ICH_VTR_EL2, Interrupt Controller VGIC Type Register

The ICH_VTR_EL2 characteristics are:

Purpose

Reports supported GIC virtualization features.

Configuration

AArch64 System register ICH_VTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [ICH_VTR\[31:0\]](#).

This register is present only when FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_VTR_EL2 are UNDEFINED.

If EL2 is not implemented, all bits in this register are RES0 from EL3, except for nV4, which is RES1 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_VTR_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|---------|----|----|----|--------|----|----|----|------|-----|-----|-----|------|------|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| PRibits | | | | PREbits | | | | IDbits | | | | SEIS | A3V | nV4 | TDS | DVIM | RES0 | | | | | | | | | | | | ListRegs | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:32]

Reserved, RES0.

PRibits, bits [31:29]

Priority bits. The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

This field is an alias of [ICV_CTLR_EL1](#).PRibits.

PREbits, bits [28:26]

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH_VTR_EL2.PRibits.

The maximum value of this field is 6, indicating 7 bits of preemption.

This field determines the minimum value of [ICH_VMCR_EL2](#).VBPR0.

IDbits, bits [25:23]

The number of virtual interrupt identifier bits supported:

| IDbits | Meaning |
|--------|----------|
| 0b000 | 16 bits. |
| 0b001 | 24 bits. |

All other values are reserved.

This field is an alias of [ICV_CTLR_EL1](#).IDbits.

SEIS, bit [22]

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:

| SEIS | Meaning |
|------|--|
| 0b0 | The virtual CPU interface logic does not support generation of SEIs. |
| 0b1 | The virtual CPU interface logic supports generation of SEIs. |

This bit is an alias of [ICV_CTLR_EL1](#).SEIS.

A3V, bit [21]

Affinity 3 Valid. Possible values are:

| A3V | Meaning |
|-----|---|
| 0b0 | The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers. |
| 0b1 | The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers. |

This bit is an alias of [ICV_CTLR_EL1](#).A3V.

nV4, bit [20]

Direct injection of virtual interrupts not supported. Possible values are:

| nV4 | Meaning |
|-----|--|
| 0b0 | The CPU interface logic supports direct injection of virtual interrupts. |
| 0b1 | The CPU interface logic does not support direct injection of virtual interrupts. |

In GICv3, the only permitted value is 0b1.

TDS, bit [19]

Separate trapping of EL1 writes to [ICV_DIR_EL1](#) supported.

| TDS | Meaning |
|-----|--|
| 0b0 | Implementation does not support ICH_HCR_EL2 .TDIR. |
| 0b1 | Implementation supports ICH_HCR_EL2 .TDIR. |

FEAT_GICv3_TDIR implements the functionality added by the value 0b1.

DVIM, bit [18]

Masking of directly-injected virtual interrupts.

| DVIM | Meaning |
|------|--|
| 0b0 | Masking of Directly-injected Virtual Interrupts not supported. |
| 0b1 | Masking of Directly-injected Virtual Interrupts is supported. |

When a PE implements the Realm Management Extension, this field is RAO/WI.

Bits [17:5]

Reserved, RES0.

ListRegs, bits [4:0]

The number of implemented List registers, minus one. For example, a value of 0b01111 indicates that the maximum of 16 List registers are implemented.

Accessing ICH_VTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICH_VTR_EL2

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b1100 | 0b1011 | 0b001 |

```
if PSTATE.EL == EL0 then

    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2.SRE == '0' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ICH_VTR_EL2;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3.SRE == '0' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return ICH_VTR_EL2;
```

ICV_AP0R<n>_EL1, Interrupt Controller Virtual Active Priorities Group 0 Registers, n = 0 - 3

The ICV_AP0R<n>_EL1 characteristics are:

Purpose

Provides information about virtual Group 0 active priorities.

Configuration

AArch64 System register ICV_AP0R<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV_AP0R<n>\[31:0\]](#).

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_AP0R<n>_EL1 are UNDEFINED.

Attributes

ICV_AP0R<n>_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing ICV_AP0R<n>_EL1

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP0R1_EL1 is only implemented in implementations that support 6 or more bits of priority. ICV_AP0R2_EL1 and ICV_AP0R3_EL1 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>_EL1.
- [ICV_AP1R<n>_EL1](#).

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_AP0R<n>_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|------------|
| 0b11 | 0b000 | 0b1100 | 0b1000 | 0b1:n[1:0] |

ICV_BPR0_EL1, Interrupt Controller Virtual Binary Point Register 0

The ICV_BPR0_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 0 interrupt preemption.

Configuration

AArch64 System register ICV_BPR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV_BPR0\[31:0\]](#).

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_BPR0_EL1 are UNDEFINED.

Attributes

ICV_BPR0_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | BinaryPoint | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

| Binary point value | Group priority field | Subpriority field | Field with binary point |
|--------------------|----------------------|-------------------|-------------------------|
| 0 | [7:1] | [0] | ggggggg.s |
| 1 | [7:2] | [1:0] | gggggg.ss |
| 2 | [7:3] | [2:0] | ggggg.sss |
| 3 | [7:4] | [3:0] | gggg.ssss |
| 4 | [7:5] | [4:0] | ggg.sssss |
| 5 | [7:6] | [5:0] | gg.ssssss |
| 6 | [7] | [6:0] | g.sssssss |
| 7 | No preemption | [7:0] | .ssssssss |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR0_EL1

The minimum binary point value is derived from the number of implemented preemption bits, as shown in the following table:

| Number of implemented preemption bits | Minimum value of BPR0 |
|---------------------------------------|-----------------------|
| 7 | 0 |
| 6 | 1 |
| 5 | 2 |

The number of implemented preemption bits is indicated by [ICH_VTR_EL2](#).PREbits.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_BPR0_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b1100 | 0b1000 | 0b011 |

Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

An attempt to program this field to a value less than the minimum value sets the field to the minimum value.

If [ICV_CTLR_EL1](#).CBPR is set to 1, Non-secure EL1 reads return [ICV_BPR0_EL1](#) + 1 saturated to 0b111. Non-secure EL1 writes are ignored.

If [ICV_CTLR_EL1](#).CBPR is set to 1, Secure EL1 reads return [ICV_BPR0_EL1](#). Secure EL1 writes modify [ICV_BPR0_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR1_EL1

For Non-secure writes, the minimum value of this field is the minimum value of [ICH_VMCR_EL2](#).VBPR0 plus one.

For Secure writes, the minimum value of this field is the minimum value of [ICH_VMCR_EL2.VBPR0](#).

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_BPR1_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b1100 | 0b1100 | 0b011 |

ICV_CTLR_EL1, Interrupt Controller Virtual Control Register

The ICV_CTLR_EL1 characteristics are:

Purpose

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

Configuration

AArch64 System register ICV_CTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV_CTLR\[31:0\]](#).

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_CTLR_EL1 are UNDEFINED.

Attributes

ICV_CTLR_EL1 is a 64-bit register.

ExtRange, bit [19]

Extended INTID range (read-only).

| ExtRange | Meaning |
|---|--|
| 0b0 | CPU interface does not support INTIDs in the range 1024..8191. <ul style="list-style-type: none"> Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. |
| Note Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them. | |
| 0b1 | CPU interface supports INTIDs in the range 1024..8191 <ul style="list-style-type: none"> All INTIDs in the range 1024..8191 are treated as requiring deactivation. |

ICV_CTLR_EL1.ExtRange is an alias of [ICC_CTLR_EL1](#).ExtRange.

RSS, bit [18]

Range Selector Support. Possible values are:

| RSS | Meaning |
|------------|--|
| 0b0 | Targeted SGIs with affinity level 0 values of 0 - 15 are supported. |
| 0b1 | Targeted SGIs with affinity level 0 values of 0 - 255 are supported. |

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

| A3V | Meaning |
|------------|---|
| 0b0 | The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers. |
| 0b1 | The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers. |

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs:

| SEIS | Meaning |
|-------------|--|
| 0b0 | The virtual CPU interface logic does not support local generation of SEIs. |
| 0b1 | The virtual CPU interface logic supports local generation of SEIs. |

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of virtual interrupt identifier bits supported:

| IDbits | Meaning |
|---------------|----------------|
| 0b000 | 16 bits. |
| 0b001 | 24 bits. |

All other values are reserved.

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation must implement at least 32 levels of physical priority (5 priority bits).

Note

This field always returns the number of priority bits implemented.

The division between group priority and subpriority is defined in the binary point registers [ICV_BPR0_EL1](#) and [ICV_BPR1_EL1](#).

Bits [7:2]

Reserved, RES0.

EOImode, bit [1]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

| EOImode | Meaning |
|---------|---|
| 0b0 | ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR_EL1 are UNPREDICTABLE. |
| 0b1 | ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide priority drop functionality only. ICV_DIR_EL1 provides interrupt deactivation functionality. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

| CBPR | Meaning |
|------|--|
| 0b0 | ICV_BPR1_EL1 determines the preemption group for virtual Group 1 interrupts. |
| 0b1 | Non-secure reads of ICV_BPR1_EL1 return ICV_BPR0_EL1 plus one, saturated to 0b111. Non-secure writes to ICV_BPR1_EL1 are ignored. Secure reads of ICV_BPR1_EL1 return ICV_BPR0_EL1 . Secure writes of ICV_BPR1_EL1 modify ICV_BPR0_EL1 . |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_CTLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_CTLR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b1100 | 0b1100 | 0b100 |

ICV_DIR_EL1, Interrupt Controller Deactivate Virtual Interrupt Register

The ICV_DIR_EL1 characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified virtual interrupt.

Configuration

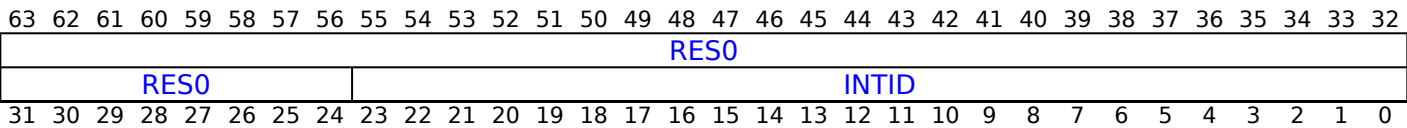

AArch64 System register ICV_DIR_EL1 bits [31:0] performs the same function as AArch32 System register [ICV_DIR\[31:0\]](#).

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_DIR_EL1 are UNDEFINED.

Attributes

ICV_DIR_EL1 is a 64-bit register.

Field descriptions

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the virtual interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICV_CTLR_EL1](#).IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_DIR_EL1

When EOImode == 0, writes are ignored. In systems supporting system error generation, an implementation might generate an SEI.

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_DIR_EL1, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b1100 | 0b1011 | 0b001 |

```

ICV_EOIR0_EL1, Interrupt Controller Virtual End Of Interrupt Register 0

The ICV_EOIR0_EL1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 0 interrupt.

Configuration

AArch64 System register ICV_EOIR0_EL1 performs the same function as AArch32 System register [ICV_EOIR0](#).

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_EOIR0_EL1 are UNDEFINED.

Attributes

ICV_EOIR0_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | INTID | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding [ICV_IAR0_EL1](#) access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICV_CTLR_EL1](#).IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the [ICV_CTLR](#).EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the [ICV_CTLR](#).EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to [ICV_DIR_EL1](#) to deactivate the virtual interrupt.

Accessing ICV_EOIR0_EL1

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from [ICV_IAR0_EL1](#), otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_EOIR0_EL1, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b1100 | 0b1000 | 0b001 |

```

ICV_HPPIR0_EL1, Interrupt Controller Virtual Highest Priority Pending Interrupt Register 0

The ICV_HPPIR0_EL1 characteristics are:

Purpose

Indicates the highest priority pending virtual Group 0 interrupt on the virtual CPU interface.

Configuration

AArch64 System register ICV_HPPIR0_EL1 performs the same function as AArch32 System register [ICV_HPPIR0](#).

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_HPPIR0_EL1 are UNDEFINED.

Attributes

ICV_HPPIR0_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

ICV_IAR0_EL1, Interrupt Controller Virtual Interrupt Acknowledge Register 0

The ICV_IAR0_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 0 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch64 System register ICV_IAR0_EL1 performs the same function as AArch32 System register [ICV_IAR0](#).

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_IAR0_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when $PSTATE.\{I,F\} == \{0,0\}$). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_IAR0_EL1 is a 64-bit register.

Field descriptions

ICV_IGRPEN0_EL1, Interrupt Controller Virtual Interrupt Group 0 Enable register

The ICV_IGRPEN0_EL1 characteristics are:

Purpose

Controls whether virtual Group 0 interrupts are enabled or not.

Configuration

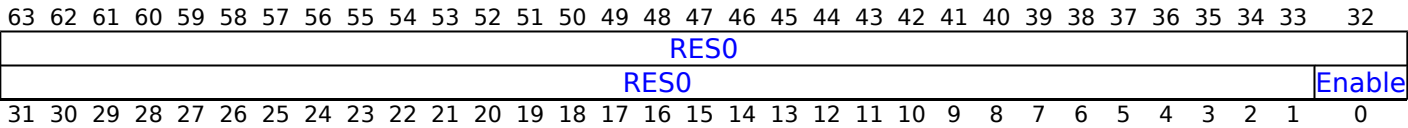

AArch64 System register ICV_IGRPEN0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV_IGRPEN0\[31:0\]](#).

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_IGRPEN0_EL1 are UNDEFINED.

Attributes

ICV_IGRPEN0_EL1 is a 64-bit register.

Field descriptions

Bits [63:1]

Reserved, RES0.

Enable, bit [0]

Enables virtual Group 0 interrupts.

| Enable | Meaning |
|--------|--|
| 0b0 | Virtual Group 0 interrupts are disabled. |
| 0b1 | Virtual Group 0 interrupts are enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_IGRPEN0_EL1

ICV_IGRPEN1_EL1, Interrupt Controller Virtual Interrupt Group 1 Enable register

The ICV_IGRPEN1_EL1 characteristics are:

Purpose

Controls whether virtual Group 1 interrupts are enabled for the current Security state.

Configuration

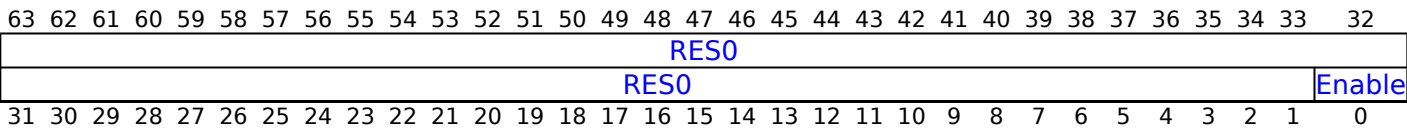

AArch64 System register ICV_IGRPEN1_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV_IGRPEN1\[31:0\]](#).

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_IGRPEN1_EL1 are UNDEFINED.

Attributes

ICV_IGRPEN1_EL1 is a 64-bit register.

Field descriptions

Bits [63:1]

Reserved, RES0.

Enable, bit [0]

Enables virtual Group 1 interrupts.

| Enable | Meaning |
|--------|--|
| 0b0 | Virtual Group 1 interrupts are disabled. |
| 0b1 | Virtual Group 1 interrupts are enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_IGRPEN1_EL1

Accesses to this register use the following encodings in the System register encoding space:

ICV_NMIAR1_EL1, Interrupt Controller Virtual Non-maskable Interrupt Acknowledge Register 1

The ICV_NMIAR1_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 1 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

This register is present only when FEAT_GICv3_NMI is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_NMIAR1_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when $PSTATE.\{I,F\} == \{0,0\}$). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_NMIAR1_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled virtual interrupt.

This is the INTID of the highest priority pending virtual interrupt, if that virtual interrupt has the Non-maskable property and is of sufficient priority for it to be signalled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICV_CTLR_EL1.IDbits](#). If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_NMIAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_NMIAR1_EL1

| op0 | op1 | CRn | CRm | op2 |

ICV_PMR_EL1, Interrupt Controller Virtual Interrupt Priority Mask Register

The ICV_PMR_EL1 characteristics are:

Purpose

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

Configuration

AArch64 System register ICV_PMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ICV_PMR\[31:0\]](#).

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_PMR_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_PMR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | Priority | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

| Implemented priority bits | Possible priority field values | Number of priority levels |
|---------------------------|-------------------------------------|---------------------------|
| [7:0] | 0x00-0xFF (0-255), all values | 256 |
| [7:1] | 0x00-0xFE (0-254), even values only | 128 |
| [7:2] | 0x00-0xFC (0-252), in steps of 4 | 64 |
| [7:3] | 0x00-0xF8 (0-248), in steps of 8 | 32 |
| [7:4] | 0x00-0xF0 (0-240), in steps of 16 | 16 |

Unimplemented priority bits are RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_PMR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_PMR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0100 | 0b0110 | 0b000 |

ICV_RPR_EL1, Interrupt Controller Virtual Running Priority Register

The ICV_RPR_EL1 characteristics are:

Purpose

Indicates the Running priority of the virtual CPU interface.

Configuration

AArch64 System register ICV_RPR_EL1 performs the same function as AArch32 System register [ICV_RPR](#).

This register is present only when FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_RPR_EL1 are UNDEFINED.

Attributes

ICV_RPR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| NMI | RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | Priority | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

NMI, bit [63]

When FEAT_GICv3_NMI is implemented:

Indicates whether the running priority is from a NMI.

| NMI | Meaning |
|-----|--|
| 0b0 | There is no active Group 1 NMI, or all active Group 1 NMIs have undergone priority drop. |
| 0b1 | There is an active Group 1 NMI. |

Otherwise:

Reserved, RES0.

Bits [62:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt.

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

Note

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

Accessing ICV_RPR_EL1

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_RPR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b1100 | 0b1011 | 0b011 |

```

ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0

The ID_AA64DFR0_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

The external register [EDDFR](#) gives information from this register.

Attributes

ID_AA64DFR0_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------------|----|----|----|----------------------|----|----|----|----------------------|----|----|----|-----------------------|----|----|----|-----------------------------|----|----|----|---------------------------|----|----|----|----------------------------|----|----|----|--------------------------|----|----|----|

| HPMN0 | | | | RES0 | | | | BRBE | | | | MTPMU | | | | TraceBuffer | | | | TraceFilt | | | | DoubleLock | | | | PMSVer | | | |
| CTX_CMPs | | | | RES0 | | | | WRPs | | | | RES0 | | | | BRPs | | | | PMUVer | | | | TraceVer | | | | DebugVer | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

HPMN0, bits [63:60]

Zero PMU event counters for a Guest operating system. Defined values are:

| HPMN0 | Meaning |
|--------|--|
| 0b0000 | Setting MDCR_EL2 .HPMN to zero has CONSTRAINED UNPREDICTABLE behavior. |
| 0b0001 | Setting MDCR_EL2 .HPMN to zero has defined behavior. |

All other values are reserved.

If FEAT_PMUv3 is not implemented, FEAT_FGT is not implemented, or EL2 is not implemented, the only permitted value is 0b0000.

FEAT_HPMN0 implements the functionality identified by the value 0b0001.

From Armv8.8, in an implementation that includes FEAT_PMUv3, FEAT_FGT, and EL2, the value 0b0000 is not permitted.

Bits [59:56]

Reserved, RES0.

BRBE, bits [55:52]

Branch Record Buffer Extension. Defined values are:

| BRBE | Meaning |
|--------|--|
| 0b0000 | Branch Record Buffer Extension not implemented. |
| 0b0001 | Branch Record Buffer Extension implemented. |
| 0b0010 | As 0b0001, and adds support for branch recording at EL3. |

All other values are reserved.

FEAT_BRBE implements the functionality identified by the value 0b0001.

FEAT_BRBEv1p1 implements the functionality identified by the value 0b0010.

From Armv9.3, if FEAT_BRBE is implemented, the value 0b0001 is not permitted.

MTPMU, bits [51:48]

Multi-threaded PMU extension. Defined values are:

| MTPMU | Meaning |
|--------|--|
| 0b0000 | FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>_ELO.MT and PMEVTYPER<n>.MT are read/write or RES0. |
| 0b0001 | FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER<n>_ELO.MT and PMEVTYPER<n>.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER<n>_ELO.MT and PMEVTYPER<n>.MT are 0. |
| 0b1111 | FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER<n>_ELO.MT and PMEVTYPER<n>.MT are RES0. |

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

TraceBuffer, bits [47:44]

Trace Buffer Extension. Defined values are:

| TraceBuffer | Meaning |
|-------------|--|
| 0b0000 | Trace Buffer Extension not implemented. |
| 0b0001 | Trace Buffer Extension implemented, FEAT_TRBE. |

All other values are reserved.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

| TraceFilt | Meaning |
|-----------|--|
| 0b0000 | Armv8.4 Self-hosted Trace Extension not implemented. |
| 0b0001 | Armv8.4 Self-hosted Trace Extension implemented. |

All other values are reserved.

FEAT_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if an Embedded Trace Macrocell Architecture PE Trace Unit is implemented, the value 0b0000 is not permitted.

DoubleLock, bits [39:36]

OS Double Lock implemented. Defined values are:

| DoubleLock | Meaning |
|------------|--|
| 0b0000 | OS Double Lock implemented. OSDLR_EL1 is RW. |
| 0b1111 | OS Double Lock not implemented. OSDLR_EL1 is RAZ/WI. |

All other values are reserved.

FEAT_DoubleLock implements the functionality identified by the value 0b0000.

In Armv8.0, the only permitted value is 0b0000.

If FEAT_Debugv8p2 is implemented and FEAT_DoPD is not implemented, the permitted values are 0b0000 and 0b1111.

If FEAT_DoPD is implemented, the only permitted value is 0b1111.

PMSVer, bits [35:32]

Statistical Profiling Extension version. Defined values are:

| PMSVer | Meaning |
|--------|--|
| 0b0000 | Statistical Profiling Extension not implemented. |
| 0b0001 | Statistical Profiling Extension implemented. |
| 0b0010 | As 0b0001, and adds: <ul style="list-style-type: none"> Support for the Event packet Alignment flag. If FEAT_SVE is implemented, support for the Scalable Vector extensions to Statistical Profiling. |
| 0b0011 | As 0b0010, and adds: <ul style="list-style-type: none"> Discard mode. Extended event filtering, including the PMSNEVER_EL1 System register. Support for the OPTIONAL previous branch target Address packet. If FEAT_PMUv3 is implemented, controls to freeze the PMU event counters after an SPE buffer management event occurs. If FEAT_PMUv3 is implemented, the SAMPLE_FEED_BR, SAMPLE_FEED_EVENT, SAMPLE_FEED_LAT, SAMPLE_FEED_LD, SAMPLE_FEED_OP, and SAMPLE_FEED_ST PMU events. |
| 0b0100 | As 0b0011, and adds: <ul style="list-style-type: none"> If FEAT_MOPS is implemented, Operation Type packet encodings for Memory Copy and Set operations. If FEAT_MTE is implemented, Operation Type packet encodings for loads and stores of Allocation Tags. |

All other values are reserved.

FEAT_SPE implements the functionality identified by the value 0b0001.

FEAT_SPEv1p1 implements the functionality identified by the value 0b0010.

FEAT_SPEv1p2 implements the functionality identified by the value 0b0011.

FEAT_SPEv1p3 implements the functionality identified by the value 0b0100.

From Armv8.5, if FEAT_SPE is implemented, the value 0b0001 is not permitted.

From Armv8.7, if FEAT_SPE is implemented, the value 0b0010 is not permitted.

From Armv8.8, if FEAT_SPE is implemented, the value 0b0011 is not permitted.

CTX_CMPs, bits [31:28]

Number of breakpoints that are context-aware, minus 1. These are the highest numbered breakpoints.

Bits [27:24]

Reserved, RES0.

WRPs, bits [23:20]

Number of watchpoints, minus 1. The value of 0b0000 is reserved.

Bits [19:16]

Reserved, RES0.

BRPs, bits [15:12]

Number of breakpoints, minus 1. The value of 0b0000 is reserved.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

| PMUVer | Meaning |
|--------|--|
| 0b0000 | Performance Monitors Extension not implemented. |
| 0b0001 | Performance Monitors Extension, PMUv3 implemented. |
| 0b0100 | PMUv3 for Armv8.1. As 0b0001, and adds support for: <ul style="list-style-type: none"> Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. If EL2 is implemented, the MDCR_EL2.HPMD control. |
| 0b0101 | PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR_EL1 register. |
| 0b0110 | PMUv3 for Armv8.5. As 0b0101, and adds support for: <ul style="list-style-type: none"> 64-bit event counters. If EL2 is implemented, the MDCR_EL2.HCCD control. If EL3 is implemented, the MDCR_EL3.SCCD control. |
| 0b0111 | PMUv3 for Armv8.7. As 0b0110, and adds support for: <ul style="list-style-type: none"> The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO controls. If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls. |
| 0b1000 | PMUv3 for Armv8.8. As 0b0111, and: <ul style="list-style-type: none"> Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected. |
| 0b1111 | IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations. |

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a PE trace unit is implemented. Defined values are:

| TraceVer | Meaning |
|----------|---|
| 0b0000 | PE trace unit System registers not implemented. |
| 0b0001 | PE trace unit System registers implemented. |

All other values are reserved.

When PE trace unit System registers are implemented, see [TRCIDR1](#) for tracing capabilities of the trace unit.

DebugVer, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

| DebugVer | Meaning |
|----------|---|
| 0b0110 | Armv8 debug architecture. |
| 0b0111 | Armv8 debug architecture with Virtualization Host Extensions. |
| 0b1000 | Armv8.2 debug architecture, FEAT_Debugv8p2. |
| 0b1001 | Armv8.4 debug architecture, FEAT_Debugv8p4. |
| 0b1010 | Armv8.8 debug architecture, FEAT_Debugv8p8. |

All other values are reserved.

FEAT_VHE adds the functionality identified by the value 0b0111.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

FEAT_Debugv8p8 adds the functionality identified by the value 0b1010.

From Armv8.1, when FEAT_VHE is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

Accessing ID_AA64DFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64DFR0_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0101 | 0b000 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);

ID_AA64DFR1_EL1, AArch64 Debug Feature Register 1

The ID_AA64DFR1_EL1 characteristics are:

Purpose

Reserved for future expansion of top level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64DFR1_EL1 is a 64-bit register.

Field descriptions

ID_AA64ISAR0_EL1, AArch64 Instruction Set Attribute Register 0

The ID_AA64ISAR0_EL1 characteristics are:

Purpose

Provides information about the instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64ISAR0_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------|----|----|----|----|---------------------|----|----|----|------------------------|----|----|----|-----------------------|----|----|----------------------|----|----|----|----------------------|----|----|---------------------|----|----|----|----------------------|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RNDR | | | | | TLB | | | | TS | | | | FHM | | | DP | | | | SM4 | | | SM3 | | | | SHA3 | | | | |
| RDM | | | | | TME | | | | Atomic | | | | CRC32 | | | SHA2 | | | | SHA1 | | | AES | | | | RES0 | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

RNDR, bits [63:60]

Indicates support for Random Number instructions in AArch64 state.

When FEAT_RNG_TRAP is implemented, the value returned by a direct read of ID_AA64ISAR0_EL1.RNDR is further controlled by the value of [SCR_EL3.TRNDR](#).

Defined values are:

| RNDR | Meaning |
|--------|--|
| 0b0000 | No Random Number instructions are implemented. |
| 0b0001 | RNDR and RNDRRS registers are implemented. |

All other values are reserved.

FEAT_RNG implements the functionality identified by the value 0b0001.

From Armv8.5, the permitted values are 0b0000 and 0b0001.

TLB, bits [59:56]

Indicates support for Outer shareable and TLB range maintenance instructions. Defined values are:

| TLB | Meaning |
|--------|---|
| 0b0000 | Outer shareable and TLB range maintenance instructions are not implemented. |
| 0b0001 | Outer shareable TLB maintenance instructions are implemented. |
| 0b0010 | Outer shareable and TLB range maintenance instructions are implemented. |

All other values are reserved.

FEAT_TLBIOS implements the functionality identified by the values 0b0001 and 0b0010.

FEAT_TLBIRANGE implements the functionality identified by the value 0b0010.

From Armv8.4, the only permitted value is 0b0010.

TS, bits [55:52]

Indicates support for flag manipulation instructions. Defined values are:

| TS | Meaning |
|--------|--|
| 0b0000 | No flag manipulation instructions are implemented. |
| 0b0001 | CFINV, RMIF, SETF16, and SETF8 instructions are implemented. |
| 0b0010 | CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented. |

All other values are reserved.

FEAT_FlagM implements the functionality identified by the value 0b0001.

FEAT_FlagM2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

In Armv8.4, the only permitted value is 0b0001.

From Armv8.5, the only permitted value is 0b0010.

FHM, bits [51:48]

Indicates support for FMLAL and FMLSL instructions. Defined values are:

| FHM | Meaning |
|--------|---|
| 0b0000 | FMLAL and FMLSL instructions are not implemented. |
| 0b0001 | FMLAL and FMLSL instructions are implemented. |

All other values are reserved.

FEAT_FHM implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

DP, bits [47:44]

Indicates support for Dot Product instructions in AArch64 state. Defined values are:

| DP | Meaning |
|--------|--|
| 0b0000 | No Dot Product instructions implemented. |
| 0b0001 | UDOT and SDOT instructions implemented. |

All other values are reserved.

FEAT_DotProd implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

SM4, bits [43:40]

Indicates support for SM4 instructions in AArch64 state. Defined values are:

| SM4 | Meaning |
|--------|--|
| 0b0000 | No SM4 instructions implemented. |
| 0b0001 | SM4E and SM4EKEY instructions implemented. |

All other values are reserved.

If FEAT_SM4 is not implemented, the value 0b0001 is reserved.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM3.

SM3, bits [39:36]

Indicates support for SM3 instructions in AArch64 state. Defined values are:

| SM3 | Meaning |
|--------|--|
| 0b0000 | No SM3 instructions implemented. |
| 0b0001 | SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 instructions implemented. |

All other values are reserved.

If FEAT_SM3 is not implemented, the value 0b0001 is reserved.

FEAT_SM3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM4.

SHA3, bits [35:32]

Indicates support for SHA3 instructions in AArch64 state. Defined values are:

| SHA3 | Meaning |
|--------|---|
| 0b0000 | No SHA3 instructions implemented. |
| 0b0001 | EOR3, RAX1, XAR, and BCAX instructions implemented. |

All other values are reserved.

If FEAT_SHA3 is not implemented, the value 0b0001 is reserved.

FEAT_SHA3 implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0001, ID_AA64ISAR0_EL1.SHA2 must have the value 0b0010.

RDM, bits [31:28]

Indicates support for SQRDMLAH and SQRDMLSH instructions in AArch64 state. Defined values are:

| RDM | Meaning |
|--------|---|
| 0b0000 | No RDMA instructions implemented. |
| 0b0001 | SQRDMLAH and SQRDMLSH instructions implemented. |

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

TME, bits [27:24]

Indicates support for TME instructions. Defined values are:

| TME | Meaning |
|------------|---|
| 0b0000 | TME instructions are not implemented. |
| 0b0001 | TCANCEL, TCOMMIT, TSTART, and TTEST instructions are implemented. |

If [HCR_EL2](#).TME == 0, reads of this field at EL1 return 0.

If [SCR_EL3](#).TME == 0, reads of this field at EL1 or EL2 return 0.

All other values are reserved.

Atomic, bits [23:20]

Indicates support for Atomic instructions in AArch64 state. Defined values are:

| Atomic | Meaning |
|---------------|--|
| 0b0000 | No Atomic instructions implemented. |
| 0b0010 | LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented. |

All other values are reserved.

FEAT_LSE implements the functionality identified by the value 0b0010.

From Armv8.1, the only permitted value is 0b0010.

CRC32, bits [19:16]

Indicates support for CRC32 instructions in AArch64 state. Defined values are:

| CRC32 | Meaning |
|--------------|--|
| 0b0000 | No CRC32 instructions implemented. |
| 0b0001 | CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX instructions implemented. |

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates support for SHA2 instructions in AArch64 state. Defined values are:

| SHA2 | Meaning |
|-------------|---|
| 0b0000 | No SHA2 instructions implemented. |
| 0b0001 | Implements instructions: SHA256H, SHA256H2, SHA256SU0, and SHA256SU1. |
| 0b0010 | Implements instructions: <ul style="list-style-type: none"> SHA256H, SHA256H2, SHA256SU0, and SHA256SU1. SHA512H, SHA512H2, SHA512SU0, and SHA512SU1. |

All other values are reserved.

FEAT_SHA256 implements the functionality identified by the value 0b0001.

FEAT_SHA512 implements the functionality identified by the value 0b0010.

In Armv8, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0010, ID_AA64ISAR0_EL1.SHA3 must have the value 0b0001.

SHA1, bits [11:8]

Indicates support for SHA1 instructions in AArch64 state. Defined values are:

| SHA1 | Meaning |
|--------|--|
| 0b0000 | No SHA1 instructions implemented. |
| 0b0001 | SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 instructions implemented. |

All other values are reserved.

FEAT_SHA1 implements the functionality identified by the value 0b0001.

From Armv8, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA2 is 0b0000, this field must have the value 0b0000.

AES, bits [7:4]

Indicates support for AES instructions in AArch64 state. Defined values are:

| AES | Meaning |
|--------|--|
| 0b0000 | No AES instructions implemented. |
| 0b0001 | AESE, AESD, AESMC, and AESIMC instructions implemented. |
| 0b0010 | As for 0b0001, plus PMULL/PMULL2 instructions operating on 64-bit data quantities. |

FEAT_AES implements the functionality identified by the value 0b0001.

FEAT_PMULL implements the functionality identified by the value 0b0010.

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0010.

Bits [3:0]

Reserved, RES0.

Accessing ID_AA64ISAR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ISAR0_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0110 | 0b000 |

```

if PSTATE.EL == EL0 then

ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1

The ID_AA64ISAR1_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64ISAR1_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

LS64, bits [63:60]

Indicates support for LD64B and ST64B* instructions, and the [ACCDATA_EL1](#) register. Defined values of this field are:

| LS64 | Meaning |
|--------|---|
| 0b0000 | The LD64B and ST64B* instructions, the ACCDATA_EL1 register, and associated traps are not supported. |
| 0b0001 | The LD64B and ST64B instructions are supported. |
| 0b0010 | The LD64B, ST64B, and ST64BV instructions, and their associated traps are supported. |
| 0b0011 | The LD64 and ST64B* instructions, the ACCDATA_EL1 register, and their associated traps are supported. |

All other values are reserved.

FEAT_LS64 implements the functionality identified by 0b0001.

FEAT_LS64_V implements the functionality identified by 0b0010.

FEAT_LS64_ACCDATA implements the functionality identified by 0b0011.

From Armv8.7, the permitted values are 0b0000, 0b0001, 0b0010, and 0b0011.

XS, bits [59:56]

Indicates support for the XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the [HCRX_EL2](#).{FGTnXS, FnXS} fields in AArch64 state. Defined values are:

| XS | Meaning |
|--------|--|
| 0b0000 | The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2 .{FGTnXS, FnXS} fields are not supported. |
| 0b0001 | The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2 .{FGTnXS, FnXS} fields are supported. |

All other values are reserved.

FEAT_XS implements the functionality identified by 0b0001.

From Armv8.7, the only permitted value is 0b0001.

I8MM, bits [55:52]

Indicates support for Advanced SIMD and Floating-point Int8 matrix multiplication instructions in AArch64 state. Defined values are:

| I8MM | Meaning |
|--------|--|
| 0b0000 | Int8 matrix multiplication instructions are not implemented. |
| 0b0001 | SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented. |

All other values are reserved.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID_AA64ZFR0_EL1](#).I8MM.

From Armv8.6, the only permitted value is 0b0001.

DGH, bits [51:48]

Indicates support for the Data Gathering Hint instruction. Defined values are:

| DGH | Meaning |
|--------|---|
| 0b0000 | Data Gathering Hint is not implemented. |
| 0b0001 | Data Gathering Hint is implemented. |

All other values are reserved.

FEAT_DGH implements the functionality identified by 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

If the DGH instruction has no effect in preventing the merging of memory accesses, the value of this field is 0b0000.

BF16, bits [47:44]

Indicates support for Advanced SIMD and Floating-point BFloat16 instructions in AArch64 state. Defined values are:

| BF16 | Meaning |
|--------|--|
| 0b0000 | BFloat16 instructions are not implemented. |
| 0b0001 | BFCVT, BFCVTN, BFCVTN2, BFDOT, BFMLALB, BFMLALT, and BFMMMLA instructions are implemented. |
| 0b0010 | As 0b0001, but the FPCR .EBF field is also supported. |

All other values are reserved.

FEAT_BF16 implements the functionality identified by 0b0001.

FEAT_EBF16 implements the functionality identified by 0b0010.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID_AA64ZFR0_EL1](#).BF16.

From Armv8.6, if FEAT_SME is implemented, the permitted values are 0b0001 and 0b0010.

From Armv8.6, if FEAT_SME is not implemented, the only permitted value is 0b0001.

SPECRES, bits [43:40]

Indicates support for prediction invalidation instructions in AArch64 state. Defined values are:

| SPECRES | Meaning |
|---------|--|
| 0b0000 | CFP RCTX, DVP RCTX, and CPP RCTX instructions are not implemented. |
| 0b0001 | CFP RCTX, DVP RCTX, and CPP RCTX instructions are implemented. |

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [39:36]

Indicates support for SB instruction in AArch64 state. Defined values are:

| SB | Meaning |
|--------|------------------------------------|
| 0b0000 | SB instruction is not implemented. |
| 0b0001 | SB instruction is implemented. |

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

FRINTTS, bits [35:32]

Indicates support for the FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented. Defined values are:

| FRINTTS | Meaning |
|---------|--|
| 0b0000 | FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are not implemented. |
| 0b0001 | FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions are implemented. |

All other values are reserved.

FEAT_FRINTTS implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

GPI, bits [31:28]

Indicates support for an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

| GPI | Meaning |
|--------|---|
| 0b0000 | Generic Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented. |
| 0b0001 | Generic Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This includes the PACGA instruction. |

All other values are reserved.

FEAT_PACIMP implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPA is non-zero, or the value of [ID_AA64ISAR2_EL1.GPA3](#) is non-zero, this field must have the value 0b0000.

GPA, bits [27:24]

Indicates whether the QARMA5 algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

| GPA | Meaning |
|--------|--|
| 0b0000 | Generic Authentication using the QARMA5 algorithm is not implemented. |
| 0b0001 | Generic Authentication using the QARMA5 algorithm is implemented. This includes the PACGA instruction. |

All other values are reserved.

FEAT_PACQARMA5 implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPI is non-zero, or the value of [ID_AA64ISAR2_EL1.GPA3](#) is non-zero, this field must have the value 0b0000.

LRCPC, bits [23:20]

Indicates support for weaker release consistency, RCpc, based model. Defined values are:

| LRCPC | Meaning |
|--------|---|
| 0b0000 | The LDAPR*, LDAPUR*, and STLUR* instructions are not implemented. |
| 0b0001 | The LDAPR* instructions are implemented. The LDAPUR*, and STLUR* instructions are not implemented. |
| 0b0010 | The LDAPR*, LDAPUR*, and STLUR* instructions are implemented. |

All other values are reserved.

FEAT_LRCPC implements the functionality identified by the value 0b0001.

FEAT_LRCPC2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

In Armv8.3, the permitted values are 0b0001 and 0b0010.

From Armv8.4, the only permitted value is 0b0010.

FCMA, bits [19:16]

Indicates support for complex number addition and multiplication, where numbers are stored in vectors. Defined values are:

| FCMA | Meaning |
|--------|---|
| 0b0000 | The FCMLA and FCADD instructions are not implemented. |
| 0b0001 | The FCMLA and FCADD instructions are implemented. |

All other values are reserved.

FEAT_FCMA implements the functionality identified by the value 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

JSCVT, bits [15:12]

Indicates support for JavaScript conversion from double precision floating point values to integers in AArch64 state. Defined values are:

| JSCVT | Meaning |
|--------|---|
| 0b0000 | The FJCVTZS instruction is not implemented. |
| 0b0001 | The FJCVTZS instruction is implemented. |

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

API, bits [11:8]

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

| API | Meaning |
|--------|--|
| 0b0000 | Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented. |
| 0b0001 | Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE. |
| 0b0010 | Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE, and the HaveEnhancedPAC2() function returning FALSE. |
| 0b0011 | Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE. |
| 0b0100 | Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE. |
| 0b0101 | Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE. |

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.

FEAT_EPAC implements the functionality identified by 0b0010.

FEAT_PAuth2 implements the functionality identified by 0b0011.

FEAT_FPAC implements the functionality identified by 0b0100.

FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

When this field is non-zero, FEAT_PACIMP is implemented.

In Armv8.3, the permitted values are 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.APA is non-zero, or the value of [ID_AA64ISAR2_EL1.APA3](#) is non-zero, this field must have the value 0b0000.

APA, bits [7:4]

Indicates whether the QARMA5 algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

| APA | Meaning |
|--------|--|
| 0b0000 | Address Authentication using the QARMA5 algorithm is not implemented. |
| 0b0001 | Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE. |
| 0b0010 | Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE. |
| 0b0011 | Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE. |
| 0b0100 | Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE. |
| 0b0101 | Address Authentication using the QARMA5 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE. |

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.

FEAT_EPAC implements the functionality identified by 0b0010.

FEAT_PAuth2 implements the functionality identified by 0b0011.

FEAT_FPAC implements the functionality identified by 0b0100.

FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

When this field is non-zero, FEAT_PACQARMA5 is implemented.

In Armv8.3, the permitted values are 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of ID_AA64ISAR1_EL1.API is non-zero, or the value of [ID_AA64ISAR2_EL1.APA3](#) is non-zero, this field must have the value 0b0000.

DPB, bits [3:0]

Data Persistence writeback. Indicates support for the [DC CVAP](#) and [DC CVADP](#) instructions in AArch64 state. Defined values are:

| DPB | Meaning |
|--------|---|
| 0b0000 | DC CVAP not supported. |
| 0b0001 | DC CVAP supported. |
| 0b0010 | DC CVAP and DC CVADP supported. |

All other values are reserved.

FEAT_DPB implements the functionality identified by the value 0b0001.

FEAT_DPB2 implements the functionality identified by the value 0b0010.

In Armv8.2, the permitted values are 0b0001 and 0b0010.

From Armv8.5, the only permitted value is 0b0010.

Accessing ID_AA64ISAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ISAR1_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0110 | 0b001 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64ISAR1_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_AA64ISAR1_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_AA64ISAR1_EL1;

```

ID_AA64ISAR2_EL1, AArch64 Instruction Set Attribute Register 2

The ID_AA64ISAR2_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64ISAR2_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----------|----|----|----|----|----|----|----|------|----|----|----|------|----|----|----|------|----|----|----|-------|----|----|----|------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | PAC_frac | | | | BC | | | | MOPS | | | | APA3 | | | | GPA3 | | | | RPRES | | | | WFXt | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:28]

Reserved, RES0.

PAC_frac, bits [27:24]

Indicates whether the ConstPACField() function used as part of the PAC addition returns FALSE or TRUE.

| PAC_frac | Meaning |
|----------|--------------------------------|
| 0b0000 | ConstPACField() returns FALSE. |
| 0b0001 | ConstPACField() returns TRUE. |

All other values are reserved.

FEAT_CONSTPACFIELD implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

BC, bits [23:20]

Indicates support for the BC instruction in AArch64 state. Defined values are:

| BC | Meaning |
|--------|------------------------------------|
| 0b0000 | BC instruction is not implemented. |
| 0b0001 | BC instruction is implemented. |

All other values are reserved.

FEAT_HBC implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

MOPS, bits [19:16]

Indicates support for the Memory Copy and Memory Set instructions in AArch64 state.

| MOPS | Meaning |
|--------|--|
| 0b0000 | The Memory Copy and Memory Set instructions are not implemented in AArch64 state. |
| 0b0001 | The Memory Copy and Memory Set instructions are implemented in AArch64 state with the following exception. If FEAT_MTE is implemented, then SETGP*, SETGM* and SETGE* instructions are also supported. |

All other values are reserved.

FEAT_MOPS implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

APA3, bits [15:12]

Indicates whether the QARMA3 algorithm is implemented in the PE for address authentication in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction. Defined values are:

| APA3 | Meaning |
|--------|--|
| 0b0000 | Address Authentication using the QARMA3 algorithm is not implemented. |
| 0b0001 | Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC() and HaveEnhancedPAC2() functions returning FALSE. |
| 0b0010 | Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC() function returning TRUE and the HaveEnhancedPAC2() function returning FALSE. |
| 0b0011 | Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning FALSE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE. |
| 0b0100 | Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning FALSE, and the HaveEnhancedPAC() function returning FALSE. |
| 0b0101 | Address Authentication using the QARMA3 algorithm is implemented, with the HaveEnhancedPAC2() function returning TRUE, the HaveFPAC() function returning TRUE, the HaveFPACCombined() function returning TRUE, and the HaveEnhancedPAC() function returning FALSE. |

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.

FEAT_EPAC implements the functionality identified by 0b0010.

FEAT_PAuth2 implements the functionality identified by 0b0011.

FEAT_FPAC implements the functionality identified by 0b0100.

FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

When this field is non-zero, FEAT_PACQARMA3 is implemented.

In Armv8.3, the permitted values are 0b0000, 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.

From Armv8.6, the permitted values are 0b0011, 0b0100, and 0b0101.

If the value of [ID_AA64ISAR1_EL1.API](#) is non-zero, or the value of [ID_AA64ISAR1_EL1.APA](#) is non-zero, this field must have the value 0b0000.

GPA3, bits [11:8]

Indicates whether the QARMA3 algorithm is implemented in the PE for generic code authentication in AArch64 state. Defined values are:

| GPA3 | Meaning |
|--------|--|
| 0b0000 | Generic Authentication using the QARMA3 algorithm is not implemented. |
| 0b0001 | Generic Authentication using the QARMA3 algorithm is implemented. This includes the PACGA instruction. |

All other values are reserved.

FEAT_PACQARMA3 implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of [ID_AA64ISAR1_EL1.GPI](#) is non-zero, or the value of [ID_AA64ISAR1_EL1.GPA](#) is non-zero, this field must have the value 0b0000.

RPRES, bits [7:4]

When [FPCR.AH](#) is 1, indicates support for 12 bits of mantissa in reciprocal and reciprocal square root instructions in AArch64 state. Defined values are:

| RPRES | Meaning |
|--------|---|
| 0b0000 | Reciprocal and reciprocal square root estimates give 8 bits of mantissa. |
| 0b0001 | Reciprocal and reciprocal square root estimates give 12 bits of mantissa. |

All other values are reserved.

FEAT_RPRES implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

WFxT, bits [3:0]

Indicates support for the WFET and WFIT instructions in AArch64 state. Defined values are:

| WFxT | Meaning |
|--------|--|
| 0b0000 | WFET and WFIT are not supported. |
| 0b0010 | WFET and WFIT are supported, and the register number is reported in the ESR_ELx on exceptions. |

All other values are reserved.

FEAT_WFxT implements the functionality identified by the value 0b0010.

From Armv8.7, the only permitted value is 0b0010.

Accessing ID_AA64ISAR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ISAR2_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0110 | 0b010 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64ISAR2_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_AA64ISAR2_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_AA64ISAR2_EL1;

```

ID_AA64MMFR0_EL1, AArch64 Memory Model Feature Register 0

The ID_AA64MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64MMFR0_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|---------|----|----|----|---------|----|----|----|-----------|----|----|----|--------|----|----|----|----------|----|----|----|-----------|----|----|----|-----------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ECV | | | | FGT | | | | RES0 | | | | | | | | ExS | | | | TGran4_2 | | | | TGran64_2 | | | | TGran16_2 | | | |
| TGran4 | | | | TGran64 | | | | TGran16 | | | | BigEndEL0 | | | | SNSMem | | | | BigEnd | | | | ASIDBits | | | | PARange | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ECV, bits [63:60]

Indicates presence of Enhanced Counter Virtualization. Defined values are:

| ECV | Meaning |
|--------|--|
| 0b0000 | Enhanced Counter Virtualization is not implemented. |
| 0b0001 | Enhanced Counter Virtualization is implemented. Supports CNTHCTL_EL2 .{EL1TVT, EL1TVCT, EL1NVPCT, EL1NVVCT, EVNTIS}, CNTKCTL_EL1 .EVNTIS, CNTPCTSS_EL0 counter views, and CNTVCTSS_EL0 counter views. Extends the PMSCR_EL1 .PCT, PMSCR_EL2 .PCT, TRFCR_EL1 .TS, and TRFCR_EL2 .TS fields. |
| 0b0010 | As 0b0001, and also includes support for CNTHCTL_EL2 .ECV and CNTPOFF_EL2 . |

All other values are reserved.

FEAT_ECV implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.6, the only permitted values are 0b0001 and 0b0010.

FGT, bits [59:56]

Indicates presence of the Fine-Grained Trap controls:

- If EL2 is implemented, the [HAFGRTR_EL2](#), [HDFGRTR_EL2](#), [HDFGWTR_EL2](#), [HFGRTR_EL2](#), [HFGITR_EL2](#) and [HFGWTR_EL2](#) registers, and their associated traps.
- If EL2 is implemented, [MDCR_EL2](#).TDCC.
- If EL3 is implemented, [MDCR_EL3](#).TDCC.
- If both EL2 and EL3 are implemented, [SCR_EL3](#).FGTEn.

Defined values are:

| FGT | Meaning |
|--------|---|
| 0b0000 | The fine-grained trap controls are not implemented. |
| 0b0001 | The fine-grained trap controls are implemented. |

All other values are reserved.

FEAT_FGT implements the functionality identified by the value 0b0001.

From Armv8.6, the only permitted value is 0b0001.

Bits [55:48]

Reserved, RES0.

ExS, bits [47:44]

Indicates support for disabling context synchronizing exception entry and exit. Defined values are:

| ExS | Meaning |
|--------|---|
| 0b0000 | All exception entries and exits are context synchronization events. |
| 0b0001 | Non-context synchronizing exception entry and exit are supported. |

All other values are reserved.

FEAT_ExS implements the functionality identified by the value 0b0001.

TGran4_2, bits [43:40]

Indicates support for 4KB memory granule size at stage 2. Defined values are:

| TGran4_2 | Meaning | Applies when |
|----------|--|-------------------------------|
| 0b0000 | Support for 4KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran4 field. | When FEAT_LPA2 is implemented |
| 0b0001 | 4KB granule not supported at stage 2. | |
| 0b0010 | 4KB granule supported at stage 2. | |
| 0b0011 | 4KB granule at stage 2 supports 52-bit input and output addresses. | |

All other values are reserved.

The 0b0000 value is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

TGran64_2, bits [39:36]

Indicates support for 64KB memory granule size at stage 2. Defined values are:

| TGran64_2 | Meaning |
|-----------|--|
| 0b0000 | Support for 64KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran64 field. |
| 0b0001 | 64KB granule not supported at stage 2. |
| 0b0010 | 64KB granule supported at stage 2. |

All other values are reserved.

The 0b0000 value is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

TGran16_2, bits [35:32]

Indicates support for 16KB memory granule size at stage 2. Defined values are:

| TGran16_2 | Meaning | Applies when |
|------------------|--|-------------------------------|
| 0b0000 | Support for 16KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran16 field. | When FEAT_LPA2 is implemented |
| 0b0001 | 16KB granule not supported at stage 2. | |
| 0b0010 | 16KB granule supported at stage 2. | |
| 0b0011 | 16KB granule at stage 2 supports 52-bit input and output addresses. | |

All other values are reserved.

The 0b0000 value is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

TGran4, bits [31:28]

Indicates support for 4KB memory translation granule size. Defined values are:

| TGran4 | Meaning | Applies when |
|---------------|---|-------------------------------|
| 0b0000 | 4KB granule supported. | When FEAT_LPA2 is implemented |
| 0b0001 | 4KB granule supports 52-bit input and output addresses. | |
| 0b1111 | 4KB granule not supported. | |

All other values are reserved.

TGran64, bits [27:24]

Indicates support for 64KB memory translation granule size. Defined values are:

| TGran64 | Meaning |
|----------------|-----------------------------|
| 0b0000 | 64KB granule supported. |
| 0b1111 | 64KB granule not supported. |

All other values are reserved.

TGran16, bits [23:20]

Indicates support for 16KB memory translation granule size. Defined values are:

| TGran16 | Meaning | Applies when |
|---------|--|-------------------------------|
| 0b0000 | 16KB granule not supported. | When FEAT_LPA2 is implemented |
| 0b0001 | 16KB granule supported. | |
| 0b0010 | 16KB granule supports 52-bit input and output addresses. | |

All other values are reserved.

BigEndEL0, bits [19:16]

Indicates support for mixed-endian at EL0 only. Defined values are:

| BigEndEL0 | Meaning |
|-----------|--|
| 0b0000 | No mixed-endian support at EL0. The SCTLR_EL1.E0E bit has a fixed value. |
| 0b0001 | Mixed-endian support at EL0. The SCTLR_EL1.E0E bit can be configured. |

All other values are reserved.

This field is invalid and is RES0 if ID_AA64MMFR0_EL1.BigEnd is not 0b0000.

SNSMem, bits [15:12]

Indicates support for a distinction between Secure and Non-secure Memory. Defined values are:

| SNSMem | Meaning |
|--------|--|
| 0b0000 | Does not support a distinction between Secure and Non-secure Memory. |
| 0b0001 | Does support a distinction between Secure and Non-secure Memory. |

Note

If EL3 is implemented, the value 0b0000 is not permitted.

All other values are reserved.

BigEnd, bits [11:8]

Indicates support for mixed-endian configuration. Defined values are:

| BigEnd | Meaning |
|--------|---|
| 0b0000 | No mixed-endian support. The SCTLR_ELx.EE bits have a fixed value. See the BigEndEL0 field, bits[19:16], for whether EL0 supports mixed-endian. |
| 0b0001 | Mixed-endian support. The SCTLR_ELx.EE and SCTLR_EL1.E0E bits can be configured. |

All other values are reserved.

ASIDBits, bits [7:4]

Number of ASID bits. Defined values are:

| ASIDBits | Meaning |
|----------|----------|
| 0b0000 | 8 bits. |
| 0b0010 | 16 bits. |

All other values are reserved.

PARange, bits [3:0]

Physical Address range supported. Defined values are:

| PARange | Meaning |
|---------|-----------------|
| 0b0000 | 32 bits, 4GB. |
| 0b0001 | 36 bits, 64GB. |
| 0b0010 | 40 bits, 1TB. |
| 0b0011 | 42 bits, 4TB. |
| 0b0100 | 44 bits, 16TB. |
| 0b0101 | 48 bits, 256TB. |
| 0b0110 | 52 bits, 4PB. |

All other values are reserved.

The value 0b0110 is permitted only if the implementation includes FEAT_LPA, otherwise it is reserved.

Accessing ID_AA64MMFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR0_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0111 | 0b000 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64MMFR0_EL1;
elseif PSTATE.EL == EL2 then
    return ID_AA64MMFR0_EL1;
elseif PSTATE.EL == EL3 then
    return ID_AA64MMFR0_EL1;

```

ID_AA64MMFR1_EL1, AArch64 Memory Model Feature Register 1

The ID_AA64MMFR1_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64MMFR1_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|---------|----|----|----|--------|----|----|----|--------|----|----|----|------|----|----|----|-----|----|----|----------|----|----|----|----|--------|----|----|----|

| RES0 | | | | CMOW | | | | TIDCP1 | | | | nTLBPA | | | | AFP | | | | HCX | | | ETS | | | | | TWED | | | |
| XNX | | | | SpecSEI | | | | PAN | | | | LO | | | | HPDS | | | | VH | | | VMIDBits | | | | | HAFDBS | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:60]

Reserved, RES0.

CMOW, bits [59:56]

Indicates support for cache maintenance instruction permission. Defined values are:

| CMOW | Meaning |
|--------|---|
| 0b0000 | SCTLR_EL1 .CMOW, SCTLR_EL2 .CMOW, and HCRX_EL2 .CMOW bits are not implemented. |
| 0b0001 | SCTLR_EL1 .CMOW is implemented. If EL2 is implemented, SCTLR_EL2 .CMOW and HCRX_EL2 .CMOW bits are implemented. |

All other values are reserved.

FEAT_CMOW implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

TIDCP1, bits [55:52]

Indicates whether [SCTLR_EL1](#).TIDCP and [SCTLR_EL2](#).TIDCP are implemented in AArch64 state. Defined values are:

| TIDCP1 | Meaning |
|---------------|--|
| 0b0000 | SCTLR_EL1 .TIDCP and SCTLR_EL2 .TIDCP bits are not implemented and are RES0. |
| 0b0001 | SCTLR_EL1 .TIDCP bit is implemented. If EL2 is implemented, SCTLR_EL2 .TIDCP bit is implemented. |

All other values are reserved.

FEAT_TIDCP1 implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

nTLBPA, bits [51:48]

Indicates support for intermediate caching of translation table walks. Defined values are:

| nTLBPA | Meaning |
|---------------|--|
| 0b0000 | The intermediate caching of translation table walks might include non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE where either: <ul style="list-style-type: none"> The caching is indexed by the physical address of the location holding the translation table entry. The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry. |
| 0b0001 | The intermediate caching of translation table walks does not include non-coherent caches of previous valid translation table entries since the last completed TLBI applicable to the PE where either: <ul style="list-style-type: none"> The caching is indexed by the physical address of the location holding the translation table entry. The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry. |

All other values are reserved.

FEAT_nTLBPA implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

AFP, bits [47:44]

Indicates support for [FPCR](#).{AH, FIZ, NEP}. Defined values are:

| AFP | Meaning |
|------------|--|
| 0b0000 | The FPCR .{AH, FIZ, NEP} fields are not supported. |
| 0b0001 | The FPCR .{AH, FIZ, NEP} fields are supported. |

All other values are reserved.

FEAT_AFP implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the only permitted value is 0b0001.

HCX, bits [43:40]

Indicates support for [HCRX_EL2](#) and its associated EL3 trap. Defined values are:

| HCX | Meaning |
|------------|---|
| 0b0000 | HCRX_EL2 and its associated EL3 trap are not supported. |
| 0b0001 | HCRX_EL2 and its associated EL3 trap are supported. |

All other values are reserved.

FEAT_HCX implements the functionality identified by the value 0b0001.

From Armv8.7, if EL2 is implemented, the only permitted value is 0b0001.

ETS, bits [39:36]

Indicates support for Enhanced Translation Synchronization. Defined values are:

| ETS | Meaning |
|--------|--|
| 0b0000 | Enhanced Translation Synchronization is not supported. |
| 0b0001 | Enhanced Translation Synchronization is supported. |

All other values are reserved.

FEAT_ETTS implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

TWED, bits [35:32]

Indicates support for the configurable delayed trapping of WFE. Defined values are:

| TWED | Meaning |
|--------|--|
| 0b0000 | Configurable delayed trapping of WFE is not supported. |
| 0b0001 | Configurable delayed trapping of WFE is supported. |

All other values are reserved.

FEAT_TWED implements the functionality identified by the value 0b0001.

From Armv8.6, the permitted values are 0b0000 and 0b0001.

XNX, bits [31:28]

Indicates support for execute-never control distinction by Exception level at stage 2. Defined values are:

| XNX | Meaning |
|--------|---|
| 0b0000 | Distinction between EL0 and EL1 execute-never control at stage 2 not supported. |
| 0b0001 | Distinction between EL0 and EL1 execute-never control at stage 2 supported. |

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [27:24]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

| SpecSEI | Meaning |
|---------|--|
| 0b0000 | The PE never generates an SError interrupt due to an External abort on a speculative read. |
| 0b0001 | The PE might generate an SError interrupt due to an External abort on a speculative read. |

All other values are reserved.

PAN, bits [23:20]

Privileged Access Never. Indicates support for the PAN bit in PSTATE, [SPSR_EL1](#), [SPSR_EL2](#), [SPSR_EL3](#), and [DPSR_EL0](#). Defined values are:

| PAN | Meaning |
|--------|--|
| 0b0000 | PAN not supported. |
| 0b0001 | PAN supported. |
| 0b0010 | PAN supported and AT S1E1RP and AT S1E1WP instructions supported. |
| 0b0011 | PAN supported, AT S1E1RP and AT S1E1WP instructions supported, and SCTLR_EL1.EPAN and SCTLR_EL2.EPAN bits supported. |

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

FEAT_PAN3 implements the functionality added by the value 0b0011.

In Armv8.1, the permitted values are 0b0001, 0b0010, and 0b0011.

From Armv8.2, the permitted values are 0b0010 and 0b0011.

From Armv8.7, the only permitted value is 0b0011.

LO, bits [19:16]

LORegions. Indicates support for LORegions. Defined values are:

| LO | Meaning |
|--------|--------------------------|
| 0b0000 | LORegions not supported. |
| 0b0001 | LORegions supported. |

All other values are reserved.

FEAT_LOR implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

HPDS, bits [15:12]

Hierarchical Permission Disables. Indicates support for disabling hierarchical controls in translation tables. Defined values are:

| HPDS | Meaning |
|--------|--|
| 0b0000 | Disabling of hierarchical controls not supported. |
| 0b0001 | Disabling of hierarchical controls supported with the TCR_EL1 .{HPD1, HPD0}, TCR_EL2 .HPD or TCR_EL2 .{HPD1, HPD0}, and TCR_EL3 .HPD bits. |
| 0b0010 | As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use. |

All other values are reserved.

FEAT_HPDS implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality identified by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

VH, bits [11:8]

Virtualization Host Extensions. Defined values are:

| VH | Meaning |
|--------|---|
| 0b0000 | Virtualization Host Extensions not supported. |
| 0b0001 | Virtualization Host Extensions supported. |

All other values are reserved.

FEAT_VHE implements the functionality identified by the value 0b0001.

From Armv8.1, the only permitted value is 0b0001.

VMIDBits, bits [7:4]

Number of VMID bits. Defined values are:

| VMIDBits | Meaning |
|----------|---------|
| 0b0000 | 8 bits |
| 0b0010 | 16 bits |

All other values are reserved.

FEAT_VMID16 implements the functionality identified by the value 0b0010.

From Armv8.1, the permitted values are 0b0000 and 0b0010.

HAFDBS, bits [3:0]

Hardware updates to Access flag and Dirty state in translation tables. Defined values are:

| HAFDBS | Meaning |
|--------|---|
| 0b0000 | Hardware update of the Access flag and dirty state are not supported. |
| 0b0001 | Hardware update of the Access flag is supported. |
| 0b0010 | Hardware update of both the Access flag and dirty state is supported. |

All other values are reserved.

FEAT_HAFDBS implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.1, the permitted values are 0b0000, 0b0001, and 0b0010.

Accessing ID_AA64MMFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR1_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0111 | 0b001 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64MMFR1_EL1;
elseif PSTATE.EL == EL2 then
    return ID_AA64MMFR1_EL1;
elseif PSTATE.EL == EL3 then
    return ID_AA64MMFR1_EL1;

```

ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2

The ID_AA64MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64MMFR2_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-----|----|----|----|-------|----|----|----|---------|----|----|----|------|----|----|----|-----|----|----|----|-----|----|----|----|-----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| EOPD | | | | EVT | | | | BBM | | | | TTL | | | | RES0 | | | | FWB | | | | IDS | | | | AT | | | |
| ST | | | | NV | | | | CCIDX | | | | VARange | | | | IESB | | | | LSM | | | | UAO | | | | CnP | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

EOPD, bits [63:60]

Indicates support for the EOPD mechanism. Defined values are:

| EOPD | Meaning |
|--------|-------------------------------------|
| 0b0000 | EOPDx mechanism is not implemented. |
| 0b0001 | EOPDx mechanism is implemented. |

All other values are reserved.

FEAT_EOPD implements the functionality identified by the value 0b0001.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_EOPD is implemented, FEAT_CSV3 must be implemented.

EVT, bits [59:56]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the [HCR_EL2](#).{TTLBOS, TLBIS, TOCU, TICAB, TID4} traps. Defined values are:

| EVT | Meaning |
|------------|---|
| 0b0000 | HCR_EL2 .{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are not supported. |
| 0b0001 | HCR_EL2 .{TOCU, TICAB, TID4} traps are supported. HCR_EL2 .{TTLBOS, TTLBIS} traps are not supported. |
| 0b0010 | HCR_EL2 .{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are supported. |

All other values are reserved.

FEAT_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0010 when EL2 is implemented.

BBM, bits [55:52]

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block size for a translation.

| BBM | Meaning |
|------------|---|
| 0b0000 | Level 0 support for changing block size is supported. |
| 0b0001 | Level 1 support for changing block size is supported. |
| 0b0010 | Level 2 support for changing block size is supported. |

All other values are reserved.

FEAT_BBIM implements the functionality identified by the values 0b0000, 0b0001, and 0b0010.

From Armv8.4, the permitted values are 0b0000, 0b0001, and 0b0010.

TTL, bits [51:48]

Indicates support for TTL field in address operations. Defined values are:

| TTL | Meaning |
|------------|---|
| 0b0000 | TLB maintenance instructions by address have bits[47:44] as RES0. |
| 0b0001 | TLB maintenance instructions by address have bits[47:44] holding the TTL field. |

All other values are reserved.

FEAT_TTL implements the functionality identified by the value 0b0001.

This field affects [TLBI IPAS2E1](#), [TLBI IPAS2E1IS](#), [TLBI IPAS2E1OS](#), [TLBI IPAS2LE1](#), [TLBI IPAS2LE1IS](#), [TLBI IPAS2LE1OS](#), [TLBI VAAE1](#), [TLBI VAAE1IS](#), [TLBI VAAE1OS](#), [TLBI VAALE1](#), [TLBI VAALE1IS](#), [TLBI VAALE1OS](#), [TLBI VAE1](#), [TLBI VAE1IS](#), [TLBI VAE1OS](#), [TLBI VAE2](#), [TLBI VAE2IS](#), [TLBI VAE2OS](#), [TLBI VAE3](#), [TLBI VAE3IS](#), [TLBI VAE3OS](#), [TLBI VALE1](#), [TLBI VALE1IS](#), [TLBI VALE1OS](#), [TLBI VALE2](#), [TLBI VALE2IS](#), [TLBI VALE2OS](#), [TLBI VALE3](#), [TLBI VALE3IS](#), [TLBI VALE3OS](#).

From Armv8.4, the only permitted value is 0b0001.

Bits [47:44]

Reserved, RES0.

FWB, bits [43:40]

Indicates support for [HCR_EL2](#).FWB. Defined values are:

| FWB | Meaning |
|------------|--|
| 0b0000 | HCR_EL2 .FWB bit is not supported. |
| 0b0001 | HCR_EL2 .FWB is supported. |

All other values reserved.

FEAT_S2FWB implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

IDS, bits [39:36]

Indicates the value of ESR_ELx.EC that reports an exception generated by a read access to the feature ID space. Defined values are:

| IDS | Meaning |
|------------|---|
| 0b0000 | An exception which is generated by a read access to the feature ID space, other than a trap caused by HCR_EL2 .TIDx, SCTLR_EL1 .UCT, or SCTLR_EL2 .UCT, is reported by ESR_ELx.EC == 0x0. |
| 0b0001 | All exceptions generated by an AArch64 read access to the feature ID space are reported by ESR_ELx.EC == 0x18. |

All other values are reserved.

The Feature ID space is defined as the System register space in AArch64 with op0==3, op1=={0, 1, 3}, CRn==0, CRm=={0-7}, op2=={0-7}.

FEAT_IDST implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AT, bits [35:32]

Identifies support for unaligned single-copy atomicity and atomic functions. Defined values are:

| AT | Meaning |
|-----------|--|
| 0b0000 | Unaligned single-copy atomicity and atomic functions are not supported. |
| 0b0001 | Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported. |

All other values are reserved.

