATION DEFINED

31 … 0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRIRQSR

ERRIRQSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xEF8`	ERRIRQSR

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>ADDR, Error Record Address Register, n = 0 - 65534

The ERR<n>ADDR characteristics are:

Purpose

If an address is associated with a detected error, then it is written to ERR<n>ADDR when the error is recorded. It is IMPLEMENTATION DEFINED how the recorded address maps to the software-visible physical address. Software might have to reconstruct the actual physical addresses using the identity of the node and knowledge of the system.

Configuration

This register is present only when error record <n> is implemented and error record <n> includes an address associated with an error. Otherwise, direct accesses to ERR<n>ADDR are RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

Attributes

ERR<n>ADDR is a 64-bit register.

Field descriptions

63	62	61	60	59-56	55-32
NS	SI	AI	VA	RES0	PADDR

31-0
PADDR

NS, bit [63]

Non-secure attribute.

NS	Meaning
`0b0`	ERR<n>ADDR.PADDR is a Secure address.
`0b1`	ERR<n>ADDR.PADDR is a Non-secure address.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SI, bit [62]

Secure Incorrect. Indicates whether ERR<n>ADDR.NS is valid.

SI	Meaning
`0b0`	ERR<n>ADDR.NS is correct. That is, it matches the programmers' view of the Non-secure attribute for the recorded location.
`0b1`	ERR<n>ADDR.NS might not be correct, and might not match the programmers' view of the Non-secure attribute for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

AI, bit [61]

Address Incorrect. Indicates whether ERR<n>ADDR.PADDR is a valid physical address that is known to match the programmers' view of the physical address for the recorded location.

AI	Meaning
0b0	ERR<n>ADDR.PADDR is a valid physical address. That is, it matches the programmers' view of the physical address for the recorded location.
0b1	ERR<n>ADDR.PADDR might not be a valid physical address, and might not match the programmers' view of the physical address for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

VA, bit [60]

Virtual Address. Indicates whether ERR<n>ADDR.PADDR field is a virtual address.

VA	Meaning
0b0	ERR<n>ADDR.PADDR is not a virtual address.
0b1	ERR<n>ADDR.PADDR is a virtual address.

No context information is provided for the virtual address. When ERR<n>ADDR.VA is 1, ERR<n>ADDR.{NS, SI, AI} read as {0, 1, 1}.

Support for this field is optional. If this field is not implemented and ERR<n>ADDR.PADDR field is a virtual address, then ERR<n>ADDR.{NS, SI, AI} read as {0, 1, 1}.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [59:56]

Reserved, RES0.

PADDR, bits [55:0]

Physical Address. Address of the recorded location. If the physical address size implemented by this component is smaller than the size of this field, then high-order bits are unimplemented and either RES0 or have a fixed read-only IMPLEMENTATION DEFINED value. Low-order address bits might also be unimplemented and RES0, for example, if the physical address is always aligned to the size of a protection granule.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing ERR<n>ADDR

ERR<n>ADDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x018 + (64 * n)	ERR<n>ADDR

This interface is accessible as follows:

- When the Common Fault Injection Model Extension is implemented by the node that owns this error record, ERR<q>PFGF.AV == 0 and ERR<n>STATUS.AV == 1 accesses to this register are **RO**.
- When the Common Fault Injection Model Extension is not implemented by the node that owns this error record and ERR<n>STATUS.AV == 1 accesses to this register are **RO**.
- Otherwise accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>CTLR, Error Record Control Register, n = 0 - 65534

The ERR<n>CTLR characteristics are:

Purpose

The error control register contains enable bits for the node that writes to this record:

- Enabling error detection and correction.
- Enabling the critical error, error recovery, and fault handling interrupts.
- Enabling in-band error response for uncorrected errors.

For each bit, if the node does not support the feature, then the bit is RES0. The definition of each record is IMPLEMENTATION DEFINED.

Configuration

This register is present only when error record <n> is implemented and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>CTLR are RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>CTLR is a 64-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [63:32]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

Bits [31:14]

Reserved, RES0.

CI, bit [13]

When ERR<n>FR.CI == 0b10:

Critical error interrupt enable. When enabled, the critical error interrupt is generated for a critical error condition.

CI	Meaning
0b0	Critical error interrupt not generated for critical errors. Critical errors are treated as Uncontained errors.
0b1	Critical error interrupt generated for critical errors.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [12]

Reserved, RES0.

WDUI, bit [11]
When ERR<n>FR.DUI == 0b11:

Error recovery interrupt for Deferred errors on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on writes.

WDUI	Meaning
`0b0`	Error recovery interrupt not generated for Deferred errors on writes.
`0b1`	Error recovery interrupt generated for Deferred errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DUI, bit [10]
When ERR<n>FR.DUI == 0b10:

Error recovery interrupt for Deferred errors enable.

When ERR<n>FR.DUI == `0b10`, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Deferred error.

DUI	Meaning
`0b0`	Error recovery interrupt not generated for Deferred errors.
`0b1`	Error recovery interrupt generated for Deferred errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.DUI == 0b11:

Error recovery interrupt for Deferred errors on reads enable.

When ERR<n>FR.DUI == `0b11`, this field is named RDUI.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on reads.

RDUI	Meaning
`0b0`	Error recovery interrupt not generated for Deferred errors on reads.
`0b1`	Error recovery interrupt generated for Deferred errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WCFI, bit [9]

When ERR<n>FR.CFI == 0b11:

Fault handling interrupt for Corrected errors on writes enable.

When enabled:

- If the node implements Corrected error counters for writes, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see ERR<n>MISC0.
- Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on writes.

WCFI	Meaning
`0b0`	Fault handling interrupt not generated for Corrected errors on writes.
`0b1`	Fault handling interrupt generated for Corrected errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CFI, bit [8]

When ERR<n>FR.CFI == 0b10:

Fault handling interrupt for Corrected errors enable.

When ERR<n>FR.CFI == `0b10`, this control applies to errors arising from both reads and writes.

When enabled:

- If the node implements Corrected error counters, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see ERR<n>MISC0.
- Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error.

CFI	Meaning
`0b0`	Fault handling interrupt not generated for Corrected errors.
`0b1`	Fault handling interrupt generated for Corrected errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.CFI == 0b11:

Fault handling interrupt for Corrected errors on reads enable.

When ERR<n>FR.CFI == `0b11`, this field is named RCFI.

When enabled:

- If the node implements Corrected error counters for reads, then the fault handling interrupt is generated when a counter overflows and the overflow bit for the counter is set to 1. For more information, see ERR<n>MISC0.
- Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on reads.

RCFI	Meaning
`0b0`	Fault handling interrupt not generated for Corrected errors on reads.
`0b1`	Fault handling interrupt generated for Corrected errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUE, bit [7]

When ERR<n>FR.UE == 0b11:

In-band error response on writes enable.

When enabled, responses to writes that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

WUE	Meaning
`0b0`	In-band error response for uncorrected errors on writes disabled.
`0b1`	In-band error response for uncorrected errors on writes enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WFI, bit [6]

When ERR<n>FR.FI == 0b11:

Fault handling interrupt on writes enable.

When enabled:

- The fault handling interrupt is generated for errors recorded as either Deferred error or Uncorrected error on writes.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters for writes, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
  - Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on writes.

WFI	Meaning
0b0	Fault handling interrupt on writes disabled.
0b1	Fault handling interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUI, bit [5]

When ERR<n>FR.UI == 0b11:

Uncorrected error recovery interrupt on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on writes.

WUI	Meaning
0b0	Error recovery interrupt on writes disabled.
0b1	Error recovery interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UE, bit [4]

When ERR<n>FR.UE == 0b10:

In-band error response enable.

When ERR<n>FR.UE == 0b10, this control applies to errors arising from both reads and writes.

When enabled, responses to transactions that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

UE	Meaning
0b0	In-band error response for uncorrected errors disabled.
0b1	In-band error response for uncorrected errors enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.UE == 0b11:

In-band error response on reads enable.

When ERR<n>FR.UE == `0b11`, this field is named RUE.

When enabled, responses to reads that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External Abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

RUE	Meaning
`0b0`	In-band error response for uncorrected errors on reads disabled.
`0b1`	In-band error response for uncorrected errors on reads enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FI, bit [3]

When ERR<n>FR.FI == 0b10:

Fault handling interrupt enable.

When ERR<n>FR.FI == `0b10`, this control applies to errors arising from both reads and writes.

When enabled:

- The fault handling interrupt is generated for all errors recorded as either Deferred error or Uncorrected error.
- If the fault handling interrupt for Corrected errors control is not implemented:
  - If the node implements Corrected error counters, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
  - Otherwise, the fault handling interrupt is also generated for all errors recorded as Corrected error.

FI	Meaning
`0b0`	Fault handling interrupt disabled.
`0b1`	Fault handling interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.FI == 0b11:

Fault handling interrupt on reads enable.

When ERR<n>FR.FI == `0b11`, this field is named RFI.

When enabled:

- The fault handling interrupt is generated for errors recorded as either Deferred error or Uncorrected error on reads.
- If the corresponding fault handling interrupt for Corrected errors control is not implemented:
    - If the node implements Corrected error counters for reads, then the fault handling interrupt is also generated when a counter overflows and the overflow bit for the counter is set to 1.
    - Otherwise, the fault handling interrupt is also generated for errors recorded as Corrected error on reads.

RFI	Meaning
`0b0`	Fault handling interrupt on reads disabled.
`0b1`	Fault handling interrupt on reads enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UI, bit [2]

When ERR<n>FR.UI == 0b10:

Uncorrected error recovery interrupt enable.

When ERR<n>FR.UI == `0b10`, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Uncorrected error.

UI	Meaning
`0b0`	Error recovery interrupt disabled.
`0b1`	Error recovery interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.UI == 0b11:

Uncorrected error recovery interrupt on reads enable.

When ERR<n>FR.UI == `0b11`, this field is named RUI.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on reads.

RUI	Meaning
`0b0`	Error recovery interrupt on reads disabled.
`0b1`	Error recovery interrupt on reads enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMPLEMENTATION DEFINED, bit [1]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

ED, bit [0]

When ERR<n>FR.ED == 0b10:

Error reporting and logging enable. When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an IMPLEMENTATION DEFINED control for error injection.

ED	Meaning
`0b0`	Error reporting disabled.
`0b1`	Error reporting enabled.

It is IMPLEMENTATION DEFINED whether the node fully disables error detection and correction when reporting is disabled. That is, even with error reporting disabled, the node might continue to silently correct errors. Uncorrected errors might result in corrupt data being silently propagated by the node.

Note

If this node requires initialization after Cold reset to prevent signaling false errors, then Arm recommends this field is set to 0 on Cold reset, meaning errors are not reported from Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error reporting after the node is initialized. Otherwise, the Cold reset value is IMPLEMENTATION DEFINED. If the Cold reset value is 1, the reset values of other controls in this register are also IMPLEMENTATION DEFINED and should not be UNKNOWN.

The reset behavior of this field is:

- On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

Accessing ERR<n>CTLR

ERR<n>CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x008` + (64 * n)	ERR<n>CTLR

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>FR, Error Record Feature Register, n = 0 - 65534

The ERR<n>FR characteristics are:

Purpose

Defines whether <n> is the first record owned by a node:

- If <n> is the first error record owned by a node, then ERR<n>FR.ED is not `0b00`.
- If <n> is not the first error record owned by a node, then ERR<n>FR.ED is `0b00`.

If <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.

Attributes

ERR<n>FR is a 64-bit register.

Field descriptions

When error record <n> is not the first error record owned by the node:

Bits	Field
63:32	RES0
31:2	RES0
1:0	ED

Bits [63:2]

Reserved, RES0.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is not the first error record owned the node.

ED	Meaning
`0b00`	Error record <n> is not the first error record owned by the node.

This field reads as `0b00`.

When error record <n> is the first error record owned by the node:

Bits	Field
63:55	IMPLEMENTATION DEFINED
54:53	CE
52	DE
51	UEO
50	UER
49	UEU
48	UC
47:32	IMPLEMENTATION DEFINED
31	FRX
30:26	RES0
25:24	TS
23:22	CI
21:20	INJ
19:18	CEO
17:16	DUI
15	RP
14:12	CEC
11:10	CFI
9:8	UE
7:6	FI
5:4	UI
3:2	IMPLEMENTATION DEFINED
1:0	ED

IMPLEMENTATION DEFINED, bits [63:55]

When ERR<n>FR.FRX != 1:

Reserved for identifying IMPLEMENTATION DEFINED controls.

Otherwise:

Reserved, RES0.

CE, bits [54:53]

When ERR<n>FR.FRX == 1:

Corrected Error recording. Describes the types of Corrected errors the node can record, if any.

CE	Meaning
0b00	Does not record Corrected errors.
0b01	Records only transient or persistent Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to either 0b01 or 0b11.
0b10	Records only non-specific Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to 0b10.
0b11	Records all types of Corrected error.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

DE, bit [52]

When ERR<n>FR.FRX == 1:

Deferred Error recording. Describes whether the node supports recording Deferred errors.

DE	Meaning
0b0	Does not record Deferred errors.
0b1	Records Deferred errors.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UEO, bit [51]

When ERR<n>FR.FRX == 1:

Latent or Restartable Error recording. Describes whether the node supports recording Latent or Restartable errors.

UEO	Meaning
0b0	Does not record Latent or Restartable errors.
0b1	Records Latent or Restartable errors.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UER, bit [50]
When ERR<n>FR.FRX == 1:

Signaled or Recoverable Error recording. Describes whether the node supports recording Signaled or Recoverable errors.

UER	Meaning
0b0	Does not record Signaled or Recoverable errors.
0b1	Records Signaled or Recoverable errors.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UEU, bit [49]
When ERR<n>FR.FRX == 1:

Unrecoverable Error recording. Describes whether the node supports recording Unrecoverable errors.

UEU	Meaning
0b0	Does not record Unrecoverable errors.
0b1	Records Unrecoverable errors.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UC, bit [48]
When ERR<n>FR.FRX == 1:

Uncontainable Error recording. Describes whether the node supports recording Uncontainable errors.

UC	Meaning
0b0	Does not record Uncontainable errors.
0b1	Records Uncontainable errors.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

IMPLEMENTATION DEFINED, bits [47:32]

Reserved for identifying IMPLEMENTATION DEFINED controls.

FRX, bit [31]
When RAS System Architecture v1.1 is implemented:

Feature Register extension. Defines whether ERR<n>FR[63:48] are architecturally defined.

FRX	Meaning
0b0	ERR<n>FR[63:48] are IMPLEMENTATION DEFINED.
0b1	ERR<n>FR[63:48] are defined by the architecture.

Otherwise:

Reserved, RES0.

Bits [30:26]

Reserved, RES0.

TS, bits [25:24]

Timestamp Extension. Indicates whether, for each error record <m> owned by this node, ERR<m>MISC3 is used as the timestamp register, and, if it is, the timebase used by the timestamp.

TS	Meaning
0b00	Does not support a timestamp register.
0b01	Implements a timestamp register in ERR<n>MISC3 for each error record <m> owned by the node. The timestamp uses the same timebase as the system Generic Timer. **Note** For an error record that has an affinity to a PE, this is the same timer that is visible through CNTPCT_EL0 at the highest Exception level on that PE.
0b10	Implements a timestamp register in ERR<m>MISC3 for each error record <m> owned by the node. The timestamp uses an IMPLEMENTATION DEFINED timebase.

All other values are reserved.

CI, bits [23:22]

Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented by the node.

CI	Meaning
0b00	Does not support the critical error interrupt. ERR<n>CTLR.CI is RES0.
0b01	Critical error interrupt is supported and always enabled. ERR<n>CTLR.CI is RES0.
0b10	Critical error interrupt is supported and controllable using ERR<n>CTLR.CI.

All other values are reserved.

INJ, bits [21:20]

Fault Injection Extension. Indicates whether the Common Fault Injection Model Extension is implemented by the node.

INJ	Meaning
0b00	Does not support the Common Fault Injection Model Extension.
0b01	Supports the Common Fault Injection Model Extension. See ERR<n>PFGF for more information.

All other values are reserved.

CEO, bits [19:18]

When ERR<n>FR.CEC != 0b000:

Corrected Error overwrite. Indicates the behavior of the node when a second or subsequent Corrected error is recorded and a first Corrected error has previously been recorded by an error record <m> owned by the node.

CEO	Meaning
0b00	Keeps the previous error syndrome.
0b01	If ERR<m>STATUS.OF is 1 before the Corrected error is counted, then the error record keeps the previous syndrome. Otherwise the previous syndrome is overwritten.

All other values are reserved.

The second or subsequent Corrected error is counted by the Corrected error counter, regardless of the value of this field. If counting the error causes unsigned overflow of the counter, then ERR<m>STATUS.OF is set to 1.

This means that, if no other error is subsequently recorded that overwrites the syndrome:

- If ERR<n>FR.CEO is `0b00`, the error record holds the syndrome for the first recorded Corrected error.
- If ERR<n>FR.CEO is `0b01`, the error record holds the syndrome for the most recently recorded Corrected error before the counter overflows.

Otherwise:

Reserved, RES0.

DUI, bits [17:16]

When ERR<n>FR.UI != 0b00:

Error recovery interrupt for deferred errors control. Indicates whether the enabling and disabling of error recovery interrupts on deferred errors is supported by the node.

DUI	Meaning
`0b00`	Does not support the enabling and disabling of error recovery interrupts on deferred errors. ERR<n>CTLR.DUI is RES0.
`0b10`	Enabling and disabling of error recovery interrupts on deferred errors is supported and controllable using ERR<n>CTLR.DUI.
`0b11`	Enabling and disabling of error recovery interrupts on deferred errors is supported, and controllable using ERR<n>CTLR.WDUI for writes and ERR<n>CTLR.RDUI for reads.

All other values are reserved.

Otherwise:

Reserved, RES0.

RP, bit [15]

When ERR<n>FR.CEC != 0b000:

Repeat counter. Indicates whether the node implements a second Corrected error counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.

RP	Meaning
`0b0`	Implements a single Corrected error counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.
`0b1`	Implements a first (repeat) counter and a second (other) counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors. The repeat counter is the same size as the primary error counter.

Otherwise:

Reserved, RES0.

CEC, bits [14:12]

Corrected Error Counter. Indicates whether the node implements the standard Corrected error counter mechanisms in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.

CEC	Meaning
0b000	Does not implement the standard Corrected error counter model.
0b010	Implements an 8-bit Corrected error counter in ERR<m>MISC0[39:32] for each error record <m> owned by the node that can record countable errors.
0b100	Implements a 16-bit Corrected error counter in ERR<m>MISC0[47:32] for each error record <m> owned by the node that can record countable errors.

All other values are reserved.

Note

Implementations might include other error counter models, or might include the standard model and not indicate this in ERR<n>FR.

CFI, bits [11:10]

When ERR<n>FR.FI != 0b00:

Fault handling interrupt for corrected errors control. Indicates whether the enabling and disabling of fault handling interrupts on corrected errors is supported by the node.

CFI	Meaning
0b00	Does not support the enabling and disabling of fault handling interrupts on corrected errors. ERR<n>CTLR.CFI is RES0.
0b10	Enabling and disabling of fault handling interrupts on corrected errors is supported and controllable using ERR<n>CTLR.CFI.
0b11	Enabling and disabling of fault handling interrupts on corrected errors is supported, and controllable using ERR<n>CTLR.WCFI for writes and ERR<n>CTLR.RCFI for reads.

All other values are reserved.

Otherwise:

Reserved, RES0.

UE, bits [9:8]

In-band error reponse (External Abort). Indicates whether the in-band error response and associated controls are implemented by the node.

UE	Meaning
0b00	Does not support the in-band error response. ERR<n>CTLR.UE is RES0.
0b01	In-band error response is supported and always enabled. ERR<n>CTLR.UE is RES0.
0b10	In-band error response is supported and controllable using ERR<n>CTLR.UE.
0b11	In-band error response is supported, and controllable using ERR<n>CTLR.WUE for writes and ERR<n>CTLR.RUE for reads.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

FI, bits [7:6]

Fault handling interrupt. Indicates whether the fault handling interrupt and associated controls are implemented by the node.

FI	Meaning
0b00	Does not support the fault handling interrupt. ERR<n>CTLR.FI is RES0.
0b01	Fault handling interrupt is supported and always enabled. ERR<n>CTLR.FI is RES0.
0b10	Fault handling interrupt is supported and controllable using ERR<n>CTLR.FI.
0b11	Fault handling interrupt is supported, and controllable using ERR<n>CTLR.WFI for writes and ERR<n>CTLR.RFI for reads.

UI, bits [5:4]

Error recovery interrupt for uncorrected errors. Indicates whether the error handling interrupt and associated controls are implemented by the node.

UI	Meaning
0b00	Does not support the error handling interrupt. ERR<n>CTLR.UI is RES0.
0b01	Error handling interrupt is supported and always enabled. ERR<n>CTLR.UI is RES0.
0b10	Error handling interrupt is supported and controllable using ERR<n>CTLR.UI.
0b11	Error handling interrupt is supported, and controllable using ERR<n>CTLR.WUI for writes and ERR<n>CTLR.RUI for reads.

IMPLEMENTATION DEFINED, bits [3:2]

IMPLEMENTATION DEFINED.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is the first record owned the node, and whether the node implements the controls for enabling and disabling error reporting and logging.

ED	Meaning
0b01	Error reporting and logging always enabled. ERR<n>CTLR.ED is RES0.
0b10	Error reporting and logging is controllable using ERR<n>CTLR.ED.

All other values are reserved.

Accessing ERR<n>FR

ERR<n>FR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x000 + (64 * n)	ERR<n>FR

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>MISC0, Error Record Miscellaneous Register 0, n = 0 - 65534

The ERR<n>MISC0 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record <n> implements architecturally-defined Corrected error counters (ERR<q>FR.CEC != `0b000`), and error record <n> can record countable errors, then ERR<n>MISC0 implements the architecturally-defined Corrected error counter or counters.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC0 are RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC0, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<q>CTLR.

Attributes

ERR<n>MISC0 is a 64-bit register.

Field descriptions

When ERR<q>FR.CEC == 0b000:

63 … 32
IMPLEMENTATION DEFINED

31 … 0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

63–48	47	46–32
IMPLEMENTATION DEFINED	OF	CEC

31–0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OF, bit [47]

Sticky overflow bit. Set to 1 when ERR<n>MISC0.CEC is incremented and wraps through zero.

OF	Meaning
0b0	Counter has not overflowed.
0b1	Counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [46:32]

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b010 and ERR<q>FR.RP == 0:

63–40	39	38–32
IMPLEMENTATION DEFINED	OF	CEC

31–0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:40]

IMPLEMENTATION DEFINED syndrome.

OF, bit [39]

Sticky overflow bit. Set to 1 when ERR<n>MISC0.CEC is incremented and wraps through zero.

OF	Meaning
0b0	Counter has not overflowed.
0b1	Counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [38:32]

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b100 and ERR<q>FR.RP == 1:

63	62:48	47	46:32
OFO	CECO	OFR	CECR

31:0
IMPLEMENTATION DEFINED

OFO, bit [63]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

OFO	Meaning
`0b0`	Other counter has not overflowed.
`0b1`	Other counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [62:48]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [47]

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

OFR	Meaning
`0b0`	Repeat counter has not overflowed.
`0b1`	Repeat counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [46:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERR<q>FR.CEC == 0b010 and ERR<q>FR.RP == 1:

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48	47	46 45 44 43 42 41 40	39	38 37 36 35 34 33 32
IMPLEMENTATION DEFINED	OFO	CECO	OFR	CECR

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OFO, bit [47]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

OFO	Meaning
`0b0`	Other counter has not overflowed.
`0b1`	Other counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [46:40]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [39]

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

OFR	Meaning
0b0	Repeat counter has not overflowed.
0b1	Repeat counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [38:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC0

Reads from ERR<n>MISC0 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<q>PFGF.MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 1. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x020 + (64 * n)	ERR<n>MISC0

Accesses on this interface are **RW**.

ERR<n>MISC1, Error Record Miscellaneous Register 1, n = 0 - 65534

The ERR<n>MISC1 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC1 are RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC1, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<q>CTLR.

Attributes

ERR<n>MISC1 is a 64-bit register.

Field descriptions

63 … 32
IMPLEMENTATION DEFINED

31 … 0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC1

Reads from ERR<n>MISC1 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<q>PFGF.MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 1. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x028` + (64 * n)	ERR<n>MISC1

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>MISC2, Error Record Miscellaneous Register 2, n = 0 - 65534

The ERR<n>MISC2 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configuration

This register is present only when (an implementation implements ERR<n>MISC2 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC2 are RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC2, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<n>MISC2 does not require zeroing to return the record to a quiescent state.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<q>CTLR.

Attributes

ERR<n>MISC2 is a 64-bit register.

Field descriptions

Bits	Field
63 - 32	IMPLEMENTATION DEFINED
31 - 0	IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC2

Reads from ERR<n>MISC2 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<q>PFGF.MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 1. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x030` + (64 * n)	ERR<n>MISC2

Accesses on this interface are **RW**.

ERR<n>MISC3, Error Record Miscellaneous Register 3, n = 0 - 65534

The ERR<n>MISC3 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record n supports the RAS Timestamp Extension (ERR<q>FR.TS != `0b00`), then ERR<n>MISC3 contains the timestamp value for error record n when the error was detected. Otherwise the contents of ERR<n>MISC3 are IMPLEMENTATION DEFINED.

Configuration

This register is present only when (an implementation implements ERR<n>MISC3 or RAS System Architecture v1.1 is implemented) and error record <n> is implemented. Otherwise, direct accesses to ERR<n>MISC3 are RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC3, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

If RAS System Architecture v1.1 is not implemented, Arm recommends that ERR<n>MISC3 does not require zeroing to return the record to a quiescent state.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<q>CTLR.

Attributes

ERR<n>MISC3 is a 64-bit register.

Field descriptions

When ERR<q>FR.TS != 0b00:

63–32
TS

31–0
TS

TS, bits [63:0]

Timestamp. Timestamp value recorded when the error was detected. Valid only if ERR<n>STATUS.V == 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO or RW**.

When ERR<q>FR.TS == 0b00:

63–32
IMPLEMENTATION DEFINED

31–0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC3

Reads from ERR<n>MISC3 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERR<q>PFGF.MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 1. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x038` + (64 * n)	ERR<n>MISC3

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>PFGCDN, Pseudo-fault Generation Countdown Register, n = 0 - 65534

The ERR<n>PFGCDN characteristics are:

Purpose

Generates one of the errors enabled in the corresponding ERR<n>PFGCTL register.

Configuration

This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCDN are RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGCDN is a 64-bit register.

Field descriptions

Bits	Field
63:32	RES0
31:0	CDN

Bits [63:32]

Reserved, RES0.

CDN, bits [31:0]

Countdown value.

This field is copied to Error Generation Counter when either:

- Software writes ERR<n>PFGCTL.CDNEN with 1.
- The Error Generation Counter decrements to zero and ERR<n>PFGCTL.R == 1.

While ERR<n>PFGCTL.CDNEN == 1 and the Error Generation Counter is nonzero, the counter decrements by 1 for each cycle at an IMPLEMENTATION DEFINED clock rate. When the counter reaches 0, one of the errors enabled in the ERR<n>PFGCTL register is generated.

Note

The current Error Generation Counter value is not visible to software.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing ERR<n>PFGCDN

ERR<n>PFGCDN can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x810` + (64 * n)	ERR<n>PFGCDN

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>PFGCTL, Pseudo-fault Generation Control Register, n = 0 - 65534

The ERR<n>PFGCTL characteristics are:

Purpose

Enables controlled fault generation.

Configuration

This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGCTL are RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGCTL is a 64-bit register.

Field descriptions

63:32
RES0

31	30	29:13	12	11	10	9	8	7:6	5	4	3	2	1	0
CDNEN	R	RES0	RAO/WI	RAO/WI	PN	ER	CI	CE	DE	UEO	UER	UEU	UC	OF

Bits [63:32]

Reserved, RES0.

CDNEN, bit [31]

Countdown Enable. Controls transfers of the value held in ERR<n>PFGCDN to the Error Generation Counter and enables this counter.

CDNEN	Meaning
`0b0`	The Error Generation Counter is disabled.
`0b1`	The Error Generation Counter is enabled. On a write of 1 to this field, the Error Generation Counter is set to ERR<n>PFGCDN.CDN.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

R, bit [30]

When the node supports this control:

Restart. Controls whether the Error Generation Counter restarts or stops counting on reaching zero.

R	Meaning
0b0	On reaching zero, the Error Generation Counter will stop counting.
0b1	On reaching zero, the Error Generation Counter is set to ERR<n>PFGCDN.CDN.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:13]

Reserved, RES0.

Bit [12]

When the node always sets ERR<n>STATUS.MV to 0b1 when an injected error is recorded:

Reserved, RAO/WI.

When the node supports this control:

Miscellaneous syndrome. The value written to ERR<n>STATUS.MV when an injected error is recorded.

MV	Meaning
0b0	ERR<n>STATUS.MV is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.MV is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

When the node always sets ERR<n>STATUS.AV to 0b1 when an injected error is recorded:

Reserved, RAO/WI.

When the node supports this control:

Address syndrome. The value written to ERR<n>STATUS.AV when an injected error is recorded.

AV	Meaning
0b0	ERR<n>STATUS.AV is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.AV is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PN, bit [10]

When the node supports this control:

Poison flag. The value written to ERR<n>STATUS.PN when an injected error is recorded.

PN	Meaning
0b0	ERR<n>STATUS.PN is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.PN is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ER, bit [9]

When the node supports this control:

Error Reported flag. The value written to ERR<n>STATUS.ER when an injected error is recorded.

ER	Meaning
0b0	ERR<n>STATUS.ER is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.ER is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CI, bit [8]

When the node supports this control:

Critical Error flag. The value written to ERR<n>STATUS.CI when an injected error is recorded.

CI	Meaning
0b0	ERR<n>STATUS.CI is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.CI is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CE, bits [7:6]

When the node supports this control:

Corrected Error generation enable. Controls the type of injected Corrected error generated by the fault injection feature of the node.

CE	Meaning
0b00	An injected Corrected error will not be generated by the fault injection feature of the node.
0b01	An injected non-specific Corrected error is generated in the fault injection state. ERR<n>STATUS.CE is set to 0b10 when the injected error is recorded.
0b10	An injected transient Corrected error is generated in the fault injection state. ERR<n>STATUS.CE is set to 0b01 when the injected error is recorded.
0b11	An injected persistent Corrected error is generated in the fault injection state. ERR<n>STATUS.CE is set to 0b11 when the injected error is recorded.

The set of permitted values for this field is defined by ERR<n>PFGF.CE.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DE, bit [5]

When the node supports this control:

Deferred Error generation enable. Controls whether an injected Deferred error is generated by the fault injection feature of the node.

DE	Meaning
0b0	An injected Deferred error will not be generated by the fault generation feature of the node.
0b1	An injected Deferred error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEO, bit [4]

When the node supports this control:

Latent or Restartable Error generation enable. Controls whether an injected Latent or Restartable error is generated by the fault injection feature of the node.

UEO	Meaning
0b0	An injected Latent or Restartable error will not be generated by the fault generation feature of the node.
0b1	An injected Latent or Restartable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UER, bit [3]

When the node supports this control:

Signaled or Recoverable Error generation enable. Controls whether an injected Signaled or Recoverable error is generated by the fault injection feature of the node.

UER	Meaning
0b0	An injected Signaled or Recoverable error will not be generated by the fault generation feature of the node.
0b1	An injected Signaled or Recoverable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEU, bit [2]

When the node supports this control:

Unrecoverable Error generation enable. Controls whether an injected Unrecoverable error is generated by the fault injection feature of the node.

UEU	Meaning
0b0	An injected Unrecoverable error will not be generated by the fault generation feature of the node.
0b1	An injected Unrecoverable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UC, bit [1]

When the node supports this control:

Uncontainable Error generation enable. Controls whether an injected Uncontainable error is generated by the fault injection feature of the node.

UC	Meaning
`0b0`	An injected Uncontainable error will not be generated by the fault generation feature of the node.
`0b1`	An injected Uncontainable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OF, bit [0]

When the node supports this control:

Overflow flag. The value written to ERR<n>STATUS.OF when an injected error is recorded.

OF	Meaning
`0b0`	ERR<n>STATUS.OF is set to 0 when an injected error is recorded.
`0b1`	ERR<n>STATUS.OF is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing ERR<n>PFGCTL

ERR<n>PFGCTL can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x808` + (64 * n)	ERR<n>PFGCTL

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>PFGF, Pseudo-fault Generation Feature Register, n = 0 - 65534

The ERR<n>PFGF characteristics are:

Purpose

Defines which common architecturally-defined fault generation features are implemented.

Configuration

This register is present only when error record <n> is implemented, the node implements the Common Fault Injection Model Extension (ERR<n>FR.INJ != 0b00) and error record <n> is the first error record owned by a node. Otherwise, direct accesses to ERR<n>PFGF are RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGF is a 64-bit register.

Field descriptions

Bits	63:32
Field	RES0

Bits	31	30	29	28	27:13	12	11	10	9	8	7:6	5	4	3	2	1	0
Field	RES0	R	SYN	NA	RES0	MV	AV	PN	ER	CI	CE	DE	UEO	UER	UEU	UC	OF

Bits [63:31]

Reserved, RES0.

R, bit [30]

Restartable. Support for Error Generation Counter restart mode.

R	Meaning
0b0	The node does not support this feature. ERR<n>PFGCTL.R is RES0.
0b1	Error Generation Counter restart mode is implemented and is controlled by ERR<n>PFGCTL.R. ERR<n>PFGCTL.R is a read/write field.

SYN, bit [29]

Syndrome. Fault syndrome injection.

SYN	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS.{IERR, SERR} to IMPLEMENTATION DEFINED values. ERR<n>STATUS.{IERR, SERR} are UNKNOWN when ERR<n>STATUS.V is 0.
0b1	When an injected error is recorded, the node does not update the ERR<n>STATUS.{IERR, SERR} fields. ERR<n>STATUS.{IERR, SERR} are writable when ERR<n>STATUS.V is 0.

Note

If ERR<n>PFGF.SYN is 1, software can write specific values into the ERR<n>STATUS.{IERR, SERR} fields when setting up a fault injection event. The sets of values that can be written to these fields is IMPLEMENTATION DEFINED.

NA, bit [28]

No access required. Defines whether this component fakes detection of the error on an access to the component or spontaneously in the fault injection state.

NA	Meaning
`0b0`	The component fakes detection of the error on an access to the component.
`0b1`	The component fakes detection of the error spontaneously in the fault injection state.

Bits [27:13]

Reserved, RES0.

MV, bit [12]

Miscellaneous syndrome.

Additional syndrome injection. Defines whether software can control all or part of the syndrome recorded in the ERR<n>MISC<m> registers when an injected error is recorded.

MV	Meaning
`0b0`	When an injected error is recorded, the node might update ERR<n>MISC<m>. If any syndrome is recorded by the node in ERR<n>MISC<m>, then ERR<n>STATUS.MV is set to 1. ERR<n>PFGCTL.MV is RES0.
`0b1`	When an injected error is recorded, the node might update some, but not all ERR<n>MISC<m> syndrome fields, and updates ERR<n>STATUS.MV as follows: • If any syndrome is recorded by the node in ERR<n>MISC<m>, then ERR<n>STATUS.MV is set to 1. • Otherwise, ERR<n>STATUS.MV is set to ERR<n>PFGCTL.MV. It is IMPLEMENTATION DEFINED which ERR<n>MISC<m> syndrome fields, if any, are updated. Some syndrome fields might always be updated by the node when an error is recorded. For example, a corrected error counter might always be updated when any countable error, including a countable injected error, is recorded. Other ERR<n>MISC<m> syndrome fields are not updated by the node and are writable when ERR<n>STATUS.MV is 0. If the node always sets ERR<n>STATUS.MV to 1 when recording an injected error then ERR<n>PFGCTL.MV is RAO/WI, otherwise ERR<n>PFGCTL.MV is a read/write field.

Note

If ERR<n>PFGF.MV is 1, software can write specific additional syndrome values into the ERR<n>MISC<m> registers when setting up a fault injection event. The values that can be written to these registers are IMPLEMENTATION DEFINED.

AV, bit [11]

Address syndrome. Address syndrome injection.

AV	Meaning
0b0	When an injected error is recorded, the node either sets ERR<n>ADDR and ERR<n>STATUS.AV for the access, or leaves these unchanged. ERR<n>PFGCTL.AV is RES0.
0b1	When an injected error is recorded, the node does not update ERR<n>ADDR and does one of: • Sets ERR<n>STATUS.AV to ERR<n>PFGCTL.AV. ERR<n>PFGCTL.AV is a read/write field. • Sets ERR<n>STATUS.AV to 1. ERR<n>PFGCTL.AV is RAO/WI. ERR<n>ADDR is writable when ERR<n>STATUS.AV is 0.

Note

If ERR<n>PFGF.AV is 1, software can write a specific address value into ERR<n>ADDR when setting up a fault injection event.

PN, bit [10]

When the node supports this flag:

Poison flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.PN status flag.

PN	Meaning
0b0	When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.PN to 1. ERR<n>PFGCTL.PN is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.PN is set to ERR<n>PFGCTL.PN. ERR<n>PFGCTL.PN is a read/write field.

This behavior replaces the architecture-defined rules for setting the ERR<n>STATUS.PN bit.

Otherwise:

Reserved, RAZ.

ER, bit [9]

When the node supports this flag:

Error Reported flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.ER status flag.

ER	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS.ER according to the architecture-defined rules for setting the ER field. ERR<n>PFGCTL.ER is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.ER is set to ERR<n>PFGCTL.ER. This behavior replaces the architecture-defined rules for setting the ER bit. ERR<n>PFGCTL.ER is a read/write field.

Otherwise:

Reserved, RAZ.

CI, bit [8]

When the node supports this flag:

Critical Error flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.CI status flag.

CI	Meaning
0b0	When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.CI to 1. ERR<n>PFGCTL.CI is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.CI is set to ERR<n>PFGCTL.CI. ERR<n>PFGCTL.CI is a read/write field.

This behavior replaces the architecture-defined rules for setting the ERR<n>STATUS.CI bit.

Otherwise:

Reserved, RAZ.

CE, bits [7:6]

When the node supports this type of error:

Corrected Error generation. Describes the types of Corrected error that the fault generation feature of the node can generate.

CE	Meaning
0b00	The fault generation feature of the node does not generate Corrected errors. ERR<n>PFGCTL.CE is RES0.
0b01	The fault generation feature of the node allows generation of a non-specific Corrected error, that is, a Corrected error that is recorded by setting ERR<n>STATUS.CE to 0b10. ERR<n>PFGCTL.CE is a read/write field. The values 0b10 and 0b11 in ERR<n>PFGCTL.CE are reserved.
0b11	The fault generation feature of the node allows generation of transient or persistent Corrected errors, that is, Corrected errors that are recorded by setting ERR<n>STATUS.CE to 0b01 or 0b11 respectively. ERR<n>PFGCTL.CE is a read/write field. The value 0b01 in ERR<n>PFGCTL.CE is reserved.

All other values are reserved.

If ERR<n>FR.FRX is 1, then ERR<n>FR.CE indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

DE, bit [5]

When the node supports this type of error:

Deferred Error generation. Describes whether the fault generation feature of the node can generate Deferred errors.

DE	Meaning
0b0	The fault generation feature of the node does not generate Deferred errors. ERR<n>PFGCTL.DE is RES0.
0b1	The fault generation feature of the node allows generation of Deferred errors. ERR<n>PFGCTL.DE is a read/write field.

If ERR<n>FR.FRX is 1, then ERR<n>FR.DE indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UEO, bit [4]

When the node supports this type of error:

Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate Latent or Restartable errors.

UEO	Meaning
0b0	The fault generation feature of the node does not generate Latent or Restartable errors. ERR<n>PFGCTL.UEO is RES0.
0b1	The fault generation feature of the node allows generation of Latent or Restartable errors. ERR<n>PFGCTL.UEO is a read/write field.

If ERR<n>FR.FRX is 1, then ERR<n>FR.UEO indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UER, bit [3]

When the node supports this type of error:

Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate Signaled or Recoverable errors.

UER	Meaning
0b0	The fault generation feature of the node does not generate Signaled or Recoverable errors. ERR<n>PFGCTL.UER is RES0.
0b1	The fault generation feature of the node allows generation of Signaled or Recoverable errors. ERR<n>PFGCTL.UER is a read/write field.

If ERR<n>FR.FRX is 1, then ERR<n>FR.UER indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UEU, bit [2]

When the node supports this type of error:

Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate Unrecoverable errors.

UEU	Meaning
0b0	The fault generation feature of the node does not generate Unrecoverable errors. ERR<n>PFGCTL.UEU is RES0.
0b1	The fault generation feature of the node allows generation of Unrecoverable errors. ERR<n>PFGCTL.UEU is a read/write field.

If ERR<n>FR.FRX is 1, then ERR<n>FR.UEU indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

UC, bit [1]

When the node supports this type of error:

Uncontainable Error generation. Describes whether the fault generation feature of the node can generate Uncontainable errors.

UC	Meaning
0b0	The fault generation feature of the node does not generate Uncontainable errors. ERR<n>PFGCTL.UC is RES0.
0b1	The fault generation feature of the node allows generation of Uncontainable errors. ERR<n>PFGCTL.UC is a read/write field.

If ERR<n>FR.FRX is 1, then ERR<n>FR.UC indicates whether the node supports this type of error.

Otherwise:

Reserved, RAZ.

OF, bit [0]

When the node supports this flag:

Overflow flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.OF status flag.

OF	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS.OF according to the architecture-defined rules for setting the OF field. ERR<n>PFGCTL.OF is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.OF is set to ERR<n>PFGCTL.OF. This behavior replaces the architecture-defined rules for setting the OF bit. ERR<n>PFGCTL.OF is a read/write field.

Otherwise:

Reserved, RAZ.

Accessing ERR<n>PFGF

ERR<n>PFGF can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x800 + (64 * n)	ERR<n>PFGF

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERR<n>STATUS, Error Record Primary Status Register, n = 0 - 65534

The ERR<n>STATUS characteristics are:

Purpose

Contains status information for error record <n>, including:

- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a Requester.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An IMPLEMENTATION DEFINED extended error code.

Within this register:

- ERR<n>STATUS.{AV, V, MV} are valid bits that define whether error record <n> registers are valid.
- ERR<n>STATUS.{UE, OF, CE, DE, UET} encode the types of error or errors recorded.
- ERR<n>STATUS.{CI, ER, PN, IERR, SERR} are syndrome fields.

Configuration

This register is present only when error record <n> is implemented. Otherwise, direct accesses to ERR<n>STATUS are RES0.

ERR<q>FR describes the features implemented by the node that owns error record <n>. <q> is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then q = n.

For IMPLEMENTATION DEFINED fields in ERR<n>STATUS, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, non-zero, and ignore writes are compliant with this requirement.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERR<q>CTLR.

Attributes

ERR<n>STATUS is a 64-bit register.

Field descriptions

When RAS System Architecture v1.1 is implemented:

63:32
RES0

31	30	29	28	27	26	25:24	23	22	21:20	19	18:16	15:8	7:0
AV	V	UE	ER	OF	MV	CE	DE	PN	UET	CI	RES0	IERR	SERR

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record <n> includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **W1C**.

UE, bit [29]

Uncorrected Error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

ER, bit [28]

Error Reported.

ER	Meaning
`0b0`	No in-band error response (External Abort) signaled to the Requester making the access or other transaction.
`0b1`	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is implemented and was 1 when an error was detected and not corrected. • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is not implemented and the component always reports errors.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0.

Note

An in-band error response signaled by the component might be masked and not generate any exception.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
    - ERR<n>STATUS.UE == 0
    - ERR<n>STATUS.DE == 0
    - this field can be set to 0b1 by a Deferred error
- **UNKNOWN/WI** if all of the following are true:
    - ERR<n>STATUS.UE == 0
    - this field is never set to 0b1 by a Deferred error
- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- A Corrected error counter is implemented, an error is counted, and the counter overflows.
- ERR<n>STATUS.V was previously 1, a Corrected error counter is not implemented, and a Corrected error is recorded.
- ERR<n>STATUS.V was previously 1, and a type of error other than a Corrected error is recorded.

Otherwise, this field is unchanged when an error is recorded.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.

- A direct write to this field that clears this field to zero might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
0b0	Since this field was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed.
0b1	Since this field was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

MV, bit [26]

When error record <n> includes an additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC<m> not valid.
0b1	The IMPLEMENTATION DEFINED contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

DE, bit [23]

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
  - ERR<n>STATUS.V == 0
  - (ERR<n>STATUS.DE == 0 and ERR<n>STATUS.UE == 0)
- Otherwise, access to this field is **W1C**.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

Note

Software might use the information in the error record registers to determine what recovery is necessary.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
  - ERR<n>STATUS.V == 0
  - ERR<n>STATUS.UE == 0
- Otherwise, access to this field is **W1C**.

CI, bit [19]

Critical Error. Indicates whether a critical error condition has been recorded.

CI	Meaning
`0b0`	No critical error condition.
`0b1`	Critical error condition.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

Bits [18:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
  - the Common Fault Injection Model Extension is not implemented by the node that owns this error record

    - ERR<n>STATUS.V == 0
- **UNKNOWN/WI** if all of the following are true:
    - ERR<q>PFGF.SYN == 0
    - ERR<n>STATUS.V == 0
- Otherwise, access to this field is **RW**.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, **nSEI** pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.
0x11	Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another component.
0x14	Internal timeout. For example, timeout on interface within the component.
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.
0x1A	Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
  - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
  - ERR<n>STATUS.V == 0
- **UNKNOWN/WI** if all of the following are true:
  - ERR<q>PFGF.SYN == 0
  - ERR<n>STATUS.V == 0
- Otherwise, access to this field is **RW**.

When RAS System Architecture v1.0 is implemented:

63 … 32
RES0

31	30	29	28	27	26	25:24	23	22	21:20	19:16	15:8	7:0
AV	V	UE	ER	OF	MV	CE	DE	PN	UET	RES0	IERR	SERR

Bits [63:32]

Reserved, RES0.

AV, bit [31]

When error record <n> includes an address associated with an error:

Address Valid.

AV	Meaning
`0b0`	ERR<n>ADDR not valid.
`0b1`	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Accessing this field has the following behavior:

- **RO** if all of the following are true:
  - ERR<n>STATUS.DE == 0
  - ERR<n>STATUS.UE == 0
  - ERR<n>STATUS.CE != 0b00
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
  - ERR<n>STATUS.UE == 0
  - ERR<n>STATUS.DE != 0
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
  - ERR<n>STATUS.UE != 0
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing this field has the following behavior:

- **RO** if all of the following are true:
  - ERR<n>STATUS.CE != 0b00
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
  - ERR<n>STATUS.DE != 0
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
  - ERR<n>STATUS.UE != 0
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

UE, bit [29]

Uncorrected Error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
  - ERR<n>STATUS.OF == 1
  - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

ER, bit [28]

Error Reported.

ER	Meaning
0b0	No in-band error response (External Abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is implemented and was 1 when an error was detected and not corrected. • The applicable one of the ERR<q>CTLR.{WUE, RUE, UE} fields is not implemented and the component always reports errors.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester, causing this field to be set to 1. If no in-band error response to the Requester, this field is set to 0.

Note

> An in-band error response signaled by the component might be masked and not generate any exception.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0, if this field is never set to 1 by a Deferred error.
- Clearing ERR<n>STATUS.{UE,DE} to {0,0}, if this field can be set to 1 by a Deferred error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
    - ERR<n>STATUS.UE == 0
    - ERR<n>STATUS.DE == 0
    - this field can be set to 0b1 by a Deferred error
- **UNKNOWN/WI** if all of the following are true:
    - ERR<n>STATUS.UE == 0
    - this field is never set to 0b1 by a Deferred error
- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
    - ERR<n>STATUS.DE == 0
    - ERR<n>STATUS.UE == 0
    - ERR<n>STATUS.CE != 0b00
    - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
    - ERR<n>STATUS.UE == 0
    - ERR<n>STATUS.DE != 0
    - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
    - ERR<n>STATUS.UE != 0
    - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 1.
- A Deferred error is detected, ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE != `0b00`. ERR<n>STATUS.CE might be updated for the new Corrected error.
- A Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is set to 1 when one of the following occurs:

- A Deferred error is detected and ERR<n>STATUS.UE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, and ERR<n>STATUS.{UE, DE} != {0, 0}.
- A Corrected error counter is implemented, ERR<n>STATUS.{UE, DE} != {0, 0}, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is cleared to 0 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 0.
- A Deferred error is detected, ERR<n>STATUS.UE == 0, and ERR<n>STATUS.DE == 0.
- A Corrected error is detected, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE == `0b00`.

The IMPLEMENTATION DEFINED clearing of this field might also depend on the value of the other error status fields.

If a Corrected error counter is implemented:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.
- A direct write to this field that clears this field to 0 might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
`0b0`	If ERR<n>STATUS.UE == 1, then no error syndrome for an Uncorrected error has been discarded. If ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1, then no error syndrome for a Deferred error has been discarded. If ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and a Corrected error counter is implemented, then the counter has not overflowed. If ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, ERR<n>STATUS.CE != `0b00`, and no Corrected error counter is implemented, then no error syndrome for a Corrected error has been discarded. **Note** This field might have been set to 1 when an error syndrome was discarded and later cleared to 0 when a higher priority syndrome was recorded.
`0b1`	At least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **W1C**.

MV, bit [26]

When error record <n> includes an additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
`0b0`	ERR<n>MISC<m> not valid.
`0b1`	The IMPLEMENTATION DEFINED contents of the ERR<n>MISC<m> registers contains additional information for an error recorded by this record.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:

- On a Cold reset, this field resets to `0`.

Accessing this field has the following behavior:

- **RO** if all of the following are true:
    - ERR<n>STATUS.DE == 0
    - ERR<n>STATUS.UE == 0

    - ERR<n>STATUS.CE != 0b00
    - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
    - ERR<n>STATUS.UE == 0
    - ERR<n>STATUS.DE != 0
    - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
    - ERR<n>STATUS.UE != 0
    - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

CE	Meaning
`0b00`	No errors were corrected.
`0b01`	At least one transient error was corrected.
`0b10`	At least one error was corrected.
`0b11`	At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to `0b10` when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
    - ERR<n>STATUS.OF == 1
    - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

DE, bit [23]

Deferred Error.

DE	Meaning
`0b0`	No errors were deferred.
`0b1`	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == 0, access to this field is **UNKNOWN/WI**.
- **RO** if all of the following are true:
    - ERR<n>STATUS.OF == 1
    - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write

- Otherwise, access to this field is **W1C**.

PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing both ERR<n>STATUS.{DE, UE} to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
  - ERR<n>STATUS.V == 0
  - (ERR<n>STATUS.DE == 0 and ERR<n>STATUS.UE == 0)
- **RO** if all of the following are true:
  - ERR<n>STATUS.DE == 0
  - ERR<n>STATUS.UE == 0
  - ERR<n>STATUS.CE != 0b00
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
  - ERR<n>STATUS.UE == 0
  - ERR<n>STATUS.DE != 0
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
  - ERR<n>STATUS.UE != 0
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

Note

Software might use the information in the error record registers to determine what recovery is necessary.

If this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if any of the following are true:
    - ERR<n>STATUS.V == 0
    - ERR<n>STATUS.UE == 0
- **RO** if all of the following are true:
    - ERR<n>STATUS.DE == 0
    - ERR<n>STATUS.UE == 0
    - ERR<n>STATUS.CE != 0b00
    - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
    - ERR<n>STATUS.UE == 0
    - ERR<n>STATUS.DE != 0
    - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
    - ERR<n>STATUS.UE != 0
    - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **W1C**.

Bits [19:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

> **Note**
>
> This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
    - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
    - ERR<n>STATUS.V == 0
- **UNKNOWN/WI** if all of the following are true:
    - ERR<q>PFGF.SYN == 0
    - ERR<n>STATUS.V == 0
- **RO** if all of the following are true:
    - ERR<n>STATUS.DE == 0
    - ERR<n>STATUS.UE == 0
    - ERR<n>STATUS.CE != 0b00
    - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
    - ERR<n>STATUS.UE == 0
    - ERR<n>STATUS.DE != 0
    - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
    - ERR<n>STATUS.UE != 0
    - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **RW**.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, **nSEI** pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, and SVE registers are data registers.
0x11	Internal control register. For example, Parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, and SVE registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another component.
0x14	Internal timeout. For example, timeout on interface within the component.
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.
0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.
0x1A	Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- **UNKNOWN/WI** if all of the following are true:
    - the Common Fault Injection Model Extension is not implemented by the node that owns this error record
    - ERR<n>STATUS.V == 0
- **UNKNOWN/WI** if all of the following are true:
    - ERR<q>PFGF.SYN == 0
    - ERR<n>STATUS.V == 0
- **RO** if all of the following are true:
    - ERR<n>STATUS.DE == 0
    - ERR<n>STATUS.UE == 0
    - ERR<n>STATUS.CE != 0b00
    - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write
- **RO** if all of the following are true:
    - ERR<n>STATUS.UE == 0
    - ERR<n>STATUS.DE != 0
    - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write
- **RO** if all of the following are true:
    - ERR<n>STATUS.UE != 0
    - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write
- Otherwise, access to this field is **RW**.

Accessing ERR<n>STATUS

ERR<n>STATUS.{AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI} are write-one-to-clear (W1C) fields, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero. ERR<n>STATUS.{IERR, SERR} are read/write (RW) fields, although the set of implemented valid values is IMPLEMENTATION DEFINED. See also ERR<n>PFGF.SYN.

After reading ERR<n>STATUS, software must clear the valid fields in the register to allow new errors to be recorded. However, between reading the register and clearing the valid fields, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

- Writes to ERR<n>STATUS.{UE, DE, CE} are ignored if ERR<n>STATUS.OF is 1 and is not being cleared to 0.
- Writes to ERR<n>STATUS.V are ignored if any of ERR<n>STATUS.{UE, DE, CE} are nonzero and are not being cleared to zero.
- Writes to ERR<n>STATUS.{AV, MV} and the ERR<n>STATUS.{ER, PN, UET, IERR, SERR} syndrome fields are ignored if the highest priority nonzero error status field is not being cleared to zero. The error status fields in priority order from highest to lowest, are ERR<n>STATUS.UE, ERR<n>STATUS.DE, and ERR<n>STATUS.CE.

When RAS System Architecture v1.1 is implemented, a write to the register is ignored if all of:

- Any of ERR<n>STATUS.{V, UE, OF, CE, DE} are nonzero before the write.
- The write does not clear the nonzero ERR<n>STATUS.{V, UE, OF, CE, DE} fields to zero by writing ones to the applicable field or fields.

Some of the fields in ERR<n>STATUS are also defined as UNKNOWN where certain combinations of ERR<n>STATUS.{V, DE, UE} are zero. The rules for writes to ERR<n>STATUS allow a node to implement such a field as a fixed read-only value.

For example, when RAS System Architecture v1.1 is implemented, a write to ERR<n>STATUS when ERR<n>STATUS.V is 1 results in either ERR<n>STATUS.V field being cleared to zero, or ERR<n>STATUS.V not changing. Since all fields in ERR<n>STATUS, other than ERR<n>STATUS.{AV, V, MV}, usually read as UNKNOWN values when ERR<n>STATUS.V is zero, this means those fields can be implemented as read-only if applicable.

To ensure correct and portable operation, when software is clearing the valid fields in the register to allow new errors to be recorded, Arm recommends that software:

- Read ERR<n>STATUS and determine which fields need to be cleared to zero.
- Write ones to all the W1C fields that are nonzero in the read value.

- Write zero to all the W1C fields that are zero in the read value.
- Write zero to all the RW fields.

Otherwise, these fields might not have the correct value when a new fault is recorded.

An exception is when the node supports writing to these fields as part of fault injection. See also ERR<n>PFGF.SYN.

ERR<n>STATUS can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0x010` + (64 * n)	ERR<n>STATUS

This interface is accessible as follows:

- When ERR<n>STATUS.V != 0, ERR<n>STATUS.V is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When ERR<n>STATUS.UE != 0, ERR<n>STATUS.UE is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When ERR<n>STATUS.OF != 0, ERR<n>STATUS.OF is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When ERR<n>STATUS.CE != 0b00, ERR<n>STATUS.CE is not being cleared to 0b00 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- When ERR<n>STATUS.DE != 0, ERR<n>STATUS.DE is not being cleared to 0b0 in the same write and RAS System Architecture v1.1 is implemented accesses to this register are **RO**.
- Otherwise accesses to this register are **RW**.

ERRPIDR0, Peripheral Identification Register 0

The ERRPIDR0 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR0 is a 32-bit register.

Field descriptions

31:8	7:0
RES0	PART_0

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, bits [7:0].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 8 bits, ERRPIDR2.REVISION and ERRPIDR3.REVAND, available to define the revision of the component.
- If a 16-bit part number is used, it is stored in ERRPIDR2.PART_2, ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 4 bits, ERRPIDR3.REVISION, available to define the revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR0

ERRPIDR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFE0	ERRPIDR0

Accesses on this interface are **RO**.

ERRPIDR1, Peripheral Identification Register 1

The ERRPIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR1 is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8	7 6 5 4	3 2 1 0
RES0	DES_0	PART_1

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0]. ERRPIDR1.DES_0 and ERRPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be not the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

> **Note**
>
> For a component designed by Arm Limited, the JEP106 identification code is `0x3B`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, bits [11:8].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 8 bits, ERRPIDR2.REVISION and ERRPIDR3.REVAND, available to define the revision of the component.

- If a 16-bit part number is used, it is stored in ERRPIDR2.PART_2, ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 4 bits, ERRPIDR3.REVISION, available to define the revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR1

ERRPIDR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xFE4`	ERRPIDR1

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRPIDR2, Peripheral Identification Register 2

The ERRPIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR2 is a 32-bit register.

Field descriptions

When the component uses a 12-bit part number:

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8	7 6 5 4	3	2 1 0
RES0	REVISION	JEDEC	DES_1

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Component major revision. ERRPIDR2.REVISION and ERRPIDR3.REVAND together form the revision number of the component, with ERRPIDR2.REVISION being the most significant part and ERRPIDR3.REVAND the least significant part. When a component is changed, ERRPIDR2.REVISION or ERRPIDR3.REVAND are increased to ensure that software can differentiate the different revisions of the component. ERRPIDR3.REVAND should be set to `0b0000` when ERRPIDR2.REVISION is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as `0b1`.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4]. ERRPIDR1.DES_0 and ERRPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be not the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

Note

For a component designed by Arm Limited, the JEP106 identification code is `0x3B`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

When the component uses a 16-bit part number:

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8	7 6 5 4	3	2 1 0
RES0	PART_2	JEDEC	DES_1

Bits [31:8]

Reserved, RES0.

PART_2, bits [7:4]

Part number, bits [15:12].

The part number is selected by the designer of the component. The designer chooses whether to use a 12-bit or a 16-bit part number:

- If a 12-bit part number is used, it is stored in ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 8 bits, ERRPIDR2.REVISION and ERRPIDR3.REVAND, available to define the revision of the component.
- If a 16-bit part number is used, it is stored in ERRPIDR2.PART_2, ERRPIDR1.PART_1 and ERRPIDR0.PART_0. There are 4 bits, ERRPIDR3.REVISION, available to define the revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as `0b1`.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4]. ERRPIDR1.DES_0 and ERRPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be not the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

Note

For a component designed by Arm Limited, the JEP106 identification code is `0x3B`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR2

ERRPIDR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xFE8`	ERRPIDR2

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRPIDR3, Peripheral Identification Register 3

The ERRPIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR3 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR3 is a 32-bit register.

Field descriptions

When the component uses a 12-bit part number:

31:8	7:4	3:0
RES0	REVAND	CMOD

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Component minor revision. ERRPIDR2.REVISION and ERRPIDR3.REVAND together form the revision number of the component, with ERRPIDR2.REVISION being the most significant part and ERRPIDR3.REVAND the least significant part. When a component is changed, ERRPIDR2.REVISION or ERRPIDR3.REVAND are increased to ensure that software can differentiate the different revisions of the component. ERRPIDR3.REVAND should be set to `0b0000` when ERRPIDR2.REVISION is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer Modified.