FEAT_LSE2 implements the functionality identified by the value 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

ST, bits [31:28]

Identifies support for small translation tables. Defined values are:

| ST | Meaning |
|-----------|--|
| 0b0000 | The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 39. |
| 0b0001 | The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules. |

All other values are reserved.

FEAT_TTST implements the functionality identified by the value 0b0001.

If FEAT_SEL2 is implemented, the only permitted value is 0b0001.

In an implementation which does not support FEAT_SEL2, the permitted values are 0b0000 and 0b0001.

NV, bits [27:24]

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization. Defined values are:

| NV | Meaning |
|-----------|---|
| 0b0000 | Nested virtualization is not supported. |
| 0b0001 | The HCR_EL2 .{AT, NV1, NV} bits are implemented. |
| 0b0010 | The VNCR_EL2 register and the HCR_EL2 .{NV2, AT, NV1, NV} bits are implemented. |

All other values are reserved.

If EL2 is not implemented, the only permitted value is 0b0000.

FEAT_NV implements the functionality identified by the value 0b0001.

FEAT_NV2 implements the functionality identified by the value 0b0010.

In Armv8.3, if EL2 is implemented, the permitted values are 0b0000 and 0b0001.

From Armv8.4, if EL2 is implemented, the permitted values are 0b0000, 0b0001, and 0b0010.

CCIDX, bits [23:20]

Support for the use of revised [CCSIDR_EL1](#) register format. Defined values are:

| CCIDX | Meaning |
|--------------|--|
| 0b0000 | 32-bit format implemented for all levels of the CCSIDR_EL1 . |
| 0b0001 | 64-bit format implemented for all levels of the CCSIDR_EL1 . |

All other values are reserved.

FEAT_CCIDX implements the functionality identified by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

VARange, bits [19:16]

Indicates support for a larger virtual address. Defined values are:

| VARange | Meaning |
|----------------|--|
| 0b0000 | VMSAv8-64 supports 48-bit VAs. |
| 0b0001 | VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The size for other translation granules is not defined by this field. |

All other values are reserved.

FEAT_LVA implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

IESB, bits [15:12]

Indicates support for the IESB bit in the SCTLR_ELx registers. Defined values are:

| IESB | Meaning |
|-------------|---|
| 0b0000 | IESB bit in the SCTLR_ELx registers is not supported. |
| 0b0001 | IESB bit in the SCTLR_ELx registers is supported. |

All other values are reserved.

FEAT_IESB implements the functionality identified by the value 0b0001.

LSM, bits [11:8]

Indicates support for LSMAOE and nTLSMD bits in [SCTLR_EL1](#) and [SCTLR_EL2](#). Defined values are:

| LSM | Meaning |
|--------|---------------------------------------|
| 0b0000 | LSMAOE and nTLSMD bits not supported. |
| 0b0001 | LSMAOE and nTLSMD bits supported. |

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

UAO, bits [7:4]

User Access Override. Defined values are:

| UAO | Meaning |
|--------|--------------------|
| 0b0000 | UAO not supported. |
| 0b0001 | UAO supported. |

All other values are reserved.

FEAT_UAO implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

CnP, bits [3:0]

Indicates support for Common not Private translations. Defined values are:

| CnP | Meaning |
|--------|--|
| 0b0000 | Common not Private translations not supported. |
| 0b0001 | Common not Private translations supported. |

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Accessing ID_AA64MMFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR2_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0111 | 0b010 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!IsZero(ID_AA64MMFR2_EL1) || boolean IMPLEMENTATION_DEFINED
"ID_AA64MMFR2_EL1 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64MMFR2_EL1;
elseif PSTATE.EL == EL2 then
    return ID_AA64MMFR2_EL1;
elseif PSTATE.EL == EL3 then
    return ID_AA64MMFR2_EL1;

```

ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0

The ID_AA64PFR0_EL1 characteristics are:

Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

The external register [EDPFR](#) gives information from this register.

Attributes

ID_AA64PFR0_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------|----|----|----|----|----------------------|----|----|----|-------------------------|----|----|---------------------|----|----|----|---------------------|----|----|----|----------------------|----|----|----------------------|----|----|----|----|---------------------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| CSV3 | | | | | CSV2 | | | | RME | | | DIT | | | | AMU | | | | MPAM | | | SEL2 | | | | | SVE | | | |
| RAS | | | | | GIC | | | | AdvSIMD | | | FP | | | | EL3 | | | | EL2 | | | EL1 | | | | | EL0 | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

CSV3, bits [63:60]

Speculative use of faulting data. Defined values are:

| CSV3 | Meaning |
|--------|--|
| 0b0000 | This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence. |
| 0b0001 | Data loaded under speculation with a permission or domain fault cannot be used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence. The execution timing of any other instructions in the speculative sequence is not a function of the data loaded under speculation. |

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

CSV2, bits [59:56]

Speculative use of out of context branch targets. Defined values are:

| CSV2 | Meaning |
|--------|---|
| 0b0000 | This PE does not disclose whether branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context. |
| 0b0001 | Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Contexts do not include the SCXTNUM_ELx register contexts. Support for the SCXTNUM_ELx registers is defined in ID_AA64PFR1_EL1.CSV2_frac . |
| 0b0010 | Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. The SCXTNUM_ELx registers are supported and the contexts include the SCXTNUM_ELx register contexts. |

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the value 0b0001.

FEAT_CSV2_2 implements the functionality identified by the value 0b0010.

In Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

RME, bits [55:52]

Realm Management Extension (RME). Defined values are:

| RME | Meaning |
|--------|---|
| 0b0000 | Realm Management Extension not implemented. |
| 0b0001 | RMEv1 is implemented. |

All other values are reserved.

FEAT_RME implements the functionality identified by the value 0b0001.

DIT, bits [51:48]

Data Independent Timing. Defined values are:

| DIT | Meaning |
|--------|---|
| 0b0000 | AArch64 does not guarantee constant execution time of any instructions. |
| 0b0001 | AArch64 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions. |

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension. Defined values are:

| AMU | Meaning |
|--------|--|
| 0b0000 | Activity Monitors Extension is not implemented. |
| 0b0001 | FEAT_AMUv1 is implemented. |
| 0b0010 | FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters. |

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

MPAM, bits [43:40]

Indicates support for MPAM Extension. Defined values are:

| MPAM | Meaning |
|--------|---|
| 0b0000 | If ID_AA64PFR1_EL1.MPAM_frac == 0b0000 , MPAM Extension is not implemented. |
| | If ID_AA64PFR1_EL1.MPAM_frac == 0b0001 , MPAM Extension version 0.1 is implemented. |
| 0b0001 | If ID_AA64PFR1_EL1.MPAM_frac == 0b0000 , MPAM Extension version 1.0 is implemented. |
| | If ID_AA64PFR1_EL1.MPAM_frac == 0b0001 , MPAM Extension version 1.1 is implemented. |

All other values are reserved.

SEL2, bits [39:36]

Secure EL2. Defined values are:

| SEL2 | Meaning |
|--------|--------------------------------|
| 0b0000 | Secure EL2 is not implemented. |
| 0b0001 | Secure EL2 is implemented. |

All other values are reserved.

FEAT_SEL2 implements the functionality identified by the value 0b0001.

SVE, bits [35:32]

Scalable Vector Extension. Defined values are:

| SVE | Meaning |
|--------|---|
| 0b0000 | SVE architectural state and programmers' model are not implemented. |
| 0b0001 | SVE architectural state and programmers' model are implemented. |

All other values are reserved.

If implemented, refer to [ID_AA64ZFR0_EL1](#) for information about which SVE instructions are available.

RAS, bits [31:28]

RAS Extension version. Defined values are:

| RAS | Meaning |
|------------|--|
| 0b0000 | No RAS Extension. |
| 0b0001 | RAS Extension implemented. |
| 0b0010 | FEAT_RASv1p1 implemented and, if EL3 is implemented, FEAT_DoubleFault implemented. As 0b0001, and adds support for: <ul style="list-style-type: none"> If EL3 is implemented, FEAT_DoubleFault. Additional ERXMISC<m>_EL1 System registers. Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions. |

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 and FEAT_DoubleFault implement the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT_DoubleFault is not implemented, and [ERRIDR_EL1](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

Note

When the value of this field is 0b0001, [ID_AA64PFR1_EL1](#).RAS_frac indicates whether FEAT_RASv1p1 is implemented.

GIC, bits [27:24]

System register GIC CPU interface. Defined values are:

| GIC | Meaning |
|------------|--|
| 0b0000 | GIC CPU interface system registers not implemented. |
| 0b0001 | System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported. |
| 0b0011 | System register interface to version 4.1 of the GIC CPU interface is supported. |

All other values are reserved.

AdvSIMD, bits [23:20]

Advanced SIMD. Defined values are:

| AdvSIMD | Meaning |
|----------------|--|
| 0b0000 | Advanced SIMD is implemented, including support for the following Sisd and SIMD operations: <ul style="list-style-type: none"> Integer byte, halfword, word and doubleword element operations. Single-precision and double-precision floating-point arithmetic. Conversions between single-precision and half-precision data types, and double-precision and half-precision data types. |
| 0b0001 | As for 0b0000, and also includes support for half-precision floating-point arithmetic. |
| 0b1111 | Advanced SIMD is not implemented. |

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

FP, bits [19:16]

Floating-point. Defined values are:

| FP | Meaning |
|-----------|---|
| 0b0000 | Floating-point is implemented, and includes support for: <ul style="list-style-type: none"> Single-precision and double-precision floating-point types. Conversions between single-precision and half-precision data types, and double-precision and half-precision data types. |
| 0b0001 | As for 0b0000, and also includes support for half-precision floating-point arithmetic. |
| 0b1111 | Floating-point is not implemented. |

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with floating-point support that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without floating-point support.

EL3, bits [15:12]

EL3 Exception level handling. Defined values are:

| EL3 | Meaning |
|------------|---|
| 0b0000 | EL3 is not implemented. |
| 0b0001 | EL3 can be executed in AArch64 state only. |
| 0b0010 | EL3 can be executed in either AArch64 or AArch32 state. |

All other values are reserved.

EL2, bits [11:8]

EL2 Exception level handling. Defined values are:

| EL2 | Meaning |
|--------|---|
| 0b0000 | EL2 is not implemented. |
| 0b0001 | EL2 can be executed in AArch64 state only. |
| 0b0010 | EL2 can be executed in either AArch64 or AArch32 state. |

All other values are reserved.

EL1, bits [7:4]

EL1 Exception level handling. Defined values are:

| EL1 | Meaning |
|--------|---|
| 0b0001 | EL1 can be executed in AArch64 state only. |
| 0b0010 | EL1 can be executed in either AArch64 or AArch32 state. |

All other values are reserved.

EL0, bits [3:0]

EL0 Exception level handling. Defined values are:

| EL0 | Meaning |
|--------|---|
| 0b0001 | EL0 can be executed in AArch64 state only. |
| 0b0010 | EL0 can be executed in either AArch64 or AArch32 state. |

All other values are reserved.

Accessing ID_AA64PFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64PFR0_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0100 | 0b000 |

```

if PSTATE.EL == EL0 then

    elsif PSTATE.EL == EL3 then
        return ID_AA64PFR0_EL1;

```

ID_AA64PFR1_EL1, AArch64 Processor Feature Register 1

The ID_AA64PFR1_EL1 characteristics are:

Purpose

Reserved for future expansion of information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

There are no configuration notes.

Attributes

ID_AA64PFR1_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:40]

Reserved, RES0.

NMI, bits [39:36]

Non-maskable Interrupt. Indicates support for Non-maskable interrupts. Defined values are:

| NMI | Meaning |
|--------|--|
| 0b0000 | SCTLR_ELx.{SPINTMASK, NMI} and PSTATE.ALLINT with its associated instructions are not supported. |
| 0b0001 | SCTLR_ELx.{SPINTMASK, NMI} and PSTATE.ALLINT with its associated instructions are supported. |

All other values are reserved.

FEAT_NMI implements the functionality identified by the value 0b0001.

From Armv8.8, the only permitted value is 0b0001.

CSV2_frac, bits [35:32]

CSV2 fractional field. Defined values are:

| CSV2_frac | Meaning |
|-----------|--|
| 0b0000 | This PE does not disclose whether branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context. The SCXTNUM_ELx registers are not supported. |
| 0b0001 | If ID_AA64PFR0_EL1.CSV2 is 0b0001, branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Within a hardware-described context, branch targets trained for branches situated at one address can control speculative execution of branches situated at different addresses only in a hard-to-determine way. The SCXTNUM_ELx registers are not supported and the contexts do not include the SCXTNUM_ELx register contexts. |
| 0b0010 | If ID_AA64PFR0_EL1.CSV2 is 0b0001, branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Within a hardware-described context, branch targets trained for branches situated at one address can control speculative execution of branches situated at different addresses only in a hard-to-determine way. The SCXTNUM_ELx registers are supported, but the contexts do not include the SCXTNUM_ELx register contexts. |

All other values are reserved.

FEAT_CSV2_1p1 implements the functionality identified by the value 0b0001.

FEAT_CSV2_1p2 implements the functionality identified by the value 0b0010.

From Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

This field is valid only if [ID_AA64PFR0_EL1.CSV2](#) is 0b0001.

RNDR_trap, bits [31:28]

Random Number trap to EL3 field. Defined values are:

| RNDR_trap | Meaning |
|-----------|--|
| 0b0000 | Trapping of RNDR and RNDRRS to EL3 is not supported. |
| 0b0001 | Trapping of RNDR and RNDRRS to EL3 is supported. SCR_EL3.TRNDR is present. |

All other values are reserved.

FEAT_RNG_TRAP implements the functionality identified by the value 0b0001.

SME, bits [27:24]

Scalable Matrix Extension field. Defined values are:

| SME | Meaning |
|--------|---|
| 0b0000 | SME architectural state and programmers' model are not implemented. |
| 0b0001 | SME architectural state and programmers' model are implemented. |

All other values are reserved.

FEAT_SME implements the functionality identified by the value 0b0001.

From Armv9.2, the permitted values are 0b0000 and 0b0001.

Bits [23:20]

Reserved, RES0.

MPAM_frac, bits [19:16]

MPAM Extension fractional field. Defined values are:

| MPAM_frac | Meaning |
|-----------|---|
| 0b0000 | If ID_AA64PFR0_EL1 .MPAM == 0b0000, MPAM Extension not implemented. |
| 0b0001 | If ID_AA64PFR0_EL1 .MPAM == 0b0001, MPAM Extension v1.0 is implemented. |
| 0b0001 | If ID_AA64PFR0_EL1 .MPAM == 0b0000, implements MPAM v0.1, which is like v1.1 but reduces support for Secure PARTIDs. |
| 0b0001 | If ID_AA64PFR0_EL1 .MPAM == 0b0001, implements MPAM v1.1 and adds support for MPAM2_EL2 .TIDR to provide trapping of MPAMIDR_EL1 when MPAMHCR_EL2 is not present. |

All other values are reserved.

RAS_frac, bits [15:12]

RAS Extension fractional field. Defined values are:

| RAS_frac | Meaning |
|----------|--|
| 0b0000 | If ID_AA64PFR0_EL1 .RAS == 0b0001, RAS Extension implemented. |
| 0b0001 | If ID_AA64PFR0_EL1 .RAS == 0b0001, as 0b0000 and adds support for: <ul style="list-style-type: none"> Additional ERXMISC<m>_EL1 System registers. Additional System registers ERXPFPCDN_EL1, ERXPFPCCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS , and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions. |

All other values are reserved.

FEAT_RASv1p1 implements the functionality identified by the value 0b0001.

This field is valid only if [ID_AA64PFR0_EL1](#).RAS == 0b0001.

MTE, bits [11:8]

Support for the Memory Tagging Extension. Defined values are:

| MTE | Meaning |
|--------|---|
| 0b0000 | Memory Tagging Extension is not implemented. |
| 0b0001 | Instruction-only Memory Tagging Extension is implemented. |
| 0b0010 | Full Memory Tagging Extension is implemented. |
| 0b0011 | Memory Tagging Extension is implemented with support for asymmetric Tag Check Fault handling. |

All other values are reserved.

FEAT_MTE implements the functionality identified by the value 0b0001.

FEAT_MTE2 implements the functionality identified by the value 0b0010.

FEAT_MTE3 implements the functionality identified by the value 0b0011.

In Armv8.5, the permitted values are 0b0000, 0b0001 and 0b0010.

From Armv8.7, the value 0b0001 is not permitted.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

| SSBS | Meaning |
|--------|--|
| 0b0000 | AArch64 provides no mechanism to control the use of Speculative Store Bypassing. |
| 0b0001 | AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe. |
| 0b0010 | As 0b0001, and adds the MSR and MRS instructions to directly read and write the PSTATE.SSBS field. |

All other values are reserved.

FEAT_SSBS implements the functionality identified by the value 0b0001.

FEAT_SSBS2 implements the functionality identified by the value 0b0010.

BT, bits [3:0]

Branch Target Identification mechanism support in AArch64 state. Defined values are:

| BT | Meaning |
|--------|--|
| 0b0000 | The Branch Target Identification mechanism is not implemented. |
| 0b0001 | The Branch Target Identification mechanism is implemented. |

All other values are reserved.

FEAT_BTI implements the functionality identified by the value 0b0001.

From Armv8.5, the only permitted value is 0b0001.

Accessing ID_AA64PFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64PFR1_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0100 | 0b001 |

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64PFR1_EL1;
elseif PSTATE.EL == EL2 then
    return ID_AA64PFR1_EL1;
elseif PSTATE.EL == EL3 then
    return ID_AA64PFR1_EL1;
```

ID_AA64SMFR0_EL1, SME Feature ID register 0

The ID_AA64SMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented features of the AArch64 Scalable Matrix Extension, when the [ID_AA64PFR1_EL1](#).SME field is not zero.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64SMFR0_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|------|--------|--------|------|--------|------|----|----|----|----|----|-------|--------|--------|------|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| FA64 | RES0 | SMEver | I16I64 | RES0 | F64F64 | RES0 | | | | | | I8I32 | F16F32 | B16F32 | RES0 | F32F32 | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

FA64, bit [63]

Indicates support for execution of the full A64 instruction set when the PE is in Streaming SVE mode. Defined values are:

| FA64 | Meaning |
|------|--|
| 0b0 | Only those A64 instructions defined as being legal can be executed in Streaming SVE mode. |
| 0b1 | All implemented A64 instructions can be executed in Streaming SVE mode, when enabled at the current Exception level by SMCR_EL1 .FA64, SMCR_EL2 .FA64, and SMCR_EL3 .FA64. |

FEAT_SME_FA64 implements the functionality identified by the value 0b1.

Bits [62:60]

Reserved, RES0.

SMEver, bits [59:56]

Indicates support for SME instructions when [ID_AA64PFR1_EL1](#).SME is not zero. Defined values are:

| SMEver | Meaning |
|--------|--|
| 0b0000 | The non-optional SME instructions are implemented. |

All other values are reserved.

FEAT_SME implements the functionality identified by the value 0b0000, when [ID_AA64PFR1_EL1](#).SME is not zero.

From Armv9.2, the only permitted value is 0b0000.

I16I64, bits [55:52]

Indicates SME support for instructions that accumulate into 64-bit integer elements in the ZA array. Defined values are:

| I16I64 | Meaning |
|--------|--|
| 0b0000 | Instructions that accumulate into 64-bit integer elements in the ZA array are not implemented. |
| 0b1111 | The variants of the ADDHA, ADDVA, SMOPA, SMOPS, SUMOPA, SUMOPS, UMOPA, UMOPS, USMOPA, and USMOPS instructions that accumulate into 64-bit integer element tiles are implemented. |

All other values are reserved.

The only permitted values are 0b0000 and 0b1111.

Bits [51:49]

Reserved, RES0.

F64F64, bit [48]

Indicates SME support for instructions that accumulate into double-precision floating-point elements in the ZA array. Defined values are:

| F64F64 | Meaning |
|--------|---|
| 0b0 | Instructions that accumulate into double-precision floating-point elements in the ZA array are not implemented. |
| 0b1 | The variants of the FMOPA and FMOPS instructions that accumulate into double-precision element tiles are implemented. |

Bits [47:40]

Reserved, RES0.

I8I32, bits [39:36]

Indicates SME support for accumulating 8-bit integer outer products into 32-bit integer tiles. Defined values are:

| I8I32 | Meaning |
|--------|---|
| 0b0000 | Instructions that accumulate 8-bit outer products into 32-bit tiles are not implemented. |
| 0b1111 | The SMOPA, SMOPS, SUMOPA, SUMOPS, UMOPA, UMOPS, USMOPA, and USMOPS instructions that accumulate 8-bit outer products into 32-bit tiles are implemented. |

All other values are reserved.

If FEAT_SME is implemented, the only permitted value is 0b1111.

F16F32, bit [35]

Indicates SME support for accumulating half-precision floating-point outer products into single-precision floating-point tiles. Defined values are:

| F16F32 | Meaning |
|---------------|---|
| 0b0 | Instructions that accumulate FP16 outer products into FP32 tiles are not implemented. |
| 0b1 | The FMOPA and FMOPS instructions that accumulate half-precision outer products into single-precision tiles are implemented. |

If FEAT_SME is implemented, the only permitted value is 0b1.

B16F32, bit [34]

Indicates SME support for accumulating BFloat16 outer products into single-precision floating-point tiles. Defined values are:

| B16F32 | Meaning |
|---------------|--|
| 0b0 | Instructions that accumulate BFloat16 outer products into single-precision tiles are not implemented. |
| 0b1 | The BFMOA and BFMOPS instructions that accumulate BFloat16 outer products into single-precision tiles are implemented. |

If FEAT_SME is implemented, the only permitted value is 0b1.

Bit [33]

Reserved, RES0.

F32F32, bit [32]

Indicates SME support for accumulating single-precision floating-point outer products into single-precision floating-point tiles. Defined values are:

| F32F32 | Meaning |
|---------------|---|
| 0b0 | Instructions that accumulate single-precision outer products into single-precision tiles are not implemented. |
| 0b1 | The FMOPA and FMOPS instructions that accumulate single-precision outer products into single-precision tiles are implemented. |

If FEAT_SME is implemented, the only permitted value is 0b1.

Bits [31:0]

Reserved, RES0.

Accessing ID_AA64SMFR0_EL1

This register is read-only and can be accessed from EL1 and higher.

This register is only accessible from the AArch64 state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64SMFR0_EL1

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b11 | 0b000 | 0b0000 | 0b0100 | 0b101 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_AA64SMFR0_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_AA64SMFR0_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_AA64SMFR0_EL1;

```

ID_AA64ZFR0_EL1, SVE Feature ID register 0

The ID_AA64ZFR0_EL1 characteristics are:

Purpose

Provides additional information about the implemented features of the AArch64 Scalable Vector Extension instruction set, when either or both of [ID_AA64PFR0_EL1](#).SVE and [ID_AA64PFR1_EL1](#).SME are not zero.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64ZFR0_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | F64MM | | | | F32MM | | | | RES0 | | | | I8MM | | | | SM4 | | | | RES0 | | | | SHA3 | | | |
| RES0 | | | | | | | | BF16 | | | | BitPerm | | | | RES0 | | | | | | | | AES | | | | SVEver | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:60]

Reserved, RES0.

F64MM, bits [59:56]

Indicates support for SVE FP64 double-precision floating-point matrix multiplication instructions. Defined values are:

| F64MM | Meaning |
|--------|--|
| 0b0000 | FP64 matrix multiplication and related instructions are not implemented. |
| 0b0001 | FP64 variant of the FMMLA instruction, and LD1RO* instructions are implemented. The 128-bit element variations of TRN1, TRN2, UZP1, UZP2, ZIP1, and ZIP2 are also implemented. |

All other values are reserved.

When the PE is in Streaming SVE mode, software should ignore and treat as zero the value in this field.

FEAT_F64MM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

F32MM, bits [55:52]

Indicates support for the SVE FP32 single-precision floating-point matrix multiplication instruction. Defined values are:

| F32MM | Meaning |
|--------------|--|
| 0b0000 | FP32 matrix multiplication instruction is not implemented. |
| 0b0001 | FP32 variant of the FMMLA instruction is implemented. |

All other values are reserved.

When the PE is in Streaming SVE mode, software should ignore and treat as zero the value in this field.

FEAT_F32MM implements the functionality identified by 0b0001.

From Arm v8.2, the permitted values are 0b0000 and 0b0001.

Bits [51:48]

Reserved, RES0.

I8MM, bits [47:44]

Indicates support for SVE Int8 matrix multiplication instructions. Defined values are:

| I8MM | Meaning |
|-------------|--|
| 0b0000 | Int8 matrix multiplication instructions are not implemented. |
| 0b0001 | SMMLA, SUDOT, UMMLA, USMMLA, and USDOT instructions are implemented. |

All other values are reserved.

When the PE is in Streaming SVE mode, software should ignore and treat as zero the value in this field.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID_AA64ISAR1_EL1.I8MM](#).

From Armv8.6, if FEAT_SVE is implemented, then the only permitted value is 0b0001. Otherwise, the value can be 0b0000 or 0b0001.

SM4, bits [43:40]

Indicates support for SVE SM4 instructions. Defined values are:

| SM4 | Meaning |
|------------|--|
| 0b0000 | SVE SM4 instructions are not implemented. |
| 0b0001 | SVE SM4E and SM4EKEY instructions are implemented. |

All other values are reserved.

When the PE is in Streaming SVE mode, software should ignore and treat as zero the value in this field.

FEAT_SVE_SM4 implements the functionality identified by 0b0001.

Bits [39:36]

Reserved, RES0.

SHA3, bits [35:32]

Indicates support for the SVE SHA3 instructions. Defined values are:

| SHA3 | Meaning |
|--------|--|
| 0b0000 | SVE SHA3 instructions are not implemented. |
| 0b0001 | SVE RAX1 instruction is implemented. |

All other values are reserved.

When the PE is in Streaming SVE mode, software should ignore and treat as zero the value in this field.

FEAT_SVE_SHA3 implements the functionality identified by 0b0001.

Bits [31:24]

Reserved, RES0.

BF16, bits [23:20]

Indicates support for SVE BFloat16 instructions. Defined values are:

| BF16 | Meaning |
|--------|--|
| 0b0000 | BFloat16 instructions are not implemented. |
| 0b0001 | BFCVT, BFCVTNT, BFDOT, BFMLALB, BFMLALT, and BFMMMLA instructions are implemented. |
| 0b0010 | As 0b0001, but the FPCR .EBF field is also supported. |

All other values are reserved.

FEAT_BF16 implements the functionality identified by 0b0001.

FEAT_EBF16 implements the functionality identified by 0b0010.

When Advanced SIMD and SVE are both implemented, this field must return the same value as [ID_AA64ISAR1_EL1](#).BF16.

From Armv8.6, if FEAT_SME is implemented, the permitted values are 0b0001 and 0b0010.

From Armv8.6, if FEAT_SME is not implemented, the only permitted value is 0b0001.

BitPerm, bits [19:16]

Indicates support for SVE bit permute instructions. Defined values are:

| BitPerm | Meaning |
|---------|--|
| 0b0000 | SVE bit permute instructions are not implemented. |
| 0b0001 | SVE BDEP, BEXT, and BGRP instructions are implemented. |

All other values are reserved.

When the PE is in Streaming SVE mode, software should ignore and treat as zero the value in this field.

FEAT_SVE_BitPerm implements the functionality identified by 0b0001.

Bits [15:8]

Reserved, RES0.

AES, bits [7:4]

Indicates support for SVE AES instructions. Defined values are:

| AES | Meaning |
|--------|--|
| 0b0000 | SVE AES instructions are not implemented. |
| 0b0001 | SVE AESE, AESD, AESMC, and AESIMC instructions are implemented. |
| 0b0010 | As 0b0001, plus SVE PMULLB and PMULLT instructions with 64-bit source. |

All other values are reserved.

When the PE is in Streaming SVE mode, software should ignore and treat as zero the value in this field.

FEAT_SVE_AES implements the functionality identified by the value 0b0001.

FEAT_SVE_PMULL128 implements the functionality identified by the value 0b0010.

The permitted values are 0b0000 and 0b0010.

SVEver, bits [3:0]

Indicates support for SVE. Defined values are:

| SVEver | Meaning |
|--------|---|
| 0b0000 | SVE instructions are implemented. |
| 0b0001 | The SVE and non-optional SVE2 instructions are implemented. |

All other values are reserved.

FEAT_SVE2 and FEAT_SME implement the functionality identified by the value 0b0001.

From Armv9, if FEAT_SME is implemented, the only permitted value is 0b0001. This value indicates that SVE and SVE2 instructions are implemented when the PE is in Streaming SVE mode.

Note

Irrespective of the value of ID_AA64ZFR0_EL1.SVEver, when the PE is in Streaming SVE mode, software should not attempt to execute any of the SVE and SVE2 instructions that are illegal in Streaming SVE mode.

Accessing ID_AA64ZFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ZFR0_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0100 | 0b100 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!IsZero(ID_AA64ZFR0_EL1) || boolean IMPLEMENTATION_DEFINED
"ID_AA64ZFR0_EL1 trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_AA64ZFR0_EL1;
elseif PSTATE.EL == EL2 then
    return ID_AA64ZFR0_EL1;
elseif PSTATE.EL == EL3 then
    return ID_AA64ZFR0_EL1;

```

ID_AFR0_EL1, AArch32 Auxiliary Feature Register 0

The ID_AFR0_EL1 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_AFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_AFR0\[31:0\]](#).

Attributes

ID_AFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

ID_DFR0_EL1, AArch32 Debug Feature Register 0

The ID_DFR0_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, [MIDR_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_DFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_DFR0\[31:0\]](#).

Attributes

ID_DFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|---------|----|----|----|----------|----|----|----|---------|----|----|----|--------|----|----|----|---------|----|----|----|---------|----|----|----|--------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| TraceFilt | | | | PerfMon | | | | MProfDbg | | | | MMapTrc | | | | CopTrc | | | | MMapDbg | | | | CopSDBG | | | | CopDbg | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version. Defined values are:

| TraceFilt | Meaning |
|-----------|--|
| 0b0000 | Armv8.4 Self-hosted Trace Extension not implemented. |
| 0b0001 | Armv8.4 Self-hosted Trace Extension implemented. |

All other values are reserved.

FEAT_TRF implements the functionality added by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

Defined values are:

| PerfMon | Meaning |
|---------|--|
| 0b0000 | Performance Monitors Extension not implemented. |
| 0b0001 | Performance Monitors Extension, PMUv1 implemented. |
| 0b0010 | Performance Monitors Extension, PMUv2 implemented. |
| 0b0011 | Performance Monitors Extension, PMUv3 implemented. |
| 0b0100 | PMUv3 for Armv8.1. As 0b0011, and adds support for: <ul style="list-style-type: none"> Extended 16-bit PMEVTYPER<n>.evtCount field. If EL2 is implemented, the HDCR.HPMD control. |
| 0b0101 | PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR register. |
| 0b0110 | PMUv3 for Armv8.5. As 0b0101, and adds support for: <ul style="list-style-type: none"> 64-bit event counters. If EL2 is implemented, the HDCR.HCCD control. If EL3 is implemented, the MDCR_EL3.SCCD control. |
| 0b0111 | PMUv3 for Armv8.7. As 0b0110, and adds support for: <ul style="list-style-type: none"> The PMCR.FZO and, if EL2 is implemented, HDCR.HPMFZO controls. If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls. |
| 0b1000 | PMUv3 for Armv8.8. As 0b0111, and: <ul style="list-style-type: none"> Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected. |
| 0b1111 | IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations. |

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

Note

In Armv7, the value 0b0000 can mean that PMUv1 is implemented. PMUv1 is not permitted in an Armv8 implementation.

MProfDbg, bits [23:20]

M-profile Debug. Support for memory-mapped debug model for M-profile processors. Defined values are:

| MProfDbg | Meaning |
|----------|--|
| 0b0000 | Not supported. |
| 0b0001 | Support for M-profile Debug architecture, with memory-mapped access. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

MMapTrc, bits [19:16]

Memory-mapped Trace. Support for memory-mapped trace model. Defined values are:

| MMapTrc | Meaning |
|---------|--|
| 0b0000 | Not supported. |
| 0b0001 | Support for Arm trace architecture, with memory-mapped access. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space. Defined values are:

| CopTrc | Meaning |
|--------|---|
| 0b0000 | Not supported. |
| 0b0001 | Support for Arm trace architecture, with System registers access. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the ARM® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

MMapDbg, bits [11:8]

Memory-mapped Debug. Support for Armv7 memory-mapped debug model for A and R-profile processors. Defined values are:

| MMapDbg | Meaning |
|---------|--|
| 0b0000 | Not supported. |
| 0b0100 | Support for Armv7, v7 Debug architecture, with memory-mapped access. |
| 0b0101 | Support for Armv7, v7.1 Debug architecture, with memory-mapped access. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

The optional memory map defined by Armv8 is not compatible with Armv7.

CopSDBG, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A-profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

CopDbg, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

| CopDbg | Meaning |
|--------|---|
| 0b0000 | Not supported. |
| 0b0010 | Armv6, v6 Debug architecture, with System registers access. |
| 0b0011 | Armv6, v6.1 Debug architecture, with System registers access. |
| 0b0100 | Armv7, v7 Debug architecture, with System registers access. |
| 0b0101 | Armv7, v7.1 Debug architecture, with System registers access. |
| 0b0110 | Armv8 debug architecture. |
| 0b0111 | Armv8 debug architecture with Virtualization Host Extensions. |
| 0b1000 | Armv8.2 debug architecture, FEAT_Debugv8p2. |
| 0b1001 | Armv8.4 debug architecture, FEAT_Debugv8p4. |
| 0b1010 | Armv8.8 debug architecture, FEAT_Debugv8p8. |

All other values are reserved.

The values 0b0000, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted in Armv8.

FEAT_VHE adds the functionality identified by the value 0b0111.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

FEAT_Debugv8p8 adds the functionality identified by the value 0b1010.

From Armv8.1, when FEAT_VHE is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_DFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_DFR0_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0001 | 0b010 |

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_DFR0_EL1;
elseif PSTATE.EL == EL2 then
    return ID_DFR0_EL1;
elseif PSTATE.EL == EL3 then
    return ID_DFR0_EL1;
```

ID_DFR1_EL1, Debug Feature Register 1

The ID_DFR1_EL1 characteristics are:

Purpose

Provides top level information about the debug system in AArch32.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_DFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_DFR1\[31:0\]](#).

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_DFR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|-------|----|----|----|-------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | RES0 | | | | | | | | HPMNO | | | | MTPMU | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:8]

Reserved, RES0.

HPMNO, bits [7:4]

Zero PMU event counters for a Guest operating system. Defined values are:

| HPMNO | Meaning |
|--------|--|
| 0b0000 | Setting HDCR .HPMN to zero has CONSTRAINED UNPREDICTABLE behavior. |
| 0b0001 | Setting HDCR .HPMN to zero has defined behavior. |

All other values are reserved.

If FEAT_PMUv3 is not implemented, FEAT_FGT is not implemented, or EL2 is not implemented, the only permitted value is 0b0000.

FEAT_HPMNO implements the functionality identified by the value 0b0001.

From Armv8.8, in an implementation that includes FEAT_PMUv3, FEAT_FGT, and EL2, the value 0b0000 is not permitted.

MTPMU, bits [3:0]

Multi-threaded PMU extension. Defined values are:

| MTPMU | Meaning |
|--------|--|
| 0b0000 | FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>. are read/write or RES0. |
| 0b0001 | FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER<n>. are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER<n>. are 0. |
| 0b1111 | FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER<n>. are RES0. |

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_DFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_DFR1_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0011 | 0b101 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && (!IsZero(ID_DFR1_EL1) || boolean IMPLEMENTATION_DEFINED "ID_DFR1_EL1
trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_DFR1_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_DFR1_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_DFR1_EL1;

```

ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0

The ID_ISAR0_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), [ID_ISAR4_EL1](#), and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR0\[31:0\]](#).

Attributes

ID_ISAR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|--------|----|----|----|-------|----|----|----|---------|----|----|----|-----------|----|----|----|----------|----|----|----|----------|----|----|----|------|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | Divide | | | | Debug | | | | Coprocc | | | | CmpBranch | | | | BitField | | | | BitCount | | | | Swap | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:28]

Reserved, RES0.

Divide, bits [27:24]

Indicates the implemented Divide instructions. Defined values are:

| Divide | Meaning |
|--------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds SDIV and UDIV in the T32 instruction set. |
| 0b0010 | As for 0b0001, and adds SDIV and UDIV in the A32 instruction set. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Debug, bits [23:20]

Indicates the implemented Debug instructions. Defined values are:

| Debug | Meaning |
|--------------|-------------------|
| 0b0000 | None implemented. |
| 0b0001 | Adds BKPT. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Coproc, bits [19:16]

Indicates the implemented System register access instructions. Defined values are:

| Coproc | Meaning |
|---------------|--|
| 0b0000 | None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions. |
| 0b0001 | Adds generic CDP, LDC, MCR, MRC, and STC. |
| 0b0010 | As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2. |
| 0b0011 | As for 0b0010, and adds generic MCRR and MRRC. |
| 0b0100 | As for 0b0011, and adds generic MCRR2 and MRRC2. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set. Defined values are:

| CmpBranch | Meaning |
|------------------|--------------------|
| 0b0000 | None implemented. |
| 0b0001 | Adds CBNZ and CBZ. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

BitField, bits [11:8]

Indicates the implemented BitField instructions. Defined values are:

| BitField | Meaning |
|-----------------|--------------------------------|
| 0b0000 | None implemented. |
| 0b0001 | Adds BFC, BFI, SBFX, and UBFX. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions. Defined values are:

| BitCount | Meaning |
|-----------------|-------------------|
| 0b0000 | None implemented. |
| 0b0001 | Adds CLZ. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set. Defined values are:

| Swap | Meaning |
|--------|--------------------|
| 0b0000 | None implemented. |
| 0b0001 | Adds SWP and SWPB. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR0_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0010 | 0b000 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elseif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_ISAR0_EL1;
    elseif PSTATE.EL == EL2 then
        return ID_ISAR0_EL1;
    elseif PSTATE.EL == EL3 then
        return ID_ISAR0_EL1;

```

ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1

The ID_ISAR1_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), [ID_ISAR4_EL1](#), and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR1\[31:0\]](#).

Attributes

ID_ISAR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|-----------|----|----|----|-----------|----|----|----|--------|----|----|----|--------|----|----|----|-----------|----|----|----|--------|----|----|----|--------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Jazelle | | | | Interwork | | | | Immediate | | | | IfThen | | | | Extend | | | | Except_AR | | | | Except | | | | Endian | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions. Defined values are:

| Jazelle | Meaning |
|---------|---|
| 0b0000 | No support for Jazelle. |
| 0b0001 | Adds the BXJ instruction and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Interwork, bits [27:24]

Indicates the implemented Interworking instructions. Defined values are:

| Interwork | Meaning |
|-----------|--|
| 0b0000 | None implemented. |
| 0b0001 | Adds the BX instruction, and the T bit in the PSR. |
| 0b0010 | As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior. |
| 0b0011 | As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Immediate, bits [23:20]

Indicates the implemented data-processing instructions with long immediates. Defined values are:

| Immediate | Meaning |
|-----------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds: <ul style="list-style-type: none"> The MOVT instruction. The MOV instruction encodings with zero-extended 16-bit immediates. The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set. Defined values are:

| IfThen | Meaning |
|--------|--|
| 0b0000 | None implemented. |
| 0b0001 | Adds the IT instructions, and the IT bits in the PSRs. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Extend, bits [15:12]

Indicates the implemented Extend instructions. Defined values are:

| Extend | Meaning |
|--------|--|
| 0b0000 | No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions. |
| 0b0001 | Adds the SXTB, SXTH, UXTB, and UXTH instructions. |
| 0b0010 | As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Except_AR, bits [11:8]

Indicates the implemented A and R-profile exception-handling instructions. Defined values are:

| Except_AR | Meaning |
|-----------|--|
| 0b0000 | None implemented. |
| 0b0001 | Adds the SRS and RFE instructions, and the A and R-profile forms of the CPS instruction. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set. Defined values are:

| Except | Meaning |
|--------|--|
| 0b0000 | Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented. |
| 0b0001 | Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Endian, bits [3:0]

Indicates the implemented Endian instructions. Defined values are:

| Endian | Meaning |
|--------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds the SETEND instruction, and the E bit in the PSRs. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | UNKNOWN | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | UNKNOWN | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR1_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0010 | 0b001 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then

ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2

The ID_ISAR2_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR3_EL1](#), [ID_ISAR4_EL1](#), and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR2\[31:0\]](#).

Attributes

ID_ISAR2_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|--------|----|----|----|-------|----|----|----|-------|----|----|----|------|----|----|----|----------------|----|----|----|---------|----|----|----|-----------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reversal | | | | PSR_AR | | | | MultU | | | | MultS | | | | Mult | | | | MultiAccessInt | | | | MemHint | | | | LoadStore | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

Reversal, bits [31:28]

Indicates the implemented Reversal instructions. Defined values are:

| Reversal | Meaning |
|----------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds the REV, REV16, and REVSH instructions. |
| 0b0010 | As for 0b0001, and adds the RBIT instruction. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

PSR_AR, bits [27:24]

Indicates the implemented A and R-profile instructions to manipulate the PSR. Defined values are:

| PSR_AR | Meaning |
|---------------|--|
| 0b0000 | None implemented. |
| 0b0001 | Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

MultU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions. Defined values are:

| MultU | Meaning |
|--------------|--|
| 0b0000 | None implemented. |
| 0b0001 | Adds the UMULL and UMLAL instructions. |
| 0b0010 | As for 0b0001, and adds the UMAAL instruction. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

MultS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions. Defined values are:

| MultS | Meaning |
|--------------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds the SMULL and SMLAL instructions. |
| 0b0010 | As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs. |
| 0b0011 | As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Mult, bits [15:12]

Indicates the implemented additional Multiply instructions. Defined values are:

| Mult | Meaning |
|-------------|---|
| 0b0000 | No additional instructions implemented. This means only MUL is implemented. |
| 0b0001 | Adds the MLA instruction. |
| 0b0010 | As for 0b0001, and adds the MLS instruction. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions. Defined values are:

| MultiAccessInt | Meaning |
|----------------|--|
| 0b0000 | No support. This means the LDM and STM instructions are not interruptible. |
| 0b0001 | LDM and STM instructions are restartable. |
| 0b0010 | LDM and STM instructions are continuable. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions. Defined values are:

| MemHint | Meaning |
|---------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds the PLD instruction. |
| 0b0010 | Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.) |
| 0b0011 | As for 0b0001 (or 0b0010), and adds the PLI instruction. |
| 0b0100 | As for 0b0011, and adds the PLDW instruction. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions. Defined values are:

| LoadStore | Meaning |
|-----------|--|
| 0b0000 | No additional load/store instructions implemented. |
| 0b0001 | Adds the LDRD and STRD instructions. |
| 0b0010 | As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3

The ID_ISAR3_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR4_EL1](#), and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR3\[31:0\]](#).

Attributes

ID_ISAR3_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:32]

Reserved, RES0.

T32EE, bits [31:28]

Indicates the implemented T32EE instructions. Defined values are:

| T32EE | Meaning |
|--------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions. Defined values are:

| TrueNOP | Meaning |
|----------------|---|
| 0b0000 | None implemented. This means there are no NOP instructions that do not have any register dependencies. |
| 0b0001 | Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions. Defined values are:

| T32Copy | Meaning |
|----------------|---|
| 0b0000 | Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register. |
| 0b0001 | Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set. Defined values are:

| TabBranch | Meaning |
|------------------|------------------------------------|
| 0b0000 | None implemented. |
| 0b0001 | Adds the TBB and TBH instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions. Defined values are:

| SynchPrim | Meaning |
|------------------|--|
| 0b0000 | If SynchPrim_frac == 0b0000, no Synchronization Primitives implemented. |
| 0b0001 | If SynchPrim_frac == 0b0000, adds the LDREX and STREX instructions. |
| | If SynchPrim_frac == 0b0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions. |
| 0b0010 | If SynchPrim_frac == 0b0000, as for [0b0001, 0b0011] and also adds the LDREXD and STREXD instructions. |

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

SVC, bits [11:8]

Indicates the implemented SVC instructions. Defined values are:

| SVC | Meaning |
|------------|---------------------------|
| 0b0000 | Not implemented. |
| 0b0001 | Adds the SVC instruction. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions. Defined values are:

| SIMD | Meaning |
|--------|--|
| 0b0000 | None implemented. |
| 0b0001 | Adds the SSAT and USAT instructions, and the Q bit in the PSRs. |
| 0b0011 | As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports Advanced SIMD and floating-point instructions, [MVFR0](#), [MVFR1](#), and [MVFR2](#) give information about the implemented Advanced SIMD instructions.

Saturate, bits [3:0]

Indicates the implemented Saturate instructions. Defined values are:

| Saturate | Meaning |
|----------|--|
| 0b0000 | None implemented. This means no non-Advanced SIMD saturate instructions are implemented. |
| 0b0001 | Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR3_EL1

Accesses to this register use the following encodings in the System register encoding space:

ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4

The ID_ISAR4_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR4\[31:0\]](#).

Attributes

ID_ISAR4_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|-------|----|----|----|----------------|----|----|----|---------|----|----|----|-----|----|----|----|-----------|----|----|----|------------|----|----|----|--------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| SWP_frac | | | | PSR_M | | | | SynchPrim_frac | | | | Barrier | | | | SMC | | | | Writeback | | | | WithShifts | | | | Unpriv | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

SWP_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions. Defined values are:

| SWP_frac | Meaning |
|----------|---|
| 0b0000 | SWP or SWPB instructions not implemented. |
| 0b0001 | SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB. |

All other values are reserved. This field is valid only if [ID_ISAR0.Swap](#) is 0b0000.

In Armv8-A, the only permitted value is 0b0000.

PSR_M, bits [27:24]

Indicates the implemented M-profile instructions to modify the PSRs. Defined values are:

| PSR_M | Meaning |
|--------------|---|
| 0b0000 | None implemented. |
| 0b0001 | Adds the M-profile forms of the CPS, MRS, and MSR instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

SynchPrim_frac, bits [23:20]

Used in conjunction with [ID_ISAR3.SynchPrim](#) to indicate the implemented Synchronization Primitive instructions. Possible values are:

| SynchPrim_frac | Meaning |
|-----------------------|---|
| 0b0000 | If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions. |
| 0b0011 | If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions. |

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the A32 and T32 instruction sets. Defined values are:

| Barrier | Meaning |
|----------------|---|
| 0b0000 | None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space. |
| 0b0001 | Adds the DMB, DSB, and ISB barrier instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

SMC, bits [15:12]

Indicates the implemented SMC instructions. Defined values are:

| SMC | Meaning |
|------------|---------------------------|
| 0b0000 | None implemented. |
| 0b0001 | Adds the SMC instruction. |

All other values are reserved.

In Armv8-A, the permitted values are:

- If EL3 is implemented and EL1 can use AArch32, the only permitted value is 0b0001.
- If neither EL3 nor EL2 is implemented, the only permitted value is 0b0000.

If EL1 cannot use AArch32, this field has the value 0b0000.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes. Defined values are:

| Writeback | Meaning |
|-----------|--|
| 0b0000 | Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes. |
| 0b0001 | Adds support for all of the writeback addressing modes. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

WithShifts, bits [7:4]

Indicates the support for instructions with shifts. Defined values are:

| WithShifts | Meaning |
|------------|--|
| 0b0000 | Nonzero shifts supported only in MOV and shift instructions. |
| 0b0001 | Adds support for shifts of loads and stores over the range LSL 0-3. |
| 0b0011 | As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions. |
| 0b0100 | As for 0b0011, and adds support for register-controlled shift options. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions. Defined values are:

| Unpriv | Meaning |
|--------|--|
| 0b0000 | None implemented. No T variant instructions are implemented. |
| 0b0001 | Adds the LDRBT, LDRT, STRBT, and STRT instructions. |
| 0b0010 | As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR4_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR4_EL1

ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5

The ID_ISAR5_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), and [ID_ISAR4_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR5\[31:0\]](#).

Attributes

ID_ISAR5_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-----|----|----|----|------|----|----|----|-------|----|----|----|------|----|----|----|------|----|----|----|-----|----|----|----|------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| VCMA | | | | RDM | | | | RES0 | | | | CRC32 | | | | SHA2 | | | | SHA1 | | | | AES | | | | SEVL | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

VCMA, bits [31:28]

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors. Defined values are:

| VCMA | Meaning |
|--------|--|
| 0b0000 | The VCMLA and VCADD instructions are not implemented in AArch32. |
| 0b0001 | The VCMLA and VCADD instructions are implemented in AArch32. |

All other values are reserved.

FEAT_FCMA implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, the only permitted value is 0b0001.

RDM, bits [27:24]

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state. Defined values are:

| RDM | Meaning |
|------------|--|
| 0b0000 | No VQRDMLAH and VQRDMLSH instructions implemented. |
| 0b0001 | VQRDMLAH and VQRDMLSH instructions implemented. |

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

In Armv8.0, the only permitted value is 0b0000.

From Armv8.1, the only permitted value is 0b0001.

Bits [23:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates whether the CRC32 instructions are implemented in AArch32 state.

| CRC32 | Meaning |
|--------------|---|
| 0b0000 | No CRC32 instructions implemented. |
| 0b0001 | CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW instructions implemented. |

All other values are reserved.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the only permitted value is 0b0001.

SHA2, bits [15:12]

Indicates whether the SHA2 instructions are implemented in AArch32 state.

| SHA2 | Meaning |
|-------------|--|
| 0b0000 | No SHA2 instructions implemented. |
| 0b0001 | SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 implemented. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SHA1, bits [11:8]

Indicates whether the SHA1 instructions are implemented in AArch32 state.

| SHA1 | Meaning |
|-------------|---|
| 0b0000 | No SHA1 instructions implemented. |
| 0b0001 | SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 implemented. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

AES, bits [7:4]

Indicates whether the AES instructions are implemented in AArch32 state.

| AES | Meaning |
|--------|--|
| 0b0000 | No AES instructions implemented. |
| 0b0001 | AESE, AESD, AESMC, and AESIMC implemented. |
| 0b0010 | As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

SEVL, bits [3:0]

Indicates whether the SEVL instruction is implemented in AArch32 state.

| SEVL | Meaning |
|--------|--|
| 0b0000 | SEVL is implemented as a NOP. |
| 0b0001 | SEVL is implemented as Send Event Local. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | UNKNOWN | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | UNKNOWN | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR5_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR5_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0010 | 0b101 |

```

```

ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6

The ID_ISAR6_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with [ID_ISAR0_EL1](#), [ID_ISAR1_EL1](#), [ID_ISAR2_EL1](#), [ID_ISAR3_EL1](#), [ID_ISAR4_EL1](#) and [ID_ISAR5_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR6_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_ISAR6\[31:0\]](#).

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_ISAR6_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|------|----|----|----|------|----|----|----|---------|----|----|----|----|----|----|----|-----|----|----|----|----|----|----|----|-------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | I8MM | | | | BF16 | | | | SPECRES | | | | SB | | | | FHM | | | | DP | | | | JSCVT | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:28]

Reserved, RES0.

I8MM, bits [27:24]

Indicates support for Advanced SIMD and floating-point Int8 matrix multiplication instructions in AArch32 state. Defined values of this field are:

| I8MM | Meaning |
|--------|---|
| 0b0000 | Int8 matrix multiplication instructions are not implemented. |
| 0b0001 | VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT instructions are implemented. |

All other values are reserved.

FEAT_AA32I8MM implements the functionality identified by 0b0001.

BF16, bits [23:20]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch32 state. Defined values are:

| BF16 | Meaning |
|-------------|--|
| 0b0000 | BFloat16 instructions are not implemented. |
| 0b0001 | VCVT, VCVTB, VCVTT, VDOT, VFMA, VFMA, and VMLA instructions with BF16 operand or result types are implemented. |

All other values are reserved.

FEAT_AA32BF16 implements the functionality identified by 0b0001.

SPECRES, bits [19:16]

Indicates support for Speculation invalidation instructions in AArch32 state. Defined values are:

| SPECRES | Meaning |
|----------------|---|
| 0b0000 | Prediction invalidation instructions are not implemented. |
| 0b0001 | CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented. |

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

SB, bits [15:12]

Indicates support for the SB instruction in AArch32 state. Defined values are:

| SB | Meaning |
|-----------|------------------------------------|
| 0b0000 | SB instruction is not implemented. |
| 0b0001 | SB instruction is implemented. |

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

From Armv8.5, the only permitted value is 0b0001.

FHM, bits [11:8]

Indicates support for Advanced SIMD and floating-point VFMA and VFMSL instructions in AArch32 state. Defined values are:

| FHM | Meaning |
|------------|--|
| 0b0000 | VFMA and VFMSL instructions are not implemented. |
| 0b0001 | VFMA and VFMSL instructions are implemented. |

All other values are reserved.

FEAT_FHM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

DP, bits [7:4]

Indicates support for dot product instructions in AArch32 state. Defined values are:

| DP | Meaning |
|-----------|---|
| 0b0000 | Dot product instructions are not implemented. |
| 0b0001 | VUDOT and VSDOT instructions are implemented. |

All other values are reserved.

FEAT_DotProd implements the functionality identified by 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

JSCVT, bits [3:0]

Indicates support for the VJCVT instruction in AArch32 state. Defined values are:

| JSCVT | Meaning |
|--------|---|
| 0b0000 | The VJCVT instruction is not implemented. |
| 0b0001 | The VJCVT instruction is implemented. |

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the only permitted value is 0b0001.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR6_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR6_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0010 | 0b111 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!IsZero(ID_ISAR6_EL1) || boolean IMPLEMENTATION_DEFINED "ID_ISAR6_EL1
trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_ISAR6_EL1;
elseif PSTATE.EL == EL2 then
    return ID_ISAR6_EL1;
elseif PSTATE.EL == EL3 then
    return ID_ISAR6_EL1;

```

ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0

The ID_MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_MMFR0\[31:0\]](#).

Attributes

ID_MMFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|------|----|----|----|--------|----|----|----|-----|----|----|----|----------|----|----|----|----------|----|----|----|------|----|----|----|------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| InnerShr | | | | FCSE | | | | AuxReg | | | | TCM | | | | ShareLvl | | | | OuterShr | | | | PMSA | | | | VMSA | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented. Defined values are:

| InnerShr | Meaning |
|----------|--|
| 0b0000 | Implemented as Non-cacheable. |
| 0b0001 | Implemented with hardware coherency support. |
| 0b1111 | Shareability ignored. |

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0_EL1.ShareLvl having the value 0b0001.

When ID_MMFR0_EL1.ShareLvl is zero, this field is UNKNOWN.

FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE. Defined values are:

| FCSE | Meaning |
|--------|-------------------|
| 0b0000 | Not supported. |
| 0b0001 | Support for FCSE. |

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers. Defined values are:

| AuxReg | Meaning |
|--------|--|
| 0b0000 | None supported. |
| 0b0001 | Support for Auxiliary Control Register only. |
| 0b0010 | Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register. |

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs. Defined values are:

| TCM | Meaning |
|--------|---|
| 0b0000 | Not supported. |
| 0b0001 | Support is IMPLEMENTATION DEFINED. Armv7 requires this setting. |
| 0b0010 | Support for TCM only, Armv6 implementation. |
| 0b0011 | Support for TCM and DMA, Armv6 implementation. |

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented. Defined values are:

| ShareLvl | Meaning |
|----------|---|
| 0b0000 | One level of shareability implemented. |
| 0b0001 | Two levels of shareability implemented. |

All other values are reserved.

From Armv8 the only permitted value is 0b0001.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented. Defined values are:

| OuterShr | Meaning |
|----------|--|
| 0b0000 | Implemented as Non-cacheable. |
| 0b0001 | Implemented with hardware coherency support. |
| 0b1111 | Shareability ignored. |

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

PMSA, bits [7:4]

Indicates support for a PMSA. Defined values are:

| PMSA | Meaning |
|--------|---|
| 0b0000 | Not supported. |
| 0b0001 | Support for IMPLEMENTATION DEFINED PMSA. |
| 0b0010 | Support for PMSAv6, with a Cache Type Register implemented. |
| 0b0011 | Support for PMSAv7, with support for memory subsections. Armv7-R profile. |

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

VMSA, bits [3:0]

Indicates support for a VMSA. Defined values are:

| VMSA | Meaning |
|--------|---|
| 0b0000 | Not supported. |
| 0b0001 | Support for IMPLEMENTATION DEFINED VMSA. |
| 0b0010 | Support for VMSAv6, with Cache and TLB Type Registers implemented. |
| 0b0011 | Support for VMSAv7, with support for remapping and the Access flag. Armv7-A profile. |
| 0b0100 | As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors. |
| 0b0101 | As for 0b0100, and adds support for the Long-descriptor translation table format. |

All other values are reserved.

In Armv8-A the only permitted value is 0b0101.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | UNKNOWN | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | UNKNOWN | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

ID_MMFR1_EL1, AArch32 Memory Model Feature Register 1

The ID_MMFR1_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_MMFR1\[31:0\]](#).

Attributes

ID_MMFR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----------|----|----|----|-------|----|----|----|-------|----|----|----|---------|----|----|----|---------|----|----|----|---------|----|----|----|---------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| BPred | | | | L1TstCln | | | | L1Uni | | | | L1Hvd | | | | L1UniSW | | | | L1HvdSW | | | | L1UniVA | | | | L1HvdVA | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements. Defined values are:

| BPred | Meaning |
|--------------|--|
| 0b0000 | No branch predictor, or no MMU present. Implies a fixed MPU configuration. |
| 0b0001 | Branch predictor requires flushing on: <ul style="list-style-type: none"> • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Changes to the TTBR0, TTBR1, or TTBCR registers. • Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported. |
| 0b0010 | Branch predictor requires flushing on: <ul style="list-style-type: none"> • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported. |
| 0b0011 | Branch predictor requires flushing only on writing new data to instruction locations. |
| 0b0100 | For execution correctness, branch predictor requires no flushing at any time. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0010, 0b0011, and 0b0100. For values other than 0b0000 and 0b0100 the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations. Defined values are:

| L1TstCln | Meaning |
|-----------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported Level 1 data cache test and clean operations are: <ul style="list-style-type: none"> • Test and clean data cache. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Test, clean, and invalidate data cache. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation. Defined values are:

| L1Uni | Meaning |
|--------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported entire Level 1 cache operations are: <ul style="list-style-type: none"> • Invalidate cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Clean cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate cache, using a recursive model that uses the cache dirty status bit. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation. Defined values are:

| L1Hvd | Meaning |
|--------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported entire Level 1 cache operations are: <ul style="list-style-type: none"> • Invalidate instruction cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate data cache. • Invalidate data cache and instruction cache, including branch predictor if appropriate. |
| 0b0011 | As for 0b0010, and adds: <ul style="list-style-type: none"> • Clean data cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation. Defined values are:

| L1UniSW | Meaning |
|----------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported Level 1 unified cache line maintenance operations by set/way are: <ul style="list-style-type: none"> • Clean cache line by set/way. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Clean and invalidate cache line by set/way. |
| 0b0011 | As for 0b0010, and adds: <ul style="list-style-type: none"> • Invalidate cache line by set/way. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation. Defined values are:

| L1HvdSW | Meaning |
|----------------|---|
| 0b0000 | None supported. |
| 0b0001 | Supported Level 1 Harvard cache line maintenance operations by set/way are: <ul style="list-style-type: none"> • Clean data cache line by set/way. • Clean and invalidate data cache line by set/way. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate data cache line by set/way. |
| 0b0011 | As for 0b0010, and adds: <ul style="list-style-type: none"> • Invalidate instruction cache line by set/way. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation. Defined values are:

| L1UniVA | Meaning |
|----------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported Level 1 unified cache line maintenance operations by VA are: <ul style="list-style-type: none"> • Clean cache line by VA. • Invalidate cache line by VA. • Clean and invalidate cache line by VA. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate branch predictor by VA, if branch predictor is implemented. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation. Defined values are:

| L1HvdVA | Meaning |
|----------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported Level 1 Harvard cache line maintenance operations by VA are: <ul style="list-style-type: none"> • Clean data cache line by VA. • Invalidate data cache line by VA. • Clean and invalidate data cache line by VA. • Clean instruction cache line by VA. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate branch predictor by VA, if branch predictor is implemented. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

ID_MMFR2_EL1, AArch32 Memory Model Feature Register 2

The ID_MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_MMFR2\[31:0\]](#).

Attributes

ID_MMFR2_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----------|----|----|----|---------|----|----|----|--------|----|----|----|--------|----|----|----|----------|----|----|----|---------|----|----|----|---------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| HWAccFlg | | | | WFIStall | | | | MemBarr | | | | UniTLB | | | | HvdTLB | | | | L1HvdRng | | | | L1HvdBG | | | | L1HvdFG | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

HWAccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation. Defined values are:

| HWAccFlg | Meaning |
|----------|--|
| 0b0000 | Not supported. |
| 0b0001 | Support for VMSAv7 Access flag, updated in hardware. |

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

WFIStall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling. Defined values are:

| WFIStall | Meaning |
|----------|---------------------------|
| 0b0000 | Not supported. |
| 0b0001 | Support for WFI stalling. |

All other values are reserved.

From Armv8, the permitted values are 0b0000 and 0b0001.

MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==0b1111) encoding space:

| MemBarr | Meaning |
|---------|---|
| 0b0000 | None supported. |
| 0b0001 | Supported memory barrier System instructions are: <ul style="list-style-type: none"> • Data Synchronization Barrier (DSB). |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Instruction Synchronization Barrier (ISB). • Data Memory Barrier (DMB). |

All other values are reserved.

From Armv8, the only permitted value is 0b0010.

Arm deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation. Defined values are:

| UniTLB | Meaning |
|--------|---|
| 0b0000 | Not supported. |
| 0b0001 | Supported unified TLB maintenance operations are: <ul style="list-style-type: none"> • Invalidate all entries in the TLB. • Invalidate TLB entry by VA. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate TLB entries by ASID match. |
| 0b0011 | As for 0b0010, and adds: <ul style="list-style-type: none"> • Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation. |
| 0b0100 | As for 0b0011, and adds: <ul style="list-style-type: none"> • Invalidate Hyp mode unified TLB entry by VA. • Invalidate entire Non-secure PL1&0 unified TLB. • Invalidate entire Hyp mode unified TLB. |
| 0b0101 | As for 0b0100, and adds the following operations: TLBIMVALIS , TLBIMVAALIS , TLBIMVALHIS , TLBIMVAL , TLBIMVAAL , TLBIMVALH . |
| 0b0110 | As for 0b0101, and adds the following operations: TLBIIPAS2IS , TLBIIPAS2LIS , TLBIIPAS2 , TLBIIPAS2L . |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0110.

HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation. Defined values are:

| L1HvdRng | Meaning |
|-----------------|--|
| 0b0000 | Not supported. |
| 0b0001 | Supported Level 1 Harvard cache maintenance range operations are: <ul style="list-style-type: none"> • Invalidate data cache range by VA. • Invalidate instruction cache range by VA. • Clean data cache range by VA. • Clean and invalidate data cache range by VA. |

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations. Defined values are:

| L1HvdBG | Meaning |
|----------------|--|
| 0b0000 | Not supported. |
| 0b0001 | Supported Level 1 Harvard cache background fetch operations are: <ul style="list-style-type: none"> • Fetch instruction cache range by VA. • Fetch data cache range by VA. |

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations. Defined values are:

| L1HvdFG | Meaning |
|----------------|--|
| 0b0000 | Not supported. |
| 0b0001 | Supported Level 1 Harvard cache foreground fetch operations are: <ul style="list-style-type: none"> • Fetch instruction cache range by VA. • Fetch data cache range by VA. |

All other values are reserved.

From Armv8, the only permitted value is 0b0000.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR2_EL1

ID_MMFR3_EL1, AArch32 Memory Model Feature Register 3

The ID_MMFR3_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_MMFR3\[31:0\]](#).

Attributes

ID_MMFR3_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|--------|----|----|----|---------|----|----|----|-----|----|----|----|-----------|----|----|----|---------|----|----|----|----------|----|----|----|----------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Supersec | | | | CMemSz | | | | CohWalk | | | | PAN | | | | MaintBcst | | | | BPMaint | | | | CMaintSW | | | | CMaintVA | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported. Defined values are:

| Supersec | Meaning |
|----------|------------------------------|
| 0b0000 | Supersections supported. |
| 0b1111 | Supersections not supported. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b1111.

CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches. Defined values are:

| CMemSz | Meaning |
|--------|--|
| 0b0000 | 4GB, corresponding to a 32-bit physical address range. |
| 0b0001 | 64GB, corresponding to a 36-bit physical address range. |
| 0b0010 | 1TB or more, corresponding to a 40-bit or larger physical address range. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b0010.

CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification. Defined values are:

| CohWalk | Meaning |
|---------|--|
| 0b0000 | Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks. |
| 0b0001 | Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

PAN, bits [19:16]

Privileged Access Never. Indicates support for the PAN bit in [CPSR](#), [SPSR](#), and [DPSR](#) in AArch32 state. Defined values are:

| PAN | Meaning |
|--------|---|
| 0b0000 | PAN not supported. |
| 0b0001 | PAN supported. |
| 0b0010 | PAN supported and ATS1CPRP and ATS1CPWP instructions supported. |

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

In Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the only permitted value is 0b0010.

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast. Defined values are:

| MaintBcst | Meaning |
|-----------|--|
| 0b0000 | Cache, TLB, and branch predictor operations only affect local structures. |
| 0b0001 | Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures. |
| 0b0010 | Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations. Defined values are:

| BPMaint | Meaning |
|----------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported branch predictor maintenance operations are: <ul style="list-style-type: none"> • Invalidate all branch predictors. |
| 0b0010 | As for 0b0001, and adds: <ul style="list-style-type: none"> • Invalidate branch predictors by VA. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches. Defined values are:

| CMaintSW | Meaning |
|-----------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported hierarchical cache maintenance instructions by set/way are: <ul style="list-style-type: none"> • Invalidate data cache by set/way. • Clean data cache by set/way. • Clean and invalidate data cache by set/way. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches. Defined values are:

| CMaintVA | Meaning |
|-----------------|--|
| 0b0000 | None supported. |
| 0b0001 | Supported hierarchical cache maintenance operations by VA are: <ul style="list-style-type: none"> • Invalidate data cache by VA. • Clean data cache by VA. • Clean and invalidate data cache by VA. • Invalidate instruction cache by VA. • Invalidate all instruction cache entries. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR3_EL1

Accesses to this register use the following encodings in the System register encoding space:

ID_MMFR4_EL1, AArch32 Memory Model Feature Register 4

The ID_MMFR4_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_MMFR4\[31:0\]](#).

Attributes

ID_MMFR4_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-------|----|----|----|-----|----|----|----|------|----|----|----|-----|----|----|----|-----|----|----|----|-----|----|----|----|---------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| EVT | | | | CCIDX | | | | LSM | | | | HPDS | | | | CnP | | | | XNX | | | | AC2 | | | | SpecSEI | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

EVT, bits [31:28]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the [HCR2](#).{TTLBIS, TOCU, TICAB, TID4} traps. Defined values are:

| EVT | Meaning |
|--------|---|
| 0b0000 | HCR2 .{TTLBIS, TOCU, TICAB, TID4} traps are not supported. |
| 0b0001 | HCR2 .{TOCU, TICAB, TID4} traps are supported. HCR2 .TTLBIS trap is not supported. |
| 0b0010 | HCR2 .{TTLBIS, TOCU, TICAB, TID4} traps are supported. |

All other values are reserved.

FEAT_EVT implements the functionality identified by the values 0b0001 and 0b0010.

If EL2 is not implemented supporting AArch32, the only permitted value is 0b0000.

In Armv8.2, the permitted values are 0b0000, 0b0001, and 0b0010.

From Armv8.5, the permitted values are:

- 0b0000 when EL2 is not implemented or does not support AArch32.
- 0b0010 when EL2 is implemented and supports AArch32.

CCIDX, bits [27:24]

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated. Defined values are:

| CCIDX | Meaning |
|--------|--|
| 0b0000 | 32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented. |
| 0b0001 | 64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented. |

All other values are reserved.

FEAT_CCIDX implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

LSM, bits [23:20]

Indicates support for LSMAOE and nTLSMD bits in [HSCTLR](#) and [SCTLR](#). Defined values are:

| LSM | Meaning |
|--------|---------------------------------------|
| 0b0000 | LSMAOE and nTLSMD bits not supported. |
| 0b0001 | LSMAOE and nTLSMD bits supported. |

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

HPDS, bits [19:16]

Hierarchical permission disables bits in translation tables. Defined values are:

| HPDS | Meaning |
|--------|--|
| 0b0000 | Disabling of hierarchical controls not supported. |
| 0b0001 | Supports disabling of hierarchical controls using the TTBCR2 .HPD0, TTBCR2 .HPD1, and HTCR .HPD bits. |
| 0b0010 | As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use. |

All other values are reserved.

FEAT_AA32HPD implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality added by the value 0b0010.

Note

The value 0b0000 implies that the encoding for [TTBCR2](#) is UNDEFINED.

CnP, bits [15:12]

Common not Private translations. Defined values are:

| CnP | Meaning |
|--------|--|
| 0b0000 | Common not Private translations not supported. |
| 0b0001 | Common not Private translations supported. |

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2 the only permitted value is 0b0001.

XNX, bits [11:8]

Support for execute-never control distinction by Exception level at stage 2. Defined values are:

| XNX | Meaning |
|--------|---|
| 0b0000 | Distinction between EL0 and EL1 execute-never control at stage 2 not supported. |
| 0b0001 | Distinction between EL0 and EL1 execute-never control at stage 2 supported. |

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

When FEAT_XNX is implemented:

- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4_EL1.XNX is 0b0000 or 0b0001:
 - ID_AA64MMFR1_EL1.XNX == 1.
 - EL2 cannot use AArch32.
 - EL1 can use AArch32.
- If EL2 can use AArch32 then the only permitted value is 0b0001.

AC2, bits [7:4]

Indicates the extension of the [ACTLR](#) and [HACTLR](#) registers using [ACTLR2](#) and [HACTLR2](#). Defined values are:

| AC2 | Meaning |
|--------|---|
| 0b0000 | ACTLR2 and HACTLR2 are not implemented. |
| 0b0001 | ACTLR2 and HACTLR2 are implemented. |

All other values are reserved.

In Armv8.0 and Armv8.1 the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

SpecSEI, bits [3:0]

Describes whether the PE can generate SError interrupt exceptions from speculative reads of memory, including speculative instruction fetches. The defined values of this field are:

| SpecSEI | Meaning |
|---------|--|
| 0b0000 | The PE never generates an SError interrupt due to an External abort on a speculative read. |
| 0b0001 | The PE might generate an SError interrupt due to an External abort on a speculative read. |

All other values are reserved.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR4_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_MMFR4_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0010 | 0b110 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && (!IsZero(ID_MMFR4_EL1) || boolean IMPLEMENTATION_DEFINED "ID_MMFR4_EL1
trapped by HCR_EL2.TID3") && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_MMFR4_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_MMFR4_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_MMFR4_EL1;

```

ID_MMFR5_EL1, AArch32 Memory Model Feature Register 5

The ID_MMFR5_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_MMFR5\[31:0\]](#).

Attributes

ID_MMFR5_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|-----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | nTLBPA | | | | ETS | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:8]

Reserved, RES0.

nTLBPA, bits [7:4]

Indicates support for intermediate caching of translation table walks. Defined values are:

| nTLBPA | Meaning |
|--------|---|
| 0b0000 | The intermediate caching of translation table walks might include non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE where either: <ul style="list-style-type: none">The caching is indexed by the physical address of the location holding the translation table entry.The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry. |
| 0b0001 | The intermediate caching of translation table walks does not include non-coherent caches of previous valid translation table entries since the last completed TLBI applicable to the PE where either: <ul style="list-style-type: none">The caching is indexed by the physical address of the location holding the translation table entry.The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry. |

All other values are reserved.

FEAT_nTLBPA implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

ETS, bits [3:0]

Indicates support for Enhanced Translation Synchronization. Defined values are:

| ETS | Meaning |
|--------|--|
| 0b0000 | Enhanced Translation Synchronization is not supported. |
| 0b0001 | Enhanced Translation Synchronization is supported. |

All other values are reserved.

FEAT_ETTS implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.7, the only permitted value is 0b0001.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR5_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_MMFR5_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0011 | 0b110 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;

        else
            return ID_MMFR5_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_MMFR5_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_MMFR5_EL1;

```

ID_PFR0_EL1, AArch32 Processor Feature Register 0

The ID_PFR0_EL1 characteristics are:

Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with [ID_PFR1_EL1](#).

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_PFR0\[31:0\]](#).

Attributes

ID_PFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-----|----|----|----|-----|----|----|----|------|----|----|----|--------|----|----|----|--------|----|----|----|--------|----|----|----|--------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RAS | | | | DIT | | | | AMU | | | | CSV2 | | | | State3 | | | | State2 | | | | State1 | | | | State0 | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

RAS, bits [31:28]

RAS Extension version. Defined values are:

| RAS | Meaning |
|--------|---|
| 0b0000 | No RAS Extension. |
| 0b0001 | RAS Extension implemented. |
| 0b0010 | FEAT_RASv1p1 implemented. As 0b0001, and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension. |

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

In Armv8.2, the only permitted value is 0b0001.

From Armv8.4, if FEAT_DoubleFault is implemented, the only permitted value is 0b0010.

From Armv8.4, when FEAT_DoubleFault is not implemented, and [ERRIDR_EL1.NUM](#) is 0, the permitted values are IMPLEMENTATION DEFINED 0b0001 or 0b0010.

Note

When the value of this field is 0b0001, [ID_PFR2_EL1.RAS_frac](#) indicates whether FEAT_RASv1p1 is implemented.

DIT, bits [27:24]

Data Independent Timing. Defined values are:

| DIT | Meaning |
|--------|---|
| 0b0000 | AArch32 does not guarantee constant execution time of any instructions. |
| 0b0001 | AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions. |

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

AMU, bits [23:20]

Indicates support for Activity Monitors Extension. Defined values are:

| AMU | Meaning |
|--------|--|
| 0b0000 | Activity Monitors Extension is not implemented. |
| 0b0001 | FEAT_AMUv1 is implemented. |
| 0b0010 | FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters. |

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

CSV2, bits [19:16]

Speculative use of out of context branch targets. Defined values are:

| CSV2 | Meaning |
|--------|--|
| 0b0000 | This PE does not disclose whether branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context. |
| 0b0001 | Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. |
| 0b0010 | Branch targets trained in one hardware-described context can exploitatively control speculative execution in a different hardware-described context only in a hard-to-determine way. Within a hardware-described context, branch targets trained for branches situated at one address can control speculative execution of branches situated at different addresses only in a hard-to-determine way. |

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the values 0b0001 and 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

State3, bits [15:12]

T32EE instruction set support. Defined values are:

| State3 | Meaning |
|--------|------------------------------------|
| 0b0000 | Not implemented. |
| 0b0001 | T32EE instruction set implemented. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

State2, bits [11:8]

Jazelle extension support. Defined values are:

| State2 | Meaning |
|--------|---|
| 0b0000 | Not implemented. |
| 0b0001 | Jazelle extension implemented, without clearing of JOSCR.CV on exception entry. |
| 0b0010 | Jazelle extension implemented, with clearing of JOSCR.CV on exception entry. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

State1, bits [7:4]

T32 instruction set support. Defined values are:

| State1 | Meaning |
|--------|--|
| 0b0000 | T32 instruction set not implemented. |
| 0b0001 | T32 encodings before the introduction of Thumb-2 technology implemented: <ul style="list-style-type: none"> • All instructions are 16-bit. • A BL or BLX is a pair of 16-bit instructions. • 32-bit instructions other than BL and BLX cannot be encoded. |
| 0b0011 | T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

State0, bits [3:0]

A32 instruction set support. Defined values are:

| State0 | Meaning |
|--------|--------------------------------------|
| 0b0000 | A32 instruction set not implemented. |
| 0b0001 | A32 instruction set implemented. |

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_PFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_PFR0_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0001 | 0b000 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && HCR_EL2.TID3 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            return ID_PFR0_EL1;
    elsif PSTATE.EL == EL2 then
        return ID_PFR0_EL1;
    elsif PSTATE.EL == EL3 then
        return ID_PFR0_EL1;

```

ID_PFR1_EL1, AArch32 Processor Feature Register 1

The ID_PFR1_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with [ID_PFR0_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_PFR1\[31:0\]](#).

Attributes

ID_PFR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-----------|----|----|----|----------|----|----|----|----------|----|----|----|----------------|----|----|----|----------|----|----|----|----------|----|----|----|---------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| GIC | | | | Virt_frac | | | | Sec_frac | | | | GenTimer | | | | Virtualization | | | | MProgMod | | | | Security | | | | ProgMod | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

GIC, bits [31:28]

System register GIC CPU interface. Defined values are:

| GIC | Meaning |
|--------|--|
| 0b0000 | GIC CPU interface system registers not implemented. |
| 0b0001 | System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported. |
| 0b0011 | System register interface to version 4.1 of the GIC CPU interface is supported. |

All other values are reserved.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for Virtualization Extensions. Defined values are:

| Virt_frac | Meaning |
|------------------|--|
| 0b0000 | No Virtualization Extensions are implemented. |
| 0b0001 | The following Virtualization Extensions are implemented: <ul style="list-style-type: none"> • The SCR.SIF bit, if EL3 is implemented. • The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented. • The MSR (banked register) and MRS (banked register) instructions. • The ERET instruction. |

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is valid only when the value of ID_PFR1_EL1.Virtualization is 0, otherwise it holds the value 0b0000.

Note

The ID_ISAR registers do not identify whether the instructions added by the Virtualization Extensions are implemented.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for Security Extensions. Defined values are:

| Sec_frac | Meaning |
|-----------------|--|
| 0b0000 | No Security Extensions are implemented. |
| 0b0001 | The following Security Extensions are implemented: <ul style="list-style-type: none"> • The VBAR register. • The TTBCR.PD0 and TTBCR.PD1 bits. |
| 0b0010 | As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported. |

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is valid only when the value of ID_PFR1_EL1.Security is 0, otherwise it holds the value 0b0000.

GenTimer, bits [19:16]

Generic Timer support. Defined values are:

| GenTimer | Meaning |
|-----------------|--|
| 0b0000 | Generic Timer is not implemented. |
| 0b0001 | Generic Timer is implemented. |
| 0b0010 | Generic Timer is implemented, and also includes support for CNTHCTL .EVNTIS and CNTKCTL .EVNTIS fields, and CNTPCTSS and CNTVCTSS counter views. |

All other values are reserved.

FEAT_ECV implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0001.

From Armv8.6, the only permitted value is 0b0010.

Virtualization, bits [15:12]

Virtualization support. Defined values are:

| Virtualization | Meaning |
|----------------|--|
| 0b0000 | EL2, Hyp mode, and the HVC instruction not implemented. |
| 0b0001 | EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented. |

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Note

The ID_ISARs do not identify whether the HVC instruction is implemented.

MProgMod, bits [11:8]

M-profile programmers' model support. Defined values are:

| MProgMod | Meaning |
|----------|---|
| 0b0000 | Not supported. |
| 0b0010 | Support for two-stack programmers' model. |

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Security, bits [7:4]

Security support. Defined values are:

| Security | Meaning |
|----------|--|
| 0b0000 | EL3, Monitor mode, and the SMC instruction not implemented. |
| 0b0001 | EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented. |
| 0b0010 | As for 0b0001, and adds the ability to set the NSACR .RFR bit. Not permitted in Armv8 as the NSACR .RFR bit is RES0. |

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32 then this field has the value 0b0001.

If EL1 cannot use AArch32 then this field has the value 0b0000.

ProgMod, bits [3:0]

Support for the standard programmers' model for Armv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes. Defined values are:

| ProgMod | Meaning |
|---------|----------------|
| 0b0000 | Not supported. |
| 0b0001 | Supported. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32 then this field has the value 0b0000.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_PFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_PFR1_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0001 | 0b001 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_PFR1_EL1;
elseif PSTATE.EL == EL2 then
    return ID_PFR1_EL1;
elseif PSTATE.EL == EL3 then
    return ID_PFR1_EL1;

```

ID_PFR2_EL1, AArch32 Processor Feature Register 2

The ID_PFR2_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with [ID_PFR0_EL1](#) and [ID_PFR1_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ID_PFR2\[31:0\]](#).

Attributes

ID_PFR2_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|------|----|----|----|------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | RAS_frac | | | | SSBS | | | | CSV3 | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:12]

Reserved, RES0.

RAS_frac, bits [11:8]

RAS Extension fractional field. Defined values are:

| RAS_frac | Meaning |
|----------|---|
| 0b0000 | If ID_PFR0_EL1 .RAS == 0b0001, RAS Extension implemented. |
| 0b0001 | If ID_PFR0_EL1 .RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension. |

All other values are reserved.

This field is valid only if [ID_PFR0_EL1](#).RAS == 0b0001.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state. Defined values are:

| SSBS | Meaning |
|--------|--|
| 0b0000 | AArch32 provides no mechanism to control the use of Speculative Store Bypassing. |
| 0b0001 | AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe. |

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

CSV3, bits [3:0]

Speculative use of faulting data. Defined values are:

| CSV3 | Meaning |
|--------|--|
| 0b0000 | This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence. |
| 0b0001 | Data loaded under speculation with a permission or domain fault cannot be used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence. The execution timing of any other instructions in the speculative sequence is not a function of the data loaded under speculation. |

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_PFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_PFR2_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0011 | 0b100 |

```
if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID3 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ID_PFR2_EL1;
elseif PSTATE.EL == EL2 then
    return ID_PFR2_EL1;
elseif PSTATE.EL == EL3 then
    return ID_PFR2_EL1;
```

IFSR32_EL2, Instruction Fault Status Register (EL2)

The IFSR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 [IFSR](#) register from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register IFSR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register [IFSR\[31:0\]](#).

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to IFSR32_EL2 are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Attributes

IFSR32_EL2 is a 64-bit register.

Field descriptions

When TTBCR.EAE == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|------|----|----|----|-----|------|----|----|----|-------|------|----|----|----|------|--|--|--|---------|--|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | FnV | RES0 | | | | ExT | RES0 | | | | FS[4] | LPAE | | | | RES0 | | | | FS[3:0] | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | | | |

Bits [63:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

| FnV | Meaning |
|-----|--|
| 0b0 | IFAR is valid. |
| 0b1 | IFAR is not valid, and holds an UNKNOWN value. |

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault Status bits. Bits [10] and [3:0] are interpreted together.

| FS | Meaning | Applies when |
|---------|--|----------------------------------|
| 0b00001 | PC alignment fault. | |
| 0b00010 | Debug exception. | |
| 0b00011 | Access flag fault, level 1. | |
| 0b00101 | Translation fault, level 1. | |
| 0b00110 | Access flag fault, level 2. | |
| 0b00111 | Translation fault, level 2. | |
| 0b01000 | Synchronous External abort, not on translation table walk. | |
| 0b01001 | Domain fault, level 1. | |
| 0b01011 | Domain fault, level 2. | |
| 0b01100 | Synchronous External abort, on translation table walk, level 1. | |
| 0b01101 | Permission fault, level 1. | |
| 0b01110 | Synchronous External abort, on translation table walk, level 2. | |
| 0b01111 | Permission fault, level 2. | |
| 0b10000 | TLB conflict abort. | |
| 0b10100 | IMPLEMENTATION DEFINED fault (Lockdown fault). | |
| 0b11001 | Synchronous parity or ECC error on memory access, not on translation table walk. | When FEAT_RAS is not implemented |
| 0b11100 | Synchronous parity or ECC error on translation table walk, level 1. | When FEAT_RAS is not implemented |
| 0b11110 | Synchronous parity or ECC error on translation table walk, level 2. | When FEAT_RAS is not implemented |

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is IFSR32_EL2[10].
- FS[3:0] is IFSR32_EL2[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

| LPAAE | Meaning |
|-------|---|
| 0b0 | Using the Short-descriptor translation table formats. |
| 0b1 | Using the Long-descriptor translation table formats. |

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|------|----|----|----|-----|------|----|-------|------|----|----|--------|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | FnV | RES0 | | | | ExT | RES0 | | LPAAE | RES0 | | | STATUS | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

| FnV | Meaning |
|-----|--|
| 0b0 | IFAR is valid. |
| 0b1 | IFAR is not valid, and holds an UNKNOWN value. |

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

| LPAE | Meaning |
|-------------|---|
| 0b0 | Using the Short-descriptor translation table formats. |
| 0b1 | Using the Long-descriptor translation table formats. |

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

| STATUS | Meaning | Applies when |
|---------------|--|----------------------------------|
| 0b000000 | Address size fault in translation table base register. | |
| 0b000001 | Address size fault, level 1. | |
| 0b000010 | Address size fault, level 2. | |
| 0b000011 | Address size fault, level 3. | |
| 0b000101 | Translation fault, level 1. | |
| 0b000110 | Translation fault, level 2. | |
| 0b000111 | Translation fault, level 3. | |
| 0b001001 | Access flag fault, level 1. | |
| 0b001010 | Access flag fault, level 2. | |
| 0b001011 | Access flag fault, level 3. | |
| 0b001101 | Permission fault, level 1. | |
| 0b001110 | Permission fault, level 2. | |
| 0b001111 | Permission fault, level 3. | |
| 0b010000 | Synchronous External abort, not on translation table walk. | |
| 0b010101 | Synchronous External abort on translation table walk, level 1. | |
| 0b010110 | Synchronous External abort on translation table walk, level 2. | |
| 0b010111 | Synchronous External abort on translation table walk, level 3. | |
| 0b011000 | Synchronous parity or ECC error on memory access, not on translation table walk. | When FEAT_RAS is not implemented |
| 0b011101 | Synchronous parity or ECC error on memory access on translation table walk, level 1. | When FEAT_RAS is not implemented |
| 0b011110 | Synchronous parity or ECC error on memory access on translation table walk, level 2. | When FEAT_RAS is not implemented |
| 0b011111 | Synchronous parity or ECC error on memory access on translation table walk, level 3. | When FEAT_RAS is not implemented |
| 0b100001 | PC alignment fault. | |
| 0b100010 | Debug exception. | |
| 0b110000 | TLB conflict abort. | |

All other values are reserved.

When FEAT_RAS is implemented, 0b011000, 0b011101, 0b011110, and 0b011111 are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing IFSR32_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, IFSR32_EL2

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|

```

ISR_EL1, Interrupt Status Register

The ISR_EL1 characteristics are:

Purpose

Shows the pending status of the IRQ, FIQ, or SError interrupt.

When executing at EL2, EL3 or Secure EL1 when [SCR_EL3.EEL2](#) == 0b0, this shows the pending status of the physical IRQ, FIQ, or SError interrupts.

When executing at either Non-secure EL1 or at Secure EL1 when [SCR_EL3.EEL2](#) == 0b1:

- If the [HCR_EL2](#).{IMO,FMO,AMO} bit has a value of 1, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the virtual IRQ, FIQ, or SError.
- If the [HCR_EL2](#).{IMO,FMO,AMO} bit has a value of 0, the corresponding ISR_EL1.{I,F,A} bit shows the pending status of the physical IRQ, FIQ, or SError.

Configuration

AArch64 System register ISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [ISR\[31:0\]](#).

Attributes

ISR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|--|--|--|--|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | | | | |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | IS | | FS | | A | | I | | F | | RES0 | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | | |

Bits [63:11]

Reserved, RES0.

IS, bit [10]

When FEAT_NMI is implemented:

IRQ with Superpriority pending bit. Indicates whether an IRQ interrupt with Superpriority is pending.

| IS | Meaning |
|-----|---|
| 0b0 | No pending IRQ with Superpriority. |
| 0b1 | An IRQ interrupt with Superpriority is pending. |

Note

The function of ISR_EL1.I to indicate the presence of a pending IRQ interrupt is unchanged regardless of Superpriority.

Otherwise:

Reserved, RES0.

FS, bit [9]**When FEAT_NMI is implemented:**

FIQ with Superpriority pending bit. Indicates whether an FIQ interrupt with Superpriority is pending.

| FS | Meaning |
|-----------|---|
| 0b0 | No pending FIQ with Superpriority. |
| 0b1 | An FIQ interrupt with Superpriority is pending. |

Note

The function of ISR_EL1.F to indicate the presence of a pending FIQ interrupt is unchanged regardless of Superpriority.

Otherwise:

Reserved, RES0.

A, bit [8]

SError interrupt pending bit. Indicates whether an SError interrupt is pending.

| A | Meaning |
|----------|---------------------------------|
| 0b0 | No pending SError. |
| 0b1 | An SError interrupt is pending. |

If the SError interrupt is edge-triggered, this field is cleared to zero when the physical SError interrupt is taken.

I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending.

| I | Meaning |
|----------|------------------------------|
| 0b0 | No pending IRQ. |
| 0b1 | An IRQ interrupt is pending. |

F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

| F | Meaning |
|----------|------------------------------|
| 0b0 | No pending FIQ. |
| 0b1 | An FIQ interrupt is pending. |

Bits [5:0]

Reserved, RES0.

Accessing ISR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ISR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b11 | 0b000 | 0b1100 | 0b0001 | 0b000 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.ISR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return ISR_EL1;
elsif PSTATE.EL == EL2 then
    return ISR_EL1;
elsif PSTATE.EL == EL3 then
    return ISR_EL1;
```

LORC_EL1, LORegion Control (EL1)

The LORC_EL1 characteristics are:

Purpose

Enables and disables LORegions, and selects the current LORegion descriptor.

Configuration

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORC_EL1 are UNDEFINED.

If no LORegion descriptors are supported by the PE, then this register is RES0.

Attributes

LORC_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | DS | | | | | | | | | | RES0 | | EN | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:10]

Reserved, RES0.

DS, bits [9:2]

Descriptor Select. Selects the current LORegion descriptor accessed by [LORSA_EL1](#), [LOREA_EL1](#), and [LORN_EL1](#).

The number of LORegion descriptors in IMPLEMENTATION DEFINED. The maximum number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are RES0, where M is $\text{Log}_2(\text{Number of LORegion descriptors supported by the implementation})$.

If this field points to an LORegion descriptor that is not supported by an implementation, then the registers [LORN_EL1](#), [LOREA_EL1](#), and [LORSA_EL1](#) are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [1]

Reserved, RES0.

EN, bit [0]

Enable. Indicates whether LORegions are enabled.

| EN | Meaning |
|-----|---|
| 0b0 | Disabled. Memory accesses do not match any LORegions. |
| 0b1 | Enabled. Memory accesses may match a LORegion. |

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing LORC_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, LORC_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b1010 | 0b0100 | 0b011 |

LOREA_EL1, LORegion End Address (EL1)

The LOREA_EL1 characteristics are:

Purpose

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by [LORC_EL1](#).DS.

Configuration

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LOREA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC_EL1](#).DS points to a LORegion that is not supported by the PE.

Attributes

LOREA_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|-----------|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | EA[51:48] | | | | EA[47:16] | | | | | | | | | | | | | | | |
| EA[47:16] | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:52]

Reserved, RES0.

EA[51:48], bits [51:48]

When FEAT_LPA is implemented:

Extension to EA[47:16]. For more information, see EA[47:16].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA[47:16], bits [47:16]

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by [LORC_EL1](#).DS. Bits[15:0] of this address are 0xFFFF. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented and 52-bit addresses are in use, EA[51:48] form bits [51:48] of the end physical address of the LORegion. Otherwise, when 52-bit addresses are not in use, EA[51:48] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:0]

Reserved, RES0.

Accessing LOREA_EL1

LORN_EL1, LORegion Number (EL1)

The LORN_EL1 characteristics are:

Purpose

Holds the number of the LORegion described in the current LORegion descriptor selected by [LORC_EL1](#).DS.

Configuration

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORN_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC_EL1](#).DS points to a LORegion that is not supported by the PE.

Attributes

LORN_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|-----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | Num | | | | | | | | | | | | | | | | | | | | | | | |

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:8]

Reserved, RES0.

Num, bits [7:0]

Number of the LORegion described in the current LORegion descriptor selected by [LORC_EL1](#).DS.

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are RES0, where N is (Log₂(Number of LORegions supported by the PE)).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing LORN_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, LORN_EL1

LORSA_EL1, LORegion Start Address (EL1)

The LORSA_EL1 characteristics are:

Purpose

Indicates whether the current LORegion descriptor selected by [LORC_EL1](#).DS is enabled, and holds the physical address of the start of the LORegion.

Configuration

This register is present only when FEAT_LOR is implemented. Otherwise, direct accesses to LORSA_EL1 are UNDEFINED.

This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- [LORC_EL1](#).DS points to a LORegion that is not supported by the PE.

Attributes

LORSA_EL1 is a 64-bit register.

Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:52]

Reserved, RES0.

SA, bits [51:16]

SA encoding when FEAT_LPA is implemented

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SA | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

SA, bits [35:0]

Bits [51:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by [LORC_EL1](#).DS.

Bits[15:0] of this address are 0x0000.

For implementations with fewer than 52 physical address bits, the corresponding upper bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SA encoding when FEAT_LPA is not implemented

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| RES0 | | | | SA | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [35:32]

Reserved, RES0.

SA, bits [31:0]

Bits [47:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by [LORC_EL1](#).DS.

Bits[15:0] of this address are 0x0000.

For implementations with fewer than 48 physical address bits, the corresponding upper bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:1]

Reserved, RES0.

Valid, bit [0]

Indicates whether the current LORegion descriptor is enabled.

| Valid | Meaning |
|-------|----------------------------------|
| 0b0 | LORegion descriptor is disabled. |
| 0b1 | LORegion descriptor is enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

MAIR_EL1, Memory Attribute Indirection Register (EL1)

The MAIR_EL1 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

Configuration

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PRRR\[31:0\]](#) when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MAIR0\[31:0\]](#) when TTBCR.EAE == 1.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register [NMRR\[31:0\]](#) when TTBCR.EAE == 0.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register [MAIR1\[31:0\]](#) when TTBCR.EAE == 1.

Attributes

MAIR_EL1 is a 64-bit register.

MAIR_EL1 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where AttrIdx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

| Attr | Meaning |
|--|--|
| 0b0000dd00 | Device memory. See encoding of 'dd' for the type of Device memory. |
| 0b0000dd01 | If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE. |
| 0b0000dd1x | UNPREDICTABLE. |
| 0boooooiii, (oooo != 0000 and iiii != 0000) | Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory. |
| 0b01000000 | If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE. |
| 0b10100000 | If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE. |
| 0b11110000 | If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE. |
| 0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111) | UNPREDICTABLE. |

'dd' is encoded as follows:

| dd | Meaning |
|------|----------------------|
| 0b00 | Device-nGnRnE memory |
| 0b01 | Device-nGnRE memory |
| 0b10 | Device-nGRE memory |
| 0b11 | Device-GRE memory |

'oooo' is encoded as follows:

| 'oooo' | Meaning |
|------------------------|--|
| 0b0000 | See encoding of Attr |
| 0b00RW, RW not 0b00 | Normal memory, Outer Write-Through Transient |
| 0b0100 | Normal memory, Outer Non-cacheable |
| 0b01RW, RW not 0b00 | Normal memory, Outer Write-Back Transient |
| 0b10RW | Normal memory, Outer Write-Through Non-transient |
| 0b11RW | Normal memory, Outer Write-Back Non-transient |

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

| 'iiii' | Meaning |
|------------------------|--|
| 0b0000 | See encoding of Attr |
| 0b00RW, RW not 0b00 | Normal memory, Inner Write-Through Transient |
| 0b0100 | Normal memory, Inner Non-cacheable |
| 0b01RW, RW not 0b00 | Normal memory, Inner Write-Back Transient |
| 0b10RW | Normal memory, Inner Write-Through Non-transient |
| 0b11RW | Normal memory, Inner Write-Back Non-transient |

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

| R or W | Meaning |
|--------|-------------|
| 0b0 | No Allocate |
| 0b1 | Allocate |

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic MAIR_EL1 or MAIR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MAIR_EL1

| op0 | op1 | CRn | CRm | op2 |

MAIR_EL2, Memory Attribute Indirection Register (EL2)

The MAIR_EL2 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIdx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

Configuration

AArch64 System register MAIR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HMAIRO\[31:0\]](#).

AArch64 System register MAIR_EL2 bits [63:32] are architecturally mapped to AArch32 System register [HMAIR1\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MAIR_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

MAIR_EL2 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

The memory attribute encoding for an AttrIdx[2:0] entry in a Long descriptor format translation table entry, where AttrIdx[2:0] gives the value of <n> in Attr<n>.

Attr is encoded as follows:

| Attr | Meaning |
|--|--|
| 0b0000dd00 | Device memory. See encoding of 'dd' for the type of Device memory. |
| 0b0000dd01 | If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise, UNPREDICTABLE. |
| 0b0000dd1x | UNPREDICTABLE. |
| 0boooooiii, (oooo != 0000 and iiii != 0000) | Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal Memory. |
| 0b01000000 | If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE. |
| 0b10100000 | If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise, UNPREDICTABLE. |
| 0b11110000 | If FEAT_MTE2 is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise, UNPREDICTABLE. |
| 0bxxxx0000, (xxxx != 0000, xxxx != 0100, xxxx != 1010, xxxx != 1111) | UNPREDICTABLE. |

'dd' is encoded as follows:

| dd | Meaning |
|------|----------------------|
| 0b00 | Device-nGnRnE memory |
| 0b01 | Device-nGnRE memory |
| 0b10 | Device-nGRE memory |
| 0b11 | Device-GRE memory |

'oooo' is encoded as follows:

| 'oooo' | Meaning |
|------------------------|--|
| 0b0000 | See encoding of Attr |
| 0b00RW, RW not 0b00 | Normal memory, Outer Write-Through Transient |
| 0b0100 | Normal memory, Outer Non-cacheable |
| 0b01RW, RW not 0b00 | Normal memory, Outer Write-Back Transient |
| 0b10RW | Normal memory, Outer Write-Through Non-transient |
| 0b11RW | Normal memory, Outer Write-Back Non-transient |

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

'iiii' is encoded as follows:

| 'iiii' | Meaning |
|------------------------|--|
| 0b0000 | See encoding of Attr |
| 0b00RW, RW not 0b00 | Normal memory, Inner Write-Through Transient |
| 0b0100 | Normal memory, Inner Non-cacheable |
| 0b01RW, RW not 0b00 | Normal memory, Inner Write-Back Transient |
| 0b10RW | Normal memory, Inner Write-Through Non-transient |
| 0b11RW | Normal memory, Inner Write-Back Non-transient |

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in 'oooo' and 'iiii' fields have the following meanings:

| R or W | Meaning |
|---------------|----------------|
| 0b0 | No Allocate |
| 0b1 | Allocate |

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic MAIR_EL2 or MAIR_EL1 is not guaranteed to be ordered with respect to accesses using the other mnemonic.

```

MAIR_EL3, Memory Attribute Indirection Register (EL3)

The MAIR_EL3 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to MAIR_EL3 are UNDEFINED.

Attributes

MAIR_EL3 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

```

MDCCINT_EL1, Monitor DCC Interrupt Enable Register

The MDCCINT_EL1 characteristics are:

Purpose

Enables interrupt requests to be signaled based on the DCC status flags.

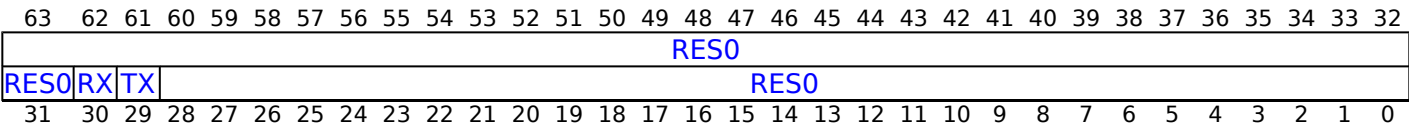

Configuration

AArch64 System register MDCCINT_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGDCCINTI\[31:0\]](#).

Attributes

MDCCINT_EL1 is a 64-bit register.

Field descriptions

Bits [63:31]

Reserved, RES0.

RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

| RX | Meaning |
|-----|---|
| 0b0 | No interrupt request generated by DTRRX. |
| 0b1 | Interrupt request will be generated on RXfull == 1. |

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

| TX | Meaning |
|-----|---|
| 0b0 | No interrupt request generated by DTRTX. |
| 0b1 | Interrupt request will be generated on TXfull == 0. |

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [28:0]

Reserved, RES0.

Accessing MDCCINT_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDCCINT_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b000 | 0b0000 | 0b0010 | 0b000 |

```

MDCCSR_EL0, Monitor DCC Status Register

The MDCCSR_EL0 characteristics are:

Purpose

Read-only register containing control status flags for the DCC.

Configuration

AArch64 System register MDCCSR_EL0 bits [30:29] are architecturally mapped to External register [EDSCR\[30:29\]](#).

AArch64 System register MDCCSR_EL0 bits [30:29] are architecturally mapped to AArch32 System register [DBGDSCRint\[30:29\]](#).

Attributes

MDCCSR_EL0 is a 64-bit register.

MDCR_EL2, Monitor Debug Configuration Register (EL2)

The MDCR_EL2 characteristics are:

Purpose

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

Configuration

AArch64 System register MDCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HDCR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MDCR_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:37]

Reserved, RES0.

HPMFZS, bit [36]

When FEAT_SPEv1p2 is implemented:

Hyp Performance Monitors Freeze-on-SPE event. Stop counters when [PMBLIMITR_EL1](#).{PMFZ, E} == {1, 1} and [PMBSR_EL1](#).S == 1.

| HPMFZS | Meaning |
|--------|--|
| 0b0 | Do not freeze on Statistical Profiling Buffer Management event. |
| 0b1 | Event counters do not count following a Statistical Profiling Buffer Management event. |

If MDCR_EL2.HPMN is less than [PMCR_EL0.N](#), this field affects the operation of event counters in the range [MDCR_EL2.HPMN .. ([PMCR_EL0.N](#)-1)].

This field does not affect the operation of other event counters and [PMCCNTR_ELO](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:30]

Reserved, RES0.

HPMFZO, bit [29]

When FEAT_PMUv3p7 is implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

| HPMFZO | Meaning |
|--------|---|
| 0b0 | Do not freeze on overflow. |
| 0b1 | Event counters do not count when PMOVSLR_EL0 [(PMCR_EL0 .N-1):MDCR_EL2.HPMN] is nonzero. |

If MDCR_EL2.HPMN is less than [PMCR_EL0](#).N, this field affects the operation of event counters in the range [MDCR_EL2.HPMN .. ([PMCR_EL0](#).N-1)].

This field does not affect the operation of other event counters and [PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented and EL3 is not implemented:

Multi-threaded PMU Enable. Enables use of the [PMEVTYPER<n>_EL0](#).MT bits.

| MTPME | Meaning |
|-------|--|
| 0b0 | FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>_EL0 .MT is zero. |
| 0b1 | PMEVTYPER<n>_EL0 .MT bits not affected by this field. |

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

| TDCC | Meaning |
|-------------|--|
| 0b0 | This control does not cause any register accesses to be trapped. |
| 0b1 | If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Trap exception to EL2, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state. |

The DCC registers trapped by this control are:

AArch64: [OSDTRRX_EL1](#), [OSDTRTX_EL1](#), [MDCCSR_EL0](#), [MDCCINT_EL1](#), and, when the PE is in Non-debug state, [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#).

AArch32: [DBGDTRRXext](#), [DBGDTRTXext](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL2.TDCC does not trap any accesses to:

AArch64: [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#).

AArch32: [DBGDTRRXint](#) and [DBGDTRTXint](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HLP, bit [26]

When FEAT_PMUv3p5 is implemented:

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

| HLP | Meaning |
|------------|--|
| 0b0 | Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [31:0]. |
| 0b1 | Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [63:0]. |

If MDCR_EL2.HPMN is less than [PMCR_EL0](#).N, this bit affects the operation of event counters in the range [MDCR_EL2.HPMN..([PMCR_EL0](#).N-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2TB, bits [25:24]**When FEAT_TRBE is implemented:**

EL2 Trace Buffer.

If EL2 is implemented and enabled in the Trace Buffer owning Security state, controls the owning translation regime.

If EL2 is implemented and enabled in the current Security state, controls access to Trace Buffer control registers from EL1.

| E2TB | Meaning |
|-------------|--|
| 0b00 | <p>If EL2 is implemented and enabled in the Trace Buffer owning Security state, the Trace Buffer owning Exception level is EL2. Otherwise, the Trace Buffer owning Exception level is EL1 and, if <code>TraceBufferEnabled() == TRUE</code>, tracing is prohibited at EL2.</p> <p>If EL2 is implemented and enabled in the current Security state, accesses to Trace Buffer control registers at EL1 generate a Trap exception to EL2.</p> |
| 0b10 | <p>Trace Buffer owning Exception level is EL1. If <code>TraceBufferEnabled() == TRUE</code>, tracing is prohibited at EL2.</p> <p>If EL2 is implemented and enabled in the current Security state, accesses to Trace Buffer control registers at EL1 generate a Trap exception to EL2.</p> |
| 0b11 | <p>Trace Buffer owning Exception level is EL1. If <code>TraceBufferEnabled() == TRUE</code>, tracing is prohibited at EL2.</p> |

All other values are reserved.

The Trace Buffer control registers trapped by this control are: [TRBBASER_EL1](#), [TRBLIMITR_EL1](#), [TRBMAR_EL1](#), [TRBPTR_EL1](#), [TRBSR_EL1](#), and [TRBTRG_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HCCD, bit [23]**When FEAT_PMUv3p5 is implemented:**

Hypervisor Cycle Counter Disable. Prohibits [PMCCNTR_EL0](#) from counting at EL2.

| HCCD | Meaning |
|-------------|--|
| 0b0 | Cycle counting by PMCCNTR_EL0 is not affected by this mechanism. |
| 0b1 | Cycle counting by PMCCNTR_EL0 is prohibited at EL2. |

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

TTRF, bit [19]

When FEAT_TRF is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2, as follows:

- Access to [TRFCR_EL1](#) is trapped to EL2, reported using EC syndrome value 0x18.
- Access to [TRFCR](#) is trapped to EL2, reported using EC syndrome value 0x03.

| TTRF | Meaning |
|------|--|
| 0b0 | Accesses to TRFCR_EL1 and TRFCR at EL1 are not affected by this control. |
| 0b1 | Accesses to TRFCR_EL1 and TRFCR at EL1 generate a trap exception to EL2 when EL2 is enabled in the current Security state. |

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]

When FEAT_PMUv3p1 is implemented and FEAT_Debugv8p2 is implemented:

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

| HPMD | Meaning |
|------|--|
| 0b0 | Event counting and PMCCNTR_EL0 are not affected by this mechanism. |
| 0b1 | Event counting by some event counters is prohibited at EL2. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled at EL2. Otherwise, PMCCNTR_EL0 is not affected by this mechanism. |

If MDCR_EL2.HPMN is not 0, this field affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)].

This field does not affect the operation of other event counters.

If [PMCR_EL0.DP](#) is 1, this field affects [PMCCNTR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3p1 is implemented:

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

| HPMD | Meaning |
|------|---|
| 0b0 | Event counting and PMCCNTR_EL0 are not affected by this mechanism. |
| 0b1 | If ExternalSecureNoninvasiveDebugEnabled() is FALSE, event counting by some event counters is prohibited at EL2, and if PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled at EL2. |

If `ExternalSecureNoninvasiveDebugEnabled()` is TRUE, this field does not affect the event counters and does not affect [PMCCNTR_EL0](#).

Otherwise:

- If MDCR_EL2.HPMN is not 0, this field affects the operation of event counters in the range [0 .. (MDCR_EL2.HPMN-1)].
- This field does not affect the operation of other event counters.
- If [PMCR_EL0.DP](#) is 1, this field affects [PMCCNTR_EL0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [16:15]

Reserved, RES0.

TPMS, bit [14]

When FEAT_SPE is implemented:

Trap Performance Monitor Sampling. If EL2 is implemented and enabled in the current Security state, controls access to Statistical Profiling control registers from EL1.

| TPMS | Meaning |
|------|---|
| 0b0 | Do not trap Statistical Profiling controls to EL2. |
| 0b1 | If EL2 is implemented and enabled in the current Security state, accesses to Statistical Profiling control registers at EL1 generate a Trap exception to EL2. |

The Statistical Profiling control registers trapped by this control are:

- [PMSCR_EL1](#), [PMSEVFR_EL1](#), [PMSFCR_EL1](#), [PMSICR_EL1](#), [PMSIDR_EL1](#), [PMSIRR_EL1](#), and [PMSLATR_EL1](#).
- If FEAT_SPEv1p2 is implemented, [PMSNEVER_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2PB, bits [13:12]

When FEAT_SPE is implemented:

EL2 Profiling Buffer. If EL2 is implemented and enabled in the Profiling Buffer owning Security state, this field controls the owning translation regime. If EL2 is implemented and enabled in the current Security state, this field controls access to Profiling Buffer control registers from EL1.

| E2PB | Meaning |
|-------------|---|
| 0b00 | If EL2 is implemented and enabled in the Profiling Buffer owning Security state, the Profiling Buffer uses the EL2 or EL2&0 stage 1 translation regime. Otherwise the Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2. |
| 0b10 | Profiling Buffer uses the EL1&0 stage 1 translation regime. If EL2 is implemented and enabled in the current Security state, accesses to Profiling Buffer control registers at EL1 generate a Trap exception to EL2. |
| 0b11 | Profiling Buffer uses the EL1&0 stage 1 translation regime. Accesses to Profiling Buffer control registers at EL1 are not trapped to EL2. |

All other values are reserved.

The Profiling Buffer control registers trapped by this control are: [PMBLIMITR_EL1](#), [PMBPTR_EL1](#), and [PMBSR_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64 state, accesses to [MDRAR_EL1](#) are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 or EL1 is using AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05 and MRRC or MCRR accesses are trapped to EL2, reported using EC syndrome value 0x0C:
 - [DBGDRAR](#), [DBGDSAR](#).

| TDRA | Meaning |
|-------------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by DBGDSCRext .UDCCdis or MDSCR_EL1 .TDCC. |

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2](#).TDE == 1.
- [HCR_EL2](#).TGE == 1.

Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDOSA, bit [10]**When FEAT_DoubleLock is implemented:**

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
 - [OSLAR_EL1](#), [OSLSR_EL1](#), [OSDLR_EL1](#), and [DBGPRCR_EL1](#).
 - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
 - [DBGOSLSR](#), [DBGOSLAR](#), [DBGOSDLR](#), and [DBGPRCR](#).
 - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

| TDOSA | Meaning |
|-------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state. |

Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2](#).TDE == 1.
- [HCR_EL2](#).TGE == 1.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
 - [OSLAR_EL1](#), [OSLSR_EL1](#), and [DBGPRCR_EL1](#).
 - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
 - [DBGOSLSR](#), [DBGOSLAR](#), and [DBGPRCR](#).
 - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to [OSDLR_EL1](#) are trapped.

It is IMPLEMENTATION DEFINED whether accesses to [DBGOSDLR](#) are trapped.

| TDOSA | Meaning |
|--------------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state. |

Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2.TDE](#) == 1.
- [HCR_EL2.TGE](#) == 1.

Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL0 and EL1 System register accesses to debug System registers that are not trapped by MDCR_EL2.TDRA or MDCR_EL2.TDOSA, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2 reported using EC syndrome value 0x18:
 - [MDCCSR_EL0](#), [MDCCINT_EL1](#), [OSDTRRX_EL1](#), [MDSCR_EL1](#), [OSDTRTX_EL1](#), [OSECCR_EL1](#), [DBGBVR<n>_EL1](#), [DBGBCR<n>_EL1](#), [DBGWVR<n>_EL1](#), [DBGWCR<n>_EL1](#), [DBGCLAIMSET_EL1](#), [DBGCLAIMCLR_EL1](#), [DBGAUTHSTATUS_EL1](#).
 - When not in Debug state, [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), [DBGDTRTX_EL0](#).
- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05.
 - [DBGDIDR](#), [DBGDSCRint](#), [DBGDCCINT](#), [DBGWFAR](#), [DBGVCR](#), [DBGDSCRExt](#), [DBGDTRTXext](#), [DBGDTRRXext](#), [DBGBVR<n>](#), [DBGBCR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#), [DBGCLAIMSET](#), [DBGCLAIMCLR](#), [DBGAUTHSTATUS](#), [DBGDEVID](#), [DBGDEVID1](#), [DBGDEVID2](#), [DBGOSECRR](#).
 - When not in Debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).
- In AArch32 state, STC accesses to [DBGDTRRXint](#) and LDC accesses to [DBGDTRTXint](#) are trapped to EL2, reported using EC syndrome value 0x06.

| TDA | Meaning |
|------------|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | EL0 or EL1 System register accesses to the debug registers are trapped from both Execution states to EL2 when EL2 is enabled in the current Security state, unless the access generates a higher priority exception. |

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

Traps of AArch64 accesses to [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#) are ignored in Debug state.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- [MDCR_EL2.TDE](#) == 1
- [HCR_EL2.TGE](#) == 1

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDE, bit [8]

Trap Debug Exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D.

| TDE | Meaning |
|------------|--|
| 0b0 | The debug target Exception level is EL1. |
| 0b1 | If EL2 is enabled for the current Effective value of SCR_EL3.NS , the debug target Exception level is EL2, otherwise the debug target Exception level is EL1. The MDCR_EL2.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register. |

For more information, see 'Routing debug exceptions'.

This field is treated as being 1 for all purposes other than a direct read when [HCR_EL2.TGE](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPME, bit [7]

When FEAT_PMUv3 is implemented:

[MDCR_EL2.HPMN..(N-1)] event counters enable.

| HPME | Meaning |
|-------------|---|
| 0b0 | Event counters in the range [MDCR_EL2.HPMN.. (PMCR_EL0.N-1)] are disabled. |
| 0b1 | Event counters in the range [MDCR_EL2.HPMN.. (PMCR_EL0.N-1)] are enabled by PMCNTENSET_EL0 . |

If MDCR_EL2.HPMN is less than [PMCR_EL0.N](#), this field affects the operation of event counters in the range [MDCR_EL2.HPMN..[\(PMCR_EL0.N-1\)](#)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPM, bit [6]

When FEAT_PMUv3 is implemented:

Trap Performance Monitors accesses. Traps EL0 and EL1 accesses to all Performance Monitor registers to EL2 when EL2 is enabled in the current Security state, from both Execution states, as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
 - [PMCR_EL0](#), [PMCNTENSET_EL0](#), [PMCNTENCLR_EL0](#), [PMOVSCCLR_EL0](#), [PMSWINC_EL0](#), [PMSELR_EL0](#), [PMCEID0_EL0](#), [PMCEID1_EL0](#), [PMCCNTR_EL0](#), [PMXEVTYPER_EL0](#), [PMXEVCNTR_EL0](#), [PMUSERENR_EL0](#), [PMINTENSET_EL1](#), [PMINTENCLR_EL1](#), [PMOVSSET_EL0](#), [PMEVCNTR<n>_EL0](#), [PMEVTYPER<n>_EL0](#), [PMCCFILTR_EL0](#).
 - If FEAT_PMUv3p4 is implemented, [PMMIR_EL1](#)

- In AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, MRRC or MCRR accesses are trapped to EL2 and reported using EC syndrome value 0x04:
 - [PMCR](#), [PMCNTENSET](#), [PMCNTENCLR](#), [PMOVSr](#), [PMSWINC](#), [PMSELR](#), [PMCEID0](#), [PMCEID1](#), [PMCCNTR](#), [PMXEVTYPER](#), [PMXEVCNTR](#), [PMUSERENR](#), [PMINTENSET](#), [PMINTENCLR](#), [PMOVSSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMCCFILTR](#).
 - If FEAT_PMUv3p1 is implemented, [PMCEID2](#), and [PMCEID3](#).
 - If FEAT_PMUv3p4 is implemented, [PMMIR](#).

| TPM | Meaning |
|-----|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | EL0 and EL1 accesses to all Performance Monitor registers are trapped to EL2 when EL2 is enabled in the current Security state. |

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPMCR, bit [5]

When FEAT_PMUv3 is implemented:

Trap [PMCR_EL0](#) or [PMCR](#) accesses. Traps EL0 and EL1 accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to [PMCR_EL0](#) are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, accesses to [PMCR](#) are trapped to EL2, reported using EC syndrome value 0x03.

| TPMCR | Meaning |
|-------|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | EL0 and EL1 accesses to the PMCR_EL0 or PMCR are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by PMUSERENR .EN or PMUSERENR_EL0 .EN. |

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPMN, bits [4:0]**When FEAT_PMUv3 is implemented:**

Defines the number of event counters that are accessible from EL3, EL2, EL1, and from EL0 if permitted.

If HPMN is not 0 and is less than [PMCR_ELO.N](#), HPMN divides the Performance Monitors into a first range [0..(HPMN-1)], and a second range [HPMN..([PMCR_ELO.N](#)-1)].

If FEAT_HPMN0 is implemented and this field is 0, all events counters are in the second range and none are in the first range.

If HPMN is equal to [PMCR_ELO.N](#), all event counters are in the first range and none are in the second range.

For an event counter <n> in the first range:

- The counter is accessible from EL1, EL2, and EL3.
- The counter is accessible from EL0 if permitted by [PMUSERENR_ELO](#) or [PMUSERENR](#).
- If FEAT_PMUv3p5 is implemented, [PMCR_ELO.LP](#) or [PMCR.LP](#) determines whether the counter overflow flag is set on unsigned overflow of [PMEVCNTR<n>_ELO\[31:0\]](#) or [PMEVCNTR<n>_ELO\[63:0\]](#).
- [PMCR_ELO.E](#) and [PMCNTENSET_ELO\[n\]](#) enable the operation of event counter n.

For an event counter <n> in the second range:

- The counter is accessible from EL2 and EL3.
- If EL2 is disabled in the current Security state, the event counter is also accessible from EL1, and from EL0 if permitted by [PMUSERENR_ELO](#).
- If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP determines whether the counter overflow flag is set on unsigned overflow of [PMEVCNTR<n>_ELO\[31:0\]](#) or [PMEVCNTR<n>_ELO\[63:0\]](#).
- MDCR_EL2.HPME and [PMCNTENSET_ELO\[n\]](#) enable the operation of event counter n.

If HPMN is larger than [PMCR_ELO.N](#), or if FEAT_HPMN0 is not implemented, and HPMN is 0, the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of MDCR_EL2.HPMN is UNKNOWN.
- Either:
 - An UNKNOWN number of counters are reserved for EL2 and EL3 use. That is, the PE behaves as if MDCR_EL2.HPMN is set to an UNKNOWN non-zero value less than or equal to [PMCR_ELO.N](#).
 - All counters are reserved for EL2 and EL3 use, meaning no counters are accessible from EL1 and EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in [PMCR_ELO.N](#).

Otherwise:

Reserved, RES0.

Accessing MDCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDCR_EL2

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0001 | 0b0001 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elsif HaveEL(EL3) && MDCR_EL3.TDA == '1' then

MDCR_EL3, Monitor Debug Configuration Register (EL3)

The MDCR_EL3 characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

Configuration

AArch64 System register MDCR_EL3 bits [31:0] can be mapped to AArch32 System register [SDCR\[31:0\]](#), but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to MDCR_EL3 are UNDEFINED.

Attributes

MDCR_EL3 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | |
|--------|-------|------|-------|------|------|------|------|------|------|------|-------|-----|-------|------|-------|-------|------|------|----|----|----|----|------|
| 636261 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 |

Bits [63:39]

Reserved, RES0.

E3BREC, bit [38]

When FEAT_BRBEv1p1 is implemented:

Branch Record Buffer EL3 Cold Reset Enable. With MDCR_EL3.E3BREW, controls branch recording at EL3.

| E3BREC | Meaning |
|---------------|---|
| 0b0 | When MDCR_EL3.E3BREW == 0: Branch recording at EL3 is disabled. When MDCR_EL3.E3BREW == 1: Branch recording at EL3 is enabled. |
| 0b1 | When MDCR_EL3.E3BREW == 0: Branch recording at EL3 is enabled. When MDCR_EL3.E3BREW == 1: Branch recording at EL3 is disabled. |

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Otherwise:

Reserved, RES0.

E3BREW, bit [37]**When FEAT_BRBEv1p1 is implemented:**

Branch Record Buffer EL3 Warm Reset Enable. With MDCR_EL3.E3BREC, controls branch recording at EL3.

For a description of the values derived by evaluating MDCR_EL3.E3BREC and MDCR_EL3.E3BREW together, see MDCR_EL3.E3BREC.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EnPMSN, bit [36]**When FEAT_SPEv1p2 is implemented:**

Trap accesses to [PMSNEVFR_EL1](#). Controls access to Statistical Profiling [PMSNEVFR_EL1](#) System register from EL2 and EL1.

| EnPMSN | Meaning |
|--------|---|
| 0b0 | Accesses to PMSNEVFR_EL1 at EL2 and EL1 generate a Trap exception to EL3. |
| 0b1 | Do not trap PMSNEVFR_EL1 to EL3. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MPMX, bit [35]**When FEAT_PMUv3p7 is implemented:**

Monitor Performance Monitors Extended control. In conjunction with MDCR_EL3.SPME, controls when event counters are enabled at EL3 and in other Secure Exception levels.

| MPMX | Meaning |
|------|--|
| 0b0 | Event counting and PMCCNTR_EL0 are not affected by this mechanism. |
| 0b1 | Event counting by some or all event counters is prohibited at EL3. If PMCR_EL0 .DP is 1, PMCCNTR_EL0 is disabled at EL3. Otherwise, PMCCNTR_EL0 is not affected by this mechanism. |

If EL2 is implemented, MDCR_EL3.SPME == 1, and [MDCR_EL2](#).HPMN is less than [PMCR_EL0](#).N then all the following are true:

- If [MDCR_EL2](#).HPMN is not 0, this field affects the operation of event counters in the range [0 .. ([MDCR_EL2](#).HPMN-1)] at EL3.
- This field does not affect the operation of other event counters.
- If [PMCR_EL0](#).DP is 1, this field affects the operation of [PMCCNTR_EL0](#) at EL3.

The operation of this field applies even when EL2 is disabled in the current Security state.

If EL2 is not implemented, MDCR_EL3.SPME == 0, or [MDCR_EL2](#).HPMN is equal to [PMCR_EL0](#).N then this field affects the operation of all event counters at EL3, and if [PMCR_EL0](#).DP is 1, the operation of [PMCCNTR_EL0](#) at EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

MCCD, bit [34]

When FEAT_PMUv3p7 is implemented:

Monitor Cycle Counter Disable. Prohibits the Cycle Counter, [PMCCNTR_EL0](#), from counting at EL3.

| MCCD | Meaning |
|------|--|
| 0b0 | Cycle counting by PMCCNTR_EL0 is not affected by this mechanism. |
| 0b1 | Cycle counting by PMCCNTR_EL0 is prohibited at EL3. |

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SBRBE, bits [33:32]

When FEAT_BRBE is implemented:

Secure Branch Record Buffer Enable. Controls branch recording by the BRBE, and access to BRBE registers and instructions at EL2 and EL1.

| SBRBE | Meaning |
|-------|---|
| 0b00 | Direct accesses to BRBE registers and instructions, except when in EL3, generate a Trap exception to EL3. EL0, EL1, and EL2 are prohibited regions. |
| 0b01 | Direct accesses to BRBE registers and instructions in Secure state, except when in EL3, generate a Trap exception to EL3. EL0, EL1, and EL2 in Secure state are prohibited regions. This control does not cause any direct accesses to BRBE registers when not in Secure state to be trapped, and does not cause any Exception levels when not in Secure state to be a prohibited region. |
| 0b10 | Direct accesses to BRBE registers and instructions, except when in EL3, generate a Trap exception to EL3. This control does not cause any Exception levels to be prohibited regions. |
| 0b11 | This control does not cause any direct accesses to BRBE registers or instruction to be trapped, and does not cause any Exception levels to be a prohibited region. |

The Branch Record Buffer registers trapped by this control are: [BRBCR_EL1](#), [BRBCR_EL2](#), [BRBCR_EL12](#), [BRBFCR_EL1](#), [BRBIDR0_EL1](#), [BRBINF<n>_EL1](#), [BRBINFINJ_EL1](#), [BRBSRC<n>_EL1](#), [BRBSRCINJ_EL1](#), [BRBTGT<n>_EL1](#), [BRBTGTINJ_EL1](#), and [BRBTS_EL1](#).

The Branch Record Buffer instructions trapped by this control are:

- [BRB IALL](#).
- [BRB INJ](#).

Note

If FEAT_BRBEv1p1 is not implemented, EL3 is a prohibited region.

If EL3 is not implemented then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [31:29]

Reserved, RES0.

MTPME, bit [28]

When FEAT_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the [PMEVTYPER<n>_ELO](#).MT bits.

| MTPME | Meaning |
|-------|--|
| 0b0 | FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>_ELO .MT is zero. |
| 0b1 | PMEVTYPER<n>_ELO .MT bits not affected by this field. |

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]

When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.

| TDCC | Meaning |
|------|---|
| 0b0 | This control does not cause any register accesses to be trapped. |
| 0b1 | Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state. |

The DCC registers trapped by this control are:

AArch64: [OSDTRRX_EL1](#), [OSDTRTX_EL1](#), [MDCCSR_EL0](#), [MDCCINT_EL1](#), and, when the PE is in Non-debug state, [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#).

AArch32: [DBGDTRRXext](#), [DBGDTRTXext](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL3.TDCC does not trap any accesses to:

AArch64: [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#).

AArch32: [DBGDTRRXint](#) and [DBGDTRTXint](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSTBE, bit [26]

When FEAT_TRBE is implemented and FEAT_RME is implemented:

Non-secure Trace Buffer Extended. Together with MDCR_EL3.NSTB, controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.

For a description of the values derived by evaluating NSTB and NSTBE together, see MDCR_EL3.NSTB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSTB, bits [25:24]

When FEAT_TRBE is implemented and FEAT_RME is implemented:

Non-secure Trace Buffer. Together with MDCR_EL3.NSTBE, controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.

| NSTB | Meaning |
|-------------|---|
| 0b00 | When MDCR_EL3.NSTBE == 0b0: Trace Buffer owning security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3. When MDCR_EL3.NSTBE == 0b1: Reserved. |
| 0b01 | When MDCR_EL3.NSTBE == 0b0: Trace Buffer owning security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure and Realm state generate Trap exceptions to EL3. When MDCR_EL3.NSTBE == 0b1: Reserved. |
| 0b10 | When MDCR_EL3.NSTBE == 0b0: Trace Buffer owning security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3. When MDCR_EL3.NSTBE == 0b1: Trace Buffer owning security state is Realm state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure and Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3. |
| 0b11 | When MDCR_EL3.NSTBE == 0b0: Trace Buffer owning security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure and Realm state. Accesses to Trace Buffer control registers at EL2 and EL1 in Secure and Realm state generate Trap exceptions to EL3. When MDCR_EL3.NSTBE == 0b1: Trace Buffer owning security state is Realm state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure and Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure and Secure state generate Trap exceptions to EL3. |

The Trace Buffer control registers trapped by this control are: [TRBBASER_EL1](#), [TRBLIMITR_EL1](#), [TRBMAR_EL1](#), [TRBPTR_EL1](#), [TRBSR_EL1](#), and [TRBTRG_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_TRBE is implemented and FEAT_RME is not implemented:

Non-secure Trace Buffer. Controls the owning translation regime and accesses to Trace Buffer control registers from EL2 and EL1.

| NSTB | Meaning |
|------|--|
| 0b00 | Trace Buffer owning security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3. |
| 0b01 | Trace Buffer owning security state is Secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Non-secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3. |
| 0b10 | Trace Buffer owning security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 generate Trap exceptions to EL3. |
| 0b11 | Trace Buffer owning security state is Non-secure state. If TraceBufferEnabled() == TRUE, tracing is prohibited in Secure state. Accesses to Trace Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3. |

The Trace Buffer control registers trapped by this control are: [TRBBASER_EL1](#), [TRBLIMITR_EL1](#), [TRBMAR_EL1](#), [TRBPTR_EL1](#), [TRBSR_EL1](#), and [TRBTRG_EL1](#).

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 1, then the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

Secure Cycle Counter Disable. Prohibits [PMCCNTR_EL0](#) from counting in Secure state.

| SCCD | Meaning |
|------|--|
| 0b0 | Cycle counting by PMCCNTR_EL0 is not affected by this mechanism. |
| 0b1 | Cycle counting by PMCCNTR_EL0 is prohibited in Secure state. |

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

ETAD, bit [22]

When FEAT_RME is implemented, external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable. Together with MDCR_EL3.ETADE, controls access to PE Trace Unit registers by an external debugger.

| ETADE | ETAD | Meaning |
|-------|------|--|
| 0b0 | 0b0 | Access to PE Trace Unit registers by an external debugger is permitted. |
| 0b0 | 0b1 | Root and Secure access to PE Trace Unit registers by an external debugger is permitted. Realm and Non-secure access to PE Trace Unit registers by an external debugger is not permitted. |
| 0b1 | 0b0 | Root and Realm access to PE Trace Unit registers by an external debugger is permitted. Secure and Non-secure access to PE Trace Unit registers by an external debugger is not permitted. |
| 0b1 | 0b1 | Root access to PE Trace Unit registers by an external debugger is permitted. Secure, Non-secure, and Realm access to PE Trace Unit registers by an external debugger is not permitted. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable. Controls Non-secure access to PE Trace Unit registers by an external debugger.

| ETAD | Meaning |
|------|--|
| 0b0 | Non-secure accesses from an external debugger to PE Trace Unit are allowed. |
| 0b1 | Non-secure accesses from an external debugger to some PE Trace Unit registers are prohibited. See individual registers for the effect of this field. |

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EPMADE, bit [21]

When FEAT_RME is implemented, FEAT_PMUV3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

External Performance Monitors Access Disable. Together with MDCR_EL3.EPMADE, controls access to Performance Monitor registers by an external debugger.

| EPMADE | EPMAD | Meaning |
|--------|-------|--|
| 0b0 | 0b0 | Access to Performance Monitor registers by an external debugger is permitted. |
| 0b0 | 0b1 | Root and Secure access to Performance Monitor registers by an external debugger is permitted. Realm and Non-secure access to Performance Monitor registers by an external debugger is not permitted. |
| 0b1 | 0b0 | Root and Realm access to Performance Monitor registers by an external debugger is permitted. Secure and Non-secure access to Performance Monitor registers by an external debugger is not permitted. |
| 0b1 | 0b1 | Root access to Performance Monitor registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Performance Monitor registers by an external debugger is not permitted. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_Debugv8p4 is implemented, FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

External Performance Monitors Non-secure Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

| EPMAD | Meaning |
|-------|---|
| 0b0 | Non-secure access to Performance Monitor registers from external debugger is permitted. |
| 0b1 | Non-secure access to Performance Monitor registers from external debugger is not permitted. |

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

| EPMAD | Meaning |
|-------|--|
| 0b0 | Access to Performance Monitor registers from external debugger is permitted. |
| 0b1 | Access to Performance Monitor registers from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. |

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EDAD, bit [20]**When FEAT_RME is implemented:**

External Debug Access Disable. Together with MDCR_EL3.EDADE, controls access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) by an external debugger.

| EDADE | EDAD | Meaning |
|-------|------|--|
| 0b0 | 0b0 | Access to Debug registers by an external debugger is permitted. |
| 0b0 | 0b1 | Root and Secure access to Debug registers by an external debugger is permitted. Realm and Non-secure access to Debug registers by an external debugger is not permitted. |
| 0b1 | 0b0 | Root and Realm access to Debug registers by an external debugger is permitted. Secure and Non-secure access to Debug registers by an external debugger is not permitted. |
| 0b1 | 0b1 | Root access to Debug registers by an external debugger is permitted. Secure, Non-secure, and Realm access to Debug registers by an external debugger is not permitted. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_Debugv8p4 is implemented:

External Debug Non-secure Access Disable. Controls Non-secure access to breakpoint, watchpoint, and [OSLAR_EL1](#) registers by an external debugger.

| EDAD | Meaning |
|------|--|
| 0b0 | Non-secure access to debug registers from external debugger is permitted. |
| 0b1 | Non-secure access to breakpoint and watchpoint registers, and OSLAR_EL1 from external debugger is not permitted. |

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable. Controls access to breakpoint, watchpoint, and [OSLAR_EL1](#) registers by an external debugger.

| EDAD | Meaning |
|------|--|
| 0b0 | Access to debug registers, and to OSLAR_EL1 from external debugger is permitted. |
| 0b1 | Access to breakpoint and watchpoint registers, and to OSLAR_EL1 from external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. |

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

External Debug Access disable. Controls access to breakpoint, watchpoint, and optionally [OSLAR_EL1](#) registers by an external debugger.

| EDAD | Meaning |
|------|--|
| 0b0 | Access to debug registers from external debugger is permitted. |
| 0b1 | Access to breakpoint and watchpoint registers from an external debugger is not permitted, unless overridden by the IMPLEMENTATION DEFINED authentication interface. It is IMPLEMENTATION DEFINED whether access to the OSLAR_EL1 register from an external debugger is permitted or not permitted. |

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TTRF, bit [19]**When FEAT_TRF is implemented:**

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

The Trace Filter registers trapped by this control are:

- [TRFCR_EL2](#), TRFCR_EL12, [TRFCR_EL1](#), reported using EC syndrome value 0x18.
- [HTRFCR](#) and [TRFCR](#), reported using EC syndrome value 0x03.

| TTRF | Meaning |
|------|--|
| 0b0 | Accesses to Trace Filter registers at EL2 and EL1 are not affected by this bit. |
| 0b1 | Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception. |

Otherwise:

Reserved, RES0.

STE, bit [18]**When FEAT_TRF is implemented:**

Secure Trace enable. Enables tracing in Secure state.

| STE | Meaning |
|-----|--|
| 0b0 | Trace prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface. |
| 0b1 | Trace in Secure state is not affected by this bit. |

This bit also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SPME, bit [17]

When FEAT_PMUv3 is implemented and FEAT_PMUv3p7 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state and EL3.

| SPME | Meaning |
|------|--|
| 0b0 | When MDCR_EL3.MPMX == 0: Event counting is prohibited in Secure state. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state. Otherwise, PMCCNTR_EL0 is not affected by this mechanism. |
| 0b1 | When MDCR_EL3.MPMX == 0: Event counting and PMCCNTR_EL0 are not affected by this mechanism. |

When MDCR_EL3.MPMX is 0, this field affects the operation of all event counters in Secure state, and if [PMCR_EL0.DP](#) is 1, the operation of [PMCCNTR_EL0](#) in Secure state.

When MDCR_EL3.MPMX is 1, this field affects the operation of event counters at EL3 only, and if [PMCR_EL0.DP](#) is 1, the operation of [PMCCNTR_EL0](#) at EL3 only. See MDCR_EL3.MPMX for more information.

When [PMCR_EL0.DP](#) is 0, [PMCCNTR_EL0](#) is not affected by this field.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

| SPME | Meaning |
|------|---|
| 0b0 | Event counting is prohibited in Secure state. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state. Otherwise, PMCCNTR_EL0 is not affected by this mechanism. |
| 0b1 | Event counting and PMCCNTR_EL0 are not affected by this mechanism. |

This field affects the operation of all event counters in Secure state, and if [PMCR_EL0.DP](#) is 1, the operation of [PMCCNTR_EL0](#) in Secure state. When [PMCR_EL0.DP](#) is 0, [PMCCNTR_EL0](#) is not affected by this field.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

When FEAT_PMUv3 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

| SPME | Meaning |
|------|---|
| 0b0 | If <code>ExternalSecureNoninvasiveDebugEnabled()</code> is FALSE, event counting is prohibited in Secure state, and if PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state. |
| 0b1 | Event counting and PMCCNTR_EL0 are not affected by this mechanism. |

If `ExternalSecureNoninvasiveDebugEnabled()` is TRUE, the event counters and [PMCCNTR_EL0](#) are not affected by this field.

Otherwise, this field affects the operation of all event counters in Secure state, and if [PMCR_EL0](#).DP is 1, the operation of [PMCCNTR_EL0](#) in Secure state. When [PMCR_EL0](#).DP is 0, [PMCCNTR_EL0](#) is not affected by this field.

If EL3 is not implemented and the Effective value of [SCR_EL3](#).NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SDD, bit [16]

AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

| SDD | Meaning |
|-----|---|
| 0b0 | Debug exceptions in Secure state are not affected by this bit. |
| 0b1 | Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state. |

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of [SCR_EL3](#).RW is 0b1.

If Secure EL2 is implemented and enabled, and Secure EL1 is using AArch32, then:

- If debug exceptions from Secure EL1 are enabled, debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of [SDER32_EL3](#).SUIDEN is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SPD32, bits [15:14]

When EL1 is capable of using AArch32:

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

| SPD32 | Meaning |
|-------|---|
| 0b00 | Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface. |
| 0b10 | Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled. |
| 0b11 | Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled. |

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored unless both of the following are true:

- The PE is in Secure state.

- The Effective value of [SCR_EL3.RW](#) is 0b0.

If Secure EL1 is using AArch32, then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of [SDER32_EL3.SUIDEN](#) is 0b1.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0b0, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSPB, bits [13:12]

When FEAT_SPE is implemented and FEAT_RME is implemented:

Non-secure Profiling Buffer. Together with MDCR_EL3.NSPBE, controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

| NSPB | Meaning |
|------|--|
| 0b00 | When MDCR_EL3.NSPBE == 0b0: Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in all Security states generate Trap exceptions to EL3. When MDCR_EL3.NSPBE == 0b1: Reserved. |
| 0b01 | When MDCR_EL3.NSPBE == 0b0: Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Realm states generate Trap exceptions to EL3. When MDCR_EL3.NSPBE == 0b1: Reserved. |
| 0b10 | When MDCR_EL3.NSPBE == 0b0: Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in all Security states generate Trap exceptions to EL3. When MDCR_EL3.NSPBE == 0b1: Profiling Buffer uses Realm Virtual Addresses. Statistical Profiling enabled in Realm state and disabled in Non-secure and Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in all Security states generate Trap exceptions to EL3. |
| 0b11 | When MDCR_EL3.NSPBE == 0b0: Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure and Realm state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure and Realm states generate Trap exceptions to EL3. When MDCR_EL3.NSPBE == 0b1: Profiling Buffer uses Realm Virtual Addresses. Statistical Profiling enabled in Realm state and disabled in Non-secure and Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Secure states generate Trap exceptions to EL3. |

The Statistical Profiling and Profiling Buffer control registers trapped by this control are:

- [PMBLIMITR_EL1](#), [PMBPTR_EL1](#), [PMBSR_EL1](#), [PMSCR_EL1](#), [PMSCR_EL2](#), [PMSCR_EL12](#), [PMSEVFR_EL1](#), [PMSFCR_EL1](#), [PMSICR_EL1](#), [PMSIDR_EL1](#), [PMSIRR_EL1](#), and [PMSLATFR_EL1](#).
- If FEAT_SPEv1p2 is implemented, [PMSNEVFR_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SPE is implemented and FEAT_RME is not implemented:

Non-secure Profiling Buffer. Controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

| NSPB | Meaning |
|------|--|
| 0b00 | Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Secure states generate Trap exceptions to EL3. |
| 0b01 | Profiling Buffer uses Secure Virtual Addresses. Statistical Profiling enabled in Secure state and disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure state generate Trap exceptions to EL3. |
| 0b10 | Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Non-secure and Secure states generate Trap exceptions to EL3. |
| 0b11 | Profiling Buffer uses Non-secure Virtual Addresses. Statistical Profiling enabled in Non-secure state and disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer control registers at EL2 and EL1 in Secure state generate Trap exceptions to EL3. |

The Statistical Profiling and Profiling Buffer control registers trapped by this control are:

- [PMBLIMITR_EL1](#), [PMBPTR_EL1](#), [PMBSR_EL1](#), [PMSCR_EL1](#), [PMSCR_EL2](#), [PMSCR_EL12](#), [PMSEVFR_EL1](#), [PMSFCR_EL1](#), [PMSICR_EL1](#), [PMSIDR_EL1](#), [PMSIRR_EL1](#), and [PMSLATFR_EL1](#).
- If FEAT_SPEv1p2 is implemented, [PMSNEVFR_EL1](#).

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 1, then the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of [SCR_EL3.NS](#) is 0, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSPBE, bit [11]

When FEAT_RME is implemented:

Non-secure Profiling Buffer Extended. Together with MDCR_EL3.NSPB, controls the owning translation regime and accesses to Statistical Profiling and Profiling Buffer control registers.

For a description of the values derived by evaluating NSPB and NSPBE together, see MDCR_EL3.NSPB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDOSA, bit [10]**When FEAT_DoubleLock is implemented:**

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:

- Accesses from AArch64 state, [OSLAR_EL1](#), [OSLSR_EL1](#), [OSDLR_EL1](#), [DBGPRCR_EL1](#), and any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit, are trapped to EL3 and reported using EC syndrome value 0x18.
- Accesses using MCR or MRC to [DBGOSLAR](#), [DBGOSLSR](#), [DBGOSDLR](#), and [DBGPRCR](#), are trapped to EL3 and reported using EC syndrome value 0x05.
- Accesses to any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

| TDOSA | Meaning |
|-------|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA . |

Note

The powerdown debug registers are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:

- AArch64: [OSLAR_EL1](#), [OSLSR_EL1](#), and [DBGPRCR_EL1](#).
- AArch32: [DBGOSLAR](#), [DBGOSLSR](#), and [DBGPRCR](#).
- AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- It is IMPLEMENTATION DEFINED whether accesses to [OSDLR_EL1](#) and [DBGOSDLR](#) are trapped.

| TDOSA | Meaning |
|-------|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA . |

Note

The powerdown debug registers are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap Debug Access. Traps EL2, EL1, and EL0 System register accesses to those debug System registers that cannot be trapped using the MDCR_EL3.TDOSA field.

Accesses to the debug registers are trapped as follows:

- In AArch64 state, the following registers are trapped to EL3 and reported using EC syndrome value 0x18:
 - [DBGBVR<n>_EL1](#), [DBGBCR<n>_EL1](#), [DBGWVR<n>_EL1](#), [DBGWCR<n>_EL1](#), [DBGCLAIMSET_EL1](#), [DBGCLAIMCLR_EL1](#), [DBGAUTHSTATUS_EL1](#), [DBGVCR32_EL2](#).
 - AArch64: [MDCR_EL2](#), [MDRAR_EL1](#), [MDCCSR_EL0](#), [MDCCINT_EL1](#), [MDSCR_EL1](#), [OSDTRRX_EL1](#), [OSDTRTX_EL1](#), [OSECCR_EL1](#).
- In AArch32 state, [SDER](#) is trapped to EL3 and reported using EC syndrome value 0x03.
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x05, accesses using MCRR or MRRC are reported using EC syndrome value 0x0C:
 - [HDCR](#), [DBGDRAR](#), [DBGDSAR](#), [DBGDIDR](#), [DBGDCCINT](#), [DBGWFAR](#), [DBGVCR](#), [DBGBVR<n>](#), [DBGBCR<n>](#), [DBGBXVR<n>](#), [DBGWCR<n>](#), [DBGWVR<n>](#).
 - [DBGCLAIMSET](#), [DBGCLAIMCLR](#), [DBGAUTHSTATUS](#), [DBGDEVID](#), [DBGDEVID1](#), [DBGDEVID2](#), [DBGOSECCR](#).
- In AArch32 state, STC accesses to [DBGDTRRXint](#) and LDC accesses to [DBGDTRTXint](#) are reported using EC syndrome value 0x06.
- When not in Debug state, the following registers are also trapped to EL3:
 - AArch64 accesses to [DBGDTR_EL0](#), [DBGDTRRX_EL0](#), and [DBGDTRTX_EL0](#), reported using EC syndrome value 0x18.
 - AArch32 accesses using MCR or MRC to [DBGDTRRXint](#) and [DBGDTRTXint](#), reported using EC syndrome value 0x05.

| TDA | Meaning |
|-----|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | EL0, EL1, and EL2 accesses to the debug registers, other than the registers that can be trapped by MDCR_EL3.TDOSA, are trapped to EL3, from any Security state and both Execution states, unless it is trapped by DBGDSCRExt .UDCCdis, MDSCR_EL1 .TDCC, HDCR .TDA or MDCR_EL2 .TDA. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:7]

Reserved, RES0.

TPM, bit [6]

When FEAT_PMUv3 is implemented:

Trap Performance Monitor register accesses. Accesses to all Performance Monitor registers from EL0, EL1, and EL2 to EL3, from any Security state and both Execution states are trapped as follows:

- In AArch64 state, accesses to the following registers are trapped to EL3 and are reported using EC syndrome value 0x18:
 - [PMCR_EL0](#), [PMCNTENSET_EL0](#), [PMCNTENCLR_EL0](#), [PMOVSLR_EL0](#), [PMSWINC_EL0](#), [PMSELR_EL0](#), [PMCEID0_EL0](#), [PMCEID1_EL0](#), [PMCCNTR_EL0](#), [PMXEVTYPER_EL0](#), [PMXEVCNTR_EL0](#), [PMUSERENR_EL0](#), [PMINTENSET_EL1](#), [PMINTENCLR_EL1](#), [PMOVSET_EL0](#), [PMEVCNTR<n>_EL0](#), [PMEVTYPER<n>_EL0](#), [PMCCFILTR_EL0](#).
 - If FEAT_PMUv3p4 is implemented, [PMMIR_EL1](#).
- In AArch32 state, accesses using MCR or MRC to the following registers are reported using EC syndrome value 0x03, accesses using MCRR or MRRC are reported using EC syndrome value 0x04:
 - [PMCR](#), [PMCNTENSET](#), [PMCNTENCLR](#), [PMOVSR](#), [PMSWINC](#), [PMSELR](#), [PMCEID0](#), [PMCEID1](#), [PMCCNTR](#), [PMXEVTYPER](#), [PMXEVCNTR](#), [PMUSERENR](#), [PMINTENSET](#), [PMINTENCLR](#), [PMOVSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMCCFILTR](#).
 - If FEAT_PMUv3p1 is implemented, [PMCEID2](#), and [PMCEID3](#).
 - If FEAT_PMUv3p4 is implemented, [PMMIR](#).

| TPM | Meaning |
|-----|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | EL2, EL1, and EL0 System register accesses to all Performance Monitor registers are trapped to EL3, unless it is trapped by HDCR .TPM or MDCR_EL2 .TPM. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

EDADE, bit [4]

When FEAT_RME is implemented:

External Debug Access Disable Extended. Together with MDCR_EL3.EDAD, controls access to breakpoint registers, watchpoint registers, and [OSLAR_EL1](#) by an external debugger.

For a description of the values derived by evaluating EDAD and EDADE together, see MDCR_EL3.EDAD.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

ETADE, bit [3]

When FEAT_RME is implemented, external debugger access to the PE Trace Unit registers is implemented and FEAT_TRBE is implemented:

External Trace Access Disable Extended. Together with MDCR_EL3.ETAD, controls access to PE Trace Unit registers by an external debugger.

For a description of the values derived by evaluating ETAD and ETADE together, see MDCR_EL3.ETAD.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EPMAD, bit [2]

When FEAT_RME is implemented, FEAT_PMuV3 is implemented and the Performance Monitors Extension supports external debug interface accesses:

External Performance Monitors Access Disable Extended. Together with MDCR_EL3.EPMAD, controls access to Performance Monitor registers by an external debugger.

For a description of the values derived by evaluating EPMAD and EPMAD together, see MDCR_EL3.EPMAD.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [1]

Reserved, RES0.

RLTE, bit [0]

When FEAT_RME is implemented and FEAT_TRF is implemented:

Realm Trace enable. Enables tracing in Realm state.

| RLTE | Meaning |
|------|--|
| 0b0 | Trace prohibited in Realm state, unless overridden by the IMPLEMENTATION DEFINED authentication interface. |
| 0b1 | Trace in Realm state is not affected by this bit. |

This bit also controls the level of authentication that is required by an external debugger to enable external tracing.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Accessing MDCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDCR_EL3

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b0001 | 0b0011 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return MDCR_EL3;