Indicates the component has been modified.

A value of `0b0000` means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.

- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

When the component uses a 16-bit part number:

31–8	7–4	3–0
RES0	REVISION	CMOD

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Component revision. When a component is changed, ERRPIDR3.REVISION is increased to ensure that software can differentiate the different revisions of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer Modified.

Indicates the component has been modified.

A value of `0b0000` means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR3

ERRPIDR3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xFEC`	ERRPIDR3

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

ERRPIDR4, Peripheral Identification Register 4

The ERRPIDR4 characteristics are:

Purpose

Provides discovery information about the component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR4 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR4 is a 32-bit register.

Field descriptions

31–8	7–4	3–0
RES0	SIZE	DES_2

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component.

The distance from the start of the address space used by this component to the end of the component identification registers.

A value of `0b0000` means one of the following is true:

- The component uses a single 4KB block.
- The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.

Any other value means the component occupies $2^{\text{ERRPIDR4.SIZE}}$ 4KB blocks.

Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1. The code identifies the designer of the component, which might not be not the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

Note

For a component designed by Arm Limited, the JEP106 bank is 5, meaning this field has the value `0x4`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing ERRPIDR4

ERRPIDR4 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	`0xFD0`	ERRPIDR4

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_ABPR, CPU Interface Aliased Binary Point Register

The GICC_ABPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_ABPR are RES0.

In systems that support two Security states:

- This register is an alias of the Non-secure copy of GICC_BPR.
- Non-secure accesses to this register return a shifted value of the binary point.
- If ICC_CTLR_EL3.CBPR_EL1NS == 1, Secure accesses to this register access ICC_BPR0_EL1.

Attributes

GICC_ABPR is a 32-bit register.

Field descriptions

31:3	2:0
RES0	Binary_Point

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- 'Secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when GICC_CTLR.CBPR == 0.
- 'Non-secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for all other cases.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICC_ABPR

This register is used only when System register access is not enabled. When System register access is enabled, the System registers ICC_BPR0_EL1 and ICC_BPR1_EL1 provide equivalent functionality.

GICC_ABPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	`0x001C`	GICC_ABPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_AEOIR, CPU Interface Aliased End Of Interrupt Register

The GICC_AEOIR characteristics are:

Purpose

A write to this register performs priority drop for the specified Group 1 interrupt and, if the appropriate GICC_CTLR.EOImodeS or GICC_CTLR.EOImodeNS field == 0, also deactivates the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_AEOIR are RES0.

When GICD_CTLR.DS==0, this register is an alias of the Non-secure view of GICC_EOIR. A Secure access to this register is identical to a Non-secure access to GICC_EOIR.

Attributes

GICC_AEOIR is a 32-bit register.

Field descriptions

31–24	23–0
RES0	INTID

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_AEOIR

A write to this register must correspond to the most recently acknowledged Group 1 interrupt. If a value other than the last value read from GICC_AIAR is written to this register, the effect is UNPREDICTABLE.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_EOIR1 provides equivalent functionality.
- For AArch64 implementations, ICC_EOIR1_EL1 provides equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_AEOIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	`0x0024`	GICC_AEOIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_AHPPIR, CPU Interface Aliased Highest Priority Pending Interrupt Register

The GICC_AHPPIR characteristics are:

Purpose

If the highest priority pending interrupt is in Group 1, this register provides the INTID of the highest priority pending interrupt on the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_AHPPIR are RES0.

If GICD_CTLR.DS==0, this register is an alias of the Non-secure view of GICC_HPPIR. A Secure access to this register is identical to a Non-secure access to GICC_HPPIR.

Attributes

GICC_AHPPIR is a 32-bit register.

Field descriptions

31:24	23:0
RES0	INTID

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

> **Note**
>
> INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_AHPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_HPPIR1 provides equivalent functionality.
- For AArch64 implementations, ICC_HPPIR1_EL1 provides equivalent functionality.

If the highest priority pending interrupt is in Group 0, a read of this register returns the special INTID 1023.

Interrupt identifiers corresponding to an interrupt group that is not enabled are ignored.

If the highest priority pending interrupt is a direct interrupt that is both individually enabled in the Distributor and part of an interrupt group that is enabled in the Distributor, and the interrupt group is disabled in the CPU interface for this PE, this register returns the special INTID 1023.

For more information about pending interrupts that are not considered when determining the highest priority pending interrupt, see 'Preemption' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_AHPPIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	`0x0028`	GICC_AHPPIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_AIAR, CPU Interface Aliased Interrupt Acknowledge Register

The GICC_AIAR characteristics are:

Purpose

Provides the INTID of the signaled Group 1 interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_AIAR are RES0.

When GICD_CTLR.DS==0, this register is an alias of the Non-secure view of GICC_IAR. A Secure access to this register is identical to a Non-secure access to GICC_IAR.

Attributes

GICC_AIAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0								INTID																							

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_AIAR

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_AIAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance

GIC CPU interface	`0x0020`	GICC_AIAR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_APR<n>, CPU Interface Active Priorities Registers, n = 0 - 3

The GICC_APR<n> characteristics are:

Purpose

Provides information about interrupt active priorities.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_APR<n> are RES0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value `0x00000000` is consistent with no interrupts being active.

When GICD_CTLR.DS == 0, these registers are Banked, and Non-secure accesses do not affect Secure operation. The Secure copies of these registers hold active priorities for Group 0 interrupts, and the Non-secure copies provide a Non-secure view of the active priorities for Group 1 interrupts.

GICC_APR1 is only implemented in implementations that support 6 or more bits of priority. GICC_APR2 and GICC_APR3 are only implemented in implementations that support 7 bits of priority.

When GICD_CTLR.DS==1, these registers hold the active priorities for Group 0 interrupts, and the active priorities for Group 1 interrupts are held by the GICC_NSAPR<n> registers.

Attributes

GICC_APR<n> is a 32-bit register.

Field descriptions

31-0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing GICC_APR<n>

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- In AArch64:
  - For Group 0, ICC_AP0R<n>_EL1.
  - For Group 1, ICC_AP1R<n>_EL1.
- In AArch32:
  - For Group 0, ICC_AP0R<n>.
  - For Group 1, ICC_AP1R<n>.

GICC_APR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	`0x00D0` + (4 * n)	GICC_APR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_BPR, CPU Interface Binary Point Register

The GICC_BPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_BPR are RES0.

In systems that support two Security states:

- This register is Banked.
- The Secure instance of this register determines Group 0 interrupt preemption.
- The Non-secure instance of this register determines Group 1 interrupt preemption.

In systems that support only one Security state, when GICC_CTLR.CBPR == 0, this register determines only Group 0 interrupt preemption.

When GICC_CTLR.CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

Attributes

GICC_BPR is a 32-bit register.

Field descriptions

31:3	2:0
RES0	Binary_Point

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- 'Secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when GICC_CTLR.CBPR == 0.
- 'Non-secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for all other cases.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Note

Aliasing the Non-secure GICC_BPR as GICC_ABPR in a multiprocessor system permits a PE that can make only Secure accesses to configure the preemption setting for Group 1 interrupts by accessing GICC_ABPR.

Accessing GICC_BPR

This register is used only when System register access is not enabled. When System register access is enabled this register is RAZ/WI, and the System registers ICC_BPR0_EL1 and ICC_BPR1_EL1 provide equivalent functionality.

GICC_BPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	`0x0008`	GICC_BPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_CTLR, CPU Interface Control Register

The GICC_CTLR characteristics are:

Purpose

Controls the CPU interface, including enabling of interrupt groups, interrupt signal bypass, binary point registers used, and separation of priority drop and interrupt deactivation.

Note

If the GIC implementation supports two Security states, independent EOI controls are provided for accesses from each Security state. Secure accesses handle both Group 0 and Group 1 interrupts, and Non-secure accesses handle Group 1 interrupts only.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_CTLR are RES0.

In a GIC implementation that supports two Security states:

- This register is Banked.
- The register bit assignments are different in the Secure and Non-secure copies.

Attributes

GICC_CTLR is a 32-bit register.

Field descriptions

When GICD_CTLR.DS==0, Non-secure access:

31–10	9	8 7	6	5	4 3 2 1	0
RES0	EOImodeNS	RES0	IRQBypDisGrp1	FIQBypDisGrp1	RES0	EnableGrp1

Bits [31:10]

Reserved, RES0.

EOImodeNS, bit [9]

Controls the behavior of Non-secure accesses to GICC_EOIR, GICC_AEOIR, and GICC_DIR.

EOImodeNS	Meaning
0b0	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
0b1	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Bits [8:7]

Reserved, RES0.

IRQBypDisGrp1, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
`0b0`	The bypass IRQ signal is signaled to the PE.
`0b1`	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

FIQBypDisGrp1, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQBypDisGrp1	Meaning
`0b0`	The bypass FIQ signal is signaled to the PE.
`0b1`	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DFB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Bits [4:1]

Reserved, RES0.

EnableGrp1, bit [0]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
`0b0`	Group 1 interrupt signaling is disabled.
`0b1`	Group 1 interrupt signaling is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

When GICD_CTLR.DS==0, Secure access:

313029282726252423222120191817161514131211	10	9	8	7	6	
RES0	EOImodeNS	EOImodeS	IRQBypDisGrp1	FIQBypDisGrp1	IRQBypDisGrp0	F

Bits [31:11]

Reserved, RES0.

EOImodeNS, bit [10]

Controls the behavior of Non-secure accesses to GICC_EOIR, GICC_AEOIR, and GICC_DIR.

EOImodeNS	Meaning
`0b0`	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
`0b1`	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

EOImodeS, bit [9]

Controls the behavior of Secure accesses to GICC_EOIR, GICC_AEOIR, and GICC_DIR.

EOImodeS	Meaning
`0b0`	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
`0b1`	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

This field shares state with GICC_CTLR.EOImode.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

IRQBypDisGrp1, bit [8]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
`0b0`	The bypass IRQ signal is signaled to the PE.
`0b1`	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

FIQBypDisGrp1, bit [7]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQBypDisGrp1	Meaning
`0b0`	The bypass FIQ signal is signaled to the PE.
`0b1`	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DFB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

IRQBypDisGrp0, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:

IRQBypDisGrp0	Meaning
`0b0`	The bypass IRQ signal is signaled to the PE.
`0b1`	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

FIQBypDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

FIQBypDisGrp0	Meaning
`0b0`	The bypass FIQ signal is signaled to the PE.
`0b1`	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

CBPR, bit [4]

Controls whether GICC_BPR provides common control of preemption to Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	GICC_BPR determines preemption for Group 0 interrupts only. GICC_ABPR determines preemption for Group 1 interrupts.
0b1	GICC_BPR determines preemption for both Group 0 and Group 1 interrupts.

This field is an alias of ICC_CTLR_EL3.CBPR_EL1NS.

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of GICC_BPR returns the value of Secure GICC_BPR.Binary_Point, incremented by 1, and saturated to 0b111.
- Non-secure writes of GICC_BPR are ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

FIQEn, bit [3]

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

FIQEn	Meaning
0b0	Group 0 interrupts are signaled using the IRQ signal.
0b1	Group 0 interrupts are signaled using the FIQ signal.

Group 1 interrupts are signaled using the IRQ signal only.

If an implementation supports two Security states, this bit is permitted to be RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bit [2]

Reserved, RES0.

EnableGrp1, bit [1]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
0b0	Group 1 interrupt signaling is disabled.
0b1	Group 1 interrupt signaling is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EnableGrp0, bit [0]

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

EnableGrp0	Meaning
0b0	Group 0 interrupt signaling is disabled.
0b1	Group 0 interrupt signaling is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When GICD_CTLR.DS == 1:

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10	9	8	7	6	5
RES0	EOImode	IRQBypDisGrp1	FIQBypDisGrp1	IRQBypDisGrp0	FIQBypDisGr

Bits [31:10]

Reserved, RES0.

EOImode, bit [9]

Controls the behavior of accesses to GICC_EOIR, GICC_AEOIR, and GICC_DIR.

EOImode	Meaning
0b0	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
0b1	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

This field shares state with GICC_CTLR.EOImodeS.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

IRQBypDisGrp1, bit [8]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

FIQBypDisGrp1, bit [7]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQBypDisGrp1	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DFB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

IRQBypDisGrp0, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:

IRQBypDisGrp0	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

FIQBypDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

FIQBypDisGrp0	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

CBPR, bit [4]

Controls whether GICC_BPR provides common control of preemption to Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	GICC_BPR determines preemption for Group 0 interrupts only. GICC_ABPR determines preemption for Group 1 interrupts.
0b1	GICC_BPR determines preemption for both Group 0 and Group 1 interrupts.

This field is an alias of ICC_CTLR_EL3.CBPR_EL1NS.

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of GICC_BPR returns the value of Secure GICC_BPR.Binary_Point, incremented by 1, and saturated to 0b111.
- Non-secure writes of GICC_BPR are ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

FIQEn, bit [3]

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

FIQEn	Meaning
0b0	Group 0 interrupts are signaled using the IRQ signal.
0b1	Group 0 interrupts are signaled using the FIQ signal.

Group 1 interrupts are signaled using the IRQ signal only.

If an implementation supports two Security states, this bit is permitted to be RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bit [2]

Reserved, RES0.

EnableGrp1, bit [1]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
0b0	Group 1 interrupt signaling is disabled.
0b1	Group 1 interrupt signaling is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EnableGrp0, bit [0]

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

EnableGrp0	Meaning
0b0	Group 0 interrupt signaling is disabled.
0b1	Group 0 interrupt signaling is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing GICC_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_CTLR and ICC_MCTLR provide equivalent functionality.
- For AArch64 implementations, ICC_CTLR_EL1 and ICC_CTLR_EL3 provide equivalent functionality.

GICC_CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	`0x0000`	GICC_CTLR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_DIR, CPU Interface Deactivate Interrupt Register

The GICC_DIR characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_DIR are RES0.

Attributes

GICC_DIR is a 32-bit register.

Field descriptions

31:24	23:0
RES0	INTID

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_DIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_DIR provides equivalent functionality.
- For AArch64 implementations, ICC_DIR_EL1 provides equivalent functionality.

Writes to this register have an effect only in the following cases:

- When GICD_CTLR.DS == 1, if GICC_CTLR.EOImode == 1.
- In GIC implementations that support two Security states:
  - If the access is Secure and GICC_CTLR.EOImodeS == 1.
  - If the access is Non-secure and GICC_CTLR.EOImodeNS == 1.

The following writes must be ignored:

- Writes to this register when the corresponding EOImode field in GICC_CTLR == 0. In systems that support system error generation, an implementation might generate a system error.
- Writes to this register when the corresponding EOImode field in GICC_CTLR == 0 and the corresponding interrupt is not active. In systems that support system error generation, an implementation might generate a system error. In implementations using the GIC Stream Protocol Interface, these writes correspond to a Deactivate packet for an interrupt that is not active. For more information, see 'Deactivate (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If the corresponding EOImode field in GICC_CTLR is 1 and this register is written to without a corresponding write to GICC_EOIR or GICC_AEOIR, the interrupt is deactivated but the bit corresponding to it in the active priorities registers remains set.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_DIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	`0x1000`	GICC_DIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_EOIR, CPU Interface End Of Interrupt Register

The GICC_EOIR characteristics are:

Purpose

A write to this register performs priority drop for the specified interrupt and, if the appropriate GICC_CTLR.EOImodeS or GICC_CTLR.EOImodeNS field == 0, also deactivates the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_EOIR are RES0.

If GICD_CTLR.DS==0:

- This register is Common.
- GICC_AEOIR is an alias of the Non-secure view of this register.

For Secure writes when GICD_CTLR.DS==0, or for Secure and Non-secure writes when GICD_CTLR.DS==1, the register provides functionality for Group 0 interrupts.

For Non-secure writes when GICD_CTLR.DS==1, the register provides functionality for Group 1 interrupts.

Attributes

GICC_EOIR is a 32-bit register.

Field descriptions

31:24	23:0
RES0	INTID

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

For every read of a valid INTID from GICC_IAR, the connected PE must perform a matching write to GICC_EOIR. The value written to GICC_EOIR must be the INTID from GICC_IAR. Reads of INTIDs 1020-1023 do not require matching writes.

Note

Arm recommends that software preserves the entire register value read from GICC_IAR, and writes that value back to GICC_EOIR on completion of interrupt processing.

For nested interrupts, the order of writes to this register must be the reverse of the order of interrupt acknowledgement. Behavior is UNPREDICTABLE if:

- This ordering constraint is not maintained.
- The value written to this register does not match an active interrupt, or the ID of a spurious interrupt.
- The value written to this register does not match the last valid interrupt value read from GICC_IAR.

For general information about the effect of writes to end of interrupt registers, and about the possible separation of the priority drop and interrupt deactivate operations, see 'Interrupt lifecycle' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If GICD_CTLR.DS==0:

- GICC_CTLR.EOImodeS controls the behavior of Secure accesses to GICC_EOIR and GICC_AEOIR.
- GICC_CTLR.EOImodeNS controls the behavior of Non-secure accesses to GICC_EOIR and GICC_AEOIR.

Accessing GICC_EOIR

The following writes must be ignored:

- Writes of INTIDs 1020-1023.
- Secure writes corresponding to Group 1 interrupts. In systems that support system error generation, an implementation might generate a system error. In this case, GIC behavior is predictable, and the highest Secure active priority (in the Secure copy of GICC_APR<n>) will be reset if the highest active priority is Secure. System behavior is UNPREDICTABLE.
- Non-secure writes corresponding to Group 0 interrupts when GICC_CTLR.EOImodeS == 1. In systems that support system error generation, an implementation might generate a system error. In this case, GIC behavior is predictable, and the highest Non-secure active priority (in the Non-secure copy of GICC_APR<n>) will be reset if the highest active priority is Non-secure. System behavior is UNPREDICTABLE.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_EOIR0 and ICC_EOIR1 provide equivalent functionality.
- For AArch64 implementations, ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_EOIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0010	GICC_EOIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_HPPIR, CPU Interface Highest Priority Pending Interrupt Register

The GICC_HPPIR characteristics are:

Purpose

Provides the INTID of the highest priority pending interrupt on the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_HPPIR are RES0.

If GICD_CTLR.DS==0:

- This register is Common.
- GICC_AHPPIR is an alias of the Non-secure view of this register.

Attributes

GICC_HPPIR is a 32-bit register.

Field descriptions

31:24	23:0
RES0	INTID

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

> **Note**
>
> INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_HPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_HPPIR0 and ICC_HPPIR1 provide equivalent functionality.
- For AArch64 implementations, ICC_HPPIR0_EL1 and ICC_HPPIR1_EL1 provide equivalent functionality.

If the highest priority pending interrupt is in Group 0, a Non-secure read of this register returns the special INTID 1023.

For Secure reads when GICD_CTLR.DS==0, or for Secure and Non-secure reads when GICD_CTLR.DS==1, returns the special INTID 1022 if the highest priority pending interrupt is in Group 1.

If no interrupts are in the pending state, a read of this register returns the special INTID 1023.

Interrupt identifiers corresponding to an interrupt group that is not enabled are ignored.

If the highest priority pending interrupt is a direct interrupt that is both individually enabled in the Distributor and part of an interrupt group that is enabled in the Distributor, and the interrupt group is disabled in the CPU interface for this PE, this register returns the special INTID 1023.

For more information about pending interrupts that are not considered when determining the highest priority pending interrupt, see 'Preemption' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_HPPIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	`0x0018`	GICC_HPPIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_IAR, CPU Interface Interrupt Acknowledge Register

The GICC_IAR characteristics are:

Purpose

Provides the INTID of the signaled interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_IAR are RES0.

This register is available in all configurations of the GIC. If GICD_CTLR.DS==0:

- This register is Common.
- GICC_AIAR is an alias of the Non-secure view of this register.

The format of the INTID is governed by whether affinity routing is enabled for a Security state.

Attributes

GICC_IAR is a 32-bit register.

<table>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td colspan="8">RES0</td><td colspan="24">INTID</td></tr>
</table>

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A read of this register returns the INTID of the highest priority pending interrupt for the CPU interface. The read returns a spurious INTID of 1023 if any of the following apply:

- Forwarding of interrupts by the Distributor to the CPU interface is disabled.
- Signaling of interrupts by the CPU interface to the connected PE is disabled.
- There are no pending interrupts on the CPU interface with sufficient priority for the interface to signal it to the PE.

When the GIC returns a valid INTID to a read of this register it treats the read as an acknowledge of that interrupt. In addition, it changes the interrupt status from pending to active, or to active and pending if the pending state of the interrupt persists. Normally, the pending state of an interrupt persists only if the interrupt is level-sensitive and remains asserted.

For every read of a valid INTID from GICC_IAR, the connected PE must perform a matching write to GICC_EOIR.

Note

- Arm recommends that software preserves the entire register value read from this register, and writes that value back to GICC_EOIR on completion of interrupt processing.
- For SPIs, although multiple target PEs might attempt to read this register at any time, only one PE can obtain a valid INTID. For more information, see 'Activation' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accessing GICC_IAR

When GICD_CTLR.DS==1, if the highest priority pending interrupt is in Group 1, the special INTID 1022 is returned.

In GIC implementations that support two Security states, if the highest priority pending interrupt is in Group 0, Non-secure reads return the special INTID 1023.

In GIC implementations that support two Security states, if the highest priority pending interrupt is in Group 1, Secure reads return the special INTID 1022.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_IAR0 and ICC_IAR1 provide equivalent functionality.
- For AArch64 implementations, ICC_IAR0_EL1 and ICC_IAR1_EL1 provide equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_IAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	`0x000C`	GICC_IAR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

GICC_IIDR, CPU Interface Identification Register

The GICC_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_IIDR are RES0.

Attributes

GICC_IIDR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8 7 6 5 4 3 2 1 0
ProductID	Architecture_version	Revision	Implementer

ProductID, bits [31:20]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture_version, bits [19:16]

The version of the GIC architecture that is implemented.

Architecture_version	Meaning
`0b0001`	GICv1.
`0b0010`	GICv2.
`0b0011`	FEAT_GICv3 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.
`0b0100`	FEAT_GICv4 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.

Other values are reserved.

Revision, bits [15:12]

Revision number for the CPU interface.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the CPU interface.

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is `0x4`.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore `0x3B`.

Accessing GICC_IIDR

GICC_IIDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	`0x00FC`	GICC_IIDR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_NSAPR<n>, CPU Interface Non-secure Active Priorities Registers, n = 0 - 3

The GICC_NSAPR<n> characteristics are:

Purpose

Provides information about Group 1 interrupt active priorities.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_NSAPR<n> are RES0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value `0x00000000` is consistent with no interrupts being active.

When GICD_CTLR.DS==0, these registers are RAZ/WI to Non-secure accesses.

GICC_NSAPR1 is only implemented in implementations that support 6 or more bits of priority. GICC_NSAPR2 and GICC_NSAPR3 are only implemented in implementations that support 7 bits of priority.

Attributes

GICC_NSAPR<n> is a 32-bit register.

Field descriptions

31 ... 0
IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing GICC_NSAPR<n>

GICC_NSAPR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	`0x00E0` + (4 * n)	GICC_NSAPR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICC_PMR, CPU Interface Priority Mask Register

The GICC_PMR characteristics are:

Purpose

This register provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Note

Higher interrupt priority corresponds to a lower value of the Priority field.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_PMR are RES0.

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

Attributes

GICC_PMR is a 32-bit register.

Field descriptions

31–8	7–0
RES0	Priority

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = `0b0`.
- For 64 supported levels, bits [1:0] = `0b00`.
- For 32 supported levels, bits [2:0] = `0b000`.
- For 16 supported levels, bits [3:0] = `0b0000`.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICC_PMR

If the GIC implementation supports two Security states:

- Non-secure accesses to this register can only read or write values corresponding to the lower half of the priority range.
- If a Secure write has programmed the register with a value that corresponds to a value in the upper half of the priority range then:
    - Any Non-secure read of the register returns `0x00`, regardless of the value held in the register.
    - Non-secure writes are ignored.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

GICC_PMR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	`0x0004`	GICC_PMR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_RPR, CPU Interface Running Priority Register

The GICC_RPR characteristics are:

Purpose

This register indicates the running priority of the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_RPR are RES0.

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

Attributes

GICC_RPR is a 32-bit register.

Field descriptions

31:8	7:0
RES0	Priority

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR was set to the minimum value.

Accessing GICC_RPR

If there is no active interrupt on the CPU interface, the idle priority value is returned.

If the GIC implementation supports two Security states, a Non-secure read of the Priority field returns:

- `0x00` if the field value is less than `0x80`.
- The Non-secure view of the Priority value if the field value is `0x80` or more.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Software cannot determine the number of implemented priority bits from this register.

GICC_RPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0014	GICC_RPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICC_STATUSR, CPU Interface Status Register

The GICC_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_STATUSR are RES0.

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

This register is used only when System register access is not enabled. If System register access is enabled, this register is not updated. Equivalent functionality might be provided by appropriate traps and exceptions.

Attributes

GICC_STATUSR is a 32-bit register.

Field descriptions

31–5	4	3	2	1	0
RES0	ASV	WROD	RWOD	WRD	RRD

Bits [31:5]

Reserved, RES0.

ASV, bit [4]

Attempted security violation.

ASV	Meaning
0b0	Normal operation.
0b1	A Non-secure access to a Secure register has been detected.

Note

This bit is not set to 1 for registers where any of the fields are Non-secure.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICC_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

If this register is implemented, GICV_STATUSR must also be implemented.

GICC_STATUSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x002C	GICC_STATUSR (S)

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.

Component	Offset	Instance
GIC CPU interface	0x002C	GICC_STATUSR (NS)

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_CLRSPI_NSR, Clear Non-secure SPI Pending Register

The GICD_CLRSPI_NSR characteristics are:

Purpose

Removes the pending state from a valid SPI if permitted by the Security state of the access and the GICD_NSACR<n> value for that SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

If GICD_TYPER.MBIS == 0, this register is reserved.

When GICD_CTLR.DS == 1, this register provides functionality for all SPIs.

Attributes

GICD_CLRSPI_NSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																			INTID												

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to GICD_CLRSPI_NSR, GICD_CLRSPI_SR, or GICD_ICPENDR<n>.
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to GICD_CLRSPI_NSR or GICD_CLRSPI_SR. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_CLRSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding GICD_NSACR<n> register is less than `0b10`.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can clear the pending state of any valid SPI.

GICD_CLRSPI_NSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0048`	GICD_CLRSPI_NSR

Accesses on this interface are **WO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_CLRSPI_SR, Clear Secure SPI Pending Register

The GICD_CLRSPI_SR characteristics are:

Purpose

Removes the pending state from a valid SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

If GICD_TYPER.MBIS == 0, this register is reserved.

When GICD_CTLR.DS == 1, this register is WI.

Attributes

GICD_CLRSPI_SR is a 32-bit register.

Field descriptions

31–13	12–0
RES0	INTID

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to GICD_CLRSPI_NSR, GICD_CLRSPI_SR, or GICD_ICPENDR<n>.
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to GICD_CLRSPI_NSR or GICD_CLRSPI_SR. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_CLRSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICD_CLRSPI_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0058	GICD_CLRSPI_SR

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **WI**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **WO**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **WI**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_CPENDSGIR<n>, SGI Clear-Pending Registers, n = 0 - 3

The GICD_CPENDSGIR<n> characteristics are:

Purpose

Removes the pending state from an SGI.

A write to this register changes the state of a pending SGI to inactive, and the state of an active and pending SGI to active.

Configuration

Four SGI clear-pending registers are implemented. Each register contains eight clear-pending bits for each of four SGIs, for a total of 16 possible SGIs.

In multiprocessor implementations, each PE has a copy of these registers.

Attributes

GICD_CPENDSGIR<n> is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0
SGI_clear_pending_bits3	SGI_clear_pending_bits2	SGI_clear_pending_bits1	SGI_clear_pending_bits0

SGI_clear_pending_bits<x>, bits [8x+7:8x], for x = 3 to 0

Removes the pending state from SGI number 4n + x for the PE corresponding to the bit number written to.

Reads and writes have the following behavior:

SGI_clear_pending_bits<x>	Meaning
`0x00`	If read, indicates that the SGI from the corresponding PE is not pending and is not active and pending. If written, has no effect.
`0x01`	If read, indicates that the SGI from the corresponding PE is pending or is active and pending. If written, removes the pending state from the SGI for the corresponding PE.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For SGI ID m, generated by processing element C writing to the corresponding GICD_SGIR field, where DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_CPENDSGIR<n> number is given by n = m DIV 4.
- The offset of the required register is (`0xF10` + (4n)).
- The offset of the required field within the register GICD_CPENDSGIR<n> is given by m MOD 4.
- The required bit in the 8-bit SGI clear-pending field m is bit C.

Accessing GICD_CPENDSGIR<n>

These registers are used only when affinity routing is not enabled. When affinity routing is enabled, this register is RES0. An implementation is permitted to make the register RAZ/WI in this case.

A register bit that corresponds to an unimplemented SGI is RAZ/WI.

These registers are byte-accessible.

If the GIC implementation supports two Security states:

- A register bit that corresponds to a Group 0 interrupt is RAZ/WI to Non-secure accesses.
- Register bits corresponding to unimplemented PEs are RAZ/WI.

GICD_CPENDSGIR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0F10` + (4 * n)	GICD_CPENDSGIR<n>

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_CTLR, Distributor Control Register

The GICD_CTLR characteristics are:

Purpose

Enables interrupts and affinity routing.

Configuration

The format of this register depends on the Security state of the access and the number of Security states supported, which is specified by GICD_CTLR.DS.

Attributes

GICD_CTLR is a 32-bit register.

Field descriptions

When access is Secure, in a system that supports two Security states:

31	3029282726252423222120191817161514131211109 8	7	6	5	4	3	2	1	0
RWP	RES0	E1NWF	DS	ARE_NS	ARE_S	RES0	EnableGrp1S	EnableGrp1NS	Enabl

RWP, bit [31]

Register Write Pending. Read only. Indicates whether a register write is in progress or not:

RWP	Meaning
0b0	No register write in progress. The effects of previous register writes to the affected register fields are visible to all logical components of the GIC architecture, including the CPU interfaces.
0b1	Register write in progress. The effects of previous register writes to the affected register fields are not guaranteed to be visible to all logical components of the GIC architecture, including the CPU interfaces, as the effects of the changes are still being propagated.

This field tracks writes to:

- GICD_CTLR[2:0], the Group Enables, for transitions from 1 to 0 only.
- GICD_CTLR[7:4], the ARE bits, E1NWF bit and DS bit.
- GICD_ICENABLER<n>.

Updates to other register fields are not tracked by this field.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:8]

Reserved, RES0.

E1NWF, bit [7]

Enable 1 of N Wakeup Functionality.

It is IMPLEMENTATION DEFINED whether this bit is programmable, or RAZ/WI.

If it is implemented, then it has the following behavior:

E1NWF	Meaning
0b0	A PE that is asleep cannot be picked for 1 of N interrupts.
0b1	A PE that is asleep can be picked for 1 of N interrupts as determined by IMPLEMENTATION DEFINED controls.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

DS, bit [6]

Disable Security.

DS	Meaning
0b0	Non-secure accesses are not permitted to access and modify registers that control Group 0 interrupts.
0b1	Non-secure accesses are permitted to access and modify registers that control Group 0 interrupts.

If DS is written from 0 to 1 when GICD_CTLR.ARE_S == 1, then GICD_CTLR.ARE for the single Security state is RAO/WI.

If the Distributor only supports a single Security state, this bit is RAO/WI.

If the Distributor supports two Security states, it IMPLEMENTATION DEFINED whether this bit is programmable or implemented as RAZ/WI.

When this field is set to 1, all accesses to GICD_CTLR access the single Security state view, and all bits are accessible.

When set to 1, this field can only be cleared by a hardware reset.

Writing this bit from 0 to 1 is UNPREDICTABLE if any of the following is true:

- GICD_CTLR.EnableGrp0==1.
- GICD_CTLR.EnableGrp1S==1.
- GICD_CTLR.EnableGrp1NS==1.
- One or more INTID is in the Active or Active and Pending state.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

ARE_NS, bit [5]

Affinity Routing Enable, Non-secure state.

ARE_NS	Meaning
0b0	Affinity routing disabled for Non-secure state.
0b1	Affinity routing enabled for Non-secure state.

When affinity routing is enabled for the Secure state, this field is RAO/WI.

Changing the ARE_NS settings from 0 to 1 is UNPREDICTABLE except when GICD_CTLR.EnableGrp1 Non-secure == 0.

Changing the ARE_NS settings from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility for Non-secure state is not implemented, this field is RAO/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

ARE_S, bit [4]

Affinity Routing Enable, Secure state.

ARE_S	Meaning
0b0	Affinity routing disabled for Secure state.
0b1	Affinity routing enabled for Secure state.

Changing the ARE_S setting from 0 to 1 is UNPREDICTABLE except when all of the following apply:

- GICD_CTLR.EnableGrp0==0.
- GICD_CTLR.EnableGrp1S==0.
- GICD_CTLR.EnableGrp1NS==0.

Changing the ARE_S settings from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility for Secure state is not implemented, this field is RAO/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Bit [3]

Reserved, RES0.

EnableGrp1S, bit [2]

Enable Secure Group 1 interrupts.

EnableGrp1S	Meaning
0b0	Secure Group 1 interrupts are disabled.
0b1	Secure Group 1 interrupts are enabled.

If GICD_CTLR.ARE_S == 0, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

EnableGrp1NS, bit [1]

Enable Non-secure Group 1 interrupts.

EnableGrp1NS	Meaning
0b0	Non-secure Group 1 interrupts are disabled.
0b1	Non-secure Group 1 interrupts are enabled.

Note

This field also controls whether LPIs are forwarded to the PE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enable Group 0 interrupts.

EnableGrp0	Meaning
0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

When access is Non-secure, in a system that supports two Security states:

31	30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5	4	3 2	1	0
RWP	RES0	ARE_NS	RES0	EnableGrp1A	EnableGrp1

RWP, bit [31]

This bit is a read-only alias of the Secure GICD_CTLR.RWP bit.

Bits [30:5]

Reserved, RES0.

ARE_NS, bit [4]

This bit is a read-write alias of the Secure GICD_CTLR.ARE_NS bit.

If GICv2 backwards compatibility for Non-secure state is not implemented, this field is RAO/WI.

Bits [3:2]

Reserved, RES0.

EnableGrp1A, bit [1]

If ARE_NS == 1, then this bit is a read-write alias of the Secure GICD_CTLR.EnableGrp1NS bit.

If ARE_NS == 0, then this bit is RES0.

EnableGrp1, bit [0]

If ARE_NS == 0, then this bit is a read-write alias of the Secure GICD_CTLR.EnableGrp1NS bit.

If ARE_NS == 1, then this bit is RES0.

When in a system that supports only a single Security state:

31	30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9	8	7	6	5	4	3 2	1	0
RWP	RES0	nASSGIreq	E1NWF	DS	RES0	ARE	RES0	EnableGrp1	EnableGrp0

RWP, bit [31]

Register Write Pending. Read only. Indicates whether a register write is in progress or not:

RWP	Meaning
`0b0`	No register write in progress. The effects of previous register writes to the affected register fields are visible to all logical components of the GIC architecture, including the CPU interfaces.
`0b1`	Register write in progress. The effects of previous register writes to the affected register fields are not guaranteed to be visible to all logical components of the GIC architecture, including the CPU interfaces, as the effects of the changes are still being propagated.

This field tracks updates to:

- GICD_CTLR[2:0], the Group Enables, for transitions from 1 to 0 only.
- GICD_CTLR[7:4], the ARE bits, E1NWF bit and DS bit.

- GICD_ICENABLER<n>, the bits that allow disabling of SPIs.

Updates to other register fields are not tracked by this field.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:9]

Reserved, RES0.

nASSGIreq, bit [8]

When FEAT_GICv4p1 is implemented:

Controls whether SGIs have an active state.

This bit is RES0 if GICD_TYPER2.GICD_TYPER2.nASSGIcap is 0.

This bit is WI when any of GICD_CTLR.{EnableGrp0,EnableGrp1} is 1.

nASSGIreq	Meaning
`0b0`	SGIs have an active state and must be deactivated.
`0b1`	SGIs do not have an active state and do not require deactivation.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Otherwise:

Reserved, RES0.

E1NWF, bit [7]

Enable 1 of N Wakeup Functionality.

It is IMPLEMENTATION DEFINED whether this bit is programmable, or RAZ/WI.

If it is implemented, then it has the following behavior:

E1NWF	Meaning
`0b0`	A PE that is asleep cannot be picked for 1 of N interrupts.
`0b1`	A PE that is asleep can be picked for 1 of N interrupts as determined by IMPLEMENTATION DEFINED controls.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

DS, bit [6]

Disable Security. This field is RAO/WI.

Bit [5]

Reserved, RES0.

ARE, bit [4]

Affinity Routing Enable.

ARE	Meaning
0b0	Affinity routing disabled.
0b1	Affinity routing enabled.

Changing the ARE settings from 0 to 1 is UNPREDICTABLE except when all of the following apply:

- GICD_CTLR.EnableGrp1==0.
- GICD_CTLR.EnableGrp0==0.

Changing ARE from 1 to 0 is UNPREDICTABLE.

If GICv2 backwards compatibility is not implemented, this field is RAO/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Bits [3:2]

Reserved, RES0.

EnableGrp1, bit [1]

Enable Group 1 interrupts.

EnableGrp1	Meaning
0b0	Group 1 interrupts disabled.
0b1	Group 1 interrupts enabled.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enable Group 0 interrupts.

EnableGrp0	Meaning
0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICD_CTLR

If an interrupt is pending within a CPU interface when the corresponding GICD_CTLR.EnableGrpX bit is written from 1 to 0 the interrupt must be retrieved from the CPU interface.

Note

This might have no effect on the forwarded interrupt if it has already been activated. When a write changes the value of ARE for a Security state or the value of the DS bit, the format used for interpreting the remaining bits provided in the write data is the format that applied before the write takes effect.

GICD_CTLR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0000	GICD_CTLR

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ICACTIVER<n>, Interrupt Clear-Active Registers, n = 0 - 31

The GICD_ICACTIVER<n> characteristics are:

Purpose

Deactivates the corresponding interrupt. These registers are used when saving and restoring GIC state.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ICACTIVER<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ICACTIVER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICACTIVER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ICACTIVER<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	
Clear_active_bit31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27	Clear_active_bit26	Cle

Clear_active_bit<x>, bit [x], for x = 31 to 0

Removes the active state from interrupt number 32n + x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
`0b0`	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
`0b1`	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICACTIVER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ICACTIVER is (`0x380` + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Accessing GICD_ICACTIVER<n>

When affinity routing is enabled for the Security state of an interrupt, the bits corresponding to SGIs and PPIs in that Security state are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ICACTIVER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

GICD_ICACTIVER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0380` + (4 * n)	GICD_ICACTIVER<n>

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ICACTIVER<n>E, Interrupt Clear-Active Registers (extended SPI range), n = 0 - 31

The GICD_ICACTIVER<n>E characteristics are:

Purpose

Removes the active state from the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICACTIVER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICACTIVER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ICACTIVER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	
Clear_active_bit31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27	Clear_active_bit26	Cle

Clear_active_bit<x>, bit [x], for x = 31 to 0

For the extended SPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
`0b0`	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
`0b1`	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICACTIVER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ICACTIVER<n>E is (`0x1C00` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_ICACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x1C00` + (4 * n)	GICD_ICACTIVER<n>E

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ICENABLER<n>, Interrupt Clear-Enable Registers, n = 0 - 31

The GICD_ICENABLER<n> characteristics are:

Purpose

Disables forwarding of the corresponding interrupt to the CPU interfaces.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ICENABLER<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ICENABLER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICENABLER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ICENABLER<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_enable_bit31	Clear_enable_bit30	Clear_enable_bit29	Clear_enable_bit28	Clear_enable_bit27	Clear_enable_bit2

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, controls the forwarding of interrupt number 32n + x to the CPU interfaces. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
`0b0`	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
`0b1`	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICENABLER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ICENABLER is (`0x180` + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Note

Writing a 1 to a GICD_ICENABLER<n> bit only disables the forwarding of the corresponding interrupt from the Distributor to any CPU interface. It does not prevent the interrupt from changing state, for example becoming pending or active and pending if it is already active.

Accessing GICD_ICENABLER<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICENABLER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When GICD_CTLR.DS==0, bits corresponding to Group 0 and Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to GICD_ISENABLER<n> and GICD_ICENABLER<n> where n=0.

Completion of a write to this register does not guarantee that the effects of the write are visible throughout the affinity hierarchy. To ensure an enable has been cleared, software must write to the register with bits set to 1 to clear the required enables. Software must then poll GICD_CTLR.RWP until it has the value zero.

GICD_ICENABLER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0180` + (4 * n)	GICD_ICENABLER<n>

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ICENABLER<n>E, Interrupt Clear-Enable Registers, n = 0 - 31

The GICD_ICENABLER<n>E characteristics are:

Purpose

Disables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICENABLER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICENABLER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ICENABLER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_enable_bit31	Clear_enable_bit30	Clear_enable_bit29	Clear_enable_bit28	Clear_enable_bit27	Clear_enable_bit26

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For the extended SPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
`0b0`	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
`0b1`	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICENABLER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ICENABLER<n>E is (`0x1400` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_ICENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICENABLER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x1400` + (4 * n)	GICD_ICENABLER<n>E

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ICFGR<n>, Interrupt Configuration Registers, n = 0 - 63

The GICD_ICFGR<n> characteristics are:

Purpose

Determines whether the corresponding interrupt is edge-triggered or level-sensitive.

Configuration

These registers are available in all GIC configurations. If the GIC implementation supports two Security states, these registers are Common.

GICD_ICFGR1 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICFGR1 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICFGR<n>

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

For SGIs, Int_config fields are RO, meaning that GICD_ICFGR0 is RO.

Changing Int_config when the interrupt is individually enabled is UNPREDICTABLE.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

Fields corresponding to unimplemented interrupts are RAZ/WI.

Attributes

GICD_ICFGR<n> is a 32-bit register.

Field descriptions

31 30	29 28	27 26	25 24	23 22	21 20	19 18	17 16	15 14	13
Int_config15	Int_config14	Int_config13	Int_config12	Int_config11	Int_config10	Int_config9	Int_config8	Int_config7	Int_cor

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b10	Corresponding interrupt is edge-triggered.

Int_config[0] (bit [2x]) is RES0.

For SGIs, this field always indicates edge-triggered.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICD_ICFGR<n>

For SPIs and PPIs, when GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICD_ICFGR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0C00` + (4 * n)	GICD_ICFGR<n>

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ICFGR<n>E, Interrupt Configuration Registers (Extended SPI Range), n = 0 - 63

The GICD_ICFGR<n>E characteristics are:

Purpose

Determines whether the corresponding SPI in the extended SPI range is edge-triggered or level-sensitive.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICFGR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICFGR<n>E registers is ((GICD_TYPER.ESPI_range+1)*2). Registers are numbered from 0.

Attributes

GICD_ICFGR<n>E is a 32-bit register.

Field descriptions

<table>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td></tr>

</table>

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

Int_config[0] (bit[2x]) is RES0.

Int_config<x>	Meaning
`0b00`	Corresponding interrupt is level-sensitive.
`0b10`	Corresponding interrupt is edge-triggered.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICD_ICFGR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICFGR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICFGR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

GICD_ICFGR<n>E, Interrupt Configuration Registers (Extended SPI Range), n = 0 - 63

GIC Distributor	Dist_base	`0x3000` + (4 * n)	GICD_ICFGR<n>E

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICD_ICPENDR<n>, Interrupt Clear-Pending Registers, n = 0 - 31

The GICD_ICPENDR<n> characteristics are:

Purpose

Removes the pending state from the corresponding interrupt.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ICPENDR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ICPENDR0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICPENDR0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ICPENDR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_pending_bit31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_pending_bit27	Clear_pendi

Clear_pending_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, removes the pending state from interrupt number 32n + x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
`0b0`	If read, indicates that the corresponding interrupt is not pending on any PE. If written, has no effect.
`0b1`	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: • If the interrupt is an SGI. In this case, the write is ignored. The pending state of an SGI can be cleared using GICD_CPENDSGIR<n>. • If the interrupt is not pending and is not active and pending. • If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICPENDR<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ICPENDR is (`0x200` + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Accessing GICD_ICPENDR<n>

Clear-pending bits for SGIs are RO/WI.

When affinity routing is enabled for the Security state of an interrupt:

- Bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ICPENDR0.
- Bits corresponding to Group 0 and Group 1 Secure interrupts can only be cleared by Secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

GICD_ICPENDR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0280` + (4 * n)	GICD_ICPENDR<n>

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ICPENDR<n>E, Interrupt Clear-Pending Registers (extended SPI range), n = 0 - 31

The GICD_ICPENDR<n>E characteristics are:

Purpose

Removes the pending state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ICPENDR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICPENDR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ICPENDR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_pending_bit31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_pending_bit27	Clear_pendi

Clear_pending_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the pending state to interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: • If the interrupt is not pending and is not active and pending. • If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICPENDR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ICPENDR<n>E is (`0x1800` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_ICPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICPENDR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x1800` + (4 * n)	GICD_ICPENDR<n>E

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_IGROUPR<n>, Interrupt Group Registers, n = 0 - 31

The GICD_IGROUPR<n> characteristics are:

Purpose

Controls whether the corresponding interrupt is in Group 0 or Group 1.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Secure.

The number of implemented GICD_IGROUPR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_IGROUPR0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_IGROUPR0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_IGROUPR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Group_status_bit31	Group_status_bit30	Group_status_bit29	Group_status_bit28	Group_status_bit27	Group_status_bit2

Group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit.

Group_status_bit<x>	Meaning
`0b0`	When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.
`0b1`	When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGRPMODR<n> to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICD_IGRPMODR<n>.

If affinity routing is disabled for the Security state of an interrupt, then:

- The corresponding GICD_IGRPMODR<n> bit is RES0.
- For Secure interrupts, the interrupt is Secure Group 0.
- For Non-secure interrupts, the interrupt is Non-secure Group 1.

The reset behavior of this field is:

- On a GIC reset:

  - When n == 0, this field resets to an UNKNOWN value.
  - When n > 0, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGROUP<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_IGROUP is (`0x080` + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Accessing GICD_IGROUPR<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_IGROUPR0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Accesses to GICD_IGROUPR0 when affinity routing is not enabled for a Security state access the same state as GICR_IGROUPR0, and must update Redistributor state associated with the PE performing the accesses. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IGROUPR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0080` + (4 * n)	GICD_IGROUPR<n>

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_IGROUPR<n>E, Interrupt Group Registers (extended SPI range), n = 0 - 31

The GICD_IGROUPR<n>E characteristics are:

Purpose

Controls whether the corresponding SPI in the extended SPI range is in Group 0 or Group 1.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IGROUPR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1:

- The number of implemented GICD_IGROUPR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.
- When GICD_CTLR.DS==0, this register is Secure.

Attributes

GICD_IGROUPR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Group_status_bit31	Group_status_bit30	Group_status_bit29	Group_status_bit28	Group_status_bit27	Group_status_bit2

Group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit.

Group_status_bit<x>	Meaning
`0b0`	When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.
`0b1`	When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGRPMODR<n>E to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICD_IGRPMODR<n>E.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0:

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGROUPR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_IGROUPR<n>E is (`0x1000` + (4*n)).

- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_IGROUPR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGROUPR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IGROUPR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x1000` + (4 * n)	GICD_IGROUPR<n>E

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_IGRPMODR<n>, Interrupt Group Modifier Registers, n = 0 - 31

The GICD_IGRPMODR<n> characteristics are:

Purpose

When GICD_CTLR.DS==0, this register together with the GICD_IGROUPR<n> registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- Secure Group 1.

Configuration

When GICD_CTLR.DS==0, these registers are Secure.

The number of implemented GICD_IGROUPR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

When GICD_CTLR.ARE_S==0 or GICD_CTLR.DS==1, the GICD_IGRPMODR<n> registers are RES0. An implementation can make these registers RAZ/WI in this case.

Attributes

GICD_IGRPMODR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	
Group_modifier_bit31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28	Group_modifier_bit27	Group_

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. When affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGROUPR<n> to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
`0b0`	`0b0`	Secure Group 0	G0S
`0b0`	`0b1`	Non-secure Group 1	G1NS
`0b1`	`0b0`	Secure Group 1	G1S
`0b1`	`0b1`	Reserved, treated as Non-secure Group 1	-

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGRPMODR<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_IGRPMODR is (`0x080` + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

See GICD_IGROUPR<n> for information about the GICD_IGRPMODR0 reset value.

Accessing GICD_IGRPMODR<n>

When affinity routing is enabled for Secure state, GICD_IGRPMODR0 is RES0 and equivalent functionality is proved by GICR_IGRPMODR0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IGRPMODR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0D00` + (4 * n)	GICD_IGRPMODR<n>

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_IGRPMODR<n>E, Interrupt Group Modifier Registers (extended SPI range), n = 0 - 31

The GICD_IGRPMODR<n>E characteristics are:

Purpose

When GICD_CTLR.DS==0, this register together with the GICD_IGROUPR<n>E registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IGRPMODR<n>E are RES0.

GICD_IGRPMODR<n>E resets to `0x00000000`.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1:

- The number of implemented GICD_IGRPMODR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.
- When GICD_CTLR.DS==0, this register is Secure.

Attributes

GICD_IGRPMODR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	
Group_modifier_bit31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28	Group_modifier_bit27	Group_

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGROUPR<n>E to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
`0b0`	`0b0`	Secure Group 0	G0S
`0b0`	`0b1`	Non-secure Group 1	G1NS
`0b1`	`0b0`	Secure Group 1	G1S
`0b1`	`0b1`	Reserved, treated as Non-secure Group 1	-

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGRPMODR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_IGRPMODR<n>E is (`0x3400` + (4*n)).

- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_IGRPMODR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGRPMODR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IGRPMODR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x3400` + (4 * n)	GICD_IGRPMODR<n>E

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICD_IIDR, Distributor Implementer Identification Register

The GICD_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the Distributor.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GICD_IIDR is a 32-bit register.

Field descriptions

31:24	23:20	19:16	15:12	11:0
ProductID	RES0	Variant	Revision	Implementer

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the Distributor:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is `0x4`.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore `0x3B`.

Accessing GICD_IIDR

GICD_IIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0008`	GICD_IIDR

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_INMIR<n>, Non-maskable Interrupt Registers, x = 0 to 31, n = 0 - 31

The GICD_INMIR<n> characteristics are:

Purpose

Holds whether the corresponding SPI has the non-maskable property.

Configuration

This register is present only when FEAT_GICv3_NMI is implemented. Otherwise, direct accesses to GICD_INMIR<n> are RES0.

When GICR_TYPER.NMI is 0, this register is RES0.

The number of implemented GICD_INMIR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

Attributes

GICD_INMIR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
NMI31	NMI30	NMI29	NMI28	NMI27	NMI26	NMI25	NMI24	NMI23	NMI22	NMI21	NMI20	NMI19	NMI18	NMI17	NMI16	NMI15	NMI1

NMI<x>, bit [x], for x = 31 to 0

Non-maskable property.

NMI<x>	Meaning
0b0	Interrupt does not have the non-maskable property.
0b1	Interrupt has the the non-maskable property.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_INMI<n> number, n, is given by n = (m DIV 32).
- The offset of the required GICD_INMI is (0xF80 + (4*n)).
- The bit number of the required in this register is (m MOD 32).

Accessing GICD_INMIR<n>

For SGIs and PPIs:

- The field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_INMIR0.

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGROUPR<n>E, the corresponding bit is RES0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_INMIR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0F80` + (4 * n)	GICD_INMIR<n>

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_INMIR<n>E, Non-maskable Interrupt Registers for Extended SPIs, x = 0 to 31, n = 0 - 31

The GICD_INMIR<n>E characteristics are:

Purpose

Holds whether the corresponding SPI in the extended SPI range has the non-maskable property.

Configuration

This register is present only when FEAT_GICv3p1 is implemented and FEAT_GICv3_NMI is implemented. Otherwise, direct accesses to GICD_INMIR<n>E are RES0.

When GICD_TYPER.ESPI is 0 or GICD_TYPER.NMI is 0, these registers are RES0.

When GICD_TYPER.ESPI is 1: the number of implemented GICD_INMIR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_INMIR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
NMI31	NMI30	NMI29	NMI28	NMI27	NMI26	NMI25	NMI24	NMI23	NMI22	NMI21	NMI20	NMI19	NMI18	NMI17	NMI16	NMI15	NMI1

NMI<x>, bit [x], for x = 31 to 0

Non-maskable property.

NMI<x>	Meaning
`0b0`	Interrupt does not have the non-maskable property.
`0b1`	Interrupt has the the non-maskable property.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_INMIR<n>E number, n, is given by n = ((m-4096) DIV 32).
- The offset of the required GICD_INMIR<n>E is (`0x3B00` + (4*n)).
- The bit number in this register is ((m-4096) MOD 32).

Accessing GICD_INMIR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGROUPR<n>E, the corresponding bit is RES0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_INMIR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x3B00` + (4 * n)	GICD_INMIR<n>E

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_IPRIORITYR<n>, Interrupt Priority Registers, n = 0 - 254

The GICD_IPRIORITYR<n> characteristics are:

Purpose

Holds the priority of the corresponding interrupt.

Configuration

These registers are available in all configurations of the GIC. When GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_IPRIORITYR<n> registers is 8*(GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_IPRIORITYR0 to GICD_IPRIORITYR7 are Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_IPRIORITYR0 to GICD_IPRIORITYR7 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_IPRIORITYR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Priority_offset_3B								Priority_offset_2B								Priority_offset_1B								Priority_offset_0B							

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IPRIORITYR<n> number, n, is given by n = m DIV 4.
- The offset of the required GICD_IPRIORITYR<n> register is (`0x400` + (4*n)).
- The byte offset of the required Priority field in this register is m MOD 4, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Accessing GICD_IPRIORITYR<n>

These registers are always used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt:

- GICR_IPRIORITYR<n> is used instead of GICD_IPRIORITYR<n> where n = 0 to 7 (that is, for SGIs and PPIs).
- GICD_IPRIORITYR<n> is RAZ/WI where n = 0 to 7.

These registers are byte-accessible.

A register field corresponding to an unimplemented interrupt is RAZ/WI.

A GIC might implement fewer than eight priority bits, but must implement at least bits [7:4] of each field. In each field, unimplemented bits are RAZ/WI, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When GICD_CTLR.DS==0:

- A register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in 'Software accesses of interrupt priority' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

It is IMPLEMENTATION DEFINED whether changing the value of a priority field changes the priority of an active interrupt.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IPRIORITYR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0400` + (4 * n)	GICD_IPRIORITYR<n>

Accesses on this interface are **RW**.

GICD_IPRIORITYR<n>E, Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC., n = 0 - 255

The GICD_IPRIORITYR<n>E characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IPRIORITYR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_IPRIORITYR<n>E registers is ((GICD_TYPER.ESPI_range+1)*8). Registers are numbered from 0.

Attributes

GICD_IPRIORITYR<n>E is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0
Priority_offset_3B	Priority_offset_2B	Priority_offset_1B	Priority_offset_0B

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IPRIORITYR<n> number, n, is given by n = (m-4096) DIV 4.
- The offset of the required GICD_IPRIORITYR<n>E register is (`0x2000` + (4*n)).
- The byte offset of the required Priority field in this register is m MOD 4, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Accessing GICD_IPRIORITYR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

GICD_IPRIORITYR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x2000` + (4 * n)	GICD_IPRIORITYR<n>E

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_IROUTER<n>, Interrupt Routing Registers, n = 32 - 1019

The GICD_IROUTER<n> characteristics are:

Purpose

When affinity routing is enabled, provides routing information for the SPI with INTID n.

Configuration

These registers are available in all configurations of the GIC. If the GIC implementation supports two Security states, these registers are Common.

The maximum value of n is given by (32*(GICD_TYPER.ITLinesNumber+1) - 1). GICD_IROUTER<n> registers where n=0 to 31 are reserved.

Attributes

GICD_IROUTER<n> is a 64-bit register.

Field descriptions

63	62 61 60 59 58 57 56	55 54 53 52 51 50 49 48	47 46 45 44 43 42 41 40	39 38 37 36 35 34 33 32
RES0				Aff3
Interrupt_Routing_Mode	RES0	Aff2	Aff1	Aff0
31	30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Interrupt_Routing_Mode, bit [31]

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

Interrupt_Routing_Mode	Meaning
`0b0`	Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.
`0b1`	Interrupts routed to any PE defined as a participating node.

If GICD_IROUTER<n>.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending behavior is CONSTRAINED UNPREDICTABLE:

- The interrupt is not forwarded to any PE, direct reads return the written value

- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the UNKNOWN implemented PE
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the written value

In implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI.

When this bit is set to 1, GICD_IROUTER<n>.{Aff3, Aff2, Aff1, Aff0} are UNKNOWN.

Note

An implementation might choose to make the Aff<n> fields RO when this field is 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:24]

Reserved, RES0.

Aff2, bits [23:16]

Affinity level 2.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For an SPI with INTID m:

- The corresponding GICD_IROUTER<n> register number, n, is given by n = m.
- The offset of the GICD_IROUTER<n> register is `0x6000` + 8n.

Accessing GICD_IROUTER<n>

These registers are used only when affinity routing is enabled. When affinity routing is not enabled:

- These registers are RES0. An implementation is permitted to make the register RAZ/WI in this case.
- The GICD_ITARGETSR<n> registers provide interrupt routing information.

Note

When affinity routing becomes enabled for a Security state (for example, following a reset or following a write to GICD_CTLR) the value of all writeable fields in this register is UNKNOWN for that Security state. When the group of an interrupt changes so the ARE setting for the interrupt changes to 1, the value of this register is UNKNOWN for that interrupt.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any GICD_IROUTER<n> registers that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

Note

For each interrupt, a GIC implementation might support fewer than 256 values for an affinity level. In this case, some bits of the corresponding affinity level field might be RO. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IROUTER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x6000` + (8 * n)	GICD_IROUTER<n>

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICD_IROUTER<n>E, Interrupt Routing Registers (Extended SPI Range), n = 0 - 1023

The GICD_IROUTER<n>E characteristics are:

Purpose

When affinity routing is enabled, provides routing information for the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_IROUTER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_IROUTER<n>E registers is (((GICD_TYPER.ESPI_range+1)*32)-1). Registers are numbered from 0.

Attributes

GICD_IROUTER<n>E is a 64-bit register.

Field descriptions

63	62 61 60 59 58 57 56	55 54 53 52 51 50 49 48	47 46 45 44 43 42 41 40	39 38 37 36 35 34 33 32
RES0				Aff3
Interrupt_Routing_Mode	RES0	Aff2	Aff1	Aff0
31	30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Interrupt_Routing_Mode, bit [31]

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

Interrupt_Routing_Mode	Meaning
`0b0`	Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.
`0b1`	Interrupts routed to any PE defined as a participating node.

If GICD_IROUTER<n>E.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending behavior is CONSTRAINED UNPREDICTABLE:

- The interrupt is not forwarded to any PE, direct reads return the written value
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the UNKNOWN implemented PE
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the written value

In implementations that do not require 1 of N distribution of SPIs, this bit might be RAZ/WI.

When this bit is set to 1, GICD_IROUTER<n>E.{Aff3, Aff2, Aff1, Aff0} are UNKNOWN.

Note

An implementation might choose to make the Aff<n> fields RO when this field is 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:24]

Reserved, RES0.

Aff2, bits [23:16]

Affinity level 2.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For an SPI with INTID m:

- The corresponding GICD_IROUTER<n>E register number, n, is given by n = m.
- The offset of the GICD_IROUTER<n>E register is `0x6000` + 8n.

Accessing GICD_IROUTER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IROUTER<n>E, the register is RES0.

When GICD_CTLR.DS==0, a register that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IROUTER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x8000` + (8 * n)	GICD_IROUTER<n>E

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ISACTIVER<n>, Interrupt Set-Active Registers, n = 0 - 31

The GICD_ISACTIVER<n> characteristics are:

Purpose

Activates the corresponding interrupt. These registers are used when saving and restoring GIC state.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ISACTIVER<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ISACTIVER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ISACTIVER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ISACTIVER<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_active_bit31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_bit26	Set_active_bit2

Set_active_bit<x>, bit [x], for x = 31 to 0

Adds the active state to interrupt number 32n + x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
`0b0`	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
`0b1`	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISACTIVER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ISACTIVER is (`0x300` + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Accessing GICD_ISACTIVER<n>

When affinity routing is enabled for the Security state of an interrupt, bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ISACTIVER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

The bit reads as one if the status of the interrupt is active or active and pending. GICD_ISPENDR<n> and GICD_ICPENDR<n> provide the pending status of the interrupt.

GICD_ISACTIVER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0300` + (4 * n)	GICD_ISACTIVER<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ISACTIVER<n>E, Interrupt Set-Active Registers (extended SPI range), n = 0 - 31

The GICD_ISACTIVER<n>E characteristics are:

Purpose

Adds the active state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ISACTIVER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISACTIVER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ISACTIVER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_active_bit31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_bit26	Set_active_bit2

Set_active_bit<x>, bit [x], for x = 31 to 0

For the extended SPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISACTIVER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ISACTIVER<n>E is (`0x1A00` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_ISACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x1A00` + (4 * n)	GICD_ISACTIVER<n>E

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ISENABLER<n>, Interrupt Set-Enable Registers, n = 0 - 31

The GICD_ISENABLER<n> characteristics are:

Purpose

Enables forwarding of the corresponding interrupt to the CPU interfaces.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ISENABLER<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ISENABLER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ISENABLER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ISENABLER<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_enable_bit31	Set_enable_bit30	Set_enable_bit29	Set_enable_bit28	Set_enable_bit27	Set_enable_bit26	Set_enable

Set_enable_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, controls the forwarding of interrupt number 32n + x to the CPU interfaces. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
`0b0`	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
`0b1`	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISENABLER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ISENABLER is (`0x100` + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

At start-up, and after a reset, a PE can use this register to discover which peripheral INTIDs the GIC supports. If GICD_CTLR.DS==0 in a system that supports EL3, the PE must do this for the Secure view of the available interrupts, and Non-secure software running on the PE must do this discovery after the Secure software has configured interrupts as Group 0/Secure Group 1 and Non-secure Group 1.

Accessing GICD_ISENABLER<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ISENABLER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When GICD_CTLR.DS==0, bits corresponding to Group 0 or Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to GICD_ISENABLER<n> and GICD_ICENABLER<n> where n=0.

For SPIs and PPIs, each bit controls the forwarding of the corresponding interrupt from the Distributor to the CPU interfaces.

GICD_ISENABLER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0100` + (4 * n)	GICD_ISENABLER<n>

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ISENABLER<n>E, Interrupt Set-Enable Registers, n = 0 - 31

The GICD_ISENABLER<n>E characteristics are:

Purpose

Enables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ISENABLER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISENABLER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ISENABLER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_enable_bit31	Set_enable_bit30	Set_enable_bit29	Set_enable_bit28	Set_enable_bit27	Set_enable_bit26	Set_enable

Set_enable_bit<x>, bit [x], for x = 31 to 0

For the extended SPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
`0b0`	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
`0b1`	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISENABLER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ISENABLER<n>E is (`0x1200` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_ISENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISENABLER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x1200` + (4 * n)	GICD_ISENABLER<n>E

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ISPENDR<n>, Interrupt Set-Pending Registers, n = 0 - 31

The GICD_ISPENDR<n> characteristics are:

Purpose

Adds the pending state to the corresponding interrupt.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ISPENDR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ISPENDR0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ISPENDR0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ISPENDR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	
Set_pending_bit31	Set_pending_bit30	Set_pending_bit29	Set_pending_bit28	Set_pending_bit27	Set_pending_bit26	Se

Set_pending_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, adds the pending state to interrupt number 32n + x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
`0b0`	If read, indicates that the corresponding interrupt is not pending on any PE. If written, has no effect.
`0b1`	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: • If the interrupt is an SGI. The pending state of an SGI can be set using GICD_SPENDSGIR<n>. • If the interrupt is not inactive and is not active. • If the interrupt is already pending because of a write to GICD_ISPENDR<n>. • If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Accessing GICD_ISPENDR<n>

Set-pending bits for SGIs are read-only and ignore writes. The Set-pending bits for SGIs are provided as GICD_SPENDSGIR<n>.

When affinity routing is enabled for the Security state of an interrupt:

- Bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ISPENDR0.
- Bits corresponding to Group 0 and Group 1 Secure interrupts can only be set by Secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

GICD_ISPENDR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0200` + (4 * n)	GICD_ISPENDR<n>

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ISPENDR<n>E, Interrupt Set-Pending Registers (extended SPI range), n = 0 - 31

The GICD_ISPENDR<n>E characteristics are:

Purpose

Adds the pending state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_ISPENDR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISPENDR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ISPENDR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	
Set_pending_bit31	Set_pending_bit30	Set_pending_bit29	Set_pending_bit28	Set_pending_bit27	Set_pending_bit26	Se

Set_pending_bit<x>, bit [x], for x = 31 to 0

For the extended SPIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: • If the interrupt is already pending because of a write to GICD_ISPENDR<n>E. • If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISPENDR<n>E number, n, is given by n = (m-4096) DIV 32.

- The offset of the required GICD_ISPENDR<n>E is (`0x1600` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_ISPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISPENDR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x1600` + (4 * n)	GICD_ISPENDR<n>E

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_ITARGETSR<n>, Interrupt Processor Targets Registers, n = 0 - 254

The GICD_ITARGETSR<n> characteristics are:

Purpose

When affinity routing is not enabled, holds the list of target PEs for the interrupt. That is, it holds the list of CPU interfaces to which the Distributor forwards the interrupt if it is asserted and has sufficient priority.

Configuration

These registers are available in all configurations of the GIC. When GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ITARGETSR<n> registers is 8*(GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ITARGETSR0 to GICD_ITARGETSR7 are Banked for each connected PEwith GICR_TYPER.Processor_Number < 8.

Accessing GICD_ITARGETSR0 to GICD_ITARGETSR7 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ITARGETSR<n> is a 32-bit register.

Field descriptions

31:24	23:16	15:8	7:0
CPU_targets_offset_3B	CPU_targets_offset_2B	CPU_targets_offset_1B	CPU_targets_offset_0B

PEs in the system number from 0, and each bit in a PE targets field refers to the corresponding PE. For example, a value of `0x3` means that the Pending interrupt is sent to PEs 0 and 1. For GICD_ITARGETSR0-GICD_ITARGETSR7, a read of any targets field returns the number of the PE performing the read.

CPU_targets_offset_3B, bits [31:24]

PE targets for an interrupt, at byte offset 3.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

CPU_targets_offset_2B, bits [23:16]

PE targets for an interrupt, at byte offset 2.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

CPU_targets_offset_1B, bits [15:8]

PE targets for an interrupt, at byte offset 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

CPU_targets_offset_0B, bits [7:0]

PE targets for an interrupt, at byte offset 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

The bits that are set to 1 in the PE targets field determine which PEs are targeted:

Value of PE targets field	Interrupt targets
0bxxxxxxx1	CPU interface 0
0bxxxxxx1x	CPU interface 1
0bxxxxx1xx	CPU interface 2
0bxxxx1xxx	CPU interface 3
0bxxx1xxxx	CPU interface 4
0bxx1xxxxx	CPU interface 5
0bx1xxxxxx	CPU interface 6
0b1xxxxxxx	CPU interface 7

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ITARGETSR<n> number, n, is given by n = m DIV 4.
- The offset of the required GICD_ITARGETSR<n> register is (0x800 + (4*n)).
- The byte offset of the required Priority field in this register is m MOD 4, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Software can write to these registers at any time. Any change to a targets field value:

- Has no effect on any active interrupt. This means that removing a CPU interface from a targets list does not cancel an active state for interrupts on that CPU interface. There is no effect on interrupts that are active and pending until the active status is cleared, at which time it is treated as a pending interrupt.
- Has an effect on any pending interrupts. This means:
  - Enables the CPU interface to be chosen as a target for the pending interrupt using an IMPLEMENTATION DEFINED mechanism.
  - Removing a CPU interface from the target list of a pending interrupt removes the pending state of the interrupt on that CPU interface.

Accessing GICD_ITARGETSR<n>

These registers are used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt, the target PEs for an interrupt are defined by GICD_IROUTER<n> and the associated byte in GICD_ITARGETSR<n> is RES0. An implementation is permitted to make the byte RAZ/WI in this case.

- These registers are byte-accessible.
- A register field corresponding to an unimplemented interrupt is RAZ/WI.
- A field bit corresponding to an unimplemented CPU interface is RAZ/WI.
- GICD_ITARGETSR0-GICD_ITARGETSR7 are read-only. Each field returns a value that corresponds only to the PE reading the register.
- It is IMPLEMENTATION DEFINED which, if any, SPIs are statically configured in hardware. The field for such an SPI is read-only, and returns a value that indicates the PE targets for the interrupt.
- If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

In a single connected PE implementation, all interrupts target one PE, and these registers are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_ITARGETSR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0800` + (4 * n)	GICD_ITARGETSR<n>

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_NSACR<n>, Non-secure Access Control Registers, n = 0 - 63

The GICD_NSACR<n> characteristics are:

Purpose

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

Configuration

The concept of selective enabling of Non-secure access to Group 0 and Secure Group 1 interrupts applies to SGIs and SPIs.

GICD_NSACR0 is a Banked register used for SGIs. A copy is provided for every PE that has a CPU interface and that supports this feature.

Attributes

GICD_NSACR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
NS_access15		NS_access14		NS_access13		NS_access12		NS_access11		NS_access10		NS_access9		NS_access8		NS_access7	

NS_access<x>, bits [2x+1:2x], for x = 15 to 0

Controls Non-secure access of the interrupt with ID 16n + x.

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:

NS_access<x>	Meaning
0b00	No Non-secure access is permitted to fields associated with the corresponding interrupt.
0b01	Non-secure read and write access is permitted to set-pending bits in GICD_ISPENDR<n> associated with the corresponding interrupt. A Non-secure write access to GICD_SETSPI_NSR is permitted to set the pending state of the corresponding interrupt. A Non-secure write access to GICD_SGIR is permitted to generate a Secure SGI for the corresponding interrupt. An implementation might also provide read access to clear-pending bits in GICD_ICPENDR<n> associated with the corresponding interrupt.
0b10	As 0b01, but adds Non-secure read and write access permission to fields associated with the corresponding interrupt in the GICD_ICPENDR<n> registers. A Non-secure write access to GICD_CLRSPI_NSR is permitted to clear the pending state of the corresponding interrupt. Also adds Non-secure read access permission to fields associated with the corresponding interrupt in the GICD_ISACTIVER<n> and GICD_ICACTIVER<n> registers.
0b11	For GICD_NSACR0 this encoding is reserved and treated as 10. For all other GICD_NSACR<n> registers this encoding is treated as 0b10, but adds Non-secure read and write access permission to GICD_ITARGETSR<n> and GICD_IROUTER<n> fields associated with the corresponding interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_NSACR<n> number, n, is given by n = m DIV 16.
- The offset of the required GICD_NSACR<n> register is (0xE00 + (4*n)).

Note

Because each field in this register comprises two bits, GICD_NSACR0 controls access rights to SGI registers, GICD_NSACR1 controls access to PPI registers (and is always RAZ/WI), and all other GICD_NSACR<n> registers control access to SPI registers.

For compatibility with GICv2, writes to GICD_NSACR0 for a particular PE must be coordinated within the Distributor and must update GICR_NSACR for the Redistributor associated with that PE.

Accessing GICD_NSACR<n>

These registers are always used when affinity routing is not enabled. When affinity routing is enabled for the Secure state, GICD_NSACR0 is RES0 and GICR_NSACR provides equivalent functionality for SGIs.

These registers do not support PPIs, therefore GICD_NSACR1 is RAZ/WI.

GICD_NSACR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0E00 + (4 * n)	GICD_NSACR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **RAZ/WI**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **RW**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **RAZ/WI**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_NSACR<n>E, Non-secure Access Control Registers, n = 0 - 63

The GICD_NSACR<n>E characteristics are:

Purpose

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICD_NSACR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICFGR<n>E registers is ((GICD_TYPER.ESPI_range+1)*2). Registers are numbered from 0.

Attributes

GICD_NSACR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
NS_access15		NS_access14		NS_access13		NS_access12		NS_access11		NS_access10		NS_access9		NS_access8		NS_access7	

NS_access<x>, bits [2x+1:2x], for x = 15 to 0

Controls Non-secure access of the interrupt with ID 16n + x.

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:

NS_access<x>	Meaning
0b00	No Non-secure access is permitted to fields associated with the corresponding interrupt.
0b01	Non-secure read and write access is permitted to set-pending bits in GICD_ISPENDR<n>E associated with the corresponding interrupt. A Non-secure write access to GICD_SETSPI_NSR is permitted to set the pending state of the corresponding interrupt.
0b10	As 0b01, but adds Non-secure read and write access permission to fields associated with the corresponding interrupt in the GICD_ICPENDR<n>E registers. A Non-secure write access to GICD_CLRSPI_NSR is permitted to clear the pending state of the corresponding interrupt. Also adds Non-secure read access permission to fields associated with the corresponding interrupt in the GICD_ISACTIVER<n>E and GICD_ICACTIVER<n>E registers.
0b11	This encoding is treated as 0b10, but adds Non-secure read and write access permission to GICD_IROUTER<n>E fields associated with the corresponding interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_NSACR<n>E number, n, is given by n = (m - 4096) DIV 16.
- The offset of the required GICD_NSACR<n>E register is (0x3600 + (4*n)).

Accessing GICD_NSACR<n>E

GICD_NSACR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x3600 + (4 * n)	GICD_NSACR<n>E

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **RAZ/WI**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **RW**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **RAZ/WI**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_SETSPI_NSR, Set Non-secure SPI Pending Register

The GICD_SETSPI_NSR characteristics are:

Purpose

Adds the pending state to a valid SPI if permitted by the Security state of the access and the GICD_NSACR<n> value for that SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

If GICD_TYPER.MBIS == 0, this register is reserved.

When GICD_CTLR.DS == 1, this register provides functionality for all SPIs.

Attributes

GICD_SETSPI_NSR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13	12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	INTID

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to GICD_CLRSPI_NSR, GICD_CLRSPI_SR, or GICD_ICPENDR<n>.
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to GICD_CLRSPI_NSR or GICD_CLRSPI_SR. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_SETSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding GICD_NSACR<n> register is 0.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can set the pending state of any valid SPI.

GICD_SETSPI_NSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0040`	GICD_SETSPI_NSR

Accesses on this interface are **WO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_SETSPI_SR, Set Secure SPI Pending Register

The GICD_SETSPI_SR characteristics are:

Purpose

Adds the pending state to a valid SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

If GICD_TYPER.MBIS == 0, this register is reserved.

When GICD_CTLR.DS == 1, this register is WI.

Attributes

GICD_SETSPI_SR is a 32-bit register.

Field descriptions

31–13	12–0
RES0	INTID

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to GICD_CLRSPI_NSR, GICD_CLRSPI_SR, or GICD_ICPENDR<n>.
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to GICD_CLRSPI_NSR or GICD_CLRSPI_SR. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_SETSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICD_SETSPI_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0050`	GICD_SETSPI_SR

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **WI**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **WO**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **WI**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_SGIR, Software Generated Interrupt Register

The GICD_SGIR characteristics are:

Purpose

Controls the generation of SGIs.

Configuration

This register is available in all configurations of the GIC. If the GIC supports two Security states this register is Common.

Attributes

GICD_SGIR is a 32-bit register.

Field descriptions

31 30 29 28 27 26	25 24	23 22 21 20 19 18 17 16	15	14 13 12 11 10 9 8 7 6 5 4	3 2 1 0
RES0	TargetListFilter	CPUTargetList	NSATT	RES0	INTID

Bits [31:26]

Reserved, RES0.

TargetListFilter, bits [25:24]

Determines how the Distributor processes the requested SGI.

TargetListFilter	Meaning
`0b00`	Forward the interrupt to the CPU interfaces specified by GICD_SGIR.CPUTargetList.
`0b01`	Forward the interrupt to all CPU interfaces except that of the PE that requested the interrupt.
`0b10`	Forward the interrupt only to the CPU interface of the PE that requested the interrupt.
`0b11`	Reserved.

CPUTargetList, bits [23:16]

When GICD_SGIR.TargetListFilter is `0b00`, this field defines the CPU interfaces to which the Distributor must forward the interrupt.

Each bit of the field refers to the corresponding CPU interface. For example, CPUTargetList[0] corresponds to interface 0. Setting a bit to 1 indicates that the interrupt must be forwarded to the corresponding interface.

If this field is `0b00000000` when GICD_SGIR.TargetListFilter is `0b00`, the Distributor does not forward the interrupt to any CPU interface.

NSATT, bit [15]

Specifies the required group of the SGI.

NSATT	Meaning
`0b0`	Forward the SGI specified in the INTID field to a specified CPU interface only if the SGI is configured as Group 0 on that interface.
`0b1`	Forward the SGI specified in the INTID field to a specified CPU interface only if the SGI is configured as Group 1 on that interface.

This field is writable only by a Secure access. Non-secure accesses can also generate Group 0 interrupts, if allowed to do so by GICD_NSACR0. Otherwise, Non-secure writes to GICD_SGIR generate an SGI only if the specified SGI is programmed as Group 1, regardless of the value of bit [15] of the write.

Bits [14:4]

Reserved, RES0.

INTID, bits [3:0]

The INTID of the SGI to forward to the specified CPU interfaces.

Accessing GICD_SGIR

This register is used only when affinity routing is not enabled. When affinity routing is enabled, this register is RES0.

It is IMPLEMENTATION DEFINED whether this register has any effect when the forwarding of interrupts by the Distributor is disabled by GICD_CTLR.

GICD_SGIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0F00`	GICD_SGIR

Accesses on this interface are **WO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_SPENDSGIR<n>, SGI Set-Pending Registers, n = 0 - 3

The GICD_SPENDSGIR<n> characteristics are:

Purpose

Adds the pending state to an SGI.

A write to this register changes the state of an inactive SGI to pending, and the state of an active SGI to active and pending.

Configuration

Four SGI set-pending registers are implemented. Each register contains eight set-pending bits for each of four SGIs, for a total of 16 possible SGIs.

In multiprocessor implementations, each PE has a copy of these registers.

Attributes

GICD_SPENDSGIR<n> is a 32-bit register.

Field descriptions

31–24	23–16	15–8	7–0
SGI_set_pending_bits3	SGI_set_pending_bits2	SGI_set_pending_bits1	SGI_set_pending_bits0

SGI_set_pending_bits<x>, bits [8x+7:8x], for x = 3 to 0

Adds the pending state to SGI number 4n + x for the PE corresponding to the bit number written to.

Reads and writes have the following behavior:

SGI_set_pending_bits<x>	Meaning
`0x00`	If read, indicates that the SGI from the corresponding PE is not pending and is not active and pending. If written, has no effect.
`0x01`	If read, indicates that the SGI from the corresponding PE is pending or is active and pending. If written, adds the pending state to the SGI for the corresponding PE.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For SGI ID m, generated by processing element C writing to the corresponding GICD_SGIR field, where DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_SPENDSGIR<n> number is given by n = m DIV 4.
- The offset of the required register is (`0xF20` + (4n)).
- The offset of the required field within the register GICD_SPENDSGIR<n> is given by m MOD 4.
- The required bit in the 8-bit SGI set-pending field m is bit C.

Accessing GICD_SPENDSGIR<n>

These registers are used only when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt then the bit associated with SGI in that Security state is RES0. An implementation is permitted to make the register RAZ/WI in this case.

A register bit that corresponds to an unimplemented SGI is RAZ/WI.

These registers are byte-accessible.

If the GIC implementation supports two Security states:

- A register bit that corresponds to a Group 0 interrupt is RAZ/WI to Non-secure accesses.
- Register bits corresponding to unimplemented PEs are RAZ/WI.

GICD_SPENDSGIR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0F20` + (4 * n)	GICD_SPENDSGIR<n>

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_STATUSR, Error Reporting Status Register

The GICD_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

Attributes

GICD_STATUSR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4	3	2	1	0
RES0	WROD	RWOD	WRD	RRD

Bits [31:4]

Reserved, RES0.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICD_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

GICD_STATUSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0010	GICD_STATUSR (S)

When an access is Secure access on this interface are **RW**.

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0010	GICD_STATUSR (NS)

When an access is Non-secure access on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_TYPER, Interrupt Controller Type Register

The GICD_TYPER characteristics are:

Purpose

Provides information about what features the GIC implementation supports. It indicates:

- Whether the GIC implementation supports two Security states.
- The maximum number of INTIDs that the GIC implementation supports.
- The number of PEs that can be used as interrupt targets.

Configuration

This register is available in all configurations of the GIC. When GICD_CTLR.DS==0, this register is Common.

Attributes

GICD_TYPER is a 32-bit register.

Field descriptions

31 30 29 28 27	26	25	24	23 22 21 20 19	18	17	16	15 14 13 12 11	10	9	8	7 6 5	4 3 2 1 0
ESPI_range	RSS	No1N	A3V	IDbits	DVIS	LPIS	MBIS	num_LPIs	SecurityExtn	NMI	ESPI	CPUNumber	ITLinesNumber

ESPI_range, bits [31:27]

When GICD_TYPER.ESPI == 1:

Indicates the maximum INTID in the Extended SPI range.

Maximum Extended SPI INTID is (32*(ESPI_range + 1) + 4095).

The ESPI_range field only indicates the maximum number of SPIs that the GIC implementation might support. This value determines the number of instances of the following interrupt registers:

- GICD_IGROUPR<n>E.
- GICD_ISENABLER<n>E.
- GICD_ICENABLER<n>E.
- GICD_ISPENDR<n>E.
- GICD_ICPENDR<n>E.
- GICD_ISACTIVER<n>E.
- GICD_ICACTIVER<n>E.
- GICD_IPRIORITYR<n>E.
- GICD_ICFGR<n>E.
- GICD_IROUTER<n>E.
- GICD_IGRPMODR<n>E.

The GIC architecture does not require a GIC implementation to support a continuous range of SPI interrupt IDs. Software must check which SPI INTIDs are supported, up to the maximum value indicated by GICD_TYPER.ESPI_range.

Otherwise:

Reserved, RES0.

RSS, bit [26]

Range Selector Support.

RSS	Meaning
0b0	The IRI supports targeted SGIs with affinity level 0 values of 0 - 15.
0b1	The IRI supports targeted SGIs with affinity level 0 values of 0 - 255.

No1N, bit [25]

Indicates whether 1 of N SPI interrupts are supported.

No1N	Meaning
0b0	1 of N SPI interrupts are supported.
0b1	1 of N SPI interrupts are not supported.

A3V, bit [24]

Affinity 3 valid. Indicates whether the Distributor supports nonzero values of Affinity level 3.

A3V	Meaning
0b0	The Distributor only supports zero values of Affinity level 3.
0b1	The Distributor supports nonzero values of Affinity level 3.

IDbits, bits [23:19]

The number of interrupt identifier bits supported, minus one.

DVIS, bit [18]
When FEAT_GICv4 is implemented:

Indicates whether the implementation supports Direct Virtual LPI injection.

DVIS	Meaning
0b0	The implementation does not support Direct Virtual LPI injection.
0b1	The implementation supports Direct Virtual LPI injection.

Otherwise:

Reserved, RES0.

LPIS, bit [17]

Indicates whether the implementation supports LPIs.

LPIS	Meaning
0b0	The implementation does not support LPIs.
0b1	The implementation supports LPIs.

MBIS, bit [16]

Indicates whether the implementation supports message-based interrupts by writing to Distributor registers.

MBIS	Meaning
0b0	The implementation does not support message-based interrupts by writing to Distributor registers. The GICD_CLRSPI_NSR, GICD_SETSPI_NSR, GICD_CLRSPI_SR, and GICD_SETSPI_SR registers are reserved.
0b1	The implementation supports message-based interrupts by writing to the GICD_CLRSPI_NSR, GICD_SETSPI_NSR, GICD_CLRSPI_SR, or GICD_SETSPI_SR registers.

num_LPIs, bits [15:11]

Number of supported LPIs.

- `0b00000` Number of LPIs as indicated by GICD_TYPER.IDbits.
- All other values Number of LPIs supported is $2^{(num\_LPIs+1)}$.
    - Available LPI INTIDs are 8192..(8192 + $2^{(num\_LPIs+1)}$ - 1).
    - This field cannot indicate a maximum LPI INTID greater than that indicated by GICD_TYPER.IDbits.

When the supported INTID width is less than 14 bits, this field is RES0 and no LPIs are supported.

SecurityExtn, bit [10]

Indicates whether the GIC implementation supports two Security states:

When GICD_CTLR.DS == 1, this field is RAZ.

SecurityExtn	Meaning
`0b0`	The GIC implementation supports only a single Security state.
`0b1`	The GIC implementation supports two Security states.

NMI, bit [9]

Non-maskable Interrupts.

NMI	Meaning
`0b0`	Non-maskable interrupt property not supported.
`0b1`	Non-maskable interrupt property is supported.

ESPI, bit [8]

Extended SPI.

ESPI	Meaning
`0b0`	Extended SPI range not implemented.
`0b1`	Extended SPI range implemented.

CPUNumber, bits [7:5]

Reports the number of PEs that can be used when affinity routing is not enabled, minus 1.

These PEs must be numbered contiguously from zero, but the relationship between this number and the affinity hierarchy from MPIDR is IMPLEMENTATION DEFINED. If the implementation does not support ARE being zero, this field is 000.

ITLinesNumber, bits [4:0]

For the INTID range 32 to 1019, indicates the maximum SPI supported.

If the value of this field is N, the maximum SPI INTID is 32(N+1) minus 1. For example, 00011 specifies that the maximum SPI INTID in is 127.

Regardless of the range of INTIDs defined by this field, interrupt IDs 1020-1023 are reserved for special purposes.

A value of 0 indicates no SPIs are support.

The ITLinesNumber field only indicates the maximum number of SPIs that the GIC implementation might support. This value determines the number of instances of the following interrupt registers:

- GICD_IGROUPR<n>.
- GICD_ISENABLER<n>.
- GICD_ICENABLER<n>.
- GICD_ISPENDR<n>.
- GICD_ICPENDR<n>.
- GICD_ISACTIVER<n>.
- GICD_ICACTIVER<n>.
- GICD_IPRIORITYR<n>.
- GICD_ITARGETSR<n>.
- GICD_ICFGR<n>.
- GICD_IROUTER<n>.
- GICD_IGRPMODR<n>.

The GIC architecture does not require a GIC implementation to support a continuous range of SPI interrupt IDs. Software must check which SPI INTIDs are supported, up to the maximum value indicated by GICD_TYPER.ITLinesNumber.

Accessing GICD_TYPER

GICD_TYPER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x0004`	GICD_TYPER

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICD_TYPER2, Interrupt Controller Type Register 2

The GICD_TYPER2 characteristics are:

Purpose

Provides information about which features the GIC implementation supports.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GICD_TYPER2 are RES0.

When GICD_CTLR.DS == 0, this register is Common.

Attributes

GICD_TYPER2 is a 32-bit register.

Field descriptions

31–9	8	7	6–5	4–0
RES0	nASSGIcap	VIL	RES0	VID

Bits [31:9]

Reserved, RES0.

nASSGIcap, bit [8]

Indicates whether SGIs can be configured to not have an active state.

nASSGIcap	Meaning
`0b0`	SGIs have an active state.
`0b1`	SGIs can be globally configured not to have an active state.

This bit is RES0 on implementations that support two Security states.

VIL, bit [7]

Indicates whether 16 bits of vPEID are implemented.

VIL	Meaning
`0b0`	GIC supports 16-bit vPEID.
`0b1`	GIC supports GICD_TYPER2.VID + 1 bits of vPEID.

Bits [6:5]

Reserved, RES0.

VID, bits [4:0]

When GICD_TYPER2.VIL == 1, the number of bits is equal to the bits of vPEID minus one.

When GICD_TYPER2.VIL == 0, this field is RES0.

Accessing GICD_TYPER2

GICD_TYPER2 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	`0x000C`	GICD_TYPER2

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICH_APR<n>, Active Priorities Registers, n = 0 - 3

The GICH_APR<n> characteristics are:

Purpose

These registers track which preemption levels are active in the virtual CPU interface, and indicate the current active priority. Corresponding bits are set to 1 in this register when an interrupt is acknowledged, based on GICH_LR<n>.Priority, and the least significant bit set is cleared on EOI.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_APR<n> are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

The number of registers required depends on how many bits are implemented in GICH_LR<n>.Priority:

- When 5 priority bits are implemented, 1 register is required (GICH_APR0).
- When 6 priority bits are implemented, 2 registers are required (GICH_APR0, GICH_APR1).
- When 7 priority bits are implemented, 4 registers are required (GICH_APR0, GICH_APR1, GICH_APR2, GICH_APR3).

Unimplemented registers are RAZ/WI.

Attributes

GICH_APR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

P<x>, bit [x], for x = 31 to 0

Active priorities. Possible values of each bit are:

P<x>	Meaning
0b0	There is no interrupt active at the priority corresponding to that bit.
0b1	There is an interrupt active at the priority corresponding to that bit.

The correspondence between priorities and bits depends on the number of bits of priority that are implemented.

If 5 bits of priority are implemented (bits [7:3] of priority), then there are 32 priority groups, and the active state of these priorities are held in GICH_APR0 in the bits corresponding to Priority[7:3].

If 6 bits of priority are implemented (bits [7:2] of priority), then there are 64 priority groups, and:

- The active state of priorities 0 - 124 are held in GICH_APR0 in the bits corresponding to 0:Priority[6:2].
- The active state of priorities 128 - 252 are held in GICH_APR1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of priority are implemented (bits [7:1] of priority), then there are 128 priority groups, and:

- The active state of priorities 0 - 62 are held in GICH_APR0 in the bits corresponding to 00:Priority[5:1].
- The active state of priorities 64 - 126 are held in GICH_APR1 in the bits corresponding to 01:Priority[5:1].
- The active state of priorities 128 - 190 are held in GICH_APR2 in the bits corresponding to 10:Priority[5:1].
- The active state of priorities 192 - 254 are held in GICH_APR3 in the bits corresponding to 11:Priority[5:1].

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing GICH_APR<n>

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- In AArch64:
  - For Group 0, ICH_AP0R<n>_EL2.
  - For Group 1, ICH_AP1R<n>_EL2.
- In AArch32:
  - For Group 0, ICH_AP0R<n>.
  - For Group 1, ICH_AP1R<n>.

GICH_APR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	`0x00F0` + (4 * n)	GICH_APR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICH_EISR, End Interrupt Status Register

The GICH_EISR characteristics are:

Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_EISR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_EISR is a 32-bit register.

Field descriptions

31302928272625242322212019181716	15	14	13	12	11	10	9	8	7	
RES0	Status15	Status14	Status13	Status12	Status11	Status10	Status9	Status8	Status7	Sta

Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

EOI maintenance interrupt status for List register <n>:

Status<n>	Meaning
`0b0`	GICH_LR<n> does not have an EOI maintenance interrupt.
`0b1`	GICH_LR<n> has an EOI maintenance interrupt that has not been handled.

For any GICH_LR<n> register, the corresponding status bit is set to 1 if all of the following are true:

- GICH_LR<n>.State is `0b00`.
- GICH_LR<n>.HW == 0.
- GICH_LR<n>.EOI == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICH_EISR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_EISR provides equivalent functionality.
- For AArch64 implementations, ICH_EISR_EL2 provides equivalent functionality.

Bits corresponding to unimplemented List registers are RAZ.

GICH_EISR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	`0x0020`	GICH_EISR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICH_ELRSR, Empty List Register Status Register

The GICH_ELRSR characteristics are:

Purpose

Indicates which List registers contain valid interrupts.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_ELRSR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_ELRSR is a 32-bit register.

Field descriptions

31302928272625242322212019181716	15	14	13	12	11	10	9	8	7	
RES0	Status15	Status14	Status13	Status12	Status11	Status10	Status9	Status8	Status7	Sta

Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>:

Status<n>	Meaning
0b0	GICH_LR<n>, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.
0b1	GICH_LR<n> does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.

For any GICH_LR<n> register, the corresponding status bit is set to 1 if GICH_LR<n>.State is 0b00 and either:

- GICH_LR<n>.HW == 1.
- GICH_LR<n>.EOI == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Accessing GICH_ELRSR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_ELRSR provides equivalent functionality.
- For AArch64 implementations, ICH_ELRSR_EL2 provides equivalent functionality.

Bits corresponding to unimplemented List registers are RES0.

GICH_ELRSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	`0x0030`	GICH_ELRSR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICH_HCR, Hypervisor Control Register

The GICH_HCR characteristics are:

Purpose

Controls the virtual CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_HCR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_HCR is a 32-bit register.

Field descriptions

31 30 29 28 27	26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8	7	6	5	4	3	2	1	0
EOICount	RES0	VGrp1DIE	VGrp1EIE	VGrp0DIE	VGrp0EIE	NPIE	LRENPIE	UIE	En

EOICount, bits [31:27]

Counts the number of EOIs received that do not have a corresponding entry in the List registers. The virtual CPU interface increments this field automatically when a matching EOI is received. EOIs that do not clear a bit in GICH_APR<n> do not cause an increment. If an EOI occurs when the value of this field is 31, then the field wraps to 0.

The maintenance interrupt is asserted whenever this field is nonzero and GICH_HCR.LRENPIE == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [26:8]

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is disabled:

VGrp1DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp1 == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is enabled:

VGrp1EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp1 == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is disabled:

VGrp0DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp0 == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is enabled:

VGrp0EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp0 == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NPIE, bit [3]

No Pending Interrupt Enable.

Enables the signaling of a maintenance interrupt while no pending interrupts are present in the List registers:

NPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable.

Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register for an EOI request:

LRENPIE	Meaning
`0b0`	Maintenance interrupt disabled.
`0b1`	Maintenance interrupt signaled while GICH_HCR.EOICount is not 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UIE, bit [1]

Underflow Interrupt Enable.

Enables the signaling of a maintenance interrupt when the List registers are either empty or hold only one valid entry.

UIE	Meaning
`0b0`	Maintenance interrupt disabled.
`0b1`	A maintenance interrupt is signaled if zero or one of the List register entries are marked as a valid interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

En, bit [0]

Enable.

Global enable bit for the virtual CPU interface.

En	Meaning
`0b0`	Virtual CPU interface operation is disabled.
`0b1`	Virtual CPU interface operation is enabled.

When this field is 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of GICV_IAR or GICV_AIAR returns a spurious interrupt ID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The VGrp1DIE, VGrp1EIE, VGrp0DIE, and VGrp0EIE fields permit the hypervisor to track the virtual CPU interfaces that are enabled. The hypervisor can then route interrupts that have multiple targets correctly and efficiently, without having to read the virtual CPU interface status.

See 'Maintenance interrupts' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069) and GICH_MISR for more information.

Accessing GICH_HCR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_HCR provides equivalent functionality.
- For AArch64 implementations, ICH_HCR_EL2 provides equivalent functionality.

GICH_HCR.En must be set to 1 for any virtual or maintenance interrupt to be asserted.

GICH_HCR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	`0x0000`	GICH_HCR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICH_LR<n>, List Registers, n = 0 - 15

The GICH_LR<n> characteristics are:

Purpose

These registers provide context information for the virtual CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_LR<n> are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

A maximum of 16 List registers can be provided. GICH_VTR.ListRegs defines the number implemented. Unimplemented List registers are RAZ/WI.

Attributes

GICH_LR<n> is a 32-bit register.

Field descriptions

31	30	29 28	27 26 25 24 23	22 21 20	19 18 17 16 15 14 13 12 11 10	9 8 7 6 5 4 3 2 1 0
HW	Group	State	Priority	RES0	pINTID	vINTID

HW, bit [31]

Indicates whether this virtual interrupt is a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt corresponding to the INTID:

HW	Meaning
`0b0`	This interrupt is triggered entirely in software. No notification is sent to the Distributor when the virtual interrupt is deactivated.
`0b1`	A hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using GICH_LR<n>.pINTID to indicate the physical interrupt identifier. If GICV_CTLR.EOImode == 0, this request corresponds to a write to GICV_EOIR or GICV_AEOIR, otherwise it corresponds to a write to GICV_DIR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Group, bit [30]

Indicates whether the interrupt is Group 0 or Group 1:

Group	Meaning
0b0	Group 0 virtual interrupt. GICV_CTLR.FIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and GICV_CTLR.EnableGrp0 enables signaling of this interrupt to the virtual machine.
0b1	Group 1 virtual interrupt, signaled as a virtual IRQ. GICV_CTLR.EnableGrp1 enables signaling of this interrupt to the virtual machine.

Note

GICV_CTLR.CBPR controls whether GICV_BPR or GICV_ABPR determines if a pending Group 1 interrupt has sufficient priority to preempt current execution.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

State, bits [29:28]

The state of the interrupt. This field has one of the following values:

State	Meaning
0b00	Inactive
0b01	Pending
0b10	Active
0b11	Active and pending

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the inactive state are ignored, except for the purpose of generating virtual maintenance interrupts.

Note

For hardware interrupts, the active and pending state is held in the Distributor rather than the virtual CPU interface. A hypervisor must only use the active and pending state for software originated interrupts, which are typically associated with virtual devices, or for SGIs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Priority, bits [27:23]

The priority of this interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:20]

Reserved, RES0.

pINTID, bits [19:10]

The function of this field depends on the value of GICH_LR<n>.HW.

When GICH_LR<n>.HW == 0:

- Bit [19] indicates whether the interrupt triggers an EOI maintenance interrupt. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits [18:13] are reserved, SBZ.

- If the vINTID field value corresponds to an SGI (that is, 0-15), bits [12:10] contain the number of the requesting PE. This appears in the corresponding field of GICV_IAR or GICV_AIAR. If the vINTID field value is not 0-15, this field must be cleared to 0.

When GICH_LR<n>.HW == 1:

- This field indicates the pINTID that the hypervisor forwards to the Distributor. This field is only required to implement enough bits to hold a valid value for the ID configuration. Any unused higher order bits are RAZ/WI.
- If the value of pINTID is 0-15 or 1020-1023, behavior is UNPREDICTABLE. If the value of pINTID is 16-31, this field applies to the PPI associated with this same PE as the virtual CPU interface requesting the deactivation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

vINTID, bits [9:0]

This INTID is returned to the VM when the interrupt is acknowledged through GICV_IAR. Each valid interrupt stored in the List registers must have a unique vINTID for that virtual CPU interface. If the value of vINTID is 1020-1023, behavior is UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICH_LR<n>

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_LR<n> provides equivalent functionality.
- For AArch64 implementations, ICH_LR<n>_EL2 provides equivalent functionality.

GICH_LR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	`0x0100` + (4 * n)	GICH_LR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICH_MISR, Maintenance Interrupt Status Register

The GICH_MISR characteristics are:

Purpose

Indicates which maintenance interrupts are asserted.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_MISR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_MISR is a 32-bit register.

Field descriptions

31:8	7	6	5	4	3	2	1	0
RES0	VGrp1D	VGrp1E	VGrp0D	VGrp0E	NP	LRENP	U	EOI

Bits [31:8]

Reserved, RES0.

VGrp1D, bit [7]

vPE Group 1 Disabled.

VGrp1D	Meaning
0b0	vPE Group 1 Disabled maintenance interrupt not asserted.
0b1	vPE Group 1 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when GICH_HCR.VGrp1DIE == 1 and GICH_VMCR.VENG1 == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

VGrp1E, bit [6]

vPE Group 1 Enabled.

VGrp1E	Meaning
0b0	vPE Group 1 Enabled maintenance interrupt not asserted.
0b1	vPE Group 1 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when GICH_HCR.VGrp1EIE == 1 and GICH_VMCR.VENG1 == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

VGrp0D, bit [5]

vPE Group 0 Disabled.

VGrp0D	Meaning
0b0	vPE Group 0 Disabled maintenance interrupt not asserted.
0b1	vPE Group 0 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when GICH_HCR.VGrp0DIE == 1 and GICH_VMCR.VENG0 == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

VGrp0E, bit [4]

vPE Group 0 Enabled.

VGrp0E	Meaning
0b0	vPE Group 0 Enabled maintenance interrupt not asserted.
0b1	vPE Group 0 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when GICH_HCR.VGrp0EIE == 1 and GICH_VMCR.VENG0 == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

NP, bit [3]

No Pending.

NP	Meaning
0b0	No Pending maintenance interrupt not asserted.
0b1	No Pending maintenance interrupt asserted.

This maintenance interrupt is asserted when GICH_HCR.NPIE == 1 and no List register is in the pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

LRENP, bit [2]

List Register Entry Not Present.

LRENP	Meaning
0b0	List Register Entry Not Present maintenance interrupt not asserted.
0b1	List Register Entry Not Present maintenance interrupt asserted.

This maintenance interrupt is asserted when GICH_HCR.LRENPIE == 1 and GICH_HCR.EOICount is nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

U, bit [1]

Underflow.

U	Meaning
0b0	Underflow maintenance interrupt not asserted.
0b1	Underflow maintenance interrupt asserted.

This maintenance interrupt is asserted when GICH_HCR.UIE == 1 and zero or one of the List register entries are marked as a valid interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

EOI, bit [0]

End Of Interrupt.

EOI	Meaning
`0b0`	End Of Interrupt maintenance interrupt not asserted.
`0b1`	End Of Interrupt maintenance interrupt asserted.

This maintenance interrupt is asserted when at least one bit in GICH_EISR == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Note

A List register is in the pending state only if the corresponding GICH_LR<n> value is `0b01`, that is, pending. The active and pending state is not included.

Accessing GICH_MISR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_MISR provides equivalent functionality.
- For AArch64 implementations, ICH_MISR_EL2 provides equivalent functionality.

A maintenance interrupt is asserted only if at least one bit is set to 1 in this register and if GICH_HCR.En == 1.

GICH_MISR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	`0x0010`	GICH_MISR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICH_VMCR, Virtual Machine Control Register

The GICH_VMCR characteristics are:

Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state. This register is updated when a virtual machine updates the virtual CPU interface registers.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_VMCR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_VMCR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24	23 22 21	20 19 18	17 16 15 14 13 12 11 10	9	8 7 6 5	4	3	2	1	0
VPMR	VBPR0	VBPR1	RES0	VEOIM	RES0	VCBPR	VFIQEn	VAckCtl	VENG1	VENG0

VPMR, bits [31:24]

Virtual priority mask. The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

This alias field is updated when a VM updates GICV_PMR.Priority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 1.

This alias field is updated when a VM updates GICV_BPR.Binary_Point.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 0.

This alias field is updated when a VM updates GICV_ABPR.Binary_Point.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [17:10]

Reserved, RES0.

VEOIM, bit [9]

Virtual EOImode. Possible values of this bit are:

VEOIM	Meaning
0b0	A write of an INTID to GICV_EOIR or GICV_AEOIR drops the priority of the interrupt with that INTID, and also deactivates that interrupt.
0b1	A write of an INTID to GICV_EOIR or GICV_AEOIR only drops the priority of the interrupt with that INTID. Software must write to GICV_DIR to deactivate the interrupt.

This alias field is updated when a VM updates GICV_CTLR.EOImode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

VCBPR	Meaning
0b0	GICV_ABPR determines the preemption group for Group 1 interrupts.
0b1	GICV_BPR determines the preemption group for Group 1 interrupts.

This alias field is updated when a VM updates GICV_CTLR.CBPR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

VFIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

This alias field is updated when a VM updates GICV_CTLR.FIQEn.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

VAckCtl	Meaning
`0b0`	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.
`0b1`	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.

This alias field is updated when a VM updates GICV_CTLR.AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VENG1, bit [1]

Virtual interrupt enable, Group 1. Possible values of this bit are:

VENG1	Meaning
`0b0`	Group 1 virtual interrupts are disabled.
`0b1`	Group 1 virtual interrupts are enabled.

This alias field is updated when a VM updates GICV_CTLR.EnableGrp1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VENG0, bit [0]

Virtual interrupt enable, Group 0. Possible values of this bit are:

VENG0	Meaning
`0b0`	Group 0 virtual interrupts are disabled.
`0b1`	Group 0 virtual interrupts are enabled.

This alias field is updated when a VM updates GICV_CTLR.EnableGrp0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Note

A List register is in the pending state only if the corresponding GICH_LR<n> value is `0b01`, that is, pending. The active and pending state is not included.

Accessing GICH_VMCR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_VMCR provides equivalent functionality.
- For AArch64 implementations, ICH_VMCR_EL2 provides equivalent functionality.

GICH_VMCR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	`0x0008`	GICH_VMCR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.

- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICH_VTR, Virtual Type Register

The GICH_VTR characteristics are:

Purpose

Indicates the number of implemented virtual priority bits and List registers.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_VTR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_VTR is a 32-bit register.

Field descriptions

31 30 29	28 27 26	25 24 23	22	21	20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5	4 3 2 1 0
PRIbits	PREbits	IDbits	SEIS	A3V	RES0	ListRegs

PRIbits, bits [31:29]

The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

PREbits, bits [28:26]

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of GICH_VTR.PRIbits.

IDbits, bits [25:23]

The number of virtual interrupt identifier bits supported:

IDbits	Meaning
`0b000`	16 bits.
`0b001`	24 bits.

All other values are reserved.

SEIS, bit [22]

SEI support. Indicates whether the virtual CPU interface supports generation of SEIs:

SEIS	Meaning
`0b0`	The virtual CPU interface logic does not support generation of SEIs.
`0b1`	The virtual CPU interface logic supports generation of SEIs.

A3V, bit [21]

Affinity 3 valid. Possible values are:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of the Aff3 field in ICC_SGI0R_EL1, ICC_SGI1R_EL1, and ICC_ASGI1R_EL1.
0b1	The virtual CPU interface logic supports nonzero values of the Aff3 field in ICC_SGI0R_EL1, ICC_SGI1R_EL1, and ICC_ASGI1R_EL1.

Bits [20:5]

Reserved, RES0.

ListRegs, bits [4:0]

The number of implemented List registers, minus one.

Accessing GICH_VTR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_VTR provides equivalent functionality.
- For AArch64 implementations, ICH_VTR_EL2 provides equivalent functionality.

GICH_VTR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0004	GICH_VTR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICM_CLRSPI_NSR, Clear Non-secure SPI Pending Register

The GICM_CLRSPI_NSR characteristics are:

Purpose

Removes the pending state from a valid SPI if permitted by the Security state of the access and the GICD_NSACR<n> value for that SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

This register is present only when GICM_TYPER.CLR == 1. Otherwise, direct accesses to GICM_CLRSPI_NSR are RES0.

When GICD_CTLR.DS == 1, this register provides functionality for all SPIs.

Attributes

GICM_CLRSPI_NSR is a 32-bit register.

Field descriptions

31:13	12:0
RES0	INTID

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of GICD_CLRSPI_NSR.

Accessing GICM_CLRSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding GICD_NSACR<n> register is less than `0b10`.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can clear the pending state of any valid SPI.

GICM_CLRSPI_NSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	`0x0048`	GICM_CLRSPI_NSR

Accesses on this interface are **WO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICM_CLRSPI_SR, Clear Secure SPI Pending Register

The GICM_CLRSPI_SR characteristics are:

Purpose

Removes the pending state from a valid SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

This register is present only when GICM_TYPER.SR == 1 and GICM_TYPER.CLR == 1. Otherwise, direct accesses to GICM_CLRSPI_SR are RES0.

When GICD_CTLR.DS == 1, this register is WI.

Attributes

GICM_CLRSPI_SR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13	12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	INTID

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of GICD_CLRSPI_SR.

Accessing GICM_CLRSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICM_CLRSPI_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	`0x0058`	GICD_CLRSPI_SR

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **WI**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **WO**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **WI**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICM_IIDR, Distributor Implementer Identification Register

The GICM_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the Distributor.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GICM_IIDR is a 32-bit register.

Field descriptions

31–24	23–20	19–16	15–12	11–0
ProductID	RES0	Variant	Revision	Implementer

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the Distributor:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is `0x4`.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore `0x3B`.

Accessing GICM_IIDR

GICM_IIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	`0x0FCC`	GICM_IIDR

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICM_SETSPI_NSR, Set Non-secure SPI Pending Register

The GICM_SETSPI_NSR characteristics are:

Purpose

Adds the pending state to a valid SPI if permitted by the Security state of the access and the GICD_NSACR<n> value for that SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

When GICD_CTLR.DS==1, this register provides functionality for all SPIs.

Attributes

GICM_SETSPI_NSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																			INTID												

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of GICD_SETSPI_NSR.

Accessing GICM_SETSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding GICD_NSACR<n> register is 0.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can set the pending state of any valid SPI.

GICM_SETSPI_NSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	0x0040	GICM_SETSPI_NSR

Accesses on this interface are **WO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICM_SETSPI_SR, Set Secure SPI Pending Register

The GICM_SETSPI_SR characteristics are:

Purpose

Adds the pending state to a valid SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

This register is present only when GICM_TYPER.SR == 1. Otherwise, direct accesses to GICM_SETSPI_SR are RES0.

When GICD_CTLR.DS==1, this register is WI.

Attributes

GICM_SETSPI_SR is a 32-bit register.

Field descriptions

31–13	12–0
RES0	INTID

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of GICD_SETSPI_SR.

Accessing GICM_SETSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICM_SETSPI_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	`0x0050`	GICM_SETSPI_SR

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **WI**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **WO**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **WI**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICM_TYPER, Distributor MSI Type Register

The GICM_TYPER characteristics are:

Purpose

Provides information about what features the GIC implementation supports.

Configuration

This register is available in all configurations of the GIC. When GICD_CTLR.DS==0, this register is Common.

Attributes

GICM_TYPER is a 32-bit register.

Field descriptions

31	30	29	28–16	15–11	10–0
Valid	CLR	SR	INTID	RES0	NumSPIs

Valid, bit [31]

Reports whether GICM_TYPER content is valid.

Valid	Meaning
`0b0`	GICM_TYPER reports no information on the capabilities of the GICM frame, all other fields are RES0.
`0b1`	GICM_TYPER reports information on capabilities of GICM frame.

CLR, bit [30]

Reports whether MSI clear registers are supported.

CLR	Meaning
`0b0`	MSI clear registers not implemented.
`0b1`	MSI clear registers implemented.

SR, bit [29]

Reports whether Secure aliases of MSI registers are supported.

SR	Meaning
`0b0`	Secure aliases of MSI registers not implemented.
`0b1`	Secure aliases of MSI registers implemented.

INTID, bits [28:16]

INTID of the first SPI assigned to this GICM frame.

Bits [15:11]

Reserved, RES0.

NumSPIs, bits [10:0]

Number of SPIs assigned to this GICM frame.

Accessing GICM_TYPER

GICM_TYPER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	0x0004	GICM_TYPER

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_CLRLPIR, Clear LPI Pending Register

The GICR_CLRLPIR characteristics are:

Purpose

Clears the pending state of the specified LPI.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_CLRLPIR is a 64-bit register.

Field descriptions

When GICR_TYPER.DirectLPI == 1:

63 … 32
RES0
pINTID
31 … 0

Bits [63:32]

Reserved, RES0.

pINTID, bits [31:0]

The INTID of the physical LPI.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER.IDbits field. Unimplemented bits are RES0.

When GICR_TYPER.DirectLPI == 0:

63 … 32
IMPLEMENTATION DEFINED
IMPLEMENTATION DEFINED
31 … 0

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing GICR_CLRLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality of this register is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if any of the following apply:

- GICR_CTLR.EnableLPIs == 0.
- The pINTID value specifies an unimplemented LPI.
- The pINTID value specifies an LPI that is not pending.

GICR_CLRLPIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	`0x0048`	GICR_CLRLPIR

Accesses on this interface are **WO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_CTLR, Redistributor Control Register

The GICR_CTLR characteristics are:

Purpose

Controls the operation of a Redistributor, and enables the signaling of LPIs by the Redistributor to the connected PE.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_CTLR is a 32-bit register.

Field descriptions

31	30 29 28 27	26	25	24	23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4	3	2	1	0
UWP	RES0	DPG1S	DPG1NS	DPG0	RES0	RWP	IR	CES	EnableLPIs

UWP, bit [31]

Upstream Write Pending. Read-only. Indicates whether all upstream writes have been communicated to the Distributor.

UWP	Meaning
0b0	The effects of all upstream writes have been communicated to the Distributor, including any Generate SGI packets. For more information, see 'Generate SGI (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).
0b1	Not all the effects of upstream writes, including any Generate SGI packets, have been communicated to the Distributor. For more information, see 'Generate SGI (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Bits [30:27]

Reserved, RES0.

DPG1S, bit [26]

Disable Processor selection for Group 1 Secure interrupts. When GICR_TYPER.DPGS == 1:

DPG1S	Meaning
0b0	A Group 1 Secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Secure Group 1 interrupts are enabled.
0b1	A Group 1 Secure SPI configured to use the 1 of N distribution model cannot select this PE.

When GICR_TYPER.DPGS == 0 this bit is RAZ/WI.

When GICD_CTLR.DS==1, this field is RAZ/WI. In GIC implementations that support two Security states, this field is only accessible by Secure accesses, and is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when GICD_CTLR.ARE_S==0.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

DPG1NS, bit [25]

Disable Processor selection for Group 1 Non-secure interrupts. When GICR_TYPER.DPGS == 1:

DPG1NS	Meaning
`0b0`	A Group 1 Non-secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Non-secure Group 1 interrupts are enabled.
`0b1`	A Group 1 Non-secure SPI configured to use the 1 of N distribution model cannot select this PE.

When GICR_TYPER.DPGS == 0 this bit is RAZ/WI.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when GICD_CTLR.ARE_NS==0.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

DPG0, bit [24]

Disable Processor selection for Group 0 interrupts. When GICR_TYPER.DPGS == 1:

DPG0	Meaning
`0b0`	A Group 0 SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Group 0 interrupts are enabled.
`0b1`	A Group 0 SPI configured to use the 1 of N distribution model cannot select this PE.

When GICR_TYPER.DPGS == 0 this bit is RAZ/WI.

When GICD_CTLR.DS == 1, this field is always accessible. In GIC implementations that support two Security states, this field is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when GICD_CTLR.ARE_S == 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Bits [23:4]

Reserved, RES0.

RWP, bit [3]

Register Write Pending. This bit indicates whether a register write for the current Security state is in progress or not.

RWP	Meaning
0b0	The effect of all previous writes to the following registers are visible to all agents in the system: • GICR_ICENABLER0 • GICR_CTLR.DPG1S • GICR_CTLR.DPG1NS • GICR_CTLR.DPG0 • GICR_CTLR, which clears EnableLPIs from 1 to 0. • In FEAT_GICv4p1, GICR_VPROPBASER, which clears Valid from 1 to 0.
0b1	The effect of all previous writes to the following registers are not guaranteed by the architecture to be visible to all agents in the system while the changes are still being propagated: • GICR_ICENABLER0 • GICR_CTLR.DPG1S • GICR_CTLR.DPG1NS • GICR_CTLR.DPG0 • GICR_CTLR, which clears EnableLPIs from 1 to 0. • In FEAT_GICv4p1, GICR_VPROPBASER, which clears Valid from 1 to 0.

IR, bit [2]

LPI invaldiate registers supported.

This bit is read-only.

IR	Meaning
0b0	This bit does not indicate whether the GICR_INVLPIR, GICR_INVALLR and GICR_SYNCR are implemented or not.
0b1	GICR_INVLPIR, GICR_INVALLR and GICR_SYNCR are implemented.

If GICR_TYPER.DirectLPI is 1 or GICR_TYPER.RVPEI is 1, GICR_INVLPIR, GICR_INVALLR, and GICR_SYNCR are always implemented.

Arm recommends that implementations report GICR_CTLR.IR as 1 in these cases.

CES, bit [1]

Clear Enable Supported.

This bit is read-only.

CES	Meaning
0b0	The IRI does not indicate whether GICR_CTLR.EnableLPIs is RES1 once set.
0b1	GICR_CTLR.EnableLPIs is not RES1 once set.

Implementing GICR_CTLR.EnableLPIs as programmable and not reporting GICR_CLTR.CES == 1 is deprecated.

Implementing GICR_CTLR.EnableLPIs as RES1 once set is deprecated.

When GICR_CLTR.CES == 0, software cannot assume that GICR_CTLR.EnableLPIs is programmable without observing the bit being cleared.

EnableLPIs, bit [0]

In implementations where affinity routing is enabled for the Security state:

EnableLPIs	Meaning
0b0	LPI support is disabled. Any doorbell interrupt generated as a result of a write to a virtual LPI register must be discarded, and any ITS translation requests or commands involving LPIs in this Redistributor are ignored.
0b1	LPI support is enabled.

Note

If GICR_TYPER.PLPIS == 0, this field is RES0. If GICD_CTLR.ARE_NS is written from 1 to 0 when this bit is 1, behavior is an IMPLEMENTATION DEFINED choice between clearing GICR_CTLR.EnableLPIs to 0 or maintaining its current value.

When affinity routing is not enabled for the Non-secure state, this bit is RES0.

When written from 0 to 1, the Redistributor loads the LPI Pending table from memory to check for any pending interrupts.

After it has been written to 1, it is IMPLEMENTATION DEFINED whether the bit becomes RES1 or can be cleared by to 0.

Where the bit remains programmable:

- Software must observe GICR_CTLR.RWP==0 after clearing GICR_CTLR.EnableLPIs from 1 to 0 before writing GICR_PENDBASER or GICR_PROPBASER, otherwise behavior is UNPREDICTABLE.
- Software must observe GICR_CTLR.RWP==0 after clearing GICR_CTLR.EnableLPIs from 1 to 0 before setting GICR_CTLR.EnableLPIs to 1, otherwise behavior is UNPREDICTABLE.

Note

If one or more ITS is implemented, Arm strongly recommends that all LPIs are mapped to another Redistributor before GICR_CTLR.EnableLPIs is cleared to 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

The participation of a PE in the 1 of N distribution model for a given interrupt group is governed by the concatenation of GICR_WAKER.ProcessorSleep, the appropriate GICR_CTLR.DPG{1, 0} bit, and the PE interrupt group enable. The behavior options are:

PS	DPG{1S, 1NS, 0}	Enable	PE Behavior
`0b0`	`0b0`	`0b0`	The PE cannot be selected.
`0b0`	`0b0`	`0b1`	The PE can be selected.
`0b0`	`0b1`	*	The PE cannot be selected.
`0b1`	*	*	The PE cannot be selected when GICD_CTLR.E1NWF == 0. When GICD_CTLR.E1NWF == 1, the mechanism by which PEs are selected isIMPLEMENTATION DEFINED.

If an SPI using the 1 of N distribution model has been forwarded to the PE, and a write to GICR_CTLR occurs that changes the DPG bit for the interrupt group of the SPI, the IRI must attempt to select a different target PE for the SPI. This might have no effect on the forwarded SPI if it has already been activated.

Accessing GICR_CTLR

GICR_CTLR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	`0x0000`	GICR_CTLR

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ICACTIVER0, Interrupt Clear-Active Register 0

The GICR_ICACTIVER0 characteristics are:

Purpose

Deactivates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICACTIVER0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	
Clear_active_bit31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27	Clear_active_bit26	Cle

Clear_active_bit<x>, bit [x], for x = 31 to 0

Removes the active state from interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICACTIVER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ICACTIVER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ICACTIVER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ICACTIVER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0380	GICR_ICACTIVER0

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ICACTIVER<n>E, Interrupt Clear-Active Registers, n = 1 - 2

The GICR_ICACTIVER<n>E characteristics are:

Purpose

Removes the active state from the corresponding PPI.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICACTIVER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICACTIVER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	
Clear_active_bit31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27	Clear_active_bit26	Cle

Clear_active_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICACTIVER<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ICACTIVER<n>E is (`0x200` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_ICACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0380` + (4 * n)	GICR_ICACTIVER<n>E

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ICENABLER0, Interrupt Clear-Enable Register 0

The GICR_ICENABLER0 characteristics are:

Purpose

Disables forwarding of the corresponding SGI or PPI to the CPU interfaces.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICENABLER0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_enable_bit31	Clear_enable_bit30	Clear_enable_bit29	Clear_enable_bit28	Clear_enable_bit27	Clear_enable_bit26

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For PPIs and SGIs, controls the forwarding of interrupt number x to the CPU interfaces. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
`0b0`	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
`0b1`	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICENABLER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICENABLER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ICENABLER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ICENABLER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ICENABLER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0180`	GICR_ICENABLER0

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ICENABLER<n>E, Interrupt Clear-Enable Registers, n = 1 - 2

The GICR_ICENABLER<n>E characteristics are:

Purpose

Disables forwarding of the corresponding PPI to the CPU interfaces.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICENABLER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICENABLER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_enable_bit31	Clear_enable_bit30	Clear_enable_bit29	Clear_enable_bit28	Clear_enable_bit27	Clear_enable_bit26

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For the extended PPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
`0b0`	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
`0b1`	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICENABLER<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ICENABLER<n>E is (`0x180` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_ICENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICENABLER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0180` + (4 * n)	GICR_ICENABLER<n>E

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ICFGR0, Interrupt Configuration Register 0

The GICR_ICFGR0 characteristics are:

Purpose

Determines whether the corresponding SGI is edge-triggered or level-sensitive.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICFGR0 is a 32-bit register.