```

MSR MDCR_EL3, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b0001 | 0b0011 | 0b001 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    MDCR_EL3 = X[t];
```

MDRAR_EL1, Monitor Debug ROM Address Register

The MDRAR_EL1 characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

Configuration

AArch64 System register MDRAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register [DBGDRAR\[63:0\]](#).

Attributes

MDRAR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | ROMADDR | | | | | | | | | | | | | | | | | | | |
| ROMADDR | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | Valid | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:52]

Reserved, RES0.

ROMADDR, bits [51:12]

ROMADDR encoding when FEAT_LPA is implemented and MDRAR_EL1.Valid != 0b00

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ROMADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

ROMADDR, bits [39:0]

Bits [51:12] of the ROM table physical address.

Bits [11:0] of the ROM table physical address are zero.

For implementations with fewer than 52 physical address bits, the corresponding upper bits of this field are RES0.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

ROMADDR encoding when FEAT_LPA is not implemented and MDRAR_EL1.Valid != 0b00

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | ROMADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [39:36]

Reserved, RES0.

ROMADDR, bits [35:0]

Bits [39:12] of the ROM table physical address.

Bits [11:0] of the ROM table physical address are zero.

For implementations with fewer than 48 physical address bits, the corresponding upper bits of this field are RES0.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

ROMADDR encoding when MDRAR_EL1.Valid == 0b00

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [39:0]

Reserved, UNKNOWN.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid.

| Valid | Meaning |
|-------|---|
| 0b00 | ROM Table address is not valid. Software must ignore ROMADDR. |
| 0b11 | ROM Table address is valid. |

Other values are reserved.

Arm recommends implementations set this field to zero.

Accessing MDRAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDRAR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b000 | 0b0001 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elsif EL2Enabled() && MDCR_EL2.<TDE,TDRA> != '00' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif HaveEL(EL3) && MDCR_EL3.TDA == '1' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return MDRAR_EL1;
elsif PSTATE.EL == EL2 then
    if Halted() && HaveEL(EL3) && EDSCR.SDD == '1' && boolean IMPLEMENTATION_DEFINED "EL3 trap
priority when SDD == '1'" && MDCR_EL3.TDA == '1' then
        UNDEFINED;
    elsif HaveEL(EL3) && MDCR_EL3.TDA == '1' then
        if Halted() && EDSCR.SDD == '1' then
            UNDEFINED;
        else
            AArch64.SystemAccessTrap(EL3, 0x18);
    else
        return MDRAR_EL1;
elsif PSTATE.EL == EL3 then
    return MDRAR_EL1;

```

MDSCR_EL1, Monitor Debug System Control Register

The MDSCR_EL1 characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

AArch64 System register MDSCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGDSCRext\[31:0\]](#).

AArch64 System register MDSCR_EL1 bit [15] is architecturally mapped to AArch32 System register [DBGDSCRint\[15\]](#).

AArch64 System register MDSCR_EL1 bit [12] is architecturally mapped to AArch32 System register [DBGDSCRint\[12\]](#).

AArch64 System register MDSCR_EL1 bits [5:2] are architecturally mapped to AArch32 System register [DBGDSCRint\[5:2\]](#).

Attributes

MDSCR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|--------|--------|------|-------|-------|--------|-------|------|-----|--------|-----|-----|-----|------|------|-----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| TFO | RXfull | TXfull | RES0 | RXOTX | URES0 | INTdis | TDARE | RES0 | SC2 | RAZ/WI | MDE | HDE | KDE | TDCC | RES0 | ERR | RES0 | SS | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

TFO, bit [31]

When FEAT_TRF is implemented:

Trace Filter override. Used for save/restore of [EDSCR.TFO](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.TFO](#). Reads and writes of this bit are indirect accesses to [EDSCR.TFO](#).

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

Used for save/restore of [EDSCR.RXfull](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.RXfull](#). Reads and writes of this bit are indirect accesses to [EDSCR.RXfull](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is **RO**.

TXfull, bit [29]

Used for save/restore of [EDSCR.TXfull](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.TXfull](#). Reads and writes of this bit are indirect accesses to [EDSCR.TXfull](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is **RO**.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of [EDSCR.RXO](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.RXO](#). Reads and writes of this bit are indirect accesses to [EDSCR.RXO](#).

When [OSLSR_EL1.OSLK](#) == 1, if bits [27,6] of the value written to MDSCR_EL1 are {1,0}, that is, the RXO bit is 1 and the ERR bit is 0, the PE sets [EDSCR.{RXO,ERR}](#) to UNKNOWN values.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is **RO**.

TXU, bit [26]

Used for save/restore of [EDSCR.TXU](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.TXU](#). Reads and writes of this bit are indirect accesses to [EDSCR.TXU](#).

When [OSLSR_EL1.OSLK](#) == 1, if bits [26,6] of the value written to MDSCR_EL1 are {1,0}, that is, the TXU bit is 1 and the ERR bit is 0, the PE sets [EDSCR.{TXU,ERR}](#) to UNKNOWN values.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Bits [25:24]

Reserved, RES0.

INTdis, bits [23:22]

Used for save/restore of [EDSCR](#).INTdis.

When [OSLSR_EL1](#).OSLK == 0, and software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this field holds the value of [EDSCR](#).INTdis. Reads and writes of this field are indirect accesses to [EDSCR](#).INTdis.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

TDA, bit [21]

Used for save/restore of [EDSCR](#).TDA.

When [OSLSR_EL1](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this bit holds the value of [EDSCR](#).TDA. Reads and writes of this bit are indirect accesses to [EDSCR](#).TDA.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Bit [20]

Reserved, RES0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented and FEAT_PCSRv8p2 is not implemented:

Used for save/restore of [EDSCR](#).SC2.

When [OSLSR_EL1](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this bit holds the value of [EDSCR](#).SC2. Reads and writes of this bit are indirect accesses to [EDSCR](#).SC2.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == 1, access to this field is **RW**.
- When OSLSR_EL1.OSLK == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [18:16]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

MDE, bit [15]

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

| MDE | Meaning |
|-----|---|
| 0b0 | Breakpoint, Watchpoint, and Vector Catch exceptions disabled. |
| 0b1 | Breakpoint, Watchpoint, and Vector Catch exceptions enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HDE, bit [14]

Used for save/restore of [EDSCR.HDE](#).

When [OSLSR_EL1.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1.OSLK](#) == 1, this bit holds the value of [EDSCR.HDE](#). Reads and writes of this bit are indirect accesses to [EDSCR.HDE](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1.OSLK](#) == 1, access to this field is **RW**.
- When [OSLSR_EL1.OSLK](#) == 0, access to this field is **RO**.

KDE, bit [13]

Local (kernel) debug enable. If EL_D is using AArch64, enable debug exceptions within EL_D . Permitted values are:

| KDE | Meaning |
|-----|--|
| 0b0 | Debug exceptions, other than Breakpoint Instruction exceptions, disabled within EL_D . |
| 0b1 | All debug exceptions enabled within EL_D . |

RES0 if EL_D is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDCC, bit [12]

Traps EL_0 accesses to the Debug Communication Channel (DCC) registers to EL_1 , or to EL_2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from both Execution states, as follows:

- In AArch64 state, MRS or MSR accesses to the following DCC registers are trapped, reported using EC syndrome value 0x18:
 - [MDCCSR_EL0](#).
 - If not in Debug state, [DBGDTR_EL0](#), [DBGDTRTX_EL0](#), and [DBGDTRRX_EL0](#).

- In AArch32 state, MRC or MCR accesses to the following registers are trapped, reported using EC syndrome value 0x05.
 - [DBGDSCRint](#), [DBGDIDR](#), [DBGDSAR](#), [DBGDRAR](#).
 - If not in Debug state, [DBGDTRRXint](#), and [DBGDTRTXint](#).
- In AArch32 state, LDC access to [DBGDTRRXint](#) and STC access to [DBGDTRTXint](#) are trapped, reported using EC syndrome value 0x06.
- In AArch32 state, MRRC accesses to [DBGDSAR](#) and [DBGDRAR](#) are trapped, reported using EC syndrome value 0x0C.

| TDCC | Meaning |
|-------------|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | EL0 using AArch64: EL0 accesses to the AArch64 DCC registers are trapped. EL0 using AArch32: EL0 accesses to the AArch32 DCC registers are trapped. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of [EDSCR](#).ERR.

When [OSLSR_EL1](#).OSLK == 0, software must treat this bit as UNK/SBZP.

When [OSLSR_EL1](#).OSLK == 1, this bit holds the value of [EDSCR](#).ERR. Reads and writes of this bit are indirect accesses to [EDSCR](#).ERR.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [OSLSR_EL1](#).OSLK == 1, access to this field is **RW**.
- When [OSLSR_EL1](#).OSLK == 0, access to this field is **RO**.

Bits [5:1]

Reserved, RES0.

SS, bit [0]

Software step control bit. If EL_D is using AArch64, enable Software step. Permitted values are:

| SS | Meaning |
|-----------|------------------------|
| 0b0 | Software step disabled |
| 0b1 | Software step enabled. |

RES0 if EL_D is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MDSCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDSCR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b000 | 0b0000 | 0b0010 | 0b010 |

```

MFAR_EL3, PA Fault Address Register

The MFAR_EL3 characteristics are:

Purpose

Holds the faulting physical address for Granule Protection Check exceptions taken to EL3.

Configuration

This register is present only when FEAT_RME is implemented. Otherwise, direct accesses to MFAR_EL3 are UNDEFINED.

Attributes

MFAR_EL3 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|-----|------|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| FPA[47:12] | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

An exception return at EL3 makes MFAR_EL3 UNKNOWN.

NS, bit [63]

Together with the NSE field, reports the physical address space of the access that triggered the Granule Protection Check exception.

| NSE | NS | Meaning |
|-----|-----|-------------|
| 0b0 | 0b0 | Secure. |
| 0b0 | 0b1 | Non-secure. |
| 0b1 | 0b0 | Root. |
| 0b1 | 0b1 | Realm. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [62]

Together with the NS field, reports the physical address space of the access that triggered the Granule Protection Check exception.

For a description of the values derived by evaluating NS and NSE together, see MFAR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [61:52]

Reserved, RES0.

FPA[51:48], bits [51:48]**When FEAT_LPA is implemented:**

When FEAT_LPA is implemented, extension to FPA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FPA[47:12], bits [47:12]

Bits [47:12] of the faulting physical address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing MFAR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MFAR_EL3

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b0110 | 0b0000 | 0b101 |

elsif PSTATE.EL == EL3 then
    MFAR_EL3 = X[t];

```

MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MIDR\[31:0\]](#).

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to External register [MIDR_EL1\[31:0\]](#).

Attributes

MIDR_EL1 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

| Implementer | Meaning |
|-------------|--|
| 0x00 | Reserved for software use. |
| 0x41 | Arm Limited. |
| 0x42 | Broadcom Corporation. |
| 0x43 | Cavium Inc. |
| 0x44 | Digital Equipment Corporation. |
| 0x46 | Fujitsu Ltd. |
| 0x49 | Infineon Technologies AG. |
| 0x4D | Motorola or Freescale Semiconductor Inc. |
| 0x4E | NVIDIA Corporation. |
| 0x50 | Applied Micro Circuits Corporation. |
| 0x51 | Qualcomm Inc. |
| 0x56 | Marvell International Ltd. |
| 0x69 | Intel Corporation. |
| 0xC0 | Ampere Computing. |

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is **RO**.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture, bits [19:16]

Architecture version. Defined values are:

| Architecture | Meaning |
|--------------|---|
| 0b0001 | Armv4. |
| 0b0010 | Armv4T. |
| 0b0011 | Armv5 (obsolete). |
| 0b0100 | Armv5T. |
| 0b0101 | Armv5TE. |
| 0b0110 | Armv5TEJ. |
| 0b0111 | Armv6. |
| 0b1111 | Architectural features are individually identified in the ID_* registers. |

All other values are reserved.

Access to this field is **RO**.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing MIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MIDR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
        else
            UNDEFINED;
    elsif PSTATE.EL == EL1 then
        if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.MIDR_EL1 == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        elsif EL2Enabled() then
            return VPIDR_EL2;
        else
            return MIDR_EL1;
    elsif PSTATE.EL == EL2 then
        return MIDR_EL1;
    elsif PSTATE.EL == EL3 then
        return MIDR_EL1;

```

MPAM0_EL1, MPAM0 Register (EL1)

The MPAM0_EL1 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL0. When EL2 is implemented and enabled in the current Security state, the MPAM virtualization option is present, [MPAMHCR_EL2.GSTAPP_PLK](#) == 1 and [HCR_EL2.TGE](#) == 0, [MPAM1_EL1](#) is used instead of MPAM0_EL1 to generate MPAM information to label memory requests.

If EL2 is implemented and enabled in the current Security state, and [HCR_EL2.E2H](#) == 0 or [HCR_EL2.TGE](#) == 0, the MPAM virtualization option is present and [MPAMHCR_EL2.EL0_VPMEN](#) == 1, then MPAM PARTIDs in MPAM0_EL1 are virtual and mapped into physical PARTIDs for the current Security state.

Configuration

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM0_EL1 are UNDEFINED.

Attributes

MPAM0_EL1 is a 64-bit register.

Field descriptions

Bits [63:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group property for PARTID_I.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM0_EL1

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAM0_EL1

MPAM1_EL1, MPAM1 Register (EL1)

The MPAM1_EL1 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL1.

When EL2 is implemented and enabled in the current Security state, the MPAM virtualization option is present, [MPAMHCR_EL2.GSTAPP_PLK](#) == 1 and [HCR_EL2.TGE](#) == 0, MPAM1_EL1 is used instead of [MPAM0_EL1](#) to generate MPAM labels for memory requests when executing at EL0.

MPAM1_EL1 is an alias for [MPAM2_EL2](#) when executing at EL2 with [HCR_EL2.E2H](#) == 1.

MPAM1_EL12 is an alias for MPAM1_EL1 when executing at EL2 or EL3 with [HCR_EL2.E2H](#) == 1.

If EL2 is implemented and enabled in the current Security state, the MPAM virtualization option is present and [MPAMHCR_EL2.EL1_VPMEN](#) == 1, MPAM PARTIDs in MPAM1_EL1 are virtual and mapped into physical PARTIDs for the current Security state. This mapping of MPAM1_EL1 virtual PARTIDs to physical PARTIDs when EL1_VPMEN is 1 also applies when MPAM1_EL1 is used at EL0 due to [MPAMHCR_EL2.GSTAPP_PLK](#).

Configuration

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register [MPAM3_EL3\[63\]](#) when EL3 is implemented.

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register [MPAM2_EL2\[63\]](#) when EL3 is not implemented and EL2 is implemented.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM1_EL1 are UNDEFINED.

Attributes

MPAM1_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|------|-----------|------|------------|------|-------|-------|----|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| MPAMEN | RES0 | FORCED_NS | RES0 | ALTSP_FRCD | RES0 | PMG_D | PMG_I | | | | | | | | | | | | | | | | | | | | | | | | | | |
| PARTID_D | | | | | | | | | | | | | | | | PARTID_I | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

| MPAMEN | Meaning |
|--------|--|
| 0b0 | The default PARTID and default PMG are output in MPAM information. |
| 0b1 | MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration. |

If neither EL3 nor EL2 is implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write bit [MPAM3_EL3.MPAMEN](#).

If EL3 is not implemented and EL2 is implemented, this field is read-only and reads the current value of the read/write bit [MPAM2_EL2.MPAMEN](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- **RW** if all of the following are true:
 - EL3 is not implemented
 - EL2 is not implemented
- Otherwise, access to this field is **RO**.

Bits [62:61]

Reserved, RES0.

FORCED_NS, bit [60]

When FEAT_MPAMv0p1 is implemented:

In the Secure state, FORCED_NS indicates the state of [MPAM3_EL3.FORCE_NS](#).

| FORCED_NS | Meaning |
|-----------|---|
| 0b0 | In the Non-secure state, always reads as 0. In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 0. |
| 0b1 | In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 1. |

Always reads as 0 in the Non-secure state.

Writes are ignored.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [59:55]

Reserved, RES0.

ALTSP_FRCD, bit [54]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Alternative PARTID forced for PARTIDs in this register.

| ALTSP_FRCD | Meaning |
|------------|--|
| 0b0 | The PARTIDs in MPAM1_EL1 and MPAM0_EL1 are using the primary PARTID space. |
| 0b1 | The PARTIDs in MPAM1_EL1 and MPAM0_EL1 are using the alternative PARTID space. |

This bit indicates that a higher Exception level has forced the PARTIDs in this register to use the alternative PARTID space defined for the current Security state.

In MPAM1_EL1, it also indicates that [MPAM0_EL1](#) is forced to use alternative PARTID space.

For more information, see 'Alternative PARTID spaces and selection' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598).

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [53:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group property for PARTID_I.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM1_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, accesses from EL3 using the mnemonic MPAM1_EL1 or MPAM1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAM1_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b1010 | 0b0101 | 0b000 |

```

MPAM2_EL2, MPAM2 Register (EL2)

The MPAM2_EL2 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL2.

Configuration

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register [MPAM3_EL3\[63\]](#) when EL3 is implemented.

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register [MPAM1_EL1\[63\]](#).

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAM2_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | |
|----------|----------|------|------|-----------|-----------|------------|--------|----------|--------------|--------------|-----|
| 63 | 62616059 | 58 | 57 | 56 | 55 | 54 | 535251 | 50 | 49 | 48 | 474 |
| MPAMEN | RES0 | TIDR | RES0 | ALTSP_HFC | ALTSP_EL2 | ALTSP_FRCD | RES0 | EnMPAMSM | TRAPMPAM0EL1 | TRAPMPAM1EL1 | |
| PARTID_D | | | | | | | | | | | |
| 31 | 30292827 | 26 | 25 | 24 | 23 | 22 | 212019 | 18 | 17 | 16 | 151 |

MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

| MPAMEN | Meaning |
|--------|---|
| 0b0 | The default PARTID and default PMG are output in MPAM information from all Exception levels. |
| 0b1 | MPAM information is output based on the MPAMn_ELx register for ELn according to the MPAM configuration. |

If EL3 is not implemented, this field is read/write.

If EL3 is implemented, this field is read-only and reads the current value of the read/write [MPAM3_EL3.MPAMEN](#) bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing this field has the following behavior:

- When EL3 is not implemented, access to this field is **RW**.
- Otherwise, access to this field is **RO**.

Bits [62:59]

Reserved, RES0.

TIDR, bit [58]

When (FEAT_MPAMvOp1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMIDR_EL1.HAS_TIDR == 1:

TIDR traps accesses to [MPAMIDR_EL1](#) from EL1 to EL2.

| TIDR | Meaning |
|------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Trap accesses to MPAMIDR_EL1 from EL1 to EL2. |

[MPAMHCR_EL2](#).TRAP_MPAMIDR_EL1 == 1 also traps [MPAMIDR_EL1](#) accesses from EL1 to EL2. If either TIDR or TRAP_MPAMIDR_EL1 are 1, accesses are trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [57]

Reserved, RES0.

ALTSP_HFC, bit [56]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Hierarchical force of alternative PARTID space controls. When [MPAM3_EL3](#).ALTSP_HEN is 0, ALTSP controls in MPAM2_EL2 have no effect. When MPAM3_EL3.ALTSP_HEN is 1, this bit selects whether the PARTIDs in [MPAM1_EL1](#) and [MPAM0_EL1](#) are in the primary (0) or alternative (1) PARTID space for the security state.

| ALTSP_HFC | Meaning |
|-----------|--|
| 0b0 | When MPAM3_EL3 .ALTSP_HEN is 1, the PARTID space of MPAM1_EL1 .PARTID_I, MPAM1_EL1 .PARTID_D, MPAM0_EL1 .PARTID_I, and MPAM0_EL1 .PARTID_D are in the primary PARTID space for the Security state. |
| 0b1 | When MPAM3_EL3 .ALTSP_HEN is 1, the PARTID space of MPAM1_EL1 .PARTID_I, MPAM1_EL1 .PARTID_D, MPAM0_EL1 .PARTID_I, and MPAM0_EL1 .PARTID_D are in the alternative PARTID space for the Security state. |

This control has no effect when [MPAM3_EL3](#).ALTSP_HEN is 0.

For more information, see 'Alternative PARTID spaces and selection' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_EL2, bit [55]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Select alternative PARTID space for PARTIDs in MPAM2_EL2 when [MPAM3_EL3](#).ALTSP_HEN is 1.

| ALTSP_EL2 | Meaning |
|------------------|--|
| 0b0 | When MPAM3_EL3.ALTSP_HEN is 1, selects the primary PARTID space for MPAM2_EL2.PARTID_I and MPAM2_EL2.PARTID_D. |
| 0b1 | When MPAM3_EL3.ALTSP_HEN is 1, selects the alternative PARTID space for MPAM2_EL2.PARTID_I and MPAM2_EL2.PARTID_D. |

For more information, see 'Alternative PARTID spaces and selection' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_FRCD, bit [54]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Alternative PARTID forced for PARTIDs in this register.

| ALTSP_FRCD | Meaning |
|-------------------|--|
| 0b0 | The PARTIDs in this register are using the primary PARTID space. |
| 0b1 | The PARTIDs in this register are using the alternative PARTID space. |

This bit indicates that a higher Exception level has forced the PARTIDs in this register to use the alternative PARTID space defined for the current Security state. In EL2, it is also 1 when MPAM2_EL2.ALTSP_EL2 is 1.

For more information, see 'Alternative PARTID spaces and selection' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [53:51]

Reserved, RES0.

EnMPAMSM, bit [50]

When FEAT_SME is implemented:

Traps execution at EL1 of instructions that directly access the [MPAMSM_EL1](#) register to EL2. The exception is reported using ESR_ELx.EC value 0x18.

| EnMPAMSM | Meaning |
|-----------------|---|
| 0b0 | This control causes execution of these instructions at EL1 to be trapped. |
| 0b1 | This control does not cause execution of any instructions to be trapped. |

This field has no effect on accesses to [MPAMSM_EL1](#) from EL2 or EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRAPMPAM0EL1, bit [49]

Trap accesses from EL1 to the [MPAM0_EL1](#) register trap to EL2.

| TRAPMPAM0EL1 | Meaning |
|--------------|--|
| 0b0 | Accesses to MPAM0_EL1 from EL1 are not trapped. |
| 0b1 | Accesses to MPAM0_EL1 from EL1 are trapped to EL2. |

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 1.
 - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

TRAPMPAM1EL1, bit [48]

Trap accesses from EL1 to the [MPAM1_EL1](#) register trap to EL2.

| TRAPMPAM1EL1 | Meaning |
|--------------|--|
| 0b0 | Accesses to MPAM1_EL1 from EL1 are not trapped. |
| 0b1 | Accesses to MPAM1_EL1 from EL1 are trapped to EL2. |

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 1.
 - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

PMG_D, bits [47:40]

Performance monitoring group for data accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group for instruction accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM2_EL2

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAM2_EL2

| op0 | op1 | CRn | CRm | op2 |

MPAM3_EL3, MPAM3 Register (EL3)

The MPAM3_EL3 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL3.

Configuration

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register [MPAM2_EL2\[63\]](#) when EL2 is implemented.

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register [MPAM1_EL1\[63\]](#).

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM3_EL3 are UNDEFINED.

Attributes

MPAM3_EL3 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| <u>MPAMEN</u> | | <u>TRAPLOWER</u> | | <u>SDEFLT</u> | | <u>FORCE_NS</u> | | <u>RESO</u> | | <u>ALTSP_HEN</u> | | <u>ALTSP_HFC</u> | | <u>ALTSP_EL3</u> | | <u>RESO</u> | | <u>RT_ALTSP_NS</u> | | <u>RESO</u> | | | | | | | | | | | | <u>PMG_</u> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| <u>PARTID_D</u> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

Values of this field are:

| MPAMEN | Meaning |
|---------------|--|
| 0b0 | The default PARTID and default PMG are output in MPAM information when executing at any ELn. |
| 0b1 | MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Access to this field is **RW**.

TRAPLOWER, bit [62]

Trap direct accesses to MPAM System registers that are not UNDEFINED from all ELn lower than EL3.

| TRAPLOWER | Meaning |
|-----------|---|
| 0b0 | Do not force trapping of direct accesses of MPAM System registers to EL3. |
| 0b1 | Force direct accesses of MPAM System registers to trap to EL3. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

SDEFLT, bit [61]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMIDR_EL1.HAS_SDEFLT == 1:

SDEFLT overrides the PARTID and PMG with the default PARTID and default PMG when executing in the Secure state.

| SDEFLT | Meaning |
|--------|---|
| 0b0 | The PARTID and PMG are determined normally in the Secure state. |
| 0b1 | When executing in the Secure state, the PARTID is always PARTID 0, and the PMG is always PMG 0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FORCE_NS, bit [60]

When FEAT_MPAMv0p1 is implemented and MPAMIDR_EL1.HAS_FORCE_NS == 1:

FORCE_NS forces MPAM_NS to always be 1 in the Secure state.

| FORCE_NS | Meaning |
|----------|--|
| 0b0 | MPAM_NS is 0 when executing in the Secure state. |
| 0b1 | MPAM_NS is 1 when executing in the Secure state. |

An implementation is permitted to have this field as RAO if the implementation does not support generating MPAM_NS as 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [59:58]

Reserved, RES0.

ALTSP_HEN, bit [57]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Hierarchical enable for alternative PARTID space controls. Alternative PARTID space controls in [MPAM2_EL2](#) have no effect when this field is zero.

| ALTSP_HEN | Meaning |
|-----------|--|
| 0b0 | Disable alternative PARTID space controls in MPAM2_EL2 . The PARTID space for PARTIDs in MPAM2_EL2 , MPAM1_EL1 , and MPAM0_EL1 is selected by MPAM3_EL3.ALTSP_HFC. |
| 0b1 | Enable alternative PARTID space controls in MPAM2_EL2 to control the PARTID space used for PARTIDs in MPAM2_EL2 , MPAM1_EL1 , and MPAM0_EL1 . |

For more information, see 'Alternative PARTID spaces and selection' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_HFC, bit [56]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Hierarchical force of alternative PARTID space controls. When MPAM3_EL3.ALTSP_HEN is 0, the PARTID space for PARTIDs in [MPAM2_EL2](#), [MPAM1_EL1](#), and [MPAM0_EL1](#) is selected by the value of this bit.

| ALTSP_HFC | Meaning |
|-----------|---|
| 0b0 | When MPAM3_EL3.ALTSP_HEN is 0, the PARTID space of MPAM2_EL2 .PARTID, MPAM1_EL1 .PARTID and MPAM0_EL1 .PARTID are the primary PARTID space for the security state. |
| 0b1 | When MPAM3_EL3.ALTSP_HEN is 0, the PARTID space of MPAM2_EL2 .PARTID and MPAM1_EL1 .PARTID and MPAM0_EL1 .PARTID are the alternative PARTID space for the security state. |

For more information, see 'Alternative PARTID spaces and selection' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_EL3, bit [55]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Select alternative PARTID space for PARTIDs in MPAM3_EL3.

| ALTSP_EL3 | Meaning |
|-----------|---|
| 0b0 | Selects the primary PARTID space of MPAM3_EL3 .PARTID_I and MPAM3_EL3.PARTID_D. |
| 0b1 | Selects the alternative PARTID space of MPAM3_EL3 .PARTID_I and MPAM3_EL3.PARTID_D. |

For more information, see 'Alternative PARTID spaces and selection' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [54:53]

Reserved, RES0.

RT_ALTSP_NS, bit [52]

When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == 1:

Alternative PARTID space selection for the Root security state.

| RT_ALTSP_NS | Meaning |
|-------------|---|
| 0b0 | The alternative PARTID space in the Root security state is the Secure PARTID space. |
| 0b1 | The alternative PARTID space in the Root security state is the Non-secure PARTID space. |

This field has no effect except in the Root security state (EL3).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [51:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group for data accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group for instruction accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM3_EL3

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAM3_EL3

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b1010 | 0b0101 | 0b000 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

MPAMHCR_EL2, MPAM Hypervisor Control Register (EL2)

The MPAMHCR_EL2 characteristics are:

Purpose

Controls the PARTID virtualization features of MPAM. It controls the mapping of virtual PARTIDs into physical PARTIDs in [MPAM0_EL1](#) when EL0_VPMEN == 1 and in [MPAM1_EL1](#) when EL1_VPMEN == 1.

Configuration

This register is present only when FEAT_MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMHCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMHCR_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| TRAP_MPAMIDR_EL1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

TRAP_MPAMIDR_EL1, bit [31]

Trap accesses from EL1 to [MPAMIDR_EL1](#) to EL2.

| TRAP_MPAMIDR_EL1 | Meaning |
|------------------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Direct accesses to MPAMIDR_EL1 from EL1 are trapped to EL2. |

The reset behavior of this field is:

- On a Warm reset:
 - When EL3 is not implemented, this field resets to 1.
 - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

Bits [30:9]

Reserved, RES0.

GSTAPP_PLK, bit [8]

Make the PARTIDs at EL0 the same as the PARTIDs at EL1. When executing at EL0, EL2 is enabled, [HCR_EL2.TGE](#) == 0 and [GSTAPP_PLK](#) = 1, [MPAM1_EL1](#) is used instead of [MPAM0_EL1](#) to generate MPAM labels for memory requests.

| GSTAPP_PLK | Meaning |
|-------------------|---|
| 0b0 | MPAM0_EL1 is used to generate MPAM labels when executing at EL0. |
| 0b1 | MPAM1_EL1 is used to generate MPAM labels when executing at EL0 with EL2 enabled and HCR_EL2.TGE == 0. Otherwise MPAM0_EL1 is used. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL1_VPMEN, bit [1]

Enable the virtual PARTID mapping of the PARTID fields in [MPAM1_EL1](#) when executing at EL1. This bit also enables virtual PARTID mapping when [MPAM1_EL1](#) is used to generate MPAM labels for memory requests at EL0 due to [GSTAPP_PLK](#) == 1.

| EL1_VPMEN | Meaning |
|------------------|---|
| 0b0 | MPAM1_EL1 .PARTID_I and MPAM1_EL1 .PARTID_D are physical PARTIDs that are used to label memory system requests. |
| 0b1 | MPAM1_EL1 .PARTID_I and MPAM1_EL1 .PARTID_D are virtual PARTIDs that are used to index the PhyPARTID fields of MPAMVPM0_EL2 to MPAMVPM7_EL2 registers to map the virtual PARTID into a physical PARTID to label memory system requests. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0_VPMEN, bit [0]

Enable the virtual PARTID mapping of the PARTID fields of [MPAM0_EL1](#) unless [HCR_EL2.E2H](#) == 1 and [HCR_EL2.TGE](#) == 1.

When [HCR_EL2.E2H](#) == 1 and [HCR_EL2.TGE](#) == 1, [EL0_VPMEN](#) is ignored and [MPAM0_EL1](#) PARTID fields are not mapped.

When [MPAMHCR_EL2.GSTAPP_PLK](#) == 1 and [HCR_EL2.TGE](#) == 0, [MPAM1_EL1](#) is used as the source of PARTIDs and the virtual PARTID mapping of [MPAM1_EL1](#) PARTIDs is controlled by [MPAMHCR_EL2.EL1_VPMEN](#).

| EL0_VPMEN | Meaning |
|------------------|---|
| 0b0 | MPAM0_EL1 .PARTID_I and MPAM0_EL1 .PARTID_D are physical PARTIDs that are used to label memory system requests. |
| 0b1 | MPAM0_EL1 .PARTID_I and MPAM0_EL1 .PARTID_D are virtual PARTIDs that are used to index the PhyPARTID fields of MPAMVPM0_EL2 to MPAMVPM7_EL2 registers to map the virtual PARTID into a physical PARTID to label memory system requests. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMHCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAMHCR_EL2

| op0 | op1 | CRn | CRm | op2 |

MPAMIDR_EL1, MPAM ID Register (EL1)

The MPAMIDR_EL1 characteristics are:

Purpose

Indicates the presence and maximum PARTID and PMG values supported in the implementation. It also indicates whether the implementation supports MPAM virtualization.

Configuration

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMIDR_EL1 are UNDEFINED.

Attributes

MPAMIDR_EL1 is a 64-bit register.

| RES0 | | | | | | | | | | VPMR_MAX | | HAS_HCR | | RES0 | PARTID_MA | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 |

MPAMIDR_EL1 indicates the MPAM implementation parameters of the PE.

Bits [63:62]

Reserved, RES0.

HAS_SDEFLT, bit [61]

HAS_SDEFLT indicates support for [MPAM3_EL3](#).SDEFLT bit. Defined values are:

| HAS_SDEFLT | Meaning |
|------------|--|
| 0b0 | The SDEFLT bit is not implemented in MPAM3_EL3 . |
| 0b1 | The SDEFLT bit is implemented in MPAM3_EL3 . |

When `MPAM3_EL3.SDEFLT == 1`, accesses from the Secure Execution state use the default PARTID, `PARTID == 0`.

HAS_FORCE_NS, bit [60]

HAS_FORCE_NS indicates support for [MPAM3_EL3.FORCE_NS](#) bit. Defined values are:

| HAS_FORCE_NS | Meaning |
|--------------|--|
| 0b0 | The FORCE_NS bit is not implemented in MPAM3_EL3 . |
| 0b1 | The FORCE_NS bit is implemented in MPAM3_EL3 . |

When [MPAM3_EL3.FORCE](#) NS == 1, accesses from the Secure Execution state have MPAM NS == 1.

SP4, bit [59]

Supports 4 MPAM PARTID spaces.

| SP4 | Meaning |
|-----|--------------------------------|
| 0b0 | MPAM supports 2 PARTID spaces. |
| 0b1 | MPAM supports 4 PARTID spaces. |

HAS_TIDR, bit [58]

HAS_TIDR indicates support for [MPAM2_EL2.TIDR](#) bit. Defined values are:

| HAS_TIDR | Meaning |
|----------|--|
| 0b0 | The TIDR bit is not implemented in MPAM2_EL2 . |
| 0b1 | The TIDR bit is implemented in MPAM2_EL2 . |

Note

Arm recommends that when the MPAM version is MPAM v0.1 or MPAM v1.1, MPAMIDR_EL1.HAS_TIDR is 1 and that the MPAM2_EL2.TIDR field is implemented.

HAS_ALTSP, bit [57]

HAS_ALTSP indicates support for alternative PARTID spaces.

| HAS_ALTSP | Meaning |
|-----------|--|
| 0b0 | Alternative PARTID spaces are not implemented. |
| 0b1 | Alternative PARTID spaces are implemented with control bits in MPAM3_EL3 and MPAM2_EL2 . |

Bits [56:40]

Reserved, RES0.

PMG_MAX, bits [39:32]

The largest value of PMG that the implementation can generate. The PMG_I and PMG_D fields of every MPAMn_ELx must implement at least enough bits to represent PMG_MAX.

Bits [31:21]

Reserved, RES0.

VPMR_MAX, bits [20:18]

When MPAMIDR_EL1.HAS_HCR == 1:

Indicates the maximum register index n for the MPAMVPM<n>_EL2 registers.

Otherwise:

Reserved, RAZ.

HAS_HCR, bit [17]

HAS_HCR indicates that the PE implementation supports MPAM virtualization, including [MPAMHCR_EL2](#), [MPAMVPMV_EL2](#), and MPAMVPM<n>_EL2 with n in the range 0 to VPMR_MAX. Must be 0 if EL2 is not implemented in either Security state.

| HAS_HCR | Meaning |
|---------|---------------------------------------|
| 0b0 | MPAM virtualization is not supported. |
| 0b1 | MPAM virtualization is supported. |

Bit [16]

Reserved, RES0.

PARTID_MAX, bits [15:0]

The largest value of PARTID that the implementation can generate. The PARTID_I and PARTID_D fields of every MPAMn_ELx must implement at least enough bits to represent PARTID_MAX.

Accessing MPAMIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAMIDR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b1010 | 0b0100 | 0b100 |

```

MPAMSM_EL1, MPAM Streaming Mode Register

The MPAMSM_EL1 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests issued by SME load and store instructions and, when the PE is in Streaming SVE mode, by SVE and SIMD&FP load and store instructions. For those requests, the MPAM labels in this register have precedence over the labels in [MPAM0_EL1](#), [MPAM1_EL1](#), [MPAM2_EL2](#), and [MPAM3_EL3](#).

It is IMPLEMENTATION DEFINED whether the MPAM labels in this register are used for memory requests due to hardware page table walks or updates performed as a result of SME load and store instructions and, when the PE is in Streaming SVE mode, SVE and SIMD&FP load and store instructions, and SVE prefetch instructions.

The MPAM labels in this register are only used if [MPAM1_EL1](#).MPAMEN is 1.

For memory requests issued from EL0, the MPAM PARTID in this register is virtual and mapped into a physical PARTID when all of the following are true:

- EL2 is implemented and enabled in the current Security state, and [HCR_EL2](#).{E2H, TGE} != {1, 1}.
- The MPAM virtualization option is implemented and [MPAMHCR_EL2](#).EL0_VPMEN == 1.

For memory requests issued from EL1, the MPAM PARTID in this register is virtual and mapped into a physical PARTID when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The MPAM virtualization option is implemented and [MPAMHCR_EL2](#).EL1_VPMEN == 1.

Configuration

This register is present only when FEAT_MPAM is implemented and FEAT_SME is implemented. Otherwise, direct accesses to MPAMSM_EL1 are UNDEFINED.

Attributes

MPAMSM_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [39:32]

Reserved, RES0.

PARTID_D, bits [31:16]

Partition ID for requests issued due to the execution at any Exception level of SME load and store instructions and, when the PE is in Streaming SVE mode, SVE and SIMD&FP load and store instructions and SVE prefetch instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:0]

Reserved, RES0.

Accessing MPAMSM_EL1

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MPAMVPM0_EL2, MPAM Virtual PARTID Mapping Register 0

The MPAMVPM0_EL2 characteristics are:

Purpose

MPAMVPM0_EL2 provides mappings from virtual PARTIDs 0 - 3 to physical PARTIDs.

[MPAMIDR_EL1.VPMR_MAX](#) field gives the index of the highest implemented MPAMVPM<n>_EL2 register. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If [MPAMIDR_EL1.VPMR_MAX](#) == 0, there is only a single MPAMVPM<n>_EL2 register, [MPAMVPM0_EL2](#).

Virtual PARTID mapping is enabled by [MPAMHCR_EL2.EL1_VPMEN](#) for PARTIDs in [MPAM1_EL1](#) and by [MPAMHCR_EL2.EL0_VPMEN](#) for PARTIDs in [MPAM0_EL1](#).

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the [MPAMVPMV_EL2.VPM_V](#) bit in bit position n is set to 1.

Configuration

This register is present only when FEAT_MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMVPM0_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM0_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

PhyPARTID3, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 3. PhyPARTID3 gives the mapping of virtual PARTID 3 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID2, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 2. PhyPARTID2 gives the mapping of virtual PARTID 2 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID1, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 1. PhyPARTID1 gives the mapping of virtual PARTID 1 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID0, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 0. PhyPARTID0 gives the mapping of virtual PARTID 0 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMVPM0_EL2

MPAMVPM1_EL2, MPAM Virtual PARTID Mapping Register 1

The MPAMVPM1_EL2 characteristics are:

Purpose

MPAMVPM1_EL2 provides mappings from virtual PARTIDs 4 - 7 to physical PARTIDs.

[MPAMIDR_EL1](#).VPMR_MAX field gives the index of the highest implemented [MPAMVPM0_EL2](#) to [MPAMVPM7_EL2](#) registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If [MPAMIDR_EL1](#).VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, [MPAMVPM0_EL2](#).

Virtual PARTID mapping is enabled by [MPAMHCR_EL2](#).EL1_VPMEN for PARTIDs in [MPAM1_EL1](#) and by [MPAMHCR_EL2](#).EL0_VPMEN for PARTIDs in [MPAM0_EL1](#).

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the [MPAMVPMV_EL2](#).VPM_V bit in bit position n is set to 1.

Configuration

This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1 and MPAMIDR_EL1.VPMR_MAX > 0. Otherwise, direct accesses to MPAMVPM1_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM1_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

PhyPARTID7, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 7. PhyPARTID7 gives the mapping of virtual PARTID 7 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID6, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 6. PhyPARTID6 gives the mapping of virtual PARTID 6 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID5, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 5. PhyPARTID5 gives the mapping of virtual PARTID 5 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID4, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 4. PhyPARTID4 gives the mapping of virtual PARTID 4 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMVPM1_EL2

Accesses to this register use the following encodings in the System register encoding space:

MPAMVPM2_EL2, MPAM Virtual PARTID Mapping Register 2

The MPAMVPM2_EL2 characteristics are:

Purpose

MPAMVPM2_EL2 provides mappings from virtual PARTIDs 8 - 11 to physical PARTIDs.

[MPAMIDR_EL1.VPMR_MAX](#) field gives the index of the highest implemented [MPAMVPM0_EL2](#) to [MPAMVPM7_EL2](#) registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If [MPAMIDR_EL1.VPMR_MAX](#) == 0, there is only a single MPAMVPM<n>_EL2 register, [MPAMVPM0_EL2](#).

Virtual PARTID mapping is enabled by [MPAMHCR_EL2.EL1_VPMEN](#) for PARTIDs in [MPAM1_EL1](#) and by [MPAMHCR_EL2.EL0_VPMEN](#) for PARTIDs in [MPAM0_EL1](#).

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the [MPAMVPMV_EL2.VPM_V](#) bit in bit position n is set to 1.

Configuration

This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1 and MPAMIDR_EL1.VPMR_MAX > 1. Otherwise, direct accesses to MPAMVPM2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM2_EL2 is a 64-bit register.

PhyPARTID11, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 11. PhyPARTID11 gives the mapping of virtual PARTID 11 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID10, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 10. PhyPARTID10 gives the mapping of virtual PARTID 10 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID9, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 9. PhyPARTID9 gives the mapping of virtual PARTID 9 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID8, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 8. PhyPARTID8 gives the mapping of virtual PARTID 8 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID15, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 15. PhyPARTID15 gives the mapping of virtual PARTID 15 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID14, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 14. PhyPARTID14 gives the mapping of virtual PARTID 14 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID13, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 13. PhyPARTID13 gives the mapping of virtual PARTID 13 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID12, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 12. PhyPARTID12 gives the mapping of virtual PARTID 12 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID19, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 19. PhyPARTID19 gives the mapping of virtual PARTID 19 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID18, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 18. PhyPARTID18 gives the mapping of virtual PARTID 18 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID17, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 17. PhyPARTID17 gives the mapping of virtual PARTID 17 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID16, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 16. PhyPARTID16 gives the mapping of virtual PARTID 16 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM5_EL2, MPAM Virtual PARTID Mapping Register 5

The MPAMVPM5_EL2 characteristics are:

Purpose

MPAMVPM5_EL2 provides mappings from virtual PARTIDs 20 - 23 to physical PARTIDs.

[MPAMIDR_EL1.VPMR_MAX](#) field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If [MPAMIDR_EL1.VPMR_MAX](#) == 0, there is only a single MPAMVPM<n>_EL2 register, [MPAMVPM0_EL2](#).

Virtual PARTID mapping is enabled by [MPAMHCR_EL2.EL1_VPMEN](#) for PARTIDs in [MPAM1_EL1](#) and by [MPAMHCR_EL2.EL0_VPMEN](#) for PARTIDs in [MPAM0_EL1](#).

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the [MPAMVPMV_EL2.VPM_V](#) bit in bit position n is set to 1.

Configuration

This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1 and MPAMIDR_EL1.VPMR_MAX > 4. Otherwise, direct accesses to MPAMVPM5_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM5_EL2 is a 64-bit register.

PhyPARTID23, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 23. PhyPARTID23 gives the mapping of virtual PARTID 23 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID22, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 22. PhyPARTID22 gives the mapping of virtual PARTID 22 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID21, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 21. PhyPARTID21 gives the mapping of virtual PARTID 21 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID20, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 20. PhyPARTID20 gives the mapping of virtual PARTID 20 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM6_EL2, MPAM Virtual PARTID Mapping Register 6

The MPAMVPM6_EL2 characteristics are:

Purpose

MPAMVPM6_EL2 provides mappings from virtual PARTIDs 24 - 27 to physical PARTIDs.

[MPAMIDR_EL1.VPMR_MAX](#) field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If [MPAMIDR_EL1.VPMR_MAX](#) == 0, there is only a single MPAMVPM<n>_EL2 register, [MPAMVPM0_EL2](#).

Virtual PARTID mapping is enabled by [MPAMHCR_EL2.EL1_VPMEN](#) for PARTIDs in [MPAM1_EL1](#) and by [MPAMHCR_EL2.EL0_VPMEN](#) for PARTIDs in [MPAM0_EL1](#).

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the [MPAMVPMV_EL2.VPM_V](#) bit in bit position n is set to 1.

Configuration

This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1 and MPAMIDR_EL1.VPMR_MAX > 5. Otherwise, direct accesses to MPAMVPM6_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM6_EL2 is a 64-bit register.

MPAMVPM7_EL2, MPAM Virtual PARTID Mapping Register 7

The MPAMVPM7_EL2 characteristics are:

Purpose

MPAMVPM7_EL2 provides mappings from virtual PARTIDs 28 - 31 to physical PARTIDs.

[MPAMIDR_EL1.VPMR_MAX](#) field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If [MPAMIDR_EL1.VPMR_MAX](#) == 0, there is only a single MPAMVPM<n>_EL2 register, [MPAMVPM0_EL2](#).

Virtual PARTID mapping is enabled by [MPAMHCR_EL2.EL1_VPMEN](#) for PARTIDs in [MPAM1_EL1](#) and by [MPAMHCR_EL2.EL0_VPMEN](#) for [MPAM0_EL1](#).

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the [MPAMVPMV_EL2.VPM_V](#) bit in bit position n is set to 1.

Configuration

This register is present only when FEAT_MPAM is implemented, MPAMIDR_EL1.HAS_HCR == 1 and MPAMIDR_EL1.VPMR_MAX == 7. Otherwise, direct accesses to MPAMVPM7_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM7_EL2 is a 64-bit register.

PhyPARTID31, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 31. PhyPARTID31 gives the mapping of virtual PARTID 31 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID30, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 30. PhyPARTID30 gives the mapping of virtual PARTID 30 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID29, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 29. PhyPARTID29 gives the mapping of virtual PARTID 29 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID28, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 28. PhyPARTID28 gives the mapping of virtual PARTID 28 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPMV_EL2, MPAM Virtual Partition Mapping Valid Register

The MPAMVPMV_EL2 characteristics are:

Purpose

Valid bits for virtual PARTID mapping entries. Each bit m corresponds to virtual PARTID mapping entry m in the MPAMVPM<n>_EL2 registers where n = m >> 2.

Configuration

This register is present only when FEAT_MPAM is implemented and MPAMIDR_EL1.HAS_HCR == 1. Otherwise, direct accesses to MPAMVPMV_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPMV_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | |
|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 |

Bits [63:32]

Reserved, RES0.

VPM_V<m>, bit [m], for m = 31 to 0

Contains valid bit for virtual PARTID mapping entry corresponding to virtual PARTID<m>.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMVPMV_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAMVPMV_EL2

MPIDR_EL1, Multiprocessor Affinity Register

The MPIDR_EL1 characteristics are:

Purpose

In a multiprocessor system, provides an additional PE identification mechanism for scheduling purposes.

Configuration

AArch64 System register MPIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MPIDR\[31:0\]](#).

In a uniprocessor system, Arm recommends that each Aff<n> field of this register returns a value of 0.

Attributes

MPIDR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|------|----|----|----|----|----|------|----|----|----|----|----|----|----|------|----|----|----|----|----|----|------|------|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | Aff3 | | | | | | | | |
| RES1 | | U | RES0 | | | | | MT | Aff2 | | | | | | | | Aff1 | | | | | | | | Aff0 | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of Aff0 for more information.

Aff3 is not supported in AArch32 state.

Bit [31]

Reserved, RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

| U | Meaning |
|-----|---|
| 0b0 | Processor is part of a multiprocessor system. |
| 0b1 | Processor is part of a uniprocessor system. |

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels.

| MT | Meaning |
|-----|---|
| 0b0 | Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent. |
| 0b1 | Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent. |

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or [MPIDR_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

Accessing MPIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPIDR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0000 | 0b101 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.MPIDR_EL1 == '1' then

    elseif EL2Enabled() then
        return VMPIDR_EL2;
    else
        return MPIDR_EL1;
elseif PSTATE.EL == EL2 then
    return MPIDR_EL1;
elseif PSTATE.EL == EL3 then
    return MPIDR_EL1;

```

MVFR0_EL1, AArch32 Media and VFP Feature Register 0

The MVFR0_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR1_EL1](#) and [MVFR2_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register MVFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MVFR0\[31:0\]](#).

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR0_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|---------|----|----|----|--------|----|----|----|----------|----|----|----|--------|----|----|----|------|----|----|----|------|----|----|----|---------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| FPRound | | | | FPShVec | | | | FPSqrt | | | | FPDivide | | | | FPTrap | | | | FPDP | | | | FPSP | | | | SIMDReg | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes. Defined values are:

| FPRound | Meaning |
|---------|--|
| 0b0000 | Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting. |
| 0b0001 | All rounding modes supported. |

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

FPSHVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors. Defined values are:

| FPSHVec | Meaning |
|----------------|-----------------------------------|
| 0b0000 | Short vectors not supported. |
| 0b0001 | Short vector operation supported. |

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations. Defined values are:

| FPSqrt | Meaning |
|---------------|----------------------------|
| 0b0000 | Not supported in hardware. |
| 0b0001 | Supported. |

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations. Defined values are:

| FPDivide | Meaning |
|-----------------|----------------------------|
| 0b0000 | Not supported in hardware. |
| 0b0001 | Supported. |

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

FPTrap, bits [15:12]

Floating Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping. Defined values are:

| FPTrap | Meaning |
|---------------|----------------|
| 0b0000 | Not supported. |
| 0b0001 | Supported. |

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

FPDP, bits [11:8]

Double Precision. Indicates whether the floating-point implementation provides support for double-precision operations. Defined values are:

| FPDP | Meaning |
|--------|--|
| 0b0000 | Not supported in hardware. |
| 0b0001 | Supported, VFPv2. |
| 0b0010 | Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values. |

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.
- VDIV.F64 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

FPSP, bits [7:4]

Single Precision. Indicates whether the floating-point implementation provides support for single-precision operations. Defined values are:

| FPSP | Meaning |
|--------|---|
| 0b0000 | Not supported in hardware. |
| 0b0001 | Supported, VFPv2. |
| 0b0010 | Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values. |

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank. Defined values are:

| SIMDReg | Meaning |
|---------|--|
| 0b0000 | The implementation has no Advanced SIMD and floating-point support. |
| 0b0001 | The implementation includes floating-point support with 16 x 64-bit registers. |
| 0b0010 | The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers. |

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| UNKNOWN | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Reserved, UNKNOWN.

Accessing MVFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MVFR0_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0000 | 0b0011 | 0b000 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else

MVFR1_EL1, AArch32 Media and VFP Feature Register 1

The MVFR1_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0_EL1](#) and [MVFR2_EL1](#).

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register MVFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MVFR1\[31:0\]](#).

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR1_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|------|----|----|----|--------|----|----|----|--------|----|----|----|---------|----|----|----|--------|----|----|----|--------|----|----|----|-------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| SIMDFMAC | | | | FPHP | | | | SIMDHP | | | | SIMDSP | | | | SIMDInt | | | | SIMDLS | | | | FPDNaN | | | | FPFtZ | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions. Defined values are:

| SIMDFMAC | Meaning |
|----------|------------------|
| 0b0000 | Not implemented. |
| 0b0001 | Implemented. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

FPHP, bits [27:24]

Floating Point Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

| FPHP | Meaning |
|-------------|---|
| 0b0000 | Not supported. |
| 0b0001 | Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision. |
| 0b0010 | As for 0b0001, and adds instructions for conversion between double-precision and half-precision. |
| 0b0011 | As for 0b0010, and adds support for half-precision floating-point arithmetic. |

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- 0b0011 in an implementation with floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

| Half Precision instructions supported | FPHP | SIMDHP |
|--|-------------|---------------|
| No support | 0b0000 | 0b0000 |
| Conversions only | 0b0010 | 0b0001 |
| Conversions and arithmetic | 0b0011 | 0b0010 |

SIMDHP, bits [23:20]

Advanced SIMD Half Precision. Indicates the level of half-precision floating-point support. Defined values are:

| SIMDHP | Meaning |
|---------------|---|
| 0b0000 | Not supported. |
| 0b0001 | SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision. |
| 0b0010 | As for 0b0001, and adds support for half-precision floating-point arithmetic. |

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0001 in an implementation with SIMD floating-point support that does not include the FEAT_FP16 extension.
- 0b0010 in an implementation with SIMD floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

| Half Precision instructions supported | FPHP | SIMDHP |
|--|-------------|---------------|
| No support | 0b0000 | 0b0000 |
| Conversions only | 0b0010 | 0b0001 |
| Conversions and arithmetic | 0b0011 | 0b0010 |

SIMDSP, bits [19:16]

Advanced SIMD Single Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions. Defined values are:

| SIMDSP | Meaning |
|---------------|---|
| 0b0000 | Not implemented. |
| 0b0001 | Implemented. This value is permitted only if the SIMDInt field is 0b0001. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SIMDInt, bits [15:12]

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions. Defined values are:

| SIMDInt | Meaning |
|----------------|------------------|
| 0b0000 | Not implemented. |
| 0b0001 | Implemented. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

SIMDLS, bits [11:8]

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions. Defined values are:

| SIMDLS | Meaning |
|---------------|------------------|
| 0b0000 | Not implemented. |
| 0b0001 | Implemented. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

FPDNAN, bits [7:4]

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode. Defined values are:

| FPDNAN | Meaning |
|---------------|--|
| 0b0000 | Not implemented, or hardware supports only the Default NaN mode. |
| 0b0001 | Hardware supports propagation of NaN values. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

FPFtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation. Defined values are:

| FPFtZ | Meaning |
|--------------|---|
| 0b0000 | Not implemented, or hardware supports only the Flush-to-Zero mode of operation. |
| 0b0001 | Hardware supports full denormalized number arithmetic. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

MVFR2_EL1, AArch32 Media and VFP Feature Register 2

The MVFR2_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and Floating-point implementation.

Must be interpreted with [MVFR0_EL1](#) and [MVFR1_EL1](#).

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register MVFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MVFR2\[31:0\]](#).

In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR2_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | FPMisc | | | | SIMDMisc | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:8]

Reserved, RES0.

FPMisc, bits [7:4]

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

| FPMisc | Meaning |
|--------|---|
| 0b0000 | Not implemented, or no support for miscellaneous features. |
| 0b0001 | Support for Floating-point selection. |
| 0b0010 | As 0b0001, and Floating-point Conversion to Integer with Directed Rounding modes. |
| 0b0011 | As 0b0010, and Floating-point Round to Integer Floating-point. |
| 0b0100 | As 0b0011, and Floating-point MaxNum and MinNum. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0100.

SIMDMisc, bits [3:0]

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

| SIMDMisc | Meaning |
|----------|--|
| 0b0000 | Not implemented, or no support for miscellaneous features. |
| 0b0001 | Floating-point Conversion to Integer with Directed Rounding modes. |
| 0b0010 | As 0b0001, and Floating-point Round to Integer Floating-point. |
| 0b0011 | As 0b0010, and Floating-point MaxNum and MinNum. |

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0011.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

```

NZCV, Condition Flags

The NZCV characteristics are:

Purpose

Allows access to the condition flags.

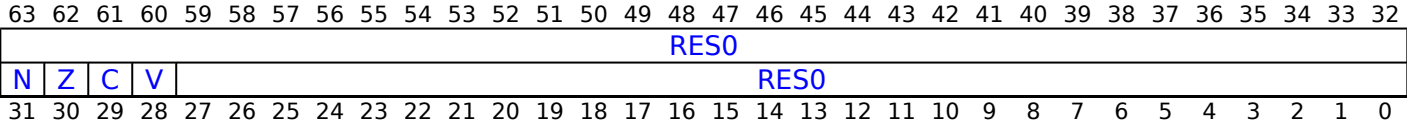

Configuration

There are no configuration notes.

Attributes

NZCV is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative condition flag. Set to 1 if the result of the last flag-setting instruction was negative.

Z, bit [30]

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

C, bit [29]

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

V, bit [28]

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

Bits [27:0]

Reserved, RES0.

Accessing NZCV

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, NZCV

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b011 | 0b0100 | 0b0010 | 0b000 |

```

OSDLR_EL1, OS Double Lock Register

The OSDLR_EL1 characteristics are:

Purpose

Used to control the OS Double Lock.

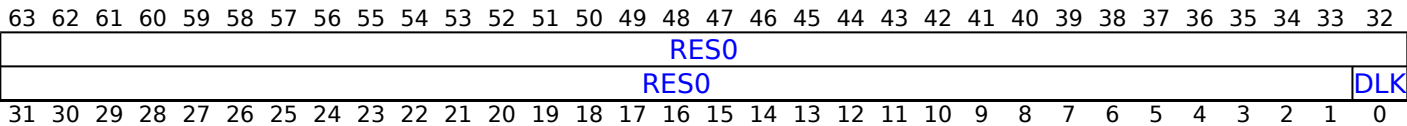

Configuration

AArch64 System register OSDLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGOSDLR\[31:0\]](#).

Attributes

OSDLR_EL1 is a 64-bit register.

Field descriptions

Bits [63:1]

Reserved, RES0.

DLK, bit [0]

When FEAT_DoubleLock is implemented:

OS Double Lock control bit.

| DLK | Meaning |
|-----|--|
| 0b0 | OS Double Lock unlocked. |
| 0b1 | OS Double Lock locked, if DBGPRCR_EL1 .CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

Accessing OSDLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

OSDTRRX_EL1, OS Lock Data Transfer Register, Receive

The OSDTRRX_EL1 characteristics are:

Purpose

Used for save and restore of [DBGDTRRX_EL0](#). It is a component of the Debug Communications Channel.

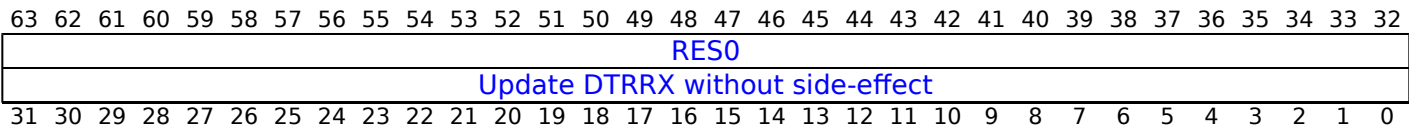

Configuration

AArch64 System register OSDTRRX_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRRXext\[31:0\]](#).

Attributes

OSDTRRX_EL1 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

Bits [31:0]

- Update DTRRX without side-effect.
- Writes to this register update the value in DTRRX and do not change RXfull.
- Reads of this register return the last value written to DTRRX and do not change RXfull.
- For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

Accessing OSDTRRX_EL1

Arm deprecates reads and writes of OSDTRRX_EL1 when the OS Lock is unlocked.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSDTRRX_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b000 | 0b0000 | 0b0000 | 0b010 |

```

OSDTRTX_EL1, OS Lock Data Transfer Register, Transmit

The OSDTRTX_EL1 characteristics are:

Purpose

Used for save/restore of [DBGDTRTX_EL0](#). It is a component of the Debug Communications Channel.

Configuration

AArch64 System register OSDTRTX_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGDTRTXext\[31:0\]](#).

Attributes

OSDTRTX_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Return DTRTX without side-effect | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

Accessing OSDTRTX_EL1

Arm deprecates reads and writes of OSDTRTX_EL1 when the OS Lock is unlocked.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSDTRTX_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b000 | 0b0000 | 0b0011 | 0b010 |

```

OSECCR_EL1, OS Lock Exception Catch Control Register

The OSECCR_EL1 characteristics are:

Purpose

Provides a mechanism for an operating system to access the contents of [EDECCR](#) that are otherwise invisible to software, so it can save/restore the contents of [EDECCR](#) over powerdown on behalf of the external debugger.

Configuration

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGOSECCR\[31:0\]](#).

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to External register [EDECCR\[31:0\]](#).

If [OSLSR_EL1.OSLK](#) == 0, then OSECCR_EL1 returns an UNKNOWN value on reads and ignores writes.

Attributes

OSECCR_EL1 is a 64-bit register.

Field descriptions

When OSLSR_EL1.OSLK == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | EDECCR | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

EDECCR, bits [31:0]

Used for save/restore to [EDECCR](#) over powerdown.

Reads or writes to this field are indirect accesses to [EDECCR](#).

Accessing OSECCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSECCR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b000 | 0b0000 | 0b0110 | 0b010 |

OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS Lock.

Configuration

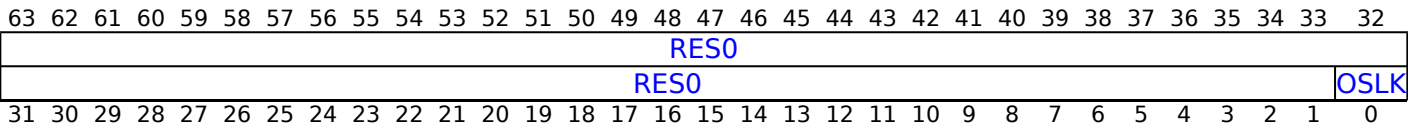

AArch64 System register OSLAR_EL1 bits [31:0] are architecturally mapped to External register [OSLAR_EL1\[31:0\]](#).

The OS Lock can also be locked or unlocked using [DBGOSLAR](#).

Attributes

OSLAR_EL1 is a 64-bit register.

Field descriptions

Bits [63:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use [OSLSR_EL1](#).OSLK to check the current status of the lock.

Accessing OSLAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MSR OSLAR_EL1, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b000 | 0b0001 | 0b0000 | 0b100 |

```

OSLSR_EL1, OS Lock Status Register

The OLSR_EL1 characteristics are:

Purpose

Provides the status of the OS Lock.

Configuration

AArch64 System register OSLSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [DBGOSLSR\[31:0\]](#).

Attributes

OSLSR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|---------|----|----|-----|------|----|---------|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | OSLM[1] | | | hTT | OSLK | | OSLM[0] | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:4]

Reserved, RES0.

OSLM, bits [3, 0]

OS Lock model implemented. Identifies the form of OS save and restore mechanism implemented.

| OSLM | Meaning |
|------|--------------------------|
| 0b00 | OS Lock not implemented. |
| 0b10 | OS Lock implemented. |

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is OLSR_EL1[3].
- OSLM[0] is OLSR_EL1[0].

nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

OSLK, bit [1]

OS Lock Status.

| OSLK | Meaning |
|------|-------------------|
| 0b0 | OS Lock unlocked. |
| 0b1 | OS Lock locked. |

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Accessing OSLSR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSLSR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b000 | 0b0001 | 0b0001 | 0b100 |

```

PAN, Privileged Access Never

The PAN characteristics are:

Purpose

Allows access to the Privileged Access Never bit.

Configuration

This register is present only when FEAT_PAN is implemented. Otherwise, direct accesses to PAN are UNDEFINED.

Attributes

PAN is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|-----|----|------|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--|--|--|--|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | | | | |

Bits [63:23]

Reserved, RES0.

PAN, bit [22]

Privileged Access Never.

| PAN | Meaning |
|-----|--|
| 0b0 | Privileged reads and write are not disabled by this mechanism. |
| 0b1 | Disables privileged read and write accesses to addresses accessible at EL0 for an enabled stage 1 translation regime that defines the EL0 permissions. |

The value of this bit is usually preserved on taking an exception, except in the following situations:

- When the target of the exception is EL1, and the value of the [SCTLR_EL1.SPAN](#) bit is 0, this bit is set to 1.
- When the target of the exception is EL2, [HCR_EL2](#).{E2H, TGE} is {1, 1}, and the value of the [SCTLR_EL2.SPAN](#) bit is 0, this bit is set to 1.

Bits [21:0]

Reserved, RES0.

Accessing PAN

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PAN

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0100 | 0b0010 | 0b011 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    return Zeros(41):PSTATE.PAN:Zeros(22);
elsif PSTATE.EL == EL2 then
    return Zeros(41):PSTATE.PAN:Zeros(22);
elsif PSTATE.EL == EL3 then
    return Zeros(41):PSTATE.PAN:Zeros(22);

```

MSR PAN, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0100 | 0b0010 | 0b011 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    PSTATE.PAN = X[t]<22>;
elsif PSTATE.EL == EL2 then
    PSTATE.PAN = X[t]<22>;
elsif PSTATE.EL == EL3 then
    PSTATE.PAN = X[t]<22>;

```

MSR PAN, #<imm>

| op0 | op1 | CRn | op2 |
|------|-------|--------|-------|
| 0b00 | 0b000 | 0b0100 | 0b100 |

PAR_EL1, Physical Address Register

The PAR_EL1 characteristics are:

Purpose

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

Configuration

AArch64 System register PAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register [PAR\[63:0\]](#).

Attributes

PAR_EL1 is a 64-bit register.

Field descriptions

When PAR_EL1.F == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|------|----|----|----|-----------|----|----|----|-----------|----|---------------------------|----|----|--|----|--|----|----|------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | | 42 | | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ATTR | | | | | | | | RES0 | | | | PA[51:48] | | | | PA[47:12] | | | | | | | | | | | | | | | | | |
| PA[47:12] | | | | | | | | | | | | | | | | NSE | | IMPLEMENTATION DEFINED | | | | NS | | SH | | RES0 | | | | | | F | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | | 10 | | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in [MAIR_EL1](#), [MAIR_EL2](#), and [MAIR_EL3](#).

The value returned in this field can be the resulting attribute that is actually implemented by the implementation, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

Note

The attributes presented are consistent with the stages of translation applied in the address translation instruction. If the instruction performed a stage 1 translation only, the attributes are from the stage 1 translation. If the instruction performed a stage 1 and stage 2 translation, the attributes are from the combined stage 1 and stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

PA[51:48], bits [51:48]

When FEAT_LPA is implemented:

Extension to PA[47:12]. For more information, see PA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[47:12], bits [47:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When FEAT_LPA is implemented and 52-bit addresses are in use, PA[51:48] forms the upper part of the address value. Otherwise, when 52-bit addresses are not in use, PA[51:48] is RES0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [11]

When FEAT_RME is implemented:

Reports the NSE attribute for a translation table entry from the EL3 translation regime.

For a description of the values derived by evaluating NS and NSE together, see PAR_EL1.NS.

For a result from a Secure, Non-secure, or Realm translation regime, this bit is UNKNOWN.

Otherwise:

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]

When FEAT_RME is implemented:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime, a Realm translation regime, and the EL3 translation regime.

For a result from an EL3 translation regime, NS and NSE are evaluated together to report the physical address space:

| NSE | NS | Meaning |
|-----|-----|-------------|
| 0b0 | 0b0 | Secure. |
| 0b0 | 0b1 | Non-secure. |
| 0b1 | 0b0 | Root. |
| 0b1 | 0b1 | Realm. |

For a result from a Secure translation regime, when [SCR_EL3.EEL2](#) is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#), [AT S1E0R](#), and [AT S1E0W](#).
- In AArch32 state: [ATS1CPR](#), [ATS1CPW](#), [ATS1CPRP](#), [ATS1CPWP](#), [ATS1CUR](#), and [ATS1CUW](#).

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

For a result from an S1E1 or S1E0 operation on the Realm EL1&0 translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when [SCR_EL3.EEL2](#) is 1, this bit reflects the Security state of the intermediate physical address space of the translation for the instructions:

- In AArch64 state: [AT S1E1R](#), [AT S1E1W](#), [AT S1E1RP](#), [AT S1E1WP](#), [AT S1E0R](#), and [AT S1E0W](#).
- In AArch32 state: [ATS1CPR](#), [ATS1CPW](#), [ATS1CPRP](#), [ATS1CPWP](#), [ATS1CUR](#), and [ATS1CUW](#).

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address.

| SH | Meaning |
|------|------------------|
| 0b00 | Non-shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

The value 0b01 is reserved.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
 - Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.
-

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

| F | Meaning |
|-----|---|
| 0b0 | Address translation completed successfully. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When PAR_EL1.F == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------------|----|----|----|----|----|----|----|---------------------------|----|----|----|---------------------------|----|----|----|------|----|------|----|-----|----|------|----|-----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| IMPLEMENTATION DEFINED | | | | | | | | IMPLEMENTATION DEFINED | | | | IMPLEMENTATION DEFINED | | | | RES0 | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | RES1 | | RES0 | S | PTW | | RES0 | | FST | | | | F | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:12]

Reserved, RES0.

Bit [11]

Reserved, RES1.

Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

| S | Meaning |
|----------|--|
| 0b0 | Translation aborted because of a fault in the stage 1 translation. |
| 0b1 | Translation aborted because of a fault in the stage 2 translation. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort ESR encoding.

| FST | Meaning | Applies when |
|------------|---|---|
| 0b000000 | Address size fault, level 0 of translation or translation table base register. | |
| 0b000001 | Address size fault, level 1. | |
| 0b000010 | Address size fault, level 2. | |
| 0b000011 | Address size fault, level 3. | |
| 0b000100 | Translation fault, level 0. | |
| 0b000101 | Translation fault, level 1. | |
| 0b000110 | Translation fault, level 2. | |
| 0b000111 | Translation fault, level 3. | |
| 0b001001 | Access flag fault, level 1. | |
| 0b001010 | Access flag fault, level 2. | |
| 0b001011 | Access flag fault, level 3. | |
| 0b001000 | Access flag fault, level 0. | When FEAT_LPA2 is implemented |
| 0b001100 | Permission fault, level 0. | When FEAT_LPA2 is implemented |
| 0b001101 | Permission fault, level 1. | |
| 0b001110 | Permission fault, level 2. | |
| 0b001111 | Permission fault, level 3. | |
| 0b010011 | Synchronous External abort on translation table walk or hardware update of translation table, level -1. | When FEAT_LPA2 is implemented |
| 0b010100 | Synchronous External abort on translation table walk or hardware update of translation table, level 0. | |
| 0b010101 | Synchronous External abort on translation table walk or hardware update of translation table, level 1. | |
| 0b010110 | Synchronous External abort on translation table walk or hardware update of translation table, level 2. | |
| 0b010111 | Synchronous External abort on translation table walk or hardware update of translation table, level 3. | |
| 0b011011 | Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1. | When FEAT_LPA2 is implemented and FEAT_RAS is not implemented |
| 0b011100 | Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0. | When FEAT_RAS is not implemented |
| 0b011101 | Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1. | When FEAT_RAS is not implemented |
| 0b011110 | Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2. | When FEAT_RAS is not implemented |
| 0b011111 | Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3. | When FEAT_RAS is not implemented |
| 0b100011 | Granule Protection Fault on translation table walk or hardware update of translation table, level -1. | When FEAT_RME is implemented and FEAT_LPA2 is implemented |
| 0b100100 | Granule Protection Fault on translation table walk or hardware update of translation table, level 0. | When FEAT_RME is implemented |
| 0b100101 | Granule Protection Fault on translation table walk or hardware update of translation table, level 1. | When FEAT_RME is implemented |
| 0b100110 | Granule Protection Fault on translation table walk or hardware update of translation table, level 2. | When FEAT_RME is implemented |

| | | |
|----------|---|--------------------------------------|
| 0b100111 | Granule Protection Fault on translation table walk or hardware update of translation table, level 3. | When FEAT_RME is implemented |
| 0b101000 | Granule Protection Fault, not on translation table walk or hardware update of translation table. | When FEAT_RME is implemented |
| 0b101001 | Address size fault, level -1. | When FEAT_LPA2 is implemented |
| 0b101011 | Translation fault, level -1. | When FEAT_LPA2 is implemented |
| 0b110000 | TLB conflict abort. | |
| 0b110001 | Unsupported atomic hardware update fault. | When FEAT_HAFDBS is implemented |
| 0b111101 | Section Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format. | When EL1 is capable of using AArch32 |
| 0b111110 | Page Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format. | When EL1 is capable of using AArch32 |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

| F | Meaning |
|-----|------------------------------|
| 0b1 | Address translation aborted. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PAR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0111 | 0b0100 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.PAR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return PAR_EL1;
elsif PSTATE.EL == EL2 then
    return PAR_EL1;
elsif PSTATE.EL == EL3 then
    return PAR_EL1;

```

MSR PAR_EL1, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0111 | 0b0100 | 0b000 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGWTR_EL2.PAR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        PAR_EL1 = X[t];
elsif PSTATE.EL == EL2 then
    PAR_EL1 = X[t];
elsif PSTATE.EL == EL3 then
    PAR_EL1 = X[t];
```

PMBIDR_EL1, Profiling Buffer ID Register

The PMBIDR_EL1 characteristics are:

Purpose

Provides information to software as to whether the buffer can be programmed at the current Exception level.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBIDR_EL1 are UNDEFINED.

Attributes

PMBIDR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|-------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | EA | | | | RES0 | | F | P | Align | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:12]

Reserved, RES0.

EA, bits [11:8]

External Abort handling. Describes how the PE manages External aborts on writes made by the Statistical Profiling Extension to the Profiling Buffer.

| EA | Meaning |
|--------|---|
| 0b0000 | Not described. |
| 0b0001 | The PE ignores External aborts on writes made by the Statistical Profiling Extension. |
| 0b0010 | The External abort generates an SError interrupt at the PE. |

All other values are reserved.

From Armv8.8, the value 0b0000 is not permitted.

Access to this field is **RO**.

Bits [7:6]

Reserved, RES0.

F, bit [5]

Flag updates. Describes how address translations performed by the Statistical Profiling Extension manage the Access flag and dirty state.

| F | Meaning |
|----------|--|
| 0b0 | Hardware management of the Access flag and dirty state for accesses made by the Statistical Profiling Extension is always disabled for all translation stages. |
| 0b1 | Hardware management of the Access flag and dirty state for accesses made by the Statistical Profiling Extension is controlled in the same way as explicit memory accesses in the Profiling Buffer owning translation regime. |

Note

If hardware management of the Access flag is disabled for a stage of translation, an access to a Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor and might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

From Armv8.8, the value 0 is not permitted.

Access to this field is **RO**.

P, bit [4]

Programming not allowed. When read at EL3, this field reads as zero. Otherwise, indicates that the Profiling Buffer is owned by a higher Exception level or another Security state. Defined values are:

| P | Meaning |
|----------|--------------------------|
| 0b0 | Programming is allowed. |
| 0b1 | Programming not allowed. |

The value read from this field depends on the current Exception level and the Effective values of [MDCR_EL3.NSPB](#), [MDCR_EL3.NSPBE](#), and [MDCR_EL2.E2PB](#):

- If EL3 is implemented, and the owning Security state is Secure state, this field reads as one from:
 - Non-secure EL1 and Non-secure EL2.
 - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
 - If Secure EL2 is implemented and enabled, and [MDCR_EL2.E2PB](#) is 0b00, Secure EL1.
- If EL3 is implemented, and the owning Security state is Non-secure state, this field reads as one from:
 - Secure EL1.
 - If Secure EL2 is implemented, Secure EL2.
 - If EL2 is implemented and [MDCR_EL2.E2PB](#) is 0b00, Non-secure EL1.
 - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
- If FEAT_RME is implemented, and the owning Security state is Realm state, this field reads as one from:
 - Non-secure EL1 and Non-secure EL2.
 - Secure EL1 and Secure EL2.
 - If [MDCR_EL2.E2PB](#) is 0b00, Realm EL1.
- If EL3 is not implemented, EL2 is implemented, and [MDCR_EL2.E2PB](#) is 0b00, this field reads as one from EL1.
- Otherwise, this field reads as zero.

Align, bits [3:0]

Defines the minimum alignment constraint for writes to [PMBPTR_EL1](#). Defined values are:

| Align | Meaning |
|--------|-------------|
| 0b0000 | Byte. |
| 0b0001 | Halfword. |
| 0b0010 | Word. |
| 0b0011 | Doubleword. |
| 0b0100 | 16 bytes. |
| 0b0101 | 32 bytes. |
| 0b0110 | 64 bytes. |
| 0b0111 | 128 bytes. |
| 0b1000 | 256 bytes. |
| 0b1001 | 512 bytes. |
| 0b1010 | 1KB. |
| 0b1011 | 2KB. |

All other values are reserved.

For more information, see 'Restrictions on the current write pointer'.

If this field is non-zero, then every record is a multiple of this size.

Access to this field is **RO**.

Accessing PMBIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBIDR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b1001 | 0b1010 | 0b111 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HDFGRTR_EL2.PMBIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return PMBIDR_EL1;
elsif PSTATE.EL == EL2 then
    return PMBIDR_EL1;
elsif PSTATE.EL == EL3 then
    return PMBIDR_EL1;

```

PMBLIMITR_EL1, Profiling Buffer Limit Address Register

The PMBLIMITR_EL1 characteristics are:

Purpose

Defines the upper limit for the profiling buffer, and enables the profiling buffer

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBLIMITR_EL1 are UNDEFINED.

Attributes

PMBLIMITR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|------|------|----|----|----|----|----|----|----|----|--|--|--|--|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | | | | |
| | | | | | | | | | | | | | | | | LIMIT | | | | | | | | | | | | | | | | | | | | | |
| LIMIT | | | | | | | | | | | | | | | | RES0 | | | | | | PMFZ | RES0 | FM | E | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | | |

LIMIT, bits [63:12]

Limit address. PMBLIMITR_EL1.LIMIT:Zeros(12) is the address of the first byte in memory after the last byte in the profiling buffer. If the smallest implemented translation granule is not 4KB, then bits[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value, $\text{Log}_2(\text{smallest implemented translation granule})$.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:6]

Reserved, RES0.

PMFZ, bit [5]

When FEAT_SPEv1p2 is implemented:

Freeze PMU on SPE event. Stop PMU event counters when [PMBSR_EL1.S](#) == 1.

| PMFZ | Meaning |
|------|--|
| 0b0 | Do not freeze PMU event counters on Statistical Profiling Buffer Management event. |
| 0b1 | Freeze PMU event counters on Statistical Profiling Buffer Management event. |

The PMU event counters affected by this control is controlled by [PMCR_EL0.FZS](#) and, if EL2 is implemented, [MDCR_EL2.HPMFZS](#). See the descriptions of these control bits for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

FM, bits [2:1]

Fill mode.

| FM | Meaning | Applies when |
|------|--|----------------------------------|
| 0b00 | Fill mode. Stop collection and raise maintenance interrupt on buffer fill. | |
| 0b10 | Discard mode. All output is discarded. | When FEAT_SPEv1p2 is implemented |

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Profiling Buffer enable

| E | Meaning |
|-----|---------------------------|
| 0b0 | All output is discarded. |
| 0b1 | Profiling buffer enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

PMBPTR_EL1, Profiling Buffer Write Pointer Register

The PMBPTR_EL1 characteristics are:

Purpose

Defines the current write pointer for the profiling buffer.

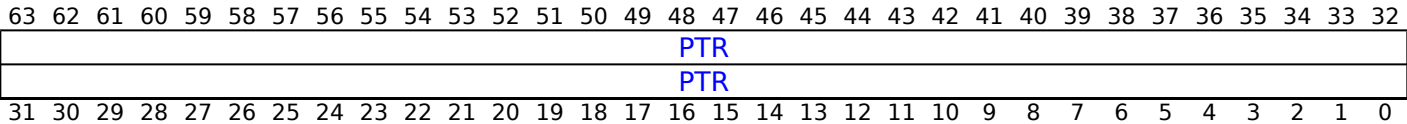

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBPTR_EL1 are UNDEFINED.

Attributes

PMBPTR_EL1 is a 64-bit register.

Field descriptions

PTR, bits [63:0]

Current write address. Defines the virtual address of the next entry to be written to the buffer.

The architecture places restrictions on the values software can write to the pointer. For more information see 'Restrictions on the current write pointer'.

Note

As a result, an implementation might treat some of bits[M:0], where M is defined by [PMBIDR_EL1](#).Align, as RES0.

- On a management interrupt, PMBPTR_EL1 is frozen.
- The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMBPTR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBPTR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b1001 | 0b1010 | 0b001 |

PMBSR_EL1, Profiling Buffer Status/syndrome Register

The PMBSR_EL1 characteristics are:

Purpose

Provides syndrome information to software when the buffer is disabled because the management interrupt has been raised.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBSR_EL1 are UNDEFINED.

Attributes

PMBSR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

| EC | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| EC | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

EC, bits [31:26]

Exception class

Top-level description of the cause of the buffer management event

| EC | Meaning | MSS | Applies when |
|----------|--|---|------------------------------|
| 0b000000 | Other buffer management event. All buffer management events other than those described by other defined Exception class codes. | MSS encoding for other buffer management events | |
| 0b011110 | Granule Protection Check fault, other than GPF, on write to Profiling Buffer. | MSS encoding for Granule Protection Check fault | When FEAT_RME is implemented |
| 0b011111 | Buffer management event for an IMPLEMENTATION DEFINED reason. | MSS encoding for a buffer management event for an IMPLEMENTATION DEFINED reason | |
| 0b100100 | Stage 1 Data Abort on write to Profiling Buffer. | MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer | |
| 0b100101 | Stage 2 Data Abort on write to Profiling Buffer. | MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer | |

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:20]

Reserved, RES0.

DL, bit [19]

Partial record lost.

Following a buffer management event other than an asynchronous External abort, indicates whether the last record written to the Profiling Buffer is complete.

| DL | Meaning |
|-----|--|
| 0b0 | PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer. |
| 0b1 | Part of a record was lost because of a buffer management event or synchronous External abort. PMBPTR_EL1 might not point to the first byte after the last complete record written to the buffer, and so restarting collection might result in a data record stream that software cannot parse. All records prior to the last record have been written to the buffer. |

When the buffer management event was because of an asynchronous External abort, this bit is set to 1 and software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if the PE never sets this bit as a result of a buffer management event caused by an asynchronous External abort.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [18]

External abort.

| EA | Meaning |
|-----|--|
| 0b0 | An External abort has not been asserted. |
| 0b1 | An External abort has been asserted and detected by the Statistical Profiling Extension. |

This bit is RES0 if the PE never sets this bit as the result of an External abort.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [17]

Service

| S | Meaning |
|-----|--|
| 0b0 | PMBIRQ is not asserted. |
| 0b1 | PMBIRQ is asserted. All profiling data has either been written to the buffer or discarded. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COLL, bit [16]

Collision detected.

| COLL | Meaning |
|------|--|
| 0b0 | No collision events detected. |
| 0b1 | At least one collision event was recorded. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS, bits [15:0]

Management Event Specific Syndrome.

Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for stage 1 or stage 2 Data Aborts on write to buffer

Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

| FSC | Meaning | Applies when |
|------------|---|--|
| 0b000000 | Address size fault, level 0 of translation or translation table base register. | |
| 0b000001 | Address size fault, level 1. | |
| 0b000010 | Address size fault, level 2. | |
| 0b000011 | Address size fault, level 3. | |
| 0b000100 | Translation fault, level 0. | |
| 0b000101 | Translation fault, level 1. | |
| 0b000110 | Translation fault, level 2. | |
| 0b000111 | Translation fault, level 3. | |
| 0b001001 | Access flag fault, level 1. | |
| 0b001010 | Access flag fault, level 2. | |
| 0b001011 | Access flag fault, level 3. | |
| 0b001000 | Access flag fault, level 0. | When FEAT_LPA2 is implemented |
| 0b001100 | Permission fault, level 0. | When FEAT_LPA2 is implemented |
| 0b001101 | Permission fault, level 1. | |
| 0b001110 | Permission fault, level 2. | |
| 0b001111 | Permission fault, level 3. | |
| 0b010000 | Synchronous External abort, not on translation table walk or hardware update of translation table. | |
| 0b010001 | Asynchronous External abort. | |
| 0b010011 | Synchronous External abort on translation table walk or hardware update of translation table, level -1. | When FEAT_LPA2 is implemented |
| 0b010100 | Synchronous External abort on translation table walk or hardware update of translation table, level 0. | |
| 0b010101 | Synchronous External abort on translation table walk or hardware update of translation table, level 1. | |
| 0b010110 | Synchronous External abort on translation table walk or hardware update of translation table, level 2. | |
| 0b010111 | Synchronous External abort on translation table walk or hardware update of translation table, level 3. | |
| 0b011011 | Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1. | When FEAT_LPA2 is implemented and FEAT_RAS is not implemented |
| 0b100001 | Alignment fault. | |
| 0b100011 | Granule Protection Fault on translation table walk or hardware update of translation table, level -1. | When FEAT_RME is implemented and FEAT_LPA2 is implemented |
| 0b100100 | Granule Protection Fault on translation table walk or hardware update of translation table, level 0. | When FEAT_RME is implemented |
| 0b100101 | Granule Protection Fault on translation table walk or hardware update of translation table, level 1. | When FEAT_RME is implemented |

| | | |
|----------|--|---------------------------------|
| 0b100110 | Granule Protection Fault on translation table walk or hardware update of translation table, level 2. | When FEAT_RME is implemented |
| 0b100111 | Granule Protection Fault on translation table walk or hardware update of translation table, level 3. | When FEAT_RME is implemented |
| 0b101000 | Granule Protection Fault, not on translation table walk or hardware update of translation table. | When FEAT_RME is implemented |
| 0b101001 | Address size fault, level -1. | When FEAT_LPA2 is implemented |
| 0b101011 | Translation fault, level -1. | When FEAT_LPA2 is implemented |
| 0b110000 | TLB conflict abort. | |
| 0b110001 | Unsupported atomic hardware update fault. | When FEAT_HAFDBS is implemented |

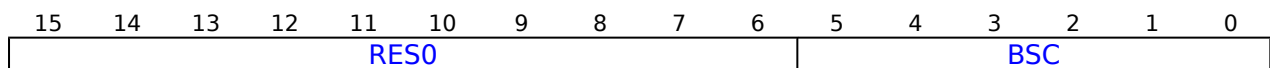

All other values are reserved.

It is IMPLEMENTATION DEFINED whether each of the Access Flag fault, asynchronous External abort and synchronous External abort, Alignment fault, and TLB Conflict abort values can be generated by the PE. For more information see 'Faults and Watchpoints'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for other buffer management events

Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Buffer status code

| BSC | Meaning |
|----------|-------------------|
| 0b000000 | Buffer not filled |
| 0b000001 | Buffer filled |

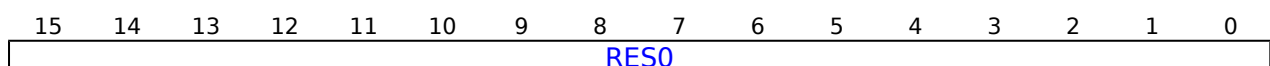

All other values are reserved. Reserved values might be defined in a future version of the architecture.

Writing a reserved value to this field will make the value of this field UNKNOWN. Values that are not supported act as reserved values when writing to this register.

The reset behavior of this field is:

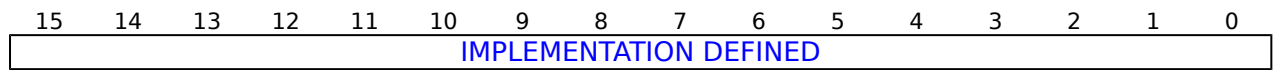

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check fault

Bits [15:0]

Reserved, RES0.

MSS encoding for a buffer management event for an IMPLEMENTATION DEFINED reason**IMPLEMENTATION DEFINED, bits [15:0]**

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR_EL0](#), increments.

Configuration

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCCFILTR\[31:0\]](#).

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to External register [PMCCFILTR_EL0\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are UNDEFINED.

Attributes

PMCCFILTR_EL0 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMCCFILTR_EL0.RLK bit.

| P | Meaning |
|-----|-----------------------------|
| 0b0 | Count cycles in EL1. |
| 0b1 | Do not count cycles in EL1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMCCFILTR_EL0.RLU bit.

| U | Meaning |
|-----|-----------------------------|
| 0b0 | Count cycles in EL0. |
| 0b1 | Do not count cycles in EL0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMCCFILTR_EL0.RLH bit.

| NSH | Meaning |
|-----|-----------------------------|
| 0b0 | Do not count cycles in EL2. |
| 0b1 | Count cycles in EL2. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]

When FEAT_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is disabled, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

T, bit [23]

When FEAT_TME is implemented:

Non-transactional state filtering bit.

| T | Meaning |
|-----|---|
| 0b0 | This bit has no effect on filtering of cycles. |
| 0b1 | Do not count cycles in Non-transactional state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]**When FEAT_RME is implemented:**

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Realm EL1 are counted.

Otherwise, cycles in Realm EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]**When FEAT_RME is implemented:**

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Realm EL0 are counted.

Otherwise, cycles in Realm EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]**When FEAT_RME is implemented:**

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Realm EL2 are counted.

Otherwise, cycles in Realm EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0

PMCCFILTR_EL0 can also be accessed by using [PMXEVTYPER_EL0](#) with [PMSELR_EL0.SEL](#) set to 0b11111.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCCFILTR_EL0

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b011 | 0b1110 | 0b1111 | 0b111 |

```

PMCCNTR_EL0, Performance Monitors Cycle Count Register

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' for more information.

[PMCCFILTER_EL0](#) determines the modes and states in which the PMCCNTR_EL0 can increment.

Configuration

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register [PMCCNTR\[63:0\]](#).

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to External register [PMCCNTR_EL0\[63:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCCNTR_EL0 are UNDEFINED.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR_EL0 continues to increment when clocks are stopped by WFI and WFE instructions.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

CCNT, bits [63:0]

Cycle count. Depending on the values of [PMCR_EL0](#).{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR_EL0](#).C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCCNTR_EL0

| op0 | op1 | CRn | CRm | op2 |

PMCEID0_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0_EL0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F.

For more information about the Common events and the use of the PMCEID<n>_EL0 registers see 'The PMU event number space and common events'.

Configuration

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID0\[31:0\]](#).

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to AArch32 System register [PMCEID2\[31:0\]](#).

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to External register [PMCEID0\[31:0\]](#).

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to External register [PMCEID2\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCEID0_EL0 are UNDEFINED.

Attributes

PMCEID0_EL0 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | |
|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 |
| IDhi31 | IDhi30 | IDhi29 | IDhi28 | IDhi27 | IDhi26 | IDhi25 | IDhi24 | IDhi23 | IDhi22 | IDhi21 | IDhi20 | IDhi19 | IDhi18 | IDhi17 | IDhi16 | IDhi15 |
| ID31 | ID30 | ID29 | ID28 | ID27 | ID26 | ID25 | ID24 | ID23 | ID22 | ID21 | ID20 | ID19 | ID18 | ID17 | ID16 | ID15 |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 |

IDhi<n>, bit [n+32], for n = 31 to 0

When FEAT_PMUv3p1 is implemented:

IDhi[n] corresponds to Common event (0x4000 + n).

For each bit:

| IDhi<n> | Meaning |
|---------|--|
| 0b0 | The Common event is not implemented, or not counted. |
| 0b1 | The Common event is implemented. |

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

| ID<n> | Meaning |
|-------|--|
| 0b0 | The Common event is not implemented, or not counted. |
| 0b1 | The Common event is implemented. |

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event (0x0020 + n).

For each bit:

| ID<n> | Meaning |
|-------|--|
| 0b0 | The Common event is not implemented, or not counted. |
| 0b1 | The Common event is implemented. |

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Accessing PMCEID1_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCEID1_EL0

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b011 | 0b1001 | 0b1100 | 0b111 |

```

PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

Purpose

Disables the Cycle Count Register, [PMCCNTR_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

Configuration

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENCLR\[31:0\]](#).

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to External register [PMCNTENCLR_EL0\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCNTENCLR_EL0 are UNDEFINED.

Attributes

PMCNTENCLR_EL0 is a 64-bit register.

Bits [63:32]

Reserved, RES0.

C, bit [31]

[PMCCNTR_EL0](#) disable bit. Disables the cycle counter register. Possible values are:

| C | Meaning |
|-----|--|
| 0b0 | When read, means the cycle counter is disabled. When written, has no effect. |
| 0b1 | When read, means the cycle counter is enabled. When written, disables the cycle counter. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN. Otherwise, N is the value in [PMCR_EL0](#).N.

| P<n> | Meaning |
|-------------------|---|
| 0b0 | When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect. |
| 0b1 | When read, means that PMEVCNTR<n>_EL0 is enabled. When written, disables PMEVCNTR<n>_EL0 . |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

AArch64 System register PMCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCR\[31:0\]](#).

AArch64 System register PMCR_EL0 bits [7:0] are architecturally mapped to External register [PMCR_EL0\[7:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMCR_EL0 are UNDEFINED.

Attributes

PMCR_EL0 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|----|----|----|----|------|-----|------|----|----|----|----|----|----|----|----|----|-----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | FZS |

Bits [63:33]

Reserved, RES0.

FZS, bit [32]

When FEAT_SPEv1p2 is implemented:

Freeze-on-SPE event. Stop counters when [PMBLIMITR_EL1](#).{PMFZ,E} == {1,1} and [PMBSR_EL1](#).S == 1.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

| FZS | Meaning |
|-----|---|
| 0b0 | Do not freeze on Statistical Profiling Buffer Management event. |
| 0b1 | Event counter PMEVCNTR<n>_EL0 does not count following a Statistical Profiling Buffer Management event if n is in the range of affected event counters. |

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and [PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset:
 - When AArch32 is supported, this field resets to 0.
 - When the implementation only supports execution in AArch64 state, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMP, bits [31:24]

When FEAT_PMUv3p7 is not implemented:

Implementer code.

If this field is zero, then PMCR_EL0.IDCODE is RES0 and software must use [MIDR_EL1](#) to identify the PE.

Otherwise, this field and PMCR_EL0.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A non-zero value has the same interpretation as [MIDR_EL1](#).Implementer.

Use of this field is deprecated.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RAZ.

IDCODE, bits [23:16]

When PMCR_EL0.IMP != 0b00000000:

Identification code. Use of this field is deprecated.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of 0b000000-0b11111. If the value is 0b000000, then only [PMCCNTR_EL0](#) is implemented. If the value is 0b11111, then [PMCCNTR_EL0](#) and 31 event counters are implemented.

When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the value of [MDCR_EL2](#).HPMN.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bit [10]

Reserved, RES0.

FZO, bit [9]**When FEAT_PMUv3p7 is implemented:**

Freeze-on-overflow. Stop event counters on overflow.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

| FZO | Meaning |
|------------|---|
| 0b0 | Do not freeze on overflow. |
| 0b1 | Event counter PMEVCNTR<n>_EL0 does not count when PMOVSCLR_EL0 [(PMN-1):0] is nonzero and n is in the range of affected event counters. |

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and [PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]**When FEAT_PMUv3p5 is implemented:**

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

| LP | Meaning |
|-----------|--|
| 0b0 | Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [31:0]. |
| 0b1 | Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [63:0]. |

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and [PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LC, bit [6]**When AArch32 is supported:**

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

| LC | Meaning |
|-----|--|
| 0b0 | Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0 [31:0]. |
| 0b1 | Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0 [63:0]. |

Arm deprecates use of [PMCR_EL0](#).LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]**When EL3 is implemented or (FEAT_PMuV3p1 is implemented and EL2 is implemented):**

Disable cycle counter when event counting is prohibited.

| DP | Meaning |
|-----|---|
| 0b0 | Cycle counting by PMCCNTR_EL0 is not affected by this mechanism. |
| 0b1 | Cycle counting by PMCCNTR_EL0 is disabled in prohibited regions: <ul style="list-style-type: none"> If FEAT_PMuV3p1 is implemented, EL2 is implemented, and MDCR_EL2.HPMD is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL2. If FEAT_PMuV3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL3. If EL3 is implemented, MDCR_EL3.SPME is 0, and either FEAT_PMuV3p7 is not implemented or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR_EL0 is disabled at EL3 and in Secure state. <p>If MDCR_EL2.HPMN is not 0, this is when event counting by event counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited.</p> |

For more information see 'Prohibiting event counting'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

| X | Meaning |
|-----|-------------------------------------|
| 0b0 | Do not export events. |
| 0b1 | Export events where not prohibited. |

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]

When AArch32 is supported:

Clock divider.

| D | Meaning |
|-----|--|
| 0b0 | When enabled, PMCCNTR_EL0 counts every clock cycle. |
| 0b1 | When enabled, PMCCNTR_EL0 counts once every 64 clock cycles. |

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

| C | Meaning |
|-----|--|
| 0b0 | No action. |
| 0b1 | Reset PMCCNTR_EL0 to zero. |

Note

Resetting [PMCCNTR_EL0](#) does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is **WO/RAZ**.

P, bit [1]

Event counter reset.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

| P | Meaning |
|-----|---|
| 0b0 | No action. |
| 0b1 | If n is in the range of affected event counters, resets each event counter PMEVCNTR<n> to zero. |

The effects of writing to this bit are:

- If EL2 is implemented and enabled in the current Security state, in EL0 and EL1, if PMN is not 0, a write of 1 to this bit resets event counters in the range [0 .. (PMN-1)].
- If EL2 is disabled in the current Security state, a write of 1 to this bit resets all the event counters.
- In EL2 and EL3, a write of 1 to this bit resets all the event counters.
- This field does not affect the operation of other event counters and [PMCCNTR_EL0](#).

Note

Resetting the event counters does not change the event counter overflow bits. If FEAT_PMUv3p5 is implemented, the values of [MDCR_EL2](#).HLP and PMCR_EL0.LP are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

E, bit [0]

Enable.

If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.

If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.

If EL2 is not implemented, PMN is PMCR_EL0.N.

| E | Meaning |
|-----|--|
| 0b0 | PMCCNTR_EL0 is disabled and event counters PMEVCNTR<n>_EL0 , where n is in the range of affected event counters, are disabled. |
| 0b1 | PMCCNTR_EL0 and event counters PMEVCNTR<n>_EL0 , where n is in the range of affected event counters, are enabled by PMCNTENSET_EL0 . |

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMCR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCR_EL0

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b011 | 0b1001 | 0b1100 | 0b000 |

```

PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVCNTR<n>\[31:0\]](#).

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to External register [PMEVCNTR<n>_EL0\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVCNTR<n>_EL0 are UNDEFINED.

Attributes

PMEVCNTR<n>_EL0 is a 64-bit register.

Field descriptions

When FEAT_PMUv3p5 is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

Bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Event counter n | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>_EL0

PMEVCNTR<n>_EL0 can also be accessed by using [PMXEVCNTR_EL0](#) with [PMSELR_EL0](#).SEL set to the value of <n>.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMEVCNTR<n>_EL0](#) is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of [PMEVCNTR<n>_EL0](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR_EL0](#).{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, [MDCR_EL2](#).HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [MDCR_EL2](#).HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMEVCNTR<n>_EL0

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|-------------|--------|
| 0b11 | 0b011 | 0b1110 | 0b10:n[4:3] | n[2:0] |

```

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVTYPER<n>\[31:0\]](#).

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to External register [PMEVTYPER<n>_EL0\[31:0\]](#).

AArch64 System register PMEVTYPER<n>_EL0 bits [63:32] are architecturally mapped to External register [PMEVFILTR<n>\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are UNDEFINED.

Attributes

PMEVTYPER<n>_EL0 is a 64-bit register.

TC, bits [63:61]

When FEAT_PMUv3_TH is implemented:

Threshold Control. Defines the threshold function. In the description of this field, the value V is the value the event specified by PMEVTYPER<n>_EL0 would increment the counter by on a processor cycle if the threshold function is disabled. Comparisons treat V and PMEVTYPER<n>_EL0.TH as unsigned integer values.

| TC | Meaning |
|-------|--|
| 0b000 | Not-equal. The counter increments by V on each processor cycle when V is not equal to PMEVTYPER<n>_EL0.TH. If PMEVTYPER<n>_EL0.TH is zero, the threshold function is disabled. |
| 0b001 | Not-equal, count. The counter increments by 1 on each processor cycle when V is not equal to PMEVTYPER<n>_EL0.TH. |
| 0b010 | Equals. The counter increments by V on each processor cycle when V is equal to PMEVTYPER<n>_EL0.TH. |
| 0b011 | Equals, count. The counter increments by 1 on each processor cycle when V is equal to PMEVTYPER<n>_EL0.TH. |
| 0b100 | Greater-than-or-equal. The counter increments by V on each processor cycle when V is PMEVTYPER<n>_EL0.TH or more. |
| 0b101 | Greater-than-or-equal, count. The counter increments by 1 on each processor cycle when V is PMEVTYPER<n>_EL0.TH or more. |
| 0b110 | Less-than. The counter increments by V on each processor cycle when V is less than PMEVTYPER<n>_EL0.TH. |
| 0b111 | Less-than, count. The counter increments by 1 on each processor cycle when V is less than PMEVTYPER<n>_EL0.TH. |

The reset behavior of this field is:

- On a Warm reset:
 - When AArch32 is supported, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [60:44]

Reserved, RES0.

TH, bits [43:32]

When FEAT_PMUv3_TH is implemented:

Threshold value. Provides the unsigned value for the threshold function defined by PMEVTYPER<n>_EL0.TC.

If PMEVTYPER<n>_EL0.TC is 0b000 and PMEVTYPER<n>_EL0.TH is zero, then the threshold function is disabled.

If [PMMIR_EL1](#).THWIDTH is less than 12, then bits PMEVTYPER<n>_EL0.TH[11:[PMMIR_EL1](#).THWIDTH] are RES0. This accounts for the behavior when writing a value greater-than-or-equal-to $2^{(\text{PMMIR_EL1.THWIDTH})}$.

The reset behavior of this field is:

- On a Warm reset:
 - When AArch32 is supported, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMEVTYPER<n>_EL0.RLK bit.

| P | Meaning |
|----------|-----------------------------|
| 0b0 | Count events in EL1. |
| 0b1 | Do not count events in EL1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMEVTYPER<n>_EL0.RLU bit.

| U | Meaning |
|----------|-----------------------------|
| 0b0 | Count events in EL0. |
| 0b1 | Do not count events in EL0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]**When EL2 is implemented:**

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If Secure EL2 is implemented, and EL3 is implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMEVTYPER<n>_EL0.RLH bit.

| NSH | Meaning |
|-----|-----------------------------|
| 0b0 | Do not count events in EL2. |
| 0b1 | Count events in EL2. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]**When EL3 is implemented:**

EL3 filtering bit.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in EL3 are counted.

Otherwise, events in EL3 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]**When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:**

Multithreading.

| MT | Meaning |
|-----|--|
| 0b0 | Count events only on controlling PE. |
| 0b1 | Count events from any PE with the same affinity at level 1 and above as this PE. |

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this field is RES0. See [ID_AA64DFR0_EL1](#).MTPMU.

This field is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and Disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]**When FEAT_SEL2 is implemented and EL3 is implemented:**

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

T, bit [23]**When FEAT_TME is implemented:**

Transactional state filtering bit. Controls counting in Transactional state.

| T | Meaning |
|----------|--|
| 0b0 | This bit has no effect on the filtering of events. |
| 0b1 | Do not count events in Transactional state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]**When FEAT_RME is implemented:**

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Realm EL1 are counted.

Otherwise, events in Realm EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]**When FEAT_RME is implemented:**

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Realm EL0 are counted.

Otherwise, events in Realm EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]**When FEAT_RME is implemented:**

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Realm EL2 are counted.

Otherwise, events in Realm EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]**When FEAT_PMUv3p1 is implemented:**

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter [PMEVCNTR<n>_EL0](#).

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.

Otherwise, if PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range 0x4000 to 0x403F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that for all values that represent reserved or unsupported events, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>_EL0

PMEVTYPER<n>_EL0 can also be accessed by using [PMXEVTYPER_EL0](#) with [PMSELR_EL0.SEL](#) set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMEVTYPER<n>_EL0](#) is as follows:

- If <n> is an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of [PMEVTYPER<n>_EL0](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR_EL0.EN](#).

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, [MDCR_EL2.HPMN](#) identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [MDCR_EL2.HPMN](#).

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMEVTYPER<n>_EL0

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|-------------|--------|
| 0b11 | 0b011 | 0b1110 | 0b11:n[4:3] | n[2:0] |

PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR_EL0](#), and the event counters [PMEVCNTR<n>_EL0](#). Reading the register shows which overflow interrupt requests are enabled.

Configuration

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENCLR\[31:0\]](#).

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to External register [PMINTENCLR_EL1\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR_EL1 are UNDEFINED.

Attributes

PMINTENCLR_EL1 is a 64-bit register.

Bits [63:32]

Reserved, RES0.

C, bit [31]

[PMCCNTR_EL0](#) overflow interrupt request disable bit. Possible values are:

| C | Meaning |
|-----|--|
| 0b0 | When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect. |
| 0b1 | When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request. |

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1, N is the value in [MDCR_EL2](#).HPMN. Otherwise, N is the value in [PMCR_EL0](#).N.

| P<n> | Meaning |
|------|---|
| 0b0 | When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect. |
| 0b1 | When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR<n>_EL0 interrupt request. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENCLR_EL1

PMMIR_EL1, Performance Monitors Machine Identification Register

The PMMIR_EL1 characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation to software.

Configuration

This register is present only when FEAT_PMuV3p4 is implemented. Otherwise, direct accesses to PMMIR_EL1 are UNDEFINED.

Attributes

PMMIR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|---------|----|----|----|-----------|----|----|----|-----------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | THWIDTH | | | | BUS_WIDTH | | | | BUS_SLOTS | | | | | | | | SLOTS | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:24]

Reserved, RES0.

THWIDTH, bits [23:20]

[PMEVTYPER<n>_EL0](#).TH width. Indicates implementation of the FEAT_PMuV3_TH feature, and, if implemented, the size of the [PMEVTYPER<n>_EL0](#).TH field.

| THWIDTH | Meaning |
|---------|--|
| 0b0000 | FEAT_PMuV3_TH is not implemented. |
| 0b0001 | 1 bit. PMEVTYPER<n>_EL0 .TH[11:1] are RES0. |
| 0b0010 | 2 bits. PMEVTYPER<n>_EL0 .TH[11:2] are RES0. |
| 0b0011 | 3 bits. PMEVTYPER<n>_EL0 .TH[11:3] are RES0. |
| 0b0100 | 4 bits. PMEVTYPER<n>_EL0 .TH[11:4] are RES0. |
| 0b0101 | 5 bits. PMEVTYPER<n>_EL0 .TH[11:5] are RES0. |
| 0b0110 | 6 bits. PMEVTYPER<n>_EL0 .TH[11:6] are RES0. |
| 0b0111 | 7 bits. PMEVTYPER<n>_EL0 .TH[11:7] are RES0. |
| 0b1000 | 8 bits. PMEVTYPER<n>_EL0 .TH[11:8] are RES0. |
| 0b1001 | 9 bits. PMEVTYPER<n>_EL0 .TH[11:9] are RES0. |
| 0b1010 | 10 bits. PMEVTYPER<n>_EL0 .TH[11:10] are RES0. |
| 0b1011 | 11 bits. PMEVTYPER<n>_EL0 .TH[11] is RES0. |
| 0b1100 | 12 bits. |

All other values are reserved.

If FEAT_PMuV3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to [PMEVTYPER<n>_EL0](#).TH is $2^{(\text{PMMIR_EL1.THWIDTH})}$ minus one.

Access to this field is **RO**.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as $\text{Log}_2(\text{number of bytes})$, plus one. Defined values are:

| BUS_WIDTH | Meaning |
|------------------|-----------------------------------|
| 0b0000 | The information is not available. |
| 0b0011 | Four bytes. |
| 0b0100 | 8 bytes. |
| 0b0101 | 16 bytes. |
| 0b0110 | 32 bytes. |
| 0b0111 | 64 bytes. |
| 0b1000 | 128 bytes. |
| 0b1001 | 256 bytes. |
| 0b1010 | 512 bytes. |
| 0b1011 | 1024 bytes. |
| 0b1100 | 2048 bytes. |

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

Access to this field is **RO**.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMMIR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMMIR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b11 | 0b000 | 0b1001 | 0b1110 | 0b110 |

```

PMOVSLR_EL0, Performance Monitors Overflow Flag Status Clear Register

The PMOVSLR_EL0 characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

Configuration

AArch64 System register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSRI\[31:0\]](#).

AArch64 System register PMOVSLR_EL0 bits [31:0] are architecturally mapped to External register [PMOVSLR_EL0\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSLR_EL0 are UNDEFINED.

Attributes

PMOVSLR_EL0 is a 64-bit register.

Bits [63:32]

Reserved, RES0.

C, bit [31]

Cycle counter overflow clear bit.

| C | Meaning |
|-----|--|
| 0b0 | When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect. |
| 0b1 | When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0. |

[PMCR_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow clear bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are RAZ/WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2.HPMN](#). Otherwise, N is the value in [PMCR_EL0.N](#).

| P<n> | Meaning |
|-------------------|---|
| 0b0 | When read, means that PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect. |
| 0b1 | When read, means that PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, clears the PMEVCNTR<n>_EL0 overflow bit to 0. |

If FEAT_PMUv3p5 is implemented, [MDCR_EL2.HLP](#) and [PMCR_EL0.LP](#) control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>_EL0](#)[31:0] or unsigned overflow of [PMEVCNTR<n>_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMSCR_EL1, Statistical Profiling Control Register (EL1)

The PMSCR_EL1 characteristics are:

Purpose

Provides EL1 controls for Statistical Profiling.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSCR_EL1 are UNDEFINED.

Attributes

PMSCR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| RES0 | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | PCT | TS | PA | CX | RES0 | E1SPE | E0SPE | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:8]

Reserved, RES0.

PCT, bits [7:6]

When EL2 is implemented:

Physical Timestamp. If timestamp sampling is enabled and the Profiling Buffer is owned by EL1, requests which timestamp counter value is collected.

If FEAT_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.

| PCT | Meaning | Applies when |
|------|--|------------------------------|
| 0b00 | Virtual timestamp. The collected timestamp is the physical counter minus the value of CNTVOFF_EL2 . | |
| 0b01 | Physical timestamp. The collected timestamp is the physical counter. | |
| 0b11 | Guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2 : <ul style="list-style-type: none"> SCR_EL3.ECVEn == 0. CNTHCTL_EL2.ECV == 0. | When FEAT_ECV is implemented |

If EL2 is enabled in the current Security state, then the value of [PMSCR_EL2](#).PCT might override or modify the meaning of this field.

This field is ignored by the PE when the Profiling Buffer owning Exception level is EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Physical Timestamp. Reserved. This field reads as 0b01 and ignores writes. Software should treat this field as UNK/SBZP.

When EL2 is not implemented, the Effective values of [CNTVOFF_EL2](#) and [CNTPOFF_EL2](#) are zero, meaning the virtual counter and physical counter have the same value.

TS, bit [5]

Timestamp enable.

| TS | Meaning |
|-----|------------------------------|
| 0b0 | Timestamp sampling disabled. |
| 0b1 | Timestamp sampling enabled. |

This bit is ignored by the PE if EL2 is implemented and the Profiling Buffer is owned by EL2. For more information, see 'Controlling the data that is collected'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PA, bit [4]

Physical Address sample enable.

| PA | Meaning |
|-----|---------------------------------------|
| 0b0 | Physical addresses are not collected. |
| 0b1 | Physical addresses are collected. |

If EL2 is implemented:

- If the Profiling Buffer is owned by EL1, this bit is combined with [PMSCR_EL2.PA](#) to determine which address is collected. For more information, see 'Controlling the data that is collected'.
- If the Profiling Buffer is owned by EL2, this bit is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CX, bit [3]

[CONTEXTIDR_EL1](#) sample enable.

| CX | Meaning |
|-----|--|
| 0b0 | CONTEXTIDR_EL1 is not collected. |
| 0b1 | CONTEXTIDR_EL1 is collected. |

If EL2 is implemented and enabled in the current Security state when an operation is sampled:

- If the PE is at EL2, this bit is ignored by the PE.
- If [HCR_EL2.TGE](#) == 1, this bit is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E1SPE, bit [1]

EL1 Statistical Profiling Enable.

| E1SPE | Meaning |
|--------------|---------------------------|
| 0b0 | Sampling disabled at EL1. |
| 0b1 | Sampling enabled at EL1. |

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when [HCR_EL2.TGE](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E0SPE, bit [0]

EL0 Statistical Profiling Enable. Controls sampling at EL0 when [HCR_EL2.TGE](#) == 0 or if EL2 is disabled or not implemented.

| E0SPE | Meaning |
|--------------|---------------------------|
| 0b0 | Sampling disabled at EL0. |
| 0b1 | Sampling enabled at EL0. |