Field descriptions

31 30	29 28	27 26	25 24	23 22	21 20	19 18	17 16	15 14	13
Int_config15	Int_config14	Int_config13	Int_config12	Int_config11	Int_config10	Int_config9	Int_config8	Int_config7	Int_con

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the is level-sensitive or edge-triggered.

Int_config<x>	Meaning
`0b00`	Corresponding interrupt is level-sensitive.
`0b10`	Corresponding interrupt is edge-triggered.

SGIs are always edge-triggered.

When the interrupt is visible to the current Security state, a read of this bit always returns the correct value to indicate the interrupt triggering method.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICFGR0

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=0.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICR_ICFGR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0C00`	GICR_ICFGR0

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ICFGR1, Interrupt Configuration Register 1

The GICR_ICFGR1 characteristics are:

Purpose

Determines whether the corresponding PPI is edge-triggered or level-sensitive.

Configuration

A copy of this register is provided for each Redistributor.

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

Changing Int_config when the interrupt is individually enabled is UNPREDICTABLE.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

Attributes

GICR_ICFGR1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13
Int_config15		Int_config14		Int_config13		Int_config12		Int_config11		Int_config10		Int_config9		Int_config8		Int_config7		Int_con

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

Int_config<x>	Meaning
`0b00`	Corresponding interrupt is level-sensitive.
`0b10`	Corresponding interrupt is edge-triggered.

Int_config[0] (bit [2x]) is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICFGR1

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=1 .

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICR_ICFGR1 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

GIC Redistributor	SGI_base	`0x0C04`	GICR_ICFGR1

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ICFGR<n>E, Interrupt configuration registers, n = 2 - 5

The GICR_ICFGR<n>E characteristics are:

Purpose

Determines whether the corresponding PPI in the extended PPI range is edge-triggered or level-sensitive.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICFGR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICFGR<n>E is a 32-bit register.

Field descriptions

31 30	29 28	27 26	25 24	23 22	21 20	19 18	17 16	15 14	13
Int_config15	Int_config14	Int_config13	Int_config12	Int_config11	Int_config10	Int_config9	Int_config8	Int_config7	Int_con

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

Int_config[0] (bit [2x]) is RES0.

Int_config<x>	Meaning
0b00	The corresponding interrupt is level-sensitive.
0b10	The corresponding interrupt is edge-triggered.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For each supported extended PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

Accessing GICR_ICFGR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICFGR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICFGR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

GIC Redistributor	SGI_base	0x0C00 + (4 * n)	GICR_ICFGR<n>E

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ICPENDR0, Interrupt Clear-Pending Register 0

The GICR_ICPENDR0 characteristics are:

Purpose

Removes the pending state from the corresponding SGI or PPI.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICPENDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_pending_bit31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_pending_bit27	Clear_pendi

Clear_pending_bit<x>, bit [x], for x = 31 to 0

Removes the pending state from interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
`0b0`	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
`0b1`	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: • If the interrupt is not pending and is not active and pending. • If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICPENDR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ICPENDR<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ICENABLER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ICPENDR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0280`	GICR_ICPENDR0

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ICPENDR<n>E, Interrupt Clear-Pending Registers, n = 1 - 2

The GICR_ICPENDR<n>E characteristics are:

Purpose

Removes the pending state from the corresponding PPI.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICPENDR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICPENDR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Clear_pending_bit31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_pending_bit27	Clear_pendi

Clear_pending_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the pending state to interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
`0b0`	If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.
`0b1`	If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: • If the interrupt is not pending and is not active and pending. • If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICR_ISPENDR<n>E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICPENDR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ICPENDR<n>E is (`0x200` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_ICPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICPENDR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0280` + (4 * n)	GICR_ICPENDR<n>E

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_IGROUPR0, Interrupt Group Register 0

The GICR_IGROUPR0 characteristics are:

Purpose

Controls whether the corresponding SGI or PPI is in Group 0 or Group 1.

Configuration

This register is available in all GIC configurations. If the GIC implementation supports two Security states, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGROUPR0 is a 32-bit register.

Field descriptions

31	30	29	
Redistributor_group_status_bit31	Redistributor_group_status_bit30	Redistributor_group_status_bit29	Redistributor_g

Redistributor_group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit. In this register:

- Bits [31:16] are group status bits for PPIs.
- Bits [15:0] are group status bits for SGIs.

Redistributor_group_status_bit<x>	Meaning
`0b0`	When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.
`0b1`	When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.

When GICD_CTLR.DS == 0, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGRPMODR0 to form a 2-bit field that defines an interrupt group. The encoding of this field is at GICR_IGRPMODR0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

The considerations for the reset value of this register are the same as those for GICD_IGROUPR<n> with n=0.

Accessing GICR_IGROUPR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGROUPR0, the corresponding bit is RES0 and equivalent functionality is provided by GICD_IGROUPR<n> with n=0.

When GICD_CTLR.DS == 0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IGROUPR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0080`	GICR_IGROUPR0

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_IGROUPR<n>E, Interrupt Group Registers, n = 1 - 2

The GICR_IGROUPR<n>E characteristics are:

Purpose

Controls whether the corresponding PPI is in Group 0 or Group 1.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_IGROUPR<n>E are RES0.

When GICD_CTLR.DS==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGROUPR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26
Group_status_bit31	Group_status_bit30	Group_status_bit29	Group_status_bit28	Group_status_bit27	Group_status_bit2

Group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit.

Group_status_bit<x>	Meaning
`0b0`	When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.
`0b1`	When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGRPMODR<n>E to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICR_IGRPMODR<n>E.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGROUPR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_IGROUPR<n>E is (`0x080` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_IGROUPR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGROUPR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_IGROUPR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0080` + (4 * n)	GICR_IGROUPR<n>E

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_IGRPMODR0, Interrupt Group Modifier Register 0

The GICR_IGRPMODR0 characteristics are:

Purpose

When GICD_CTLR.DS==0, this register together with the GICR_IGROUPR0 register, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

When GICD_CTLR.DS==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGRPMODR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	
Group_modifier_bit31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28	Group_modifier_bit27	Group_

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGROUPR0 to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
`0b0`	`0b0`	Secure Group 0	G0S
`0b0`	`0b1`	Non-secure Group 1	G1NS
`0b1`	`0b0`	Secure Group 1	G1S
`0b1`	`0b1`	Reserved, treated as Non-secure Group 1	-

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_IGRPMODR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR0, the corresponding bit is RES0 and equivalent functionality is provided by GICD_IGRPMODR<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_IGRPMODR<n>.

When GICD_CTLR.ARE_S == 0 or GICD_CTLR.DS == 1, GICR_IGRPMODR0 is RES0. An implementation can make this register RAZ/WI in this case.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IGRPMODR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0D00`	GICR_IGRPMODR0

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_IGRPMODR<n>E, Interrupt Group Modifier Registers, n = 1 - 2

The GICR_IGRPMODR<n>E characteristics are:

Purpose

When GICD_CTLR.DS==0, this register together with the GICR_IGROUPR<n>E registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_IGRPMODR<n>E are RES0.

When GICD_CTLR.DS==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGRPMODR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	
Group_modifier_bit31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28	Group_modifier_bit27	Group_

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGROUPR<n>E to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
`0b0`	`0b0`	Secure Group 0	G0S
`0b0`	`0b1`	Non-secure Group 1	G1NS
`0b1`	`0b0`	Secure Group 1	G1S
`0b1`	`0b1`	Reserved, treated as Non-secure Group 1	-

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGRPMODR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_IGRPMODR<n>E is (`0xD00` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_IGRPMODR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_IGRPMODR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0D00` + (4 * n)	GICR_IGRPMODR<n>E

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_IIDR, Redistributor Implementer Identification Register

The GICR_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the Redistributor.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GICR_IIDR is a 32-bit register.

Field descriptions

31:24	23:20	19:16	15:12	11:0
ProductID	RES0	Variant	Revision	Implementer

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the Redistributor:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is `0x4`.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore `0x3B`.

Accessing GICR_IIDR

GICR_IIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	`0x0004`	GICR_IIDR

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_INMIR0, Non-maskable Interrupt Register for PPIs.

The GICR_INMIR0 characteristics are:

Purpose

Controls whether the corresponding PPI has the non-maskable property.

Configuration

This register is present only when FEAT_GICv3_NMI is implemented. Otherwise, direct accesses to GICR_INMIR0 are RES0.

When GICD_TYPER.NMI is 0, this register is RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_INMIR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
nmi31	nmi30	nmi29	nmi28	nmi27	nmi26	nmi25	nmi24	nmi23	nmi22	nmi21	nmi20	nmi19	nmi18	nmi17	nmi16	nmi15	nmi1

nmi<x>, bit [x], for x = 31 to 0

Non-maskable property.

nmi<x>	Meaning
`0b0`	Interrupt does not have the non-maskable property.
`0b1`	Interrupt has the non-maskable property.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

Accessing GICR_INMIR0

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_INMIR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0F80`	GICR_INMIR0

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_INMIR<n>E, Non-maskable Interrupt Registers for Extended PPIs, x = 1 to 2., n = 1 - 2

The GICR_INMIR<n>E characteristics are:

Purpose

Controls whether the corresponding Extended PPI has the non-maskable property.

Configuration

This register is present only when FEAT_GICv3p1 is implemented and FEAT_GICv3_NMI is implemented. Otherwise, direct accesses to GICR_INMIR<n>E are RES0.

When GICR_TYPER.PPInum is `0b0000` or GICD_TYPER.NMI is 0, these registers are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_INMIR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14
nmi31	nmi30	nmi29	nmi28	nmi27	nmi26	nmi25	nmi24	nmi23	nmi22	nmi21	nmi20	nmi19	nmi18	nmi17	nmi16	nmi15	nmi1

nmi<x>, bit [x], for x = 31 to 0

Non-maskable property.

nmi<x>	Meaning
`0b0`	Interrupt does not have the non-maskable property.
`0b1`	Interrupt has the non-maskable property.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

Accessing GICR_INMIR<n>E

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_INMIR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0F80` + (4 * n)	GICR_INMIR<n>E

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_INVALLR, Redistributor Invalidate All Register

The GICR_INVALLR characteristics are:

Purpose

Invalidates any cached configuration data of all physical LPIs, causing the GIC to reload the interrupt configuration from the physical LPI Configuration table at the address specified by GICR_PROPBASER.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_INVALLR is a 64-bit register.

Field descriptions

Bits	Field
63	V
62:48	RES0
47:32	vPEID
31:0	RES0

V, bit [63]

When FEAT_GICv4p1 is implemented:

Indicates whether the INTID is virtual or physical.

V	Meaning
`0b0`	Invalidate is for a physical INTID.
`0b1`	Invalidate is for a virtual INTID.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

vPEID, bits [47:32]

When FEAT_GICv4p1 is implemented:

When GICR_INVLPIR.V == 0, this field is RES0

When GICR_INVLPIR.V == 1, this field is the target vPEID of the invalidate.

> **Note**
>
> The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are RES0.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

Note

If any LPI has been forwarded to the PE and a valid write to GICR_INVALLR is received, the Redistributor must ensure it reloads its properties from memory. This has no effect on the forwarded LPI if it has already been activated.

Accessing GICR_INVALLR

This register is mandatory when any of the following are true:

- GICR_TYPER.Direct is 1.
- GICR_CTLR.IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

Writes to this register have no effect if no physical LPIs are currently stored in the local Redistributor cache.

GICR_INVALLR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	`0x00B0`	GICR_INVALLR

Accesses on this interface are **WO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_INVLPIR, Redistributor Invalidate LPI Register

The GICR_INVLPIR characteristics are:

Purpose

Invalidates the cached configuration data of a specified LPI, causing the GIC to reload the interrupt configuration from the physical LPI Configuration table at the address specified by GICR_PROPBASER.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_INVLPIR is a 64-bit register.

Field descriptions

63	62–48	47–32
V	RES0	vPEID

31–0
INTID

V, bit [63]

When FEAT_GICv4p1 is implemented:

Indicates whether the INTID is virtual or physical.

V	Meaning
`0b0`	Invalidate is for a physical INTID.
`0b1`	Invalidate is for a virtual INTID.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

vPEID, bits [47:32]

When FEAT_GICv4p1 is implemented:

When GICR_INVLPIR.V == 0, this field is RES0

When GICR_INVLPIR.V == 1, this field is the target vPEID of the invalidate.

> **Note**
>
> The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are RES0.

Otherwise:

Reserved, RES0.

INTID, bits [31:0]

The INTID of the physical LPI to be cleaned.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER.IDbits field. Unimplemented bits are RES0.

Note

If any LPI has been forwarded to the PE and a valid write to GICR_INVLPIR is received, the Redistributor must ensure it reloads its properties from memory and apply any changes by retrieving and reforwarding the LPI as required. This has no effect on the forwarded LPI if it has already been activated.

Accessing GICR_INVLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory when any of the following are true:

- GICR_TYPER.Direct is 1.
- GICR_CTLR.IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

Writes to this register have no effect if either:

- The specified LPI is not currently stored in the local Redistributor.
- The pINTID field corresponds to an unimplemented LPI.

GICR_INVLPIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x00A0	GICR_INVLPIR

Accesses on this interface are **WO**.

GICR_IPRIORITYR<n>, Interrupt Priority Registers, n = 0 - 7

The GICR_IPRIORITYR<n> characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each SGI and PPI supported by the GIC.

Configuration

A copy of these registers is provided for each Redistributor.

These registers are configured as follows:

- GICR_IPRIORITYR0-GICR_IPRIORITYR3 store the priority of SGIs.
- GICR_IPRIORITYR4-GICR_IPRIORITYR7 store the priority of PPIs.

Attributes

GICR_IPRIORITYR<n> is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0
Priority_offset_3B	Priority_offset_2B	Priority_offset_1B	Priority_offset_0B

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_IPRIORITYR<n>

These registers are used when affinity routing is enabled for the Security state of the interrupt. When affinity routing is not enabled the bits corresponding to the interrupt are RAZ/WI and GICD_IPRIORITYR<n> provides equivalent functionality.

These registers are used for SGIs and PPIs only. Equivalent functionality for SPIs is provided by GICD_IPRIORITYR<n>.

These registers are byte-accessible.

When GICD_CTLR.DS == 0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in 'Software accesses of interrupt priority' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IPRIORITYR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0400` + (4 * n)	GICR_IPRIORITYR<n>

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_IPRIORITYR<n>E, Interrupt Priority Registers (extended PPI range), n = 8 - 23

The GICR_IPRIORITYR<n>E characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each extended PPI supported by the GIC.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_IPRIORITYR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IPRIORITYR<n>E is a 32-bit register.

Field descriptions

31 - 24	23 - 16	15 - 8	7 - 0
Priority_offset_3B	Priority_offset_2B	Priority_offset_1B	Priority_offset_0B

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IPRIORITYR<n> number, n, is given by n = (m-1024) DIV 4.
- The offset of the required GICR_IPRIORITYR<n>E register is (`0x400` + (4*n)).
- The byte offset of the required Priority field in this register is m MOD 4, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Accessing GICR_IPRIORITYR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

GICR_IPRIORITYR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0400` + (4 * n)	GICR_IPRIORITYR<n>E

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ISACTIVER0, Interrupt Set-Active Register 0

The GICR_ISACTIVER0 characteristics are:

Purpose

Activates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISACTIVER0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_active_bit31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_bit26	Set_active_bit2

Set_active_bit<x>, bit [x], for x = 31 to 0

Adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
`0b0`	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
`0b1`	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ISACTIVER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ISACTIVER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ISACTIVER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISACTIVER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

GIC Redistributor	SGI_base	`0x0300`	GICR_ISACTIVER0

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ISACTIVER<n>E, Interrupt Set-Active Registers, n = 1 - 2

The GICR_ISACTIVER<n>E characteristics are:

Purpose

Adds the active state to the corresponding PPI.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ISACTIVER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISACTIVER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_active_bit31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_bit26	Set_active_bit2

Set_active_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
`0b0`	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
`0b1`	If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISACTIVER<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ISACTIVER<n>E is (`0x200` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_ISACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ISACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0300` + (4 * n)	GICR_ISACTIVER<n>E

Accesses on this interface are **RW**.

GICR_ISENABLER0, Interrupt Set-Enable Register 0

The GICR_ISENABLER0 characteristics are:

Purpose

Enables forwarding of the corresponding SGI or PPI to the CPU interfaces.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISENABLER0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_enable_bit31	Set_enable_bit30	Set_enable_bit29	Set_enable_bit28	Set_enable_bit27	Set_enable_bit26	Set_enable

Set_enable_bit<x>, bit [x], for x = 31 to 0

For PPIs and SGIs, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
`0b0`	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
`0b1`	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Accessing GICR_ISENABLER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISENABLER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ISENABLER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ISENABLER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISENABLER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0100`	GICR_ISENABLER0

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_ISENABLER<n>E, Interrupt Set-Enable Registers, n = 1 - 2

The GICR_ISENABLER<n>E characteristics are:

Purpose

Enables forwarding of the corresponding PPI to the CPU interfaces.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ISENABLER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISENABLER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Set_enable_bit31	Set_enable_bit30	Set_enable_bit29	Set_enable_bit28	Set_enable_bit27	Set_enable_bit26	Set_enable

Set_enable_bit<x>, bit [x], for x = 31 to 0

For the extended PPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISENABLER<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ISENABLER<n>E is (`0x100` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_ISENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISENABLER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ISENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0100` + (4 * n)	GICR_ISENABLER<n>E

Accesses on this interface are **RW**.

GICR_ISPENDR0, Interrupt Set-Pending Register 0

The GICR_ISPENDR0 characteristics are:

Purpose

Adds the pending state to the corresponding SGI or PPI.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISPENDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	
Set_pending_bit31	Set_pending_bit30	Set_pending_bit29	Set_pending_bit28	Set_pending_bit27	Set_pending_bit26	Se

Set_pending_bit<x>, bit [x], for x = 31 to 0

For PPIs and SGIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
`0b0`	If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.
`0b1`	If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: • If the interrupt is already pending because of a write to GICR_ISPENDR0. • If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ISPENDR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ISPENDR<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ISPENDR<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISPENDR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0200	GICR_ISPENDR0

Accesses on this interface are **RW**.

GICR_ISPENDR<n>E, Interrupt Set-Pending Registers, n = 1 - 2

The GICR_ISPENDR<n>E characteristics are:

Purpose

Adds the pending state to the corresponding PPI.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ISPENDR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISPENDR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	
Set_pending_bit31	Set_pending_bit30	Set_pending_bit29	Set_pending_bit28	Set_pending_bit27	Set_pending_bit26	Se

Set_pending_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
`0b0`	If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.
`0b1`	If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: • If the interrupt is already pending because of a write to GICR_ISPENDR<n>E. • If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISPENDR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ISPENDR<n>E is (`0x200` + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_ISPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISPENDR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ISPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0200` + (4 * n)	GICR_ISPENDR<n>E

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_MPAMIDR, Report maximum PARTID and PMG Register

The GICR_MPAMIDR characteristics are:

Purpose

Reports the maximum support PARTID and PMG values.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_MPAMIDR are RES0.

A copy of this register is provided for each Redistributor.

When GICR_TYPER.MPAM==0, this register is RES0.

Attributes

GICR_MPAMIDR is a 32-bit register.

Field descriptions

31–24	23–16	15–0
RES0	PMGmax	PARTIDmax

Bits [31:24]

Reserved, RES0.

PMGmax, bits [23:16]

Maximum PMG value supported.

PARTIDmax, bits [15:0]

Maximum PARTID value supported.

Accessing GICR_MPAMIDR

GICR_MPAMIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0018	GICR_MPAMIDR

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_NSACR, Non-secure Access Control Register

The GICR_NSACR characteristics are:

Purpose

Enables Secure software to permit Non-secure software to create SGIs targeting the PE connected to this Redistributor by writing to ICC_SGI1R_EL1, ICC_ASGI1R_EL1 or ICC_SGI0R_EL1.

For more information, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Configuration

For a description on when a write to ICC_SGI0R_EL1, ICC_SGI1R_EL1 or ICC_ASGI1R_EL1 is permitted to generate an interrupt, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

GICR_NSACR is a 32-bit register.

Field descriptions

31 30	29 28	27 26	25 24	23 22	21 20	19 18	17 16	15 14
NS_access15	NS_access14	NS_access13	NS_access12	NS_access11	NS_access10	NS_access9	NS_access8	NS_access7

NS_access<x>, bits [2x+1:2x], for x = 15 to 0

Configures the level of Non-secure access permitted when the SGI is in Secure Group 0 or Secure Group 1, as defined from GICR_IGROUPR0 and GICR_IGRPMODR0. A field is provided for each SGI. The possible values of each 2-bit field are:

NS_access<x>	Meaning
`0b00`	Non-secure writes are not permitted to generate Secure Group 0 SGIs or Secure Group 1 SGIs.
`0b01`	Non-secure writes are permitted to generate a Secure Group 0 SGI.
`0b10`	As `0b01`, but additionally Non-secure writes to are permitted to generate a Secure Group 1 SGI.
`0b11`	Reserved. If the field is programmed to the reserved value, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the valid values. However, to maintain the principle that as the value increases additional accesses are permitted Arm strongly recommends that implementations treat this value as `0b10`. It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the valid value chosen.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_NSACR

This register is used when affinity routing is enabled. When affinity routing is not enabled for the Security state of the interrupt, GICD_NSACR<n> with n=0 provides equivalent functionality.

This register does not support PPIs.

GICR_NSACR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	`0x0E00`	GICR_NSACR

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **RAZ/WI**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **RW**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **RAZ/WI**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_PARTIDR, Set PARTID and PMG Register

The GICR_PARTIDR characteristics are:

Purpose

Sets the PARTID and PMG values used for memory accesses by the Redistributor.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_PARTIDR are RES0.

A copy of this register is provided for each Redistributor.

When GICR_TYPER.MPAM==0, this register is RES0.

Attributes

GICR_PARTIDR is a 32-bit register.

Field descriptions

31–24	23–16	15–0
RES0	PMG	PARTID

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

PMG value used when Redistributor accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PMG values in the range 0 to PMG_MAX are stateful or RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

PARTID, bits [15:0]

PARTID value used when Redistributor accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PARTID values in the range 0 to PARTID_MAX are stateful or RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Accessing GICR_PARTIDR

GICR_PARTIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x001C	GICR_PARTIDR

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICR_PENDBASER, Redistributor LPI Pending Table Base Address Register

The GICR_PENDBASER characteristics are:

Purpose

Specifies the base address of the LPI Pending table, and the Shareability and Cacheability of accesses to the LPI Pending table.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_PENDBASER is a 64-bit register.

Field descriptions

63	62	61 60 59	58 57 56	55 54 53 52	51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
RES0	PTZ	RES0	OuterCache	RES0	Physical_Address

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16	15 14 13 12	11 10	9 8 7	6 5 4 3 2 1 0
Physical_Address	RES0	Shareability	InnerCache	RES0

Bit [63]

Reserved, RES0.

PTZ, bit [62]

Pending Table Zero. Indicates to the Redistributor whether the LPI Pending table is zero when GICR_CTLR.EnableLPIs == 1.

This field is WO, and reads as 0.

PTZ	Meaning
`0b0`	The LPI Pending table is not zero, and contains live data.
`0b1`	The LPI Pending table is zero. Software must ensure the LPI Pending table is zero before this value is written.

Bits [61:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Pending table.

OuterCache	Meaning
`0b000`	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
`0b001`	Normal Outer Non-cacheable.
`0b010`	Normal Outer Cacheable Read-allocate, Write-through.
`0b011`	Normal Outer Cacheable Read-allocate, Write-back.
`0b100`	Normal Outer Cacheable Write-allocate, Write-through.
`0b101`	Normal Outer Cacheable Write-allocate, Write-back.
`0b110`	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
`0b111`	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:16]

Bits [51:16] of the physical address containing the LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Pending table.

Shareability	Meaning
`0b00`	Non-shareable.
`0b01`	Inner Shareable.
`0b10`	Outer Shareable.
`0b11`	Reserved. Treated as `0b00`.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Pending table.

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:0]

Reserved, RES0.

Accessing GICR_PENDBASER

Having the GICR_PENDBASER OuterCache, Shareability or InnerCache fields programmed to different values on different Redistributors with GICR_CTLR.EnableLPIs == 1 in the system is UNPREDICTABLE.

Changing GICR_PENDBASER with GICR_CTLR.EnableLPIs == 1 is UNPREDICTABLE.

GICR_PENDBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0078	GICR_PENDBASER

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_PROPBASER, Redistributor Properties Base Address Register

The GICR_PROPBASER characteristics are:

Purpose

Specifies the base address of the LPI Configuration table, and the Shareability and Cacheability of accesses to the LPI Configuration table.

Configuration

A copy of this register is provided for each Redistributor.

An implementation might make this register RO, for example to correspond to an LPI Configuration table in read-only memory.

Attributes

GICR_PROPBASER is a 64-bit register.

Field descriptions

63:59	58:56	55:52	51:32
RES0	OuterCache	RES0	Physical_Address

31:12	11:10	9:7	6:5	4:0
Physical_Address	Shareability	InnerCache	RES0	IDbits

Bits [63:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table.

OuterCache	Meaning
`0b000`	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
`0b001`	Normal Outer Non-cacheable.
`0b010`	Normal Outer Cacheable Read-allocate, Write-through.
`0b011`	Normal Outer Cacheable Read-allocate, Write-back.
`0b100`	Normal Outer Cacheable Write-allocate, Write-through.
`0b101`	Normal Outer Cacheable Write-allocate, Write-back.
`0b110`	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
`0b111`	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table.

Shareability	Meaning
`0b00`	Non-shareable.
`0b01`	Inner Shareable.
`0b10`	Outer Shareable.
`0b11`	Reserved. Treated as `0b00`.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table.

InnerCache	Meaning
`0b000`	Device-nGnRnE.
`0b001`	Normal Inner Non-cacheable.
`0b010`	Normal Inner Cacheable Read-allocate, Write-through.
`0b011`	Normal Inner Cacheable Read-allocate, Write-back.
`0b100`	Normal Inner Cacheable Write-allocate, Write-through.
`0b101`	Normal Inner Cacheable Write-allocate, Write-back.
`0b110`	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
`0b111`	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IDbits, bits [4:0]

The number of bits of LPI INTID supported, minus one, by the LPI Configuration table starting at Physical_Address.

If the value of this field is larger than the value of GICD_TYPER.IDbits, the GICD_TYPER.IDbits value applies.

If the value of this field is less than `0b1101`, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all physical LPIs are out of range.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_PROPBASER

It is IMPLEMENTATION DEFINED whether GICR_PROPBASER can be set to different values on different Redistributors. GICR_TYPER.CommonLPIAff identifies the Redistributors that must have GICR_PROPBASER set to the same values whenever GICR_CTLR.EnableLPIs == 1.

Setting different values in different copies of GICR_PROPBASER on Redistributors that are required to use a common LPI Configuration table when GICR_CTLR.EnableLPIs == 1 leads to UNPREDICTABLE behavior.

Other restrictions apply when a Redistributor caches information from GICR_PROPBASER. For more information, see 'LPI Configuration tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

GICR_PROPBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	`0x0070`	GICR_PROPBASER

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_SETLPIR, Set LPI Pending Register

The GICR_SETLPIR characteristics are:

Purpose

Generates an LPI by setting the pending state of the specified LPI.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_SETLPIR is a 64-bit register.

Field descriptions

When GICR_TYPER.DirectLPI == 1:

Bits	Field
63:32	RES0
31:0	pINTID

Bits [63:32]

Reserved, RES0.

pINTID, bits [31:0]

The INTID of the physical LPI to be generated.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER.IDbits field. Unimplemented bits are RES0.

When GICR_TYPER.DirectLPI == 0:

Bits	Field
63:32	IMPLEMENTATION DEFINED
31:0	IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing GICR_SETLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if either:

- The pINTID field corresponds to an LPI that is already pending.
- The pINTID field corresponds to an unimplemented LPI.
- GICR_CTLR.EnableLPIs == 0.

GICR_SETLPIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	`0x0040`	GICR_SETLPIR

Accesses on this interface are **WO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_STATUSR, Error Reporting Status Register

The GICR_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

A copy of this register is provided for each Redistributor.

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

Attributes

GICR_STATUSR is a 32-bit register.

Field descriptions

31–4	3	2	1	0
RES0	WROD	RWOD	WRD	RRD

Bits [31:4]

Reserved, RES0.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICR_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

GICR_STATUSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0010	GICR_STATUSR (S)

When an access is Secure access on this interface are **RW**.

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0010	GICR_STATUSR (NS)

When an access is Non-secure access on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_SYNCR, Redistributor Synchronize Register

The GICR_SYNCR characteristics are:

Purpose

Indicates completion of register based invalidate operations.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_SYNCR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1	0
RES0	Busy

Bits [31:1]

Reserved, RES0.

Busy, bit [0]

Indicates completion of invalidation operations

Busy	Meaning
`0b0`	No operations are in progress.
`0b1`	A write is in progress to one or more of the following registers: • GICR_INVLPIR. • GICR_INVALLR. • GICv3, GICR_CLRLPIR.

This field tracks operations initiated on the same Redistributor.

Accessing GICR_SYNCR

When this register is accessed, it is optional that an implementation might wait until all operations are complete before returning a value, in which case GICR_SYNCR.Busy is always 0.

This register is mandatory when any of the following are true:

- GICR_TYPER.Direct is 1.
- GICR_CTLR.IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

GICR_SYNCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

GIC Redistributor	RD_base	`0x00C0`	GICR_SYNCR

Accesses on this interface are **RO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_TYPER, Redistributor Type Register

The GICR_TYPER characteristics are:

Purpose

Provides information about the configuration of this Redistributor.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_TYPER is a 64-bit register.

Field descriptions

63 62 61 60 59	58	57 56	55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40	39	38	37	36	35	34	33	32
Affinity_Value											
PPInum	VSGI	CommonLPIAff	Processor_Number	RVPEID	MPAM	DPGS	Last	DirectLPI	Dirty	VLPIS	PLPIS
31 30 29 28 27	26	25 24	23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8	7	6	5	4	3	2	1	0

Affinity_Value, bits [63:32]

The identity of the PE associated with this Redistributor.

Bits [63:56] provide Aff3, the Affinity level 3 value for the Redistributor.

Bits [55:48] provide Aff2, the Affinity level 2 value for the Redistributor.

Bits [47:40] provide Aff1, the Affinity level 1 value for the Redistributor.

Bits [39:32] provide Aff0, the Affinity level 0 value for the Redistributor.

PPInum, bits [31:27]

When FEAT_GICv3p1 is implemented:

The value derived from this field specifies the maximum PPI INTID that a GIC implementation can support. An implementation might not implement all PPIs up to this maximum.

PPInum	Meaning
`0b00000`	Maximum PPI INTID is 31.
`0b00001`	Maximum PPI INTID is 1087.
`0b00010`	Maximum PPI INTID is 1119.

All other values are reserved.

Otherwise:

Reserved, RES0.

VSGI, bit [26]

When FEAT_GICv4p1 is implemented:

Indicates whether vSGIs are supported.

VSGI	Meaning
0b0	Direct injection of SGIs not supported.
0b1	Direct injection of SGIs supported.

Otherwise:

Reserved, RES0.

CommonLPIAff, bits [25:24]

The affinity level at which Redistributors share an LPI Configuration table.

CommonLPIAff	Meaning
0b00	All Redistributors must share an LPI Configuration table.
0b01	All Redistributors with the same Aff3 value must share an LPI Configuration table.
0b10	All Redistributors with the same Aff3.Aff2 value must share an LPI Configuration table.
0b11	All Redistributors with the same Aff3.Aff2.Aff1 value must share an LPI Configuration table.

Processor_Number, bits [23:8]

A unique identifier for the PE. When GITS_TYPER.PTA == 0, an ITS uses this field to identify the interrupt target.

When affinity routing is disabled for a Security state, this field indicates which GICD_ITARGETSR<n> corresponds to this Redistributor.

RVPEID, bit [7]

When FEAT_GICv4p1 is implemented:

Indicates how the resident vPE is specified.

RVPEID	Meaning
0b0	GICR_VPENDBASER records the address of the vPE's Virtual Pending Table.
0b1	GICR_VPENDBASER records vPEID.

Otherwise:

Reserved, RES0.

MPAM, bit [6]

When FEAT_GICv3p1 is implemented:

MPAM

MPAM	Meaning
0b0	MPAM not supported.
0b1	MPAM supported.

Otherwise:

Reserved, RES0.

DPGS, bit [5]

Sets support for GICR_CTLR.DPG* bits.

DPGS	Meaning
0b0	GICR_CTLR.DPG* bits are not supported.
0b1	GICR_CTLR.DPG* bits are supported.

Last, bit [4]

Indicates whether this Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

Last	Meaning
0b0	This Redistributor is not the highest-numbered Redistributor in a series of contiguous Redistributor pages.
0b1	This Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

DirectLPI, bit [3]

Indicates whether this Redistributor supports direct injection of LPIs.

DirectLPI	Meaning
0b0	This Redistributor does not support direct injection of LPIs. The GICR_SETLPIR, GICR_CLRLPIR, GICR_INVLPIR, GICR_INVALLR, and GICR_SYNCR registers are either not implemented, or have an IMPLEMENTATION DEFINED purpose.
0b1	This Redistributor supports direct injection of LPIs. The GICR_SETLPIR, GICR_CLRLPIR, GICR_INVLPIR, GICR_INVALLR, and GICR_SYNCR registers are implemented.

Dirty, bit [2]

Controls the functionality of GICR_VPENDBASER.Dirty.

Dirty	Meaning
0b0	GICR_VPENDBASER.Dirty is UNKNOWN when GICR_VPENDBASER.Valid == 1.
0b1	GICR_VPENDBASER.Dirty indicates when the Virtual Pending Table has been parsed when GICR_VPENDBASER.Valid is written from 0 to 1.

When GICR_TYPER.VLPIS == 0, this field is RES0.

Note

In GICv4p1 implementations this field is RES1.

VLPIS, bit [1]

Indicates whether the GIC implementation supports virtual LPIs and the direct injection of virtual LPIs.

VLPIS	Meaning
0b0	The implementation does not support virtual LPIs or the direct injection of virtual LPIs.
0b1	The implementation supports virtual LPIs and the direct injection of virtual LPIs.

Note

In GICv3 implementations this field is RES0.

PLPIS, bit [0]

Indicates whether the GIC implementation supports physical LPIs.

PLPIS	Meaning
0b0	The implementation does not support physical LPIs.
0b1	The implementation supports physical LPIs.

Accessing GICR_TYPER

GICR_TYPER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0008	GICR_TYPER

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_VPENDBASER, Virtual Redistributor LPI Pending Table Base Address Register

The GICR_VPENDBASER characteristics are:

Purpose

Specifies the base address of the memory that holds the virtual LPI Pending table for the currently scheduled virtual machine.

Configuration

Attributes

GICR_VPENDBASER is a 64-bit register.

Field descriptions

When FEAT_GICv4 is implemented:

63	62	61	60	59	58 57 56	55 54 53 52	51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
Valid	IDAI	PendingLast	Dirty	RES0	OuterCache	RES0	Physical_Address

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16	15 14 13 12	11 10	9 8 7	6 5 4 3 2 1 0
Physical_Address	RES0	Shareability	InnerCache	RES0

Valid, bit [63]

This bit controls whether the virtual LPI Pending table is valid.

Valid	Meaning
`0b0`	The virtual LPI Pending table is not valid. No vPE is scheduled.
`0b1`	The virtual LPI Pending table is valid. A vPE is scheduled.

Setting GICR_VPENDBASER.Valid == 1 when the associated CPU interface does not implement FEAT_GICv4 is UNPREDICTABLE.

Note

Software can determine whether a PE supports FEAT_GICv3 or FEAT_GICv4 by reading ID_AA64PFR0_EL1.

Writing a new value to any bit of GICR_VPENDBASER, other than GICR_VPENDBASER.Valid, when GICR_VPENDBASER.Valid==1 is UNPREDICTABLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

IDAI, bit [62]

Implementation Defined Area Invalid. Indicates whether the IMPLEMENTATION DEFINED area in the virtual LPI Pending table is valid.

IDAI	Meaning
0b0	The IMPLEMENTATION DEFINED area is valid.
0b1	The IMPLEMENTATION DEFINED area is invalid and all pending interrupt information is held in the architecturally defined part of the virtual LPI Pending table.

For more information, see 'LPI Pending tables' and 'Virtual LPI Configuration tables and virtual LPI Pending tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

PendingLast, bit [61]

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR_VPENDBASER.Valid has been written from 1 to 0 and is otherwise UNKNOWN.

PendingLast	Meaning
0b0	There are no pending and enabled interrupts for the last scheduled vPE.
0b1	There is at least one pending interrupt for the last scheduled vPE. It is IMPLEMENTATION DEFINED whether this bit is set when the only pending interrupts for the last scheduled vPE are not enabled. Arm deprecates setting PendingLast to 1 when the only pending interrupts for the last scheduled virtual machine are not enabled.

When the GICR_VPENDBASER.Valid bit is written from 0 to 1, this bit is RES1.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Dirty, bit [60]

When GICR_VPENDBASER.Valid == 0:

Indicates whether a de-scheduling operation is in progress.

This field is read-only.

Dirty	Meaning
0b0	No de-scheduling operation in process.
0b1	De-scheduling operation in process.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty==1.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

When GICR_VPENDBASER.Valid == 1 and GICR_TYPER.Dirty == 1:

This field is read-only. Reports whether the Virtual Pending table has been parsed.

Dirty	Meaning
0b0	Parsing of the Virtual Pending Table has completed.
0b1	Parsing of the Virtual Pending Table has not completed.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Otherwise:

This field is read-only. This fields is UNKNOWN.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Bit [59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to virtual LPI Pending tables of vPEs targeting this Redistributor.

OuterCache	Meaning
`0b000`	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
`0b001`	Normal Outer Non-cacheable.
`0b010`	Normal Outer Cacheable Read-allocate, Write-through.
`0b011`	Normal Outer Cacheable Read-allocate, Write-back.
`0b100`	Normal Outer Cacheable Write-allocate, Write-through.
`0b101`	Normal Outer Cacheable Write-allocate, Write-back.
`0b110`	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
`0b111`	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the OuterCacheabilty attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:16]

Bits [51:16] of the physical address containing the virtual LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the virtual LPI Pending table.

Shareability	Meaning
`0b00`	Non-shareable.
`0b01`	Inner Shareable.
`0b10`	Outer Shareable.
`0b11`	Reserved. Treated as `0b00`.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the Shareability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the virtual LPI Pending table.

InnerCache	Meaning
`0b000`	Device-nGnRnE.
`0b001`	Normal Inner Non-cacheable.
`0b010`	Normal Inner Cacheable Read-allocate, Write-through.
`0b011`	Normal Inner Cacheable Read-allocate, Write-back.
`0b100`	Normal Inner Cacheable Write-allocate, Write-through.
`0b101`	Normal Inner Cacheable Write-allocate, Write-back.
`0b110`	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
`0b111`	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the InnerCacheabilty attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:0]

Reserved, RES0.

When FEAT_GICv4p1 is implemented:

63	62	61	60	59	58	57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
Valid	Doorbell	PendingLast	Dirty	VGrp0En	VGrp1En	RES0

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	vPEID

Valid, bit [63]

This bit controls whether a vPE is scheduled:

Valid	Meaning
0b0	The virtual LPI Pending table is not valid. No vPE is scheduled.
0b1	The virtual LPI Pending table is valid. A vPE is scheduled.

Setting GICR_VPENDBASER.Valid == 1 when the associated CPU interface does not implement FEAT_GICv4 is UNPREDICTABLE.

Note

Software can determine whether a PE supports FEAT_GICv3 or FEAT_GICv4 by reading ID_AA64PFR0_EL1.

Writing a new value to any bit of GICR_VPENDBASER, other than GICR_VPENDBASER.Valid, when GICR_VPENDBASER.Valid==1 is UNPREDICTABLE.

Setting GICR_VPENDBASER.Valid to 1 is UNPREDICTABLE if GICR_VPROPBASER.Valid == 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Doorbell, bit [62]

When GICR_VPENDBASER.Valid is written from 1 to 0, this bit controls whether a default doorbell interrupt is requested for the descheduled vPE.

Doorbell	Meaning
0b0	No default doorbell requested.
0b1	Default doorbell requested.

When GICR_VPENDBASER.Valid is written from 1 to 0, if there are outstanding enabled pending interrupts then this bit is treated as 0.

When GICR_VPENDBASER.Valid is written from 1 to 0, if GICR_VPENDBASER.PendingLast is written as 1 then this bit is treated as 0.

When GICR_VPENDBASER.Valid == 1, reads return an UNKNOWN value.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

PendingLast, bit [61]

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR_VPENDBASER.Valid is written from 1 to 0 and is otherwise UNKNOWN.

PendingLast	Meaning
0b0	There are no pending and enabled interrupts for the last scheduled vPE.
0b1	There is at least one pending and enabled interrupt for the last scheduled vPE.

When the GICR_VPENDBASER.Valid bit is written from 0 to 1, this bit is RES1.

When GICR_VPENDBASER.Valid is written from 1 to 0, if GICR_VPENDBASER.PendingLast is written as 1, then this bit is set to an UNKNOWN value.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Dirty, bit [60]

When GICR_VPENDBASER.Valid == 0:

Read-only. Indicates whether a de-scheduling operation is in progress.

Dirty	Meaning
0b0	No de-scheduling operation in progess.
0b1	De-scheduling operation in progess.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Otherwise:

Read-only. Reports whether the Virtual Pending table has been parsed.

Dirty	Meaning
0b0	Parsing of the Virtual Pending Table is complete.
0b1	Parsing of the Virtual Pending Table has not completed.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

VGrp0En, bit [59]

Enable virtual Group 0 interrupts.

VGrp0En	Meaning
0b0	Forwarding of virtual Group 0 interrupts disabled.
0b1	Forwarding of virtual Group 0 interrupts enabled.

Writing a new value to VGrp0En while GICR_VPENDBASER.Valid==1 is CONSTRAINED UNPREDICTABLE:

- The update is ignored.
- The update is ignored for all purposes other than a direct read of the register.
- The virtual group enable is updated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

VGrp1En, bit [58]

Enable virtual Group 1 interrupts.

VGrp1En	Meaning
0b0	Forwarding of virtual Group 1 interrupts disabled.
0b1	Forwarding of virtual Group 1 interrupts enabled.

Writing a new value to VGrp1En while GICR_VPENDBASER.Valid==1 is CONSTRAINED UNPREDICTABLE:

- The update is ignored.
- The update is ignored for all purposes other than a direct read of the register.
- The virtual group enable is updated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [57:16]

Reserved, RES0.

vPEID, bits [15:0]

When GICR_VPENDBASER.Valid == 1, ID of scheduled vPE.

When GICR_VPENDBASER.Valid == 1, if GICR_VPENDBASER.vPEID is set to a value greater than the configured vPEID width, the behavior of this field is CONSTRAINED UNPREDICTABLE:

- GICR_VPENDBASER.vPEID is treated as having an UNKNOWN valid value for all purposes other than a direct read of the register.
- GICR_VPENDBASER.Valid is treated as being set to 0 for all purposes other than a direct read of the register.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields, unimplemented bits are RES0.

Accessing GICR_VPENDBASER

The effect of a write to this register is not guaranteed to be visible throughout the affinity hierarchy, as indicated by GICR_CTLR.RWP == 0.

GICR_VPENDBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	VLPI_base	0x0078	GICR_VPENDBASER

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICR_VPROPBASER, Virtual Redistributor Properties Base Address Register

The GICR_VPROPBASER characteristics are:

Purpose

Specifies the base address of the memory that holds the virtual LPI Configuration table for the currently scheduled virtual machine.

Configuration

This register is provided in FEAT_GICv4 implementations only.

Attributes

GICR_VPROPBASER is a 64-bit register.

Field descriptions

When FEAT_GICv4 is implemented:

63 62 61 60 59	58 57 56	55 54 53 52	51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
RES0	OuterCache	RES0	Physical_Address

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12	11 10	9 8 7	6 5	4 3 2 1 0
Physical_Address	Shareability	InnerCache	RES0	IDbits

Bits [63:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table.

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the virtual LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table.

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table.

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IDbits, bits [4:0]

The number of bits of virtual LPI INTID supported, minus one.

If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all virtual LPIs are out of range.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

When FEAT_GICv4p1 is implemented:

63	62	61 60 59	58 57 56	55	54 53	52	51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
Valid	RES0	Entry_Size	OuterCache	Indirect	Page_Size	Z	Physical_Address

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12	11 10	9 8 7	6 5 4 3 2 1 0
Physical_Address	Shareability	InnerCache	Size

Valid, bit [63]

This bit controls whether the vPE Configuration Table is valid.

Valid	Meaning
`0b0`	The vPE Configuration table is not valid.
`0b1`	The vPE Configuration table is valid.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Bit [62]

Reserved, RES0.

Entry_Size, bits [61:59]

Specifies the number 64-bit doublewords per table entry, minus one.

This bit is read-only.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the table.

OuterCache	Meaning
`0b000`	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
`0b001`	Normal Outer Non-cacheable.
`0b010`	Normal Outer Cacheable Read-allocate, Write-through.
`0b011`	Normal Outer Cacheable Read-allocate, Write-back.
`0b100`	Normal Outer Cacheable Write-allocate, Write-through.
`0b101`	Normal Outer Cacheable Write-allocate, Write-back.
`0b110`	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
`0b111`	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Indirect, bit [55]

This field indicates whether GICR_VPROPBASER specifies a single, flat table or a two-level table where the first level contains a list of descriptors.

Indirect	Meaning
`0b0`	Single Level. The Size field indicates the number of pages used to store data associated with each table entry.
`0b1`	Two Level. The Size field indicates the number of pages that contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used.

This field is RAZ/WI for GIC implementations that only support flat tables.

If the supported vPEID width indicated by GICD_TYPER2.VIL and GICD_TYPER2.VID, and the smallest page size that is supported result in a single level table that requires multiple pages, then implementing this bit as RAZ/WI is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Page_Size, bits [54:53]

The following values indicate the size of page that the translation table uses:

Page_Size	Meaning
`0b00`	4KB.
`0b01`	16KB.
`0b10`	64KB.
`0b11`	Reserved. Treated as `0b10`.

Note

If the GIC implementation supports only a single, fixed page size, this field might be RO.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Z, bit [52]

When GICR_VPROPBASER.Valid is written from 0 to 1, GICR_VPROPBASER.Z indicates whether the vPE Configuration table is known to contain all zeros.

Z	Meaning
`0b0`	The vPE Configutation table is not zero, and contains live data.
`0b1`	The vPE Configuration table is zero.

Setting GICR_VPROPBASER.Z to 0 causes the IRI to reload configuration from memory

When GICR_VPROPBASER.Valid is written from 0 to 1, if GICR_VPROPBASER.Z==1 behavior is UNPREDICTABLE if the allocated memory does not contain all zeros.

This field is WO, and reads as 0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table.

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table.

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Size, bits [6:0]

The number of pages of physical memory allocated to the table, minus one.

GICR_VPROPBASER.Page_Size specifies the size of each page.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing GICR_VPROPBASER

GICR_VPROPBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	VLPI_base	0x0070	GICR_VPROPBASER

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_VSGIPENDR, Redistributor virtual SGI pending state register

The GICR_VSGIPENDR characteristics are:

Purpose

Requests the pending state of virtual SGIs for a specified vPE.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GICR_VSGIPENDR are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_VSGIPENDR is a 32-bit register.

Field descriptions

31	30–16	15–0
Busy	RES0	Pending

Busy, bit [31]

ID of target vPEID

Busy	Meaning
`0b0`	Query of virtual SGI state not in progress.
`0b1`	Query of virtual SGI state in progress.

Bits [30:16]

Reserved, RES0.

Pending, bits [15:0]

Pending state of virtual SGIs for requested vPEID.

This field is UNKNOWN when GICR_VSGIPENDR.Busy == 1

Accessing GICR_VSGIPENDR

64-bit access only.

GICR_VSGIPENDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	VLPI_base	`0x0088`	GICR_VSGIPENDR

Accesses on this interface are **RO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_VSGIR, Redistributor virtual SGI pending state request register

The GICR_VSGIR characteristics are:

Purpose

Requests the pending state of virtual SGIs for a specified vPE.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GICR_VSGIR are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_VSGIR is a 32-bit register.

Field descriptions

31:16	15:0
RES0	vPEID

Bits [31:16]

Reserved, RES0.

vPEID, bits [15:0]

ID of target vPE

Writing this field is CONSTRAINED UNPREDICTABLE when GICR_VSGIPENDR.Busy == 1, with either the write ignored or a new query started.

Writing a value greater than the configured vPEID width behaviur is CONSTRAINED UNPREDICTABLE:

- GICR_VPENDBASER.vPEID is treated as having an UNKNOWN valid value for all purposes other than a direct read of the register.
- GICR_VPENDBASER.Valid is treated as being set to 0 for all purposes other than a direct read of the register.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are RES0.

Accessing GICR_VSGIR

64-bit access only.

GICR_VSGIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

GIC Redistributor	VLPI_base	`0x0080`	GICR_VSGIR

Accesses on this interface are **WO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_WAKER, Redistributor Wake Register

The GICR_WAKER characteristics are:

Purpose

Permits software to control the behavior of the WakeRequest power management signal corresponding to the Redistributor. Power management operations follow the rules in 'Power management' in in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_WAKER is a 32-bit register.

Field descriptions

31	302928272625242322212019181716151413121110987654 3	2	1	0
IMPLEMENTATION DEFINED	RES0	ChildrenAsleep	ProcessorSleep	IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bit [31]

IMPLEMENTATION DEFINED.

Bits [30:3]

Reserved, RES0.

ChildrenAsleep, bit [2]

Read-only. Indicates whether the connected PE is quiescent:

ChildrenAsleep	Meaning
`0b0`	An interface to the connected PE might be active.
`0b1`	All interfaces to the connected PE are quiescent.

The reset behavior of this field is:

- On a GIC reset, this field resets to 1.

ProcessorSleep, bit [1]

Indicates whether the Redistributor can assert the **WakeRequest** signal:

ProcessorSleep	Meaning
0b0	This PE is not in, and is not entering, a low power state.
0b1	The PE is either in, or is in the process of entering, a low power state. All interrupts that arrive at the Redistributor: • Assert a **WakeRequest** signal. • Are held in the pending state at the Redistributor, and are not communicated to the CPU interface. **Note** When ProcessorSleep == 1, the Redistributor must ensure that any interrupts that are pending on the CPU interface are released. For an implementation that is using the GIC Stream Protocol Interface: • A Quiesce command puts the interface between the Redistributor and the CPU interface in a quiescent state. For more information, see 'Quiesce (IRI)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069). • A Release command releases any interrupts that are pending on the CPU interface. For more information, see 'Release (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Before powering down a PE, software must set this bit to 1 and wait until ChildrenAsleep == 1. After powering up a PE, or following a failed powerdown, software must set this bit to 0 and wait until ChildrenAsleep == 0.

Changing ProcessorSleep from 1 to 0 when ChildrenAsleep is not 1 results in UNPREDICTABLE behavior.

Changing ProcessorSleep from 0 to 1 when the Enable for each interrupt group in the associated CPU interface is not 0 results in UNPREDICTABLE behavior.

The reset behavior of this field is:

- On a GIC reset, this field resets to 1.

IMPLEMENTATION DEFINED, bit [0]

IMPLEMENTATION DEFINED.

Accessing GICR_WAKER

To ensure a Redistributor is quiescent, software must write to GICR_WAKER with ProcessorSleep == 1, then poll the register until ChildrenAsleep == 1.

Resetting the connected PE when GICR_WAKER.ProcessorSleep==0 or GICR_WAKER.ChildresAsleep==0, can lead to UNPREDICTABLE behaviour in the IRI.

Resetting the IRI when GICR_WAKER.ProcessorSleep==0 or GICR_WAKER.ChildresAsleep==0 can lead to UNPREDICTABLE behaviour in the connected PE.

GICR_WAKER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	`0x0014`	GICR_WAKER

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **RW**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **RW**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **RAZ/WI**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_ABPR, Virtual Machine Aliased Binary Point Register

The GICV_ABPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

This register corresponds to GICC_ABPR in the physical CPU interface.

Note

GICH_LR<n>.Group determines whether a virtual interrupt is Group 0 or Group 1.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_ABPR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_ABPR is a 32-bit register.

Field descriptions

31–3	2–0
RES0	Binary_Point

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

The Binary_Point field of this register is aliased to GICH_VMCR.VBPR1.

Accessing GICV_ABPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_BPR1 provides equivalent functionality.
- For AArch64 implementations, ICC_BPR1_EL1 provides equivalent functionality.

The value contained in this register is one greater than the actual applied binary point value, as described in 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This register is used for Group 1 interrupts when GICV_CTLR.CBPR == 0. GICV_BPR provides equivalent functionality for Group 0 interrupts, and for Group 1 interrupts when GICV_CTLR.CBPR == 1.

GICV_ABPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	`0x001C`	GICV_ABPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_AEOIR, Virtual Machine Aliased End Of Interrupt Register

The GICV_AEOIR characteristics are:

Purpose

A write to this register performs a priority drop for the specified Group 1 virtual interrupt and, if GICV_CTLR.EOImode == 0, also deactivates the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_AEOIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_AEOIR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25	24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	INTID

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A successful EOI request means that:

- The highest priority bit in GICH_APR<n> is cleared, causing the running priority to drop.
- If the appropriate GICV_CTLR.EOImode bit == 0, the interrupt is deactivated in the corresponding List register. If the INTID corresponds to a hardware interrupt, the interrupt is also deactivated in the Distributor.

Note

Only Group 1 interrupts can target the hypervisor, and therefore only Group 1 interrupts are deactivated in the Distributor.

A write to this register is UNPREDICTABLE if the INTID corresponds to a Group 0 interrupt. In addition, the following GICv2 UNPREDICTABLE cases require specific actions:

- If highest active priority is Group 0 and the identified interrupt is in the List Registers and it matches the highest active priority. When EL2 is using System registers and ICH_VTR_EL2.SEIS is 1, an IMPLEMENTATION DEFINED SEI might be generated, otherwise GICv3 implementations must ignore such writes.
- If the identified interrupt is in the List Registers, and the HW bit is 1, and the interrupt to be deactivated is an SGI (that is, the value of Physical_ID is between 0 and 15). GICv3 implementations must perform the deactivate operation. This means that a GICv3 implementation in legacy operation must ensure only a single SGI is active for a PE.
- If the identified interrupt is in the List Registers, and the HW bit is 1, and the corresponding pINTID field value is between 1020 and 1023, indicating a special purpose INTID. GICv3 implementations must not perform a deactivate operation but must still change the state of the List register as appropriate. When EL2 is using System registers and ICH_VTR_EL2.SEIS is 1, an implementation might generate a system error.

Accessing GICV_AEOIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_EOIR1 provides equivalent functionality.
- For AArch64 implementations, ICC_EOIR1_EL1 provides equivalent functionality.

This register is used for Group 1 interrupts only. GICV_EOIR provides equivalent functionality for Group 0 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_AEOIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	`0x0024`	GICV_AEOIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_AHPPIR, Virtual Machine Aliased Highest Priority Pending Interrupt Register

The GICV_AHPPIR characteristics are:

Purpose

Provides the INTID of the highest priority pending Group 1 virtual interrupt in the List registers.

This register corresponds to the physical CPU interface register GICC_AHPPIR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_AHPPIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_AHPPIR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25	24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	INTID

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

> **Note**
>
> INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A read of this register returns the spurious INTID 1023 if any of the following are true:

- There are no pending interrupts of sufficiently high priority value to be signaled to the PE.
- The highest priority pending interrupt is in Group 0.

Accessing GICV_AHPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_HPPIR1 provides equivalent functionality.

- For AArch64 implementations, ICC_HPPIR1_EL1 provides equivalent functionality.

This register is used for Group 1 interrupts only. GICV_HPPIR provides equivalent functionality for Group 0 interrupts.

The register does not return the INTID of an interrupt that is active and pending.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_AHPPIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	`0x0028`	GICV_AHPPIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_AIAR, Virtual Machine Aliased Interrupt Acknowledge Register

The GICV_AIAR characteristics are:

Purpose

Provides the INTID of the signaled Group 1 virtual interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

This register corresponds to the physical CPU interface register GICC_AIAR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_AIAR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_AIAR is a 32-bit register.

Field descriptions

31–25	24–0
RES0	INTID

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

The operation of this register is similar to the operation of GICV_IAR. When a vPE reads this register, the corresponding GICH_LR<n>.Group field is checked to determine whether the interrupt is in Group 0 or Group 1:

- If the interrupt is Group 0, the spurious INTID 1023 is returned and the interrupt is not acknowledged.
- If the interrupt is Group 1, the INTID is returned. The List register entry is updated to active state, and the appropriate bit in GICH_APR<n> is set to 1.

A read of this register returns the spurious INTID 1023 if any of the following are true:

- When the virtual CPU interface is enabled and GICH_HCR.En == 1:

    - There are no pending interrupts of sufficiently high priority value to be signaled to the PE.
    - The highest priority pending interrupt is in Group 0.
- Interrupt signaling by the virtual CPU interface is disabled.

Accessing GICV_AIAR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_IAR1 provides equivalent functionality.
- For AArch64 implementations, ICC_IAR1_EL1 provides equivalent functionality.

This register is used for Group 1 interrupts only. GICV_IAR provides equivalent functionality for Group 0 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_AIAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	`0x0020`	GICV_AIAR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_APR<n>, Virtual Machine Active Priorities Registers, n = 0 - 3

The GICV_APR<n> characteristics are:

Purpose

Provides information about interrupt active priorities.

These registers correspond to the physical CPU interface registers GICC_APR<n>.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_APR<n> are RES0.

When System register access is disabled for EL2, these registers access GICH_APR<n>, and all active priorities for virtual machines are held in GICH_APR<n> regardless of interrupt group.

When System register access is enabled for EL2, these registers access ICH_AP1R<n>_EL2, and all active priorities for virtual machines are held in ICH_AP1R<n>_EL2 regardless of interrupt group.

Attributes

GICV_APR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

P<x>, bit [x], for x = 31 to 0

Provides information about active priorities for the virtual machine.

See GICH_APR<n> and ICH_AP1R<n>_EL2 for the correspondence between priorities and bits.

Accessing GICV_APR<n>

If System register access is not enabled for EL2, these registers access GICH_APR<n>. If System register access is enabled for EL2, these registers access ICH_AP1R<n>_EL2. All active priority mapped guests are held in the accessed registers, regardless of interrupt group.

GICV_APR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	`0x00D0` + (4 * n)	GICV_APR<n>

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICV_BPR, Virtual Machine Binary Point Register

The GICV_BPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

This register corresponds to GICC_BPR in the physical CPU interface.

Note

GICH_LR<n>.Group determines whether a virtual interrupt is Group 0 or Group 1.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_BPR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

When GICV_CTLR.CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

Attributes

GICV_BPR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																													Binary_Point		

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see 'ICC_BPR0_EL1 Binary Point for Group 1 interrupts when CBPR == 1, or for Group 0 interrupts' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The Binary_Point field of this register is aliased to GICH_VMCR.VBPR0.