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when [HCR_EL2.TGE](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSCR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b11 | 0b000 | 0b1001 | 0b1001 | 0b000 |

```

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

Bits [63:8]

Reserved, RES0.

PCT, bits [7:6]

Physical Timestamp. If timestamp sampling is enabled, determines which counter is collected. The behavior depends on the Profiling Buffer owning Exception level.

If FEAT_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.

| PCT | Meaning | Applies when |
|------|--|------------------------------|
| 0b00 | <p>Virtual timestamp. The collected timestamp is the physical counter minus a virtual offset. If any of the following are true, the virtual offset is zero, otherwise the virtual offset is the value of CNTVOFF_EL2:</p> <ul style="list-style-type: none"> The sampled operation executed at EL2 and HCR_EL2.E2H == 1. The sampled operation executed at EL0 and HCR_EL2.{E2H,TGE} == {1,1}. <hr/> <p>Note If the Profiling Buffer owning Exception level is EL1, the virtual offset is always CNTVOFF_EL2.</p> | |
| 0b01 | <p>If the Profiling Buffer owning Exception level is EL1, then the timestamp value is selected by PMSCR_EL1.PCT. Otherwise, physical timestamp. The collected timestamp is the physical counter.</p> | |
| 0b11 | <p>If the Profiling Buffer owning Exception level is EL1 and PMSCR_EL1.PCT == 0b00, then guest virtual timestamp. The collected timestamp is the physical counter minus the value of CNTVOFF_EL2. Otherwise, guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2:</p> <ul style="list-style-type: none"> SCR_EL3.ECVEn == 0. CNTHCTL_EL2.ECV == 0. | When FEAT_ECV is implemented |

All other values are reserved.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 0b01, other than for a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TS, bit [5]

Timestamp Enable.

| TS | Meaning |
|-----|------------------------------|
| 0b0 | Timestamp sampling disabled. |
| 0b1 | Timestamp sampling enabled. |

This bit is ignored by the PE when any of the following are true:

- The Profiling Buffer owning Exception level is EL1.
- In Secure state, and either FEAT_SEL2 is not implemented or Secure EL2 is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PA, bit [4]

Physical Address Sample Enable.

| PA | Meaning |
|-----|---------------------------------------|
| 0b0 | Physical addresses are not collected. |
| 0b1 | Physical addresses are collected. |

If the Profiling Buffer owning Exception level is EL1, and EL2 is enabled in the current Security state, this bit is combined with [PMSCR_EL1.PA](#) to determine which address is collected.

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit and behaves as if this bit is set to 1, other than for a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CX, bit [3]

[CONTEXTIDR_EL2](#) Sample Enable.

| CX | Meaning |
|-----|--|
| 0b0 | CONTEXTIDR_EL2 is not collected. |
| 0b1 | CONTEXTIDR_EL2 is collected. |

If EL2 is not implemented or EL2 is disabled in the current Security state, the PE ignores the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E2SPE, bit [1]

EL2 Statistical Profiling Enable.

| E2SPE | Meaning |
|-------|---------------------------|
| 0b0 | Sampling disabled at EL2. |
| 0b1 | Sampling enabled at EL2. |

This bit is RES0 if [MDCR_EL2.E2PB](#) != 0b00.

If EL2 is disabled in the current Security state, this bit is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOHSPE, bit [0]

EL0 Statistical Profiling Enable.

| EOHSPE | Meaning |
|--------|---------------------------|
| 0b0 | Sampling disabled at EL0. |
| 0b1 | Sampling enabled at EL0. |

If [MDCR_EL2.E2PB](#) != 0b00, this bit is RES0.

If EL2 is implemented and enabled in the current Security state, this bit is ignored by the PE when [HCR_EL2.TGE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMSELR_EL0, Performance Monitors Event Counter Selection Register

The PMSELR_EL0 characteristics are:

Purpose

Selects the current event counter [PMEVCNTR<n>_EL0](#) or the cycle counter, CCNT.

PMSELR_EL0 is used in conjunction with [PMXEVTYPER_EL0](#) to determine the event that increments a selected event counter, and the modes and states in which the selected counter increments.

It is also used in conjunction with [PMXVCNTR_EL0](#), to determine the value of a selected event counter.

Configuration

AArch64 System register PMSELR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMSELR\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSELR_EL0 are UNDEFINED.

Attributes

PMSELR_EL0 is a 64-bit register.

Field descriptions

| RES0 | | | | | | | | | | | | | | | | SEL | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:5]

Reserved, RES0.

SEL, bits [4:0]

Selects event counter, [PMEVCNTR<n>_EL0](#), where n is the value held in this field. This value identifies which event counter is accessed when a subsequent access to [PMXEVTYPER_EL0](#) or [PMXVCNTR_EL0](#) occurs.

This field can take any value from 0 (0b000000) to (PMCR.N)-1, or 31 (0b111111).

When PMSELR_EL0.SEL is 0b111111, it selects the cycle counter and:

- A read of the [PMXEVTYPER_EL0](#) returns the value of [PMCCFILTR_EL0](#).
- A write of the [PMXEVTYPER_EL0](#) writes to [PMCCFILTR_EL0](#).
- A read or write of [PMXVCNTR_EL0](#) has CONSTRAINED UNPREDICTABLE effects. For more information, see [PMXVCNTR_EL0](#).

For more information about the results of accesses to the event counters, see [PMXEVTYPER_EL0](#) and [PMXVCNTR_EL0](#).

For more information about the number of counters accessible at each Exception level, see [MDCR_EL2](#).HPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSELR_EL0

Accesses to this register use the following encodings in the System register encoding space:

PMSEVFR_EL1, Sampling Event Filter Register

The PMSEVFR_EL1 characteristics are:

Purpose

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if E[3] and E[5] are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 set (TLB walk) are recorded.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSEVFR_EL1 are UNDEFINED.

Attributes

PMSEVFR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | |
|-------|-------|-------|-------|-------|-------|-------|-------|--------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | |
| E[63] | E[62] | E[61] | E[60] | E[59] | E[58] | E[57] | E[56] | E[55] | E[54] | E[53] | E[52] | E[51] | E[50] | E[49] | E[48] | | | | | | |
| E[31] | E[30] | E[29] | E[28] | E[27] | E[26] | E[25] | E[24] | RAZ/WI | | | | | E[18] | E[17] | E[16] | E[15] | E[14] | E[13] | E[12] | E[11] | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | |

E[<x>], bit [x], for x = 63 to 48, 31 to 24, 15 to 12

E[<x>] is the event filter for event <x>. If event <x> is not implemented, or filtering on event <x> is not supported, the corresponding bit is RAZ/WI.

| E[<x>] | Meaning |
|--------|---|
| 0b0 | Event <x> is ignored. |
| 0b1 | Do not record samples that have event <x> == 0. |

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, if the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when [PMSECR_EL1.FE](#) == 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:32]

Reserved, RAZ/WI.

Bits [23:19]

Reserved, RAZ/WI.

E[18], bit [18]

When FEAT_SPEv1p1 is implemented and FEAT_SVE is implemented:

Empty predicate.

| E[18] | Meaning |
|--------------|---|
| 0b0 | Empty predicate event is ignored. |
| 0b1 | Do not record samples that have the Empty predicate event == 0. |

This bit is ignored by the PE when [PMSFCR_EL1](#).FE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]

When FEAT_SPEv1p1 is implemented and FEAT_SVE is implemented:

Partial predicate.

| E[17] | Meaning |
|--------------|---|
| 0b0 | Partial predicate event is ignored. |
| 0b1 | Do not record samples that have the Partial predicate event == 0. |

This bit is ignored by the PE when [PMSFCR_EL1](#).FE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[16], bit [16]

When FEAT_TME is implemented:

Transactional

| E[16] | Meaning |
|--------------|---|
| 0b0 | Transactional event is ignored. |
| 0b1 | Do not record samples that have the Transactional event == 0. |

This bit is ignored by the PE when [PMSFCR_EL1](#).FE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[11], bit [11]

When FEAT_SPEv1p1 is implemented:

Alignment.

| E[11] | Meaning |
|--------------|---|
| 0b0 | Alignment event is ignored. |
| 0b1 | Do not record samples that have the Alignment event == 0. |

This bit is ignored by the PE when [PMSFCR_EL1](#).FE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [10:8]

Reserved, RAZ/WI.

E[7], bit [7]

Mispredicted.

| E[7] | Meaning |
|-------------|--|
| 0b0 | Mispredicted event is ignored. |
| 0b1 | Do not record samples that have the Mispredicted event == 0. |

This bit is ignored by the PE when [PMSFCR_EL1](#).FE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[6], bit [6]

When FEAT_SPEv1p2 is implemented:

Not taken.

| E[6] | Meaning |
|-------------|---|
| 0b0 | Not taken event is ignored. |
| 0b1 | Do not record samples that have the Not taken event == 0. |

This field is ignored by the PE when [PMSFCR_EL1](#).FE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[5], bit [5]

TLB walk.

| E[5] | Meaning |
|-------------|--|
| 0b0 | TLB walk event is ignored. |
| 0b1 | Do not record samples that have the TLB walk event == 0. |

This bit is ignored by the PE when [PMSFCR_EL1](#).FE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RAZ/WI.

E[3], bit [3]

Level 1 data or unified cache refill.

| E[3] | Meaning |
|-------------|--|
| 0b0 | Level 1 data or unified cache refill event is ignored. |
| 0b1 | Do not record samples that have the Level 1 data or unified cache refill event == 0. |

This bit is ignored by the PE when [PMSFCR_EL1](#).FE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RAZ/WI.

E[1], bit [1]

When the PE supports sampling of speculative instructions:

Architecturally executed.

When the PE supports sampling of speculative instructions:

| E[1] | Meaning |
|-------------|--|
| 0b0 | Architecturally executed event is ignored. |
| 0b1 | Do not record samples that have the Architecturally executed event == 0. |

This bit is ignored by the PE when [PMSFCR_EL1](#).FE == 0.

If the PE does not support the sampling of speculative instructions, or always discards the sample record for speculative instructions, this bit reads as an UNKNOWN value and the PE ignores its value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, UNKNOWN.

Bit [0]

Reserved, RAZ/WI.

PMSFCR_EL1, Sampling Filter Control Register

The PMSFCR_EL1 characteristics are:

Purpose

Controls sample filtering. The filter is the logical AND of the FL, FT and FE bits. For example, if FE == 1 and FT == 1 only samples including the selected operation types and the selected events will be recorded

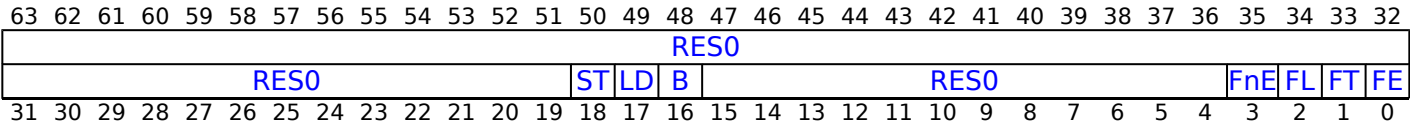

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSFCR_EL1 are UNDEFINED.

Attributes

PMSFCR_EL1 is a 64-bit register.

Field descriptions

Bits [63:19]

Reserved, RES0.

ST, bit [18]

Store filter enable

| ST | Meaning |
|-----|--|
| 0b0 | Do not record store operations |
| 0b1 | Record all store operations, including vector stores and all atomic operations |

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LD, bit [17]

Load filter enable

| LD | Meaning |
|-----|---|
| 0b0 | Do not record load operations |
| 0b1 | Record all load operations, including vector loads and atomic operations that return data |

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

B, bit [16]

Branch filter enable

| B | Meaning |
|-----|--|
| 0b0 | Do not record branch and exception return operations |
| 0b1 | Record all branch and exception return operations |

This bit is ignored by the PE when PMSFCR_EL1.FT == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:4]

Reserved, RES0.

FnE, bit [3]

When FEAT_SPEv1p2 is implemented:

Filter by event, inverted.

| FnE | Meaning |
|-----|---|
| 0b0 | Inverted event filtering disabled. |
| 0b1 | Inverted event filtering enabled. Samples including the events selected by PMSNEVFR_EL1 will not be recorded. |

If any of the following are true, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FnE == 0:

- PMSFCR_EL1.FnE == 1 and [PMSNEVFR_EL1](#) is zero.
- PMSFCR_EL1.FnE == 1, PMSFCR_EL1.FE == 1, and there exists a value x such that [PMSEVFR_EL1.E\[x\]](#) == 1 and [PMSNEVFR_EL1.E\[x\]](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FL, bit [2]

Filter by latency

| FL | Meaning |
|-----|--|
| 0b0 | Latency filtering disabled |
| 0b1 | Latency filtering enabled. Samples with a total latency less than PMSLATFR_EL1.MINLAT will not be recorded |

If this field is set to 1 and PMSLATFR_EL1.MINLAT is set to zero, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FL is set to 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FT, bit [1]

Filter by operation type. The filter is the logical OR of the ST, LD and B bits. For example, if LD and ST are both set, both load and store operations are recorded

| FT | Meaning |
|-----|--|
| 0b0 | Type filtering disabled |
| 0b1 | Type filtering enabled. Samples not one of the selected operation types will not be recorded |

If this field is set to 1 and the PMSFCR_EL1.{ST, LD, B} bits are all set to zero, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FT is set to 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FE, bit [0]

Filter by event.

| FE | Meaning |
|-----|---|
| 0b0 | Event filtering disabled. |
| 0b1 | Event filtering enabled. Samples not including the events selected by PMSEVFR_EL1 will not be recorded. |

If any of the following are true, it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FE == 0:

- PMSFCR_EL1.FE == 1 and [PMSEVFR_EL1](#) is zero.
- FEAT_SPEv1p2 is implemented, PMSFCR_EL1.FnE == 1, PMSFCR_EL1.FE == 1, and there exists a value x such that [PMSEVFR_EL1](#).E[x] == 1 and [PMSNEVER_EL1](#).E[x] == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMSICR_EL1, Sampling Interval Counter Register

The PMSICR_EL1 characteristics are:

Purpose

Software must write zero to PMSICR_EL1 before enabling sample profiling for a sampling session. Software must then treat PMSICR_EL1 as an opaque, 64-bit, read/write register used for context switches only.

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSICR_EL1 are UNDEFINED.

The value of PMSICR_EL1 does not change whilst profiling is disabled.

Attributes

PMSICR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ECOUNT | | | | | | | | RES0 | | | | | | | | | | | | | | | | | | | | | | | |
| COUNT | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ECOUNT, bits [63:56]

When PMSIDR_EL1.ERnd == 1:

Secondary sample interval counter.

This field provides the secondary counter used after the primary counter reaches zero. Whilst the secondary counter is nonzero and profiling is enabled, the secondary counter decrements by 1 for each member of the sample population. The primary counter also continues to decrement since it is also nonzero. When the secondary counter reaches zero, a member of the sampling population is selected for sampling.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [55:32]

Reserved, RES0.

COUNT, bits [31:0]

Primary sample interval counter

Provides the primary counter used for sampling.

The primary counter is reloaded when the value of this register is zero and the PE moves from a state or Exception level where profiling is disabled to a state or Exception level where profiling is enabled

Whilst the primary counter is nonzero and sampling is enabled, the primary counter decrements by 1 for each member of the sample population

When the counter reaches zero, the behavior depends on the values of PMSIDR_EL1.ERnd and PMSIRR_EL1.RND

- If [PMSIRR_EL1](#).RND == 0 or PMSIDR_EL1.ERnd == 0:
 - A member of the sampling population is selected for sampling
 - The primary counter is reloaded
- If [PMSIRR_EL1](#).RND == 1 and [PMSIDR_EL1](#).ERnd == 1:
 - The secondary counter is set to a random or pseudorandom value in the range 0x00 to 0xFF
 - The primary counter is reloaded

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMSIDR_EL1, Sampling Profiling ID Register

The PMSIDR_EL1 characteristics are:

Purpose

Describes the Statistical Profiling implementation to software

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSIDR_EL1 are UNDEFINED.

Attributes

PMSIDR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-----|--------|----|----|----|-----------|----|----|----|---------|----|----|----|----------|----|----|----|------|-----|------|-----|----------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | PBT | Format | | | | CountSize | | | | MaxSize | | | | Interval | | | | RES0 | FnE | ERnd | LDS | ArchInst | FL | FT | FE |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:25]

Reserved, RES0.

PBT, bit [24]

Previous branch target Address packet. Defined values are:

| PBT | Meaning |
|-----|--|
| 0b0 | Previous branch target Address packet not supported. |
| 0b1 | Previous branch target Address packet support implemented. |

FEAT_SPEv1p2 adds the OPTIONAL functionality identified by the value 1.

Format, bits [23:20]

From Armv8.7:

Defines the format of the sample records. Defined values are:

| Format | Meaning |
|--------|-----------|
| 0b0000 | Format 0. |

All other values are reserved.

Otherwise:

Reserved, RAZ.

CountSize, bits [19:16]

Defines the size of the counters.

| CountSize | Meaning | Applies when |
|-----------|-----------------------------|--------------|
| 0b0010 | 12-bit saturating counters. | |
| 0b0011 | 16-bit saturating counters. | From Armv8.8 |

All other values are reserved.

Access to this field is **RO**.

MaxSize, bits [15:12]

Defines the largest size for a single record, rounded up to a power-of-two. If this is the same as the minimum alignment ([PMBIDR_EL1.Align](#)), then each record is exactly this size. Defined values are:

| MaxSize | Meaning |
|---------|------------|
| 0b0100 | 16 bytes. |
| 0b0101 | 32 bytes. |
| 0b0110 | 64 bytes. |
| 0b0111 | 128 bytes. |
| 0b1000 | 256 bytes. |
| 0b1001 | 512 bytes. |
| 0b1010 | 1KB. |
| 0b1011 | 2KB. |

All other values are reserved.

The values 0b0100 and 0b0101 are not permitted for an implementation.

Access to this field is **RO**.

Interval, bits [11:8]

Recommended minimum sampling interval. This provides guidance from the implementer to the smallest minimum sampling interval, N. Defined values are:

| Interval | Meaning |
|----------|---------|
| 0b0000 | 256. |
| 0b0010 | 512. |
| 0b0011 | 768. |
| 0b0100 | 1,024. |
| 0b0101 | 1,536. |
| 0b0110 | 2,048. |
| 0b0111 | 3,072. |
| 0b1000 | 4,096. |

All other values are reserved.

Access to this field is **RO**.

Bit [7]

Reserved, RES0.

FnE, bit [6]

Filtering by events, inverted. Defined values are:

| FnE | Meaning |
|-----|--|
| 0b0 | PMSNEVFR_EL1 is not implemented and PMSFCR_EL1 .FnE is RES0. |
| 0b1 | PMSNEVFR_EL1 and PMSFCR_EL1 .FnE are implemented. |

FEAT_SPEv1p2 adds the functionality identified by the value 1.

ERnd, bit [5]

Defines how the random number generator is used in determining the interval between samples, when enabled by [PMSIRR_EL1](#).RND. Defined values are:

| ERnd | Meaning |
|------|--|
| 0b0 | The random number is added at the start of the interval, and the sample is taken and a new interval started when the combined interval expires. |
| 0b1 | The random number is added and the new interval started after the interval programmed in PMSIRR_EL1 .INTERVAL expires, and the sample is taken when the random interval expires. |

Access to this field is **RO**.

LDS, bit [4]

Data source indicator for sampled load instructions. Defined values are:

| LDS | Meaning |
|-----|-------------------------------------|
| 0b0 | Loaded data source not implemented. |
| 0b1 | Loaded data source implemented. |

Access to this field is **RO**.

ArchInst, bit [3]

Architectural instruction profiling. Defined values are:

| ArchInst | Meaning |
|----------|--|
| 0b0 | Micro-op sampling implemented. |
| 0b1 | Architecture instruction sampling implemented. |

Access to this field is **RO**.

FL, bit [2]

Filtering by latency. This bit is RAO.

FT, bit [1]

Filtering by operation type. This bit is RAO.

FE, bit [0]

Filtering by events. This bit is RAO.

Accessing PMSIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSIDR_EL1

| op0 | op1 | CRn | CRm | op2 |

PMSIRR_EL1, Sampling Interval Reload Register

The PMSIRR_EL1 characteristics are:

Purpose

Defines the interval between samples.

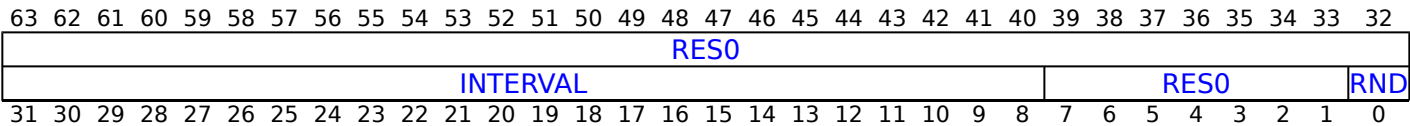

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSIRR_EL1 are UNDEFINED.

Attributes

PMSIRR_EL1 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

INTERVAL, bits [31:8]

Bits [31:8] of the PMSICR_EL1 interval counter reload value. Software must set this to a non-zero value. If software sets this to zero, an UNKNOWN sampling interval is used. Software should set this to a value greater than the minimum indicated by PMSIDR_EL1.Interval.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:1]

Reserved, RES0.

RND, bit [0]

Controls randomization of the sampling interval.

| RND | Meaning |
|-----|--|
| 0b0 | Disable randomization of sampling interval. |
| 0b1 | Add (pseudo-)random jitter to sampling interval. |

The random number generator is not architected.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSIRR_EL1

Accesses to this register use the following encodings in the System register encoding space:

PMSLATFR_EL1, Sampling Latency Filter Register

The PMSLATFR_EL1 characteristics are:

Purpose

Controls sample filtering by latency

Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSLATFR_EL1 are UNDEFINED.

Attributes

PMSLATFR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | MINLAT | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:16]

Reserved, RES0.

MINLAT, bits [15:0]

Minimum latency. When [PMSFCR_EL1](#).FL is 1, defines the minimum total latency for filtered operations. Samples with a total latency less than PMSLATFR_EL1.MINLAT are not recorded.

If [PMSIDR_EL1](#).CountSize is 0b0010, PMSLATFR_EL1.MINLAT[15:12] is RES0.

This field is ignored by the PE when [PMSFCR_EL1](#).FL == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMSNEVFR_EL1, Sampling Inverted Event Filter Register

The PMSNEVFR_EL1 characteristics are:

Purpose

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if E[3] and E[5] are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 (TLB walk) clear are recorded.

Configuration

This register is present only when FEAT_SPEv1p2 is implemented. Otherwise, direct accesses to PMSNEVFR_EL1 are UNDEFINED.

Attributes

PMSNEVFR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | |
|-------|-------|-------|-------|-------|-------|-------|-------|--------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | |
| E[63] | E[62] | E[61] | E[60] | E[59] | E[58] | E[57] | E[56] | E[55] | E[54] | E[53] | E[52] | E[51] | E[50] | E[49] | E[48] | | | | | | |
| E[31] | E[30] | E[29] | E[28] | E[27] | E[26] | E[25] | E[24] | RAZ/WI | | | | | | E[18] | E[17] | E[16] | E[15] | E[14] | E[13] | E[12] | E[11] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | |

E[<x>], bit [x], for x = 63 to 48, 31 to 24, 15 to 12

E[<x>] is the event filter for IMPLEMENTATION DEFINED event <x>.

| E[<x>] | Meaning |
|--------|---|
| 0b0 | Event <x> is ignored. |
| 0b1 | Do not record samples that have event <x> == 1. |

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This bit is ignored by the PE when [PMSFCR_EL1.FnE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When event <x> is not implemented, or filtering on event <x> is not supported, access to this field is **RAZ/WI**.

Bits [47:32]

Reserved, RAZ/WI.

Bits [23:19]

Reserved, RAZ/WI.

E[18], bit [18]**When FEAT_SVE is implemented and FEAT_SPEv1p1 is implemented:**

Not empty predicate.

| E[18] | Meaning |
|--------------|---|
| 0b0 | Empty predicate event is ignored. |
| 0b1 | Do not record samples that have the Empty predicate event == 1. |

This field is ignored by the PE when [PMSFCR_EL1](#).FnE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]**When FEAT_SVE is implemented and FEAT_SPEv1p1 is implemented:**

Not partial predicate.

| E[17] | Meaning |
|--------------|---|
| 0b0 | Partial predicate event is ignored. |
| 0b1 | Do not record samples that have the Partial predicate event == 1. |

This field is ignored by the PE when [PMSFCR_EL1](#).FnE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[16], bit [16]**When FEAT_TME is implemented:**

Not transactional.

| E[16] | Meaning |
|--------------|---|
| 0b0 | Transactional event is ignored. |
| 0b1 | Do not record samples that have the Transactional event == 1. |

This field is ignored by the PE when [PMSFCR_EL1](#).FnE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[11], bit [11]

When FEAT_SPEv1p1 is implemented:

Aligned.

| E[11] | Meaning |
|--------------|--|
| 0b0 | Misalignment event is ignored. |
| 0b1 | Do not record samples that have the Misalignment event == 1. |

This field is ignored by the PE when [PMSFCR_EL1](#).FnE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [10:8]

Reserved, RAZ/WI.

E[7], bit [7]

Correctly predicted.

| E[7] | Meaning |
|-------------|--|
| 0b0 | Mispredicted event is ignored. |
| 0b1 | Do not record samples that have the Mispredicted event == 1. |

This field is ignored by the PE when [PMSFCR_EL1](#).FnE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[6], bit [6]

Taken.

| E[6] | Meaning |
|-------------|---|
| 0b0 | Not taken event is ignored. |
| 0b1 | Do not record samples that have the Not taken event == 1. |

This field is ignored by the PE when [PMSFCR_EL1](#).FnE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[5], bit [5]

TLB hit.

| E[5] | Meaning |
|-------------|--|
| 0b0 | TLB walk event is ignored. |
| 0b1 | Do not record samples that have the TLB walk event == 1. |

This field is ignored by the PE when [PMSFCR_EL1](#).FnE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RAZ/WI.

E[3], bit [3]

Level 1 data or unified cache hit.

| E[3] | Meaning |
|------|--|
| 0b0 | Level 1 data or unified cache refill event is ignored. |
| 0b1 | Do not record samples that have the Level 1 data or unified cache refill event == 1. |

This field is ignored by the PE when [PMSFCR_EL1](#).FnE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RAZ/WI.

E[1], bit [1]

When the PE supports sampling of speculative instructions:

Speculative.

| E[1] | Meaning |
|------|--|
| 0b0 | Architecturally executed event is ignored. |
| 0b1 | Do not record samples that have the Architecturally executed event == 1. |

This field is ignored by the PE when [PMSFCR_EL1](#).FnE == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bit [0]

Reserved, RAZ/WI.

PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see 'SW_INCR'.

Configuration

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMSWINC\[31:0\]](#).

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to External register [PMSWINC_EL0\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC_EL0 are UNDEFINED.

Attributes

PMSWINC_EL0 is a 64-bit register.

Bits [63:31]

Reserved, RES0.

P<n>, bit [n], for n = 30 to 0

Event counter software increment bit for [PMEVCNTR<n>_EL0](#).

If N is less than 31, then bits [30:N] are WI. When EL2 is implemented and enabled in the current Security state, in EL1 and EL0, N is the value in [MDCR_EL2](#).HPMN. Otherwise, N is the value in [PMCR_EL0](#).N.

| P<n> | Meaning |
|------|---|
| 0b0 | No action. The write to this bit is ignored. |
| 0b1 | If PMEVCNTR<n>_EL0 is enabled and configured to count the software increment event, increments PMEVCNTR<n>_EL0 by 1. If PMEVCNTR<n>_EL0 is disabled, or not configured to count the software increment event, the write to this bit is ignored. |

Accessing PMSWINC_EL0

Accesses to this register use the following encodings in the System register encoding space:

MSR PMSWINC_EL0, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b011 | 0b1001 | 0b1100 | 0b100 |

```

Purpose

Configuration

Attributes

Field descriptions

Bits [63:4]

ER, bit [3]

Event counter Read. Traps EL0 access to event counters to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped accesses are reported using EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CR, bit [2]

Cycle counter Read. Traps EL0 access to cycle counter reads to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped MRC accesses are reported using EC syndrome value 0x03, trapped MRRC accesses are reported using EC syndrome value 0x04.

| CR | Meaning |
|-----|--|
| 0b0 | EL0 using AArch64: EL0 read accesses to the PMCCNTR_EL0 are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 read accesses to the PMCCNTR are trapped if PMUSERENR_EL0.EN is also 0. |
| 0b1 | Overrides PMUSERENR_EL0.EN and enables access to: <ul style="list-style-type: none"> • PMCCNTR_EL0 at EL0. • PMCCNTR at EL0. |

SW, bit [1]

Traps Software Increment writes to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1.

In AArch64 state, trapped accesses are reported using EC syndrome value 0x18.

In AArch32 state, trapped accesses are reported using EC syndrome value 0x03.

| SW | Meaning |
|-----|--|
| 0b0 | EL0 using AArch64: EL0 writes to the PMSWINC_EL0 are trapped if PMUSERENR_EL0.EN is also 0. EL0 using AArch32: EL0 writes to the PMSWINC are trapped if PMUSERENR_EL0.EN is also 0. |
| 0b1 | Overrides PMUSERENR_EL0.EN and enables access to: <ul style="list-style-type: none"> • PMSWINC_EL0 at EL0. • PMSWINC at EL0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Traps EL0 accesses to the Performance Monitor registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from both Execution states as follows:

- In AArch64 state, MRS or MSR accesses to the following registers are reported using EC syndrome value 0x18:
 - [PMCR_EL0](#), [PMOVSCLR_EL0](#), [PMSELR_EL0](#), [PMCEID0_EL0](#), [PMCEID1_EL0](#), [PMCCNTR_EL0](#), [PMXEVTYPER_EL0](#), [PMXVCNTR_EL0](#), [PMCNTENSET_EL0](#), [PMCNTENCLR_EL0](#), [PMOVSSET_EL0](#), [PMEVCNTR<n>_EL0](#), [PMEVTYPER<n>_EL0](#), [PMCCFILTR_EL0](#), [PMSWINC_EL0](#).
 - If FEAT_PMUv3p4 is implemented, [PMMIR_EL1](#).
- In AArch32 state, MRC or MCR accesses to the following registers are reported using EC syndrome value 0x03:
 - [PMCR](#), [PMOVS](#), [PMSELR](#), [PMCEID0](#), [PMCEID1](#), [PMCCNTR](#), [PMXEVTYPER](#), [PMXVCNTR](#), [PMCNTENSET](#), [PMCNTENCLR](#), [PMOVSSET](#), [PMEVCNTR<n>](#), [PMEVTYPER<n>](#), [PMCCFILTR](#), [PMSWINC](#).
 - If FEAT_PMUv3p4 is implemented, [PMMIR](#).
 - If FEAT_PMUv3p1 is implemented, in AArch32 state, [PMCEID2](#), and [PMCEID3](#).
- In AArch32 state, MRRC or MCRR accesses to [PMCCNTR](#) are reported using EC syndrome value 0x04.

| EN | Meaning |
|-----|---|
| 0b0 | While at EL0, accesses to the specified registers at EL0 are trapped, unless overridden by one of PMUSERENR_EL0.{ER, CR, SW}. |
| 0b1 | While at EL0, software can access all of the specified registers. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMUSERENR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMUSERENR_EL0

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b011 | 0b1001 | 0b1110 | 0b000 |

PMXEVCNTR_EL0, Performance Monitors Selected Event Count Register

The PMXEVCNTR_EL0 characteristics are:

Purpose

Reads or writes the value of the selected event counter, [PMEVCNTR<n>_EL0](#). [PMSELR_EL0](#).SEL determines which event counter is selected.

Configuration

AArch64 System register PMXEVCNTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVCNTR\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVCNTR_EL0 are UNDEFINED.

Attributes

PMXEVCNTR_EL0 is a 64-bit register.

Field descriptions

When FEAT_PMUv3p5 is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| PMEVCNTR<n> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| PMEVCNTR<n> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

PMEVCNTR<n>, bits [63:0]

Value of the selected event counter, [PMEVCNTR<n>_EL0](#), where n is the value stored in [PMSELR_EL0](#).SEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| PMEVCNTR<n> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, [PMEVCNTR<n>_EL0](#), where n is the value stored in [PMSELR_EL0](#).SEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVCNTR_EL0

If FEAT_FGT is implemented and [PMSELR_EL0.SEL](#) is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMXEVCNTR_EL0](#) is as follows:

- If [PMSELR_EL0.SEL](#) selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and [PMSELR_EL0.SEL](#) is greater than or equal to the number of accessible event counters, then reads and writes of [PMXEVCNTR_EL0](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if [PMSELR_EL0.SEL](#) has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and [PMSELR_EL0.SEL](#) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR_EL0](#).{ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, [MDCR_EL2](#).HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [MDCR_EL2](#).HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMXEVCNTR_EL0

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b011 | 0b1001 | 0b1101 | 0b010 |

PMXEVTYPERS_EL0, Performance Monitors Selected Event Type Register

The PMXEVTYPERS_EL0 characteristics are:

Purpose

When [PMSELR_EL0.SEL](#) selects an event counter, this accesses a [PMEVTYPERS<n>_EL0](#) register. When [PMSELR_EL0.SEL](#) selects the cycle counter, this accesses [PMCCFILTR_EL0](#).

Configuration

AArch64 System register PMXEVTYPERS_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMXEVTYPERS\[31:0\]](#).

This register is present only when FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPERS_EL0 are UNDEFINED.

Attributes

PMXEVTYPERS_EL0 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| Event type register or PMCCFILTR_EL0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

When [PMSELR_EL0.SEL](#) == 31, this register accesses [PMCCFILTR_EL0](#).

Otherwise, this register accesses [PMEVTYPERS<n>_EL0](#) where n is the value in [PMSELR_EL0.SEL](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVTYPERS_EL0

If FEAT_FGT is implemented, and [PMSELR_EL0.SEL](#) is not 31 and is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of [PMXEVTYPERS_EL0](#) is as follows:

- If [PMSELR_EL0.SEL](#) selects an unimplemented event counter, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented, and [PMSELR_EL0.SEL](#) is not 31 and is greater than or equal to the number of accessible event counters, then reads and writes of [PMXEVTYPERS_EL0](#) are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if [PMSELR_EL0.SEL](#) has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if [PMSELR_EL0.SEL](#) is 31.

- If EL2 is implemented and enabled in the current Security state, [PMSELR_EL0](#) is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Note

In EL0, an access is permitted if it is enabled by [PMUSERENR_EL0](#).EN.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, [MDCR_EL2](#).HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see [MDCR_EL2](#).HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMXEVTYPER_EL0

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b011 | 0b1001 | 0b1101 | 0b001 |

REVIDR_EL1, Revision ID Register

The REVIDR_EL1 characteristics are:

Purpose

Provides implementation-specific minor revision information.

Configuration

AArch64 System register REVIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [REVIDR\[31:0\]](#).

If REVIDR_EL1 has the same value as [MIDR_EL1](#), then its contents have no significance.

Attributes

REVIDR_EL1 is a 64-bit register.

Field descriptions

Bits [63:24]

Reserved, RES0.

SEED, bits [23:8]

Seed register used for generating values returned by RandomAllocationTag().

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

TAG, bits [3:0]

Tag generated by the most recent IRG instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing RGSR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RGSR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0001 | 0b0000 | 0b101 |

RMR_EL1, Reset Management Register (EL1)

The RMR_EL1 characteristics are:

Purpose

When this register is implemented:

- A write to the register at EL1 can request a Warm reset.
- If EL1 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch64 System register RMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [RMR\[31:0\]](#) when the highest implemented Exception level is EL1.

This register is present only when the highest implemented Exception level is EL1. Otherwise, direct accesses to RMR_EL1 are UNDEFINED.

When EL1 is the highest implemented Exception level:

- If EL1 can use all Execution states then this register must be implemented.
- If EL1 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Attributes

RMR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--|------|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | | |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | RR | | AA64 | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | |

Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

AA64, bit [0]

When EL1 is capable of using AArch32:

When EL1 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

| AA64 | Meaning |
|------|----------|
| 0b0 | AArch32. |
| 0b1 | AArch64. |

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL1 can only use AArch64 state, this bit is RAO/WI.

When implemented as a RW field, this field resets to 1 on a Cold reset.

Otherwise:

Reserved, RAO/WI.

Accessing RMR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RMR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b1100 | 0b0000 | 0b010 |

```
if PSTATE.EL == EL1 && IsHighestEL(EL1) then
    return RMR_EL1;
else
    UNDEFINED;
```

MSR RMR_EL1, <Xt>

RMR_EL2, Reset Management Register (EL2)

The RMR_EL2 characteristics are:

Purpose

When this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch64 System register RMR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HRMR\[31:0\]](#) when the highest implemented Exception level is EL2.

This register is present only when the highest implemented Exception level is EL2. Otherwise, direct accesses to RMR_EL2 are UNDEFINED.

When EL2 is the highest implemented Exception level:

- If EL2 can use all Execution states then this register must be implemented.
- If EL2 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Attributes

RMR_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

RNDR, Random Number

The RNDR characteristics are:

Purpose

Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is 0.

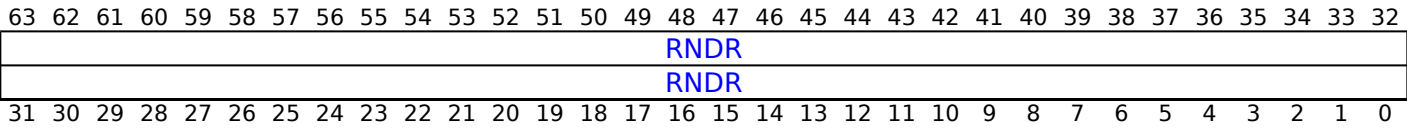

Configuration

This register is present only when FEAT_RNG is implemented or FEAT_RNG_TRAP is implemented. Otherwise, direct accesses to RNDR are UNDEFINED.

Attributes

RNDR is a 64-bit register.

Field descriptions

RNDR, bits [63:0]

Random Number. Returns a 64-bit Random Number which is reseeded from the True Random Number source at an IMPLEMENTATION DEFINED rate.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing RNDR

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RNDR

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b011 | 0b0010 | 0b0100 | 0b000 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_RNG_TRAP) && SCR_EL3.TRNDR == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    elsif !IsFeatureImplemented(FEAT_RNG) then
        UNDEFINED;
    else
        return RNDR;
elsif PSTATE.EL == EL1 then
    if IsFeatureImplemented(FEAT_RNG_TRAP) && SCR_EL3.TRNDR == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    elsif !IsFeatureImplemented(FEAT_RNG) then

RNDRRS, Reseeded Random Number

The RNDRRS characteristics are:

Purpose

Reseeded Random Number. Returns a 64-bit random number which is reseeded from the True Random Number source immediately before the read of the random number.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is 0.

When FEAT_RNG_TRAP is implemented and [SCR_EL3](#).TRNDR is 1, reads of this register are trapped to EL3.

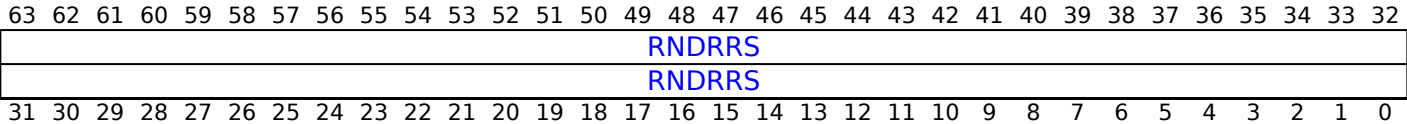

Configuration

This register is present only when FEAT_RNG is implemented or FEAT_RNG_TRAP is implemented. Otherwise, direct accesses to RNDRRS are UNDEFINED.

Attributes

RNDRRS is a 64-bit register.

Field descriptions

RNDRRS, bits [63:0]

Reseeded Random Number. Returns a 64-bit Random Number which is reseeded from the True Random Number source immediately before this read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing RNDRRS

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RNDRRS

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b011 | 0b0010 | 0b0100 | 0b001 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_RNG_TRAP) && SCR_EL3.TRNDR == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    elsif !IsFeatureImplemented(FEAT_RNG) then
        UNDEFINED;
    else
        return RNDRRS;
elsif PSTATE.EL == EL1 then
    if IsFeatureImplemented(FEAT_RNG_TRAP) && SCR_EL3.TRNDR == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    elsif !IsFeatureImplemented(FEAT_RNG) then
        UNDEFINED;
    else
        return RNDRRS;
elsif PSTATE.EL == EL2 then
    if IsFeatureImplemented(FEAT_RNG_TRAP) && SCR_EL3.TRNDR == '1' then
        AArch64.SystemAccessTrap(EL3, 0x18);
    elsif !IsFeatureImplemented(FEAT_RNG) then

RVBAR_EL1, Reset Vector Base Address Register (if EL2 and EL3 not implemented)

The RVBAR_EL1 characteristics are:

Purpose

If EL1 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

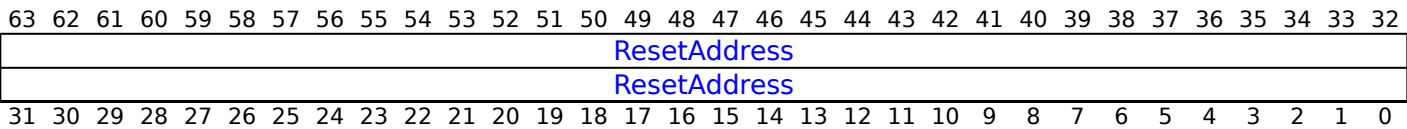

Configuration

This register is present only when the highest implemented Exception level is EL1. Otherwise, direct accesses to RVBAR_EL1 are UNDEFINED.

Attributes

RVBAR_EL1 is a 64-bit register.

Field descriptions

ResetAddress, bits [63:0]

The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing RVBAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RVBAR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b1100 | 0b0000 | 0b001 |

```
if PSTATE.EL == EL1 && IsHighestEL(EL1) then
    return RVBAR_EL1;
else
    UNDEFINED;
```

RVBAR_EL2, Reset Vector Base Address Register (if EL3 not implemented)

The RVBAR_EL2 characteristics are:

Purpose

If EL2 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

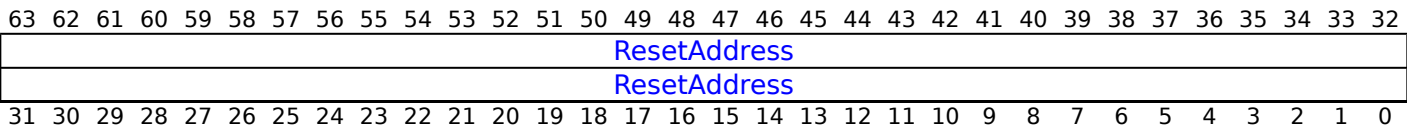

Configuration

This register is present only when the highest implemented Exception level is EL2. Otherwise, direct accesses to RVBAR_EL2 are UNDEFINED.

Attributes

RVBAR_EL2 is a 64-bit register.

Field descriptions

ResetAddress, bits [63:0]

The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing RVBAR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RVBAR_EL2

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b1100 | 0b0000 | 0b001 |

```
if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && HCR_EL2.NV == '1' then
    AArch64.SystemAccessTrap(EL2, 0x18);
elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    return RVBAR_EL2;
else
    UNDEFINED;
```

RVBAR_EL3, Reset Vector Base Address Register (if EL3 implemented)

The RVBAR_EL3 characteristics are:

Purpose

If EL3 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to RVBAR_EL3 are UNDEFINED.

Only implemented if the highest Exception level implemented is EL3.

Attributes

RVBAR_EL3 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

ResetAddress, bits [63:0]

The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing RVBAR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RVBAR_EL3

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b1100 | 0b0000 | 0b001 |

```
if PSTATE.EL == EL3 && IsHighestEL(EL3) then
    return RVBAR_EL3;
else
    UNDEFINED;
```

SYS S1_<op1>_<Cn>_<Cm>_<op2>, SYSL S1_<op1>_<Cn>_<Cm>_<op2>, IMPLEMENTATION DEFINED maintenance instructions

The SYS S1_<op1>_<Cn>_<Cm>_<op2>, SYSL S1_<op1>_<Cn>_<Cm>_<op2> characteristics are:

Purpose

This area of the System instruction encoding space is reserved for IMPLEMENTATION DEFINED System instructions.

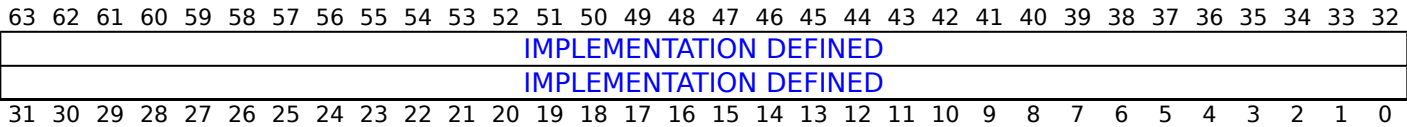

Configuration

There are no configuration notes.

Attributes

SYS S1_<op1>_<Cn>_<Cm>_<op2>, SYSL S1_<op1>_<Cn>_<Cm>_<op2> is a 64-bit System instruction.

Field descriptions

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Executing the SYS S1_<op1>_<Cn>_<Cm>_<op2>, SYSL S1_<op1>_<Cn>_<Cm>_<op2> instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

SYS #<op1>, <Cn>, <Cm>, #<op2>{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|----------|--------|---------|----------|
| 0b01 | op1[2:0] | 0b1x11 | Cm[3:0] | op2[2:0] |

```

if PSTATE.EL == EL0 then

        IMPLEMENTATION_DEFINED "S3";

```

SCR_EL3, Secure Configuration Register

The SCR_EL3 characteristics are:

Purpose

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0, EL1, and EL2. The Security state is Secure, Non-secure, or Realm.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ, SError interrupts, and External abort exceptions are taken to EL3.
- Whether various operations are trapped to EL3.

Configuration

AArch64 System register SCR_EL3 bits [31:0] can be mapped to AArch32 System register [SCR\[31:0\]](#), but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCR_EL3 are UNDEFINED.

Attributes

SCR_EL3 is a 64-bit register.

Bit [63]

Reserved, RES0.

NSE, bit [62]

When FEAT_RME is implemented:

This field, evaluated with SCR_EL3.NS, selects the Security state of EL2 and lower Exception levels.

For a description of the values derived by evaluating NS and NSE together, see SCR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [61:49]

Reserved, RES0.

GPF, bit [48]**When FEAT_RME is implemented:**

Controls the reporting of Granule protection faults at EL0, EL1 and EL2.

| GPF | Meaning |
|-----|---|
| 0b0 | This control does not cause exceptions to be routed from EL0, EL1 or EL2 to EL3. |
| 0b1 | GPFs at EL0, EL1 and EL2 are routed to EL3 and reported as Granule Protection Check exceptions. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [47:42]

Reserved, RES0.

EnTP2, bit [41]**When FEAT_SME is implemented:**

Traps instructions executed at EL2, EL1, and EL0 that access [TPIDR2_EL0](#) to EL3. The exception is reported using ESR_ELx.EC value 0x18.

| EnTP2 | Meaning |
|-------|---|
| 0b0 | This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped. |
| 0b1 | This control does not cause execution of any instructions to be trapped. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRNDR, bit [40]**When FEAT_RNG_TRAP is implemented:**

Controls trapping of reads of [RNDR](#) and [RNDRRS](#). The exception is reported using ESR_ELx.EC value 0x18.

| TRNDR | Meaning |
|-------|--|
| 0b0 | <p>This control does not cause RNDR and RDNRRS to be trapped.</p> <p>When FEAT_RNG is implemented:</p> <ul style="list-style-type: none"> ID_AA64ISAR0_EL1.RNDR returns the value 0b0001. <p>When FEAT_RNG is not implemented:</p> <ul style="list-style-type: none"> ID_AA64ISAR0_EL1.RNDR returns the value 0b0000. MRS reads of RNDR and RDNRRS are UNDEFINED. |
| 0b1 | <p>ID_AA64ISAR0_EL1.RNDR returns the value 0b0001.</p> <p>Any attempt to read RNDR or RNDRRS is trapped to EL3.</p> |

When FEAT_RNG is not implemented, Arm recommends that SCR_EL3.TRNDR is initialized before entering Exception levels below EL3 and not subsequently changed.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [39]

Reserved, RES0.

HXEn, bit [38]

When FEAT_HCX is implemented:

Enables access to the [HCRX_EL2](#) register at EL2 from EL3.

| HXEn | Meaning |
|------|--|
| 0b0 | Accesses at EL2 to HCRX_EL2 are trapped to EL3. Indirect reads of HCRX_EL2 return 0. |
| 0b1 | This control does not cause any instructions to be trapped. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ADEn, bit [37]

When FEAT_LS64 is implemented:

Enables access to the [ACCDATA_EL1](#) register at EL1 and EL2.

| ADEn | Meaning |
|------|---|
| 0b0 | Accesses to ACCDATA_EL1 at EL1 and EL2 are trapped to EL3, unless the accesses are trapped to EL2 by the EL2 fine-grained trap. |
| 0b1 | This control does not cause accesses to ACCDATA_EL1 to be trapped. |

If the [HFGWTR_EL2](#).nACCDATA_EL1 or [HFGTR_EL2](#).nACCDATA_EL1 traps are enabled, they take priority over this trap.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [36]

When FEAT_LS64 is implemented:

Traps execution of an ST64BV0 instruction at EL0, EL1, or EL2 to EL3.

| EnAS0 | Meaning |
|-------|---|
| 0b0 | EL0 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL1 by SCTLR_EL1.EnAS0 , or to EL2 by either HCRX_EL2.EnAS0 or SCTLR_EL2.EnAS0 . EL1 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL2 by HCRX_EL2.EnAS0 . EL2 execution of an ST64BV0 instruction is trapped to EL3. |
| 0b1 | This control does not cause any instructions to be trapped. |

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [35]

When FEAT_AMUv1p1 is implemented:

Activity Monitors Virtual Offsets Enable.

| AMVOFFEN | Meaning |
|----------|--|
| 0b0 | Accesses to AMEVCNTVOFF0<n>_EL2 and AMEVCNTVOFF1<n>_EL2 at EL2 are trapped to EL3. Indirect reads of the virtual offset registers are zero. |
| 0b1 | Accesses to AMEVCNTVOFF0<n>_EL2 and AMEVCNTVOFF1<n>_EL2 are not affected by this field. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [34]

When FEAT_TME is implemented:

Enables access to the TSTART, TCOMMIT, TTEST and TCANCEL instructions at EL0, EL1 and EL2.

| TME | Meaning |
|-----|---|
| 0b0 | EL0, EL1 and EL2 accesses to TSTART, TCOMMIT, TTEST and TCANCEL instructions are UNDEFINED. |
| 0b1 | This control does not cause any instruction to be UNDEFINED. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [33:30]**When FEAT_TWED is implemented:**

TWE Delay. A 4-bit unsigned number that, when SCR_EL3.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCR_EL3.TWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [29]**When FEAT_TWED is implemented:**

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCR_EL3.TWE.

Traps are reported using an ESR_ELx.EC value of 0x01.

| TWEDEn | Meaning |
|---------------|---|
| 0b0 | The delay for taking the trap is IMPLEMENTATION DEFINED. |
| 0b1 | The delay for taking the trap is at least the number of cycles defined in SCR_EL3.TWEDEL. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECVEn, bit [28]**When FEAT_ECV is implemented:**

ECV Enable. Enables access to the [CNTPOFF_EL2](#) register.

| ECVEn | Meaning |
|--------------|---|
| 0b0 | EL2 accesses to CNTPOFF_EL2 are trapped to EL3, and the value of CNTPOFF_EL2 is treated as 0 for all purposes other than direct reads or writes to the register from EL3. |
| 0b1 | EL2 accesses to CNTPOFF_EL2 are not trapped to EL3 by this mechanism. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTEn, bit [27]**When FEAT_FGT is implemented:**

Fine-Grained Traps Enable. When EL2 is implemented, enables the traps to EL2 controlled by [HAFGRTR_EL2](#), [HDFGRTR_EL2](#), [HDFGWTR_EL2](#), [HFGTRTR_EL2](#), [HFGITR_EL2](#), and [HFGWTR_EL2](#), and controls access to those registers.

Note

If EL2 is not implemented but EL3 is implemented, FEAT_FGT implements the [MDCR_EL3](#).TDC traps.

| FGTEn | Meaning |
|-------|--|
| 0b0 | EL2 accesses to HAFGRTR_EL2 , HDFGRTR_EL2 , HDFGWTR_EL2 , HFGTRTR_EL2 , HFGITR_EL2 and HFGWTR_EL2 registers are trapped to EL3, and the traps to EL2 controlled by those registers are disabled. |
| 0b1 | EL2 accesses to HAFGRTR_EL2 , HDFGRTR_EL2 , HDFGWTR_EL2 , HFGTRTR_EL2 , HFGITR_EL2 and HFGWTR_EL2 registers are not trapped to EL3 by this mechanism. |

Traps caused by accesses to the fine-grained trap registers are reported using an ESR_ELx.EC value of 0x18 and its associated ISS.

Otherwise:

Reserved, RES0.

ATA, bit [26]

When FEAT_MTE2 is implemented:

Allocation Tag Access. Controls access at EL2, EL1 and EL0 to Allocation Tags.

| ATA | Meaning |
|-----|--|
| 0b0 | Access to Allocation Tags is prevented. Accesses at EL1 and EL2 to GCR_EL1 , RGSR_EL1 , TFSR_EL1 , TFSR_EL2 or TFSRE0_EL1 that are not UNDEFINED or trapped to a lower Exception level are trapped to EL3. Accesses at EL2 to TFSR_EL12 that are not UNDEFINED are trapped to EL3. |
| 0b1 | This control does not prevent access to Allocation Tags. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [25]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Enable access to the [SCXTNUM_EL2](#), [SCXTNUM_EL1](#), and [SCXTNUM_EL0](#) registers.

| EnSCXT | Meaning |
|--------|---|
| 0b0 | Accesses at EL0, EL1 and EL2 to SCXTNUM_EL0 , SCXTNUM_EL1 , or SCXTNUM_EL2 registers are trapped to EL3 if they are not trapped by a higher priority exception, and the values of these registers are treated as 0. |
| 0b1 | This control does not cause any accesses to be trapped, or register values to be treated as 0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:22]

Reserved, RES0.

FIEN, bit [21]

When FEAT_RASv1p1 is implemented:

Fault Injection enable. Trap accesses to the registers [ERXPFPCDN_EL1](#), [ERXPFPGCTL_EL1](#), and [ERXPFPGF_EL1](#) from EL1 and EL2 to EL3, reported using an ESR_ELx.EC value of 0x18.

| FIEN | Meaning |
|------|--|
| 0b0 | Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3. |
| 0b1 | This control does not cause any instructions to be trapped. |

If EL3 is not implemented, the Effective value of SCR_EL3.FIEN is 0b1.

If [ERRIDR_EL1](#).NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [20]

When FEAT_DoubleFault is implemented:

Non-maskable External Aborts. When [SCR_EL3](#).EA == 1, controls whether PSTATE.A masks SError interrupts at EL3.

| NMEA | Meaning |
|------|---|
| 0b0 | If SCR_EL3 .EA == 1, asserted SError interrupts are not taken at EL3 if PSTATE.A == 1. |
| 0b1 | If SCR_EL3 .EA == 1, asserted SError interrupts are taken at EL3 regardless of the value of PSTATE.A. |

When SCR_EL3.EA == 0:

- Asserted SError interrupts are not taken at EL3 regardless of the value of PSTATE.A and this field.
- This field is ignored and its Effective value is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EASE, bit [19]**When FEAT_DoubleFault is implemented:**

External aborts to SError interrupt vector.

| EASE | Meaning |
|-------------|---|
| 0b0 | Synchronous External abort exceptions taken to EL3 are taken to the appropriate synchronous exception vector offset from VBAR_EL3 . |
| 0b1 | Synchronous External abort exceptions taken to EL3 are taken to the appropriate SError interrupt vector offset from VBAR_EL3 . |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

EEL2, bit [18]**When FEAT_SEL2 is implemented:**

Secure EL2 Enable.

| EEL2 | Meaning |
|-------------|---|
| 0b0 | All behaviors associated with Secure EL2 are disabled. All registers, including timer registers, defined by FEAT_SEL2 are UNDEFINED, and those timers are disabled. |
| 0b1 | All behaviors associated with Secure EL2 are enabled. |

When the value of this bit is 1, then:

- When SCR_EL3.NS == 0, the SCR_EL3.RW bit is treated as 1 for all purposes other than reading or writing the register.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2, using the EC value of [ESR_EL2](#).EC == 0x3 :
 - A read or write of the [SCR](#).
 - A read or write of the [NSACR](#).
 - A read or write of the [MVBAR](#).
 - A read or write of the [SDCR](#).
 - Execution of an ATS12NSO** instruction.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using the EC value of [ESR_EL2](#).EC == 0x0 :
 - Execution of an SRS instruction that uses R13_mon.
 - Execution of an MRS (Banked register) or MSR (Banked register) instruction that would access [SPSR_mon](#), R13_mon, or R14_mon.

Note

If the Effective value of SCR_EL3.EEL2 is 0, then these operations executed in Secure EL1 using AArch32 are trapped to EL3.

A Secure only implementation that does not implement EL3 but implements EL2, behaves as if SCR_EL3.EEL2 == 1.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [17]**When FEAT_SEL2 is implemented and FEAT_PAuth is implemented:**

Controls the use of the following instructions related to Pointer Authentication. Traps are reported using an ESR_ELx.EC value of 0x09:

- PACGA, which is always enabled.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAB when:
 - In EL0, when [HCR_EL2.TGE](#) == 0 or [HCR_EL2.E2H](#) == 0, and the associated [SCTLR_EL1.En<N><M>](#) == 1.
 - In EL0, when [HCR_EL2.TGE](#) == 1 and [HCR_EL2.E2H](#) == 1, and the associated [SCTLR_EL2.En<N><M>](#) == 1.
 - In EL1, when the associated [SCTLR_EL1.En<N><M>](#) == 1.
 - In EL2, when the associated [SCTLR_EL2.En<N><M>](#) == 1.

| API | Meaning |
|-----|--|
| 0b0 | The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.API bit. |
| 0b1 | This control does not cause any instructions to be trapped. |

An instruction is trapped only if Pointer Authentication is enabled for that instruction, for more information, see 'System register control of pointer authentication'.

Note

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SEL2 is not implemented and FEAT_PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- PACGA.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAB when:
 - In Non-secure EL0, when [HCR_EL2.TGE](#) == 0 or [HCR_EL2.E2H](#) == 0, and the associated [SCTLR_EL1.En<N><M>](#) == 1.
 - In Non-secure EL0, when [HCR_EL2.TGE](#) == 1 and [HCR_EL2.E2H](#) == 1, and the associated [SCTLR_EL2.En<N><M>](#) == 1.
 - In Secure EL0, when the associated [SCTLR_EL1.En<N><M>](#) == 1.
 - In Secure or Non-secure EL1, when the associated [SCTLR_EL1.En<N><M>](#) == 1.
 - In EL2, when the associated [SCTLR_EL2.En<N><M>](#) == 1.

| API | Meaning |
|-----|--|
| 0b0 | The use of any instruction related to pointer authentication in any Exception level except EL3 when the instructions are enabled are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.API bit. |
| 0b1 | This control does not cause any instructions to be trapped. |

Note

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [16]

When FEAT_PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers, using an ESR_ELx.EC value of 0x18, from EL1 or EL2 to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps:

- [APIAKeyLo_EL1](#), [APIAKeyHi_EL1](#), [APIBKeyLo_EL1](#), [APIBKeyHi_EL1](#).
- [APDAKeyLo_EL1](#), [APDAKeyHi_EL1](#), [APDBKeyLo_EL1](#), [APDBKeyHi_EL1](#).
- [APGAKeyLo_EL1](#), and [APGAKeyHi_EL1](#).

| APK | Meaning |
|-----|--|
| 0b0 | Access to the registers holding "key" values for pointer authentication from EL1 or EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps. |
| 0b1 | This control does not cause any instructions to be trapped. |

For more information, see 'System register control of pointer authentication'.

Note

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [15]

When FEAT_RAS is implemented:

Trap Error record accesses. Accesses to the RAS ERR* and RAS ERX* registers from EL1 and EL2 to EL3 are trapped as follows:

- Accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x18:
 - [ERRIDR_EL1](#), [ERRSELR_EL1](#), [ERXADDR_EL1](#), [ERXCTLR_EL1](#), [ERXFR_EL1](#), [ERXMISC0_EL1](#), [ERXMISC1_EL1](#), and [ERXSTATUS_EL1](#).
- If FEAT_RASv1p1 is implemented, accesses from EL1 and EL2 using AArch64 to [ERXMISC2_EL1](#), and [ERXMISC3_EL1](#), are trapped and reported using an ESR_ELx.EC value of 0x18.

- Accesses from EL1 and EL2 using AArch32, to the following registers are trapped and reported using an ESR_ELx.EC value of 0x03:
 - [ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#).
- If FEAT_RASv1p1 is implemented, accesses from EL1 and EL2 using AArch32 to the following registers are trapped and reported using an ESR_ELx.EC value of 0x03:
 - [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), and [ERXMISC7](#).

| TERR | Meaning |
|-------------|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [14]

When FEAT_LOR is implemented:

Trap LOR registers. Traps accesses to the [LORSA_EL1](#), [LOREA_EL1](#), [LORN_EL1](#), [LORC_EL1](#), and [LORID_EL1](#) registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

| TLOR | Meaning |
|-------------|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped HCR_EL2.TLOR . |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [13]

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from any Security state and both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxF is implemented, this trap also applies to the WFET instruction.

| TWE | Meaning |
|------------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE , HCR.TWE , SCTLR_EL1.nTWE , SCTLR_EL2.nTWE , or HCR_EL2.TWE . |

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TWI, bit [12]

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from any Security state and both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

| TWI | Meaning |
|-----|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI , HCR.TWI , SCTLR_EL1.nTWI , SCTLR_EL2.nTWI , or HCR_EL2.TWI . |

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ST, bit [11]

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

| ST | Meaning |
|-----|---|
| 0b0 | Secure EL1 using AArch64 accesses to the CNTPS_TVAL_EL1 , CNTPS_CTL_EL1 , and CNTPS_CVAL_EL1 are trapped to EL3 when Secure EL2 is disabled. If Secure EL2 is enabled, the behavior is as if the value of this field was 0b1. |
| 0b1 | This control does not cause any instructions to be trapped. |

Note

Accesses to the Counter-timer Physical Secure timer registers are always enabled at EL3. These registers are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RW, bit [10]

When EL1 is capable of using AArch32 or EL2 is capable of using AArch32:

Execution state control for lower Exception levels.

| RW | Meaning |
|-----|--|
| 0b0 | Lower levels are all AArch32. |
| 0b1 | The next lower level is AArch64. If EL2 is present: <ul style="list-style-type: none"> EL2 is AArch64. EL2 controls EL1 and EL0 behaviors. If EL2 is not present: <ul style="list-style-type: none"> EL1 is AArch64. EL0 is determined by the Execution state described in the current process state when executing at EL0. |

If AArch32 state is supported by the implementation at EL1, SCR_EL3.NS == 1 and AArch32 state is not supported by the implementation at EL2, the Effective value of this bit is 1.

If AArch32 state is supported by the implementation at EL1, FEAT_SEL2 is implemented and SCR_EL3.{EEL2, NS} == {1, 0}, the Effective value of this bit is 1.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.

SIF, bit [9]

When FEAT_SEL2 is implemented:

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from memory marked in the first stage of translation as being Non-secure.

| SIF | Meaning |
|-----|--|
| 0b0 | Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are permitted. |
| 0b1 | Secure state instruction fetches from memory marked in the first stage of translation as being Non-secure are not permitted. |

When FEAT_PAN3 is implemented, it is IMPLEMENTATION DEFINED whether SCR_EL3.SIF is also used to determine instruction access permission for the purpose of PAN.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction fetch from Non-secure memory.

| SIF | Meaning |
|-----|--|
| 0b0 | Secure state instruction fetches from Non-secure memory are permitted. |
| 0b1 | Secure state instruction fetches from Non-secure memory are not permitted. |

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HCE, bit [8]

Hypervisor Call instruction enable. Enables HVC instructions at EL3 and, if EL2 is enabled in the current Security state, at EL2 and EL1, in both Execution states, reported using an ESR_ELx.EC value of 0x00.

| HCE | Meaning |
|-----|--|
| 0b0 | HVC instructions are UNDEFINED. |
| 0b1 | HVC instructions are enabled at EL3, EL2, and EL1. |

Note

HVC instructions are always UNDEFINED at EL0 and, if Secure EL2 is disabled, at Secure EL1. Any resulting exception is taken from the current Exception level to the current Exception level.

If EL2 is not implemented, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SMD, bit [7]

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from any Security state and both Execution states, reported using an ESR_ELx.EC value of 0x00.

| SMD | Meaning |
|-----|---|
| 0b0 | SMC instructions are enabled at EL3, EL2 and EL1. |
| 0b1 | SMC instructions are UNDEFINED. |

Note

SMC instructions are always UNDEFINED at EL0. Any resulting exception is taken from the current Exception level to the current Exception level.

If [HCR_EL2.TSC](#) or [HCR.TSC](#) traps attempted EL1 execution of SMC instructions to EL2, that trap has priority over this disable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

EA, bit [3]

External Abort and SError interrupt routing.

| EA | Meaning |
|-----------|--|
| 0b0 | When executing at Exception levels below EL3, External aborts and SError interrupts are not taken to EL3. In addition, when executing at EL3: <ul style="list-style-type: none"> • SError interrupts are not taken. • External aborts are taken to EL3. |
| 0b1 | When executing at any Exception level, External aborts and SError interrupts are taken to EL3. |

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIQ, bit [2]

Physical FIQ Routing.

| FIQ | Meaning |
|------------|--|
| 0b0 | When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3. When executing at EL3, physical FIQ interrupts are not taken. |
| 0b1 | When executing at any Exception level, physical FIQ interrupts are taken to EL3. |

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRQ, bit [1]

Physical IRQ Routing.

| IRQ | Meaning |
|------------|--|
| 0b0 | When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3. When executing at EL3, physical IRQ interrupts are not taken. |
| 0b1 | When executing at any Exception level, physical IRQ interrupts are taken to EL3. |

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [0]

When FEAT_RME is implemented:

Non-secure bit. This field is used in combination with SCR_EL3.NSE to select the Security state of EL2 and lower Exception levels.

| NSE | NS | Meaning |
|------------|-----------|----------------|
| 0b0 | 0b0 | Secure. |
| 0b0 | 0b1 | Non-secure. |
| 0b1 | 0b0 | Reserved. |
| 0b1 | 0b1 | Realm. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure bit.

| NS | Meaning |
|-----|---|
| 0b0 | Indicates that EL0 and EL1 are in Secure state. |
| 0b1 | Indicates that Exception levels lower than EL3 are in Non-secure state, so memory accesses from those Exception levels cannot access Secure memory. |

When $\text{SCR_EL3}\{EEL2, NS\} == \{1, 0\}$, then EL2 is using AArch64 and in Secure state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCR_EL3

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b0001 | 0b0001 | 0b000 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return SCR_EL3;
```

MSR SCR_EL3, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b0001 | 0b0001 | 0b000 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SCR_EL3 = X[t];
```

SCTLR_EL1, System Control Register (EL1)

The SCTLR_EL1 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL1 and EL0.

Configuration

AArch64 System register SCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [SCTLR\[31:0\]](#).

Attributes

SCTLR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | |
|-------|-----------|--------|--------|------|------|-------|-------|-------|-----|-------|-------|------|------|--------|------|-----|-----|--------|

| TIDCP | SPINTMASK | NMI | EnTP2 | RES0 | EPAN | EnALS | EnAS0 | EnASR | TME | TME0 | TMT | TMT0 | | TWEDEL | | | | TWEDEL |
| EnIA | EnIB | LSMAOE | nTLSMD | EnDA | UCI | EE | EOE | SPAN | EIS | IESBT | TSCXT | WXN | nTWE | RES0 | nTWI | UCT | DZE | EnD |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 |

TIDCP, bit [63]

When FEAT_TIDCP1 is implemented:

Trap IMPLEMENTATION DEFINED functionality. When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps EL0 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL1.

| TIDCP | Meaning |
|-------|--|
| 0b0 | No instructions accessing the System register or System instruction spaces are trapped by this mechanism. |
| 0b1 | Instructions accessing the following System register or System instruction spaces are trapped to EL1 by this mechanism: <ul style="list-style-type: none"> In AArch64 state, EL0 access to the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome 0x18: <ul style="list-style-type: none"> IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}. IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name. In AArch32 state, EL0 MCR and MRC access to the following encodings are trapped and reported using EC syndrome 0x03: <ul style="list-style-type: none"> All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}. All coproc==p15, CRn==c10, opc1 == {0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}. All coproc==p15, CRn==c11, opc1 == {0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPINTMASK, bit [62]**When FEAT_NMI is implemented:**

Superpriority Interrupt Mask enable. When SCTLR_EL1.NMI is 1, controls the value of PSTATE.ALLINT on taking an exception to EL1.

| SPINTMASK | Meaning |
|-----------|--|
| 0b0 | PSTATE.ALLINT is set to 1 on taking an exception to EL1. |
| 0b1 | PSTATE.ALLINT is set to 0 on taking an exception to EL1. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]**When FEAT_NMI is implemented:**

Non-maskable Interrupt enable. Enables support for IRQ and FIQ interrupts with Superpriority, and determines additional masking behavior of the PSTATE.I and PSTATE.F flags.

| NMI | Meaning |
|-----|--|
| 0b0 | The behaviour of PSTATE.I and PSTATE.F is unchanged. IRQ and FIQ interrupts with Superpriority have no effect on interrupts that are targeted at EL1. |
| 0b1 | IRQ and FIQ interrupts can be marked as having Superpriority as an additional attribute, and additional Superpriority masking behavior is determined by PSTATE.ALLINT. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

Otherwise:

Reserved, RES0.

EnTP2, bit [60]**When FEAT_SME is implemented:**

Traps instructions executed at EL0 that access [TPIDR2_EL0](#) to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1. The exception is reported using ESR_ELx.EC value 0x18.

| EnTP2 | Meaning |
|-------|---|
| 0b0 | This control causes execution of these instructions at EL0 to be trapped. |
| 0b1 | This control does not cause execution of any instructions to be trapped. |

If FEAT_VHE is implemented, EL2 is implemented and enabled in the current Security state, and [HCR_EL2.{E2H, TGE}](#) == {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [59:58]

Reserved, RES0.

EPAN, bit [57]

When FEAT_PAN3 is implemented:

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL1 data access to a page with stage 1 EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

| EPAN | Meaning |
|------|---|
| 0b0 | No additional Permission faults are generated by this mechanism. |
| 0b1 | An EL1 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault. Any speculative data accesses that would generate a Permission fault if the accesses were not speculative will not cause an allocation into a cache. |

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [56]

When FEAT_LS64 is implemented:

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 to EL1.

| EnALS | Meaning |
|-------|--|
| 0b0 | Execution of an LD64B or ST64B instruction at EL0 is trapped to EL1. |
| 0b1 | This control does not cause any instructions to be trapped. |

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]

When FEAT_LS64 is implemented:

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an ST64BV0 instruction at EL0 to EL1.

| EnAS0 | Meaning |
|-------|---|
| 0b0 | Execution of an ST64BV0 instruction at EL0 is trapped to EL1. |
| 0b1 | This control does not cause any instructions to be trapped. |

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [54]

When FEAT_LS64 is implemented:

When [HCR_EL2](#).{E2H, TGE} != {1, 1}, traps execution of an ST64BV instruction at EL0 to EL1.

| EnASR | Meaning |
|-------|--|
| 0b0 | Execution of an ST64BV instruction at EL0 is trapped to EL1. |
| 0b1 | This control does not cause any instructions to be trapped. |

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [53]

When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL1.

| TME | Meaning |
|-----|--|
| 0b0 | Any attempt to execute a TSTART instruction at EL1 is trapped to EL1, unless HCR_EL2 .TME or SCR_EL3 .TME causes TSTART instructions to be UNDEFINED at EL1. |
| 0b1 | This control does not cause any TSTART instruction to be trapped. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME0, bit [52]**When FEAT_TME is implemented:**

Enables the Transactional Memory Extension at EL0.

| TME0 | Meaning |
|-------------|--|
| 0b0 | Any attempt to execute a TSTART instruction at EL0 is trapped to EL1, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL0. |
| 0b1 | This control does not cause any TSTART instruction to be trapped. |

If FEAT_VHE is implemented, EL2 is implemented and enabled in the current Security state, and [HCR_EL2](#).{E2H, TGE} == {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT, bit [51]**When FEAT_TME is implemented:**

Forces a trivial implementation of the Transactional Memory Extension at EL1.

| TMT | Meaning |
|------------|---|
| 0b0 | This control does not cause any TSTART instruction to fail. |
| 0b1 | When the TSTART instruction is executed at EL1, the transaction fails with a TRIVIAL failure cause. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT0, bit [50]**When FEAT_TME is implemented:**

Forces a trivial implementation of the Transactional Memory Extension at EL0.

| TMT0 | Meaning |
|-------------|---|
| 0b0 | This control does not cause any TSTART instruction to fail. |
| 0b1 | When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause. |

If FEAT_VHE is implemented, EL2 is implemented and enabled in the current Security state, and [HCR_EL2](#).{E2H, TGE} == {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [49:46]**When FEAT_TWED is implemented:**

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL1.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCTLR_EL1.nTWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]**When FEAT_TWED is implemented:**

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCTLR_EL1.nTWE.

| TWEDEn | Meaning |
|---------------|---|
| 0b0 | The delay for taking the trap is IMPLEMENTATION DEFINED. |
| 0b1 | The delay for taking the trap is at least the number of cycles defined in SCTLR_EL1.TWEDEL. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]**When FEAT_SSBS is implemented:**

Default PSTATE.SSBS value on Exception Entry.

| DSSBS | Meaning |
|--------------|---|
| 0b0 | PSTATE.SSBS is set to 0 on an exception to EL1. |
| 0b1 | PSTATE.SSBS is set to 1 on an exception to EL1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]**When FEAT_MTE2 is implemented:**

Allocation Tag Access in EL1. When [SCR_EL3.ATA](#)=1 and [HCR_EL2.ATA](#)=1, controls EL1 access to Allocation Tags.

| ATA | Meaning |
|-----|--|
| 0b0 | Access to Allocation Tags is prevented. |
| 0b1 | This control does not prevent access to Allocation Tags. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]**When FEAT_MTE2 is implemented:**

Allocation Tag Access in EL0. When [SCR_EL3.ATA](#)=1, [HCR_EL2.ATA](#)=1, and [HCR_EL2](#).{E2H, TGE} != {1, 1}, controls EL0 access to Allocation Tags.

| ATA0 | Meaning |
|------|--|
| 0b0 | Access to Allocation Tags is prevented. |
| 0b1 | This control does not prevent access to Allocation Tags. |

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF, bits [41:40]**When FEAT_MTE2 is implemented:**

Tag Check Fault in EL1. Controls the effect of Tag Check Faults due to Loads and Stores in EL1.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

| TCF | Meaning | Applies when |
|------|--|-------------------------------|
| 0b00 | Tag Check Faults have no effect on the PE. | When FEAT_MTE3 is implemented |
| 0b01 | Tag Check Faults cause a synchronous exception. | |
| 0b10 | Tag Check Faults are asynchronously accumulated. | |
| 0b11 | Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes. | |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]**When FEAT_MTE2 is implemented:**

Tag Check Fault in EL0. When [HCR_EL2](#).{E2H,TGE} != {1,1}, controls the effect of Tag Check Faults due to Loads and Stores in EL0.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

Note

Software may change this control bit on a context switch.

| TCF0 | Meaning | Applies when |
|------|--|-------------------------------|
| 0b00 | Tag Check Faults have no effect on the PE. | |
| 0b01 | Tag Check Faults cause a synchronous exception. | |
| 0b10 | Tag Check Faults are asynchronously accumulated. | |
| 0b11 | Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes. | When FEAT_MTE3 is implemented |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]**When FEAT_MTE2 is implemented:**

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL1, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into [TFSRE0_EL1](#) and [TFSR_EL1](#) registers.

| ITFSB | Meaning |
|-------|--|
| 0b0 | Tag Check Faults are not synchronized on entry to EL1. |
| 0b1 | Tag Check Faults are synchronized on entry to EL1. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT1, bit [36]**When FEAT_BT1 is implemented:**

PAC Branch Type compatibility at EL1.

| BT1 | Meaning |
|-----|--|
| 0b0 | When the PE is executing at EL1, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11. |
| 0b1 | When the PE is executing at EL1, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]**When FEAT_BT1 is implemented:**

PAC Branch Type compatibility at EL0.

| BT0 | Meaning |
|-----|--|
| 0b0 | When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11. |
| 0b1 | When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11. |

When the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, the value of SCTLR_EL1.BT0 has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [34]

Reserved, RES0.