Accessing GICV_BPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_BPR0 provides equivalent functionality.
- For AArch64 implementations, ICC_BPR0_EL1 provides equivalent functionality.

GICV_BPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	`0x0008`	GICV_BPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICV_CTLR, Virtual Machine Control Register

The GICV_CTLR characteristics are:

Purpose

Controls the behavior of virtual interrupts.

This register corresponds to the physical CPU interface register GICC_CTLR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_CTLR are RES0.

This register is available when a GIC implementation supports interrupt virtualization.

Attributes

GICV_CTLR is a 32-bit register.

Field descriptions

31:10	9	8:5	4	3	2	1	0
RES0	EOImode	RES0	CBPR	FIQEn	AckCtl	EnableGrp1	EnableGrp0

Bits [31:10]

Reserved, RES0.

EOImode, bit [9]

Controls the behavior associated with the GICV_EOIR, GICV_AEOIR, and GICV_DIR registers:

EOImode	Meaning
0b0	Writes to GICV_EOIR and GICV_AEOIR perform priority drop and deactivate interrupt operations simultaneously. Behavior on a write to GICV_DIR is unpredictable. When it has completed processing the interrupt, the virtual machine writes to GICV_EOIR or GICV_AEOIR to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the physical Distributor.
0b1	Writes to GICV_EOIR and GICV_AEOIR perform priority drop operation only. Writes to GICV_DIR perform deactivate interrupt operation only. When it has completed processing the interrupt, the virtual machine writes to GICV_DIR to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the Distributor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

CBPR, bit [4]

Controls whether GICV_BPR affects both Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	GICV_BPR affects Group 0 virtual interrupts only. GICV_ABPR affects Group 1 virtual interrupts only.
0b1	GICV_BPR affects both Group 0 and Group 1 virtual interrupts.

For more information, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIQEn, bit [3]

FIQ Enable. Controls whether Group 0 virtual interrupts are presented as virtual FIQs:

FIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AckCtl, bit [2]

Arm deprecates use of this bit. Arm strongly recommends that software is written to operate with this bit always cleared to 0.

Acknowledge control. When the highest priority interrupt is Group 1, determines whether GICV_IAR causes the CPU interface to acknowledge the interrupt or returns the spurious identifier 1022, and whether GICV_HPPIR returns the interrupt ID or the special identifier 1022.

AckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an interrupt ID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the interrupt ID of the corresponding interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EnableGrp1, bit [1]

Enables the signaling of Group 1 virtual interrupts by the virtual CPU interface to the virtual machine:

EnableGrp1	Meaning
0b0	Signaling of Group 1 interrupts is disabled.
0b1	Signaling of Group 1 interrupts is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enables the signaling of Group 0 virtual interrupts by the virtual CPU interface to the virtual machine:

EnableGrp0	Meaning
`0b0`	Signaling of Group 0 interrupts is disabled.
`0b1`	Signaling of Group 0 interrupts is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICV_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_CTLR provides equivalent functionality.
- For AArch64 implementations, ICC_CTLR_EL1 provides equivalent functionality.

GICV_CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	`0x0000`	GICV_CTLR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_DIR, Virtual Machine Deactivate Interrupt Register

The GICV_DIR characteristics are:

Purpose

Deactivates a specified virtual interrupt in the GICH_LR<n> List registers.

This register corresponds to the physical CPU interface register GICC_DIR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_DIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_DIR is a 32-bit register.

Field descriptions

31:25	24:0
RES0	INTID

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

When the virtual machine writes to this register, the specified interrupt in the List registers is changed from active to inactive, or from active and pending to pending. If the specified interrupt is present in the List registers but is not in either the active or active and pending states, the effect is UNPREDICTABLE. If the specified interrupt is not present in the List registers, GICH_HCR.EOICount is incremented, potentially generating a maintenance interrupt.

Note

If the specified interrupt is not present in the List registers, the virtual machine cannot recover the INTID. Therefore, the hypervisor must ensure that, when GICV_CTLR.EOImode == 1, no more than one active interrupt is

---

transferred from the List registers into a software list. If more than one active interrupt that is not stored in the List registers exists, the hypervisor must handle accesses to GICV_DIR in software, typically by trapping these accesses.

If the corresponding GICH_LR<n>.HW == 1, indicating a hardware interrupt, then a deactivate request is sent to the physical Distributor, identifying the physical INTID from the corresponding field in the List register. This effect is identical to a Non-secure write to GICC_DIR from the PE having that physical INTID. This means that if the corresponding physical interrupt is marked as Group 0, the request is ignored.

Note

Interrupt deactivation using this register is based on the provided INTID, with no requirement to deactivate interrupts in any particular order. A single register is therefore used to deactivate both Group 0 and Group 1 interrupts.

Accessing GICV_DIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_DIR provides equivalent functionality.
- For AArch64 implementations, ICC_DIR_EL1 provides equivalent functionality.

Writes to this register are valid only when GICV_CTLR.EOImode == 1. Writes to this register are otherwise UNPREDICTABLE.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_DIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	`0x1000`	GICV_DIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_EOIR, Virtual Machine End Of Interrupt Register

The GICV_EOIR characteristics are:

Purpose

A write to this register performs a priority drop for the specified Group 0 virtual interrupt and, if GICV_CTLR.EOImode == 0, also deactivates the interrupt.

This register corresponds to the physical CPU interface register GICC_EOIR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_EOIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_EOIR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25	24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	INTID

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

The behavior of this register depends on the setting of GICV_CTLR.EOImode:

GICV_CTLR.EOImode	Behavior
0b0	Both the priority drop and the deactivate interrupt effects occur
0b1	Only the priority drop effect occurs.

A successful EOI request means that:

- The highest priority bit in GICH_APR<n> is cleared, causing the running priority to drop.
- If the appropriate GICV_CTLR.EOImode bit == 0, the interrupt is deactivated in the corresponding List register GICH_LR<n>. If GICH_LR<n>.HW == 1, indicating the INTID corresponds to a hardware interrupt,

a deactivate request is also sent to the physical Distributor, identifying the physical INTID from the corresponding field in the List register. This effect is identical to a Non-secure write to GICC_DIR from the PE having that physical INTID. This means that if the corresponding physical interrupt is marked as Group 0, and GICD_CTLR.DS == 0, the deactivation request is ignored. See GICC_EOIR for more information.

Note

Only Group 1 interrupts can target the hypervisor, and therefore only Group 1 interrupts are deactivated in the Distributor.

Accessing GICV_EOIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_EOIR0 provides equivalent functionality.
- For AArch64 implementations, ICC_EOIR0_EL1 provides equivalent functionality.

This register is used for Group 0 interrupts only. GICV_AEOIR provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_EOIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	`0x0010`	GICV_EOIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

GICV_HPPIR, Virtual Machine Highest Priority Pending Interrupt Register

The GICV_HPPIR characteristics are:

Purpose

Provides the INTID of the highest priority pending Group 0 virtual interrupt in the List registers.

This register corresponds to the physical CPU interface register GICC_HPPIR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_HPPIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_HPPIR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25	24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	INTID

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

> **Note**
>
> INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Reads of the GICC_HPPIR that do not return a valid INTID return a spurious INTID, 1022 or 1023. See 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Highest priority pending interrupt Group	GICV_HPPIR read	GICV_CTLR.AckCtl	Returned INTID
1	Non-secure	x	ID of Group 1 interrupt
1	Secure	0	1022
1	Secure	1	ID of Group 1 interrupt
0	Non-secure	x	1023
0	Secure	x	ID of Group 0 interrupt
No pending interrupts	x	x	1023

If the CPU interface supports only a single Security state, the entries that apply to Secure reads describe the behavior.

Accessing GICV_HPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_HPPIR0 provides equivalent functionality.
- For AArch64 implementations, ICC_HPPIR0_EL1 provides equivalent functionality.

This register is used for Group 0 interrupts only. GICV_AHPPIR provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_HPPIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	`0x0018`	GICV_HPPIR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_IAR, Virtual Machine Interrupt Acknowledge Register

The GICV_IAR characteristics are:

Purpose

Provides the INTID of the signaled Group 0 virtual interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

This register corresponds to the physical CPU interface register GICC_IAR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_IAR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_IAR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0							INTID																								

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

When the virtual machine writes to this register, the virtual CPU interface acknowledges the highest priority pending virtual interrupt and sets the state in the corresponding List register to active. The appropriate bit in the active priorities register GICH_APR<n> is set to 1.

If GICH_LR<n>.HW == 0, indicating that the interrupt is software-triggered, then bits [12:10] of GICH_LR<n> are returned in bits [12:10] of GICV_IAR. Otherwise bits [12:10] are RES0.

A read of this register returns the spurious INTID 1023 if either of the following is true:

- There are no pending interrupts of sufficiently high priority value to be signaled to the PE with the virtual CPU interface enabled and GICH_HCR.En == 1.
- Interrupt signaling by the virtual CPU interface is disabled.

A read of this register returns the spurious INTID 1022 if the highest priority pending interrupt is Group 1 and GICV_CTLR.AckCtl == 0.

Accessing GICV_IAR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_IAR0 provides equivalent functionality.
- For AArch64 implementations, ICC_IAR0_EL1 provides equivalent functionality.

This register is used for Group 0 interrupts only. GICV_AIAR provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_IAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x000C	GICV_IAR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_IIDR, Virtual Machine CPU Interface Identification Register

The GICV_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the virtual CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_IIDR are RES0.

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

Attributes

GICV_IIDR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20	19 18 17 16	15 14 13 12	11 10 9 8 7 6 5 4 3 2 1 0
ProductID	Architecture_version	Revision	Implementer

ProductID, bits [31:20]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture_version, bits [19:16]

The version of the GIC architecture that is implemented.

Architecture_version	Meaning
`0b0001`	GICv1.
`0b0010`	GICv2.
`0b0011`	GICv3 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.
`0b0100`	GICv4 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.

Other values are reserved.

Revision, bits [15:12]

Revision number for the CPU interface.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the CPU interface.

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is `0x4`.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore `0x3B`.

Accessing GICV_IIDR

GICV_IIDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	`0x00FC`	GICV_IIDR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_PMR, Virtual Machine Priority Mask Register

The GICV_PMR characteristics are:

Purpose

This register provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

Note

Higher interrupt priority corresponds to a lower value of the Priority field.

This register corresponds to the physical CPU interface register GICC_PMR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_PMR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

The Priority field of this register is aliased to GICH_VMCR.VMPR, to enable state to be switched easily between virtual machines during context-switching.

Attributes

GICV_PMR is a 32-bit register.

Field descriptions

31:8	7:0
RES0	Priority

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = `0b0`.
- For 64 supported levels, bits [1:0] = `0b00`.
- For 32 supported levels, bits [2:0] = `0b000`.
- For 16 supported levels, bits [3:0] = `0b0000`.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICV_PMR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_PMR provides equivalent functionality.
- For AArch64 implementations, ICC_PMR_EL1 provides equivalent functionality.

GICV_PMR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	`0x0004`	GICV_PMR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_RPR, Virtual Machine Running Priority Register

The GICV_RPR characteristics are:

Purpose

This register indicates the running priority of the virtual CPU interface.

This register corresponds to the physical CPU interface register GICC_RPR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_RPR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_RPR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0
RES0	Priority

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the virtual CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR was set to the minimum value.

Accessing GICV_RPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_RPR provides equivalent functionality.
- For AArch64 implementations, ICC_RPR_EL1 provides equivalent functionality.

Depending on the implementation, if no bits are set to 1 in GICH_APR<n>, indicating no active virtual interrupts in the virtual CPU interface, the priority reads as `0xFF` or `0xF8` to reflect the number of supported interrupt priority bits defined by GICH_VTR.PRIbits.

GICV_RPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	`0x0014`	GICV_RPR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_STATUSR, Virtual Machine Error Reporting Status Register

The GICV_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_STATUSR are RES0.

In systems where this register is implemented, Arm expects that when a virtual machine is scheduled, the hypervisor ensures that this register is cleared to 0. The hypervisor might check for illegal accesses when the virtual machine is unscheduled.

Attributes

GICV_STATUSR is a 32-bit register.

Field descriptions

31–4	3	2	1	0
RES0	WROD	RWOD	WRD	RRD

Bits [31:4]

Reserved, RES0.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
`0b0`	Normal operation.
`0b1`	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
`0b0`	Normal operation.
`0b1`	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
`0b0`	Normal operation.
`0b1`	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
`0b0`	Normal operation.
`0b1`	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICV_STATUSR

This is an optional register. If the register is implemented, GICC_STATUSR must also be implemented. If the register is not implemented, the location is RAZ/WI.

This register is used only when System register access is not enabled. If System register access is enabled, this register is not updated. Equivalent function might be provided by appropriate traps and exceptions.

GICV_STATUSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	`0x002C`	GICV_STATUSR

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_BASER<n>, ITS Translation Table Descriptors, n = 0 - 7

The GITS_BASER<n> characteristics are:

Purpose

Specifies the base address and size of the ITS translation tables.

Configuration

A copy of this register is provided for each ITS translation table.

Bits [63:32] and bits [31:0] are accessible independently.

A maximum of 8 GITS_BASER<n> registers can be provided. Unimplemented registers are RES0.

When GITS_CTLR.Enabled == 1 or GITS_CTLR.Quiescent == 0, writing this register is UNPREDICTABLE.

Attributes

GITS_BASER<n> is a 64-bit register.

Field descriptions

63	62	61 60 59	58 57 56	55 54 53	52 51 50 49 48	47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
Valid	Indirect	InnerCache	Type	OuterCache	Entry_Size	Physical_Address

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12	11 10	9 8	7 6 5 4 3 2 1 0
Physical_Address	Shareability	Page_Size	Size

Valid, bit [63]

Indicates whether software has allocated memory for the translation table:

Valid	Meaning
`0b0`	No memory is allocated for the translation table. The ITS discards any writes to the interrupt translation page when either: • GITS_BASER<n>.Type specifies any valid table entry type other than interrupt collections, that is, any value other than `0b100`. • GITS_BASER<n>.Type specifies an interrupt collection and GITS_TYPER.HCC == 0.
`0b1`	Memory is allocated to the translation table.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Indirect, bit [62]

This field indicates whether an implemented register specifies a single, flat table or a two-level table where the first level contains a list of descriptors.

Indirect	Meaning
0b0	Single Level. The Size field indicates the number of pages used by the ITS to store data associated with each table entry.
0b1	Two Level. The Size field indicates the number of pages which contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used.

For more information, see 'The ITS tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field is RAZ/WI for GIC implementations that only support flat tables. If the maximum width of the scaling factor that is identified by GITS_BASER<n>.Type and the smallest page size that is supported result in a single level table that requires multiple pages, then implementing this bit as RAZ/WI is DEPRECATED.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [61:59]

Indicates the Inner Cacheability attributes of accesses to the table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Type, bits [58:56]

Read only. Specifies the type of entity that requires entries in the corresponding translation table. The possible values of the field are:

Type	Meaning
0b000	Unimplemented. This register does not correspond to a translation table.
0b001	Devices. This register corresponds to a translation table that scales with the width of the DeviceID. Only a single GITS_BASER<n> register reports this type.
0b010	vPEs. FEAT_GICv4 only. This register corresponds to a translation table that scales with the number of vPEs in the system. The translation table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of vPEs in the system. Only a single GITS_BASER<n> register reports this type.
0b100	Interrupt collections. This register corresponds to a translation table that scales with the number of interrupt collections in the system. The translation table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of interrupt collections. Not more than one GITS_BASER<n> register will report this type.

Other values are reserved.

For FEAT_GICv4p1, the registers are allocated as follows:

- GITS_BASER0.Type is 0b001 (Device).
- GITS_BASER1.Type is either 0b100 (Collection Table) or 0b000 (Unimplemented).
- GITS_BASER2.Type is either 0b010 (vPE) or 0b000 (Unimplemented).
- GITS_BASER<n>.Type, where 'n' is in the range 3 to 7, is 0b000 (Unimplemented).

For FEAT_GICv3, FEAT_GICv3p1, and FEAT_GICv4, Arm recommends that the GITS_BASER<n> use the same allocations.

Other allocations of Type values are deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

OuterCache, bits [55:53]

Indicates the Outer Cacheability attributes of accesses to the table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Entry_Size, bits [52:48]

Read-only. Specifies the number of bytes per translation table entry, minus one.

Physical_Address, bits [47:12]

Physical Address. When Page_Size is 4KB or 16KB:

- Bits [51:48] of the base physical address are zero.
- This field provides bits[47:12] of the base physical address of the table.
- Bits[11:0] of the base physical address are zero.
- The address must be aligned to the size specified in the Page Size field. Otherwise the effect is CONSTRAINED UNPREDICTABLE, and can be one of the following:
    - Bits[X:12], where X is derived from the page size, are treated as zero.
    - The value of bits[X:12] are used when calculating the address of a table access.

When Page_Size is 64KB:

- Bits[47:16] of the register provide bits[47:16] of the base physical address of the table.
- Bits[15:12] of the register provide bits[51:48] of the base physical address of the table.
- Bits[15:0] of the base physical address are 0.

In implementations that support fewer than 52 bits of physical address, any unimplemented upper bits might be RAZ/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Page_Size, bits [9:8]

The size of page that the translation table uses:

Page_Size	Meaning
0b00	4KB.
0b01	16KB.
0b10	64KB.
0b11	Reserved. Treated as 0b10.

Note

If the GIC implementation supports only a single, fixed page size, this field might be RO.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Size, bits [7:0]

The number of pages of physical memory allocated to the table, minus one. GITS_BASER<n>.Page_Size specifies the size of each page.

If GITS_BASER<n>.Type == 0, this field is RAZ/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GITS_BASER<n>

GITS_BASER<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0100 + (8 * n)	GITS_BASER<n>

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_CBASER, ITS Command Queue Descriptor

The GITS_CBASER characteristics are:

Purpose

Specifies the base address and size of the ITS command queue.

Configuration

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CBASER is a 64-bit register.

Field descriptions

63	62	61 60 59	58 57 56	55 54 53	52	51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
Valid	RES0	InnerCache	RES0	OuterCache	RES0	Physical_Address

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12	11 10	9 8	7 6 5 4 3 2 1 0
Physical_Address	Shareability	RES0	Size

Valid, bit [63]

Indicates whether software has allocated memory for the command queue:

Valid	Meaning
0b0	No memory is allocated for the command queue.
0b1	Memory is allocated to the command queue.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Bit [62]

Reserved, RES0.

InnerCache, bits [61:59]

Indicates the Inner Cacheability attributes of accesses to the command queue. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [58:56]

Reserved, RES0.

OuterCache, bits [55:53]

Indicates the Outer Cacheability attributes of accesses to the command queue. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bit [52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the base physical address of the command queue. Bits [11:0] of the base address are 0.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

If bits [15:12] are not all zeros, behavior is a CONSTRAINED UNPREDICTABLE choice:

- Bits [15:12] are treated as if all the bits are zero. The value read back from those bits is either the value written or zero.
- The result of the calculation of an address for a command queue read can be corrupted.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the command queue. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [9:8]

Reserved, RES0.

Size, bits [7:0]

The number of 4KB pages of physical memory allocated to the command queue, minus one.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

The command queue is a circular buffer and wraps at Physical Address [47:0] + (4096 * (Size + 1)).

Note

When this register is successfully written, the value of GITS_CREADR is set to zero.

Accessing GITS_CBASER

When GITS_CTLR.Enabled == 1 or GITS_CTLR.Quiescent == 0, writing this register is UNPREDICTABLE.

GITS_CBASER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	`0x0080`	GITS_CBASER

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_CREADR, ITS Read Register

The GITS_CREADR characteristics are:

Purpose

Specifies the offset from GITS_CBASER where the ITS reads the next ITS command.

Configuration

This register is cleared to 0 when a value is written to GITS_CBASER.

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CREADR is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
RES0

RES0	Offset	RES0	Stalled
31 30 29 28 27 26 25 24 23 22 21 20	19 18 17 16 15 14 13 12 11 10 9 8 7 6 5	4 3 2 1	0

Bits [63:20]

Reserved, RES0.

Offset, bits [19:5]

Bits [19:5] of the offset from GITS_CBASER. Bits [4:0] of the offset are zero.

Bits [4:1]

Reserved, RES0.

Stalled, bit [0]

Reports whether the processing of commands is stalled because of a command error.

Stalled	Meaning
`0b0`	ITS command queue is not stalled because of a command error.
`0b1`	ITS command queue is stalled because of a command error.

For more information, see 'The ITS command interface' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accessing GITS_CREADR

GITS_CREADR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance

GIC ITS control	`0x0090`	GITS_CREADR

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_CTLR, ITS Control Register

The GITS_CTLR characteristics are:

Purpose

Controls the operation of an ITS.

Configuration

The ITS_Number (bits [7:4]) and bit [1] fields apply only in FEAT_GICv4 implementations, and are RES0 in FEAT_GICv3 implementations.

Attributes

GITS_CTLR is a 32-bit register.

Field descriptions

31	30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9	8	7 6 5 4	3 2	1	0
Quiescent	RES0	UMSIirq	ITS_Number	RES0	ImDe	Enabled

Quiescent, bit [31]

Read-only. Indicates completion of all ITS operations when GITS_CTLR.Enabled == 0.

Quiescent	Meaning
0b0	The ITS is not quiescent and cannot be powered down.
0b1	The ITS is quiescent and can be powered down.

For the ITS to be considered inactive, there must be no transactions in progress. In addition, all operations required to ensure that mapping data is consistent with external memory must be complete.

Note

In distributed GIC implementations, this bit is set to 1 only after the ITS forwards any operations that have not yet been completed to the Redistributors and receives confirmation that all such operations have reached the appropriate Redistributor.

In FEAT_GICv3, FEAT_GICv3p1, and FEAT_GICv4, when GITS_CTLR.Enabled == 1, the value of GITS_CTLR.Quiescent is UNKNOWN.

In FEAT_GICv4p1, when GITS_CTLR.Enabled == 1, the value of GITS_CTLR.Quiescent reads as 1 until the write to Enabled has taken effect and then reads as 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to 1.

Bits [30:9]

Reserved, RES0.

UMSIirq, bit [8]

Unmapped MSI reporting interrupt enable.

UMSIirq	Meaning
0b0	The ITS does not assert an interrupt signal when GITS_STATUSR.UMSI is 1.
0b1	The ITS asserts an interrupt signal when GITS_STATUSR.UMSI is 1.

If GITS_TYPER.UMSIirq is 0, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

ITS_Number, bits [7:4]

In FEAT_GICv3 implementations this field is RES0.

In FEAT_GICv4 implementations with more than one ITS instance, this field indicates the ITS number for use with 'VMOVP GICv4.0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

It is IMPLEMENTATION DEFINED whether this field is programmable or RO.

If this field is programmable, changing this field when GITS_CTLR.Quiescent == 0 or GITS_CTLR.Enabled == 1 is UNPREDICTABLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [3:2]

Reserved, RES0.

ImDe, bit [1]

In GICv3 implementations, this bit is RES0.

In GICv4 implementations, this bit is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Enabled, bit [0]

Controls whether the ITS is enabled:

Enabled	Meaning
0b0	The ITS is not enabled. Writes to GITS_TRANSLATER are ignored and no further command queue entries are processed.
0b1	The ITS is enabled. Writes to GITS_TRANSLATER result in interrupt translations and the command queue is processed.

If a write to this register changes this field from 1 to 0, the ITS must ensure that both:

- Any caches containing mapping data are made consistent with external memory.
- GITS_CTLR.Quiescent == 0 until all caches are consistent with external memory.

Changing GITS_CTLR.Enabled from 0 to 1 when GITS_CTLR.Quiescent is 0 results in UNPREDICTABLE behavior.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Accessing GITS_CTLR

GITS_CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	`0x0000`	GITS_CTLR

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_CWRITER, ITS Write Register

The GITS_CWRITER characteristics are:

Purpose

Specifies the offset from GITS_CBASER where software writes the next ITS command.

Configuration

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CWRITER is a 64-bit register.

Field descriptions

63 … 32
RES0

31 … 20	19 … 5	4 … 1	0
RES0	Offset	RES0	Retry

Bits [63:20]

Reserved, RES0.

Offset, bits [19:5]

Bits [19:5] of the offset from GITS_CBASER. Bits [4:0] of the offset are zero.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [4:1]

Reserved, RES0.

Retry, bit [0]

Writing this bit has the following effects:

Retry	Meaning
`0b0`	No effect on the processing commands by the ITS.
`0b1`	Restarts the processing of commands by the ITS if it stalled because of a command error. **Note** If the processing of commands is not stalled because of a command error, writing 1 to this bit has no effect.

When read, this bit is RES0.

For more information, see 'The ITS command interface' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If GITS_CWRITER is written with a value outside of the valid range specified by GITS_CBASER.Physical_Address and GITS_CBASER.Size, behavior is a CONSTRAINED UNPREDICTABLE choice, as follows:

- The command queue is considered invalid, and no further commands are processed until GITS_CWRITER is written with a value that is in the valid range.
- The value is treated as a valid UNKNOWN value.

An implementation might choose to report a system error in an IMPLEMENTATION DEFINED manner.

Accessing GITS_CWRITER

GITS_CWRITER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0088	GITS_CWRITER

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_IIDR, ITS Identification Register

The GITS_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the ITS.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GITS_IIDR is a 32-bit register.

Field descriptions

31–24	23–20	19–16	15–12	11–0
ProductID	RES0	Variant	Revision	Implementer

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the ITS:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is `0x4`.
- Bit [7] is always 0.

- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore `0x3B`.

Accessing GITS_IIDR

GITS_IIDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	`0x0004`	GITS_IIDR

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_MPAMIDR, Report maximum PARTID and PMG Register

The GITS_MPAMIDR characteristics are:

Purpose

Reports the maximum support PARTID and PMG values.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GITS_MPAMIDR are RES0.

A copy of this register is provided for each ITS.

When GITS_TYPER.MPAM==0, this register is RES0.

Attributes

GITS_MPAMIDR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	PMGmax	PARTIDmax

Bits [31:24]

Reserved, RES0.

PMGmax, bits [23:16]

Maximum PMG value supported.

PARTIDmax, bits [15:0]

Maximum PARTID value supported.

Accessing GITS_MPAMIDR

GITS_MPAMIDR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x0010

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_MPIDR, Report ITS's affinity.

The GITS_MPIDR characteristics are:

Purpose

Reports ITS's affinity when the vPE Table is shared with Redistributors.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GITS_MPIDR are RES0.

A copy of this register is provided for each ITS.

When GITS_TYPER.SVPET==0, this register is RES0.

Attributes

GITS_MPIDR is a 32-bit register.

Field descriptions

31–24	23–16	15–8	7–0
Aff3	Aff2	Aff1	RES0

Aff3, bits [31:24]

The Affinity level 3 value for the ITS.

Aff2, bits [23:16]

The Affinity level 2 value for the ITS.

Aff1, bits [15:8]

The Affinity level 1 value for the ITS.

Bits [7:0]

Reserved, RES0.

Accessing GITS_MPIDR

GITS_MPIDR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x0018

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_PARTIDR, Set PARTID and PMG Register

The GITS_PARTIDR characteristics are:

Purpose

Sets the PARTID and PMG values used for memory accesses by the ITS.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GITS_PARTIDR are RES0.

A copy of this register is provided for each ITS.

When GITS_TYPER.MPAM==0, this register is RES0.

Attributes

GITS_PARTIDR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	PMG	PARTID

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

PMG value used when ITS accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PMG values in the range 0 to PMG_MAX are stateful or RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

PARTID, bits [15:0]

PARTID value used when ITS accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PARTID values in the range 0 to PARTID_MAX are stateful or RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to `0`.

Accessing GITS_PARTIDR

GITS_PARTIDR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	`0x0014`

Accesses on this interface are **RW**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_SGIR, ITS SGI Register

The GITS_SGIR characteristics are:

Purpose

Written by software to signal a virtual SGI for translation by the ITS.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GITS_SGIR are RES0.

This register is provided only in FEAT_GICv4p1 implementations.

Attributes

GITS_SGIR is a 64-bit register.

Field descriptions

63 … 48	47 … 32
RES0	vPEID

31 … 4	3 … 0
RES0	vINTID

Bits [63:48]

Reserved, RES0.

vPEID, bits [47:32]

ID of target vPEID.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are RES0.

Bits [31:4]

Reserved, RES0.

vINTID, bits [3:0]

INTID of virtual SGI.

Accessing GITS_SGIR

64-bit access only.

GITS_SGIR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	`0x20020`

Accesses on this interface are **WO**.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_STATUSR, ITS Error Reporting Status Register

The GITS_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.
- Unmapped MSIs.

Configuration

Attributes

GITS_STATUSR is a 32-bit register.

Field descriptions

31–10	9–6	5	4	3	2	1	0
RES0	Syndrome	Overflow	UMSI	WROD	RWOD	WRD	RRD

Bits [31:10]

Reserved, RES0.

Syndrome, bits [9:6]

Syndrome for the MSI that set GITS_STATUSR.UMSI to 1.

Syndrome	Meaning
0b0000	Unknown reason.
0b0010	DeviceID out of range.
0b0011	DeviceID unmapped.
0b0100	EventID out of range.
0b0101	EventID unmapped.
0b0111	Collection unmapped.
0b1001	vPEID unmapped.

An implementation might not support reporting all syndromes, and might report `0b0000` for any cause.

This field is UNKNOWN when GITS_STATUSR.UMSI is 0.

Overflow, bit [5]

Reports whether an unmapped MSI has been received while GITS_STATUSR.UMSI is 1.

Overflow	Meaning
0b0	No unmapped MSIs have been received since GITS_STATUSR.UMSI set to 1.
0b1	At least one unmapped MSIs have been received since GITS_STATUSR.UMSI set to 1.

A software write of 1 to the bit clears it. A write of any other value is ignored.

If GITS_TYPER.UMSI is 0, this field is RES0.

UMSI, bit [4]

Reports whether an unmapped MSI has been received

An unmapped MSI is defined as an MSI arriving at GITS_TRANSLATER for which there is insufficient mapping information for it to be forwarded to a Redistributor.

It is IMPLEMENTATION DEFINED whether an INT command can be reported as an unmapped MSI.

UMSI	Meaning
0b0	No unmapped MSIs have been received.
0b1	Unmapped MSI received.

A software write of 1 to the bit clears it. A write of any other value is ignored.

If GITS_TYPER.UMSI is 0, this field is RES0.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GITS_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

GITS_STATUSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	`0x0040`	GITS_STATUSR

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_TRANSLATER, ITS Translation Register

The GITS_TRANSLATER characteristics are:

Purpose

Written by a requesting Device to signal an interrupt for translation by the ITS.

Configuration

This register is at the same offset as GICD_SETSPI_NSR in the Distributor, and is at the same offset as GICR_SETLPIR in the Redistributor.

Attributes

GITS_TRANSLATER is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EventID																															

EventID, bits [31:0]

An identifier corresponding to the interrupt to be translated.

Note

The size of the EventID is DeviceID specific, and set when the DeviceID is mapped to an ITT (using MAPD).

The number of EventID bits implemented is reported by GITS_TYPER.ID_bits. If a write specifies non-zero identifiers bits outside this range behavior is a CONSTRAINED UNPREDICTABLE choice between:

- Non-zero identifier bits outside the supported range are ignored.
- The write is ignored.

The DeviceID presented to an ITS is used to index a device table. The device table maps the DeviceID to an interrupt translation table for that device.

Accessing GITS_TRANSLATER

16-bit access to bits [15:0] of this register must be supported. When this register is written by a 16-bit transaction, bits [31:16] are written as zero.

Implementations must ensure that:

- A unique DeviceID is provided for each requesting device, and the DeviceID is presented to the ITS when a write to this register occurs in a manner that cannot be spoofed by any agent capable of performing writes.
- The DeviceID presented corresponds to the DeviceID field in the ITS commands.

Writes to this register are ignored if any of the following are true:

- GITS_CTLR.Enabled == 0.
- The presented DeviceID is not mapped to an Interrupt Translation Table.
- The DeviceID is larger than the supported size.
- The DeviceID is mapped to an Interrupt Translation Table, but the EventID is outside the range specified by MAPD.

- The EventID is mapped to an Interrupt Translation Table and the EventID is within the range specified by MAPD, but the EventID is unmapped.

Translation requests that result from writes to this register are subject to certain ordering rules. For more information, see 'Ordering of translations with the output to ITS commands' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

GITS_TRANSLATER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS translation	`0x0040`	GITS_TRANSLATER

Accesses on this interface are **WO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_TYPER, ITS Type Register

The GITS_TYPER characteristics are:

Purpose

Specifies the features that an ITS supports.

Configuration

Attributes

GITS_TYPER is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47	46	45	44	43	42 41	40	39	38	37	36	35	3
RES0	INV	UMSIirq	UMSI	nID	SVPET	VMAPP	VSGI	MPAM	VMOVP	CIL	CIDb	

HCC	RES0	PTA	SEIS	Devbits	ID_bits	ITT_entry_size	IMPLEMENTATION DEFINED	C
31 30 29 28 27 26 25 24	23 22 21 20	19	18	17 16 15 14 13	12 11 10 9 8	7 6 5 4	3	

Bits [63:47]

Reserved, RES0.

INV, bit [46]

ITS cache invalidation behavior on disable.

INV	Meaning
0b0	It is IMPLEMENTATION DEFINED whether ITS caches are invalidated on clearing GITS_CTLR.Enabled and GITS_BASER<n>.Valid.
0b1	ITS caches are invalidated on clearing GITS_CTLR.Enabled and GITS_BASER<n>.Valid.

If GITS_TYPER.INV is 1, after the following sequence:

- GITS_CTLR.Enabled written to 0.
- A read of GITS_CTLR.Quiescent returns 1.
- GITS_BASER<n>.Valid written to 0.

There is no cached information from the ITS memory structure pointed to by GITS_BASER<n>.

UMSIirq, bit [45]

Indicates support for generating an interrupt on receiving unmapped MSI.

UMSIirq	Meaning
0b0	Interrupt on unmapped MSI not supported.
0b1	Interrupt on unmapped MSI is supported.

If GITS_TYPER.UMSI is 0, this field is RES0.

UMSI, bit [44]

Indicates suport for reporting receipt of unmapped MSIs.

UMSI	Meaning
0b0	Reporting of unmapped MSIs is not supported.
0b1	Reporting of unmapped MSIs is supported.

nID, bit [43]
When FEAT_GICv4p1 is implemented:

nID

nID	Meaning
0b0	Individual doorbell interrupt supported.
0b1	Individual doorbell interrupt not supported.

Otherwise:

Reserved, RES0.

SVPET, bits [42:41]
When FEAT_GICv4p1 is implemented:

SVPET

SVPET	Meaning
0b00	vPE Table is not shared with Redistributors.
0b01	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR.Aff3.
0b10	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3 and Aff2.
0b11	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3, Aff2 and Aff1.

Otherwise:

Reserved, RES0.

VMAPP, bit [40]
When FEAT_GICv4p1 is implemented:

VMAPP

VMAPP	Meaning
0b0	FEAT_GICv4 VMAPP command layout.
0b1	FEAT_GICv4p1 VMAPP command layout.

Otherwise:

Reserved, RES0.

VSGI, bit [39]
When FEAT_GICv4p1 is implemented:

VSGI

VSGI	Meaning
0b0	Direct injection of SGIs is not supported.
0b1	Direct injection of SGIs is supported.

Otherwise:

Reserved, RES0.

MPAM, bit [38]

When FEAT_GICv3p1 is implemented:

MPAM

MPAM	Meaning
0b0	MPAM is not supported.
0b1	MPAM is supported.

Otherwise:

Reserved, RES0.

VMOVP, bit [37]

Indicates the form of the VMOVP command.

VMOVP	Meaning
0b0	When moving a vPE, software must issue a VMOVP on all ITSs that have mappings for that vPE. The ITSList and Sequence Number fields in the VMOVP command must ensure synchronization, otherwise behavior is UNPREDICTABLE.
0b1	When moving a vPE, software must only issue a VMOVP on one of the ITSs that has a mapping for that vPE. The ITSList and Sequence Number fields in the VMOVP command are RES0.

CIL, bit [36]

Collection ID Limit.

CIL	Meaning
0b0	ITS supports 16-bit Collection ID, GITS_TYPER.CIDbits is RES0.
0b1	GITS_TYPER.CIDbits indicates supported Collection ID size

In implementations that do not support Collections in external memory, this bit is RES0 and the number of Collections supported is reported by GITS_TYPER.HCC.

CIDbits, bits [35:32]

Number of Collection ID bits.

- The number of bits of Collection ID minus one.
- When GITS_TYPER.CIL == 0, this field is RES0.

HCC, bits [31:24]

Hardware Collection Count. The number of interrupt collections supported by the ITS without provisioning of external memory.

Note

Collections held in hardware are unmapped at reset.

Bits [23:20]

Reserved, RES0.

PTA, bit [19]

Physical Target Addresses. Indicates the format of the target address:

PTA	Meaning
0b0	The target address corresponds to the PE number specified by GICR_TYPER.Processor_Number.
0b1	The target address corresponds to the base physical address of the required Redistributor.

For more information, see 'RDbase' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

SEIS, bit [18]

SEI support. Indicates whether the virtual CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The ITS does not support local generation of SEIs.
0b1	The ITS supports local generation of SEIs.

Devbits, bits [17:13]

The number of DeviceID bits implemented, minus one.

ID_bits, bits [12:8]

The number of EventID bits implemented, minus one.

ITT_entry_size, bits [7:4]

Read-only. Indicates the number of bytes per translation table entry, minus one.

For more information about the ITS command 'MAPD', see MAPD.

IMPLEMENTATION DEFINED, bit [3]

IMPLEMENTATION DEFINED.

CCT, bit [2]

Cumulative Collection Tables.

CCT	Meaning
0b0	The total number of supported collections is determined by the number of collections held in memory only.
0b1	The total number of supported collections is determined by number of collections that are held in memory and the number indicated by GITS_TYPER.HCC.

If GITS_TYPER.HCC == 0, or if memory backed collections are not supported (all GITS_BASER<n>.Type != 100), this bit is RES0.

Virtual, bit [1]
When FEAT_GICv4 is implemented:

Indicates whether the ITS supports virtual LPIs and direct injection of virtual LPIs:

Virtual	Meaning
0b0	The ITS does not support virtual LPIs or direct injection of virtual LPIs.
0b1	The ITS supports virtual LPIs and direct injection of virtual LPIs.

Otherwise:

Reserved, RES0.

Physical, bit [0]

Indicates whether the ITS supports physical LPIs:

Physical	Meaning
0b0	The ITS does not support physical LPIs.
0b1	The ITS supports physical LPIs.

This field is RES1, indicating that the ITS supports physical LPIs.

Accessing GITS_TYPER

GITS_TYPER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0008	GITS_TYPER

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_UMSIR, ITS Unmapped MSI register

The GITS_UMSIR characteristics are:

Purpose

Provides the DeviceID and EventID of the unmapped MSI that set GITS_STATUSR.UMSI.

Configuration

This register is present only when GITS_TYPER.UMSI == 1. Otherwise, direct accesses to GITS_UMSIR are RES0.

Attributes

GITS_UMSIR is a 64-bit register.

Field descriptions

Bits	Field
63:32	DeviceID
31:0	EventID

DeviceID, bits [63:32]

DeviceID of MSI that set GITS_STATUSR.UMSI to 1.

If GITS_STATUSR.UMSI is 0, this field is UNKNOWN.

EventID, bits [31:0]

EventID of MSI that set GITS_STATUSR.UMSI to 1.

If GITS_STATUSR.UMSI is 0, this field is UNKNOWN.

Accessing GITS_UMSIR

GITS_UMSIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0048	GITS_UMSIR

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch64 System register MIDR_EL1[31:0].

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MIDR[31:0].

It is IMPLEMENTATION DEFINED whether MIDR_EL1 is implemented in the Core power domain or in the Debug power domain.

Attributes

MIDR_EL1 is a 32-bit register.

Field descriptions

31–24	23–20	19–16	15–4	3–0
Implementer	Variant	Architecture	PartNum	Revision

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

Implementer	Meaning
`0x00`	Reserved for software use.
`0x41`	Arm Limited.
`0x42`	Broadcom Corporation.
`0x43`	Cavium Inc.
`0x44`	Digital Equipment Corporation.
`0x46`	Fujitsu Ltd.
`0x49`	Infineon Technologies AG.
`0x4D`	Motorola or Freescale Semiconductor Inc.
`0x4E`	NVIDIA Corporation.
`0x50`	Applied Micro Circuits Corporation.
`0x51`	Qualcomm Inc.
`0x56`	Marvell International Ltd.
`0x69`	Intel Corporation.
`0xC0`	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is **RO**.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture, bits [19:16]

Architecture version. Defined values are:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

Access to this field is **RO**.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are `0x0` or `0x7`, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing MIDR_EL1

MIDR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD00	MIDR_EL1

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMCFG_CASSOC, MPAM Cache Maximum Associativity Partition Configuration Register

The MPAMCFG_CASSOC characteristics are:

Purpose

The MPAMCFG_CASSOC is a 32-bit read/write register that controls the maximum fraction of the cache associativity that the PARTID selected by MPAMCFG_PART_SEL is permitted to allocate.

MPAMCFG_CASSOC_s controls the cache maximum associativity for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_CASSOC_ns controls the cache maximum associativity for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_CASSOC is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_CCAP_PART == 1, (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CCAP_IDR.HAS_CASSOC == 1. Otherwise, direct accesses to MPAMCFG_CASSOC are RES0.

Attributes

MPAMCFG_CASSOC is a 32-bit register.

Field descriptions

31–16	15–0
RES0	CASSOC

Bits [31:16]

Reserved, RES0.

CASSOC, bits [15:0]

Maximum cache associativity usage in fixed-point fraction format by the partition selected by MPAMCFG_PART_SEL. The fraction represents the portion of the cache associativity that the PARTID is permitted to allocate. CASSOC controls the fraction of associativity in each associativity grouping of the cache. In a set associative cache, CASSOC applies to the fraction of the ways in each set.

The implemented width of the fixed-point fraction is given in MPAMF_CCAP_IDR.CASSOC_WD. Unimplemented bits within the field are RAZ/WI. The implemented bits of the CASSOC field are always the most significant bits of the field.

The fixed-point fraction CASSOC is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the cache that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_CASSOC

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_CASSOC_s must be accessible from the Secure MPAM feature page. MPAMCFG_CASSOC_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_CASSOC_s and MPAMCFG_CASSOC_ns must be separate registers. The Secure instance (MPAMCFG_CASSOC_s) accesses the cache maximum associativity partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_CASSOC_ns) accesses the cache maximum associativity partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CASSOC access the cache maximum associativity partitioning configuration settings for the cache resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CASSOC access the cache maximum associativity partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CASSOC access the cache maximum associativity partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CASSOC access the cache maximum associativity partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_CASSOC can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0118	MPAMCFG_CASSOC_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0118	MPAMCFG_CASSOC_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMCFG_CMAX, MPAM Cache Maximum Capacity Partition Configuration Register

The MPAMCFG_CMAX characteristics are:

Purpose

The MPAMCFG_CMAX is a 32-bit read/write register that controls the maximum fraction of the cache capacity that the PARTID selected by MPAMCFG_PART_SEL is permitted to allocate.

MPAMCFG_CMAX_s controls the cache maximum capacity for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_CMAX_ns controls the cache maximum capacity for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_CMAX is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_CCAP_PART == 1 and MPAMF_CCAP_IDR.NO_CMAX == 0. Otherwise, direct accesses to MPAMCFG_CMAX are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_CMAX is a 32-bit register.

Field descriptions

31	30–16	15–0
SOFTLIM	RES0	CMAX

SOFTLIM, bit [31]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CCAP_IDR.HAS_CMAX_SOFTLIM == 1:

Soft limiting of CMAX. Soft limiting allows some allocations by a PARTID when its cache use is above the CMAX maximum cache capacity.

SOFTLIM	Meaning
0b0	When CMAX cache capacity is exceeded, the partition is not allowed to increase its cache capacity usage. It is only permitted to replace a line that was previously occupied by a line allocated by that PARTID.
0b1	When CMAX cache capacity is exceeded, the partition is permitted to allocate capacity beyond CMAX, but only from invalid lines or lines belonging to disabled PARTIDs.

Otherwise:

Reserved, RES0.

Bits [30:16]

Reserved, RES0.

CMAX, bits [15:0]

Maximum cache capacity usage in fixed-point fraction format by the partition selected by MPAMCFG_PART_SEL. The fraction represents the portion of the total cache capacity that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in MPAMF_CCAP_IDR.CMAX_WD. Unimplemented bits within the field are RAZ/WI. The implemented bits of the CMAX field are always the most significant bits of the field.

The fixed-point fraction CMAX is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the cache that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_CMAX

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_CMAX_s must be accessible from the Secure MPAM feature page. MPAMCFG_CMAX_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_CMAX_s and MPAMCFG_CMAX_ns must be separate registers. The Secure instance (MPAMCFG_CMAX_s) accesses the cache capacity partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_CMAX_ns) accesses the cache capacity partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the cache resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_CMAX can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0108	MPAMCFG_CMAX_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0108	MPAMCFG_CMAX_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMCFG_CMIN, MPAM Cache Minimum Capacity Partition Configuration Register

The MPAMCFG_CMIN characteristics are:

Purpose

The MPAMCFG_CMIN is a 32-bit read/write register that controls the fraction of the cache capacity that the PARTID selected by MPAMCFG_PART_SEL has priority to allocate.

MPAMCFG_CMIN_s controls the cache minimum capacity for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_CMIN_ns controls the cache minimum capacity for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_CMIN is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_CCAP_PART == 1, (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CCAP_IDR.HAS_CMIN == 1. Otherwise, direct accesses to MPAMCFG_CMIN are RES0.

Attributes

MPAMCFG_CMIN is a 32-bit register.

Field descriptions

31:16	15:0
RES0	CMIN

Bits [31:16]

Reserved, RES0.

CMIN, bits [15:0]

Minimum cache capacity usage in fixed-point fraction format by the partition selected by MPAMCFG_PART_SEL. The fraction represents the portion of the total cache capacity that the PARTID has priority to allocate.

The implemented width of the fixed-point fraction is the same as the width of MPAMCFG_CMAX.CMAX which is given in MPAMF_CCAP_IDR.CMAX_WD. Unimplemented bits within the field are RAZ/WI. The implemented bits of the CMIN field are always the most significant bits of the field.

The fixed-point fraction CMIN is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the cache that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_CMIN

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_CMIN_s must be accessible from the Secure MPAM feature page. MPAMCFG_CMIN_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_CMIN_s and MPAMCFG_CMIN_ns must be separate registers. The Secure instance (MPAMCFG_CMIN_s) accesses the cache minimum capacity partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_CMIN_ns) accesses the cache minimum capacity partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CMIN access the cache minimum capacity partitioning configuration settings for the cache resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CMIN access the cache minimum capacity partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CMIN access the cache minimum capacity partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CMIN access the cache minimum capacity partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_CMIN can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0110	MPAMCFG_CMIN_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0110	MPAMCFG_CMIN_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMCFG_CPBM<n>, MPAM Cache Portion Bitmap Partition Configuration Register, n = 0 - 1023

The MPAMCFG_CPBM<n> characteristics are:

Purpose

The MPAMCFG_CPBM<n> register array gives access to the cache portion bitmap. Each register in the array is a read/write register that configures the cache portions numbered from <n * 32> to <31 + (n * 32)> that a PARTID is allowed to allocate.

After setting MPAMCFG_PART_SEL with a PARTID, software writes to the MPAMCFG_CPBM<n> register to configure which cache portions the PARTID is allowed to allocate.

The MPAMCFG_CPBM<n> register that contains the bitmap bit corresponding to cache portion p has n equal to p[15:5]. The field, P<x>, of that MPAMCFG_CPBM<n> register that contains the bitmap bit corresponding to cache portion p has x equal to p[4:0].

MPAMCFG_CPBM<n>_s controls cache portions for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_CPBM<n>_ns controls the cache portions for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_CPBM<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CPOR_PART == 1. Otherwise, direct accesses to MPAMCFG_CPBM<n> are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_CPBM<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	
P<32 * n + 31>	P<32 * n + 30>	P<32 * n + 29>	P<32 * n + 28>	P<32 * n + 27>	P<32 * n + 26>	P<32 * n + 25>	P

P<x + (n * 32)>, bit [x], for x = 31 to 0

Portion allocation control bit. Each cache portion allocation control bit, MPAMCFG_CPBM<n>.P<x>, grants permission to the PARTID selected by MPAMCFG_PART_SEL to allocate cache lines within cache portion <x + (n * 32)>.

P<x + (n * 32)>	Meaning
`0b0`	The PARTID is not permitted to allocate into cache portion <x + (n * 32)>.
`0b1`	The PARTID is permitted to allocate within cache portion <x + (n * 32)>.

The number of bits in the cache portion partitioning bit map of this component is given in MPAMF_CPOR_IDR.CPBM_WD. CPBM_WD contains a value from 1 to 2^{15}, inclusive. Values of CPBM_WD greater than 32 require an array of 32-bit MPAMCFG_CPBM<n> registers to access the cache portion bitmap, up to 1024 registers.

Bits MPAMCFG_CPBM<n>.P<<x + (n * 32)>>, where <x + (n * 32)> is greater than or equal to CPBM_WD, are RES0:

- If n > MPAMF_CPOR_IDR.CPBM_WD[15:5], the entire 32 P<x> are RES0.
- If n == MPAMF_CPOR_IDR.CPBM_WD[15:5], bits [31: CPBM_WD[4:0]] are RES0 and the remaining bits are valid.
- If n < MPAMF_CPOR_IDR.CPBM_WD[15:5], the entire 32 P<x> are valid.

Accessing MPAMCFG_CPBM<n>

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_CPBM<n>_s must be accessible from the Secure MPAM feature page. MPAMCFG_CPBM<n>_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_CPBM<n>_s and MPAMCFG_CPBM<n>_ns must be separate registers. The Secure instance (MPAMCFG_CPBM<n>_s) accesses the cache portion bitmap used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_CPBM<n>_ns) accesses the cache portion bitmap used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the cache resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_CPBM<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x1000` + (4 * n)	MPAMCFG_CPBM<n>_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x1000` + (4 * n)	MPAMCFG_CPBM<n>_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMCFG_DIS, MPAM Partition Configuration Disable Register

The MPAMCFG_DIS characteristics are:

Purpose

Disables a PARTID configuration as set in other MPAMCFG registers.

MPAMCFG_DIS_s disables a Secure PARTID. MPAMCFG_DIS_ns disables a Non-secure PARTID.

Configuration

The power domain of MPAMCFG_DIS is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_ENDIS == 1. Otherwise, direct accesses to MPAMCFG_DIS are RES0.

Attributes

MPAMCFG_DIS is a 32-bit register.

Field descriptions

31	30 – 16	15 – 0
NFU	RES0	PARTID

NFU, bit [31]

No Future Use.

NFU	Meaning
0b0	Control settings of the disabled PARTID must be retained.
0b1	Control settings of the disabled PARTID may take an UNKNOWN value.

Bits [30:16]

Reserved, RES0.

PARTID, bits [15:0]

Selects the PARTID to disable.

Accessing MPAMCFG_DIS

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_DIS_s must be accessible from the Secure MPAM feature page. MPAMCFG_DIS_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_DIS_s and MPAMCFG_DIS_ns must be separate registers. The Secure instance (MPAMCFG_DIS_s) accesses the PARTID disable used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_DIS_ns) accesses the PARTID disable used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_DIS access the PARTID disable configuration settings for the PARTID disable resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_DIS access the PARTID disable configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_DIS access the PARTID disable configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_DIS access the PARTID disable configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_DIS can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x0310`	MPAMCFG_DIS_s

Accesses on this interface are **WO/RAZ**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x0310`	MPAMCFG_DIS_ns

Accesses on this interface are **WO/RAZ**.

MPAMCFG_EN, MPAM Partition Configuration Enable Register

The MPAMCFG_EN characteristics are:

Purpose

Enables a PARTID configuration as set in other MPAMCFG registers.

MPAMCFG_EN_s enables a Secure PARTID. MPAMCFG_EN_ns enables a Non-secure PARTID.

Configuration

The power domain of MPAMCFG_EN is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_ENDIS == 1. Otherwise, direct accesses to MPAMCFG_EN are RES0.

Attributes

MPAMCFG_EN is a 32-bit register.

Field descriptions

31–16	15–0
RES0	PARTID

Bits [31:16]

Reserved, RES0.

PARTID, bits [15:0]

Selects the PARTID to enable.

Accessing MPAMCFG_EN

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_EN_s must be accessible from the Secure MPAM feature page. MPAMCFG_EN_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_EN_s and MPAMCFG_EN_ns must be separate registers. The Secure instance (MPAMCFG_EN_s) accesses the PARTID enable used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_EN_ns) accesses the PARTID enable used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_EN access the PARTID enable configuration settings for the PARTID enable resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_EN access the PARTID enable configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_EN access the PARTID enable configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_EN access the PARTID enable configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_EN can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x0300`	MPAMCFG_EN_s

Accesses on this interface are **WO/RAZ**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x0300`	MPAMCFG_EN_ns

Accesses on this interface are **WO/RAZ**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMCFG_EN_FLAGS, MPAM Partition Configuration Enable Flags Register

The MPAMCFG_EN_FLAGS characteristics are:

Purpose

Enable flags for 32 PARTIDs.

MPAMCFG_EN_FLAGS_s gives read/write access to 32 Secure PARTIDs. MPAMCFG_EN_FLAGS_ns gives read/write access to 32 Non-secure PARTIDs.

Configuration

The power domain of MPAMCFG_EN_FLAGS is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_ENDIS == 1. Otherwise, direct accesses to MPAMCFG_EN_FLAGS are RES0.

Attributes

MPAMCFG_EN_FLAGS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11
EN31	EN30	EN29	EN28	EN27	EN26	EN25	EN24	EN23	EN22	EN21	EN20	EN19	EN18	EN17	EN16	EN15	EN14	EN13	EN12	EN11

EN<x>, bit [x], for x = 31 to 0

PARTID Enable flags. The group of flags accessed is selected by MPAMCFG_PART_SEL.PARTID & `0x0000001F` in bit [0] to MPAMCFG_PART_SEL.PARTID | `0x0000001F` in bit [31].

EN<x>	Meaning
`0b0`	The PARTID is disabled.
`0b1`	The PARTID is enabled.

Each bit in MPAMCFG_EN_FLAGS gives access to the same state as controlled by MPAMCFG_EN and MPAMCFG_DIS.

Bits MPAMCFG_EN_FLAGS.EN<x>, where (MPAMCFG_PART_SEL.PARTID & `0x0000001F`) + x is greater than MPAMF_IDR.PARTID_MAX, are not required to be implemented.

As with other partitioning controls, the enable flag for PARTID 0 must be reset to `0b1` (enabled).

Accessing MPAMCFG_EN_FLAGS

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_EN_FLAGS_s must be accessible from the Secure MPAM feature page. MPAMCFG_EN_FLAGS_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_EN_FLAGS_s and MPAMCFG_EN_FLAGS_ns must be separate registers. The Secure instance (MPAMCFG_EN_FLAGS_s) accesses the PARTID enable used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_EN_FLAGS_ns) accesses the PARTID enable used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_EN_FLAGS access the PARTID enable configuration settings for the PARTID enable resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_EN_FLAGS access the PARTID enable configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_EN_FLAGS access the PARTID enable configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_EN_FLAGS access the PARTID enable configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_EN_FLAGS can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0320	MPAMCFG_EN_FLAGS_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0320	MPAMCFG_EN_FLAGS_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMCFG_INTPARTID, MPAM Internal PARTID Narrowing Configuration Register

The MPAMCFG_INTPARTID characteristics are:

Purpose

MPAMCFG_INTPARTID is a 32-bit read/write register that controls the mapping of the PARTID selected by MPAMCFG_PART_SEL into a narrower internal PARTID (intPARTID).

MPAMCFG_INTPARTID_s controls the mapping for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_INTPARTID_ns controls the mapping for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

The MPAMCFG_INTPARTID register associates the request PARTID (reqPARTID) in the MPAMCFG_PART_SEL register with an internal PARTID (intPARTID) in this register. To set that association, store reqPARTID into the MPAMCFG_PART_SEL register and then store the intPARTID into the MPAMCFG_INTPARTID register. To read the association, store reqPARTID into the MPAMCFG_PART_SEL register and then read MPAMCFG_INTPARTID.

If the intPARTID stored into MPAMCFG_INTPARTID is out-of-range or does not have the INTERNAL bit set, the association of reqPARTID to intPARTID is not written and MPAMF_ESR is set to indicate an intPARTID_Range error.

If MPAMCFG_PART_SEL.INTERNAL is 1 when MPAMCFG_INTPARTID is read or written, MPAMF_ESR is set to indicate an Unexpected_INTERNAL error.

Configuration

The power domain of MPAMCFG_INTPARTID is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PARTID_NRW == 1. Otherwise, direct accesses to MPAMCFG_INTPARTID are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_INTPARTID is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17	16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	INTERNAL	INTPARTID

Bits [31:17]

Reserved, RES0.

INTERNAL, bit [16]

Internal PARTID flag.

This bit must be 1 when written to the register. If written as 0, the write will not update the reqPARTID to intPARTID association.

On a read of this register, the bit will always read the value last written.

INTPARTID, bits [15:0]

This field contains the intPARTID mapped to the reqPARTID in MPAMCFG_PART_SEL.

The maximum intPARTID supported is MPAMF_PARTID_NRW_IDR.INTPARTID_MAX.

Accessing MPAMCFG_INTPARTID

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_INTPARTID_s must be accessible from the Secure MPAM feature page. MPAMCFG_INTPARTID_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_INTPARTID_s and MPAMCFG_INTPARTID_ns must be separate registers. The Secure instance (MPAMCFG_INTPARTID_s) accesses the PARTID narrowing used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_INTPARTID_ns) accesses the PARTID narrowing used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_INTPARTID access the PARTID narrowing configuration settings without being affected by MPAMCFG_PART_SEL.RIS.

Loads and stores to MPAMCFG_INTPARTID access the PARTID narrowing configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_INTPARTID can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0600	MPAMCFG_INTPARTID_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0600	MPAMCFG_INTPARTID_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMCFG_MBW_MAX, MPAM Memory Bandwidth Maximum Partition Configuration Register

The MPAMCFG_MBW_MAX characteristics are:

Purpose

MPAMCFG_MBW_MAX is a 32-bit read/write register that controls the maximum fraction of memory bandwidth that the PARTID selected by MPAMCFG_PART_SEL is permitted to use.

MPAMCFG_MBW_MAX_s controls maximum bandwidth for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_MAX_ns controls the maximum bandwidth for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

A PARTID that has used more than MAX is given no access to additional bandwidth if HARDLIM == 1 or is given additional bandwidth only if there are no requests from PARTIDs that have not exceeded their MAX if HARDLIM == 0.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_MAX is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_MAX == 1. Otherwise, direct accesses to MPAMCFG_MBW_MAX are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_MAX is a 32-bit register.

Field descriptions

31	30–16	15–0
HARDLIM	RES0	MAX

HARDLIM, bit [31]

Hard bandwidth limiting.

HARDLIM	Meaning
0b0	When MAX bandwidth is exceeded, the partition contends with a low preference for downstream bandwidth beyond MAX.
0b1	When MAX bandwidth is exceeded, the partition does not use any more bandwidth until the memory bandwidth measurement for the partition falls below MAX.

Bits [30:16]

Reserved, RES0.

MAX, bits [15:0]

Memory maximum bandwidth allocated to the partition selected by MPAMCFG_PART_SEL. MAX is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in MPAMF_MBW_IDR.BWA_WD. Unimplemented bits are RAZ/WI. The implemented bits of the MAX field are always to the left of the field. For example, if BWA_WD = 3, the implemented bits are MPAMCFG_MBW_MAX[15:13] and MPAMCFG_MBW_MAX[12:0] are unimplemented.

The fixed-point fraction MAX is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the bandwidth that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_MBW_MAX

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_MAX_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_MAX_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_MBW_MAX_s and MPAMCFG_MBW_MAX_ns must be separate registers. The Secure instance (MPAMCFG_MBW_MAX_s) accesses the memory maximum bandwidth partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_MAX_ns) accesses the memory maximum bandwidth partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_MBW_MAX can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0208	MPAMCFG_MBW_MAX_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0208	MPAMCFG_MBW_MAX_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMCFG_MBW_MIN, MPAM Memory Bandwidth Minimum Partition Configuration Register

The MPAMCFG_MBW_MIN characteristics are:

Purpose

MPAMCFG_MBW_MIN is a 32-bit read/write register that controls the minimum fraction of memory bandwidth that the PARTID selected by MPAMCFG_PART_SEL is permitted to use.

MPAMCFG_MBW_MIN_s controls the minimum bandwidth for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_MIN_ns controls the minimum bandwidth for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

A PARTID that has used less than MIN is given preferential access to bandwidth.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_MIN is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_MIN == 1. Otherwise, direct accesses to MPAMCFG_MBW_MIN are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_MIN is a 32-bit register.

Field descriptions

31 – 16	15 – 0
RES0	MIN

Bits [31:16]

Reserved, RES0.

MIN, bits [15:0]

Memory minimum bandwidth allocated to the partition selected by MPAMCFG_PART_SEL. MIN is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in MPAMF_MBW_IDR.BWA_WD. Unimplemented bits are RAZ/WI. The implemented bits of the MIN field are always to the left of the field. For example, if BWA_WD = 4, the implemented bits are MPAMCFG_MBW_MIN[15:12] and MPAMCFG_MBW_MIN[11:0] are unimplemented.

The fixed-point fraction MIN is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the bandwidth that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_MBW_MIN

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_MIN_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_MIN_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_MBW_MIN_s and MPAMCFG_MBW_MIN_ns must be separate registers. The Secure instance (MPAMCFG_MBW_MIN_s) accesses the memory minimum bandwidth partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_MIN_ns) accesses the memory minimum bandwidth partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_MBW_MIN can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0200	MPAMCFG_MBW_MIN_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0200	MPAMCFG_MBW_MIN_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMCFG_MBW_PBM<n>, MPAM Bandwidth Portion Bitmap Partition Configuration Register, n = 0 - 127

The MPAMCFG_MBW_PBM<n> characteristics are:

Purpose

The MPAMCFG_MBW_PBM<n> register array gives access to the memory bandwidth portion bitmap. Each register in the array is a read/write register that configures the bandwidth portions <32 * n> to <(32 * n) + 31> that a PARTID is allowed to allocate.

After setting MPAMCFG_PART_SEL with a PARTID, software writes to one or more of the MPAMCFG_MBW_PBM<n> registers to configure which bandwidth portions the PARTID is allowed to allocate.

The MPAMCFG_MBW_PBM<n> register that contains the bitmap bit corresponding to memory bandwidth portion p has n equal to p[11:5]. The field, P<<x + (32 * n)>> of that MPAMCFG_MBW_PBM<n> register that contains the bitmap bit corresponding to memory bandwidth portion p has x equal to p[4:0].

The MPAMCFG_MBW_PBM<n>_s registers control the bandwidth portion bitmap for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. The MPAMCFG_MBW_PBM<n>_ns registers control the bandwidth portion bitmap for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_PBM<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_PBM == 1. Otherwise, direct accesses to MPAMCFG_MBW_PBM<n> are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_PBM<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
P<32 * n + 31>	P<32 * n + 30>	P<32 * n + 29>	P<32 * n + 28>	P<32 * n + 27>	P<32 * n + 26>	P<32 * n + 25>

P<x + (32 * n)>, bit [x], for x = 31 to 0

Portion allocation control bit. Each bandwidth portion allocation control bit MPAMCFG_MBW_PBM<n>.P<<x + (32 * n)>> grants permission to the PARTID selected by MPAMCFG_PART_SEL to allocate bandwidth within bandwidth portion <x + (32 * n)>.

P<x + (32 * n)>	Meaning
0b0	The PARTID is not permitted to allocate into bandwidth portion <x + (32 * n)>.
0b1	The PARTID is permitted to allocate within bandwidth portion <x + (32 * n)>.

The number of bits in the bandwidth portion partitioning bit map of this component is given in MPAMF_MBW_IDR.BWPBM_WD. BWPBM_WD contains a value from 1 to 2^{12}, inclusive. Values of BWPBM_WD greater than 32 require a group of 32-bit registers to access the bandwidth portion bitmap, up to 128 32-bit registers.

Bits MPAMCFG_MBW_PBM<n>.P<<x + (32 * n)>>, where <x + (32 * n)>is greater than or equal to BWPBM_WD are RES0:

- If n > MPAMF_MBW_IDR.BWPBM_WD[11:5], the entire 32 P<x> are RES0.
- If n == MPAMF_MBW_IDR.BWPBM_WD[11:5], bits [31: BWPBM_WD[4:0]] are RES0 and the remaining bits are valid.
- If n < MPAMF_MBW_IDR.BWPBM_WD[11:5], the entire 32 P<x> are valid.

Accessing MPAMCFG_MBW_PBM<n>

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_PBM<n>_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_PBM<n>_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_MBW_PBM<n>_s and MPAMCFG_MBW_PBM<n>_ns must be separate registers. The Secure instance (MPAMCFG_MBW_PBM<n>_s) accesses the memory bandwidth portion bitmap used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_PBM<n>_ns) accesses the memory bandwidth portion bitmap used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_MBW_PBM<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMCFG_MBW_PROP, MPAM Memory Bandwidth Proportional Stride Partition Configuration Register

The MPAMCFG_MBW_PROP characteristics are:

Purpose

Controls the proportional stride of memory bandwidth that the PARTID selected by MPAMCFG_PART_SEL uses.

MPAMCFG_MBW_PROP_s controls the bandwidth proportional stride for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_PROP_ns controls the bandwidth proportional stride for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

Proportional stride is a relative cost of bandwidth requested by one PARTID in relation to the costs of the bandwidths requested by each other PARTID also competing to use the bandwidth.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_PROP is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_PROP == 1. Otherwise, direct accesses to MPAMCFG_MBW_PROP are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_PROP is a 32-bit register.

Field descriptions

31	30–16	15–0
EN	RES0	STRIDEM1

EN, bit [31]

Enable proportional stride bandwidth partitioning.

EN	Meaning
`0b0`	The selected partition is not regulated by proportional stride bandwidth partitioning.
`0b1`	The selected partition has bandwidth usage regulated by proportional stride bandwidth partitioning as controlled by STRIDEM1.

Bits [30:16]

Reserved, RES0.

STRIDEM1, bits [15:0]

Memory bandwidth stride minus 1 allocated to the partition selected by MPAMCFG_PART_SEL. STRIDEM1 represents the normalized cost of bandwidth consumption by the partition.

The proportional stride partitioning control parameter is an unsigned integer representing the normalized cost to a partition for consuming bandwidth. Larger values have a larger cost and correspond to a lesser allocation of bandwidth while smaller values indicate a lesser cost and therefore a higher allocation of bandwidth.

The implemented width of STRIDEM1 is given in MPAMF_MBW_IDR.BWA_WD.

Accessing MPAMCFG_MBW_PROP

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_PROP_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_PROP_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_MBW_PROP_s and MPAMCFG_MBW_PROP_ns must be separate registers. The Secure instance (MPAMCFG_MBW_PROP_s) accesses the memory proportional stride bandwidth partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_PROP_ns) accesses the memory proportional stride bandwidth partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_MBW_PROP can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0500	MPAMCFG_MBW_PROP_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0500	MPAMCFG_MBW_PROP_ns

Accesses on this interface are **RW**.

MPAMCFG_MBW_WINWD, MPAM Memory Bandwidth Partitioning Window Width Configuration Register

The MPAMCFG_MBW_WINWD characteristics are:

Purpose

MPAMCFG_MBW_WINWD is a 32-bit register that shows and sets the value of the window width for the PARTID in MPAMCFG_PART_SEL.

MPAMCFG_MBW_WINWD_s reads and controls the bandwidth control window width for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_WINWD_ns reads and controls the bandwidth control window width for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

MPAMCFG_MBW_WINWD is read-only if MPAMF_MBW_IDR.WINDWR == 0, and the window width is set by the hardware, even if variable.

MPAMCFG_MBW_WINWD is read/write if MPAMF_MBW_IDR.WINDWR == 1, permitting configuration of the window width for each PARTID independently on hardware that supports this functionality.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_WINWD is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_MBW_PART == 1. Otherwise, direct accesses to MPAMCFG_MBW_WINWD are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_WINWD is a 32-bit register.

Field descriptions

31:24	23:8	7:0
RES0	US_INT	US_FRAC

Bits [31:24]

Reserved, RES0.

US_INT, bits [23:8]

Window width, integer microseconds.

This field reads (and sets) the integer part of the window width in microseconds for the PARTID selected by MPAMCFG_PART_SEL.

US_FRAC, bits [7:0]

Window width, fractional microseconds.

This field reads (and sets) the fractional part of the window width in microseconds for the PARTID selected by MPAMCFG_PART_SEL.

Accessing MPAMCFG_MBW_WINWD

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_MBW_WINWD_s must be accessible from the Secure MPAM feature page. MPAMCFG_MBW_WINWD_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_MBW_WINWD_s and MPAMCFG_MBW_WINWD_ns must be separate registers. The Secure instance (MPAMCFG_MBW_WINWD_s) accesses the window width used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_MBW_WINWD_ns) accesses the window width used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_MBW_WINWD can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0220	MPAMCFG_MBW_WINWD_s

This interface is accessible as follows:

- When MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are **RO**.
- When MPAMF_MBW_IDR.WINDWR == 1 accesses to this register are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0220	MPAMCFG_MBW_WINWD_ns

This interface is accessible as follows:

- When MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are **RO**.
- When MPAMF_MBW_IDR.WINDWR == 1 accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMCFG_PART_SEL, MPAM Partition Configuration Selection Register

The MPAMCFG_PART_SEL characteristics are:

Purpose

Selects a partition ID to configure.

MPAMCFG_PART_SEL_s selects a Secure PARTID to configure. MPAMCFG_PART_SEL_ns selects a Non-secure PARTID to configure.

After setting this register with a PARTID, software (usually a hypervisor) can perform a series of accesses to MPAMCFG registers to configure parameters for MPAM resource controls to use when requests have that PARTID.

Configuration

The power domain of MPAMCFG_PART_SEL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and (MPAMF_IDR.HAS_CCAP_PART == 1, or MPAMF_IDR.HAS_CPOR_PART == 1, or MPAMF_IDR.HAS_MBW_PART == 1, or MPAMF_IDR.HAS_PRI_PART == 1, or MPAMF_IDR.HAS_PARTID_NRW == 1, or (MPAMF_IDR.EXT == 0 and MPAMF_IDR.HAS_IMPL_IDR == 1) or (MPAMF_IDR.EXT == 1, MPAMF_IDR.HAS_IMPL_IDR == 1 and MPAMF_IDR.NO_IMPL_PART == 0)). Otherwise, direct accesses to MPAMCFG_PART_SEL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_PART_SEL is a 32-bit register.

Field descriptions

31 30 29 28	27 26 25 24	23 22 21 20 19 18 17	16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	RIS	RES0	INTERNAL	PARTID_SEL

Bits [31:28]

Reserved, RES0.

RIS, bits [27:24]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MPAMCFG registers and describe with MPAMF ID registers.

Otherwise:

Reserved, RES0.

Bits [23:17]

Reserved, RES0.

INTERNAL, bit [16]

Internal PARTID.

If MPAMF_IDR.HAS_PARTID_NRW =0, this field is RAZ/WI.

If MPAMF_IDR.HAS_PARTID_NRW = 1:

INTERNAL	Meaning
0b0	PARTID_SEL is interpreted as a request PARTID and ignored except for use with MPAMCFG_INTPARTID register access.
0b1	PARTID_SEL is interpreted as an internal PARTID and used for access to MPAMCFG control settings except for MPAMCFG_INTPARTID.

If PARTID narrowing is implemented as indicated by MPAMF_IDR.HAS_PARTID_NRW = 1, when accessing other MPAMCFG registers the value of the MPAMCFG_PART_SEL.INTERNAL bit is checked for these conditions:

- When the MPAMCFG_INTPARTID register is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 0, an Unexpected_INTERNAL error is set in MPAMF_ESR.
- When an MPAMCFG register other than MPAMCFG_INTPARTID is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 1, MPAMF_ESR is set to indicate an intPARTID_Range error.

In either error case listed here, the value returned by a read operation is UNPREDICTABLE, and the control settings are not affected by a write.

PARTID_SEL, bits [15:0]

Selects the partition ID to configure.

Reads and writes to other MPAMCFG registers are indexed by PARTID_SEL and by the NS bit used to access MPAMCFG_PART_SEL to access the configuration for a single partition.

Accessing MPAMCFG_PART_SEL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_PART_SEL_s must be accessible from the Secure MPAM feature page. MPAMCFG_PART_SEL_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_PART_SEL_s and MPAMCFG_PART_SEL_ns must be separate registers. The Secure instance (MPAMCFG_PART_SEL_s) accesses the PARTID selector used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_PART_SEL_ns) accesses the PARTID selector used for Non-secure PARTIDs.

MPAMCFG_PART_SEL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0100	MPAMCFG_PART_SEL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0100	MPAMCFG_PART_SEL_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMCFG_PRI, MPAM Priority Partition Configuration Register

The MPAMCFG_PRI characteristics are:

Purpose

Controls the internal and downstream priority of requests attributed to the PARTID selected by MPAMCFG_PART_SEL.

MPAMCFG_PRI_s controls the priorities for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_PRI_ns controls the priorities for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_PRI is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PRI_PART == 1. Otherwise, direct accesses to MPAMCFG_PRI are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_PRI is a 32-bit register.

Field descriptions

<table>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td colspan="16">DSPRI</td><td colspan="16">INTPRI</td></tr>
</table>

DSPRI, bits [31:16]

Downstream priority.

If MPAMF_PRI_IDR.HAS_DSPRI == 0, bits of this field are RES0 as this field is not used.

If MPAMF_PRI_IDR.HAS_DSPRI == 1, this field is a priority value applied to downstream communications from this MSC for transactions of the partition selected by MPAMCFG_PART_SEL.

The implemented width of this field is MPAMF_PRI_IDR.DSPRI_WD bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of MPAMF_PRI_IDR.DSPRI_0_IS_LOW.

INTPRI, bits [15:0]

Internal priority.

If MPAMF_PRI_IDR.HAS_INTPRI == 0, bits of this field are RES0 as this field is not used.

If MPAMF_PRI_IDR.HAS_INTPRI == 1, this field is a priority value applied internally inside this MSC for transactions of the partition selected by MPAMCFG_PART_SEL.

The implemented width of this field is MPAMF_PRI_IDR.INTPRI_WD bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of MPAMF_PRI_IDR.INTPRI_0_IS_LOW.

Accessing MPAMCFG_PRI

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_PRI_s must be accessible from the Secure MPAM feature page. MPAMCFG_PRI_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_PRI_s and MPAMCFG_PRI_ns must be separate registers. The Secure instance (MPAMCFG_PRI_s) accesses the priority partitioning used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_PRI_ns) accesses the priority partitioning used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the priority resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_PRI can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0400	MPAMCFG_PRI_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0400	MPAMCFG_PRI_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMF_AIDR, MPAM Architecture Identification Register

The MPAMF_AIDR characteristics are:

Purpose

Identifies the version of the MPAM architecture that this MSC implements.

Note: The following values are defined for bits [7:0]:

- `0x01` == MPAM architecture v0.1
- `0x10` == MPAM architecture v1.0
- `0x11` == MPAM architecture v1.1

Configuration

The power domain of MPAMF_AIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_AIDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_AIDR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8	7 6 5 4	3 2 1 0
RES0	ArchMajorRev	ArchMinorRev

Bits [31:8]

Reserved, RES0.

ArchMajorRev, bits [7:4]

Major revision of the MPAM architecture implemented by the MSC.

This table shows the only valid combinations of MPAM version numbers in an MSC. FORCE_NS functionality is only available in MPAM v0.1.

ArchMajorRev	ArchMinorRev	MPAMv	Available
0	0		None.
0	1	v0.1	MPAMv1.0 + MPAMv1.1 + FORCE_NS
1	0	v1.0	MPAMv1.0
1	1	v1.1	MPAMv1.0 + MPAMv1.1 - FORCE_NS

Use of MPAMv0.1 in MSCs is restricted to limited circumstances. The MSC must be able to initiate requests in the Secure address space which have MPAM PARTID forced to the Non-secure space with that forcing not controllable or observable by the software that configures the device for Secure requests. Please contact Arm before setting MPAMF_AIDR to report MPAMv0.1.

ArchMinorRev, bits [3:0]

Minor revision of the MPAM architecture implemented by the MSC.

See the table in the description of the ArchMajorRev field in this register.

Accessing MPAMF_AIDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_AIDR is read-only.

MPAMF_AIDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_AIDR must have the same contents in the Secure and Non-secure MPAM feature pages.

MPAMF_AIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0020	MPAMF_AIDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0020	MPAMF_AIDR_ns

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMF_CCAP_IDR, MPAM Features Cache Capacity Partitioning ID register

The MPAMF_CCAP_IDR characteristics are:

Purpose

Indicates the number of fractional bits in MPAMCFG_CMAX.CMAX.

MPAMF_CCAP_IDR_s indicates the number of fractional bits in the Secure instance of MPAMCFG_CMAX. MPAMF_CCAP_IDR_ns indicates the number of fractional bits in the Non-secure instance of MPAMCFG_CMAX.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has information within the field description.

Configuration

The power domain of MPAMF_CCAP_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CCAP_PART == 1. Otherwise, direct accesses to MPAMF_CCAP_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_CCAP_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27 26 25 24 23 22 21 20 19 18 17 16 15 14 13	12 11 10 9 8	7 6	5 4 3 2 1 0
HAS_CMAX_SOFTLIM	NO_CMAX	HAS_CMIN	HAS_CASSOC	RES0	CASSOC_WD	RES0	CMAX_WD

HAS_CMAX_SOFTLIM, bit [31]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Has soft limiting selection field in MPAMCFG_CMAX.

HAS_CMAX_SOFTLIM	Meaning
0b0	If MPAMCFG_CMAX is implemented, it has no SOFTLIM field and the maximum capacity is controlled with a hard limit.
0b1	If MPAMCFG_CMAX is implemented, that register has a SOFTLIMIT field to select between hard or soft limiting to the CMAX parameter.

If RIS is implemented, this field indicates selectable limiting for the cache maximum capacity control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

NO_CMAX, bit [30]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Does not have CMAX partitioning.

NO_CMAX	Meaning
0b0	MPAMCFG_CMAX is implemented.
0b1	MPAMCFG_CMAX is not implemented.

If RIS is implemented, this field indicates the absence of a cache maximum capacity partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

HAS_CMIN, bit [29]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Has cache minimum capacity partitioning.

HAS_CMIN	Meaning
0b0	MPAMCFG_CMIN is not implemented.
0b1	MPAMCFG_CMIN is implemented.

If RIS is implemented, this field indicates the presence of a cache minimum capacity partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

HAS_CASSOC, bit [28]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Has cache maximum associativity partitioning.

HAS_CASSOC	Meaning
0b0	MPAMCFG_CASSOC is not implemented.
0b1	MPAMCFG_CASSOC is implemented.

If RIS is implemented, this field indicates the presence of a cache maximum associativity partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

Bits [27:13]

Reserved, RES0.

CASSOC_WD, bits [12:8]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Number of fractional bits implemented in the cache associativity partitioning control, MPAMCFG_CASSOC.CASSOC, of this MSC. See MPAMCFG_CASSOC.

If RIS is implemented, this field indicates the number of fractional bits in the cache capacity partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

Bits [7:6]

Reserved, RES0.

CMAX_WD, bits [5:0]

Number of fractional bits implemented in the cache capacity partitioning control, MPAMCFG_CMAX.CMAX, of this device. See MPAMCFG_CMAX.

This field must contain a value from 1 to 16, inclusive.

If RIS is implemented, this field indicates the number of fractional bits in the cache capacity partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Accessing MPAMF_CCAP_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_CCAP_IDR is read-only.

MPAMF_CCAP_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_CCAP_IDR is permitted to have the same contents when read from the Secure or Non-secure MPAM feature pages unless the register contents are different for the different versions, when MPAMF_CCAP_IDR_s is permitted to have either the same or different contents to MPAMF_CCAP_IDR_ns.

There must be separate registers in the Secure (MPAMF_CCAP_IDR_s) and Non-secure (MPAMF_CCAP_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_CCAP_IDR shows the configuration of cache capacity partitioning for the cache resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_CCAP_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0038	MPAMF_CCAP_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0038	MPAMF_CCAP_IDR_ns

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMF_CPOR_IDR, MPAM Features Cache Portion Partitioning ID register

The MPAMF_CPOR_IDR characteristics are:

Purpose

Indicates the number of bits in MPAMCFG_CPBM<n>.

MPAMF_CPOR_IDR_s indicates the number of bits in the Secure instance of MPAMCFG_CPBM<n>.
MPAMF_CPOR_IDR_ns indicates the number of bits in the Non-secure instance of MPAMCFG_CPBM<n>.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selector, MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has information within the field description.

Configuration

The power domain of MPAMF_CPOR_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CPOR_PART == 1. Otherwise, direct accesses to MPAMF_CPOR_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_CPOR_IDR is a 32-bit register.

Field descriptions

31 … 16	15 … 0
RES0	CPBM_WD

Bits [31:16]

Reserved, RES0.

CPBM_WD, bits [15:0]

Number of bits in the cache portion partitioning bit map of this device. See MPAMCFG_CPBM<n>.

This field must contain a value from 1 to 32768, inclusive. Values greater than 32 require a group of 32-bit registers to access the CPBM, up to 1024 if CPBM_WD is the largest value.

If RIS is implemented, this field indicates the number bits in the cache portion bitmap for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Accessing MPAMF_CPOR_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_CPOR_IDR is read-only.

MPAMF_CPOR_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_CPOR_IDR is permitted to have the same contents when read from the Secure or Non-secure MPAM feature pages unless the register contents are different for the different versions, when MPAMF_CPOR_IDR_s is permitted to have either the same or different contents to MPAMF_CPOR_IDR_ns.

There must be separate registers in the Secure (MPAMF_CPOR_IDR_s) and Non-secure (MPAMF_CPOR_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_CPOR_IDR shows the configuration of cache portion partitioning for the cache resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_CPOR_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x0030`	MPAMF_CPOR_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x0030`	MPAMF_CPOR_IDR_ns

Accesses on this interface are **RO**.

MPAMF_CSUMON_IDR, MPAM Features Cache Storage Usage Monitoring ID register

The MPAMF_CSUMON_IDR characteristics are:

Purpose

Indicates the number of cache storage usage monitor instances and other properties of the CSU monitoring.

MPAMF_CSUMON_IDR_s indicates the number and properties of Secure cache storage usage monitoring.
MPAMF_CSUMON_IDR_ns indicates the number and properties of Non-secure cache storage usage monitoring.

If MPAMF_IDR.HAS_RIS is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by MPAMCFG_PART_SEL.RIS. Fields that do not mention RIS are constant across all resource instances.

Configuration

The power domain of MPAMF_CSUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MPAMF_CSUMON_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_CSUMON_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24232221201918171615141312	11
HAS_CAPTURE	CSU_RO	HAS_XCL	RES0	HAS_OFLOW_LNKG	HAS_OFSR	HAS_OFLOW_CAPT	RES0	NUM

HAS_CAPTURE, bit [31]

The implementation supports copying an MSMON_CSU to the corresponding MSMON_CSU_CAPTURE on a capture event.

HAS_CAPTURE	Meaning
0b0	MSMON_CSU_CAPTURE is not implemented and there is no support for capture events in the CSU monitor.
0b1	The MSMON_CSU_CAPTURE register is implemented and the CSU monitor supports the capture event behavior.

If RIS is implemented, this field indicates that CSU monitor capture is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

CSU_RO, bit [30]

The implementation of MSMON_CSU is read-only.

CSU_RO	Meaning
0b0	MSMON_CSU is read/write.
0b1	MSMON_CSU is read-only.

If RIS is implemented, this field indicates that the MSMON_CSU monitor register is read-only for the resource instance selected by MPAMCFG_PART_SEL.RIS.

HAS_XCL, bit [29]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Has filtering to exclude clean data and implements the MSMON_CFG_CSU_FLT.XCL field.

HAS_XCL	Meaning
0b0	MSMON_CFG_CSU_FLT does not implement the XCL field.
0b1	MSMON_CFG_CSU_FLT implements the XCL field to exclude counting data in the clean state in the monitor instance.

If RIS is implemented, this field indicates that the MSMON_CFG_CSU_FLT.XCL field is implemented in the CSU monitor instances for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

Bit [28]

Reserved, RES0.

HAS_OFLOW_LNKG, bit [27]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Supports MSMON_CFG_CSU_CTL.OFLOW_LNKG field to control how overflow on an instance affects other monitor instances in this MSC.

HAS_OFLOW_LNKG	Meaning
0b0	Does not support CSU overflow linkage.
0b1	Supports CSU overflow linkage and the MSMON_CFG_CSU_CTL.OFLOW_LNKG field.

If RIS is implemented, this field indicates that MSMON_CFG_CSU_CTL.OFLOW_LNKG is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

HAS_OFSR, bit [26]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

The CSU monitor overflow status bitmap register, MSMON_CSU_OFSR, is implemented.

HAS_OFSR	Meaning
0b0	MSMON_CSU_OFSR register is not implemented.
0b1	MSMON_CSU_OFSR register is implemented.

If RIS is implemented, this field indicates that CSU monitor overflow status bitmap register is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

HAS_OFLOW_CAPT, bit [25]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Supports MSMON_CFG_CSU_CTL.OFLOW_CAPT field to transfer the CSU monitor instance to its capture register on an overflow or overflow linkage event.

HAS_OFLOW_CAPT	Meaning
0b0	Does not support capture on overflow.
0b1	Supports capture on overflow and the MSMON_CFG_CSU_CTL.OFLOW_CAPT field.

If RIS is implemented, this field indicates that MSMON_CFG_CSU_CTL.OFLOW_CAPT is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

Bits [24:16]

Reserved, RES0.

NUM_MON, bits [15:0]

The number of cache storage usage monitor instances implemented.

The largest MSMON_CFG_MON_SEL.MON_SEL value is NUM_MON minus 1.

If RIS is implemented, this field indicates the number of CSU monitor instances implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Accessing MPAMF_CSUMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_CSUMON_IDR is read-only.

MPAMF_CSUMON_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_CSUMON_IDR is permitted to have the same contents when read from the Secure or Non-secure MPAM feature pages unless the register contents are different for the different versions, when MPAMF_CSUMON_IDR_s is permitted to have either the same or different contents to MPAMF_CSUMON_IDR_ns.

There must be separate registers in the Secure (MPAMF_CSUMON_IDR_s) and Non-secure (MPAMF_CSUMON_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_CSUMON_IDR shows the configuration of cache storage usage monitoring for the cache resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF_CSUMON_IDR is not affected by MSMON_CFG_MON_SEL.RIS.

MPAMF_CSUMON_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0088	MPAMF_CSUMON_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance

MPAM	MPAMF_BASE_ns	0x0088	MPAMF_CSUMON_IDR_ns

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMF_ECR, MPAM Error Control Register

The MPAMF_ECR characteristics are:

Purpose

MPAMF_ECR is a 32-bit read/write register that controls MPAM error interrupts for this MSC.

MPAMF_ECR_s controls Secure MPAM error handling. MPAMF_ECR_ns controls Non-secure MPAM error handling.

Configuration

The power domain of MPAMF_ECR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_ECR are RES0.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the MPAMF_ESR and MPAMF_ECR must be RAZ/WI.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ECR is a 32-bit register.

Field descriptions

31:1	0
RES0	INTEN

Bits [31:1]

Reserved, RES0.

INTEN, bit [0]

Interrupt Enable.

INTEN	Meaning
0b0	MPAM error interrupts are not signaled.
0b1	MPAM error interrupts are signaled.

Accessing MPAMF_ECR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_ECR_s must be accessible from the Secure MPAM feature page. MPAMF_ECR_ns must be accessible from the Non-secure MPAM feature page.

MPAMF_ECR_s and MPAMF_ECR_ns must be separate registers. The Secure instance (MPAMF_ECR_s) accesses the error interrupt controls used for Secure PARTIDs, and the Non-secure instance (MPAMF_ECR_ns) accesses the error interrupt controls used for Non-secure PARTIDs.

MPAMF_ECR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00F0	MPAMF_ECR_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00F0	MPAMF_ECR_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMF_ERR_MSI_ADDR_H, MPAM Error MSI High-part Address Register

The MPAMF_ERR_MSI_ADDR_H characteristics are:

Purpose

MPAMF_ERR_MSI_ADDR_H is a 32-bit read/write register for the high part of the MPAM error MSI address.

MPAMF_ERR_MSI_ADDR_H_s is the high part of the MSI write address for error interrupts related to Secure PARTIDs. MPAMF_ERR_MSI_ADDR_H_ns is the high part of the MSI write address for error interrupts related to Non-secure PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_ADDR_H is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_ADDR_H are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ADDR_H is a 32-bit register.

Field descriptions

31:20	19:0
RES0	MSI_ADDR_H

Bits [31:20]

Reserved, RES0.

MSI_ADDR_H, bits [19:0]

MSI write address bits[51:32].

Accessing MPAMF_ERR_MSI_ADDR_H

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_ERR_MSI_ADDR_H_s must be accessible from the Secure MPAM feature page.
MPAMF_ERR_MSI_ADDR_H_ns must be accessible from the Non-secure MPAM feature page.

MPAMF_ERR_MSI_ADDR_H_s and MPAMF_ERR_MSI_ADDR_H_ns must be separate registers. The Secure instance (MPAMF_ERR_MSI_ADDR_H_s) accesses the high part of the memory address for MSI write to signal an MPAM error used for Secure PARTIDs, and the Non-secure instance (MPAMF_ERR_MSI_ADDR_H_ns) accesses the high part of the memory address for MSI write to signal an MPAM error used for Non-secure PARTIDs.

MPAMF_ERR_MSI_ADDR_H can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

MPAM	MPAMF_BASE_s	`0x00E4`	MPAMF_ERR_MSI_ADDR_H_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x00E4`	MPAMF_ERR_MSI_ADDR_H_ns

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMF_ERR_MSI_ADDR_L, MPAM Error MSI Low-part Address Register

The MPAMF_ERR_MSI_ADDR_L characteristics are:

Purpose

MPAMF_ERR_MSI_ADDR_L is a 32-bit read/write register for the low part of the MPAM error MSI address.

MPAMF_ERR_MSI_ADDR_L_s is the low part of the MSI write address for error interrupts related to Secure PARTIDs. MPAMF_ERR_MSI_ADDR_L_ns is the low part of the MSI write address for error interrupts related to Non-secure PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_ADDR_L is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_ADDR_L are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ADDR_L is a 32-bit register.

Field descriptions

31–2	1–0
MSI_ADDR_L	Bits[1:0]

MSI_ADDR_L, bits [31:2]

MSI write address bits[31:2].

Bits [1:0]

Reads as `0b00`.

Access to this field is **RO**.

Accessing MPAMF_ERR_MSI_ADDR_L

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_ERR_MSI_ADDR_L_s must be accessible from the Secure MPAM feature page. MPAMF_ERR_MSI_ADDR_L_ns must be accessible from the Non-secure MPAM feature page.

MPAMF_ERR_MSI_ADDR_L_s and MPAMF_ERR_MSI_ADDR_L_ns must be separate registers. The Secure instance (MPAMF_ERR_MSI_ADDR_L_s) accesses the low part of the memory address for MSI write to signal an MPAM error used for Secure PARTIDs, and the Non-secure instance (MPAMF_ERR_MSI_ADDR_L_ns) accesses the low part of the memory address for MSI write to signal an MPAM error used for Non-secure PARTIDs.

MPAMF_ERR_MSI_ADDR_L can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00E0	MPAMF_ERR_MSI_ADDR_L_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00E0	MPAMF_ERR_MSI_ADDR_L_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMF_ERR_MSI_ATTR, MPAM Error MSI Write Attributes Register

The MPAMF_ERR_MSI_ATTR characteristics are:

Purpose

MPAMF_ERR_MSI_ATTR is a 32-bit read/write register that controls MPAM error MSI write attributes for MPAM errors in this MSC.

MPAMF_ERR_MSI_ATTR_s controls the attributes of Secure MPAM error MSI writes. MPAMF_ERR_MSI_ATTR_ns controls the attributes of Non-secure MPAM error MSI writes.

Configuration

The power domain of MPAMF_ERR_MSI_ATTR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_ATTR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ATTR is a 32-bit register.

Field descriptions

31 30	29 28	27 26 25 24	23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1	0
RES0	MSI_SH	MSI_MEMATTR	RES0	MSIEN

Bits [31:30]

Reserved, RES0.

MSI_SH, bits [29:28]

Sharability attribute of MSI writes.

MSI_SH	Meaning
`0b00`	Non-shareable.
`0b01`	Reserved, CONSTRAINED UNPREDICTABLE.
`0b10`	Outer Shareable.
`0b11`	Inner Shareable.

When MPAMF_ERR_MSI_ATTR.MSI_MEMATTR specifies a Device memory type, the contents of this field are IGNORED and Shareability is effectively Outer Shareable.

MSI_MEMATTR, bits [27:24]

Memory attributes of MSI writes.

Note: This encoding matches the VMSAv8-64 stage 2 MemAttr[3:0] field as described in the Arm ARM, except that the following encodings are Reserved (not UNPREDICTABLE) and behave as DEvice-nGnRnE: `0b0100`, `0b1000`, and `0b1100`.

MSI_MEMATTR	Meaning
`0b0000`	Device-nGnRnE.
`0b0001`	Device-nGnRE.
`0b0010`	Device-nGRE.
`0b0011`	Device-GRE.
`0b0100`	Reserved. Behave as Device-nGnRnE, `0b0000`.
`0b0101`	Normal Inner Non-cacheable, Outer Non-cacheable.
`0b0110`	Normal Inner Write-Through Cacheable, Outer Non-cacheable.
`0b0111`	Normal Inner Write-Back Cacheable, Outer Non-cacheable.
`0b1000`	Reserved. Behave as Device-nGnRnE, `0b0000`.
`0b1001`	Normal Inner Non-Cachable, Outer Write-Through Cacheable.
`0b1010`	Normal Inner Write-Through Cacheable, Outer Write-Through Cacheable.
`0b1011`	Normal Inner Write-Back Cacheable, Outer Write-Through Cacheable.
`0b1100`	Reserved. Behave as Device-nGnRnE, `0b0000`.
`0b1101`	Normal Inner Non-cacheable, Outer Write-Back Cacheable.
`0b1110`	Normal Inner Write-Through Cacheable, Outer Write-Back Cacheable.
`0b1111`	Normal Inner Write-Back Cacheable, Outer Write-Back Cacheable.

When this field specifies a Device memory type, the contents of MPAMF_ERR_MSI_ATTR.MSI_SH are IGNORED and Shareability is effectively Outer Shareable.

Device types may be implemented as any Device type with more than 'n' characters. For example, if this field is set to `0b0010`, an implementation may treat the MSI write as the specified type, Device-nGRE, or as Device-nGnRE or as Device-nGnRnE.

Reserved encodings `0b0100`, `0b1000`, and `0b1100` must be implemented to behave the same as the `0b0000` encoding.

Bits [23:1]

Reserved, RES0.

MSIEN, bit [0]

Error interrupt MSI Enable.

MSIEN	Meaning
`0b0`	MPAM error MSI writes are not generated to signal enabled MPAM error interrupts. When error MSI writesare disabled, hardwired error interrupts could be generated.
`0b1`	MPAM error MSI writes are generated to signal enabled MPAM error interrupts. When error MSI writes are enabled, hardwired error interrupts are not generated.

The value of this field affects whether hardwired error interrupts are generated.

The reset behavior of this field is:

- On a MSC reset, this field resets to `0`.

Accessing MPAMF_ERR_MSI_ATTR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_ERR_MSI_ATTR_s must be accessible from the Secure MPAM feature page. MPAMF_ERR_MSI_ATTR_ns must be accessible from the Non-secure MPAM feature page.

MPAMF_ERR_MSI_ATTR_s and MPAMF_ERR_MSI_ATTR_ns must be separate registers. The Secure instance (MPAMF_ERR_MSI_ATTR_s) accesses the memory access attributes for MSI write to signal an MPAM error used for Secure PARTIDs, and the Non-secure instance (MPAMF_ERR_MSI_ATTR_ns) accesses the memory access attributes for MSI write to signal an MPAM error used for Non-secure PARTIDs.

MPAMF_ERR_MSI_ATTR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00EC	MPAMF_ERR_MSI_ATTR_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00EC	MPAMF_ERR_MSI_ATTR_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMF_ERR_MSI_DATA, MPAM Error MSI Data Register

The MPAMF_ERR_MSI_DATA characteristics are:

Purpose

MPAMF_ERR_MSI_DATA is a 32-bit read/write register for the MPAM error MSI data.

MPAMF_ERR_MSI_DATA_s is the data for the MSI write for error interrupts related to Secure PARTIDs. MPAMF_ERR_MSI_DATA_ns is the data for the MSI write for error interrupts related to Non-secure PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_DATA is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_DATA are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_DATA is a 32-bit register.

Field descriptions

31–0
MSI_DATA

MSI_DATA, bits [31:0]

MSI data to be written to ITS to signal an MSI.

Accessing MPAMF_ERR_MSI_DATA

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_ERR_MSI_DATA_s must be accessible from the Secure MPAM feature page. MPAMF_ERR_MSI_DATA_ns must be accessible from the Non-secure MPAM feature page.

MPAMF_ERR_MSI_DATA_s and MPAMF_ERR_MSI_DATA_ns must be separate registers. The Secure instance (MPAMF_ERR_MSI_DATA_s) accesses the data for MSI write to signal an MPAM error used for Secure PARTIDs, and the Non-secure instance (MPAMF_ERR_MSI_DATA_ns) accesses the data for MSI write to signal an MPAM error used for Non-secure PARTIDs.

MPAMF_ERR_MSI_DATA can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x00E8`	MPAMF_ERR_MSI_DATA_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x00E8`	MPAMF_ERR_MSI_DATA_ns

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

MPAMF_ERR_MSI_MPAM, MPAM Error MSI Write MPAM Information Register

The MPAMF_ERR_MSI_MPAM characteristics are:

Purpose

MPAMF_ERR_MSI_MPAM is a 32-bit read/write register that sets the MPAM information for error MSI write attributes for MPAM errors in this MSC.

MPAMF_ERR_MSI_MPAM_s controls MPAM information labeling of Secure MPAM error MSI writes.
MPAMF_ERR_MSI_MPAM_ns controls MPAM information labeling of Non-secure MPAM error MSI writes.

Configuration

The power domain of MPAMF_ERR_MSI_MPAM is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_MPAM are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_MPAM is a 32-bit register.

Field descriptions

31:24	23:16	15:0
RES0	PMG	PARTID

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group property for PARTID MSC error interrupt write.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition ID for MSC error interrupt write.

The PARTID in this register is in the Secure PARTID space in the MPAMF_ERR_MSI_MPAM_s instance and in the Non-secure PARTID space in the MPAMF_ERR_MSI_MPAM_ns instance of this register.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMF_ERR_MSI_MPAM

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_ERR_MSI_MPAM_s must be accessible from the Secure MPAM feature page. MPAMF_ERR_MSI_MPAM_ns must be accessible from the Non-secure MPAM feature page.

MPAMF_ERR_MSI_MPAM_s and MPAMF_ERR_MSI_MPAM_ns must be separate registers. The Secure instance (MPAMF_ERR_MSI_MPAM_s) accesses the MPAM information for MSI write request to signal an MPAM error used for Secure PARTIDs, and the Non-secure instance (MPAMF_ERR_MSI_MPAM_ns) accesses the MPAM information for MSI write request to signal an MPAM error used for Non-secure PARTIDs.

MPAMF_ERR_MSI_MPAM can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00DC	MPAMF_ERR_MSI_MPAM_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00DC	MPAMF_ERR_MSI_MPAM_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMF_ESR, MPAM Error Status Register

The MPAMF_ESR characteristics are:

Purpose

Indicates MPAM error status for this MSC.

MPAMF_ESR_s reports Secure MPAM errors. MPAMF_ESR_ns reports Non-secure MPAM errors.

Software should write this register after reading the status of an error to reset ERRCODE to `0x0000` and OVRWR to 0 so that future errors are not reported with OVRWR set.

Configuration

The power domain of MPAMF_ESR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_ESR are RES0.

MPAMF_ESR is 64-bit register when MPAM v0.1 or v1.1 is implemented and MPAMF_IDR.HAS_EXTD_ESR == 1.

Otherwise, MPAMF_ESR is a 32-bit register.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the MPAMF_ESR and MPAMF_ECR must be RAZ/WI.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ESR is a:

- 64-bit register when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_EXTD_ESR == 1
- 32-bit register otherwise

Field descriptions

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_EXTD_ESR == 1:

63:36	35:32
RES0	RIS

31	30:28	27:24	23:16	15:0
OVRWR	RES0	ERRCODE	PMG	PARTID_MON

Bits [63:36]

Reserved, RES0.

RIS, bits [35:32]

When MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. Where applicable to the ERRCODE, captures the RIS value for the error.

Otherwise:

Reserved, RES0.

OVRWR, bit [31]

Overwritten.

If 0 and ERRCODE == `0b0000`, no errors have occurred.

If 0 and ERRCODE is non-zero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is non-zero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is zero must not be produced by hardware and is only reached when software writes this combination into this register.

Bits [30:28]

Reserved, RES0.

ERRCODE, bits [27:24]

Error code.

ERRCODE	Meaning
`0b0000`	No error.
`0b0001`	PARTID_SEL_Range.
`0b0010`	Req_PARTID_Range.
`0b0011`	MSMONCFG_ID_RANGE.
`0b0100`	Req_PMG_Range.
`0b0101`	Monitor_Range.
`0b0110`	intPARTID_Range.
`0b0111`	Unexpected_INTERNAL.
`0b1000`	Undefined_RIS_PART_SEL.
`0b1001`	RIS_No_Control.
`0b1010`	Undefined_RIS_MON_SEL.
`0b1011`	RIS_No_Monitor.
`0b1100`	Reserved.
`0b1101`	Reserved.
`0b1110`	Reserved.
`0b1111`	Reserved.

PMG, bits [23:16]

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to `0x00` on an error that does not capture PMG.

PARTID_MON, bits [15:0]

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0.

Otherwise:

31	30 29 28	27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
OVRWR	RES0	ERRCODE	PMG	PARTID_MON

OVRWR, bit [31]

Overwritten.

If 0 and ERRCODE == `0b0000`, no errors have occurred.

If 0 and ERRCODE is non-zero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is non-zero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is 0 must not be produced by hardware and is only reached when software writes this combination into this register.

Bits [30:28]

Reserved, RES0.

ERRCODE, bits [27:24]

Error code.

ERRCODE	Meaning
`0b0000`	No error.
`0b0001`	PARTID_SEL_Range.
`0b0010`	Req_PARTID_Range.
`0b0011`	MSMONCFG_ID_RANGE.
`0b0100`	Req_PMG_Range.
`0b0101`	Monitor_Range.
`0b0110`	intPARTID_Range.
`0b0111`	Unexpected_INTERNAL.
`0b1000`	Reserved.
`0b1001`	Reserved.
`0b1010`	Reserved.
`0b1011`	Reserved.
`0b1100`	Reserved.
`0b1101`	Reserved.
`0b1110`	Reserved.
`0b1111`	Reserved.

PMG, bits [23:16]

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to `0x00` on an error that does not capture PMG.

PARTID_MON, bits [15:0]

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to `0x0000`.

Accessing MPAMF_ESR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_ESR_s must be accessible from the Secure MPAM feature page. MPAMF_ESR_ns must be accessible from the Non-secure MPAM feature page.

MPAMF_ESR_s and MPAMF_ESR_ns must be separate registers. The Secure instance (MPAMF_ESR_s) accesses the error status used for Secure PARTIDs, and the Non-secure instance (MPAMF_ESR_ns) accesses the error status used for Non-secure PARTIDs.

MPAMF_ESR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00F8	MPAMF_ESR_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00F8	MPAMF_ESR_ns

Accesses on this interface are **RW**.

MPAMF_IDR, MPAM Features Identification Register

The MPAMF_IDR characteristics are:

Purpose

Indicates which memory partitioning and monitoring features are present on this MSC.

MPAMF_IDR_s indicates the MPAM features accessed from the Secure MPAM feature page. MPAMF_IDR_ns indicates the MPAM features accessed from the Non-secure MPAM feature page.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has that information within the field description.

Configuration

The power domain of MPAMF_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_IDR are RES0.

MPAMF_IDR is 64-bit register when MPAM v0.1 or v1.1 is implemented.

Otherwise, MPAMF_IDR is a 32-bit register.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_IDR is a:

- 64-bit register when FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented
- 32-bit register otherwise

Field descriptions

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

63	62	61	60	59	58	57	56
RES0				RIS_MAX			
HAS_PARTID_NRW	HAS_MSMON	HAS_IMPL_IDR	EXT	HAS_PRI_PART	HAS_MBW_PART	HAS_CPOR_PART	HAS_CCAP_PART
31	30	29	28	27	26	25	24

Bits [63:60]

Reserved, RES0.

RIS_MAX, bits [59:56]

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Maximum RIS value supported in MPAMCFG_PART_SEL. Must be `0b0000` if MPAMF_IDR.HAS_RIS == 0.

Otherwise:

Reserved, RES0.

Bits [55:44]

Reserved, RES0.

HAS_NFU, bit [43]

When FEAT_MPAMv1p1 is implemented or FEAT_MPAMv0p1 is implemented:

Has No Future Use field in MPAMCFG_DIS. Indicates that MPAMCFG_DIS.NFU is implemented.

HAS_NFU	Meaning
0b0	MPAMCFG_DIS.NFU is not implemented. A PARTID disabled through access to MPAMCFG_DIS must preserve the control settings of the disabled PARTID.
0b1	Implements MPAMCFG_DIS.NFU. A PARTID disabled with NFU as 1 may have its control settings forgotten.

If MPAMF_IDR.HAS_ENDIS is 0b0, this field must also be 0b0.

This field must be the same in each instance of this register and for any value in MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

HAS_ENDIS, bit [42]

When FEAT_MPAMv1p1 is implemented or FEAT_MPAMv0p1 is implemented:

Has PARTID enable and disable. Indicates that this MSC supports PARTID disable and enable via MPAMCFG_DIS, MPAMCFG_EN and MPAMCFG_EN_FLAGS registers.

HAS_ENDIS	Meaning
0b0	Does not support PARTID enable and disable functionality, and MPAMCFG_EN, MPAMCFG_DIS and MPAMCFG_EN_FLAGS registers are not implemented.
0b1	Supports PARTID enable and disable through the MPAMCFG_EN, MPAMCFG_DIS and MPAMCFG_EN_FLAGS registers.

All three registers must be implemented when this field is 1, MPAMCFG_EN, MPAMCFG_DIS, and MPAMCFG_EN_FLAGS.

This field must be the same in each instance of this register and for any value in MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

Bit [41]

Reserved, RES0.

HAS_ERR_MSI, bit [40]

When MPAMF_IDR.EXT == 1:

Has support for MSI writes to signal MPAM error interrupts. These registers are implemented: MPAMF_ERR_MSI_ADDR_L, MPAMF_ERR_MSI_ADDR_H, MPAMF_ERR_MSI_ATTR, MPAMF_ERR_MSI_DATA, and MPAMF_ERR_MSI_MPAM.

HAS_ERR_MSI	Meaning
0b0	MPAMF_ERR_MSI_ADDR_L, MPAMF_ERR_MSI_ADDR_H, MPAMF_ERR_MSI_ATTR, MPAMF_ERR_MSI_DATA, and MPAMF_ERR_MSI_MPAM registers are not implemented.
0b1	MPAMF_ERR_MSI_ADDR_L, MPAMF_ERR_MSI_ADDR_H, MPAMF_ERR_MSI_ATTR, MPAMF_ERR_MSI_DATA, and MPAMF_ERR_MSI_MPAM are implemented and can be used to generate writes to signal error interrupts.

If MPAMF_IDR.HAS_ESR is 0, this bit must also be 0.

Otherwise:

Reserved, RES0.

HAS_ESR, bit [39]
When MPAMF_IDR.EXT == 1:

MPAMF_ESR is implemented.

HAS_ESR	Meaning
0b0	MPAMF_ESR, MPAMF_ECR, and MPAM error handling are not implemented.
0b1	MPAMF_ESR, MPAMF_ECR, and MPAM error handling are implemented.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the MPAMF_ESR and MPAMF_ECR must be RAZ/WI.

Otherwise:

Reserved, RES0.

HAS_EXTD_ESR, bit [38]
When MPAMF_IDR.EXT == 1:

MPAMF_ESR is 64 bits.

HAS_EXTD_ESR	Meaning
0b0	MPAMF_ESR is 32 bits.
0b1	MPAMF_ESR is 64 bits.

When MPAMF_IDR.HAS_RIS and MPAMF_IDR.HAS_ESR, this field must be 1.

Otherwise:

Reserved, RES0.

NO_IMPL_MSMON, bit [37]
When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_IMPL_IDR == 1:

MPAMF_IMPL_IDR defines no IMPLEMENTATION DEFINED resource monitors.

NO_IMPL_MSMON	Meaning
0b0	MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource monitor.
0b1	MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource monitors.

If RIS is implemented, this field indicates the presence of IMPLEMENTATION DEFINED resource monitors described in MPAMF_IMPL_IDR for the selected resource instance.

Otherwise:

Reserved, RES0.

NO_IMPL_PART, bit [36]

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_IMPL_IDR == 1:

MPAMF_IMPL_IDR defines no IMPLEMENTATION DEFINED resource controls.

NO_IMPL_PART	Meaning
0b0	MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource control.
0b1	MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource controls.

If RIS is implemented, this field indicates the presence of IMPLEMENTATION DEFINED resource controls described in MPAMF_IMPL_IDR for the selected resource instance.

Otherwise:

Reserved, RES0.

Bits [35:33]

Reserved, RES0.

HAS_RIS, bit [32]

When MPAMF_IDR.EXT == 1:

Has resource instance selector. Indicates that MPAMCFG_PART_SEL contains the RIS field that selects a resource instance to control.

HAS_RIS	Meaning
0b0	MPAMCFG_PART_SEL does not implement the MPAMCFG_PART_SEL.RIS field or multiple resource instance support.
0b1	MPAMCFG_PART_SEL implements the MPAMCFG_PART_SEL.RIS field and MPAM resource instance numbers up to and including MPAMF_IDR.RIS_MAX.

Otherwise:

Reserved, RES0.

HAS_PARTID_NRW, bit [31]

Has PARTID narrowing.

HAS_PARTID_NRW	Meaning
0b0	Does not have MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID, or intPARTID mapping support.
0b1	Supports the MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID registers.

HAS_MSMON, bit [30]

Has resource Monitors. Indicates whether this MSC has MPAM resource monitors.

HAS_MSMON	Meaning
0b0	Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR.
0b1	Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR.

HAS_IMPL_IDR, bit [29]

Has MPAMF_IMPL_IDR. Indicates whether this MSC has the IMPLEMENTATION SPECIFIC MPAM features register, MPAMF_IMPL_IDR.

HAS_IMPL_IDR	Meaning
0b0	Does not have MPAMF_IMPL_IDR.
0b1	Has MPAMF_IMPL_IDR.

EXT, bit [28]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Extended MPAMF_IDR.

EXT	Meaning
0b0	MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits.
0b1	MPAMF_IDR has bits defined in [63:32]. The register is 64-bits.

Otherwise:

Reserved, RES0.

HAS_PRI_PART, bit [27]

Has Priority Partitioning. Indicates that MPAM priority partitioning is implemented and MPAMF_PRI_IDR exists.

HAS_PRI_PART	Meaning
0b0	Does not support priority partitioning or have MPAMF_PRI_IDR.
0b1	Has priority partitioning and MPAMF_PRI_IDR.

If RIS is implemented, this field indicates the presence of priority partitioning resource controls as described in MPAMF_PRI_IDR for the selected resource instance.

HAS_MBW_PART, bit [26]

Has Memory Bandwidth Partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and MPAMF_MBW_IDR.

HAS_MBW_PART	Meaning
0b0	Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register.
0b1	Has MPAMF_MBW_IDR register.

If RIS is implemented, this field indicates the presence of memory bandwidth partitioning resource controls as described in MPAMF_MBW_IDR for the selected resource instance.

HAS_CPOR_PART, bit [25]

Has Cache Portion Partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and MPAMF_CPOR_IDR.

HAS_CPOR_PART	Meaning
`0b0`	Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPBM<n> registers.
`0b1`	Has MPAMF_CPOR_IDR and MPAMCFG_CPBM<n> registers.

If RIS is implemented, this field indicates the presence of cache portion partitioning resource controls as described in MPAMF_CPOR_IDR for the selected resource instance.

HAS_CCAP_PART, bit [24]

Has Cache Capacity Partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

HAS_CCAP_PART	Meaning
`0b0`	Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.
`0b1`	Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

If RIS is implemented, this field indicates the presence of cache capacity partitioning resource controls as described in MPAMF_CPOR_IDR for the selected resource instance.

PMG_MAX, bits [23:16]

Maximum supported value of PMG.

The value of this field is permitted to vary between the instances of MPAM_IDR, each reporting the maximum supported PMG value in the PARTID space associated with that instance.

In MPAMF_IDR_s, this field is permitted to report the maximum PMG value for the Non-secure PARTID space or for the Secure PARTID space. The maximum PMG value for the Secure PARTID space can be read from MPAMF_SIDR.PMG_MAX.

PARTID_MAX, bits [15:0]

Maximum supported value of PARTID.

The value of this field is permitted to vary between the instances of MPAM_IDR, each reporting the maximum supported PARTID value in the PARTID space associated with that instance.

In MPAMF_IDR_s, this field is permitted to report the maximum PARTID value for the Non-secure PARTID space or for the Secure PARTID space. The maximum PARTID value for the Secure PARTID space can be read from MPAMF_SIDR.PARTID_MAX.

Otherwise:

31	30	29	28	27	26	25	24	23
HAS_PARTID_NRW	HAS_MSMON	HAS_IMPL_IDR	EXT	HAS_PRI_PART	HAS_MBW_PART	HAS_CPOR_PART	HAS_CCAP_PART	

HAS_PARTID_NRW, bit [31]

Has PARTID Narrowing.

HAS_PARTID_NRW	Meaning
0b0	Does not have MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID, or intPARTID mapping support.
0b1	Supports the MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID registers.

HAS_MSMON, bit [30]

Has resource Monitors. Indicates whether this MSC has MPAM resource monitors.

HAS_MSMON	Meaning
0b0	Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR.
0b1	Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR.

HAS_IMPL_IDR, bit [29]

Has MPAMF_IMPL_IDR. Indicates whether this MSC has the IMPLEMENTATION SPECIFIC MPAM features register, MPAMF_IMPL_IDR.

HAS_IMPL_IDR	Meaning
0b0	Does not have MPAMF_IMPL_IDR.
0b1	Has MPAMF_IMPL_IDR.

EXT, bit [28]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Extended MPAMF_IDR.

EXT	Meaning
0b0	MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits.
0b1	MPAMF_IDR has bits defined in [63:32]. The register is 64-bits.

Otherwise:

Reserved, RES0.

HAS_PRI_PART, bit [27]

Has Priority Partitioning. Indicates whether this MSC implements MPAM priority partitioning and MPAMF_PRI_IDR.

HAS_PRI_PART	Meaning
0b0	Does not support priority partitioning or have MPAMF_PRI_IDR.
0b1	Has MPAMF_PRI_IDR.

HAS_MBW_PART, bit [26]

Has Memory Bandwidth Partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and MPAMF_MBW_IDR.

HAS_MBW_PART	Meaning
0b0	Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register.
0b1	Has MPAMF_MBW_IDR register.

HAS_CPOR_PART, bit [25]

Has Cache Portion Partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and MPAMF_CPOR_IDR.

HAS_CPOR_PART	Meaning
0b0	Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPBM<n> registers.
0b1	Has MPAMF_CPOR_IDR and MPAMCFG_CPBM<n> registers.

HAS_CCAP_PART, bit [24]

Has Cache Capacity Partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

HAS_CCAP_PART	Meaning
0b0	Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.
0b1	Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

PMG_MAX, bits [23:16]

Maximum supported value of PMG.

The value of this field is permitted to vary between the instances of MPAM_IDR, each reporting the maximum supported PMG value in the PARTID space associated with that instance.

In MPAMF_IDR_s this field is permitted to report the maximum PMG value for the Non-secure PARTID space or for the Secure PARTID space. The maximum PMG value for the Secure PARTID space can be read from MPAMF_SIDR.PMG_MAX.

PARTID_MAX, bits [15:0]

Maximum supported value of PARTID.

The value of this field is permitted to vary between the instances of MPAM_IDR, each reporting the maximum supported PARTID value in the PARTID space associated with that instance.

In MPAMF_IDR_s this field is permitted to report the maximum PARTID value for the Non-secure PARTID space or for the Secure PARTID space. The maximum PARTID value for the Secure PARTID space can be read from MPAMF_SIDR.PARTID_MAX.

Accessing MPAMF_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_IDR is read-only.

MPAMF_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_IDR is permitted to have the same contents when read from the Secure or Non-secure MPAM feature pages unless the register contents are different for the different versions, when MPAMF_IDR_s is permitted to have either the same or different contents to MPAMF_IDR_ns.

There must be separate registers in the Secure (MPAMF_IDR_s) and Non-secure (MPAMF_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_IDR shows the configuration of MSC MPAM for the resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0000	MPAMF_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0000	MPAMF_IDR_ns

Accesses on this interface are **RO**.

MPAMF_IIDR, MPAM Implementation Identification Register

The MPAMF_IIDR characteristics are:

Purpose

Uniquely identifies the MSC implementation by the combination of implementer, product ID, variant, and revision.

Configuration

The power domain of MPAMF_IIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_IIDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_IIDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ProductID												Variant				Revision				Implementer											

ProductID, bits [31:20]

The MSC implementer as identified in the MPAMF_IIDR.Implementer field must assure each product has a unique ProductID from any other with the same Implementer value.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [19:16]

This field distinguishes product variants or major revisions of the product.

Note

Implementations of ProductID with differing software interfaces are expected to have different values in the MPAMF_IIDR.Variant field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

This field distinguishes minor revisions of the product.

Note

> This field is intended to differentiate product revisions that are minor changes and are largely software compatible with previous revisions.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the MPAM MSC.

[11:8] must contain the JEP106 continuation code of the implementer.

[7] must always be 0.

[6:0] must contain the JEP106 identity code of the implementer.

For an Arm implementation, bits[11:0] are `0x43B`.

Accessing MPAMF_IIDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_IIDR is read-only.

MPAMF_IIDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_IIDR must have the same contents in the Secure and Non-secure MPAM feature pages.

MPAMF_IIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x0018`	MPAMF_IIDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x0018`	MPAMF_IIDR_ns

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMF_IMPL_IDR, MPAM Implementation-Specific Partitioning Feature Identification Register

The MPAMF_IMPL_IDR characteristics are:

Purpose

Indicates the implementation-defined partitioning and monitoring features and parameters of the MSC.

MPAMF_IMPL_IDR_s indicates IMPLEMENTATION DEFINED partitioning and monitoring features accessed from the Secure MPAM feature page. MPAMF_IMPL_IDR_ns indicates those accessed from the Non-secure MPAM feature page.

If MPAMF_IDR.HAS_RIS is 1, this register gives the implementation-specific features and parameters of the resource instance selected by MPAMCFG_PART_SEL.RIS for any features that are specific to the resource.

Configuration

The power domain of MPAMF_IMPL_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_IMPL_IDR == 1. Otherwise, direct accesses to MPAMF_IMPL_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_IMPL_IDR is a 32-bit register.

Field descriptions

<table>
<tr><td>31</td><td>30</td><td>29</td><td>28</td><td>27</td><td>26</td><td>25</td><td>24</td><td>23</td><td>22</td><td>21</td><td>20</td><td>19</td><td>18</td><td>17</td><td>16</td><td>15</td><td>14</td><td>13</td><td>12</td><td>11</td><td>10</td><td>9</td><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr>
<tr><td colspan="32">IMPLFEAT</td></tr>
</table>

IMPLFEAT, bits [31:0]

All 32 bits of this register are available to be used as the implementer sees fit to indicate the presence of IMPLEMENTATION DEFINED MPAM features in this MSC and to give additional implementation-specific read-only information about the parameters of implementation-specific MPAM features to software.