MSCEn, bit [33]**When FEAT_MOPS is implemented and (HCR_EL2.E2H == 0 or HCR_EL2.TGE == 0):**

MemCpy and MemSet instructions Enable. Enables execution of the MemCpy and MemSet instructions at EL0.

| MSCEn | Meaning |
|-------|--|
| 0b0 | Execution of the MemCpy and MemSet instructions is UNDEFINED at EL0. |
| 0b1 | This control does not cause any instructions to be UNDEFINED. |

When FEAT_MOPS is implemented and [HCR_EL2](#).{E2H, TGE} is {1, 1}, the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CMOW, bit [32]

When FEAT_CMOW is implemented:

Controls cache maintenance instruction permission for the following instructions executed at EL0.

- [IC IVAU](#), [DC CIVAC](#), [DC CIGDVAC](#) and [DC CIGVAC](#).

| CMOW | Meaning |
|------|--|
| 0b0 | These instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, do not generate a stage 1 permission fault. |
| 0b1 | If enabled as a result of SCTLR_EL1 .UCI==1, these instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, generate a stage 1 permission fault. |

When AArch64.HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

For this control, stage 1 has write permission if all of the following apply:

- AP[2] is 0 or DBM is 1 in the stage 1 descriptor.
- Where APTable is in use, APTable[1] is 0 for all levels of the translation table.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIA, bit [31]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

| EnIA | Meaning |
|------|---|
| 0b0 | Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled. |
| 0b1 | Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled. |

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

| EnIB | Meaning |
|------|---|
| 0b0 | Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled. |
| 0b1 | Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled. |

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]**When FEAT_LSMAOC is implemented:**

Load Multiple and Store Multiple Atomicity and Ordering Enable.

| LSMAOE | Meaning |
|--------|---|
| 0b0 | For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered. |
| 0b1 | The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0. |

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]**When FEAT_LSMAOC is implemented:**

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

| nTLSMD | Meaning |
|---------------|--|
| 0b0 | All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault. |
| 0b1 | All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped. |

This bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnDA, bit [27]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

| EnDA | Meaning |
|-------------|--|
| 0b0 | Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled. |
| 0b1 | Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled. |

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

Traps EL0 execution of cache maintenance instructions, to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2.TGE](#) is 1, from AArch64 state only, reported using an [ESR_ELx.EC](#) value of 0x18.

This applies to [DC CVAU](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#), and [IC IVAU](#).

If [FEAT_DPB2](#) is implemented, this trap also applies to [DC CVADP](#).

If [FEAT_MTE](#) is implemented, this trap also applies to [DC CIGVAC](#), [DC CIGDVAC](#), [DC CGVAC](#), [DC CGDVAC](#), [DC CGVAP](#), and [DC CGDVAP](#).

If [FEAT_DPB2](#) and [FEAT_MTE](#) are implemented, this trap also applies to [DC CGVADP](#) and [DC CGDVADP](#).

| UCI | Meaning |
|-----|--|
| 0b0 | Execution of the specified instructions at EL0 using AArch64 is trapped. |
| 0b1 | This control does not cause any instructions to be trapped. |

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on execution at EL0.

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

EE, bit [25]

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

| EE | Meaning |
|-----|---|
| 0b0 | Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian. |
| 0b1 | Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian. |

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

When [FEAT_VHE](#) is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

E0E, bit [24]

Endianness of data accesses at EL0.

| E0E | Meaning |
|-----|--|
| 0b0 | Explicit data accesses at EL0 are little-endian. |
| 0b1 | Explicit data accesses at EL0 are big-endian. |

If an implementation only supports Little-endian accesses at EL0, then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0, then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SPAN, bit [23]

When FEAT_PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1.

| SPAN | Meaning |
|------|--|
| 0b0 | PSTATE.PAN is set to 1 on taking an exception to EL1. |
| 0b1 | The value of PSTATE.PAN is left unchanged on taking an exception to EL1. |

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EIS, bit [22]

When FEAT_ExS is implemented:

Exception Entry is Context Synchronizing.

| EIS | Meaning |
|-----|---|
| 0b0 | The taking of an exception to EL1 is not a context synchronizing event. |
| 0b1 | The taking of an exception to EL1 is a context synchronizing event. |

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EIS is set to 0b0:

- Indirect writes to [ESR_EL1](#), [FAR_EL1](#), [SPSR_EL1](#), [ELR_EL1](#) are synchronized on exception entry to EL1, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EIS:

- Changes to the PSTATE information on entry to EL1.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When FEAT_IESB is implemented:

Implicit Error Synchronization event enable. Possible values are:

| IESB | Meaning |
|------|--|
| 0b0 | Disabled. |
| 0b1 | An implicit error synchronization event is added: <ul style="list-style-type: none"> • At each exception taken to EL1. • Before the operational pseudocode of each ERET instruction executed at EL1. |

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL1 and before each DRPS instruction executed at EL1, in addition to the other cases where it is added.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap EL0 Access to the [SCXTNUM_EL0](#) register, when EL0 is using AArch64.

| TSCXT | Meaning |
|-------|--|
| 0b0 | EL0 access to SCXTNUM_EL0 is not disabled by this mechanism. |
| 0b1 | EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The value of SCXTNUM_EL0 is treated as 0. |

When FEAT_VHE is implemented, and the value of [HCR_EL2.{E2H, TGE}](#) is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

| WXN | Meaning |
|-----|---|
| 0b0 | This control has no effect on memory access permissions. |
| 0b1 | Any region that is writable in the EL1&0 translation regime is forced to XN for accesses from software executing at EL1 or EL0. |

This bit applies only when SCTLR_EL1.M bit is set.

The WXN bit is permitted to be cached in a TLB.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2](#).TGE is 1, from both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

| nTWE | Meaning |
|------|---|
| 0b0 | Any attempt to execute a WFE instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state. |
| 0b1 | This control does not cause any instructions to be trapped. |

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2](#).TGE is 1, from both Execution states, reported using an ESR_ELx.EC value of 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

| nTWI | Meaning |
|-------------|---|
| 0b0 | Any attempt to execute a WFI instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state. |
| 0b1 | This control does not cause any instructions to be trapped. |

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

UCT, bit [15]

Traps EL0 accesses to the [CTR_EL0](#) to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2](#).TGE is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

| UCT | Meaning |
|------------|---|
| 0b0 | Accesses to the CTR_EL0 from EL0 using AArch64 are trapped. |
| 0b1 | This control does not cause any instructions to be trapped. |

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

DZE, bit [14]

Traps EL0 execution of [DC ZVA](#) instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2](#).TGE is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

If FEAT_MTE is implemented, this trap also applies to [DC GVA](#) and [DC GZVA](#).

| DZE | Meaning |
|------------|---|
| 0b0 | Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped. Reading DCZID_EL0 .DZP from EL0 returns 1, indicating that the instructions this trap applies to are not supported. |
| 0b1 | This control does not cause any instructions to be trapped. |

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

EnDB, bit [13]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL1&0 translation regime.

For more information, see 'System register control of pointer authentication'.

| EnDB | Meaning |
|------|--|
| 0b0 | Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled. |
| 0b1 | Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled. |

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Stage 1 instruction access Cacheability control, for accesses at EL0 and EL1:

| I | Meaning |
|-----|---|
| 0b0 | All instruction access to Stage 1 Normal memory from EL0 and EL1 are Stage 1 Non-cacheable. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory. |
| 0b1 | This control has no effect on the Stage 1 Cacheability of instruction access to Stage 1 Normal memory from EL0 and EL1. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory. |

When the value of the [HCR_EL2.DC](#) bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the SCTLR_EL1.I bit.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

EOS, bit [11]

When FEAT_ExS is implemented:

Exception Exit is Context Synchronizing.

| EOS | Meaning |
|------------|---|
| 0b0 | An exception return from EL1 is not a context synchronizing event |
| 0b1 | An exception return from EL1 is a context synchronizing event |

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

If SCTLR_EL1.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EOS:

- The indirect write of the PSTATE and PC values from [SPSR_EL1](#) and [ELR_EL1](#) on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]

When FEAT_SPECRES is implemented:

Enable EL0 Access to the following instructions:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

| EnRCTX | Meaning |
|---------------|---|
| 0b0 | EL0 access to these instructions is disabled, and these instructions are trapped to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2 .TGE is 1. |
| 0b1 | EL0 access to these instructions is enabled. |

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1,1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UMA, bit [9]

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.{D, A, I, F} masks to EL1, or to EL2 when it is implemented and enabled for the current Security state and [HCR_EL2](#).TGE is 1, from AArch64 state only, reported using an ESR_ELx.EC value of 0x18.

| UMA | Meaning |
|-----|---|
| 0b0 | Any attempt at EL0 using AArch64 to execute an MRS, MSR(REGISTER), or MSR(IMMEDIATE) instruction that accesses the DAIF is trapped. |
| 0b1 | This control does not cause any instructions to be trapped. |

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SED, bit [8]

When EL0 is capable of using AArch32:

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

| SED | Meaning |
|-----|---|
| 0b0 | SETEND instruction execution is enabled at EL0 using AArch32. |
| 0b1 | SETEND instructions are UNDEFINED at EL0 using AArch32 and any attempt at EL0 to access a SETEND instruction generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, reported using an ESR_ELx.EC value of 0x00. |

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

When FEAT_VHE is implemented, and the value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

ITD, bit [7]

When EL0 is capable of using AArch32:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

| ITD | Meaning |
|-----|--|
| 0b0 | All IT instruction functionality is enabled at EL0 using AArch32. |
| 0b1 | <p>Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED and generates an exception, reported using an ESR_ELx.EC value of 0x00, to EL1 or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1:</p> <ul style="list-style-type: none"> • All encodings of the IT instruction with hw1[3:0] != 1000. • All encodings of the subsequent instruction with the following values for hw1: <ul style="list-style-type: none"> ◦ 0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. ◦ 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5. ◦ 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm ◦ 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm] ◦ 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. ◦ 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. <p>These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.</p> <p>It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:</p> <ul style="list-style-type: none"> • A 16-bit instruction, that can only be followed by another 16-bit instruction. • The first half of a 32-bit instruction. <p>This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.</p> <p>An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.</p> |

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information, see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR_EL1 then it must also be implemented in the [SCTLR_EL2](#), [HSTCLR](#), and [SCTLR](#).

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

Otherwise:

Reserved, RES1.

nAA, bit [6]

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions.

| nAA | Meaning |
|-----|--|
| 0b0 | LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses. |
| 0b1 | This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes. |

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]

When EL0 is capable of using AArch32:

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

| CP15BEN | Meaning |
|---------|--|
| 0b0 | EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is UNDEFINED and generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2 .TGE is 1. The exception is reported using an ESR_ELx.EC value of 0x00. |
| 0b1 | EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is enabled. |

CP15BEN is optional, but if it is implemented in the SCTLR_EL1 then it must also be implemented in the [SCTLR_EL2](#), [HSCTLR](#), and [SCTLR](#).

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement CP15BEN, access to this field is **RAO/WI**.

Otherwise:

Reserved, RES0.

SA0, bit [4]

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Stage 1 Cacheability control, for data accesses.

| C | Meaning |
|-----|--|
| 0b0 | All data access to Stage 1 Normal memory from EL0 and EL1, and all Normal memory accesses from unified cache to the EL1&0 Stage 1 translation tables, are treated as Stage 1 Non-cacheable. |
| 0b1 | This control has no effect on the Stage 1 Cacheability of: <ul style="list-style-type: none"> Data access to Normal memory from EL0 and EL1. Normal memory accesses to the EL1&0 Stage 1 translation tables. |

When the value of the [HCR_EL2](#).DC bit is 1, the PE ignores SCTLR.C. This means that Non-secure EL0 and Non-secure EL1 data accesses to Normal memory are Cacheable.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0.

| A | Meaning |
|-----|---|
| 0b0 | Alignment fault checking disabled when executing at EL1 or EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed. |
| 0b1 | Alignment fault checking enabled when executing at EL1 or EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception. |

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL1&0 stage 1 address translation.

| M | Meaning |
|-----|---|
| 0b0 | EL1&0 stage 1 address translation disabled. See the SCTLR_EL1.I field for the behavior of instruction accesses to Normal memory. |
| 0b1 | EL1&0 stage 1 address translation enabled. |

If the value of [HCR_EL2](#).{DC, TGE} is not {0, 0} then in Non-secure state the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of the field.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL1, this field resets to 0.

Accessing SCTLR_EL1

When [HCR_EL2](#).E2H is 1, without explicit synchronization, access from EL3 using the mnemonic SCTLR_EL1 or SCTLR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0001 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;

SCTLR_EL2, System Control Register (EL2)

The SCTLR_EL2 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL2.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, these controls apply also to execution at EL0.

Configuration

AArch64 System register SCTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HSCTLR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SCTLR_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | |

TIDCP, bit [63]

When FEAT_TIDCP1 is implemented and HCR_EL2.E2H == 1:

Trap IMPLEMENTATION DEFINED functionality. Traps EL0 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2.

| TIDCP | Meaning |
|-------|--|
| 0b0 | No instructions accessing the System register or System instruction spaces are trapped by this mechanism. |
| 0b1 | <p>If HCR_EL2.TGE==0, no instructions accessing the System register or System instruction spaces are trapped by this mechanism.</p> <p>If HCR_EL2.TGE==1, instructions accessing the following System register or System instruction spaces are trapped to EL2 by this mechanism:</p> <ul style="list-style-type: none"> In AArch64 state, EL0 access to the encodings in the following reserved encoding spaces are trapped and reported using EC syndrome 0x18: <ul style="list-style-type: none"> IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}. IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name. In AArch32 state, EL0 MCR and MRC access to the following encodings are trapped and reported using EC syndrome 0x03: <ul style="list-style-type: none"> All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}. All coproc==p15, CRn==c10, opc1 == {0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}. All coproc==p15, CRn==c11, opc1 == {0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPINTMASK, bit [62]

When FEAT_NMI is implemented:

Superpriority Interrupt Mask enable. When SCTLR_EL2.NMI is 1, controls the value of PSTATE.ALLINT on taking an exception to EL2.

| SPINTMASK | Meaning |
|-----------|--|
| 0b0 | PSTATE.ALLINT is set to 1 on taking an exception to EL2. |
| 0b1 | PSTATE.ALLINT is set to 0 on taking an exception to EL2. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]

When FEAT_NMI is implemented:

Non-maskable Interrupt enable. Enables support for IRQ and FIQ interrupts with Superpriority, and determines additional masking behavior of the PSTATE.I and PSTATE.F flags.

| NMI | Meaning |
|-----|--|
| 0b0 | The behaviour of PSTATE.I and PSTATE.F is unchanged. IRQ and FIQ interrupts with Superpriority have no effect on interrupts that are targeted at EL2. |
| 0b1 | IRQ and FIQ interrupts can be marked as having Superpriority as an additional attribute, and additional Superpriority masking behavior is determined by PSTATE.ALLINT. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Otherwise:

Reserved, RES0.

EnTP2, bit [60]

When FEAT_SME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps instructions executed at EL0 that access [TPIDR2_EL0](#) to EL2 when EL2 is implemented and enabled for the current Security state. The exception is reported using ESR_ELx.EC value 0x18.

| EnTP2 | Meaning |
|-------|---|
| 0b0 | This control causes execution of these instructions at EL0 to be trapped. |
| 0b1 | This control does not cause execution of any instructions to be trapped. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [59:58]

Reserved, RES0.

EPAN, bit [57]

When FEAT_PAN3 is implemented and HCR_EL2.E2H == 1:

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL2 data access to a page with EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

| EPAN | Meaning |
|------|---|
| 0b0 | No additional Permission faults are generated by this mechanism. |
| 0b1 | An EL2 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault. Any speculative data accesses that would generate a Permission fault if the accesses were not speculative will not cause an allocation into a cache. |

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [56]

When FEAT_LS64 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of an LD64B or ST64B instruction at EL0 to EL2.

| EnALS | Meaning |
|-------|--|
| 0b0 | Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2. |
| 0b1 | This control does not cause any instructions to be trapped. |

A trap of an LD64B or ST64B instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000002.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]

When FEAT_LS64 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of an ST64BV0 instruction at EL0 to EL2.

| EnAS0 | Meaning |
|-------|---|
| 0b0 | Execution of an ST64BV0 instruction at EL0 is trapped to EL2. |
| 0b1 | This control does not cause any instructions to be trapped. |

A trap of an ST64BV0 instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [54]

When FEAT_LS64 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of an ST64BV instruction at EL0 to EL2.

| EnASR | Meaning |
|-------|--|
| 0b0 | Execution of an ST64BV instruction at EL0 is trapped to EL2. |
| 0b1 | This control does not cause any instructions to be trapped. |

A trap of an ST64BV instruction is reported using an ESR_ELx.EC value of 0x0A, with an ISS code of 0x0000000.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME, bit [53]

When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL2.

| TME | Meaning |
|------------|---|
| 0b0 | Any attempt to execute a TSTART instruction at EL2 is trapped, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL2. |
| 0b1 | This control does not cause any TSTART instruction to be trapped. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TME0, bit [52]

When FEAT_TME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Enables the Transactional Memory Extension at EL0.

| TME0 | Meaning |
|-------------|--|
| 0b0 | Any attempt to execute a TSTART instruction at EL0 is trapped to EL2, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL0. |
| 0b1 | This control does not cause any TSTART instruction to be trapped. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT, bit [51]

When FEAT_TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL2.

| TMT | Meaning |
|------------|---|
| 0b0 | This control does not cause any TSTART instruction to fail. |
| 0b1 | When the TSTART instruction is executed at EL2, the transaction fails with a TRIVIAL failure cause. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMT0, bit [50]

When FEAT_TME is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Forces a trivial implementation of the Transactional Memory Extension at EL0.

| TMT0 | Meaning |
|-------------|---|
| 0b0 | This control does not cause any TSTART instruction to fail. |
| 0b1 | When the TSTART instruction is executed at EL0, the transaction fails with a TRIVIAL failure cause. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEL, bits [49:46]

When FEAT_TWED is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE caused by SCTLR_EL2.nTWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]

When FEAT_TWED is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

TWE Delay Enable. Enables a configurable delayed trap of the WFE instruction caused by SCTLR_EL2.nTWE.

| TWEDEn | Meaning |
|---------------|---|
| 0b0 | The delay for taking a WFE trap is IMPLEMENTATION DEFINED. |
| 0b1 | The delay for taking a WFE trap is at least the number of cycles defined in SCTLR_EL2.TWEDEL. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

| DSSBS | Meaning |
|-------|---|
| 0b0 | PSTATE.SSBS is set to 0 on an exception to EL2. |
| 0b1 | PSTATE.SSBS is set to 1 on an exception to EL2. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL2. When [SCR_EL3.ATA](#) is 1, controls EL2 access to Allocation Tags.

| ATA | Meaning |
|-----|--|
| 0b0 | Access to Allocation Tags is prevented. |
| 0b1 | This control does not prevent access to Allocation Tags. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]

When FEAT_MTE2 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Allocation Tag Access in EL0. When [SCR_EL3.ATA](#) is 1, controls EL0 access to Allocation Tags.

| ATA0 | Meaning |
|------|--|
| 0b0 | Access to Allocation Tags is prevented. |
| 0b1 | This control does not prevent access to Allocation Tags. |

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:

Tag Check Fault in EL2. Controls the effect of Tag Check Faults due to Loads and Stores in EL2.

| TCF | Meaning | Applies when |
|------|--|-------------------------------|
| 0b00 | Tag Check Faults have no effect on the PE. | When FEAT_MTE3 is implemented |
| 0b01 | Tag Check Faults cause a synchronous exception. | |
| 0b10 | Tag Check Faults are asynchronously accumulated. | |
| 0b11 | Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes. | |

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]

When FEAT_MTE2 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Tag Check Fault in EL0. Controls the effect of Tag Check Faults due to Loads and Stores in EL0.

| TCF0 | Meaning | Applies when |
|------|--|-------------------------------|
| 0b00 | Tag Check Faults have no effect on the PE. | When FEAT_MTE3 is implemented |
| 0b01 | Tag Check Faults cause a synchronous exception. | |
| 0b10 | Tag Check Faults are asynchronously accumulated. | |
| 0b11 | Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes. | |

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]**When FEAT_MTE2 is implemented:**

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL2, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into [TFSRE0_EL1](#), [TFSR_EL1](#) and [TFSR_EL2](#) registers.

| ITFSB | Meaning |
|-------|--|
| 0b0 | Tag Check Faults are not synchronized on entry to EL2. |
| 0b1 | Tag Check Faults are synchronized on entry to EL2. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bit [36]**When FEAT_BT1 is implemented:**

PAC Branch Type compatibility at EL2.

When [HCR_EL2](#).{E2H, TGE} == {1, 1}, this bit is named BT1.

| BT | Meaning |
|-----|--|
| 0b0 | When the PE is executing at EL2, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11. |
| 0b1 | When the PE is executing at EL2, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]**When FEAT_BT1 is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:**

PAC Branch Type compatibility at EL0.

| BT0 | Meaning |
|-----|--|
| 0b0 | When the PE is executing at EL0, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11. |
| 0b1 | When the PE is executing at EL0, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [34]

Reserved, RES0.

MSCEn, bit [33]

When FEAT_MOPS is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

MemCpy and MemSet instructions Enable. Enables execution of the MemCpy and MemSet instructions at EL0.

| MSCEn | Meaning |
|-------|--|
| 0b0 | Execution of the MemCpy and MemSet instructions is UNDEFINED at EL0. |
| 0b1 | This control does not cause any instructions to be UNDEFINED. |

When FEAT_MOPS is implemented and [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CMOW, bit [32]

When FEAT_CMOW is implemented and HCR_EL2.E2H == 1:

Controls cache maintenance instruction permission for the following instructions executed at EL0.

- [IC IVAU](#), [DC CIVAC](#), [DC CIGDVAC](#) and [DC CIGVAC](#).

| CMOW | Meaning |
|------|--|
| 0b0 | These instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, do not generate a stage 1 permission fault. |
| 0b1 | If enabled as a result of SCTLR_EL2 .UCI==1, these instructions executed at EL0 with stage 1 read permission, but without stage 1 write permission, generate a stage 1 permission fault. |

When [HCR_EL2](#).TGE is 0, this bit has no effect on execution at EL0.

For this control, stage 1 has write permission if all of the following apply:

- AP[2] is 0 or DBM is 1 in the stage 1 descriptor.
- Where APTTable is in use, APTTable[1] is 0 for all levels of the translation table.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIA, bit [31]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

| EnIA | Meaning |
|------|---|
| 0b0 | Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled. |
| 0b1 | Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled. |

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

| EnIB | Meaning |
|------|---|
| 0b0 | Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled. |
| 0b1 | Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled. |

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]

When FEAT_LSMAOC is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

| LSMAOE | Meaning |
|--------|---|
| 0b0 | For all memory accesses at EL0, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered. |
| 0b1 | The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0. |

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]

When FEAT_LSMAOC is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

| nTLSMD | Meaning |
|--------|--|
| 0b0 | All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault. |
| 0b1 | All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped. |

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnDA, bit [27]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

| EnDA | Meaning |
|------|--|
| 0b0 | Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled. |
| 0b1 | Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled. |

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

When `HCR_EL2.E2H == 1` and `HCR_EL2.TGE == 1`:

Traps execution of cache maintenance instructions at EL0 to EL2, from AArch64 state only. This applies to [DC CVAU](#), [DC CIVAC](#), [DC CVAC](#), [DC CVAP](#), and [IC IVAU](#).

If FEAT_DPB2 is implemented, this trap also applies to [DC CVADP](#).

If FEAT_MTE is implemented, this trap also applies to [DC CIGVAC](#), [DC CIGDVAC](#), [DC CGVAC](#), [DC CGDVAC](#), [DC CGVAP](#), and [DC CGDVAP](#).

If FEAT_DPB2 and FEAT_MTE are implemented, this trap also applies to [DC CGVADP](#) and [DC CGDVADP](#).

| UCI | Meaning |
|-----|---|
| 0b0 | Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. |
| 0b1 | This control does not cause any instructions to be trapped. |

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

| EE | Meaning |
|-----|---|
| 0b0 | Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are little-endian. |
| 0b1 | Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are big-endian. |

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

EOE, bit [24]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Endianness of data accesses at EL0.

| EOE | Meaning |
|-----|--|
| 0b0 | Explicit data accesses at EL0 are little-endian. |
| 0b1 | Explicit data accesses at EL0 are big-endian. |

If an implementation only supports Little-endian accesses at EL0, then this bit is RES0. This option is not permitted when SCTLR_EL1.EE is RES1.

If an implementation only supports Big-endian accesses at EL0, then this bit is RES1. This option is not permitted when SCTLR_EL1.EE is RES0.

This bit has no effect on the endianness of LDTR, LDTRH, LDTRSH, LDTRSW, STTR, and STTRH instructions executed at EL1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPAN, bit [23]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Set Privileged Access Never, on taking an exception to EL2.

| SPAN | Meaning |
|------|--|
| 0b0 | PSTATE.PAN is set to 1 on taking an exception to EL2. |
| 0b1 | The value of PSTATE.PAN is left unchanged on taking an exception to EL2. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EIS, bit [22]**When FEAT_ExS is implemented:**

Exception entry is a context synchronization event.

| EIS | Meaning |
|------------|---|
| 0b0 | The taking of an exception to EL2 is not a context synchronization event. |
| 0b1 | The taking of an exception to EL2 is a context synchronization event. |

If SCTLR_EL2.EIS is set to 0b0:

- Indirect writes to [ESR_EL2](#), [FAR_EL2](#), [SPSR_EL2](#), [ELR_EL2](#), and [HPFAR_EL2](#) are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]**When FEAT_IESB is implemented:**

Implicit Error Synchronization event enable.

| IESB | Meaning |
|-------------|--|
| 0b0 | Disabled. |
| 0b1 | An implicit error synchronization event is added: <ul style="list-style-type: none"> • At each exception taken to EL2. • Before the operational pseudocode of each ERET instruction executed at EL2. |

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]

When (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented), HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.

| TSCXT | Meaning |
|--------------|--|
| 0b0 | EL0 access to SCXTNUM_EL0 is not disabled by this mechanism. |
| 0b1 | EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL2, and the SCXTNUM_EL0 value is treated as 0. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When FEAT_CSV2_2 is not implemented, FEAT_CSV2_1p2 is not implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES1.

Otherwise:

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

| WXN | Meaning |
|------------|---|
| 0b0 | This control has no effect on memory access permissions. |
| 0b1 | Any region that is writable in the EL2 or EL2&0 translation regime is forced to XN for accesses from software executing at EL2. |

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of WFE instructions at EL0 to EL2, from both Execution states.

| nTWE | Meaning |
|-------------|--|
| 0b0 | Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state. |
| 0b1 | This control does not cause any instructions to be trapped. |

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of WFI instructions at EL0 to EL2, from both Execution states.

| nTWI | Meaning |
|------|---|
| 0b0 | Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state. |
| 0b1 | This control does not cause any instructions to be trapped. |

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE or WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

UCT, bit [15]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps EL0 accesses to the [CTR_ELO](#) to EL2, from AArch64 state only.

| UCT | Meaning |
|-----|--|
| 0b0 | Accesses to the CTR_ELO from EL0 using AArch64 are trapped to EL2. |
| 0b1 | This control does not cause any instructions to be trapped. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DZE, bit [14]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Traps execution of [DC ZVA](#) instructions at EL0 to EL2, from AArch64 state only.

If FEAT_MTE is implemented, this trap also applies to [DC GVA](#) and [DC GZVA](#).

| DZE | Meaning |
|-----|---|
| 0b0 | Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions that this trap applies to are not supported. |
| 0b1 | This control does not cause any instructions to be trapped. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnDB, bit [13]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL2 or EL2&0 translation regime.

For more information, see 'System register control of pointer authentication'.

| EnDB | Meaning |
|------|--|
| 0b0 | Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled. |
| 0b1 | Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled. |

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2 and, when EL2 is enabled in the current Security state and [HCR_EL2](#).{E2H,TGE} == {1,1}, EL0.

| I | Meaning |
|----------|---|
| 0b0 | All instruction accesses to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. When EL2 is enabled in the current Security state and HCR_EL2 .{E2H, TGE} == {1, 1}, all instruction accesses to Normal memory from EL0 are Non-cacheable for all levels of instruction and unified cache. If SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory. |
| 0b1 | This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and, when EL2 is enabled in the current Security state and HCR_EL2 .{E2H, TGE} == {1, 1}, instruction access to Normal memory from EL0. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory. |

This bit has no effect on the EL3 translation regime.

When EL2 is disabled in the current Security state or [HCR_EL2](#).{E2H,TGE} != {1,1}, this bit has no effect on the EL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

EOS, bit [11]

When FEAT_ExS is implemented:

Exception exit is a context synchronization event.

| EOS | Meaning |
|------------|--|
| 0b0 | An exception return from EL2 is not a context synchronization event. |
| 0b1 | An exception return from EL2 is a context synchronization event. |

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from [SPSR_EL2](#) and [ELR_EL2](#) on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]

When FEAT_SPECRES is implemented, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Enable EL0 Access to the following instructions:

- AArch32 CFPRCTX, DVPRCTX and CPPRCTX instructions.
- AArch64 CFP RCTX, DVP RCT and CPP RCTX instructions.

| EnRCTX | Meaning |
|--------|--|
| 0b0 | EL0 access to these instructions is disabled, and these instructions are trapped to EL1. |
| 0b1 | EL0 access to these instructions is enabled. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SED, bit [8]

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

| SED | Meaning |
|-----|---|
| 0b0 | SETEND instruction execution is enabled at EL0 using AArch32. |
| 0b1 | SETEND instructions are UNDEFINED at EL0 using AArch32. |

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When EL0 can only use AArch64, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES1.

Otherwise:

Reserved, RES0.

ITD, bit [7]

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

| ITD | Meaning |
|-----|---|
| 0b0 | All IT instruction functionality is enabled at EL0 using AArch32. |
| 0b1 | Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED: <ul style="list-style-type: none"> • All encodings of the IT instruction with hw1[3:0] != 1000. • All encodings of the subsequent instruction with the following values for hw1: <ul style="list-style-type: none"> ◦ 0b11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. ◦ 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions' in the Arm® Architecture Reference Manual, Armv8, for Armv8-A architecture profile, section F3.2.5. ◦ 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm ◦ 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm] ◦ 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. ◦ 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn. <p>These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.</p> <p>It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:</p> <ul style="list-style-type: none"> • A 16-bit instruction, that can only be followed by another 16-bit instruction. • The first half of a 32-bit instruction. <p>This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.</p> <p>An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.</p> |

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR_EL2 then it must also be implemented in the [SCTLR_EL1](#), [HSCTLR](#), and [SCTLR](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

When EL0 can only use AArch64, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES1.

Otherwise:

Reserved, RES0.

nAA, bit [6]

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults under certain conditions at EL2, and, when EL2 is enabled in the current Security state and [HCR_EL2](#).{E2H, TGE} == {1, 1}, EL0.

| nAA | Meaning |
|-----|--|
| 0b0 | LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses. |
| 0b1 | This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]

When EL0 is capable of using AArch32, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

| CP15BEN | Meaning |
|---------|--|
| 0b0 | EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is UNDEFINED. |
| 0b1 | EL0 using AArch32: EL0 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is enabled. |

CP15BEN is optional, but if it is implemented in the SCTLR_EL2 then it must also be implemented in the [SCTLR_EL1](#), [HSCTLR](#), and [SCTLR](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement CP15BEN, access to this field is **RAO/WI**.

When EL0 can only use AArch64, HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

Reserved, RES0.

Otherwise:

Reserved, RES1.

SA0, bit [4]

When HCR_EL2.E2H == 1 and HCR_EL2.TGE == 1:

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Data access Cacheability control, for accesses at EL2 and, when EL2 is enabled in the current Security state and [HCR_EL2](#).{E2H, TGE} == {1, 1}, EL0

| C | Meaning |
|-----|---|
| 0b0 | <p>The following are Non-cacheable for all levels of data and unified cache:</p> <ul style="list-style-type: none"> Data accesses to Normal memory from EL2. When HCR_EL2.{E2H, TGE} != {1, 1}, Normal memory accesses to the EL2 translation tables. When EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}: <ul style="list-style-type: none"> Data accesses to Normal memory from EL0. Normal memory accesses to the EL2&0 translation tables. |
| 0b1 | <p>This control has no effect on the Cacheability of:</p> <ul style="list-style-type: none"> Data access to Normal memory from EL2. When HCR_EL2.{E2H, TGE} != {1, 1}, Normal memory accesses to the EL2 translation tables. When EL2 is enabled in the current Security state and HCR_EL2.{E2H, TGE} == {1, 1}: <ul style="list-style-type: none"> Data accesses to Normal memory from EL0. Normal memory accesses to the EL2&0 translation tables. |

This bit has no effect on the EL3 translation regime.

When EL2 is disabled in the current Security state or [HCR_EL2](#).{E2H, TGE} != {1, 1}, this bit has no effect on the EL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and, when EL2 is enabled in the current Security state and [HCR_EL2](#).{E2H, TGE} == {1, 1}, EL0.

| A | Meaning |
|-----|--|
| 0b0 | Alignment fault checking disabled when executing at EL2. When EL2 is enabled in the current Security state and HCR_EL2 .{E2H, TGE} == {1, 1}, alignment fault checking disabled when executing at EL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed. |
| 0b1 | Alignment fault checking enabled when executing at EL2. When EL2 is enabled in the current Security state and HCR_EL2 .{E2H, TGE} == {1, 1}, alignment fault checking enabled when executing at EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception. |

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 or EL2&0 stage 1 address translation.

| M | Meaning |
|-----|--|
| 0b0 | When HCR_EL2 .{E2H, TGE} != {1, 1}, EL2 stage 1 address translation disabled. When HCR_EL2 .{E2H, TGE} == {1, 1}, EL2&0 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory. |
| 0b1 | When HCR_EL2 .{E2H, TGE} != {1, 1}, EL2 stage 1 address translation enabled. When HCR_EL2 .{E2H, TGE} == {1, 1}, EL2&0 stage 1 address translation enabled. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing SCTLR_EL2

When [HCR_EL2](#).E2H is 1, without explicit synchronization, access from EL2 using the mnemonic SCTLR_EL2 or SCTLR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL2

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0001 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then

SCTLR_EL3, System Control Register (EL3)

The SCTLR_EL3 characteristics are:

Purpose

Provides top level control of the system, including its memory system, at EL3.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to SCTLR_EL3 are UNDEFINED.

Attributes

SCTLR_EL3 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | |

Bit [63]

Reserved, RES0.

SPINTMASK, bit [62]

When FEAT_NMI is implemented:

Superpriority Interrupt Mask enable. When SCTLR_EL3.NMI is 1, controls the value of PSTATE.ALLINT on taking an exception to EL3.

| SPINTMASK | Meaning |
|-----------|--|
| 0b0 | PSTATE.ALLINT is set to 1 on taking an exception to EL3. |
| 0b1 | PSTATE.ALLINT is set to 0 on taking an exception to EL3. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]

When FEAT_NMI is implemented:

Non-maskable Interrupt enable. Enables support for IRQ and FIQ interrupts with Superpriority, and determines additional masking behavior of the PSTATE.I and PSTATE.F flags.

| NMI | Meaning |
|-----|--|
| 0b0 | The behaviour of PSTATE.I and PSTATE.F is unchanged. IRQ and FIQ interrupts with Superpriority have no effect on interrupts that are targeted at EL3. |
| 0b1 | IRQ and FIQ interrupts can be marked as having Superpriority as an additional attribute, and additional Superpriority masking behavior is determined by PSTATE.ALLINT. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [60:54]

Reserved, RES0.

TME, bit [53]

When FEAT_TME is implemented:

Enables the Transactional Memory Extension at EL3.

| TME | Meaning |
|-----|---|
| 0b0 | Any attempt to execute a TSTART instruction at EL3 is trapped, unless HCR_EL2.TME or SCR_EL3.TME causes TSTART instructions to be UNDEFINED at EL3. |
| 0b1 | This control does not cause any TSTART instruction to be trapped. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [52]

Reserved, RES0.

TMT, bit [51]

When FEAT_TME is implemented:

Forces a trivial implementation of the Transactional Memory Extension at EL3.

| TMT | Meaning |
|-----|---|
| 0b0 | This control does not cause any TSTART instruction to fail. |
| 0b1 | When the TSTART instruction is executed at EL3, the transaction fails with a TRIVIAL failure cause. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [50:45]

Reserved, RES0.

DSSBS, bit [44]

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

| DSSBS | Meaning |
|-------|---|
| 0b0 | PSTATE.SSBS is set to 0 on an exception to EL3. |
| 0b1 | PSTATE.SSBS is set to 1 on an exception to EL3. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]

When FEAT_MTE2 is implemented:

Allocation Tag Access in EL3. Controls EL3 access to Allocation Tags.

| ATA | Meaning |
|-----|--|
| 0b0 | Access to Allocation Tags is prevented. |
| 0b1 | This control does not prevent access to Allocation Tags. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TCF, bits [41:40]

When FEAT_MTE2 is implemented:

Tag Check Fault in EL3. Controls the effect of Tag Check Faults due to Loads and Stores in EL3.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

| TCF | Meaning | Applies when |
|------|--|-------------------------------|
| 0b00 | Tag Check Faults have no effect on the PE. | |
| 0b01 | Tag Check Faults cause a synchronous exception. | |
| 0b10 | Tag Check Faults are asynchronously accumulated. | |
| 0b11 | Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes. | When FEAT_MTE3 is implemented |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

ITFSB, bit [37]

When FEAT_MTE2 is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL3, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into [TFSRE0_EL1](#) and TFSR_ELx registers.

| ITFSB | Meaning |
|-------|--|
| 0b0 | Tag Check Faults are not synchronized on entry to EL3. |
| 0b1 | Tag Check Faults are synchronized on entry to EL3. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bit [36]

When FEAT_BTI is implemented:

PAC Branch Type compatibility at EL3.

| BT | Meaning |
|-----|--|
| 0b0 | When the PE is executing at EL3, PACIASP and PACIBSP are compatible with PSTATE.BTYPE == 0b11. |
| 0b1 | When the PE is executing at EL3, PACIASP and PACIBSP are not compatible with PSTATE.BTYPE == 0b11. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:32]

Reserved, RES0.

EnIA, bit [31]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APIAKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

| EnIA | Meaning |
|------|---|
| 0b0 | Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is not enabled. |
| 0b1 | Pointer authentication (using the APIAKey_EL1 key) of instruction addresses is enabled. |

For more information, see 'System register control of pointer authentication'.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APIBKey_EL1 key) of instruction addresses in the EL3 translation regime.

Possible values of this bit are:

| EnIB | Meaning |
|------|---|
| 0b0 | Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is not enabled. |
| 0b1 | Pointer authentication (using the APIBKey_EL1 key) of instruction addresses is enabled. |

For more information, see 'System register control of pointer authentication'.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a

pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication (using the APDAKey_EL1 key) of instruction addresses in the EL3 translation regime.

| EnDA | Meaning |
|------|--|
| 0b0 | Pointer authentication (using the APDAKey_EL1 key) of data addresses is not enabled. |
| 0b1 | Pointer authentication (using the APDAKey_EL1 key) of data addresses is enabled. |

For more information, see 'System register control of pointer authentication'.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]

Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

| EE | Meaning |
|-----|---|
| 0b0 | Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian. |
| 0b1 | Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian. |

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The EE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bit [23]

Reserved, RES1.

EIS, bit [22]

When FEAT_ExS is implemented:

Exception Entry is Context Synchronizing.

| EIS | Meaning |
|-----|---|
| 0b0 | The taking of an exception to EL3 is not a context synchronizing event. |
| 0b1 | The taking of an exception to EL3 is a context synchronizing event. |

If SCTLR_EL3.EIS is set to 0b0:

- Indirect writes to [ESR_EL3](#), [FAR_EL3](#), [SPSR_EL3](#), [ELR_EL3](#) are synchronized on exception entry to EL3, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EIS:

- Changes to the PSTATE information on entry to EL3.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Debug state exit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]

When FEAT_IESB is implemented:

Implicit Error Synchronization event enable.

| IESB | Meaning |
|-------------|--|
| 0b0 | Disabled. |
| 0b1 | An implicit error synchronization event is added: <ul style="list-style-type: none"> • At each exception taken to EL3. • Before the operational pseudocode of each ERET instruction executed at EL3. |

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field and, if implemented, [SCR_EL3.NMEA](#). If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSX instruction taken to EL3 and before each DRPS instruction executed at EL3, in addition to the other cases where it is added.

When FEAT_DoubleFault is implemented, the PE is in Non-debug state, and the Effective value of [SCR_EL3.NMEA](#) is 1, this field is ignored and its Effective value is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN.

| WXN | Meaning |
|------------|--|
| 0b0 | This control has no effect on memory access permissions. |
| 0b1 | Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3. |

This bit applies only when SCTLR_EL3.M bit is set.

The WXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:14]

Reserved, RES0.

EnDB, bit [13]**When FEAT_PAuth is implemented:**

Controls enabling of pointer authentication (using the APDBKey_EL1 key) of instruction addresses in the EL3 translation regime.

| EnDB | Meaning |
|------|--|
| 0b0 | Pointer authentication (using the APDBKey_EL1 key) of data addresses is not enabled. |
| 0b1 | Pointer authentication (using the APDBKey_EL1 key) of data addresses is enabled. |

For more information, see 'System register control of pointer authentication'.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL3:

| I | Meaning |
|-----|---|
| 0b0 | All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory. |
| 0b1 | This control has no effect on the Cacheability of instruction access to Normal memory from EL3. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory. |

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

EOS, bit [11]**When FEAT_ExS is implemented:**

Exception Exit is Context Synchronizing.

| EOS | Meaning |
|-----|---|
| 0b0 | An exception return from EL3 is not a context synchronizing event |
| 0b1 | An exception return from EL3 is a context synchronizing event |

If SCTLR_EL3.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EOS:

- The indirect write of the PSTATE and PC values from [SPSR_EL3](#) and [ELR_EL3](#) on exception return is synchronized.
- If the PE enters Debug state before the first instruction after an Exception return from EL3 to Non-secure state, any pending Halting debug event completes execution.
- The GIC behavior that allocates interrupts to FIQ or IRQ changes simultaneously with leaving the EL3 Exception level.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [10:7]

Reserved, RES0.

nAA, bit [6]

When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL3 under certain conditions.

| nAA | Meaning |
|-----|--|
| 0b0 | LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes for accesses. |
| 0b1 | This control bit does not cause LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH, STLLR, STLLRH, STLR, STLRH, STLUR, or STLURH to generate an Alignment fault if all bytes being accessed are not within a single 16-byte quantity, aligned to 16 bytes. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

| C | Meaning |
|----------|--|
| 0b0 | All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache. |
| 0b1 | This control has no effect on the Cacheability of: <ul style="list-style-type: none"> Data access to Normal memory from EL3. Normal memory accesses to the EL3 translation tables. |

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL3.

| A | Meaning |
|----------|---|
| 0b0 | Alignment fault checking disabled when executing at EL3. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed. |
| 0b1 | Alignment fault checking enabled when executing at EL3. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception. |

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

| M | Meaning |
|----------|--|
| 0b0 | EL3 stage 1 address translation disabled. See the SCTLR_EL3.I field for the behavior of instruction accesses to Normal memory. |
| 0b1 | EL3 stage 1 address translation enabled. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL3, this field resets to 0.

Accessing SCTLR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL3

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b0001 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;

SCXTNUM_EL0, EL0 Read/Write Software Context Number

The SCXTNUM_EL0 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL0 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

Configuration

This register is present only when FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented. Otherwise, direct accesses to SCXTNUM_EL0 are UNDEFINED.

Attributes

SCXTNUM_EL0 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

SCXTNUM_EL1, EL1 Read/Write Software Context Number

The SCXTNUM_EL1 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL1 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

Configuration

This register is present only when FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented. Otherwise, direct accesses to SCXTNUM_EL1 are UNDEFINED.

Attributes

SCXTNUM_EL1 is a 64-bit register.

SCXTNUM_EL2, EL2 Read/Write Software Context Number

The SCXTNUM_EL2 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL2 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

Configuration

This register is present only when FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented. Otherwise, direct accesses to SCXTNUM_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

SCXTNUM_EL2 is a 64-bit register.

SCXTNUM_EL3, EL3 Read/Write Software Context Number

The SCXTNUM_EL3 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL3 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

Configuration

This register is present only when EL3 is implemented and (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented). Otherwise, direct accesses to SCXTNUM_EL3 are UNDEFINED.

Attributes

SCXTNUM_EL3 is a 64-bit register.

Field descriptions

SDER32_EL2, AArch32 Secure Debug Enable Register

The SDER32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register [SDER](#) from Secure EL2 and EL3 only.

Configuration

AArch64 System register SDER32_EL2 bits [63:0] are architecturally mapped to AArch64 System register [SDER32_EL3\[63:0\]](#) when EL3 is implemented.

AArch64 System register SDER32_EL2 bits [31:0] are architecturally mapped to AArch32 System register [SDER\[31:0\]](#).

This register is present only when EL2 is implemented, FEAT_SEL2 is implemented and EL1 is capable of using AArch32. Otherwise, direct accesses to SDER32_EL2 are UNDEFINED.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

Attributes

SDER32_EL2 is a 64-bit register.

SDER32_EL3, AArch32 Secure Debug Enable Register

The SDER32_EL3 characteristics are:

Purpose

Allows access to the AArch32 register [SDER](#) from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register `SDER32_EL3` bits [63:0] are architecturally mapped to AArch64 System register `SDER32_EL2` [63:0] when EL2 is implemented and FEAT_SEL2 is implemented.

AArch64 System register SDER32_EL3 bits [31:0] are architecturally mapped to AArch32 System register [SDER\[31:0\]](#).

This register is present only when EL3 is implemented and EL1 is capable of using AArch32. Otherwise, direct accesses to `SDER32_EL3` are UNDEFINED.

This register is ignored by the PE when one or more of the following are true:

- The PE is in Non-secure state.
- EL1 is using AArch64.

Attributes

SDER32_EL3 is a 64-bit register.

```

SMCR_EL1, SME Control Register (EL1)

The SMCR_EL1 characteristics are:

Purpose

This register controls aspects of Streaming SVE that are visible at Exception levels EL1 and EL0.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMCR_EL1 are UNDEFINED.

This register has no effect if the PE is not in Streaming SVE mode.

When [HCR_EL2](#).{E2H, TGE} == {1, 1} and EL2 is enabled in the current Security state, this register has no effect on execution at EL0 and EL1.

Attributes

SMCR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|-----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

FA64, bit [31]

When FEAT_SME_FA64 is implemented:

Controls whether execution of an A64 instruction is considered legal when the PE is in Streaming SVE mode.

| FA64 | Meaning |
|------|---|
| 0b0 | This control does not cause any instruction to be treated as legal in Streaming SVE mode. |
| 0b1 | This control causes all implemented A64 instructions to be treated as legal in Streaming SVE mode at EL1 and EL0, if they are treated as legal at more privileged Exception levels in the current Security state. |

Arm recommends that portable SME software should not rely on this optional feature, and that operating systems should provide a means to test for compliance with this recommendation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Effective Streaming SVE Vector Length (SVL).

Constrains the effective Streaming SVE vector register length for EL1 and EL0 to (LEN+1)*128 bits. SVL only takes effect when the PE is in Streaming SVE mode.

An implementation is permitted to include any set of Streaming SVE vector lengths that are powers of two, from 128 bits to 2048 bits inclusive.

For all purposes other than returning the result of a direct read of SMCR_EL1, this field selects the effective vector length as follows:

- If the requested length is smaller than the minimum implemented Streaming SVE vector length, then the minimum implemented Streaming SVE vector length is used.
- If the requested length is larger than the effective vector length at the next more privileged Exception level in the current Security state, if any, then the effective vector length at the more privileged Exception level is used.
- If the requested length is not implemented, then the requested length rounded down to the nearest implemented Streaming SVE vector length is used.
- Otherwise, the requested length is used.

An indirect read of SMCR_EL1.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMCR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic SMCR_EL1 or SMCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMCR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0001 | 0b0010 | 0b110 |

SMCR_EL2, SME Control Register (EL2)

The SMCR_EL2 characteristics are:

Purpose

This register controls aspects of Streaming SVE that are visible at Exception levels EL2, EL1, and EL0.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMCR_EL2 are UNDEFINED.

This register has no effect if the PE is not in Streaming SVE mode, or if EL2 is not enabled in the current Security state.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

SMCR_EL2 is a 64-bit register.

Bits [63:32]

Reserved, RES0.

FA64, bit [31] When FEAT_SME_FA64 is implemented:

Controls whether execution of an A64 instruction is considered legal when the PE is in Streaming SVE mode.

| FA64 | Meaning |
|------|--|
| 0b0 | This control does not cause any instruction to be treated as legal in Streaming SVE mode. |
| 0b1 | This control causes all implemented A64 instructions to be treated as legal in Streaming SVE mode at EL2, if they are treated as legal at EL3. |

Arm recommends that portable SME software should not rely on this optional feature, and that operating systems should provide a means to test for compliance with this recommendation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Effective Streaming SVE Vector Length (SVL).

Constrains the effective Streaming SVE vector register length for EL2, EL1, and EL0 to (LEN+1)*128 bits when EL2 is enabled in the current Security state. SVL only takes effect when the PE is in Streaming SVE mode.

An implementation is permitted to include any set of Streaming SVE vector lengths that are powers of two, from 128 bits to 2048 bits inclusive.

For all purposes other than returning the result of a direct read of SMCR_EL2, this field selects the effective vector length as follows:

- If the requested length is smaller than the minimum implemented Streaming SVE vector length, then the minimum implemented Streaming SVE vector length is used.
- If the requested length is larger than the effective vector length at the next more privileged Exception level in the current Security state, if any, then the effective vector length at the more privileged Exception level is used.
- If the requested length is not implemented, then the requested length rounded down to the nearest implemented Streaming SVE vector length is used.
- Otherwise, the requested length is used.

An indirect read of SMCR_EL2.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMCR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic SMCR_EL2 or SMCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMCR_EL2

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0001 | 0b0010 | 0b110 |

```

Bits [63:32]

Reserved, RES0.

FA64, bit [31]

When FEAT_SME_FA64 is implemented:

Controls whether execution of an A64 instruction is considered legal when the PE is in Streaming SVE mode.

| FA64 | Meaning |
|------|---|
| 0b0 | This control does not cause any instruction to be treated as legal in Streaming SVE mode. |
| 0b1 | This control causes all implemented A64 instructions to be treated as legal in Streaming SVE mode at EL3. |

Arm recommends that portable SME software should not rely on this optional feature, and that operating systems should provide a means to test for compliance with this recommendation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Effective Streaming SVE Vector Length (SVL).

Constrains the effective Streaming SVE vector register length for all Exception levels to (LEN+1)*128 bits. SVL only takes effect when the PE is in Streaming SVE mode.

An implementation is permitted to include any set of Streaming SVE vector lengths that are powers of two, from 128 bits to 2048 bits inclusive.

For all purposes other than returning the result of a direct read of SMCR_EL3, this field selects the effective vector length as follows:

- If the requested length is smaller than the minimum implemented Streaming SVE vector length, then the minimum implemented Streaming SVE vector length is used.
- If the requested length is not implemented, then the requested length rounded down to the nearest implemented Streaming SVE vector length is used.
- Otherwise, the requested length is used.

An indirect read of SMCR_EL3.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

It is not required that this value is the same as the value of [MIDR_EL1.Implementer](#).

Access to this field is **RO**.

Revision, bits [23:16]

Revision number for the Streaming Mode Compute Unit (SMCU).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SMPS, bit [15]

Indicates support for Streaming SVE mode execution priority.

| SMPS | Meaning |
|------|---------------------------------|
| 0b0 | Priority control not supported. |
| 0b1 | Priority control supported. |

Bits [14:12]

Reserved, RES0.

Affinity, bits [11:0]

The SMCU affinity of the accessing PE.

- A value of zero indicates that the PE's implementation of Streaming SVE mode is not shared with other PEs.
- Otherwise, the value identifies which SMCU is associated with this PE. The Affinity value associated with each SMCU is unique within the system as a whole.

Accessing SMIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMIDR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b001 | 0b0000 | 0b0000 | 0b110 |

```

if PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2.TGE == '1' then
            AArch64.SystemAccessTrap(EL2, 0x18);
        else
            AArch64.SystemAccessTrap(EL1, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TID1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return SMIDR_EL1;
elseif PSTATE.EL == EL2 then
    return SMIDR_EL1;
elseif PSTATE.EL == EL3 then
    return SMIDR_EL1;

```

SMPRI_EL1, Streaming Mode Priority Register

The SMPRI_EL1 characteristics are:

Purpose

Configures the streaming execution priority for instructions executed on a shared Streaming Mode Compute Unit (SMCU) when the PE is in Streaming SVE mode at any Exception Level.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMPRI_EL1 are UNDEFINED.

When [SMIDR_EL1](#).SMPS is '0', this register is RES0.

Attributes

SMPRI_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:4]

Reserved, RES0.

Priority, bits [3:0]

Streaming execution priority value.

Either this value is used directly, or it is mapped into an effective priority value using [SMPRMAP_EL2](#).

This value is used directly when any of the following are true:

- The current Exception level is EL3 or EL2.
- The current Exception level is EL1 or EL0, if EL2 is implemented and enabled in the current Security state and [HCRX_EL2](#).SMPME is '0'.
- The current Exception level is EL1 or EL0, if EL2 is either not implemented or not enabled in the current Security state.

The precise meaning and behavior of each streaming execution priority value is IMPLEMENTATION DEFINED.

In an implementation that shares execution resources between PEs, higher priority values are allocated more processing resource than other PEs configured with lower priority values in the same Priority domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMPRI_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMPRI_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|

SMPRIMAP_EL2, Streaming Mode Priority Mapping Register

The SMPRIMAP_EL2 characteristics are:

Purpose

Maps the value in [SMPRI_EL1](#) to a streaming execution priority value for instructions executed at EL1 and EL0 in the same Security states as EL2.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMPRIMAP_EL2 are UNDEFINED.

When [SMIDR_EL1](#).SMPS is '0', this register is RES0.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

SMPRIMAP_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

When all of the following are true, the value in [SMPRI_EL1](#) is mapped to a streaming execution priority using this register:

- The current Exception level is EL1 or EL0.
- EL2 is implemented and enabled in the current Security state.
- [HCRX_EL2](#).SMPME is '1'.

Otherwise, [SMPRI_EL1](#) holds the streaming execution priority value.

P15, bits [63:60]

Priority Mapping Entry 15. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#).Priority value is '15'.

This value is the highest streaming execution priority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P14, bits [59:56]

Priority Mapping Entry 14. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#).Priority value is '14'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P13, bits [55:52]

Priority Mapping Entry 13. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '13'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P12, bits [51:48]

Priority Mapping Entry 12. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '12'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P11, bits [47:44]

Priority Mapping Entry 11. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '11'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P10, bits [43:40]

Priority Mapping Entry 10. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '10'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P9, bits [39:36]

Priority Mapping Entry 9. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '9'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P8, bits [35:32]

Priority Mapping Entry 8. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '8'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P7, bits [31:28]

Priority Mapping Entry 7. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '7'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P6, bits [27:24]

Priority Mapping Entry 6. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '6'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P5, bits [23:20]

Priority Mapping Entry 5. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '5'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P4, bits [19:16]

Priority Mapping Entry 4. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '4'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P3, bits [15:12]

Priority Mapping Entry 3. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '3'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P2, bits [11:8]

Priority Mapping Entry 2. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '2'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P1, bits [7:4]

Priority Mapping Entry 1. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '1'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P0, bits [3:0]

Priority Mapping Entry 0. This entry is used when priority mapping is supported and enabled, and the [SMPRI_EL1](#). Priority value is '0'.

This value is the lowest streaming execution priority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMPRIMAP_EL2

SP_EL0, Stack Pointer (EL0)

The SP_EL0 characteristics are:

Purpose

Holds the stack pointer associated with EL0. At higher Exception levels, this is used as the current stack pointer when the value of [SPSel.SP](#) is 0.

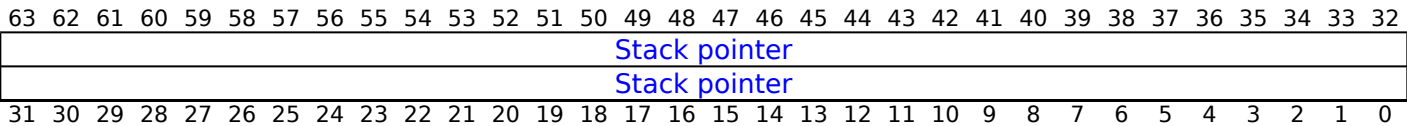

Configuration

There are no configuration notes.

Attributes

SP_EL0 is a 64-bit register.

Field descriptions

Bits [63:0]

Stack pointer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SP_EL0

When the value of PSTATE.SP is 0, this register is accessible at all Exception levels as the current stack pointer.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SP_EL0

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0100 | 0b0001 | 0b000 |

SP_EL1, Stack Pointer (EL1)

The SP_EL1 characteristics are:

Purpose

Holds the stack pointer associated with EL1. When executing at EL1, the value of [SPSel.SP](#) determines the current stack pointer:

| SPSel.SP | Current stack pointer |
|----------|------------------------|
| 0b0 | SP_EL0 |
| 0b1 | SP_EL1 |

Configuration

There are no configuration notes.

Attributes

SP_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

SP_EL2, Stack Pointer (EL2)

The SP_EL2 characteristics are:

Purpose

Holds the stack pointer associated with EL2. When executing at EL2, the value of [SPSel.SP](#) determines the current stack pointer:

| SPSel.SP | Current stack pointer |
|----------|------------------------|
| 0b0 | SP_EL0 |
| 0b1 | SP_EL2 |

Configuration

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SP_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| Stack pointer | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Stack pointer | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:0]

Stack pointer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SP_EL2

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of [SPSel.SP](#) is 1, this register is also accessible at EL2 as the current stack pointer.

Note

When the value of [SPSel.SP](#) is 0, [SP_EL0](#) is used as the current stack pointer at all Exception levels.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SP_EL2

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b0100 | 0b0001 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return SP_EL2;

```

MSR SP_EL2, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b0100 | 0b0001 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SP_EL2 = X[t];

```

SP_EL3, Stack Pointer (EL3)

The SP_EL3 characteristics are:

Purpose

Holds the stack pointer associated with EL3. When executing at EL3, the value of [SPSel.SP](#) determines the current stack pointer:

| SPSel.SP | Current stack pointer |
|----------|------------------------|
| 0b0 | SP_EL0 |
| 0b1 | SP_EL3 |

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to SP_EL3 are UNDEFINED.

Attributes

SP_EL3 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| Stack pointer | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Stack pointer | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:0]

Stack pointer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SP_EL3

This register is not accessible using MRS and MSR instructions.

When the value of [SPSel.SP](#) is 1, this register is accessible at EL3 as the current stack pointer.

Note

When the value of [SPSel.SP](#) is 0, [SP_EL0](#) is used as the current stack pointer at all Exception levels.

SPSel, Stack Pointer Select

The SPSel characteristics are:

Purpose

Allows the Stack Pointer to be selected between SP_EL0 and SP_ELx.

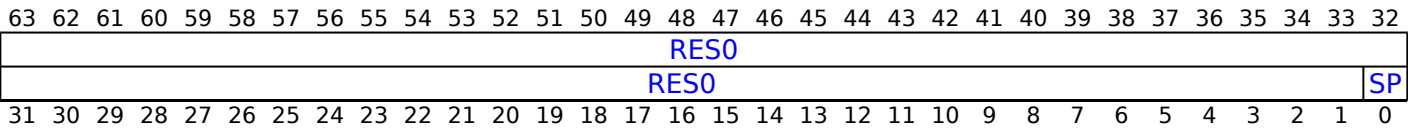

Configuration

There are no configuration notes.

Attributes

SPSel is a 64-bit register.

Field descriptions

Bits [63:1]

Reserved, RES0.

SP, bit [0]

Stack pointer to use. Possible values of this bit are:

| SP | Meaning |
|-----|-------------------------------------|
| 0b0 | Use SP_EL0 at all Exception levels. |
| 0b1 | Use SP_ELx for Exception level ELx. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Accessing SPSel

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSel

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0100 | 0b0010 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    return Zeros(63):PSTATE.SP;
elsif PSTATE.EL == EL2 then
    return Zeros(63):PSTATE.SP;
elsif PSTATE.EL == EL3 then
    return Zeros(63):PSTATE.SP;

```

MSR SPSel, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0100 | 0b0010 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    PSTATE.SP = X[t]<0>;
elsif PSTATE.EL == EL2 then
    PSTATE.SP = X[t]<0>;
elsif PSTATE.EL == EL3 then
    PSTATE.SP = X[t]<0>;

```

MSR SPSel, #<imm>

| op0 | op1 | CRn | op2 |
|------|-------|--------|-------|
| 0b00 | 0b000 | 0b0100 | 0b101 |

SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

Purpose

Holds the saved process state when an exception is taken to Abort mode.

Configuration

AArch64 System register SPSR_abt bits [31:0] are architecturally mapped to AArch32 System register [SPSR_abt\[31:0\]](#).

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_abt is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|---------|----|------|-----|-----|----|----|---------|----|----|----|----|----|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| N | Z | C | V | Q | IT[1:0] | J | SSBS | PAN | DIT | IL | GE | IT[7:2] | E | A | I | F | T | M[4:0] | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Abort mode, and copied to PSTATE.IT on executing an exception return operation in Abort mode.

SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_abt[26:25].
- IT[7:2] is SPSR_abt[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

| M[4:0] | Meaning |
|---------|-------------|
| 0b10000 | User. |
| 0b10001 | FIQ. |
| 0b10010 | IRQ. |
| 0b10011 | Supervisor. |
| 0b10111 | Abort. |
| 0b11011 | Undefined. |
| 0b11111 | System. |

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_abt

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_abt

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0100 | 0b0011 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    return SPSR_abt;
elseif PSTATE.EL == EL3 then
    return SPSR_abt;

```

MSR SPSR_abt, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0100 | 0b0011 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    SPSR_abt = X[t];
elseif PSTATE.EL == EL3 then
    SPSR_abt = X[t];

```

SPSR_EL1, Saved Program Status Register (EL1)

The SPSR_EL1 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL1.

Configuration

AArch64 System register SPSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [SPSR_svc\[31:0\]](#).

Attributes

SPSR_EL1 is a 64-bit register.

Field descriptions

When AArch32 is supported and exception taken from AArch32 state:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|---------|-----|------|-----|----|----|----|----|----|----|---------|----|----|----|----|----|----|----|----|------|----|----|----|--------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| N | Z | C | V | Q | IT[1:0] | DIT | SSBS | PAN | SS | IL | GE | | | | IT[7:2] | | | | E | A | I | F | T | M[4] | | | | M[3:0] | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL1, and copied to PSTATE.Q on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL1, and copied to PSTATE.IT on executing an exception return operation in EL1.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL1[26:25].
- IT[7:2] is SPSR_EL1[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL1, and copied to PSTATE.GE on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL1, and copied to PSTATE.E on executing an exception return operation in EL1.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL1, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL1, and copied to PSTATE.T on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL1 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

| M[4] | Meaning |
|-------------|--------------------------|
| 0b1 | AArch32 execution state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL1, and copied to PSTATE.M[3:0] on executing an exception return operation in EL1.

| M[3:0] | Meaning |
|---------------|----------------|
| 0b0000 | User. |
| 0b0001 | FIQ. |
| 0b0010 | IRQ. |
| 0b0011 | Supervisor. |
| 0b0111 | Abort. |
| 0b1011 | Undefined. |
| 0b1111 | System. |

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|------|-----|-----|-----|-----|----|----|------|----|----|----|--------|------|-------|----|----|----|----|------|------|--------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| N | Z | C | V | RES0 | TCO | DIT | UAO | PAN | SS | IL | RES0 | | | | ALLINT | SSBS | BTYPE | D | A | I | F | RES0 | M[4] | M[3:0] | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]

When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL1, and copied to PSTATE.TCO on executing an exception return operation in EL1.