If RIS is implemented, this register indicates the implementation-specific features and parameters of the resource instance selected by MPAMCFG_PART_SEL.RIS.

Accessing MPAMF_IMPL_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_IMPL_IDR is read-only.

MPAMF_IMPL_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_IMPL_IDR is permitted to have the same contents when read from the Secure or Non-secure MPAM feature pages unless the register contents are different for the different versions, when MPAMF_IMPL_IDR_s is permitted to have either the same or different contents to MPAMF_IMPL_IDR_ns.

There must be separate registers in the Secure (MPAMF_IMPL_IDR_s) and Non-secure (MPAMF_IMPL_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_IMPL_IDR shows the configuration of implementation-specific features for the resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_IMPL_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0028	MPAMF_IMPL_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0028	MPAMF_IMPL_IDR_ns

Accesses on this interface are **RO**.

MPAMF_MBW_IDR, MPAM Memory Bandwidth Partitioning Identification Register

The MPAMF_MBW_IDR characteristics are:

Purpose

Indicates which MPAM bandwidth partitioning features are present on this MSC.

MPAMF_MBW_IDR_s indicates bandwidth partitioning features accessed from the Secure MPAM feature page. MPAMF_MBW_IDR_ns indicates bandwidth partitioning features accessed from the Non-secure MPAM feature page.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has that information within the field description.

Configuration

The power domain of MPAMF_MBW_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_MBW_PART == 1. Otherwise, direct accesses to MPAMF_MBW_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MBW_IDR is a 32-bit register.

Field descriptions

31 30 29	28 27 26 25 24 23 22 21 20 19 18 17 16	15	14	13	12	11	10	9 8 7 6	5 4 3 2 1 0
RES0	BWPBM_WD	RES0	WINDWR	HAS_PROP	HAS_PBM	HAS_MAX	HAS_MIN	RES0	BWA_WD

Bits [31:29]

Reserved, RES0.

BWPBM_WD, bits [28:16]

Bandwidth portion bitmap width.

The number of bandwidth portion bits in the MPAMCFG_MBW_PBM<n> register array.

If MPAMF_MBW_IDR.HAS_PBM is 1, this field must contain a value from 1 to 4096, inclusive. Values greater than 32 require a group of 32-bit registers to access the BWPBM, up to 128 if BWPBM_WD is the largest value.

If MPAMF_MBW_IDR.HAS_PBM is 0, this field must be ignored by software.

If RIS is implemented, this field indicates the width of the memory bandwidth portion bitmap partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Bit [15]

Reserved, RES0.

WINDWR, bit [14]

Indicates the bandwidth accounting period register is writable.

WINDWR	Meaning
0b0	The bandwidth accounting period is readable from MPAMCFG_MBW_WINWD which might be fixed or vary due to clock rate reconfiguration of the memory channel or memory controller.
0b1	The bandwidth accounting width is readable and writable per partition in MPAMCFG_MBW_WINWD.

HAS_PROP, bit [13]

Indicates that this MSC implements proportional stride bandwidth partitioning and the MPAMCFG_MBW_PROP register can be accessed.

HAS_PROP	Meaning
0b0	There is no memory bandwidth proportional stride control and the MPAMCFG_MBW_PROP register is RES0.
0b1	The proportional stride memory bandwidth partitioning scheme is supported and the MPAMCFG_MBW_PROP register can be accessed.

If RIS is implemented, this field indicates the presence of the memory bandwidth proportional stride partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

HAS_PBM, bit [12]

Indicates that bandwidth portion partitioning is implemented and the MPAMCFG_MBW_PBM<n> register array can be accessed.

HAS_PBM	Meaning
0b0	There is no memory bandwidth portion control and the MPAMCFG_MBW_PBM<n> is RES0.
0b1	The memory bandwidth portion allocation scheme exists and the MPAMCFG_MBW_PBM<n> register can be accessed.

If RIS is implemented, this field indicates the presence of the memory bandwidth portion partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

HAS_MAX, bit [11]

Indicates that this MSC implements maximum bandwidth partitioning and the MPAMCFG_MBW_MAX register can be accessed.

HAS_MAX	Meaning
0b0	There is no maximum memory bandwidth control and the MPAMCFG_MBW_MAX register is RES0.
0b1	The maximum memory bandwidth allocation scheme is supported and the MPAMCFG_MBW_MAX register can be accessed.

If RIS is implemented, this field indicates the presence of the maximum bandwidth partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

HAS_MIN, bit [10]

Indicates that this MSC implements minimum bandwidth partitioning and the MPAMCFG_MBW_MIN register can be accessed.

HAS_MIN	Meaning
0b0	There is no minimum memory bandwidth control and the MPAMCFG_MBW_MIN register is RES0.
0b1	The minimum memory bandwidth allocation scheme is supported and the MPAMCFG_MBW_MIN register can be accessed.

If RIS is implemented, this field indicates the presence of the minimum bandwidth partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Bits [9:6]

Reserved, RES0.

BWA_WD, bits [5:0]

Number of implemented bits in the bandwidth allocation fields: MIN, MAX, and STRIDE. See MPAMCFG_MBW_MIN, MPAMCFG_MBW_MAX, and MPAMCFG_MBW_PROP.

In any of these bandwidth allocation fields exist, this field must have a value from 1 to 16, inclusive. Otherwise, it is permitted to be 0.

If RIS is implemented, this field indicates the number of implemented bits in the bandwidth allocation control fields for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Accessing MPAMF_MBW_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_MBW_IDR is read-only.

MPAMF_MBW_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_MBW_IDR is permitted to have the same contents when read from the Secure or Non-secure MPAM feature pages unless the register contents are different for the different versions, when MPAMF_MBW_IDR_s is permitted to have either the same or different contents to MPAMF_MBW_IDR_ns.

There must be separate registers in the Secure (MPAMF_MBW_IDR_s) and Non-secure (MPAMF_MBW_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_MBW_IDR shows the configuration of memory bandwidth partitioning for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_MBW_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0040	MPAMF_MBW_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0040	MPAMF_MBW_IDR_ns

Accesses on this interface are **RO**.

MPAMF_MBWUMON_IDR, MPAM Features Memory Bandwidth Usage Monitoring ID register

The MPAMF_MBWUMON_IDR characteristics are:

Purpose

Indicates the number of memory bandwidth usage monitor instances implemented. This register also indicates several properties of MBWU monitoring, including whether the implementation supports capture, scaling, or long counters.

MPAMF_MBWUMON_IDR_s indicates the number of Secure memory bandwidth usage monitor instances. MPAMF_MBWUMON_IDR_ns indicates the number of Non-secure memory bandwidth usage monitor instances.

If MPAMF_IDR.HAS_RIS is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by MPAMCFG_PART_SEL.RIS. Fields that do not mention RIS are constant across all resource instances.

Configuration

The power domain of MPAMF_MBWUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MPAMF_MBWUMON_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MBWUMON_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24232221	2019181716	15141
HAS_CAPTURE	HAS_LONG	LWD	HAS_RWBW	HAS_OFLOW_LNKG	HAS_OFSR	HAS_OFLOW_CAPT	RES0	SCALE	

HAS_CAPTURE, bit [31]

The implementation supports copying an MSMON_MBWU to the corresponding MSMON_MBWU_CAPTURE on a capture event.

HAS_CAPTURE	Meaning
0b0	MSMON_MBWU_CAPTURE is not implemented and there is no support for capture events in the MBWU monitor.
0b1	The MSMON_MBWU_CAPTURE register is implemented and the MBWU monitor supports the capture event behavior.

If RIS is implemented, this field indicates that MBWU monitor capture is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

If MPAMF_MBWUMON_IDR.HAS_LONG is 1, this also indicates that MSMON_MBWU_L_CAPTURE is implemented.

HAS_LONG, bit [30]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Indicates whether MSMON_MBWU_L is implemented.

If HAS_CAPTURE is 1, indicates whether MSMON_MBWU_L_CAPTURE is implemented.

HAS_LONG	Meaning
0b0	Does not implement MSMON_MBWU_L or MSMON_MBWU_L_CAPTURE.
0b1	Implements MSMON_MBWU_L. If HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE is also implemented.

If RIS is implemented, this field indicates that the long MBWU monitor is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

If MPAMF_MBWUMON_IDR.HAS_CAPTURE is 1, this also indicates that MSMON_MBWU_L_CAPTURE is implemented.

Otherwise:

Reserved, RES0.

LWD, bit [29]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Long register VALUE width.

If MPAMF_MBWUMON_IDR.HAS_LONG is 0, MPAMF_MBWUMON_IDR.LWD must also be 0.

LWD	Meaning
0b0	If MPAMF_MBWUMON_IDR.HAS_LONG is 1, MSMON_MBWU_L has 44-bit VALUE field in bits [43:0]. Bits [62:44] are RES0. If HAS_LONG is 1 and MPAMF_MBWUMON_IDR.HAS_CAPTURE is 1, MSMON_MBWU_L_CAPTURE also has 44-bit VALUE field in bits [43:0].
0b1	MSMON_MBWU_L has 63-bit VALUE field in bits [62:0]. If MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE also has 63-bit VALUE field in bits [62:0].

If RIS is implemented, this field indicates the length of the MSMON_MBWU_L.VALUE field implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

HAS_RWBW, bit [28]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Read/write bandwidth selection is implemented in MSMON_CFG_MBWU_FLT.

HAS_RWBW	Meaning
0b0	Read/write bandwidth selection is not implemented.
0b1	Read/write bandwidth selection is implemented.

If RIS is implemented, this field indicates whether read/write bandwidth collection selection is available in MSMON_CFG_MBWU_FLT for resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

HAS_OFLOW_LNKG, bit [27]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Supports MSMON_CFG_MBWU_CTL.OFLOW_LNKG field to control how overflow on an instance affects other monitor instances in this MSC.

HAS_OFLOW_LNKG	Meaning
0b0	Does not support MBWU overflow linkage.
0b1	Supports MBWU overflow linkage and the MSMON_CFG_MBWU_CTL.OFLOW_LNKG field.

If RIS is implemented, this field indicates that MSMON_CFG_MBWU_CTL.OFLOW_LNKG is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

HAS_OFSR, bit [26]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

The MBWU monitor overflow status bitmap register, MSMON_MBWU_OFSR, is implemented.

HAS_OFSR	Meaning
0b0	MSMON_MBWU_OFSR register is not implemented.
0b1	MSMON_MBWU_OFSR register is implemented.

If RIS is implemented, this field indicates that MBWU monitor overflow status bitmap register is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

HAS_OFLOW_CAPT, bit [25]

Supports MSMON_CFG_MBWU_CTL.OFLOW_CAPT field to transfer the MBWU monitor instance to its capture register on an overflow or overflow linkage event.

HAS_OFLOW_CAPT	Meaning
0b0	Does not support MBWU capture on overflow.
0b1	Supports MBWU capture on overflow and the MSMON_CFG_MBWU_CTL.OFLOW_CAPT field.

If RIS is implemented, this field indicates that MSMON_CFG_MBWU_CTL.OFLOW_CAPT is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Bits [24:21]

Reserved, RES0.

SCALE, bits [20:16]

Scaling of MSMON_MBWU.VALUE in bits. If scaling is enabled by MSMON_CFG_MBWU_CTL.SCLEN, the byte count in the VALUE field has been shifted by SCALE bits to the right.

SCALE	Meaning
0b00000	Scaling is not implemented.
0bxxxxx	Other values are right shift count when scaling is enabled.

If RIS is implemented, this field indicates the scale value for MSMON_MBWU.VALUE field for the resource instance selected by MPAMCFG_PART_SEL.RIS.

NUM_MON, bits [15:0]

The number of memory bandwidth usage monitor instances implemented. The largest monitor instance selector, MSMON_CFG_MON_SEL.MON_SEL, is NUM_MON minus 1.

If RIS is implemented, this field indicates the number of MBWU monitor instances for MSMON_MBWU.VALUE field for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Accessing MPAMF_MBWUMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_MBWUMON_IDR is read-only.

MPAMF_MBWUMON_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_MBWUMON_IDR is permitted to have the same contents when read from the Secure or Non-secure MPAM feature pages unless the register contents are different for the different versions, when MPAMF_MBWUMON_IDR_s is permitted to have either the same or different contents to MPAMF_MBWUMON_IDR_ns.

There must be separate registers in the Secure (MPAMF_MBWUMON_IDR_s) and Non-secure (MPAMF_MBWUMON_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_MBWUMON_IDR shows the configuration of memory bandwidth monitoring for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF_MBWUMON_IDR is not affected by MSMON_CFG_MON_SEL.RIS.

MPAMF_MBWUMON_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x0090`	MPAMF_MBWUMON_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x0090`	MPAMF_MBWUMON_IDR_ns

Accesses on this interface are **RO**.

MPAMF_MSMON_IDR, MPAM Resource Monitoring Identification Register

The MPAMF_MSMON_IDR characteristics are:

Purpose

Indicates which MPAM monitoring features are present on this MSC.

MPAMF_MSMON_IDR_s indicates Secure monitoring features. MPAMF_MSMON_IDR_ns indicates Non-secure monitoring features.

If MPAMF_IDR.HAS_RIS is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by MPAMCFG_PART_SEL.RIS. Fields that do not mention RIS are constant across all resource instances.

Configuration

The power domain of MPAMF_MSMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_MSMON == 1. Otherwise, direct accesses to MPAMF_MSMON_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MSMON_IDR is a 32-bit register.

Field descriptions

31	30	29	28	27262524232221201918	17	
HAS_LOCAL_CAPT_EVNT	NO_HW_OFLW_INTR	HAS_OFLW_MSI	HAS_OFLOW_SR	RES0	MSMON_MBWU	MS

HAS_LOCAL_CAPT_EVNT, bit [31]

Has local capture event generator. Indicates whether this MSC has the MPAM local capture event generator and the MSMON_CAPT_EVNT register.

HAS_LOCAL_CAPT_EVNT	Meaning
`0b0`	Does not support MPAM local capture event generator or MSMON_CAPT_EVNT.
`0b1`	Supports the MPAM local capture event generator and the MSMON_CAPT_EVNT register.

NO_HW_OFLW_INTR, bit [30]

When FEAT_MPAMv1p1 is implemented:

Does not have hardwired MPAM monitor overflow interrupt.

NO_HW_OFLW_INTR	Meaning
`0b0`	Supports generating a hardwired interrupt to signal MPAM monitor overflow.
`0b1`	No support for a hardwired interrupt to signal MPAM monitor overflow.

If this field is 0, the MSC supports generating a hardwired interrupt for monitor overflow events.

If this field is 0 and the HAS_OFLW_MSI field in this register is 1, the MSC supports generating both hardwired interrupts and MSI writes to signal interrupts.

Otherwise:

Reserved, RES0.

HAS_OFLW_MSI, bit [29]

When FEAT_MPAMv1p1 is implemented:

Has support for MSI writes to signal MPAM monitor overflow interrupts. These registers are implemented: MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA and MSMON_OFLOW_MSI_MPAM.

HAS_OFLW_MSI	Meaning
0b0	MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA and MSMON_OFLOW_MSI_MPAM registers are not implemented.
0b1	MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA and MSMON_OFLOW_MSI_ATTR are implemented and can be used to generate writes to signal MPAM monitor overflow interrupts.

If MPAMF_MSMON_IDR.NO_HW_OFLW_INTR is 1 and this bit is 0, this MSC does not support monitor overflow interrupts.

Otherwise:

Reserved, RES0.

HAS_OFLOW_SR, bit [28]

When FEAT_MPAMv1p1 is implemented:

Has MPAM monitor overflow status register MSMON_OFLOW_SR.

HAS_OFLOW_SR	Meaning
0b0	Does not have MSMON_OFLOW_SR.
0b1	Supports MSMON_OFLOW_SR.

Otherwise:

Reserved, RES0.

Bits [27:18]

Reserved, RES0.

MSMON_MBWU, bit [17]

Memory bandwidth usage monitoring. Indicates whether MPAM monitoring for Memory Bandwidth Usage by PARTID and PMG is implemented and whether the following bandwidth usage registers are accessible:

- MPAMF_MBWUMON_IDR, MSMON_CFG_MBWU_CTL, MSMON_CFG_MBWU_FLT, MSMON_MBWU.
- The optional MSMON_MBWU_CAPTURE.

- If MPAM v0.1 or MPAM v1.1 is implemented, the optional MSMON_MBWU_L and the optional MSMON_MBWU_L_CAPTURE.

MSMON_MBWU	Meaning
`0b0`	Does not have monitoring for memory bandwidth usage and does not use the bandwidth usage registers.
`0b1`	Has monitoring of memory bandwidth usage and uses the bandwidth usage registers.

If RIS is implemented, this field indicates that memory bandwidth usage monitoring is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS as described in MPAMF_MBWUMON_IDR.

MSMON_CSU, bit [16]

Cache storage usage monitoring. Indicates whether MPAM monitoring of cache storage usage by PARTID and PMG is implemented and the following registers are accessible:

- MPAMF_CSUMON_IDR, MSMON_CFG_CSU_CTL, MSMON_CFG_CSU_FLT, MSMON_CSU.
- The optional MSMON_CSU_CAPTURE.

MSMON_CSU	Meaning
`0b0`	Does not have monitoring for cache storage usage or the MPAMF_CSUMON_IDR, MSMON_CFG_CSU_CTL, MSMON_CFG_CSU_FLT, MSMON_CSU or MSMON_CSU_CAPTURE registers.
`0b1`	Has monitoring of cache storage usage and the MPAMF_CSUMON_IDR, MSMON_CFG_CSU_CTL, MSMON_CFG_CSU_FLT, MSMON_CSU and optional MSMON_CSU_CAPTURE registers.

If RIS is implemented, this field indicates that cache storage usage monitoring is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS as described in MPAMF_CSUMON_IDR.

Bits [15:0]

Reserved, RES0.

Accessing MPAMF_MSMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_MSMON_IDR is read-only.

MPAMF_MSMON_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_MSMON_IDR is permitted to have the same contents when read from the Secure or Non-secure MPAM feature pages unless the register contents are different for the different versions, when MPAMF_MSMON_IDR_s is permitted to have either the same or different contents to MPAMF_MSMON_IDR_ns.

There must be separate registers in the Secure (MPAMF_MSMON_IDR_s) and Non-secure (MPAMF_MSMON_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_MSMON_IDR shows the configuration of memory system monitoring for the resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF_MSMON_IDR is not affected by MSMON_CFG_MON_SEL.RIS.

MPAMF_MSMON_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x0080`	MPAMF_MSMON_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0080	MPAMF_MSMON_IDR_ns

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMF_PARTID_NRW_IDR, MPAM PARTID Narrowing ID register

The MPAMF_PARTID_NRW_IDR characteristics are:

Purpose

Indicates the largest internal PARTID for this MSC.

MPAMF_PARTID_NRW_IDR_s indicates the largest Secure internal PARTID. MPAMF_PARTID_NRW_IDR_ns indicates the largest Non-secure internal PARTID.

PARTID narrowing is global to the MSC and does not vary by resource instance.

Configuration

The power domain of MPAMF_PARTID_NRW_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PARTID_NRW == 1. Otherwise, direct accesses to MPAMF_PARTID_NRW_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_PARTID_NRW_IDR is a 32-bit register.

Field descriptions

31:16	15:0
RES0	INTPARTID_MAX

Bits [31:16]

Reserved, RES0.

INTPARTID_MAX, bits [15:0]

The largest intPARTID supported in this MSC.

Accessing MPAMF_PARTID_NRW_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_PARTID_NRW_IDR is read-only.

MPAMF_PARTID_NRW_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_PARTID_NRW_IDR is permitted to have the same contents when read from the Secure or Non-secure MPAM feature pages unless the register contents are different for the different versions, when MPAMF_PARTID_NRW_IDR_s is permitted to have either the same or different contents to MPAMF_PARTID_NRW_IDR_ns.

There must be separate registers in the Secure (MPAMF_PARTID_NRW_IDR_s) and Non-secure (MPAMF_PARTID_NRW_IDR_ns) MPAM feature pages.

MPAMF_PARTID_NRW_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0050	MPAMF_PARTID_NRW_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0050	MPAMF_PARTID_NRW_IDR_ns

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMF_PRI_IDR, MPAM Priority Partitioning Identification Register

The MPAMF_PRI_IDR characteristics are:

Purpose

Indicates which MPAM priority partitioning features are present on this MSC.

MPAMF_PRI_IDR_s indicates priority partitioning features accessed from the Secure MPAM feature page. MPAMF_PRI_IDR_ns indicates priority partitioning features accessed from the Non-secure MPAM feature page.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has that information within the field description.

Configuration

The power domain of MPAMF_PRI_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PRI_PART == 1. Otherwise, direct accesses to MPAMF_PRI_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_PRI_IDR is a 32-bit register.

Field descriptions

31 30 29 28 27 26	25 24 23 22 21 20	19 18	17	16	15 14 13 12 11 10	9 8 7 6 5 4	3 2	1	0
RES0	DSPRI_WD	RES0	DSPRI_0_IS_LOW	HAS_DSPRI	RES0	INTPRI_WD	RES0	INTPRI_0_IS_LOW	HAS_INTP

Bits [31:26]

Reserved, RES0.

DSPRI_WD, bits [25:20]

Number of implemented bits in the downstream priority field (DSPRI) of MPAMCFG_PRI.

If HAS_DSPRI == 1, this field must contain a value from 1 to 16, inclusive.

If HAS_DSPRI == 0, this field must be 0.

If RIS is implemented, this field indicates the number of downstream priority bits for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Bits [19:18]

Reserved, RES0.

DSPRI_0_IS_LOW, bit [17]

Indicates whether 0 in MPAMCFG_PRI.DSPRI is the lowest or the highest downstream priority.

DSPRI_0_IS_LOW	Meaning
0b0	In the MPAMCFG_PRI.DSPRI field, a value of 0 means the highest priority.
0b1	In the MPAMCFG_PRI.DSPRI field, a value of 0 means the lowest priority.

If RIS is implemented, this field indicates that 0 is the lowest downstream priority for the resource instance selected by MPAMCFG_PART_SEL.RIS.

HAS_DSPRI, bit [16]

Indicates that the MPAMCFG_PRI register implements the DSPRI field.

HAS_DSPRI	Meaning
0b0	This MSC supports priority partitioning, but does not implement a downstream priority (DSPRI) field in the MPAMCFG_PRI register.
0b1	This MSC supports downstream priority partitioning and implements the downstream priority (DSPRI) field in the MPAMCFG_PRI register.

If RIS is implemented, this field indicates that downstream priority is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Bits [15:10]

Reserved, RES0.

INTPRI_WD, bits [9:4]

Number of implemented bits in the internal priority field (INTPRI) in the MPAMCFG_PRI register.

If HAS_INTPRI == 1, this field must contain a value from 1 to 16, inclusive.

If HAS_INTPRI == 0, this field must be 0.

If RIS is implemented, this field indicates the number of internal priority bits for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Bits [3:2]

Reserved, RES0.

INTPRI_0_IS_LOW, bit [1]

Indicates whether 0 in MPAMCFG_PRI.INTPRI is the lowest or the highest internal priority.

INTPRI_0_IS_LOW	Meaning
0b0	In the MPAMCFG_PRI.INTPRI field, a value of 0 means the highest priority.
0b1	In the MPAMCFG_PRI.INTPRI field, a value of 0 means the lowest priority.

If RIS is implemented, this field indicates that 0 is the lowest internal priority for the resource instance selected by MPAMCFG_PART_SEL.RIS.

HAS_INTPRI, bit [0]

Indicates that this MSC implements the INTPRI field in the MPAMCFG_PRI register.

HAS_INTPRI	Meaning
0b0	This MSC supports priority partitioning, but does not implement the internal priority (INTPRI) field in the MPAMCFG_PRI register.
0b1	This MSC supports internal priority partitioning and implements the internal priority (INTPRI) field in the MPAMCFG_PRI register.

If RIS is implemented, this field indicates that internal priority is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Accessing MPAMF_PRI_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMF_PRI_IDR is read-only.

MPAMF_PRI_IDR must be readable from the Non-secure and Secure MPAM feature pages.

MPAMF_PRI_IDR is permitted to have the same contents when read from the Secure or Non-secure MPAM feature pages unless the register contents are different for the different versions, when MPAMF_PRI_IDR_s is permitted to have either the same or different contents to MPAMF_PRI_IDR_ns.

There must be separate registers in the Secure (MPAMF_PRI_IDR_s) and Non-secure (MPAMF_PRI_IDR_ns) MPAM feature pages.

When MPAMF_IDR.HAS_RIS is 1, MPAMF_PRI_IDR shows the configuration of priority partitioning for the resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_PRI_IDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0048	MPAMF_PRI_IDR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0048	MPAMF_PRI_IDR_ns

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MPAMF_SIDR, MPAM Features Secure Identification Register

The MPAMF_SIDR characteristics are:

Purpose

The MPAMF_SIDR is a 32-bit read-only register that indicates the maximum Secure PARTID and Secure PMG on this MSC.

Configuration

The power domain of MPAMF_SIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_SIDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_SIDR is a 32-bit register.

Field descriptions

31–24	23–16	15–0
RES0	S_PMG_MAX	S_PARTID_MAX

Bits [31:24]

Reserved, RES0.

S_PMG_MAX, bits [23:16]

Maximum value of Secure PMG supported by this component.

S_PARTID_MAX, bits [15:0]

Maximum value of Secure PARTID supported by this component.

Accessing MPAMF_SIDR

This register is only within the Secure MPAM feature page memory frame.

MPAMF_SIDR is read-only.

MPAMF_SIDR must only be readable from the Secure MPAM feature page. If the system or the MSC does not support the Secure address map, this register must not be accessible.

MPAMF_SIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0008	MPAMF_SIDR_s

Accesses on this interface are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MSMON_CAPT_EVNT, MPAM Capture Event Generation Register

The MSMON_CAPT_EVNT characteristics are:

Purpose

Generates a local capture event when written with bit[0] as 1.

MSMON_CAPT_EVNT_s generates local capture events for Secure monitor instances only or for Secure and Non-secure monitor instances. MSMON_CAPT_EVNT_ns generates local capture events for Non-secure monitor instances only.

Configuration

The power domain of MSMON_CAPT_EVNT is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.HAS_LOCAL_CAPT_EVNT == 1. Otherwise, direct accesses to MSMON_CAPT_EVNT are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CAPT_EVNT is a 32-bit register.

Field descriptions

31–2	1	0
RES0	ALL	NOW

Bits [31:2]

Reserved, RES0.

ALL, bit [1]

In the Secure instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Secure and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.
- If ALL is written as 0 and NOW is written as 1, signal a capture event to Secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.

In the Non-secure instance of this register, this bit is RAZ/WI.

This bit always reads as zero.

ALL	Meaning
`0b0`	Send capture event only to monitor instances in the same MPAM feature page as this register.
`0b1`	Send capture event to monitor instances in certain MPAM feature pages as described in the ALL field of this register.

NOW, bit [0]

When written as 1, this bit causes an event to those monitor instances described in the ALL field that have CAPT_EVNT set to the value of 7.

When this bit is written as 0, no event is signaled.

This bit always reads as zero.

Accessing MSMON_CAPT_EVNT

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CAPT_EVNT_s must be accessible from the Secure MPAM feature page. MSMON_CAPT_EVNT_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CAPT_EVNT_s and MSMON_CAPT_EVNT_ns must be separate registers. The Secure instance (MSMON_CAPT_EVNT_s) can generate local capture events for Secure monitor instances only or for Secure and Non-secure monitor instances, and the Non-secure instance (MSMON_CAPT_EVNT_ns) can generate local capture events for Non-secure monitor instances only.

MSMON_CAPT_EVNT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x0808`	MSMON_CAPT_EVNT_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x0808`	MSMON_CAPT_EVNT_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MSMON_CFG_CSU_CTL, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Control Register

The MSMON_CFG_CSU_CTL characteristics are:

Purpose

Controls the CSU monitor selected by MSMON_CFG_MON_SEL.

MSMON_CFG_CSU_CTL_s controls the Secure cache storage usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CFG_CSU_CTL_ns controls Non-secure cache storage usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance configuration accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Configuration

The power domain of MSMON_CFG_CSU_CTL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CFG_CSU_CTL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_CSU_CTL is a 32-bit register.

Field descriptions

31	30 29 28	27	26	25	24	23	22 21 20	19	18	
EN	CAPT_EVNT	CAPT_RESET	OFLOW_STATUS	OFLOW_INTR	OFLOW_FRZ	OFLOW_CAPT	SUBTYPE	RES0	CEVNT_OFLW	MAT

EN, bit [31]

Enabled.

EN	Meaning
0b0	The monitor instance is disabled and must not collect any information.
0b1	The monitor instance is enabled to collect information according to the configuration of the instance.

CAPT_EVNT, bits [30:28]

Capture event selector.

Select the event that triggers capture from the following:

CAPT_EVNT	Meaning
0b000	No capture event is triggered.
0b001	External capture event 1 (optional, but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the Security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

If capture is not implemented for the CSU monitor type as indicated by MPAMF_CSUMON_IDR.HAS_CAPTURE = 0, this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset after capture.

Controls whether the value of MSMON_CSU is reset to zero immediately after being copied to MSMON_CSU_CAPTURE.

CAPT_RESET	Meaning
0b0	Monitor is not reset on capture.
0b1	Monitor is reset on capture.

If capture is not implemented for the CSU monitor type as indicated by MPAMF_CSUMON_IDR.HAS_CAPTURE = 0, this field is RAZ/WI.

Because the CSU monitor type produces a measurement rather than a count, it might not make sense to ever reset the value after a capture. If there is no reason to ever reset a CSU monitor, this field is RAZ/WI.

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of MSMON_CSU has overflowed.

If MPAMF_CSUMON_IDR.HAS_OFLOW_CAPT is 1 or MPAMF_CSUMON_IDR.HAS_OFLOW_LNKG is 1, then a store to MSMON_CSU when this field is 1 resets this field to 0.

OFLOW_STATUS	Meaning
0b0	No overflow has occurred.
0b1	At least one overflow has occurred since this bit was last written to zero.

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

OFLOW_INTR, bit [25]

Overflow Interrupt.

Controls whether an overflow interrupt is generated when the value of MSMON_CSU has overflowed.

OFLOW_INTR	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_CSU.
0b1	On overflow, an implementation-specific interrupt is signaled.

If OFLOW_INTR is not supported by the implementation, this field is RAZ/WI.

OFLOW_FRZ, bit [24]

Freeze Monitor on Overflow.

Controls whether the value of MSMON_CSU freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	Monitor count wraps on overflow.
0b1	Monitor count freezes on overflow. The frozen value might be 0 or another value if the monitor overflowed with an increment larger than 1.

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

OFLOW_CAPT, bit [23]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_OFLOW_CAPT == 1:

Capture Monitor on Overflow.

Controls whether the value of MSMON_CSU is captured on an overflow or an overflow linkage event.

OFLOW_CAPT	Meaning
0b0	Monitor is not captured on an overflow or when affected by an overflow linkage event.
0b1	Monitor is captured on an overflow or when affected by an overflow linkage event. If OFLOW_FRZ is 1, the monitor does not continue to count after the overflow or overflow linkage event. If CAPT_RESET is 1, the monitor instance resets to 0.

If RIS is implemented, this field indicates that MSMON_CFG_CSU_CTL.OFLOW_CAPT is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Otherwise:

Reserved, RES0.

SUBTYPE, bits [22:20]

Subtype. Type of cache storage usage counted by this monitor.

This field is not currently used for CSU monitors, but reserved for future use.

This field is RAZ/WI.

Bit [19]

Reserved, RES0.

CEVNT_OFLW, bit [18]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_OFLOW_LNKG == 1:

Capture Event performs overflow behavior.

Selects whether a capture event matching the CAPT_EVNT field performs the overflow behavior or the capture behavior.

CEVNT_OFLW	Meaning
0b0	On a capture event matching the CAPT_EVNT field, the capture behaviors are performed.
0b1	On a capture event matching the CAPT_EVNT field, the overflow behaviors are performed.

Otherwise:

Reserved, RES0.

MATCH_PMG, bit [17]

Match PMG.

Controls whether the monitor measures only storage used with PMG matching MSMON_CFG_CSU_FLT.PMG.

MATCH_PMG	Meaning
0b0	The monitor measures storage used with any PMG value.
0b1	The monitor only measures storage used with the PMG value matching MSMON_CFG_CSU_FLT.PMG.

If MATCH_PMG is 1 and MATCH_PARTID is 0, it is CONSTRAINED UNPREDICTABLE whether the monitor instance:

- Measures the storage used with matching PMG and with any PARTID.
- Measures no storage usage, that is, MSMON_CSU.VALUE is zero.
- Measures the storage used with matching PMG and PARTID, that is, treats MATCH_PARTID as == 1.

MATCH_PARTID, bit [16]

Match PARTID.

Controls whether the monitor measures only storage used with PARTID matching MSMON_CFG_CSU_FLT.PARTID.

MATCH_PARTID	Meaning
0b0	The monitor measures storage used with any PARTID value.
0b1	The monitor only measures storage used with the PARTID value matching MSMON_CFG_CSU_FLT.PARTID.

Bits [15:11]

Reserved, RES0.

OFLOW_LNKG, bits [10:8]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_OFLOW_LNKG == 1:

Overflow linkage event.

Controls signaling of a capture event on overflow of this monitor instance.

OFLOW_LNKG	Meaning
0b000	Overflow of the monitor instance only affects this monitor instance.
0b001	Overflow of this monitor instance signals Capture Event 1.
0b010	Overflow of this monitor instance signals Capture Event 2.
0b011	Overflow of this monitor instance signals Capture Event 3.
0b100	Overflow of this monitor instance signals Capture Event 4.
0b101	Overflow of this monitor instance signals Capture Event 5.
0b110	Overflow of this monitor instance signals Capture Event 6.
0b111	Reserved.

Otherwise:

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code. The CSU monitor is TYPE = `0x43`.

TYPE is a read-only constant indicating the type of the monitor.

Reads as `0x43`.

Access to this field is **RO**.

Accessing MSMON_CFG_CSU_CTL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CFG_CSU_CTL_s must be accessible from the Secure MPAM feature page. MSMON_CFG_CSU_CTL_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CFG_CSU_CTL_s and MSMON_CFG_CSU_CTL_ns must be separate registers. The Secure instance (MSMON_CFG_CSU_CTL_s) accesses the cache storage usage monitor controls used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_CSU_CTL_ns) accesses the cache storage usage monitor controls used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CFG_CSU_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x0818`	MSMON_CFG_CSU_CTL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x0818`	MSMON_CFG_CSU_CTL_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MSMON_CFG_CSU_FLT, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Filter Register

The MSMON_CFG_CSU_FLT characteristics are:

Purpose

Configures PARTID and PMG to measure or count in the CSU monitor selected by MSMON_CFG_MON_SEL.

MSMON_CFG_CSU_FLT_s sets filter conditions for the Secure cache storage usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CFG_CSU_CTL_ns sets filter conditions for the Non-secure cache storage usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Configuration

The power domain of MSMON_CFG_CSU_FLT is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CFG_CSU_FLT are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_CSU_FLT is a 32-bit register.

Field descriptions

31	30–24	23–16	15–0
XCL	RES0	PMG	PARTID

XCL, bit [31]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_XCL == 1:

Exclude Clean. The monitor instance does not count cache storage used by lines in an unmodified cache state.

XCL	Meaning
`0b0`	Monitor instance counts cache storage in modified and unmodified cache lines.
`0b1`	Monitor instance counts cache storage in modified cache lines only.

Otherwise:

Reserved, RES0.

Bits [30:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter cache storage usage monitoring.

If MSMON_CFG_CSU_CTL.MATCH_PMG is 0, this field is not used to match cache storage to a PMG and the contents of this field is ignored.

If MSMON_CFG_CSU_CTL.MATCH_PMG is 1 and MSMON_CFG_CSU_CTL.MATCH_PARTID is 1, the monitor instance selected by MSMON_CFG_MON_SEL measures or counts cache storage labeled with PMG equal to this field and PARTID equal to the PARTID field.

If MSMON_CFG_CSU_CTL.MATCH_PMG is 1 and MSMON_CFG_CSU_CTL.MATCH_PARTID is 0, the behavior of the monitor instance selected by MSMON_CFG_MON_SEL is CONSTRAINED UNPREDICTABLE. See MSMON_CFG_CSU_CTL.MATCH_PMG for more information.

PARTID, bits [15:0]

Partition ID to filter cache storage usage monitoring.

If MSMON_CFG_CSU_CTL.MATCH_PARTID is 0 and MSMON_CFG_CSU_CTL.MATCH_PMG is 0, the monitor measures all allocated cache storage.

If MSMON_CFG_CSU_CTL.MATCH_PARTID is 0 and MSMON_CFG_CSU_CTL.MATCH_PMG is 1, the behavior of the monitor is CONSTRAINED UNPREDICTABLE. See the description of MSMON_CFG_CSU_CTL.MATCH_PMG.

If MSMON_CFG_CSU_CTL.MATCH_PARTID is 1 and MSMON_CFG_CSU_CTL.MATCH_PMG is 0, the monitor selected by MSMON_CFG_MON_SEL measures or counts cache storage labeled with PARTID equal to this field.

If MSMON_CFG_CSU_CTL.MATCH_PARTID is 1 and MSMON_CFG_CSU_CTL.MATCH_PMG is 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts cache storage labeled with PARTID equal to this field and PMG equal to the PMG field.

Accessing MSMON_CFG_CSU_FLT

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CFG_CSU_FLT_s must be accessible from the Secure MPAM feature page. MSMON_CFG_CSU_FLT_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CFG_CSU_FLT_s and MSMON_CFG_CSU_FLT_ns must be separate registers. The Secure instance (MSMON_CFG_CSU_FLT_s) accesses the PARTID and PMG matching for a cache storage usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_CSU_FLT_ns) accesses the PARTID and PMG matching for a cache storage usage monitor used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_CSU_FLT access the monitor configuration settings for the resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_CSU_FLT access the monitor configuration settings for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CFG_CSU_FLT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0810	MSMON_CFG_CSU_FLT_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0810	MSMON_CFG_CSU_FLT_ns

Accesses on this interface are **RW**.

MSMON_CFG_MBWU_CTL, MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Control Register

The MSMON_CFG_MBWU_CTL characteristics are:

Purpose

Controls the MBWU monitor selected by MSMON_CFG_MON_SEL.

MSMON_CFG_MBWU_CTL_s controls the Secure memory bandwidth usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CFG_MBWU_CTL_ns controls Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance configuration accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Configuration

The power domain of MSMON_CFG_MBWU_CTL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_CFG_MBWU_CTL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MBWU_CTL is a 32-bit register.

Field descriptions

31	30 29 28	27	26	25	24	23	22 21 20	19	18	
EN	CAPT_EVNT	CAPT_RESET	OFLOW_STATUS	OFLOW_INTR	OFLOW_FRZ	OFLOW_CAPT	SUBTYPE	SCLEN	CEVNT_OFLW	MA

EN, bit [31]

Enabled.

EN	Meaning
0b0	The monitor instance is disabled and must not collect any information.
0b1	The monitor instance is enabled to collect information according to the configuration of the instance.

CAPT_EVNT, bits [30:28]

Capture event selector.

When the selected capture event occurs, MSMON_MBWU of the monitor instance is copied to MSMON_MBWU_CAPTURE of the same instance. If the long counter is also implemented, MSMON_MBWU_L is also copied to MSMON_MBWU_L_CAPTURE.

Select the event that triggers capture from the following:

CAPT_EVNT	Meaning
0b000	No capture event is triggered.
0b001	External capture event 1 (optional, but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the Security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

If capture is not implemented for the MBWU monitor type as indicated by MPAMF_MBWUMON_IDR.HAS_CAPTURE = 0, this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset MSMON_MBWU.VALUE after capture.

Controls whether the VALUE field of the monitor instance is reset to zero immediately after being copied to the corresponding capture register.

CAPT_RESET	Meaning
0b0	MSMON_MBWU.VALUE field of the monitor instance is not reset on capture.
0b1	MSMON_MBWU.VALUE field of the monitor instance is reset on capture.

If capture is not implemented for the MBWU monitor type as indicated by MPAMF_MBWUMON_IDR.HAS_CAPTURE = 0, this field is RAZ/WI.

This control bit affects both MSMON_MBWU and MSMON_MBWU_L in implementations that include MSMON_MBWU_L.

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of MSMON_MBWU has overflowed.

OFLOW_STATUS	Meaning
0b0	MSMON_MBWU.VALUE has not overflowed.
0b1	MSMON_MBWU.VALUE has overflowed at least once since this bit was last written to zero.

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

Overflow status for MSMON_MBWU_L.VALUE is reported in MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L.

If MPAMF_MBWUMON_IDR.HAS_OFLOW_CAPT is 1 or MPAMF_MBWUMON_IDR.HAS_OFLOW_LNKG is 1, then a store to MSMON_MBWU when this field is 1 resets this field to 0.

OFLOW_INTR, bit [25]

Enable interrupt on overflow of MSMON_MBWU.VALUE.

OFLOW_INTR	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_MBWU.VALUE.
0b1	An implementation-specific interrupt is signaled on an overflow of MSMON_MBWU.VALUE.

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

If overflow interrupt is not supported by the MSC implementation, this field is RAZ/WI.

Interrupt enable for overflow of MSMON_MBWU_L.VALUE is controlled by MSMON_CFG_MBWU_CTL.OFLOW_INTR_L.

OFLOW_FRZ, bit [24]

Freeze monitor instance on overflow.

Controls whether MSMON_MBWU.VALUE field of the monitor instance freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	MSMON_MBWU.VALUE field of the monitor instance wraps on overflow.
0b1	MSMON_MBWU.VALUE field of the monitor instance freezes on overflow. If the increment that caused the overflow was 1, the frozen value is the post-increment value of 0. If the increment that caused the overflow was larger than 1, the frozen value of the monitor might be 0 or a larger value less than the final increment.

If overflow is not possible for the instance of the MBWU monitor in the implementation, this field is RAZ/WI.

This control bit affects both MSMON_MBWU and MSMON_MBWU_L in implementations that include MSMON_MBWU_L.

OFLOW_CAPT, bit [23]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_OFLOW_CAPT == 1:

Capture Monitor on Overflow.

Controls whether the value of MSMON_MBWU is captured on an overflow or an overflow linkage event.

OFLOW_CAPT	Meaning
0b0	Monitor register MSMON_MBWU is not captured on an overflow or when affected by an overflow linkage event.
0b1	Monitor register MSMON_MBWU is captured on an overflow or when affected by an overflow linkage event. If OFLOW_FRZ is 1, the monitor does not continue to count after the overflow or overflow linkage event. If CAPT_RESET is 1, the monitor instance resets to 0.

If this bit is 1, this monitor instance treats an overflow of this monitor instance as a private capture event.

If this bit is 1, this monitor instance also treats overflow linkage events for which it qualifies as a private capture event.

Otherwise:

Reserved, RES0.

SUBTYPE, bits [22:20]

Subtype. Type of bandwidth counted by this monitor.

This field is not currently used for MBWU monitors, but reserved for future use.

This field is RAZ/WI.

SCLEN, bit [19]

MSMON_MBWU.VALUE Scaling Enable.

Enables scaling of MSMON_MBWU.VALUE by MPAMF_MBWUMON_IDR.SCALE.

SCLEN	Meaning
0b0	MSMON_MBWU.VALUE has bytes counted by the monitor instance.
0b1	MSMON_MBWU.VALUE has bytes counted by the monitor instance, shifted right by MPAMF_MBWUMON_IDR.SCALE.

CEVNT_OFLW, bit [18]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_OFLOW_LNKG == 1:

Capture Event performs overflow behavior.

Selects whether a capture event matching the CAPT_EVNT field perform the overflow behavior or the capture behavior.

CEVNT_OFLW	Meaning
0b0	On a capture event matching the CAPT_EVNT field the capture behaviors are performed.
0b1	On a capture event matching the CAPT_EVNT field the overflow behaviors are performed.

Otherwise:

Reserved, RES0.

MATCH_PMG, bit [17]

Match PMG.

Controls whether the monitor instance only counts data transferred with PMG matching MSMON_CFG_MBWU_FLT.PMG.

MATCH_PMG	Meaning
0b0	The monitor instance counts data transferred with any PMG value.
0b1	The monitor instance only counts data transferred with the PMG value matching MSMON_CFG_MBWU_FLT.PMG.

MATCH_PARTID, bit [16]

Match PARTID.

Controls whether the monitor instance counts only data transferred with PARTID matching MSMON_CFG_MBWU_FLT.PARTID.

MATCH_PARTID	Meaning
0b0	The monitor instance counts data transferred with any PARTID value.
0b1	The monitor instance only counts data transferred with the PARTID value matching MSMON_CFG_MBWU_FLT.PARTID.

OFLOW_STATUS_L, bit [15]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Overflow Status of MSMON_MBWU_L.VALUE of the monitor instance.

Indicates whether MSMON_MBWU_L.VALUE has overflowed.

OFLOW_STATUS_L	Meaning
0b0	MSMON_MBWU_L.VALUE has not overflowed.
0b1	MSMON_MBWU_L.VALUE has overflowed at least once since this bit was last written to zero.

If MPAMF_MBWUMON_IDR.HAS_LONG == 0, this bit is RES0.

Overflow status of MSMON_MBWU.VALUE is reported in MSMON_CFG_MBWU_CTL.OFLOW_STATUS.

If MPAMF_MBWUMON_IDR.HAS_OFLOW_CAPT is 1 or MPAMF_MBWUMON_IDR.HAS_OFLOW_LNKG is 1, then a store to MSMON_MBWU_L when this field is 1 resets this field to 0.

Otherwise:

Reserved, RES0.

OFLOW_INTR_L, bit [14]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_LONG == 1:

Overflow Interrupt for MSMON_MBWU_L.

Controls whether an MPAM overflow interrupt is generated when MSMON_MBWU_L.VALUE overflows.

OFLOW_INTR_L	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_MBWU_L.VALUE.
0b1	An implementation-specific interrupt is signaled on overflow of MSMON_MBWU_L.VALUE.

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

If the overflow interrupt is not supported by the MSC implementation, this field is RAZ/WI.

Otherwise:

Reserved, RES0.

OFLOW_CAPT_L, bit [13]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_MBWUMON_IDR.HAS_LONG == 1 and MPAMF_MBWUMON_IDR.HAS_OFLOW_CAPT == 1:

Capture Long Monitor on Overflow.

Controls whether MSMON_MBWU_L is captured on an overflow or an overflow linkage event.

OFLOW_CAPT_L	Meaning
0b0	Monitor register MSMON_MBWU_L is not captured on an overflow or when affected by an overflow linkage event.
0b1	Monitor register MSMON_MBWU_L is captured on an overflow or when affected by an overflow linkage event. If OFLOW_FRZ is 1, the monitor does not continue to count after the overflow or overflow linkage event. If CAPT_RESET is 1, the monitor instance resets to 0.

If this bit is 1, this monitor instance treats an overflow of this monitor instance as a private capture event.

If this bit is 1, this monitor instance also treats overflow linkage events for which it qualifies as a private capture event.

Otherwise:

Reserved, RES0.

Bits [12:11]

Reserved, RES0.

OFLOW_CAPT_L, bits [10:8]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_OFLOW_LNKG == 1:

Overflow linkage event.

Controls signaling of a capture event on overflow of this monitor instance.

OFLOW_CAPT_L	Meaning
`0b000`	Overflow of the monitor instance only affects this monitor instance.
`0b001`	Overflow of this monitor instance signals Capture Event 1.
`0b010`	Overflow of this monitor instance signals Capture Event 2.
`0b011`	Overflow of this monitor instance signals Capture Event 3.
`0b100`	Overflow of this monitor instance signals Capture Event 4.
`0b101`	Overflow of this monitor instance signals Capture Event 5.
`0b110`	Overflow of this monitor instance signals Capture Event 6.
`0b111`	Reserved.

Otherwise:

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code. The MBWU monitor is TYPE = `0x42`.

TYPE is a read-only constant indicating the type of the monitor.

Reads as `0x42`.

Access to this field is **RO**.

Accessing MSMON_CFG_MBWU_CTL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CFG_MBWU_CTL_s must be accessible from the Secure MPAM feature page. MSMON_CFG_MBWU_CTL_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CFG_MBWU_CTL_s and MSMON_CFG_MBWU_CTL_ns must be separate registers. The Secure instance (MSMON_CFG_MBWU_CTL_s) accesses the memory bandwidth usage monitor controls used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_MBWU_CTL_ns) accesses the memory bandwidth usage monitor controls used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_MBWU_CTL access the monitor configuration settings for the bandwidth resource instance selected by MSMON_CFG_MON_SEL.RIS and the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_MBWU_CTL access the monitor configuration settings for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CFG_MBWU_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0828	MSMON_CFG_MBWU_CTL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0828	MSMON_CFG_MBWU_CTL_ns

Accesses on this interface are **RW**.

MSMON_CFG_MBWU_FLT, MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Filter Register

The MSMON_CFG_MBWU_FLT characteristics are:

Purpose

Controls PARTID and PMG to measure or count in the MBWU monitor selected by MSMON_CFG_MON_SEL.

MSMON_CFG_MBWU_FLT_s sets filter conditions for the Secure memory bandwidth usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CFG_MBWU_CTL_ns sets filter conditions for the Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Configuration

The power domain of MSMON_CFG_MBWU_FLT is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_CFG_MBWU_FLT are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MBWU_FLT is a 32-bit register.

Field descriptions

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

31 30	29 28 27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RWBW	RES0	PMG	PARTID

RW filtering.

RWBW, bits [31:30]

When MPAMF_MBWUMON_IDR.HAS_RWBW == 1:

Read/write bandwidth filter. Configures the selected monitor instance to count all bandwidth, only read bandwidth or only write bandwidth.

RWBW	Meaning
0b00	Monitor instance counts read bandwidth and write bandwidth.
0b01	Monitor instance counts write bandwidth only.
0b10	Monitor instance counts read bandwidth only.
0b11	Reserved.

Otherwise:

Reserved, RES0.

Bits [29:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If MSMON_CFG_MBWU_CTL.MATCH_PMG == 0, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If MSMON_CFG_MBWU_CTL.MATCH_PMG == 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts memory bandwidth labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If MSMON_CFG_MBWU_CTL.MATCH_PARTID == 0, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If MSMON_CFG_MBWU_CTL.MATCH_PARTID == 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts memory bandwidth labeled with PARTID equal to this field.

Otherwise:

31:24	23:16	15:0
RES0	PMG	PARTID

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If MSMON_CFG_MBWU_CTL.MATCH_PMG == 0, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If MSMON_CFG_MBWU_CTL.MATCH_PMG == 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts memory bandwidth labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If MSMON_CFG_MBWU_CTL.MATCH_PARTID == 0, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If MSMON_CFG_MBWU_CTL.MATCH_PARTID == 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts memory bandwidth labeled with PARTID equal to this field.

Accessing MSMON_CFG_MBWU_FLT

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CFG_MBWU_FLT_s must be accessible from the Secure MPAM feature page. MSMON_CFG_MBWU_FLT_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CFG_MBWU_FLT_s and MSMON_CFG_MBWU_FLT_ns must be separate registers. The Secure instance (MSMON_CFG_MBWU_FLT_s) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_MBWU_FLT_ns) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Non-secure PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_MBWU_FLT access the monitor configuration settings for the bandwidth resource instance selected by MSMON_CFG_MON_SEL.RIS and the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_MBWU_FLT access the monitor configuration settings for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CFG_MBWU_FLT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0820	MSMON_CFG_MBWU_FLT_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0820	MSMON_CFG_MBWU_FLT_ns

Accesses on this interface are **RW**.

MSMON_CFG_MON_SEL, MPAM Monitor Instance Selection Register

The MSMON_CFG_MON_SEL characteristics are:

Purpose

Selects a monitor instance to access through the MSMON configuration and counter registers.

MSMON_CFG_MON_SEL_s selects a Secure monitor instance to access via the Secure MPAM feature page. MSMON_CFG_MON_SEL_ns selects a Non-secure monitor instance to access via the Non-secure MPAM feature page.

Note

Different performance monitoring features within an MSC could have different numbers of monitor instances. See the NUM_MON field in the corresponding ID register. This means that a monitor out-of-bounds error might be signaled when an MSMON_CFG register is accessed because the value in MSMON_CFG_MON_SEL.MON_SEL is too large for the particular monitoring feature.

To configure a monitor, set MON_SEL in this register to the index of the monitor instance to configure, then write to the MSMON_CFG_x register to set the configuration of the monitor. At a later time, read the monitor register (for example, MSMON_MBWU) to get the value of the monitor.

Configuration

The power domain of MSMON_CFG_MON_SEL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and (MPAMF_IDR.HAS_MSMON == 1, or (MPAMF_IDR.HAS_IMPL_IDR == 1 and MPAMF_IDR.EXT == 0) or (MPAMF_IDR.HAS_IMPL_IDR == 1, MPAMF_IDR.EXT == 1 and MPAMF_IDR.NO_IMPL_MSMON == 0)). Otherwise, direct accesses to MSMON_CFG_MON_SEL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MON_SEL is a 32-bit register.

Field descriptions

31 30 29 28	27 26 25 24	23 22 21 20 19 18 17 16	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
RES0	RIS	RES0	MON_SEL

Bits [31:28]

Reserved, RES0.

RIS, bits [27:24]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MSMON_CFG registers.

Otherwise:

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

MON_SEL, bits [15:0]

Selects the monitor instance to configure or read.

Reads and writes to other MSMON registers are indexed by MON_SEL and by the NS bit used to access MSMON_CFG_MON_SEL to access the configuration for a single monitor.

Accessing MSMON_CFG_MON_SEL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CFG_MON_SEL_s must be accessible from the Secure MPAM feature page. MSMON_CFG_MON_SEL_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CFG_MON_SEL_s and MSMON_CFG_MON_SEL_ns must be separate registers. The Secure instance (MSMON_CFG_MON_SEL_s) accesses the monitor instance selector used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_MON_SEL_ns) accesses the monitor instance selector used for Non-secure PARTIDs.

MSMON_CFG_MON_SEL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0800	MSMON_CFG_MON_SEL_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0800	MSMON_CFG_MON_SEL_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MSMON_CSU, MPAM Cache Storage Usage Monitor Register

The MSMON_CSU characteristics are:

Purpose

Accesses the CSU monitor instance selected by MSMON_CFG_MON_SEL.

MSMON_CSU_s is a Secure cache storage usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CSU_ns is a Non-secure cache storage usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Configuration

The power domain of MSMON_CSU is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CSU are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU is a 32-bit register.

Field descriptions

31	30–0
NRDY	VALUE

NRDY, bit [31]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_CSU.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_CSU.VALUE field might be inaccurate or otherwise not represent the actual cache storage usage.

VALUE, bits [30:0]

Cache storage usage measurement value if MSMON_CSU.NRDY is 0. Invalid if MSMON_CSU.NRDY is 1.

VALUE is the cache storage usage measured in bytes meeting the criteria set in MSMON_CFG_CSU_FLT and MSMON_CFG_CSU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing MSMON_CSU

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CSU_s must be accessible from the Secure MPAM feature page. MSMON_CSU_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CSU_s and MSMON_CSU_ns must be separate registers. The Secure instance (MSMON_CSU_s) accesses the cache storage usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CSU_ns) accesses the cache storage usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to MSMON_CSU access the cache storage usage monitor monitor instance for the cache resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, reads and writes to MSMON_CSU access the cache storage usage monitor monitor instance for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CSU can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0840	MSMON_CSU_s

This interface is accessible as follows:

- When MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are **RW**.
- When MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0840	MSMON_CSU_ns

This interface is accessible as follows:

- When MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are **RW**.
- When MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MSMON_CSU_CAPTURE, MPAM Cache Storage Usage Monitor Capture Register

The MSMON_CSU_CAPTURE characteristics are:

Purpose

MSMON_CSU_CAPTURE is a 32-bit read-write register that accesses the captured MSMON_CSU monitor instance selected by MSMON_CFG_MON_SEL.

MSMON_CSU_CAPTURE_s is the Secure cache storage usage monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_CSU_CAPTURE_ns is the Non-secure cache storage usage monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance capture register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Configuration

The power domain of MSMON_CSU_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_CSU == 1 and MPAMF_CSUMON_IDR.HAS_CAPTURE == 1. Otherwise, direct accesses to MSMON_CSU_CAPTURE are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU_CAPTURE is a 32-bit register.

Field descriptions

31	30 … 0
NRDY	VALUE

NRDY, bit [31]

Not Ready. Indicates whether the captured monitor value has possibly inaccurate data.

NRDY	Meaning
`0b0`	The captured monitor instance was ready and the MSMON_CSU_CAPTURE.VALUE field is accurate.
`0b1`	The captured monitor instance was not ready and the contents of the MSMON_CSU_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual cache storage usage.

VALUE, bits [30:0]

Captured cache storage usage measurement if MSMON_CSU_CAPTURE.NRDY is 0. Invalid if MSMON_CSU_CAPTURE.NRDY is 1.

VALUE is the captured cache storage usage measurement in bytes meeting the criteria set in MSMON_CFG_CSU_FLT and MSMON_CFG_CSU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing MSMON_CSU_CAPTURE

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CSU_CAPTURE_s must be accessible from the Secure MPAM feature page. MSMON_CSU_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CSU_CAPTURE_s and MSMON_CSU_CAPTURE_ns must be separate registers. The Secure instance (MSMON_CSU_CAPTURE_s) accesses the captured cache storage usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CSU_CAPTURE_ns) accesses the captured cache storage usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to MSMON_CSU_CAPTURE access the monitor instance for the cache resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, reads and writes to MSMON_CSU_CAPTURE access the monitor instance for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CSU_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0848	MSMON_CSU_CAPTURE_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0848	MSMON_CSU_CAPTURE_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MSMON_CSU_OFSR, MPAM CSU Monitor Overflow Status Register

The MSMON_CSU_OFSR characteristics are:

Purpose

MSMON_CSU_OFSR is a 32-bit read-only register that shows bitmap of CSU monitor instance overflow status for a contiguous group of 32 monitor instances.

MSMON_CSU_OFSR_s gives a bitmap of pending CSU overflow status for 32 Secure CSU monitor instances. MSMON_CSU_OFSR_ns gives a bitmap of pending CSU overflow status for 32 Non-secure CSU monitor instances.

Configuration

The power domain of MSMON_CSU_OFSR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_CSUMON_IDR.HAS_OFSR == 1. Otherwise, direct accesses to MSMON_CSU_OFSR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU_OFSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
OFPND31	OFPND30	OFPND29	OFPND28	OFPND27	OFPND26	OFPND25	OFPND24	OFPND23	OFPND22	OFPND21	OFPND20

OFPND<i>, bit [i], for i = 31 to 0

Overflow status bitmap for CSU monitor instances. The RIS and the contiguous range of CSU monitor instances are set in MSMON_CFG_MON_SEL. i of 0 corresponds to the CSU monitor instance MSMON_CFG_MON_SEL.MON_SEL & `0xFFE0`.

OFPND<i>	Meaning
`0b0`	CSU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & `0xFFE0` + i) does not have a pending overflow.
`0b1`	CSU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & `0xFFE0` + i) has a pending overflow.

After reading MSMON_OFLOW_SR to determine that a CSU monitor instance has a pending overflow and which RIS values have pending overflows, an interrupt service routine could poll groups of 32 monitor instances in a RIS for pending monitors by reading this bitmap and incrementing MSMON_CFG_MON_SEL.MON_SEL by 32.

Accessing MSMON_CSU_OFSR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CSU_OFSR_s must be accessible from the Secure MPAM feature page. MSMON_CSU_OFSR_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CSU_OFSR_s and MSMON_CSU_OFSR_ns must be separate registers. The Secure instance (MSMON_CSU_OFSR_s) accesses the CSU monitor overflow status bitmap used for Secure PARTIDs, and the Non-secure instance (MSMON_CSU_OFSR_ns) accesses the CSU monitor overflow status bitmap used for Non-secure PARTIDs.

MSMON_CSU_OFSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x0858`	MSMON_CSU_OFSR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x0858`	MSMON_CSU_OFSR_ns

Accesses on this interface are **RO**.

MSMON_MBWU, MPAM Memory Bandwidth Usage Monitor Register

The MSMON_MBWU characteristics are:

Purpose

Accesses the monitor instance selected by MSMON_CFG_MON_SEL.

MSMON_MBWU_s is the Secure memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_s. MSMON_MBWU_ns is the Non-secure memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_ns.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Configuration

The power domain of MSMON_MBWU is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_MBWU are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU is a 32-bit register.

Field descriptions

31	30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
NRDY	VALUE

NRDY, bit [31]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_MBWU.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_MBWU.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [30:0]

Memory bandwidth usage counter value if MSMON_MBWU.NRDY is 0. Invalid if MSMON_MBWU.NRDY is 1.

VALUE is the scaled count of bytes transferred since the monitor was last reset that met the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

If MSMON_CFG_MBWU_CTL.SCLEN enables scaling, the count in VALUE is the number of bytes shifted right by MPAMF_MBWUMON_IDR.SCALE bit positions and rounded.

Accessing MSMON_MBWU

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_s must be accessible from the Secure MPAM feature page. MSMON_MBWU_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_s and MSMON_MBWU_ns must be separate registers. The Secure instance (MSMON_MBWU_s) accesses the memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_ns) accesses the memory bandwidth usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU access the memory bandwidth usage monitor instance for the resource instance selected by MSMON_CFG_MON_SEL.RIS and the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU access the memory bandwidth usage monitor instance for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_MBWU can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x0860`	MSMON_MBWU_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x0860`	MSMON_MBWU_ns

Accesses on this interface are **RW**.

MSMON_MBWU_CAPTURE, MPAM Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU_CAPTURE characteristics are:

Purpose

Accesses the captured MSMON_MBWU monitor instance selected by MSMON_CFG_MON_SEL.

MSMON_MBWU_CAPTURE_s is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_MBWU_CAPTURE_ns is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance capture register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Configuration

The power domain of MSMON_MBWU_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1 and MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1. Otherwise, direct accesses to MSMON_MBWU_CAPTURE are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_CAPTURE is a 32-bit register.

Field descriptions

31	30–0
NRDY	VALUE

NRDY, bit [31]

Not Ready. The captured NRDY bit from the corresponding instance of MSMON_MBWU. This bit indicates whether the captured monitor value has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_MBWU_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_MBWU_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [30:0]

Captured memory bandwidth usage counter value if MSMON_MBWU_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_CAPTURE.NRDY is 1.

VALUE is the captured VALUE field from the corresponding instance of MSMON_MBWU, the count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

VALUE captures the MSMON_MBWU.VALUE and preserves any scaling that had been performed on the VALUE field in that register.

Accessing MSMON_MBWU_CAPTURE

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_CAPTURE_s must be accessible from the Secure MPAM feature page. MSMON_MBWU_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_CAPTURE_s and MSMON_MBWU_CAPTURE_ns must be separate registers. The Secure instance (MSMON_MBWU_CAPTURE_s) accesses the captured memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_CAPTURE_ns) accesses the captured memory bandwidth usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU_CAPTURE access the monitor instance for the bandwidth resource instance selected by MSMON_CFG_MON_SEL.RIS and the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU_CAPTURE access the monitor instance for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_MBWU_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0868	MSMON_MBWU_CAPTURE_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0868	MSMON_MBWU_CAPTURE_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MSMON_MBWU_L, MPAM Long Memory Bandwidth Usage Monitor Register

The MSMON_MBWU_L characteristics are:

Purpose

Accesses the monitor instance selected by MSMON_CFG_MON_SEL.

MSMON_MBWU_L_s is the Secure long memory bandwidth usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_MBWU_L_ns is the Non-secure long memory bandwidth usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance long monitor register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Configuration

The power domain of MSMON_MBWU_L is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1 and MPAMF_MBWUMON_IDR.HAS_LONG == 1. Otherwise, direct accesses to MSMON_MBWU_L are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_L is a 64-bit register.

Field descriptions

When MPAMF_MBWUMON_IDR.LWD == 0:

Bits	Field
63	NRDY
62:44	RES0
43:32	VALUE
31:0	VALUE

NRDY, bit [63]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
`0b0`	The monitor instance is ready and the MSMON_MBWU_L.VALUE field is accurate.
`0b1`	The monitor instance is not ready and the contents of the MSMON_MBWU_L.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

Bits [62:44]

Reserved, RES0.

VALUE, bits [43:0]

Long (44-bit) memory bandwidth usage counter value if MSMON_MBWU_L.NRDY is 0. Invalid if MSMON_MBWU_L.NRDY is 1.

VALUE is the long count of bytes transferred since the monitor was last reset that met the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

When MPAMF_MBWUMON_IDR.LWD == 1:

63	62 … 32
NRDY	VALUE

31 … 0
VALUE

NRDY, bit [63]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_MBWU_L.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_MBWU_L.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [62:0]

Long (63-bit) memory bandwidth usage counter value if MSMON_MBWU_L.NRDY is 0. Invalid if MSMON_MBWU_L.NRDY is 1.

VALUE is the long count of bytes transferred since the monitor instance was last reset that met the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing MSMON_MBWU_L

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_L_s must be accessible from the Secure MPAM feature page. MSMON_MBWU_L_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_L_s and MSMON_MBWU_L_ns must be separate registers. The Secure instance (MSMON_MBWU_L_s) accesses the long memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_L_ns) accesses the long memory bandwidth usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU_L access the long memory bandwidth usage monitor instance for the bandwidth resource instance selected by MSMON_CFG_MON_SEL.RIS and the monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU_L access the long memory bandwidth usage monitor instance for the monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_MBWU_L can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0880	MSMON_MBWU_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x0880`	MSMON_MBWU_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MSMON_MBWU_L_CAPTURE, MPAM Long Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU_L_CAPTURE characteristics are:

Purpose

Accesses the captured MSMON_MBWU_L monitor instance selected by MSMON_CFG_MON_SEL.

MSMON_MBWU_L_CAPTURE_s is the Secure long memory bandwidth usage monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL. MSMON_MBWU_L_CAPTURE_ns is the Non-secure long memory bandwidth usage monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.

If MPAMF_IDR.HAS_RIS is 1, the monitor instance long capture register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Configuration

The power domain of MSMON_MBWU_L_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1, MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1 and MPAMF_MBWUMON_IDR.HAS_LONG == 1. Otherwise, direct accesses to MSMON_MBWU_L_CAPTURE are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_L_CAPTURE is a 64-bit register.

Field descriptions

When MPAMF_MBWUMON_IDR.LWD == 0:

63	62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44	43 42 41 40 39 38 37 36 35 34 33 32
NRDY	RES0	VALUE

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
VALUE

NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_MBWU_L_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

Bits [62:44]

Reserved, RES0.

VALUE, bits [43:0]

Captured long memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY is 1.

VALUE is the captured 44-bit count of bytes transferred since the monitor instance was last reset that met the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

When MPAMF_MBWUMON_IDR.LWD == 1:

63	62–32
NRDY	VALUE

31–0
VALUE

NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
`0b0`	The captured monitor instance was ready and the MSMON_MBWU_L_CAPTURE.VALUE field is accurate.
`0b1`	The captured monitor instance was not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [62:0]

The captured long memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY is 1.

VALUE is the captured 63-bit count of bytes transferred since the monitor instance was last reset that met the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing MSMON_MBWU_L_CAPTURE

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_L_CAPTURE_s must be accessible from the Secure MPAM feature page. MSMON_MBWU_L_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_L_CAPTURE_s and MSMON_MBWU_L_CAPTURE_ns must be separate registers. The Secure instance (MSMON_MBWU_L_CAPTURE_s) accesses the captured long memory bandwidth usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_L_CAPTURE_ns) accesses the captured long memory bandwidth usage monitor used for Non-secure PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU_L_CAPTURE access the monitor instance for the bandwidth resource instance selected by MSMON_CFG_MON_SEL.RIS and the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU_L_CAPTURE access the monitor instance for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_MBWU_L_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x0890`	MSMON_MBWU_CAPTURE_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x0890`	MSMON_MBWU_CAPTURE_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MSMON_MBWU_OFSR, MPAM MBWU Monitor Overflow Status Register

The MSMON_MBWU_OFSR characteristics are:

Purpose

MSMON_MBWU_OFSR is a 32-bit read-only register that shows bitmap of MBWU monitor instance overflow status for a contiguous group of 32 monitor instances.

MSMON_MBWU_OFSR_s gives a bitmap of pending MBWU overflow status for 32 Secure MBWU monitor instances. MSMON_MBWU_OFSR_ns gives a bitmap of pending MBWU overflow status for 32 Non-secure MBWU monitor instances.

Configuration

The power domain of MSMON_MBWU_OFSR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_MBWUMON_IDR.HAS_OFSR == 1. Otherwise, direct accesses to MSMON_MBWU_OFSR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_OFSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20
OFPND31	OFPND30	OFPND29	OFPND28	OFPND27	OFPND26	OFPND25	OFPND24	OFPND23	OFPND22	OFPND21	OFPND20

OFPND<i>, bit [i], for i = 31 to 0

Overflow status bitmap for MBWU monitor instances. The RIS and the contiguous range of MBWU monitor instances are set in MSMON_CFG_MON_SEL. i of 0 corresponds to the MBWU monitor instance MSMON_CFG_MON_SEL.MON_SEL & `0xFFE0`.

OFPND<i>	Meaning
`0b0`	MBWU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & `0xFFE0` + i) does not have a pending overflow.
`0b1`	MBWU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & `0xFFE0` + i) has a pending overflow.

After reading MSMON_OFLOW_SR to determine that an MBWU monitor instance has a pending overflow and which RIS values have pending overflows, an interrupt service routine could poll groups of 32 monitor instances in a RIS for pending monitors by reading this bitmap and incrementing MSMON_CFG_MON_SEL.MON_SEL by 32.

A pending overflow may be in either the MSMON_CFG_MBWU_CTL.OFLOW_STATUS or MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L field.

Accessing MSMON_MBWU_OFSR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_MBWU_OFSR_s must be accessible from the Secure MPAM feature page. MSMON_MBWU_OFSR_ns must be accessible from the Non-secure MPAM feature page.

MSMON_MBWU_OFSR_s and MSMON_MBWU_OFSR_ns must be separate registers. The Secure instance (MSMON_MBWU_OFSR_s) accesses the MBWU monitor overflow status bitmap used for Secure PARTIDs, and the Non-secure instance (MSMON_MBWU_OFSR_ns) accesses the MBWU monitor overflow status bitmap used for Non-secure PARTIDs.

MSMON_MBWU_OFSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x0898`	MSMON_MBWU_OFSR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x0898`	MSMON_MBWU_OFSR_ns

Accesses on this interface are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MSMON_OFLOW_MSI_ADDR_H, MPAM Monitor Overflow MSI Write High-part Address Register

The MSMON_OFLOW_MSI_ADDR_H characteristics are:

Purpose

MSMON_OFLOW_MSI_ADDR_H is a 32-bit read/write register for the high part of the MPAM monitor overflow MSI address.

MSMON_OFLOW_MSI_ADDR_H_s is the high part of the MSI write address for monitor overflow interrupts from Secure monitor instances. MSMON_OFLOW_MSI_ADDR_H_ns is the high part of the MSI write address for monitor overflow interrupts from Non-secure monitor instances.

Configuration

The power domain of MSMON_OFLOW_MSI_ADDR_H is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_ADDR_H are RES0.

MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA, and MSMON_OFLOW_MSI_MPAM must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_ADDR_H is a 32-bit register.

Field descriptions

31–20	19–0
RES0	MSI_ADDR_H

Bits [31:20]

Reserved, RES0.

MSI_ADDR_H, bits [19:0]

MSI write address bits[51:32].

Accessing MSMON_OFLOW_MSI_ADDR_H

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_OFLW_MSI_ADDR_H_s must be accessible from the Secure MPAM feature page. MSMON_OFLW_MSI_ADDR_H_ns must be accessible from the Non-secure MPAM feature page.

MSMON_OFLW_MSI_ADDR_H_s and MSMON_OFLW_MSI_ADDR_H_ns must be separate registers. The Secure instance (MSMON_OFLW_MSI_ADDR_H_s) accesses the high part of the monitor overflow MSI write address of Secure monitors, and the Non-secure instance (MSMON_OFLW_MSI_ADDR_H_ns) accesses the high part of the monitor overflow MSI write address of Non-secure monitors.

MSMON_OFLOW_MSI_ADDR_H can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08E4	MSMON_OFLW_MSI_ADDR_H_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08E4	MSMON_OFLW_MSI_ADDR_H_ns

Accesses on this interface are **RW**.

MSMON_OFLOW_MSI_ADDR_L, MPAM Monitor Overflow MSI Low-part Address Register

The MSMON_OFLOW_MSI_ADDR_L characteristics are:

Purpose

MSMON_OFLOW_MSI_ADDR_L is a 32-bit read/write register for the low part of the MPAM monitor MSI address.

MSMON_OFLOW_MSI_ADDR_L_s is the low part of the MSI write address for overflow interrupts from Secure monitor intances. MSMON_OFLOW_MSI_ADDR_L_ns is the low part of the MSI write address for overflow interrupts from Non-secure monitor instances.

Configuration

The power domain of MSMON_OFLOW_MSI_ADDR_L is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_ADDR_L are RES0.

MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA, and MSMON_OFLOW_MSI_MPAM must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_ADDR_L is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MSI_ADDR_L																														Bits[1:0]	

MSI_ADDR_L, bits [31:2]

MSI write address bits[31:2].

Bits [1:0]

Reads as `0b00`.

Access to this field is **RO**.

Accessing MSMON_OFLOW_MSI_ADDR_L

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_OFLOW_MSI_ADDR_L_s must be accessible from the Secure MPAM feature page. MSMON_OFLOW_MSI_ADDR_L_ns must be accessible from the Non-secure MPAM feature page.

MSMON_OFLOW_MSI_ADDR_L_s and MSMON_OFLOW_MSI_ADDR_L_ns must be separate registers. The Secure instance (MSMON_OFLOW_MSI_ADDR_L_s) accesses the low part of the overflow MSI write address used for Secure PARTIDs, and the Non-secure instance (MSMON_OFLOW_MSI_ADDR_L_ns) accesses the low part of the overflow MSI write address used for Non-secure PARTIDs.

MSMON_OFLOW_MSI_ADDR_L can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08E0	MSMON_OFLOW_MSI_ADDR_L_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08E0	MSMON_OFLOW_MSI_ADDR_L_ns

Accesses on this interface are **RW**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MSMON_OFLOW_MSI_ATTR, MPAM Monitor Overflow MSI Write Attributes Register

The MSMON_OFLOW_MSI_ATTR characteristics are:

Purpose

MSMON_OFLOW_MSI_ATTR is a 32-bit read/write register that controls MPAM monitor overflow MSI write attributes for MPAM monitor overflows in this MSC.

MSMON_OFLOW_MSI_ATTR_s controls Secure MPAM monitor overflow MSI writes. MSMON_OFLOW_MSI_ATTR_ns controls Non-secure MPAM monitor overflow MSI writes.

Configuration

The power domain of MSMON_OFLOW_MSI_ATTR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_ATTR are RES0.

MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA, and MSMON_OFLOW_MSI_MPAM must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_ATTR is a 32-bit register.

Field descriptions

31 30	29 28	27 26 25 24	23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1	0
RES0	MSI_SH	MSI_MEMATTR	RES0	MSIEN

Bits [31:30]

Reserved, RES0.

MSI_SH, bits [29:28]

Sharability attribute of MSI writes.

MSI_SH	Meaning
0b00	Non-shareable.
0b01	Reserved, CONSTRAINED UNPREDICTABLE.
0b10	Outer Shareable.
0b11	Inner Shareable.

When MSMON_OFLOW_MSI_ATTR.MSI_MEMATTR specifies a Device memory type, the contents of this field are IGNORED and Shareability is effectively Outer Shareable.

MSI_MEMATTR, bits [27:24]

Memory attributes of MSI writes.

Note: This encoding matches the VMSAv8-64 stage 2 MemAttr[3:0] field as described in the Arm ARM, except that the following encodings are Reserved (not UNPREDICTABLE) and behave as DEvice-nGnRnE: `0b0100`, `0b1000`, and `0b1100`.

MSI_MEMATTR	Meaning
0b0000	Device-nGnRnE.
0b0001	Device-nGnRE.
0b0010	Device-nGRE.
0b0011	Device-GRE.
0b0100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b0101	Normal Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal Inner Write-Through Cacheable, Outer Non-cacheable.
0b0111	Normal Inner Write-Back Cacheable, Outer Non-cacheable.
0b1000	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1001	Normal Inner Non-Cachable, Outer Write-Through Cacheable.
0b1010	Normal Inner Write-Through Cacheable, Outer Write-Through Cachable.
0b1011	Normal Inner Write-Back Cacheable, Outer Write-Through Cachable.
0b1100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1101	Normal Inner Non-cacheable, Outer Write-Back Cacheable.
0b1110	Normal Inner Write-Through Cacheable, Outer Write-Back Cacheable.
0b1111	Normal Inner Write-Back Cacheable, Outer Write-Back Cacheable.

When this field specifies a Device memory type, the contents of MSMON_OFLOW_MSI_ATTR.MSI_SH are IGNORED and Shareability is effectively Outer Shareable.

Device types may be implemented as any Device type with more n characters. For example, if this field is set to `0b0010`, an implementation may treat the MSI write as the specified type, Device-nGRE, or as Device-nGnRE or as Device-nGnRnE.

Reserved encodings `0b0100`, `0b1000`, and `0b1100` must be implemented to behave the same as the `0b0000` encoding.

Bits [23:1]

Reserved, RES0.

MSIEN, bit [0]

Monitor overflow MSI write enable.

MSIEN	Meaning
0b0	MPAM monitor overflow MSI writes are not generated to signal enabled MPAM monitor overflow interrupts. When monitor overflow MSI writes are disabled, hardwired monitor overflow interrupt could be generated if hardwired monitor overflow interrupt is implemented.
0b1	MPAM monitor overflow MSI writes are generated to signal enabled MPAM monitor overflow interrupts. When monitor overflow MSI writes are enabled, hardwired monitor overflow interrupts are not generated.

This enable affects whether a hardwired overlow interrupt is generated.

The reset behavior of this field is:

- On a MSC reset, this field resets to `0`.

Accessing MSMON_OFLOW_MSI_ATTR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_OFLOW_MSI_ATTR_s must be accessible from the Secure MPAM feature page. MSMON_OFLOW_MSI_ATTR_ns must be accessible from the Non-secure MPAM feature page.

MSMON_OFLOW_MSI_ATTR_s and MSMON_OFLOW_MSI_ATTR_ns must be separate registers. The Secure instance (MSMON_OFLOW_MSI_ATTR_s) accesses the monitor overflow MSI write attributes of Secure monitors, and the Non-secure instance (MSMON_OFLOW_MSI_ATTR_ns) accesses the monitor overflow MSI write attributes of Non-secure monitors.

MSMON_OFLOW_MSI_ATTR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x08EC`	MSMON_OFLOW_MSI_ATTR_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x08EC`	MSMON_OFLOW_MSI_ATTR_ns

Accesses on this interface are **RW**.

MSMON_OFLOW_MSI_DATA, MPAM Monitor Overflow MSI Write Data Register

The MSMON_OFLOW_MSI_DATA characteristics are:

Purpose

MSMON_OFLOW_MSI_DATA is a 32-bit read/write register for the MPAM monitor overflow MSI data.

MSMON_OFLOW_MSI_DATA_s is the data for the MSI write for monitor overflow from Secure monitor instances. MSMON_OFLOW_MSI_DATA_ns is the data for the MSI writes for monitor overflow interrupts from Non-secure monitor instances.

Configuration

The power domain of MSMON_OFLOW_MSI_DATA is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_DATA are RES0.

MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA, and MSMON_OFLOW_MSI_MPAM must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_DATA is a 32-bit register.

Field descriptions

31–0
MSI_DATA

MSI_DATA, bits [31:0]

MSI write data word.

Accessing MSMON_OFLOW_MSI_DATA

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_OFLOW_MSI_DATA_s must be accessible from the Secure MPAM feature page. MSMON_OFLOW_MSI_DATA_ns must be accessible from the Non-secure MPAM feature page.

MSMON_OFLOW_MSI_DATA_s and MSMON_OFLOW_MSI_DATA_ns must be separate registers. The Secure instance (MSMON_OFLOW_MSI_DATA_s) accesses the monitor overflow MSI write data of Secure monitors, and the Non-secure instance (MSMON_OFLOW_MSI_DATA_ns) accesses the monitor overflow MSI write data of Non-secure monitors.

MSMON_OFLOW_MSI_DATA can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08E8	MSMON_OFLOW_MSI_DATA_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08E8	MSMON_OFLOW_MSI_DATA_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MSMON_OFLOW_MSI_MPAM, MPAM Monitor Overflow MSI Write MPAM Information Register

The MSMON_OFLOW_MSI_MPAM characteristics are:

Purpose

MSMON_OFLOW_MSI_MPAM is a 32-bit read/write register that sets the MPAM information for a monitor overflow MSI write.

MSMON_OFLOW_MSI_MPAM_s controls MPAM information labeling of Secure monitor overflow MSI writes. MSMON_OFLOW_MSI_MPAM_ns controls MPAM information labeling of Non-secure monitor overflow MSI writes.

Configuration

The power domain of MSMON_OFLOW_MSI_MPAM is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_MPAM are RES0.

MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA, and MSMON_OFLOW_MSI_MPAM must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_MPAM is a 32-bit register.

Field descriptions

31:24	23:16	15:0
RES0	PMG	PARTID

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group property for an MSC monitor overflow MSI write.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition ID for an MSC monitor overflow MSI write.

The PARTID in this field is in the Secure PARTID space in the MSMON_OFLOW_MSI_MPAM_s instance and in the Non-secure PARTID space in the MSMON_OFLOW_MSI_MPAM_ns instance of this register.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

Accessing MSMON_OFLOW_MSI_MPAM

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_OFLOW_MSI_MPAM_s must be accessible from the Secure MPAM feature page. MSMON_OFLOW_MSI_MPAM_ns must be accessible from the Non-secure MPAM feature page.

MSMON_OFLOW_MSI_MPAM_s and MSMON_OFLOW_MSI_MPAM_ns must be separate registers. The Secure instance (MSMON_OFLOW_MSI_MPAM_s) accesses the monitor overflow MSI MPAM information of Secure monitors, and the Non-secure instance (MSMON_OFLOW_MSI_MPAM_ns) accesses the monitor overflow MSI MPAM information of Non-secure monitors.

MSMON_OFLOW_MSI_MPAM can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	`0x08DC`	MSMON_OFLOW_MSI_MPAM_s

Accesses on this interface are **RW**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	`0x08DC`	MSMON_OFLOW_MSI_MPAM_ns

Accesses on this interface are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

MSMON_OFLOW_SR, MPAM Monitor Overflow Status Register

The MSMON_OFLOW_SR characteristics are:

Purpose

MSMON_OFLOW_SR is a 32-bit read-only register that shows MPAM monitor overflow status for this MSC.

MSMON_OFLOW_SR_s gives the status of overflows of Secure MPAM monitors. MSMON_OFLOW_SR_ns gives the status of overflows of Non-secure MPAM monitors.

Configuration

The power domain of MSMON_OFLOW_SR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_MSMON_IDR.HAS_OFLOW_SR == 1. Otherwise, direct accesses to MSMON_OFLOW_SR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_SR is a 32-bit register.

Field descriptions

31	30	2928272625242322212019181716	15	14	13	12	
CSU_OFLOW_PND	MBWU_OFLOW_PND	RES0	RIS_PND15	RIS_PND14	RIS_PND13	RIS_PND12	RIS

CSU_OFLOW_PND, bit [31]

At least one cache storage usage monitor has OFLOW_STATUS of 1 in MSMON_CFG_CSU_CTL.

CSU_OFLOW_PND	Meaning
0b0	There are no cache storage usage monitor instances where MSMON_CFG_CSU_CTL.OFLOW_STATUS is 1.
0b1	MSMON_CFG_CSU_CTL for at least one of the cache storage usage monitor instances has OFLOW_STATUS set to 1.

This field clears when MSMON_CFG_CSU_CTL.OFLOW_STATUS has been reset to 0 for all CSU monitor instances in this MSC.

MBWU_OFLOW_PND, bit [30]

At least one memory bandwidth usage monitor instance has OFLOW_STATUS or OFLOW_STATUS_L of 1 in MSMON_CFG_MBWU_CTL.

MBWU_OFLOW_PND	Meaning
0b0	There are no memory bandwidth usage monitor instances where MSMON_CFG_MBWU_CTL.OFLOW_STATUS is 1.
0b1	MSMON_CFG_MBWU_CTL for at least one of the memory bandwidth usage monitor instances has either OFLOW_STATUS or OFLOW_STATUS_L set to 1.

This field clears when MSMON_CFG_MBWU_CTL.OFLOW_STATUS and MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L have been reset to 0 for all MBWU monitor instances in this MSC.

Bits [29:16]

Reserved, RES0.

RIS_PND<r>, bit [r], for r = 15 to 0

Overflow status by RIS.

RIS_PND<r>	Meaning
0b0	RIS r has no unread overflows of any type of monitor.
0b1	RIS r has at least one unread overflow in at least one of the monitor types.

Combined with the CSU_OFLOW_PND and MBWU_OFLOW_PND flags in this register, an interrupt service routine could poll only the monitor types indicated in monitors for the resource instances flagged in this field.

Bit r is set when any monitor instance of any type in resource instance r has OFLOW_STATUS or OFLOW_STATUS_L set to 1.

Accessing MSMON_OFLOW_SR

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_OFLOW_SR_s must be accessible from the Secure MPAM feature page. MSMON_OFLOW_SR_ns must be accessible from the Non-secure MPAM feature page.

MSMON_OFLOW_SR_s and MSMON_OFLOW_SR_ns must be separate registers. The Secure instance (MSMON_OFLOW_SR_s) accesses the monitor overflow status summary of Secure monitors, and the Non-secure instance (MSMON_OFLOW_SR_ns) accesses the monitor overflow status summary of Non-secure monitors.

MSMON_OFLOW_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08F0	MSMON_OFLOW_SR_s

Accesses on this interface are **RO**.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08F0	MSMON_OFLOW_SR_ns

Accesses on this interface are **RO**.

OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS Lock.

Configuration

External register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch64 System register OSLAR_EL1[31:0].

OSLAR_EL1 is in the Core power domain.

The OS Lock can also be locked or unlocked using DBGOSLAR.

If FEAT_Debugv8p2 is not implemented, it is IMPLEMENTATION DEFINED whether external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

If FEAT_Debugv8p2 is implemented, external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

Attributes

OSLAR_EL1 is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1	0
RES0	OSLK

Bits [31:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use EDPRSR.OSLK to check the current status of the lock.

Accessing OSLAR_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

OSLAR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	`0x300`	OSLAR_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **WO**.
- When IsCorePowered(), !DoubleLockStatus(), !AllowExternalDebugAccess() and FEAT_Debugv8p2 is not implemented accesses to this register are **IMPDEF**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. Arm recommends that this register is implemented.

Attributes

PMAUTHSTATUS is a 32-bit register.

Field descriptions

31:8	7:6	5:4	3:2	1:0
RES0	SNID	SID	NSNID	NSID

Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

Holds the same value as DBGAUTHSTATUS_EL1.SNID.

SID, bits [5:4]

Secure invasive debug. Possible values of this field are:

SID	Meaning
`0b00`	Not implemented.

All other values are reserved.

NSNID, bits [3:2]

Holds the same value as DBGAUTHSTATUS_EL1.NSNID.

NSID, bits [1:0]

Non-secure invasive debug. Possible values of this field are:

NSID	Meaning
`0b00`	Not implemented.

All other values are reserved.

Accessing PMAUTHSTATUS

PMAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xFB8`	PMAUTHSTATUS

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

Configuration

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCCFILTR_EL0[31:0].

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCCFILTR[31:0].

PMCCFILTR_EL0 is in the Core power domain.

On a Warm or Cold reset, RW fields in this register reset to:

- Architecturally UNKNOWN values if the reset is to an Exception level that is using AArch64.
- 0 if the reset is to an Exception level that is using AArch32.

The register is not affected by an External debug reset.

Attributes

PMCCFILTR_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
P	U	NSK	NSU	NSH	M	RES0	SH	RES0

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

P	Meaning
`0b0`	Count cycles in EL1.
`0b1`	Do not count cycles in EL1.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

U	Meaning
`0b0`	Count cycles in EL0.
`0b1`	Do not count cycles in EL0.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

NSH	Meaning
`0b0`	Do not count cycles in EL2.
`0b1`	Count cycles in EL2.

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

> **Note**
>
> This field is not visible in the AArch32 PMCCFILTR System register.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]
When FEAT_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is disabled, this field is RES0.

Note

This field is not visible in the AArch32 PMCCFILTR System register.

Otherwise:

Reserved, RES0.

Bits [23:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCFILTR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0x47C`	PMCCFILTR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. For more information, see 'Time as measured by the Performance Monitors cycle counter'.

PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

Configuration

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0].

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0].

PMCCNTR_EL0 is in the Core power domain.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions

63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
CCNT
CCNT
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCNTR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance	Range

PMU	`0x0F8`	PMCCNTR_EL0	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	`0x0FC`	PMCCNTR_EL0	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range `0x0000` to `0x001F`.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Note

This view of the register was previously called PMCEID0_EL0.

Configuration

External register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[31:0].

External register PMCEID0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID0[31:0].

PMCEID0 is in the Core power domain.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

ID<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID0

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xE20`	PMCEID0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range `0x020` to `0x03F`.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Note

This view of the register was previously called PMCEID1_EL0.

Configuration

External register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[31:0].

External register PMCEID1 bits [31:0] are architecturally mapped to AArch32 System register PMCEID1[31:0].

PMCEID1 is in the Core power domain.

Attributes

PMCEID1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event (`0x0020` + n).

For each bit:

ID<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID1

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xE24`	PMCEID1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range `0x4000` to `0x401F`.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Configuration

External register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[63:32].

External register PMCEID2 bits [31:0] are architecturally mapped to AArch32 System register PMCEID2[31:0].

PMCEID2 is in the Core power domain.

This register is present only when FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are RES0.

Attributes

PMCEID2 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	
IDhi31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16	IDhi15	ID

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to Common event (`0x4000` + n).

For each bit:

IDhi<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU

features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID2

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID2 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xE28`	PMCEID2

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range `0x4020` to `0x403F`.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Configuration

External register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[63:32].

External register PMCEID3 bits [31:0] are architecturally mapped to AArch32 System register PMCEID3[31:0].

PMCEID3 is in the Core power domain.

This register is present only when FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are RES0.

Attributes

PMCEID3 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	
IDhi31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16	IDhi15	ID

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to Common event (`0x4020` + n).

For each bit:

IDhi<n>	Meaning
`0b0`	The Common event is not implemented, or not counted.
`0b1`	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU

features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID3

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID3 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xE2C`	PMCEID3

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

Purpose

Contains PMU-specific configuration data.

Configuration

PMCFGR is in the Core power domain.

Attributes

PMCFGR is a 32-bit register.

Field descriptions

31 30 29 28	27 26 25 24 23 22	21	20	19	18	17	16	15	14	13 12 11 10 9 8	7 6 5 4 3 2 1 0
NCG	RES0	FZO	RES0	UEN	WT	NA	EX	CCD	CC	SIZE	N

NCG, bits [31:28]

This feature is not supported, so this field is RAZ.

Reads as `0b0000`.

Access to this field is **RO**.

Bits [27:22]

Reserved, RES0.

FZO, bit [21]

Freeze-on-overflow supported. Defined values are:

FZO	Meaning
`0b0`	Freeze-on-overflow mechanism is not supported. PMCR_EL0.FZO is RES0.
`0b1`	Freeze-on-overflow mechanism is supported. PMCR_EL0.FZO is RW.

FEAT_PMUv3p7 implements the functionality added by the value `0b1`.

From Armv8.7, if FEAT_PMUv3 is implemented, the only permitted value is `0b1`.

Bit [20]

Reserved, RES0.

UEN, bit [19]

User-mode Enable Register supported. PMUSERENR_EL0 is not visible in the external debug interface, so this bit is RAZ.

Reads as `0b0`.

Access to this field is **RO**.

WT, bit [18]

This feature is not supported, so this bit is RAZ.

Reads as `0b0`.

Access to this field is **RO**.

NA, bit [17]

This feature is not supported, so this bit is RAZ.

Reads as `0b0`.

Access to this field is **RO**.

EX, bit [16]

Export supported. Value is IMPLEMENTATION DEFINED.

EX	Meaning
`0b0`	PMCR_EL0.X is RES0.
`0b1`	PMCR_EL0.X is read/write.

Access to this field is **RO**.

CCD, bit [15]

Cycle counter has prescale.

This is RES1 if AArch32 is supported, and RAZ otherwise.

CCD	Meaning
`0b0`	PMCR_EL0.D is RES0.
`0b1`	PMCR_EL0.D is read/write.

CC, bit [14]

Dedicated cycle counter (counter 31) supported.

Reads as `0b1`.

Access to this field is **RO**.

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8, the largest counter is 64-bits, so the value of this field is `0b111111`.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8, the counters are a doubleword-aligned addresses.

Reads as `0b111111`.

Access to this field is **RO**.

N, bits [7:0]

Number of counters implemented in addition to the cycle counter, PMCCNTR_EL0. The maximum number of event counters is 31.

N	Meaning
0x00	Only PMCCNTR_EL0 implemented.
0x01	PMCCNTR_EL0 plus one event counter implemented.

and so on up to 0b00011111, which indicates PMCCNTR_EL0 and 31 event counters implemented.

Accessing PMCFGR

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCFGR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE00	PMCFGR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCID1SR, CONTEXTIDR_EL1 Sample Register

The PMCID1SR characteristics are:

Purpose

Contains the sampled value of CONTEXTIDR_EL1, captured on reading PMPCSR[31:0].

Configuration

PMCID1SR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMCID1SR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Attributes

PMCID1SR is a 32-bit register.

Field descriptions

31–0
CONTEXTIDR_EL1

CONTEXTIDR_EL1, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR.
- If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register and PMCID1SR samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent PMPCSR sample.

Because the value written to PMCID1SR is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether PMCID1SR is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCID1SR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

PMCID1SR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0x208`	PMCID1SR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance
PMU	`0x228`	PMCID1SR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCID2SR, CONTEXTIDR_EL2 Sample Register

The PMCID2SR characteristics are:

Purpose

Contains the sampled value of CONTEXTIDR_EL2, captured on reading PMPCSR[31:0].

Configuration

PMCID2SR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMCID2SR are RES0.

Note

If FEAT_PCSRv8p2 is not implemented, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Attributes

PMCID2SR is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
CONTEXTIDR_EL2

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample is generated:

- If the PE is not executing at EL3, EL2 is using AArch64, and EL2 is enabled in the current Security state, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- Otherwise, this field is set to an UNKNOWN value.

Because the value written to PMCID2SR is an indirect read of CONTEXTIDR_EL2, it is CONSTRAINED UNPREDICTABLE whether PMCID2SR is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR_EL2.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCID2SR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

PMCID2SR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0x22C	PMCID2SR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR0 is a 32-bit register.

Field descriptions

31–8	7–0
RES0	PRMBL_0

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as `0x0D`.

Access to this field is **RO**.

Accessing PMCIDR0

PMCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xFF0`	PMCIDR0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCIDR1, Performance Monitors Component Identification Register 1

The PMCIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR1 is a 32-bit register.

Field descriptions

31–8	7–4	3–0
RES0	CLASS	PRMBL_1

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
`0b1001`	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as `0x9`.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Reads as `0b0000`.

Access to this field is **RO**.

Accessing PMCIDR1

PMCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xFF4	PMCIDR1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCIDR2, Performance Monitors Component Identification Register 2

The PMCIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR2 is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8	7 6 5 4 3 2 1 0
RES0	PRMBL_2

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as `0x05`.

Access to this field is **RO**.

Accessing PMCIDR2

PMCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xFF8`	PMCIDR2

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCIDR3, Performance Monitors Component Identification Register 3

The PMCIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR3 is a 32-bit register.

Field descriptions

31 … 8	7 … 0
RES0	PRMBL_3

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as `0xB1`.

Access to this field is **RO**.

Accessing PMCIDR3

PMCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xFFC`	PMCIDR3

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

Purpose

Disables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

Configuration

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0].

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

PMCNTENCLR_EL0 is in the Core power domain.

Attributes

PMCNTENCLR_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

PMCCNTR_EL0 disable bit. Disables the cycle counter register. Possible values are:

C	Meaning
`0b0`	When read, means the cycle counter is disabled. When written, has no effect.
`0b1`	When read, means the cycle counter is enabled. When written, disables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
`0b0`	When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
`0b1`	When read, means that PMEVCNTR<n>_EL0 is enabled. When written, disables PMEVCNTR<n>_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENCLR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENCLR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xC20`	PMCNTENCLR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

Purpose

Enables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>. Reading this register shows which counters are enabled.

Configuration

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[31:0].

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

PMCNTENSET_EL0 is in the Core power domain.

Attributes

PMCNTENSET_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

PMCCNTR_EL0 enable bit. Enables the cycle counter register. Possible values are:

C	Meaning
`0b0`	When read, means the cycle counter is disabled. When written, has no effect.
`0b1`	When read, means the cycle counter is enabled. When written, enables the cycle counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter enable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
`0b0`	When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect.
`0b1`	When read, means that PMEVCNTR<n>_EL0 event counter is enabled. When written, enables PMEVCNTR<n>_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENSET_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENSET_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC00	PMCNTENSET_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch32 System register PMCR[7:0].

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch64 System register PMCR_EL0[7:0].

PMCR_EL0 is in the Core power domain.

This register is only partially mapped to the internal PMCR System register. An external agent must use other means to discover the information held in PMCR[31:11], such as accessing PMCFGR and the ID registers.

Attributes

PMCR_EL0 is a 32-bit register.

Field descriptions

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11	10	9	8	7	6	5	4	3	2	1	0
RAZ/WI	RES0	FZO	RES0	LP	LC	DP	X	D	C	P	E

Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

Bit [10]

Reserved, RES0.

FZO, bit [9]
When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
- If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

FZO	Meaning
`0b0`	Do not freeze on overflow.
`0b1`	Event counter PMEVCNTR<n>_EL0 does not count when PMOVSCLR_EL0[(PMN-1):0] is nonzero and n is in the range of affected event counters.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and PMCCNTR_EL0.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
- If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[63:0].

If PMN is not 0, this bit affects the operation of event counters in the range [0 .. (PMN-1)].

The field does not affect the operation of other event counters and PMCCNTR_EL0.

The operation of this field applies even when EL2 is disabled in the current Security state.

Otherwise:

Reserved, RES0.

LC, bit [6]

When AArch32 is supported:

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].

Arm deprecates use of PMCR_EL0.LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

DP	Meaning
`0b0`	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
`0b1`	Cycle counting by PMCCNTR_EL0 is disabled in prohibited regions: • If FEAT_PMUv3p1 is implemented, EL2 is implemented, and MDCR_EL2.HPMD is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL2. • If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL3. • If EL3 is implemented, MDCR_EL3.SPME is 0, and either FEAT_PMUv3p7 is not implemented or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR_EL0 is disabled at EL3 and in Secure state. If MDCR_EL2.HPMN is not 0, this is when event counting by event counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited.

For more information, see 'Prohibiting event counting'.

The reset behavior of this field is:

- On a Warm reset:
  - When the implementation only supports execution in AArch32 state, this field resets to `0`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
`0b0`	Do not export events.
`0b1`	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

When AArch32 is supported:

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR_EL0 counts every clock cycle.
0b1	When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR_EL0 to zero.

Note

Resetting PMCCNTR_EL0 does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is **WO/RAZ**.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

P	Meaning
0b0	No action.
0b1	Reset all event counters, not including PMCCNTR_EL0, to zero.

Note

Resetting the event counters does not change the event counter overflow bits. If FEAT_PMUv3p5 is implemented, the value of MDCR_EL2.HLP, or PMCR_EL0.LP is ignored and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

E, bit [0]

Enable.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is HDCR.HPMN.
- If EL2 is implemented and is using AArch64, PMN is MDCR_EL2.HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

E	Meaning
`0b0`	PMCCNTR_EL0 is disabled and event counters PMEVCNTR<n>_EL0, where n is in the range of affected event counters, are disabled.
`0b1`	PMCCNTR_EL0 and event counters PMEVCNTR<n>_EL0, where n is in the range of affected event counters, are enabled by PMCNTENSET_EL0.

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to `0`.

Accessing PMCR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xE04`	PMCR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF0 is a 32-bit register.

Field descriptions

31 … 0
MPIDR_EL1lo

MPIDR_EL1lo, bits [31:0]

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing PMDEVAFF0

PMDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xFA8`	PMDEVAFF0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF1 is a 32-bit register.

Field descriptions

31:0
MPIDR_EL1hi

MPIDR_EL1hi, bits [31:0]

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented Exception level.

Accessing PMDEVAFF1

PMDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xFAC`	PMDEVAFF1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the Performance Monitor component.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVARCH is a 32-bit register.

Field descriptions

31 … 21	20	19 … 16	15 … 12	11 … 0
ARCHITECT	PRESENT	REVISION	ARCHVER	ARCHPART

ARCHITECT, bits [31:21]

Defines the architecture of the component. For Performance Monitors, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, `0x4`.

Bits [27:21] are the JEP106 ID code, `0x3B`.

Reads as `0b01000111011`.

Access to this field is **RO**.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as `0b1`.

Access to this field is **RO**.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For Performance Monitors, the revision defined by Armv8 is `0x0`.

All other values are reserved.

Reads as `0b0000`.

Access to this field is **RO**.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

All other values are reserved.

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHVER is PMDEVARCH.ARCHID[15:12].

Reads as `0b0010`.

Access to this field is **RO**.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning	Applies when
`0xA16`	Armv8-A PE performance monitors.	
`0xA26`	Armv8-A PE performance monitors, including the 64-bit programmers' model extension.	From Armv8.8

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHPART is PMDEVARCH.ARCHID[11:0].

Access to this field is **RO**.

Accessing PMDEVARCH

PMDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xFBC`	PMDEVARCH

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMDEVID, Performance Monitors Device ID register

The PMDEVID characteristics are:

Purpose

Provides information about features of the Performance Monitors implementation.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required from Armv8.2 and in any implementation that includes FEAT_PCSRv8p2. Otherwise, its location is RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Attributes

PMDEVID is a 32-bit register.

Field descriptions

31–4	3–0
RES0	PCSample

Bits [31:4]

Reserved, RES0.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using Performance Monitors registers.

PCSample	Meaning
`0b0000`	PC Sample-based Profiling Extension is not implemented in the Performance Monitors register space.
`0b0001`	PC Sample-based Profiling Extension is implemented in the Performance Monitors register space.

All other values are reserved.

FEAT_PCSRv8p2 implements the functionality identified by the value `0b0001`.

Accessing PMDEVID

PMDEVID can be accessed through the external debug interface:

Component	Offset	Instance

PMU	`0xFC8`	PMDEVID

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PEs performance monitor interface.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVTYPE is a 32-bit register.

Field descriptions

31–8	7–4	3–0
RES0	SUB	MAJOR

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as `0b0001`.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type. Indicates this is a performance monitor component.

Reads as `0b0110`.

Access to this field is **RO**.

Accessing PMDEVTYPE

PMDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xFCC`	PMDEVTYPE

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.

- Otherwise accesses to this register generate an error response.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMEVCNTR<n>_EL0[31:0].

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVCNTR<n>[31:0].

PMEVCNTR<n>_EL0 is in the Core power domain.

Attributes

PMEVCNTR<n>_EL0 is a:

- 64-bit register when FEAT_PMUv3p5 is implemented
- 32-bit register otherwise

Field descriptions

When FEAT_PMUv3p5 is implemented:

Bits	Field
63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32	Event counter n
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0	Event counter n

Bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If the highest implemented Exception level is using AArch32, the optional external interface to the performance monitors is implemented, and the PMCR.LP and HDCR.HLP bits are RAZ/WI, then locations in the external interface to the performance monitors that map to PMEVCNTR<n>_EL0[63:32] return UNKNOWN values on reads.

If the implementation does not support AArch64, bits [63:32] of the event counters are not required to be implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Bits	Field
31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0	Event counter n

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>_EL0

External accesses to the performance monitors ignore PMUSERENR_EL0 and, if implemented, MDCR_EL2.{TPM, TPMCR, HPMN} and MDCR_EL3.TPM. This means that all counters are accessible regardless of the current Exception level or privilege of the access.

If FEAT_PMUv3p5 is not implemented, when IsCorePowered(), DoubleLockStatus(), OSLockStatus() or !AllowExternalPMUAccess(), 32-bit accesses to `0x004+8×n` have a CONSTRAINED UNPREDICTABLE behavior.

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVCNTR<n>_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0x000` + (8 * n)	PMEVCNTR<n>_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMEVFILTR<n>, Performance Monitors Event Type Select Register <n>, n = 0 - 30

The PMEVFILTR<n> characteristics are:

Purpose

External access to PMEVTYPER<n>_EL0[63:32].

Configuration

External register PMEVFILTR<n> bits [31:0] are architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0[63:32] when AArch64 is supported.

PMEVFILTR<n> is in the Core power domain.

This register is present only when FEAT_PMUv3_TH is implemented. Otherwise, direct accesses to PMEVFILTR<n> are RES0.

Note

If FEAT_Debugv8p4 is implemented, the OPTIONAL Software Lock is not implemented.

If FEAT_DoPD is implemented, FEAT_DoubleLock is not implemented.

Attributes

PMEVFILTR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TC			RES0																	TH											

TC, bits [31:29]

When FEAT_PMUv3_TH is implemented:

Threshold Control. Defines the threshold function. In the description of this field, the value V is the value the event specified by PMEVTYPER<n>_EL0 would increment the counter by on a processor cycle if the threshold function is disabled. Comparisons treat V and PMEVFILTR<n>.TH as unsigned integer values.

TC	Meaning
0b000	Not-equal. The counter increments by V on each processor cycle when V is not equal to PMEVFILTR<n>.TH. If PMEVFILTR<n>.TH is zero, the threshold function is disabled.
0b001	Not-equal, count. The counter increments by 1 on each processor cycle when V is not equal to PMEVFILTR<n>.TH.
0b010	Equals. The counter increments by V on each processor cycle when V is equal to PMEVFILTR<n>.TH.
0b011	Equals, count. The counter increments by 1 on each processor cycle when V is equal to PMEVFILTR<n>.TH.
0b100	Greater-than-or-equal. The counter increments by V on each processor cycle when V is PMEVFILTR<n>.TH or more.
0b101	Greater-than-or-equal, count. The counter increments by 1 on each processor cycle when V is PMEVFILTR<n>.TH or more.
0b110	Less-than. The counter increments by V on each processor cycle when V is less than PMEVFILTR<n>.TH.
0b111	Less-than, count. The counter increments by 1 on each processor cycle when V is less than PMEVFILTR<n>.TH.

The reset behavior of this field is:

- On a Warm reset:
  - When AArch32 is supported, this field resets to 0.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [28:12]

Reserved, RES0.

TH, bits [11:0]

When FEAT_PMUv3_TH is implemented:

Threshold value. Provides the unsigned value for the threshold function defined by PMEVFILTR<n>.TC.

If PMEVFILTR<n>.TC is 0b000 and PMEVFILTR<n>.TH is zero, then the threshold function is disabled.

If PMMIR.THWIDTH is less than 12, then bits PMEVFILTR<n>.TH[11:PMMIR.THWIDTH] are RES0. This accounts for the behavior when writing a value greater-than-or-equal-to $2^{(\text{PMMIR.THWIDTH})}$.

The reset behavior of this field is:

- On a Warm reset:
  - When AArch32 is supported, this field resets to 0.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing PMEVFILTR<n>

PMEVFILTR<n> can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xA00 + (4 * n)	PMEVFILTR<n>

This interface is accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus() or !AllowExternalPMUAccess() accesses to this register generate an error response.
- When SoftwareLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0[31:0].

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVTYPER<n>[31:0].

PMEVTYPER<n>_EL0 is in the Core power domain.

If event counter n is not implemented:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess(), accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

Attributes

PMEVTYPER<n>_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23–16	15–10	9–0
P	U	NSK	NSU	NSH	M	MT	SH	RES0	evtCount[15:10]	evtCount[9:0]

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

P	Meaning
0b0	Count events in EL1.
0b1	Do not count events in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.

U	Meaning
0b0	Count events in EL0.
0b1	Do not count events in EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]
When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]
When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]
When EL2 is implemented:

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.

NSH	Meaning
0b0	Do not count events in EL2.
0b1	Count events in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

EL3 filtering bit.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in EL3 are counted.

Otherwise, events in EL3 are not counted.

Most applications can ignore this field and set its value to `0b0`.

> **Note**
>
> This field is not visible in the AArch32 PMEVTYPER<n> System register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]

When (FEAT_MTPMU is implemented and enabled) or an IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:

Multithreading.

MT	Meaning
`0b0`	Count events only on controlling PE.
`0b1`	Count events from any PE with the same affinity at level 1 and above as this PE.

> **Note**
>
> - When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
> - Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]

When FEAT_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

Note

This field is not visible in the AArch32 PMEVTYPER<n> System register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>_EL0.

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.

Otherwise, if PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range `0x0000` to `0x003F`, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range `0x4000` to `0x403F`, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that for all values that represent reserved or unsupported events, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVTYPER<n>_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0x400` + (4 * n)	PMEVTYPER<n>_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

Configuration

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0].

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

PMINTENCLR_EL1 is in the Core power domain.

Attributes

PMINTENCLR_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:

C	Meaning
`0b0`	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
`0b1`	When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
`0b0`	When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.
`0b1`	When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR<n>_EL0 interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENCLR_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENCLR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xC60`	PMINTENCLR_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0. Reading the register shows which overflow interrupt requests are enabled.

Configuration

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[31:0].

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENSET[31:0].

PMINTENSET_EL1 is in the Core power domain.

Attributes

PMINTENSET_EL1 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

PMCCNTR_EL0 overflow interrupt request enable bit. Possible values are:

C	Meaning
`0b0`	When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
`0b1`	When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request enable bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
`0b0`	When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect.
`0b1`	When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, enables the PMEVCNTR<n>_EL0 interrupt request.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENSET_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENSET_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xC40`	PMINTENSET_EL1

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

Purpose

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

It is IMPLEMENTATION DEFINED whether PMITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

PMITCTRL is a 32-bit register.

Field descriptions

31:1	0
RES0	IME

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

IME	Meaning
`0b0`	Normal operation.
`0b1`	Integration mode enabled.

The following resets apply:

- If the register is implemented in the Core power domain:
  - On a Cold reset, this field resets to 0.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to 0.
  - On a Warm reset, the value of this field is unchanged.

Accessing PMITCTRL

PMITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xF00`	PMITCTRL

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

Purpose

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

Attributes

PMLAR is a 32-bit register.

Field descriptions

When Software Lock is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
KEY																															

KEY, bits [31:0]

Lock Access control. Writing the key value `0xC5ACCE55` to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																															

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing PMLAR

PMLAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
PMU	0xFB0	PMLAR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

Purpose

Indicates the current status of the software lock for Performance Monitors registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

Attributes

PMLSR is a 32-bit register.

Field descriptions

31–3	2	1	0
RES0	nTT	SLK	SLI

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required.

Reads as `0b0`.

Access to this field is **RO**.

SLK, bit [1]

When Software Lock is implemented and FEAT_DoPD is not implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

SLK	Meaning
`0b0`	Lock clear. Writes are permitted to this component's registers.
`0b1`	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On an External debug reset, this field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

SLI	Meaning
`0b0`	Software Lock not implemented or not memory-mapped access.
`0b1`	Software Lock implemented and memory-mapped access.

Accessing PMLSR

PMLSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
PMU	`0xFB4`	PMLSR

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation.

Configuration

PMMIR is in the Core power domain.

This register is present only when FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are RES0.

Attributes

PMMIR is a 32-bit register.

Field descriptions

31:24	23:20	19:16	15:8	7:0
RES0	THWIDTH	BUS_WIDTH	BUS_SLOTS	SLOTS

Bits [31:24]

Reserved, RES0.

THWIDTH, bits [23:20]

PMEVFILTR<n>.TH width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the PMEVFILTR<n>.TH field.

THWIDTH	Meaning
0b0000	FEAT_PMUv3_TH is not implemented.
0b0001	1 bit. PMEVFILTR<n>.TH[11:1] are RES0.
0b0010	2 bits. PMEVFILTR<n>.TH[11:2] are RES0.
0b0011	3 bits. PMEVFILTR<n>.TH[11:3] are RES0.
0b0100	4 bits. PMEVFILTR<n>.TH[11:4] are RES0.
0b0101	5 bits. PMEVFILTR<n>.TH[11:5] are RES0.
0b0110	6 bits. PMEVFILTR<n>.TH[11:6] are RES0.
0b0111	7 bits. PMEVFILTR<n>.TH[11:7] are RES0.
0b1000	8 bits. PMEVFILTR<n>.TH[11:8] are RES0.
0b1001	9 bits. PMEVFILTR<n>.TH[11:9] are RES0.
0b1010	10 bits. PMEVFILTR<n>.TH[11:10] are RES0.
0b1011	11 bits. PMEVFILTR<n>.TH[11] is RES0.
0b1100	12 bits.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to PMEVFILTR<n>.TH is $2^{(\text{PMMIR.THWIDTH})}$ minus one.

Access to this field is **RO**.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as Log_2(number of bytes), plus one. Defined values are:

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

Access to this field is **RO**.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment by in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMMIR

If the Core power domain is off or in a low-power state, access on this interface returns an Error.

PMMIR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xE40	PMMIR

This interface is accessible as follows:

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or !AllowExternalPMUAccess() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSCLR_EL0 characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>. Writing to this register clears these bits.

Configuration

External register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0].

External register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0].

PMOVSCLR_EL0 is in the Core power domain.

Attributes

PMOVSCLR_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Cycle counter overflow clear bit.

C	Meaning
`0b0`	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
`0b1`	When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow clear bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, clears the PMEVCNTR<n>_EL0 overflow bit to 0.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSCLR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSCLR_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xC80	PMOVSCLR_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>.

Configuration

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0].

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

PMOVSSET_EL0 is in the Core power domain.

Attributes

PMOVSSET_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Cycle counter overflow set bit.

C	Meaning
`0b0`	When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect.
`0b1`	When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow set bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are RAZ/WI.

P<n>	Meaning
0b0	When read, means that PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect.
0b1	When read, means that PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, sets the PMEVCNTR<n>_EL0 overflow bit to 1.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<n>_EL0[31:0] or unsigned overflow of PMEVCNTR<n>_EL0[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSSET_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSSET_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	0xCC0	PMOVSSET_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMPCSR, Program Counter Sample Register

The PMPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configuration

PMPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMPCSR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Support for 64-bit atomic reads is IMPLEMENTATION DEFINED. If 64-bit atomic reads are implemented, a 64-bit read of PMPCSR has the same side-effect as a 32-bit read of PMCSR[31:0] followed by a 32-bit read of PMPCSR[63:32], returning the combined value. For example, if the PE is in Debug state then a 64-bit atomic read returns bits[31:0] == `0xFFFFFFFF` and bits[63:32] UNKNOWN.

Attributes

PMPCSR is a 64-bit register.

Field descriptions

63	62 61	60 59 58 57 56	55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32
NS	EL	RES0	PCSample[55:32]

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
PCSample[31:0]

NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
`0b0`	Sample is from Secure state.
`0b1`	Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

EL	Meaning
`0b00`	Sample is from EL0.
`0b01`	Sample is from EL1.
`0b10`	Sample is from EL2.
`0b11`	Sample is from EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [60:56]

Reserved, RES0.

PCSample[55:32], bits [55:32]

Bits[55:32] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PCSample[31:0], bits [31:0]

Bits[31:0] of the sampled instruction address value.

PMPCSR[31:0] reads as `0xFFFFFFFF` when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of PMPCSR[31:0] is permitted but not required to return `0xFFFFFFFF`.

PMPCSR[31:0] reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of PMPCSR[31:0].

For the cases where a read of PMPCSR[31:0] returns `0xFFFFFFFF` or an UNKNOWN value, the read has the side-effect of setting PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR to UNKNOWN values.

Otherwise, a read of PMPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

For a read of PMPCSR[31:0] from the memory-mapped interface, if PMLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

PMPCSR can be accessed through the external debug interface:

Component	Offset	Instance	Range

PMU	`0x200`	PMPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	`0x204`	PMPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	`0x220`	PMPCSR	31:0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Component	Offset	Instance	Range
PMU	`0x224`	PMPCSR	63:32

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR0 is a 32-bit register.

Field descriptions

31:8	7:0
RES0	PART_0

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMPIDR0

PMPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xFE0`	PMPIDR0

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR1 is a 32-bit register.

Field descriptions

31–8	7–4	3–0
RES0	DES_0	PART_1

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is `0b1011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMPIDR1

PMPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xFE4`	PMPIDR1

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMPIDR2, Performance Monitors Peripheral Identification Register 2

The PMPIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR2 is a 32-bit register.

Field descriptions

31:8	7:4	3	2:0
RES0	REVISION	JEDEC	DES_1

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as `0b1`.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is `0b011`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMPIDR2

PMPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xFE8`	PMPIDR2

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR3 is a 32-bit register.

Field descriptions

31–8	7–4	3–0
RES0	REVAND	CMOD

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using PMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMPIDR3

PMPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance

PMU	`0xFEC`	PMPIDR3

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR4 is a 32-bit register.

Field descriptions

31–8	7–4	3–0
RES0	SIZE	DES_2

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as `0b0000`.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is `0b0100`.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMPIDR4

PMPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance

PMU	`0xFD0`	PMPIDR4

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event `0x00`. For more information, see 'SW_INCR'.

Configuration

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMSWINC_EL0[31:0].

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSWINC[31:0].

PMSWINC_EL0 is in the Core power domain.

Implementation of this register is OPTIONAL.

If this register is implemented, use of it is deprecated.

If 1 is written to bit [n] from the external debug interface, it is CONSTRAINED UNPREDICTABLE whether or not a SW_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

Attributes

PMSWINC_EL0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bit [31]

Reserved, RES0.

P<n>, bit [n], for n = 30 to 0

Event counter software increment bit for PMEVCNTR<n>_EL0.

If PMCFGR.N is less than 31, bits [30:PMCFGR.N] are WI.

P<n>	Meaning
`0b0`	No action. The write to this bit is ignored.
`0b1`	It is CONSTRAINED UNPREDICTABLE whether a SW_INCR event is generated for event counter n.

Accessing PMSWINC_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMSWINC_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0xCA0`	PMSWINC_EL0

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:34; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMVIDSR, VMID Sample Register

The PMVIDSR characteristics are:

Purpose

Contains the sampled VMID value that is captured on reading PMPCSR[31:0].

Configuration

PMVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMVIDSR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of EDDEVID.PCSample.

Attributes

PMVIDSR is a 32-bit register.

Field descriptions

31:16	15:8	7:0
RES0	VMID[15:8]	VMID

Bits [31:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When FEAT_VMID16 is implemented:

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]

VMID sample. The VMID associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- This field is set to an UNKNOWN value if any of the following apply:
    - EL2 is disabled in the current Security state.
    - The PE is executing at EL2.

    - EL2 is enabled in the current Security state, the PE is executing at EL0, EL2 is using AArch64, HCR_EL2.E2H == 1, and HCR_EL2.TGE == 1.
- Otherwise:
    - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
    - If EL2 is using AArch64, FEAT_VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
    - If EL2 is using AArch32, this field is set to VTTBR.VMID.

Because the value written to PMVIDR is an indirect read of the VMID value, it is CONSTRAINED UNPREDICTABLE whether PMVIDSR is set to the original or new value if PMPCSR samples:

- An instruction that writes to the VMID value.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

PMVIDSR can be accessed through the external debug interface:

Component	Offset	Instance
PMU	`0x20C`	PMVIDSR

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 15:33; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.