When FEAT_MTE2 is not implemented, it is CONSTRAINED UNPREDICTABLE whether this field is RES0 or behaves as if FEAT_MTE is implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]

When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL1, and copied to PSTATE.UAO on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

ALLINT, bit [13]

When FEAT_NMI is implemented:

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on taking an exception to EL1, and copied to PSTATE.ALLINT on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL1, and copied to PSTATE.BTYPE on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL1, and copied to PSTATE.D on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL1 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

| M[4] | Meaning |
|-------------|--------------------------|
| 0b0 | AArch64 execution state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

| M[3:0] | Meaning |
|---------------|----------------|
| 0b0000 | EL0t. |
| 0b0100 | EL1t. |
| 0b0101 | EL1h. |

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL1 and copied to PSTATE.EL on executing an exception return operation in EL1.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL1 and copied to PSTATE.SP on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic SPSR_EL1 or SPSR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0100 | 0b0000 | 0b000 |

```

SPSR_EL2, Saved Program Status Register (EL2)

The SPSR_EL2 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL2.

Configuration

AArch64 System register SPSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [SPSR_hyp\[31:0\]](#).

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SPSR_EL2 is a 64-bit register.

Field descriptions

When AArch32 is supported and exception taken from AArch32 state:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|---------|-----|------|-----|----|----|----|---------|----|----|----|----|----|------|--------|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| N | Z | C | V | Q | IT[1:0] | DIT | SSBS | PAN | SS | IL | GE | IT[7:2] | E | A | I | F | T | M[4] | M[3:0] | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL2, and copied to PSTATE.Q on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL2, and copied to PSTATE.IT on executing an exception return operation in EL2.

SPSR_EL2.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL2[26:25].
- IT[7:2] is SPSR_EL2[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL2, and copied to PSTATE.GE on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL2, and copied to PSTATE.E on executing an exception return operation in EL2.

If the implementation does not support big-endian operation, SPSR_EL2.E is RES0. If the implementation does not support little-endian operation, SPSR_EL2.E is RES1. On executing an exception return operation in EL2, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL2.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL2.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL2, and copied to PSTATE.T on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL2 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

| M[4] | Meaning |
|-------------|--------------------------|
| 0b1 | AArch32 execution state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL2, and copied to PSTATE.M[3:0] on executing an exception return operation in EL2.

| M[3:0] | Meaning |
|---------------|----------------|
| 0b0000 | User. |
| 0b0001 | FIQ. |
| 0b0010 | IRQ. |
| 0b0011 | Supervisor. |
| 0b0111 | Abort. |
| 0b1010 | Hyp. |
| 0b1011 | Undefined. |
| 0b1111 | System. |

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|------|----|-----|-----|-----|----|----|------|----|----|--------|------|-------|----|----|----|----|------|------|--------|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| N | Z | C | V | RES0 | TC | DIT | UAO | PAN | SS | IL | RES0 | | | ALLINT | SSBS | BTYPE | D | A | I | F | RES0 | M[4] | M[3:0] | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]**When FEAT_MTE is implemented:**

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL2, and copied to PSTATE.TCO on executing an exception return operation in EL2.

When FEAT_MTE2 is not implemented, it is CONSTRAINED UNPREDICTABLE whether this field is RES0 or behaves as if FEAT_MTE is implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]**When FEAT_UAO is implemented:**

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL2, and copied to PSTATE.UAO on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

ALLINT, bit [13]

When FEAT_NMI is implemented:

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on taking an exception to EL2, and copied to PSTATE.ALLINT on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL2, and copied to PSTATE.BTYPE on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL2, and copied to PSTATE.D on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL2 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

| M[4] | Meaning |
|-------------|--------------------------|
| 0b0 | AArch64 execution state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

| M[3:0] | Meaning |
|---------------|----------------|
| 0b0000 | EL0t. |
| 0b0100 | EL1t. |
| 0b0101 | EL1h. |
| 0b1000 | EL2t. |
| 0b1001 | EL2h. |

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL2 and copied to PSTATE.EL on executing an exception return operation in EL2.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL2 and copied to PSTATE.SP on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic SPSR_EL2 or SPSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_EL2

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b11 | 0b100 | 0b0100 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return SPSR_EL1;
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return SPSR_EL2;
elsif PSTATE.EL == EL3 then
    return SPSR_EL2;

```

MSR SPSR_EL2, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b11 | 0b100 | 0b0100 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        SPSR_EL1 = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    SPSR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    SPSR_EL2 = X[t];

```

MRS <Xt>, SPSR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0100 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '011' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        return NVMem[0x160];
    else
        return SPSR_EL1;
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        return SPSR_EL2;
    else
        return SPSR_EL1;
elsif PSTATE.EL == EL3 then
    return SPSR_EL1;

```

MSR SPSR_EL1, <Xt>

| op0 | op1 | CRn | CRm | op2 |

| 0b11 | 0b000 | 0b0100 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '011' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        NVMem[0x160] = X[t];
    else
        SPSR_EL1 = X[t];
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        SPSR_EL2 = X[t];
    else
        SPSR_EL1 = X[t];
elsif PSTATE.EL == EL3 then
    SPSR_EL1 = X[t];

```

SPSR_EL3, Saved Program Status Register (EL3)

The SPSR_EL3 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL3.

Configuration

AArch64 System register SPSR_EL3 bits [31:0] can be mapped to AArch32 System register [SPSR_mon\[31:0\]](#), but this is not architecturally mandated.

This register is present only when EL3 is implemented. Otherwise, direct accesses to SPSR_EL3 are UNDEFINED.

Attributes

SPSR_EL3 is a 64-bit register.

Field descriptions

When AArch32 is supported and exception taken from AArch32 state:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|---------|-----|------|-----|----|----|----|---------|----|----|----|----|----|------|--------|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| N | Z | C | V | Q | IT[1:0] | DIT | SSBS | PAN | SS | IL | GE | IT[7:2] | E | A | I | F | T | M[4] | M[3:0] | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

An exception return from EL3 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL3, and copied to PSTATE.Q on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL3, and copied to PSTATE.IT on executing an exception return operation in EL3.

SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL3[26:25].
- IT[7:2] is SPSR_EL3[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL3, and copied to PSTATE.GE on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL3, and copied to PSTATE.E on executing an exception return operation in EL3.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL3, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL3, and copied to PSTATE.T on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL3 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

| M[4] | Meaning |
|-------------|--------------------------|
| 0b1 | AArch32 execution state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL3, and copied to PSTATE.M[3:0] on executing an exception return operation in EL3.

| M[3:0] | Meaning |
|---------------|----------------|
| 0b0000 | User. |
| 0b0001 | FIQ. |
| 0b0010 | IRQ. |
| 0b0011 | Supervisor. |
| 0b0110 | Monitor. |
| 0b0111 | Abort. |
| 0b1010 | Hyp. |
| 0b1011 | Undefined. |
| 0b1111 | System. |

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|------|----|-----|-----|-----|----|----|------|----|----|--------|------|-------|----|----|----|----|------|------|--------|----|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| N | Z | C | V | RES0 | TC | DIT | UAO | PAN | SS | IL | RES0 | | | ALLINT | SSBS | BTYPE | D | A | I | F | RES0 | M[4] | M[3:0] | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

An exception return from EL3 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]**When FEAT_MTE is implemented:**

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL3, and copied to PSTATE.TCO on executing an exception return operation in EL3.

When FEAT_MTE2 is not implemented, it is CONSTRAINED UNPREDICTABLE whether this field is RES0 or behaves as if FEAT_MTE is implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]**When FEAT_UAO is implemented:**

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL3, and copied to PSTATE.UAO on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:14]

Reserved, RES0.

ALLINT, bit [13]

When FEAT_NMI is implemented:

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on taking an exception to EL3, and copied to PSTATE.ALLINT on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]

When FEAT_BTI is implemented:

Branch Type Indicator. Set to the value of PSTATE.BTYPE on taking an exception to EL3, and copied to PSTATE.BTYPE on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL3, and copied to PSTATE.D on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL3 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

| M[4] | Meaning |
|-------------|--------------------------|
| 0b0 | AArch64 execution state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

| M[3:0] | Meaning |
|---------------|----------------|
| 0b0000 | EL0t. |
| 0b0100 | EL1t. |
| 0b0101 | EL1h. |
| 0b1000 | EL2t. |
| 0b1001 | EL2h. |
| 0b1100 | EL3t. |
| 0b1101 | EL3h. |

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL3 and copied to PSTATE.EL on executing an exception return operation in EL3.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL3 and copied to PSTATE.SP on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_EL3

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b11 | 0b110 | 0b0100 | 0b0000 | 0b000 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return SPSR_EL3;
```

MSR SPSR_EL3, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b11 | 0b110 | 0b0100 | 0b0000 | 0b000 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    SPSR_EL3 = X[t];
```

SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

Purpose

Holds the saved process state when an exception is taken to FIQ mode.

Configuration

AArch64 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch32 System register [SPSR_fiq\[31:0\]](#).

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_fiq is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| N | Z | C | V | Q | IT[1:0] | | J | SSBS | PAN | DIT | IL | GE | | | | IT[7:2] | | | | E | A | I | F | T | M[4:0] | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to FIQ mode, and copied to PSTATE.IT on executing an exception return operation in FIQ mode.

SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_fiq[26:25].
- IT[7:2] is SPSR_fiq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

| M[4:0] | Meaning |
|---------------|----------------|
| 0b10000 | User. |
| 0b10001 | FIQ. |
| 0b10010 | IRQ. |
| 0b10011 | Supervisor. |
| 0b10111 | Abort. |
| 0b11011 | Undefined. |
| 0b11111 | System. |

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_fiq

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_fiq

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to IRQ mode, and copied to PSTATE.IT on executing an exception return operation in IRQ mode.

SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_irq[26:25].
- IT[7:2] is SPSR_irq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

| M[4:0] | Meaning |
|---------------|----------------|
| 0b10000 | User. |
| 0b10001 | FIQ. |
| 0b10010 | IRQ. |
| 0b10011 | Supervisor. |
| 0b10111 | Abort. |
| 0b11011 | Undefined. |
| 0b11111 | System. |

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_irq

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_irq

| op0 | op1 | CRn | CRm | op2 |

SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

Purpose

Holds the saved process state when an exception is taken to Undefined mode.

Configuration

AArch64 System register SPSR_und bits [31:0] are architecturally mapped to AArch32 System register [SPSR_und\[31:0\]](#).

If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_und is a 64-bit register.

Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Undefined mode, and copied to PSTATE.IT on executing an exception return operation in Undefined mode.

SPSR_und.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_und[26:25].
- IT[7:2] is SPSR_und[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]**When FEAT_DIT is implemented:**

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

| M[4:0] | Meaning |
|---------------|----------------|
| 0b10000 | User. |
| 0b10001 | FIQ. |
| 0b10010 | IRQ. |
| 0b10011 | Supervisor. |
| 0b10111 | Abort. |
| 0b11011 | Undefined. |
| 0b11111 | System. |

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_und

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_und

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b11 | 0b100 | 0b0100 | 0b0011 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    return SPSR_und;
elseif PSTATE.EL == EL3 then
    return SPSR_und;

```

MSR SPSR_und, <Xt>

| op0 | op1 | CRn | CRm | op2 |

SSBS, Speculative Store Bypass Safe

The SSBS characteristics are:

Purpose

Allows access to the Speculative Store Bypass Safe bit.

Configuration

This register is present only when FEAT_SSBS is implemented. Otherwise, direct accesses to SSBS are UNDEFINED.

Attributes

SSBS is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:13]

Reserved, RES0.

SSBS, bit [12]

Speculative Store Bypass Safe.

Prohibits speculative loads or stores which might practically allow a cache timing side channel.

A cache timing side channel might be exploited where a load or store uses an address that is derived from a register that is being loaded from memory using a load instruction speculatively read from a memory location. If PSTATE.SSBS is enabled, the address derived from the load instruction might be from earlier in the coherence order than the latest store to that memory location with the same virtual address.

| SSBS | Meaning |
|------|---|
| 0b0 | Hardware is not permitted to load or store speculatively, in a manner that could practically give rise to a cache timing side channel, using an address derived from a register value that has been loaded from memory using a load instruction (L) that speculatively reads an entry from earlier in the coherence order from that location being loaded from than the entry generated by the latest store (S) to that location using the same virtual address as L. |
| 0b1 | Hardware is permitted to load or store speculatively, in a manner that could practically give rise to a cache timing side channel, using an address derived from a register value that has been loaded from memory using a load instruction (L) that speculatively reads an entry from earlier in the coherence order from that location being loaded from than the entry generated by the latest store (S) to that location using the same virtual address as L. |

The value of this bit is set to the value in the SCTLRL_ELx.DSSBS field on taking an exception to ELx.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [11:0]

Reserved, RES0.

Accessing SSBS

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SSBS

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b011 | 0b0100 | 0b0010 | 0b110 |

SVCR, Streaming Vector Control Register

The SVCR characteristics are:

Purpose

Controls Streaming SVE mode and SME behavior.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SVCR are UNDEFINED.

Attributes

SVCR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | ZA |
| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | SM |

Bits [63:2]

Reserved, RES0.

ZA, bit [1]

Enables ZA array storage. The possible values of this bit are:

| ZA | Meaning |
|-----|---|
| 0b0 | SME ZA array storage is invalid and not accessible. SME instructions that access the ZA array are illegal. |
| 0b1 | SME ZA array storage is valid and accessible. If SME instructions are not trapped, SME instructions that access the ZA array are legal. |

When the value of PSTATE.ZA is changed, the following applies:

- When changed from 0 to 1, all implemented bits of the SME ZA storage are set to zero.
- When changed from 1 to 0, there is no observable change to SME ZA storage.
- There is no effect on the SVE vector and predicate registers and [FPSR](#).

A direct or indirect read of ZA appears to occur in program order relative to a direct write of SVCR, and to MSR SVCRZA and MSR SVCRSMZA instructions, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SM, bit [0]

Enables Streaming SVE mode. The possible values of this bit are:

| SM | Meaning |
|-----|--------------------------------------|
| 0b0 | The PE is not in Streaming SVE mode. |
| 0b1 | The PE is in Streaming SVE mode. |

When the value of PSTATE.SM is changed, the following applies:

- When changed from 0 to 1, an entry to Streaming SVE mode is performed.
- When changed from 1 to 0, an exit from Streaming SVE mode is performed.
- All implemented bits of the SVE registers Z0-Z31, P0-P15, and FFR in the new mode are set to zero.
- [FPSR](#) in the new mode is set to 0x0000_0000_0800_009f, in which all cumulative status bits are set to 1.
- There is no effect on ZA storage.

A direct or indirect read of SM appears to occur in program order relative to a direct write of SVCR, and to MSR SVCRSM and MSR SVCRSMZA instructions, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing SVCR

SVCR is read/write and can be accessed from any Exception level.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SVCR

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b011 | 0b0100 | 0b0010 | 0b010 |

```

TCO, Tag Check Override

The TCO characteristics are:

Purpose

When FEAT_MTE is implemented, this register allows tag checks to be disabled globally.

When FEAT_MTE2 is not implemented, it is CONstrained UNpredictable whether this register is RES0 or behaves as if FEAT_MTE is implemented.

Configuration

This register is present only when FEAT_MTE is implemented. Otherwise, direct accesses to TCO are UNDEFINED.

Attributes

TCO is a 64-bit register.

| RES0 | | | | | | TCO | | RES0 | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:26]

Reserved, RES0.

TCO, bit [25]

Allows memory tag checks to be globally disabled.

| TCO | Meaning |
|-----|--|
| 0b0 | Loads and Stores are not affected by this control. |
| 0b1 | Loads and Stores are unchecked. |

Bits [24:0]

Reserved, RES0.

Accessing TCO

For information about the operation of the MSR (immediate) accessor, see MSR (immediate).

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCO

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b011 | 0b0100 | 0b0010 | 0b111 |

```

if PSTATE.EL == EL0 then
    return Zeros(38):PSTATE.TC0:Zeros(25);
elsif PSTATE.EL == EL1 then
    return Zeros(38):PSTATE.TC0:Zeros(25);
elsif PSTATE.EL == EL2 then
    return Zeros(38):PSTATE.TC0:Zeros(25);
elsif PSTATE.EL == EL3 then
    return Zeros(38):PSTATE.TC0:Zeros(25);

```

MSR TC0, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b011 | 0b0100 | 0b0010 | 0b111 |

```

if PSTATE.EL == EL0 then
    PSTATE.TC0 = X[t]<25>;
elsif PSTATE.EL == EL1 then
    PSTATE.TC0 = X[t]<25>;
elsif PSTATE.EL == EL2 then
    PSTATE.TC0 = X[t]<25>;
elsif PSTATE.EL == EL3 then
    PSTATE.TC0 = X[t]<25>;

```

MSR TC0, #<imm>

| op0 | op1 | CRn | op2 |
|------|-------|--------|-------|
| 0b00 | 0b011 | 0b0100 | 0b100 |

TCR_EL1, Translation Control Register (EL1)

The TCR_EL1 characteristics are:

Purpose

The control register for stage 1 of the EL1&0 translation regime.

Configuration

AArch64 System register TCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [TTBCR\[31:0\]](#).

AArch64 System register TCR_EL1 bits [63:32] are architecturally mapped to AArch32 System register [TTBCR2\[31:0\]](#).

Attributes

TCR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | |
|------|-----|-------|-------|-------|-------|------|------|-------|-------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 |
| RES0 | DS | TCMA1 | TCMA0 | EOPD1 | EOPD0 | NFD1 | NFD0 | TBID1 | TBID0 | HWU162 | HWU161 | HWU160 | HWU159 | HWU158 | HWU157 | HWU156 | HWU155 | HWU154 |
| TG1 | SH1 | ORGN1 | IRGN1 | EPD1 | A1 | T1SZ | | | | | | | | | TG0 | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 |

Any of the bits in TCR_EL1, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

Bits [63:60]

Reserved, RES0.

DS, bit [59]

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL1&0 translation regime.

| DS | Meaning |
|-----|---|
| 0b0 | <p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p> |
| 0b1 | <p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of translation table descriptors hold output address[51:50].</p> <p>The shareability information of block and page descriptors for cacheable locations is determined by:</p> <ul style="list-style-type: none"> • TCR_EL1.SH0 if the VA is translated using tables pointed to by TTBR0_EL1. • TCR_EL1.SH1 if the VA is translated using tables pointed to by TTBR1_EL1. <p>The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of TTBR0_EL1 or TTBR1_EL1 are used to hold bits[51:48] of the output address in all cases.</p> <hr/> <p>Note</p> <p>As FEAT_LVA must be implemented if TCR_EL1.DS == 1, the minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12, as determined by that extension.</p> <hr/> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p> <hr/> <p>Note</p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p> <hr/> |

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA1, bit [58]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if [HCR_EL2](#).{E2H,TGE}!={1,1}, when address[59:55] = 0b11111.

| TCMA1 | Meaning |
|-------------|---|
| 0b0 | This control has no effect on the generation of Unchecked accesses at EL1 or EL0. |
| 0b1 | All accesses at EL1 and EL0 are Unchecked. |
| Note | |

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if [HCR_EL2](#).{E2H,TGE}!= {1,1}, when address[59:55] = 0b00000.

| TCMA0 | Meaning |
|-------|---|
| 0b0 | This control has no effect on the generation of Unchecked accesses at EL1 or EL0. |
| 0b1 | All accesses at EL1 and EL0 are Unchecked. |

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EOPD1, bit [56]

When FEAT_EOPD is implemented:

Faulting control for Unprivileged access to any address translated by [TTBR1_EL1](#).

| EOPD1 | Meaning |
|-------|---|
| 0b0 | Unprivileged access to any address translated by TTBR1_EL1 will not generate a fault by this mechanism. |
| 0b1 | Unprivileged access to any address translated by TTBR1_EL1 will generate a level 0 Translation fault. |

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EOPD0, bit [55]**When FEAT_EOPD is implemented:**

Faulting control for Unprivileged access to any address translated by [TTBR0_EL1](#).

| EOPD0 | Meaning |
|--------------|---|
| 0b0 | Unprivileged access to any address translated by TTBR0_EL1 will not generate a fault by this mechanism. |
| 0b1 | Unprivileged access to any address translated by TTBR0_EL1 will generate a level 0 Translation fault. |

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]**When FEAT_SVE is implemented or FEAT_TME is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR1_EL1](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR1_EL1](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

| NFD1 | Meaning |
|-------------|---|
| 0b0 | Does not disable stage 1 translation table walks using TTBR1_EL1 . |
| 0b1 | A TLB miss on a virtual address that is translated using TTBR1_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]**When FEAT_SVE is implemented or FEAT_TME is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR0_EL1](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR0_EL1](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

| NFD0 | Meaning |
|------|---|
| 0b0 | Does not disable stage 1 translation table walks using TTBR0_EL1 . |
| 0b1 | A TLB miss on a virtual address that is translated using TTBR0_EL1 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

| TBID1 | Meaning |
|-------|--|
| 0b0 | TCR_EL1.TBI1 applies to Instruction and Data accesses. |
| 0b1 | TCR_EL1.TBI1 applies to Data accesses only. |

This affects addresses where the address would be translated by tables pointed to by [TTBR1_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

| TBID0 | Meaning |
|--------------|--|
| 0b0 | TCR_EL1.TBI0 applies to Instruction and Data accesses. |
| 0b1 | TCR_EL1.TBI0 applies to Data accesses only. |

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

| HWU162 | Meaning |
|---------------|---|
| 0b0 | For translations using TTBR1_EL1 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR1_EL1 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1. |

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU161, bit [49]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

| HWU161 | Meaning |
|---------------|---|
| 0b0 | For translations using TTBR1_EL1 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR1_EL1 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1. |

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU160, bit [48]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

| HWU160 | Meaning |
|--------|---|
| 0b0 | For translations using TTBR1_EL1 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR1_EL1 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1. |

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU159, bit [47]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL1](#).

| HWU159 | Meaning |
|--------|---|
| 0b0 | For translations using TTBR1_EL1 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR1_EL1 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1. |

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU062, bit [46]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

| HWU062 | Meaning |
|--------|---|
| 0b0 | For translations using TTBR0_EL1 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR0_EL1 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1. |

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU061, bit [45]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

| HWU061 | Meaning |
|--------|---|
| 0b0 | For translations using TTBR0_EL1 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR0_EL1 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1. |

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU060, bit [44]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

| HWU060 | Meaning |
|--------|---|
| 0b0 | For translations using TTBR0_EL1 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR0_EL1 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1. |

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU059, bit [43]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

| HWU059 | Meaning |
|--------|---|
| 0b0 | For translations using TTBR0_EL1 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR0_EL1 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1. |

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HPD1, bit [42]**When FEAT_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR1_EL1](#).

| HPD1 | Meaning |
|------|--|
| 0b0 | Hierarchical permissions are enabled. |
| 0b1 | Hierarchical permissions are disabled. |

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]**When FEAT_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0_EL1](#).

| HPD0 | Meaning |
|------|--|
| 0b0 | Hierarchical permissions are enabled. |
| 0b1 | Hierarchical permissions are disabled. |

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL0 and EL1.

| HD | Meaning |
|-----|--|
| 0b0 | Stage 1 hardware management of dirty state disabled. |
| 0b1 | Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL0 and EL1.

| HA | Meaning |
|-----|--------------------------------------|
| 0b0 | Stage 1 Access flag update disabled. |
| 0b1 | Stage 1 Access flag update enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the [TTBR1_EL1](#) region, or ignored and used for tagged addresses.

| TBI1 | Meaning |
|------|--|
| 0b0 | Top Byte used in the address calculation. |
| 0b1 | Top Byte ignored in the address calculation. |

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by [TTBR1_EL1](#). It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL1.TBID1 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TBIO, bit [37]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL1](#) region, or ignored and used for tagged addresses.

| TBIO | Meaning |
|------|--|
| 0b0 | Top Byte used in the address calculation. |
| 0b1 | Top Byte ignored in the address calculation. |

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL1](#). It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL1.TBID0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBIO is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

ASID Size.

| AS | Meaning |
|-----|--|
| 0b0 | 8 bit - the upper 8 bits of TTBR0_EL1 and TTBR1_EL1 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB. |
| 0b1 | 16 bit - the upper 16 bits of TTBR0_EL1 and TTBR1_EL1 are used for allocation and matching in the TLB. |

If the implementation has only 8 bits of ASID, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

| IPS | Meaning |
|-------|-----------------|
| 0b000 | 32 bits, 4GB. |
| 0b001 | 36 bits, 64GB. |
| 0b010 | 40 bits, 1TB. |
| 0b011 | 42 bits, 4TB. |
| 0b100 | 44 bits, 16TB. |
| 0b101 | 48 bits, 256TB. |
| 0b110 | 52 bits, 4PB. |

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL1 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

Granule size for the [TTBR1_EL1](#).

| TG1 | Meaning |
|------|---------|
| 0b01 | 16KB. |
| 0b10 | 4KB. |
| 0b11 | 64KB. |

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1_EL1](#).

| SH1 | Meaning |
|------|------------------|
| 0b00 | Non-shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1_EL1](#).

| ORGN1 | Meaning |
|-------|---|
| 0b00 | Normal memory, Outer Non-cacheable. |
| 0b01 | Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1_EL1](#).

| IRGN1 | Meaning |
|-------|---|
| 0b00 | Normal memory, Inner Non-cacheable. |
| 0b01 | Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Translation table walk disable for translations using [TTBR1_EL1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1_EL1](#). The encoding of this bit is:

| EPD1 | Meaning |
|------|--|
| 0b0 | Perform translation table walks using TTBR1_EL1 . |
| 0b1 | A TLB miss on an address that is translated using TTBR1_EL1 generates a Translation fault. No translation table walk is performed. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Selects whether [TTBR0_EL1](#) or [TTBR1_EL1](#) defines the ASID. The encoding of this bit is:

| A1 | Meaning |
|-----|---|
| 0b0 | TTBR0_EL1 .ASID defines the ASID. |
| 0b1 | TTBR1_EL1 .ASID defines the ASID. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T1SZ, bits [21:16]

The size offset of the memory region addressed by [TTBR1_EL1](#). The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL1](#).

| TG0 | Meaning |
|------------|----------------|
| 0b00 | 4KB |
| 0b01 | 64KB |
| 0b10 | 16KB |

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

| SH0 | Meaning |
|------------|-----------------|
| 0b00 | Non-shareable |
| 0b10 | Outer Shareable |
| 0b11 | Inner Shareable |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

| ORGN0 | Meaning |
|--------------|---|
| 0b00 | Normal memory, Outer Non-cacheable. |
| 0b01 | Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL1](#).

| IRGN0 | Meaning |
|-------|---|
| 0b00 | Normal memory, Inner Non-cacheable. |
| 0b01 | Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Translation table walk disable for translations using [TTBR0_EL1](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0_EL1](#). The encoding of this bit is:

| EPD0 | Meaning |
|------|--|
| 0b0 | Perform translation table walks using TTBR0_EL1 . |
| 0b1 | A TLB miss on an address that is translated using TTBR0_EL1 generates a Translation fault. No translation table walk is performed. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL1](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TCR_EL1 or TCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL1

| op0 | op1 | CRn | CRm | op2 |
|-----|-----|-----|-----|-----|
|-----|-----|-----|-----|-----|

| | | | | |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0010 | 0b0000 | 0b010 |
|------|-------|--------|--------|-------|

```

if PSTATE.EL == EL0 then

TCR_EL2, Translation Control Register (EL2)

The TCR_EL2 characteristics are:

Purpose

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the Effective value of [HCR_EL2.E2H](#) is 0, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using [TTBR0_EL2](#).
- When the value of [HCR_EL2.E2H](#) is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
 - A lower VA range, translated using [TTBR0_EL2](#).
 - A higher VA range, translated using [TTBR1_EL2](#).

Configuration

AArch64 System register TCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HTCR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

TCR_EL2 is a 64-bit register.

Field descriptions

When HCR_EL2.E2H == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|------|------|-------|-------|-------|-------|-----|------|----|----|----|------|----|-----|-----|-------|-------|------|------|----|----|----|----|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES1 | TCMA | TBID | HWU62 | HWU61 | HWU60 | HWU59 | HPD | RES1 | HD | HA | TB | RES0 | PS | TG0 | SH0 | ORGN0 | IRGN0 | RES0 | T0SZ | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | |

Any of the bits in TCR_EL2, other than the A1 bit and the EPDx bits when they have the value 1, are permitted to be cached in a TLB.

Bits [63:33]

Reserved, RES0.

DS, bit [32]

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL2 translation regime.

| DS | Meaning |
|-----|---|
| 0b0 | <p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of TCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p> |
| 0b1 | <p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of translation table descriptors hold output address[51:50].</p> <p>The shareability information of block and page descriptors for cacheable locations is determined by TCR_EL2.SH0.</p> <p>The minimum value of TCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of TTBR0_EL2 are used to hold bits[51:48] of the output address in all cases.</p> <hr/> <p>Note</p> <p>As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.T0SZ field is 12, as determined by that extension.</p> <hr/> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p> <hr/> <p>Note</p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p> <hr/> |

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

TCMA, bit [30]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL2 when address [59:56] = 0b0000.

| TCMA | Meaning |
|------|---|
| 0b0 | This control has no effect on the generation of Unchecked accesses. |
| 0b1 | All accesses are Unchecked. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

| TBID | Meaning |
|------|---|
| 0b0 | TCR_EL2.TBI applies to Instruction and Data accesses. |
| 0b1 | TCR_EL2.TBI applies to Data accesses only. |

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL2](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

| HWU62 | Meaning |
|-------|---|
| 0b0 | Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU61, bit [27]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

| HWU61 | Meaning |
|-------|---|
| 0b0 | Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

| HWU60 | Meaning |
|-------|---|
| 0b0 | Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU59, bit [25]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

| HWU59 | Meaning |
|-------|---|
| 0b0 | Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HPD, bit [24]

When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0_EL2](#).

| HPD | Meaning |
|-----|--|
| 0b0 | Hierarchical permissions are enabled. |
| 0b1 | Hierarchical permissions are disabled. |

Note

In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL2.

| HD | Meaning |
|-----|--|
| 0b0 | Stage 1 hardware management of dirty state disabled. |
| 0b1 | Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL2.

| HA | Meaning |
|-----|--------------------------------------|
| 0b0 | Stage 1 Access flag update disabled. |
| 0b1 | Stage 1 Access flag update enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL2](#) region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state'.

| TBI | Meaning |
|-----|--|
| 0b0 | Top Byte used in the address calculation. |
| 0b1 | Top Byte ignored in the address calculation. |

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID is 1, then this field only applies to Data accesses.

If the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

| PS | Meaning |
|-------|-----------------|
| 0b000 | 32 bits, 4GB. |
| 0b001 | 36 bits, 64GB. |
| 0b010 | 40 bits, 1TB. |
| 0b011 | 42 bits, 4TB. |
| 0b100 | 44 bits, 16TB. |
| 0b101 | 48 bits, 256TB. |
| 0b110 | 52 bits, 4PB. |

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL2](#).

| TG0 | Meaning |
|------|---------|
| 0b00 | 4KB. |
| 0b01 | 64KB. |
| 0b10 | 16KB. |

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

| SH0 | Meaning |
|------|------------------|
| 0b00 | Non-shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

| ORGN0 | Meaning |
|-------|---|
| 0b00 | Normal memory, Outer Non-cacheable. |
| 0b01 | Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

| IRGN0 | Meaning |
|-------|---|
| 0b00 | Normal memory, Inner Non-cacheable. |
| 0b01 | Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL2](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_VHE is implemented and HCR_EL2.E2H == 1:

| | | | | | | | | | | | | | | | | | | |
|------|-----|-------|-------|-------|-------|------|------|-------|-------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 |
| RES0 | DS | TCMA1 | TCMA0 | EOPD1 | EOPD0 | NFD1 | NFD0 | TBID1 | TBID0 | HWU162 | HWU161 | HWU160 | HWU159 | HWU158 | HWU157 | HWU156 | HWU155 | HWU154 |
| TG1 | SH1 | ORGN1 | IRGN1 | EPD1 | A1 | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 |

Any of the bits in TCR_EL2 are permitted to be cached in a TLB.

Bits [63:60]

Reserved, RES0.

DS, bit [59]

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL2&0 translation regime.

| DS | Meaning |
|-----|--|
| 0b0 | <p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p> |
| 0b1 | <p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of translation table descriptors hold output address[51:50].</p> <p>The shareability information of block and page descriptors for cacheable locations is determined by:</p> <ul style="list-style-type: none"> • TCR_EL2.SH0 if the VA is an address that is translated using tables pointed to by TTBR0_EL2. • TCR_EL2.SH1 if the VA is an address that is translated using tables pointed to by TTBR1_EL2. <p>The minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 16 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of TTBR0_EL2 or TTBR1_EL2 are used to hold bits[51:48] of the output address in all cases.</p> <hr/> <p>Note</p> <p>As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 12, as determined by that extension.</p> <hr/> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p> <hr/> <p>Note</p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p> <hr/> |

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA1, bit [58]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = 0b11111.

| TCMA1 | Meaning |
|-------------|---|
| 0b0 | This control has no effect on the generation of Unchecked accesses at EL2 or EL0. |
| 0b1 | All accesses are Unchecked. |
| Note | |

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = 0b00000.

| TCMA0 | Meaning |
|-------|---|
| 0b0 | This control has no effect on the generation of Unchecked accesses at EL2 or EL0. |
| 0b1 | All accesses are Unchecked. |

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EOPD1, bit [56]

When FEAT_EOPD is implemented:

Faulting control for Unprivileged access to any address translated by [TTBR1_EL2](#).

| EOPD1 | Meaning |
|-------|---|
| 0b0 | Unprivileged access to any address translated by TTBR1_EL2 will not generate a fault by this mechanism. |
| 0b1 | Unprivileged access to any address translated by TTBR1_EL2 will generate a level 0 Translation fault. |

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EOPD0, bit [55]**When FEAT_EOPD is implemented:**

Faulting control for Unprivileged access to any address translated by [TTBR0_EL2](#).

| EOPD0 | Meaning |
|--------------|---|
| 0b0 | Unprivileged access to any address translated by TTBR0_EL2 will not generate a fault by this mechanism. |
| 0b1 | Unprivileged access to any address translated by TTBR0_EL2 will generate a level 0 Translation fault. |

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]**When FEAT_SVE is implemented or FEAT_TME is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR1_EL2](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR1_EL2](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

| NFD1 | Meaning |
|-------------|---|
| 0b0 | Does not disable stage 1 translation table walks using TTBR1_EL2 . |
| 0b1 | A TLB miss on a virtual address that is translated using TTBR1_EL2 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]**When FEAT_SVE is implemented or FEAT_TME is implemented:**

Non-fault translation table walk disable for stage 1 translations using [TTBR0_EL2](#).

This bit controls whether to perform a stage 1 translation table walk in response to a non-fault unprivileged access for a virtual address that is translated using [TTBR0_EL2](#).

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

For more information, see 'The Scalable Vector Extension (SVE)'.

If FEAT_TME is implemented, the affected access types include all accesses generated by a load or store instruction in Transactional state.

| NFD0 | Meaning |
|------|---|
| 0b0 | Does not disable stage 1 translation table walks using TTBR0_EL2 . |
| 0b1 | A TLB miss on a virtual address that is translated using TTBR0_EL2 due to the specified access types causes the access to fail without taking an exception. No stage 1 translation table walk is performed. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging in AArch64 state'.

| TBID1 | Meaning |
|-------|--|
| 0b0 | TCR_EL2.TBI1 applies to Instruction and Data accesses. |
| 0b1 | TCR_EL2.TBI1 applies to Data accesses only. |

This affects addresses where the address would be translated by tables pointed to by [TTBR1_EL2](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]

When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For more information, see 'Address tagging in AArch64 state'.

| TBID0 | Meaning |
|-------|--|
| 0b0 | TCR_EL2.TBI0 applies to Instruction and Data accesses. |
| 0b1 | TCR_EL2.TBI0 applies to Data accesses only. |

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL2](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

| HWU162 | Meaning |
|--------|---|
| 0b0 | For translations using TTBR1_EL2 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR1_EL2 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU161, bit [49]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

| HWU161 | Meaning |
|--------|---|
| 0b0 | For translations using TTBR1_EL2 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR1_EL2 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU160, bit [48]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

| HWU160 | Meaning |
|--------|---|
| 0b0 | For translations using TTBR1_EL2 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR1_EL2 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU159, bit [47]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR1_EL2](#).

| HWU159 | Meaning |
|--------|---|
| 0b0 | For translations using TTBR1_EL2 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR1_EL2 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU062, bit [46]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

| HWU062 | Meaning |
|--------|---|
| 0b0 | For translations using TTBR0_EL1 , bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR0_EL1 , bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU061, bit [45]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

| HWU061 | Meaning |
|--------|---|
| 0b0 | For translations using TTBR0_EL1 , bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR0_EL1 , bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU060, bit [44]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

| HWU060 | Meaning |
|--------|---|
| 0b0 | For translations using TTBR0_EL1 , bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR0_EL1 , bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU059, bit [43]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using [TTBR0_EL1](#).

| HWU059 | Meaning |
|--------|---|
| 0b0 | For translations using TTBR0_EL1 , bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | For translations using TTBR0_EL1 , bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1. |

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HPD1, bit [42]**When FEAT_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR1_EL2](#).

| HPD1 | Meaning |
|------|--|
| 0b0 | Hierarchical permissions are enabled. |
| 0b1 | Hierarchical permissions are disabled. |

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]**When FEAT_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0_EL2](#).

| HPD0 | Meaning |
|------|--|
| 0b0 | Hierarchical permissions are enabled. |
| 0b1 | Hierarchical permissions are disabled. |

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL2.

| HD | Meaning |
|-----|--|
| 0b0 | Stage 1 hardware management of dirty state disabled. |
| 0b1 | Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 1 translations from EL2.

| HA | Meaning |
|-----|--------------------------------------|
| 0b0 | Stage 1 Access flag update disabled. |
| 0b1 | Stage 1 Access flag update enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR1_EL2](#) region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state'.

| TBI1 | Meaning |
|------|--|
| 0b0 | Top Byte used in the address calculation. |
| 0b1 | Top Byte ignored in the address calculation. |

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR1_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID1 is 1, then this field only applies to Data accesses.

If the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TBIO, bit [37]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL2](#) region, or ignored and used for tagged addresses.

For more information, see 'Address tagging in AArch64 state'.

| TBIO | Meaning |
|------|--|
| 0b0 | Top Byte used in the address calculation. |
| 0b1 | Top Byte ignored in the address calculation. |

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL2](#). It has an effect whether the EL2, or EL2&0, translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID0 is 1, then this field only applies to Data accesses.

If the value of TBIO is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

ASID Size.

| AS | Meaning |
|-----|--|
| 0b0 | 8 bit - the upper 8 bits of TTBR0_EL2 and TTBR1_EL2 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB. |
| 0b1 | 16 bit - the upper 16 bits of TTBR0_EL2 and TTBR1_EL2 are used for allocation and matching in the TLB. |

If the implementation has only 8 bits of ASID, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

| IPS | Meaning | Applies when |
|-------|-----------------|------------------------------|
| 0b000 | 32 bits, 4GB. | |
| 0b001 | 36 bits, 64GB. | |
| 0b010 | 40 bits, 1TB. | |
| 0b011 | 42 bits, 4TB. | |
| 0b100 | 44 bits, 16TB. | |
| 0b101 | 48 bits, 256TB. | |
| 0b110 | 52 bits, 4PB. | When FEAT_LPA is implemented |

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL2 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG1, bits [31:30]

Granule size for the [TTBR1_EL2](#).

| TG1 | Meaning |
|------|---------|
| 0b01 | 16KB. |
| 0b10 | 4KB. |
| 0b11 | 64KB. |

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

| SH1 | Meaning |
|------|------------------|
| 0b00 | Non-shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

| ORGN1 | Meaning |
|-------|---|
| 0b00 | Normal memory, Outer Non-cacheable. |
| 0b01 | Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using [TTBR1_EL2](#).

| IRGN1 | Meaning |
|-------|---|
| 0b00 | Normal memory, Inner Non-cacheable. |
| 0b01 | Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Translation table walk disable for translations using [TTBR1_EL2](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR1_EL2](#). The encoding of this bit is:

| EPD1 | Meaning |
|------|--|
| 0b0 | Perform translation table walks using TTBR1_EL2 . |
| 0b1 | A TLB miss on an address that is translated using TTBR1_EL2 generates a Translation fault. No translation table walk is performed. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Selects whether [TTBR0_EL2](#) or [TTBR1_EL2](#) defines the ASID. The encoding of this bit is:

| A1 | Meaning |
|-----|---|
| 0b0 | TTBR0_EL2 .ASID defines the ASID. |
| 0b1 | TTBR1_EL2 .ASID defines the ASID. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T1SZ, bits [21:16]

The size offset of the memory region addressed by [TTBR1_EL2](#). The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL2](#).

| TG0 | Meaning |
|------------|----------------|
| 0b00 | 4KB. |
| 0b01 | 64KB. |
| 0b10 | 16KB. |

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

| SH0 | Meaning |
|------------|------------------|
| 0b00 | Non-shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

| ORGN0 | Meaning |
|--------------|---|
| 0b00 | Normal memory, Outer Non-cacheable. |
| 0b01 | Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL2](#).

| IRGN0 | Meaning |
|-------|---|
| 0b00 | Normal memory, Inner Non-cacheable. |
| 0b01 | Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Translation table walk disable for translations using [TTBR0_EL2](#). This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using [TTBR0_EL2](#). The encoding of this bit is:

| EPD0 | Meaning |
|------|--|
| 0b0 | Perform translation table walks using TTBR0_EL2 . |
| 0b1 | A TLB miss on an address that is translated using TTBR0_EL2 generates a Translation fault. No translation table walk is performed. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL2](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TCR_EL2 or TCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL2

| op0 | op1 | CRn | CRm | op2 |
|-----|-----|-----|-----|-----|
|-----|-----|-----|-----|-----|

| | | | | |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0010 | 0b0000 | 0b010 |
|------|-------|--------|--------|-------|

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return TCR_EL2;
elsif PSTATE.EL == EL3 then
    return TCR_EL2;

```

MSR TCR_EL2, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0010 | 0b0000 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    TCR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    TCR_EL2 = X[t];

```

MRS <Xt>, TCR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0010 | 0b0000 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TRVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGTR_EL2.TCR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        return NVMem[0x120];
    else
        return TCR_EL1;
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        return TCR_EL2;
    else
        return TCR_EL1;
elsif PSTATE.EL == EL3 then
    return TCR_EL1;

```

MSR TCR_EL1, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0010 | 0b0000 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.TVM == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HFGWTR_EL2.TCR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2.<NV2,NV1,NV> == '111' then
        NVMem[0x120] = X[t];
    else
        TCR_EL1 = X[t];
elsif PSTATE.EL == EL2 then
    if HCR_EL2.E2H == '1' then
        TCR_EL2 = X[t];
    else
        TCR_EL1 = X[t];
elsif PSTATE.EL == EL3 then
    TCR_EL1 = X[t];

```

TCR_EL3, Translation Control Register (EL3)

The TCR_EL3 characteristics are:

Purpose

The control register for stage 1 of the EL3 translation regime.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to TCR_EL3 are UNDEFINED.

Attributes

TCR_EL3 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Any of the bits in TCR_EL3 are permitted to be cached in a TLB.

Bits [63:33]

Reserved, RES0.

DS, bit [32]

When FEAT_LPA2 is implemented:

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 1 of the EL3 translation regime.

| DS | Meaning |
|-----|---|
| 0b0 | <p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of TCR_EL3.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>Output address[51:48] is 0b0000.</p> |
| 0b1 | <p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] of table translation descriptors hold output address[51:50].</p> <p>The shareability information of block and page descriptors for cacheable locations is determined by TCR_EL3.SH0.</p> <p>The minimum value of TCR_EL3.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault.</p> <p>All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes.</p> <p>Bits[5:2] of TTBR0_EL3 are used to hold bits[51:48] of the output address in all cases.</p> <hr/> <p>Note</p> <p>As FEAT_LVA must be implemented if TCR_EL3.DS == 1, the minimum value of the TCR_EL3.T0SZ field is 12, as determined by that extension.</p> <hr/> <p>For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00.</p> <hr/> <p>Note</p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p> <hr/> |

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

TCMA, bit [30]

When FEAT_MTE2 is implemented:

Controls the generation of Unchecked accesses at EL3 when address [59:56] = 0b0000.

| TCMA | Meaning |
|------|---|
| 0b0 | This control has no effect on the generation of Unchecked accesses. |
| 0b1 | All accesses are Unchecked. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]

When FEAT_PAAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

| TBID | Meaning |
|------|---|
| 0b0 | TCR_EL3.TBI applies to Instruction and Data accesses. |
| 0b1 | TCR_EL3.TBI applies to Data accesses only. |

This affects addresses where the address would be translated by tables pointed to by [TTBR0_EL3](#).

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

| HWU62 | Meaning |
|-------|---|
| 0b0 | Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1. |

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU61, bit [27]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

| HWU61 | Meaning |
|-------|---|
| 0b0 | Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1. |

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

| HWU60 | Meaning |
|-------|---|
| 0b0 | Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1. |

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU59, bit [25]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

| HWU59 | Meaning |
|-------|---|
| 0b0 | Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1. |

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HPD, bit [24]**When FEAT_HPDS is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by [TTBR0_EL3](#).

| HPD | Meaning |
|-----|--|
| 0b0 | Hierarchical permissions are enabled. |
| 0b1 | Hierarchical permissions are disabled. |

Note
In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]**When FEAT_HAFDBS is implemented:**

Hardware management of dirty state in stage 1 translations from EL3.

| HD | Meaning |
|-----|--|
| 0b0 | Stage 1 hardware management of dirty state disabled. |
| 0b1 | Stage 1 hardware management of dirty state enabled, only if the HA bit is also set to 1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]**When FEAT_HAFDBS is implemented:**

Hardware Access flag update in stage 1 translations from EL3.

| HA | Meaning |
|-----|--------------------------------------|
| 0b0 | Stage 1 Access flag update disabled. |
| 0b1 | Stage 1 Access flag update enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the [TTBR0_EL3](#) region, or ignored and used for tagged addresses.

| TBI | Meaning |
|-----|--|
| 0b0 | Top Byte used in the address calculation. |
| 0b1 | Top Byte ignored in the address calculation. |

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by [TTBR0_EL3](#). It has an effect whether the EL3 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL3.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- An exception return to EL3.

For more information, see 'Address tagging in AArch64 state'.

Note

This control determines the scope of address tagging. It never causes an exception to be generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

| PS | Meaning |
|-------|-----------------|
| 0b000 | 32 bits, 4GB. |
| 0b001 | 36 bits, 64GB. |
| 0b010 | 40 bits, 1TB. |
| 0b011 | 42 bits, 4TB. |
| 0b100 | 44 bits, 16TB. |
| 0b101 | 48 bits, 256TB. |
| 0b110 | 52 bits, 4PB. |

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by TCR_EL3 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [TTBR0_EL3](#).

| TG0 | Meaning |
|------|---------|
| 0b00 | 4KB. |
| 0b01 | 64KB. |
| 0b10 | 16KB. |

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [TTBR0_EL3](#).

| SH0 | Meaning |
|------|------------------|
| 0b00 | Non-shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [TTBR0_EL3](#).

| ORGN0 | Meaning |
|-------|---|
| 0b00 | Normal memory, Outer Non-cacheable. |
| 0b01 | Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [TTBR0_EL3](#).

| IRGN0 | Meaning |
|-------|---|
| 0b00 | Normal memory, Inner Non-cacheable. |
| 0b01 | Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

TOSZ, bits [5:0]

The size offset of the memory region addressed by [TTBR0_EL3](#). The region size is $2^{(64-TOSZ)}$ bytes.

The maximum and minimum possible values for TOSZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL3

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b0010 | 0b0000 | 0b010 |

```

if PSTATE.EL == EL0 then

TFSR_EL1, Tag Fault Status Register (EL1)

The TFSR_EL1 characteristics are:

Purpose

Holds accumulated Tag Check Faults occurring in EL1 that are not taken precisely.

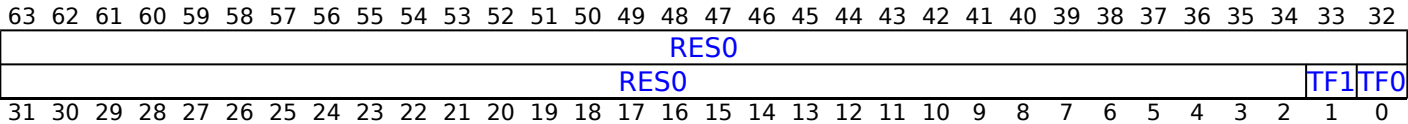

Configuration

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to TFSR_EL1 are UNDEFINED.

Attributes

TFSR_EL1 is a 64-bit register.

Field descriptions

Bits [63:2]

Reserved, RES0.

TF1, bit [1]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b1 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TF0, bit [0]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TFSR_EL1

TFSR_EL2, Tag Fault Status Register (EL2)

The TFSR_EL2 characteristics are:

Purpose

Holds accumulated Tag Check Faults occurring in EL2 that are not taken precisely.

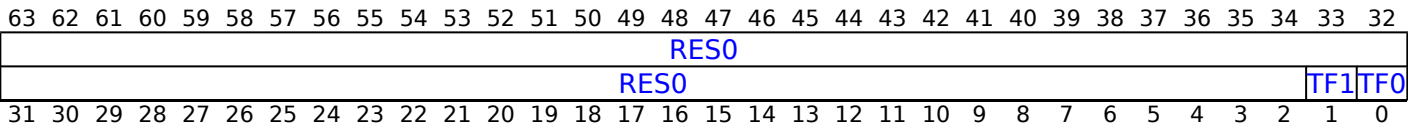

Configuration

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to TFSR_EL2 are UNDEFINED.

Attributes

TFSR_EL2 is a 64-bit register.

Field descriptions

Bits [63:2]

Reserved, RES0.

TF1, bit [1]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b1 occurs.

When [HCR_EL2.E2H](#)==0b0, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TF0, bit [0]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TFSR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TFSR_EL2 or TFSR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TFSR_EL2

TFSR_EL3, Tag Fault Status Register (EL3)

The TFSR_EL3 characteristics are:

Purpose

Holds accumulated Tag Check Faults occurring in EL3 that are not taken precisely.

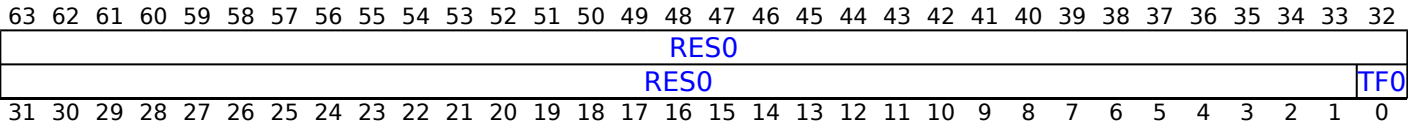

Configuration

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to TFSR_EL3 are UNDEFINED.

Attributes

TFSR_EL3 is a 64-bit register.

Field descriptions

Bits [63:1]

Reserved, RES0.

TF0, bit [0]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TFSR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TFSR_EL3

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b0101 | 0b0110 | 0b000 |

```

TFSRE0_EL1, Tag Fault Status Register (EL0).

The TFSRE0_EL1 characteristics are:

Purpose

Holds accumulated Tag Check Faults occurring in EL0 that are not taken precisely.

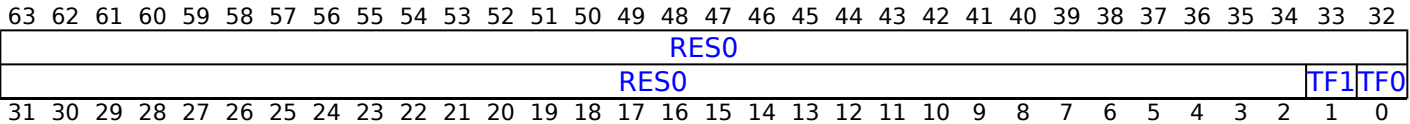

Configuration

This register is present only when FEAT_MTE2 is implemented. Otherwise, direct accesses to TFSRE0_EL1 are UNDEFINED.

Attributes

TFSRE0_EL1 is a 64-bit register.

Field descriptions

Bits [63:2]

Reserved, RES0.

TF1, bit [1]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b1 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TF0, bit [0]

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TFSRE0_EL1

```

TLBI ALLE1, TLBI ALLE1NXS, TLB Invalidate All, EL1

The TLBI ALLE1, TLBI ALLE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate an address using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate an address using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation only applies to the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI ALLE1, TLBI ALLE1NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI ALLE1, TLBI ALLE1NXS instruction

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI ALLE1{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b100 | 0b1000 | 0b0111 | 0b100 |

```

if PSTATE.EL == EL0 then

```

TLBI ALLE1IS, TLBI ALLE1ISNXS, TLB Invalidate All, EL1, Inner Shareable

The TLBI ALLE1IS, TLBI ALLE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate an address using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate an address using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI ALLE1OS, TLBI ALLE1OSNXS, TLB Invalidate All, EL1, Outer Shareable

The TLBI ALLE1OS, TLBI ALLE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate an address using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate an address using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI ALLE1OS, TLBI ALLE1OSNXS are UNDEFINED.

Attributes

TLBI ALLE1OS, TLBI ALLE1OSNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI ALLE1OS, TLBI ALLE1OSNXS instruction

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI ALLE1OS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |

    else
        AArch64.TLBI_ALL(SecurityStateAtEL(EL2), Regime_EL2, Shareability_NSH, TLBI_ExcludeXS);

```

TLBI ALLE2IS, TLBI ALLE2ISNXS, TLB Invalidate All, EL2, Inner Shareable

The TLBI ALLE2IS, TLBI ALLE2ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate an address using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate an address using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI ALLE2IS, TLBI ALLE2ISNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI ALLE2IS, TLBI ALLE2ISNXS instruction

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI ALLE2IS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |

    else
        AArch64.TLBI_ALL(SecurityStateAtEL(EL2), Regime_EL2, Shareability_ISH, TLBI_ExcludeXS);

```

TLBI ALLE2OS, TLBI ALLE2OSNXS, TLB Invalidate All, EL2, Outer Shareable

The TLBI ALLE2OS, TLBI ALLE2OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate an address using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate an address using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI ALLE2OS, TLBI ALLE2OSNXS are UNDEFINED.

Attributes

TLBI ALLE2OS, TLBI ALLE2OSNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI ALLE2OS, TLBI ALLE2OSNXS instruction

TLBI ASIDE1, TLBI ASIDE1NXS, TLB Invalidate by ASID, EL1

The TLBI ASIDE1, TLBI ASIDE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate an address using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI ASIDE1, TLBI ASIDE1NXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this System instruction.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Bits [47:0]

Reserved, RES0.

Executing the TLBI ASIDE1, TLBI ASIDE1NXS instruction

TLBI ASIDE1IS, TLBI ASIDE1ISNXS, TLB Invalidate by ASID, EL1, Inner Shareable

The TLBI ASIDE1IS, TLBI ASIDE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate an address using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI ASIDE1IS, TLBI ASIDE1ISNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

TLBI ASIDE1OS, TLBI ASIDE1OSNXS, TLB Invalidate by ASID, EL1, Outer Shareable

The TLBI ASIDE1OS, TLBI ASIDE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate an address using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI ASIDE1OS, TLBI ASIDE1OSNXS are UNDEFINED.

Attributes

TLBI ASIDE1OS, TLBI ASIDE1OSNXS is a 64-bit System instruction.

TLBI IPAS2E1, TLBI IPAS2E1NXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI IPAS2E1, TLBI IPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI IPAS2E1, TLBI IPAS2E1NXS is a 64-bit System instruction.

Field descriptions

| IPA[47:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {0, 0}, NS selects the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|------------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

When FEAT_LPA is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2E1, TLBI IPAS2E1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

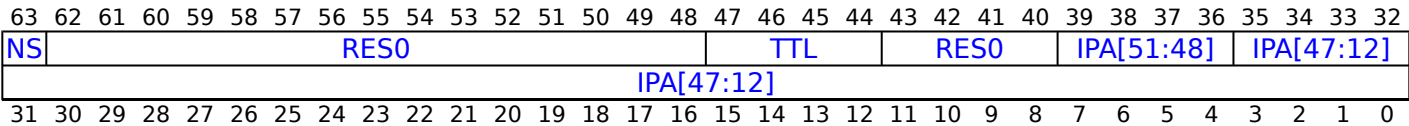

Configuration

There are no configuration notes.

Attributes

TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS is a 64-bit System instruction.

Field descriptions

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]
When FEAT_LPA is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

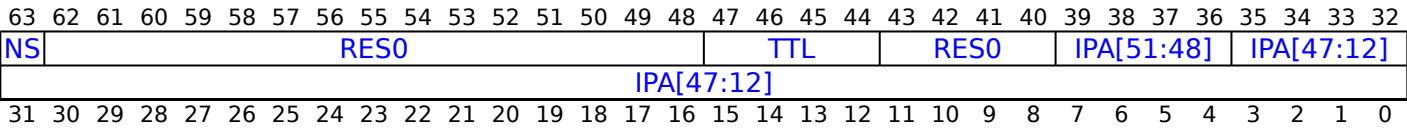

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS are UNDEFINED.

Attributes

TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS is a 64-bit System instruction.

Field descriptions

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

Extension to IPA[47:12]. For more information, see IPA[47:12].

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI IPAS2E1OS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |

TLBI IPAS2LE1, TLBI IPAS2LE1NXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBI IPAS2LE1, TLBI IPAS2LE1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI IPAS2LE1, TLBI IPAS2LE1NXS is a 64-bit System instruction.

Field descriptions

| NS | | RES0 | | | | | | | | | | | | | | TTL | | | | RES0 | | | | IPA[51:48] | | | | IPA[47:12] | | | |
| IPA[47:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]
When FEAT_LPA is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2LE1, TLBI IPAS2LE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

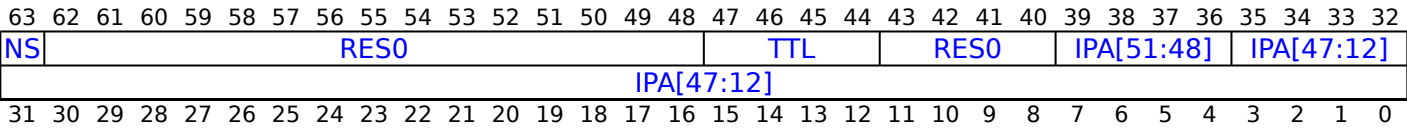

Configuration

There are no configuration notes.

Attributes

TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS is a 64-bit System instruction.

Field descriptions

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]

TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

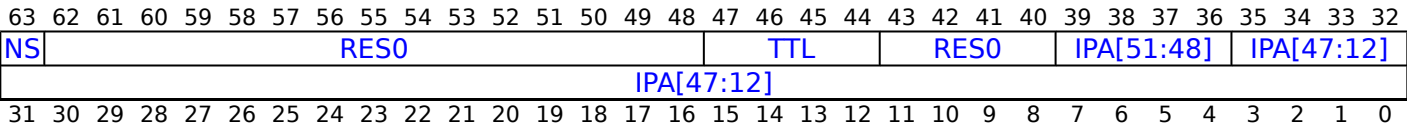

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS is a 64-bit System instruction.

Field descriptions

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:40]

Reserved, RES0.

IPA[51:48], bits [39:36]

Extension to IPA[47:12]. For more information, see IPA[47:12].

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented, and 52-bit addresses and a 64KB translation granule are in use, IPA[51:48] form the upper part of the address value. Otherwise, IPA[51:48] are RES0.

Executing the TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI IPAS2LE1OS{, <Xt>}

TLBI PAALL, TLB Invalidate GPT Information by PA, All Entries, Local

The TLBI PAALL characteristics are:

Purpose

Invalidates cached copies of GPT entries from TLBs. Details:

- The invalidation applies to TLB entries containing GPT information that relates to a physical address.
- The invalidation applies to all TLB entries containing GPT information.
- The invalidation affects only the TLBs for the PE executing the operation.

The full set of TLB maintenance instructions that invalidate cached GPT entries is: [TLBI PAALL](#), [TLBI PAALLOS](#), [TLBI RPALOS](#), and [TLBI RPAOS](#).

These instructions have the same ordering, observability, and completion behavior as all other TLBI instructions.

Configuration

This instruction is present only when FEAT_RME is implemented. Otherwise, direct accesses to TLBI PAALL are UNDEFINED.

Attributes

TLBI PAALL is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI PAALL instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI PAALL{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b110 | 0b1000 | 0b0111 | 0b100 |

```

if PSTATE.EL == EL0 then

    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    AArch64.TLBI_PAALL(Shareability_NSH);

```

TLBI PAALLOS, TLB Invalidate GPT Information by PA, All Entries, Outer Shareable

The TLBI PAALLOS characteristics are:

Purpose

Invalidates cached copies of GPT entries from TLBs. Details:

- The invalidation applies to TLB entries containing GPT information that relates to a physical address.
- The invalidation applies to all TLB entries containing GPT information.
- The invalidation affects all TLBs in the Outer Shareable domain.

The full set of TLB maintenance instructions that invalidate cached GPT entries is: [TLBI PAALL](#), [TLBI PAALLOS](#), [TLBI RPALOS](#), and [TLBI RPAOS](#).

These instructions have the same ordering, observability, and completion behavior as all other TLBI instructions.

Configuration

This instruction is present only when FEAT_RME is implemented. Otherwise, direct accesses to TLBI PAALLOS are UNDEFINED.

Attributes

TLBI PAALLOS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI PAALLOS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI PAALLOS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b110 | 0b1000 | 0b0001 | 0b100 |

```

    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    AArch64.TLBI_PAALL(Shareability_OSH);
```

TLBI RIPAS2E1, TLBI RIPAS2E1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI RIPAS2E1, TLBI RIPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

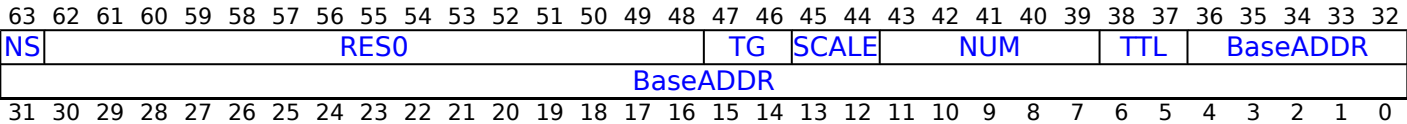

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2E1, TLBI RIPAS2E1NXS are UNDEFINED.

Attributes

TLBI RIPAS2E1, TLBI RIPAS2E1NXS is a 64-bit System instruction.

Field descriptions

NS, bit [63]

When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|--|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RIPAS2E1, TLBI RIPAS2E1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RIPAS2E1{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b100 | 0b1000 | 0b0100 | 0b010 |

```

if PSTATE.EL == EL0 then

        TLBILevel_Any, TLBI_ExcludeXS, X[t]);

```

TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS are UNDEFINED.

Attributes

TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS is a 64-bit System instruction.

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|--|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS are UNDEFINED.

Attributes

TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS is a 64-bit System instruction.

Field descriptions

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|--|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```
TLBI RIPAS2E1OS{, <Xt>}
```

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b100 | 0b1000 | 0b0100 | 0b011 |

```

TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseAddr \leq VA < BaseAddr + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

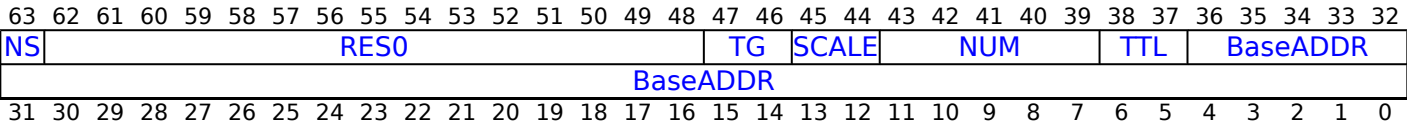

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS is a 64-bit System instruction.

Field descriptions

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS instruction

TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

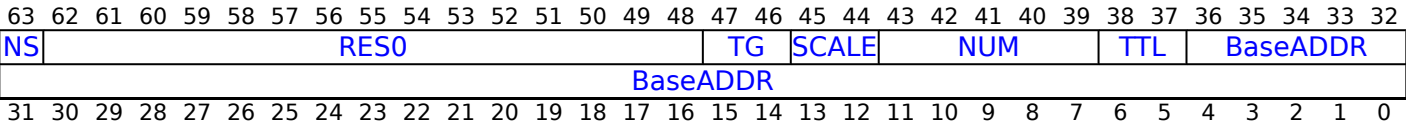

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS is a 64-bit System instruction.

Field descriptions

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 2 only translation table entry, from the final level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - [SCR_EL3](#).{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
 - [SCR_EL3](#).{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
 - [SCR_EL3](#).NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
 - [SCR_EL3](#).NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

- If $TTL == 10$ and $BaseADDR[24:14]$ is not equal to 00000000000.
- For the 64K translation granule:
 - If $TTL == 01$ and $BaseADDR[41:16]$ is not equal to 00000000000000000000000000000000.
 - If $TTL == 10$ and $BaseADDR[28:16]$ is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|----|-----|----------|----|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| NS | RES0 | | | | | | | | | | | | | | TG | SCALE | NUM | | | | | TTL | BaseADDR | | | | | | | | | |
| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {0, 0}, NS selects the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and [SCR_EL3](#).{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

| NS | Meaning |
|-----|-------------------------------------|
| 0b0 | IPA is in the Secure IPA space. |
| 0b1 | IPA is in the Non-secure IPA space. |

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RIPAS2LE1OS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b100 | 0b1000 | 0b0100 | 0b111 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

        AArch64.TLBI_RIPAS2(SecurityStateAtEL(EL1), Regime_EL10, VMID[], Shareability_OSH,
    TLBIlevel_Last, TLBI_ExcludeXS, X[t]);

```

TLBI RPALOS, TLB Range Invalidate GPT Information by PA, Last level, Outer Shareable

The TLBI RPALOS characteristics are:

Purpose

Invalidates cached copies of GPT entries from TLBs. Details:

- The invalidation applies to TLB entries containing GPT information that relates to a physical address.
- The invalidation affects all TLBs in the Outer Shareable domain.
- Invalidates TLB entries containing GPT information from the final level of the GPT walk that relates to the supplied physical address.
- Invalidations are range-based, invalidating TLB entries starting from the address in BaseADDR, within the range as specified by SIZE.

The full set of TLB maintenance instructions that invalidate cached GPT entries is: [TLBI PAALL](#), [TLBI PAALLOS](#), [TLBI RPALOS](#), and [TLBI RPAOS](#).

These instructions have the same ordering, observability, and completion behavior as all other TLBI instructions.

Configuration

This instruction is present only when FEAT_RME is implemented. Otherwise, direct accesses to TLBI RPALOS are UNDEFINED.

Attributes

TLBI RPALOS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|------|----|----|----|---------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | SIZE | | | | RES0 | | | | Address | | | | | | | |
| Address | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:48]

Reserved, RES0.

SIZE, bits [47:44]

Size of the range for invalidation.

If SIZE is a reserved value, no TLB entries are required to be invalidated.

| SIZE | Meaning |
|--------|---------|
| 0b0000 | 4KB. |
| 0b0001 | 16KB. |
| 0b0010 | 64KB. |
| 0b0011 | 2MB. |
| 0b0100 | 32MB. |
| 0b0101 | 512MB. |
| 0b0110 | 1GB. |
| 0b0111 | 16GB. |
| 0b1000 | 64GB. |
| 0b1001 | 512GB. |

All other values are reserved.

If SIZE gives a range smaller than the configured physical granule size in [GPCCR_EL3.PGS](#), then the effective value of SIZE is taken to be the size configured by [GPCCR_EL3.PGS](#).

If [GPCCR_EL3.PGS](#) is configured to a reserved value, no TLB entries are required to be invalidated.

Bits [43:40]

Reserved, RES0.

Address, bits [39:0]

The starting address for the range of the maintenance instruction.

This field is decoded with reference to the value of [GPCCR_EL3.PGS](#) to give BaseADDR as follows:

| GPCCR_EL3.PGS | BaseADDR |
|---------------|----------------------------|
| 0b00 (4KB) | BaseADDR[51:12] = Xt[39:0] |
| 0b10 (16KB) | BaseADDR[51:14] = Xt[39:2] |
| 0b01 (64KB) | BaseADDR[51:16] = Xt[39:4] |

Other bits of BaseADDR are treated as zero, to give the effective value of BaseADDR.

If the effective value of BaseADDR is not aligned to the size of the effective value of SIZE, no TLB entries are required to be invalidated.

If [GPCCR_EL3.PGS](#) is configured to a reserved value, no TLB entries are required to be invalidated.

Executing the TLBI RPALOS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RPALOS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b110 | 0b1000 | 0b0100 | 0b111 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    AArch64.TLBI_RPA(TLBIlevel_Last, X[t], Shareability_0SH);

```

TLBI RPAOS, TLB Range Invalidate GPT Information by PA, Outer Shareable

The TLBI RPAOS characteristics are:

Purpose

Invalidates cached copies of GPT entries from TLBs. Details:

- The invalidation applies to TLB entries containing GPT information that relates to a physical address.
- The invalidation affects all TLBs in the Outer Shareable domain.
- Invalidates TLB entries containing GPT information from all levels of the GPT walk that relates to the supplied physical address.
- Invalidations are range-based, invalidating TLB entries starting from the address in BaseADDR, within the range as specified by SIZE.

The full set of TLB maintenance instructions that invalidate cached GPT entries is: [TLBI PAALL](#), [TLBI PAALLOS](#), [TLBI RPALOS](#), and [TLBI RPAOS](#).

These instructions have the same ordering, observability, and completion behavior as all other TLBI instructions.

Configuration

This instruction is present only when FEAT_RME is implemented. Otherwise, direct accesses to TLBI RPAOS are UNDEFINED.

Attributes

TLBI RPAOS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|------|----|----|----|---------|----|----|----|----|----|----|----|--|--|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | | |

Bits [63:48]

Reserved, RES0.

SIZE, bits [47:44]

Size of the range for invalidation.

If SIZE is a reserved value, no TLB entries are required to be invalidated.

| SIZE | Meaning |
|--------|---------|
| 0b0000 | 4KB. |
| 0b0001 | 16KB. |
| 0b0010 | 64KB. |
| 0b0011 | 2MB. |
| 0b0100 | 32MB. |
| 0b0101 | 512MB. |
| 0b0110 | 1GB. |
| 0b0111 | 16GB. |
| 0b1000 | 64GB. |
| 0b1001 | 512GB. |

All other values are reserved.

If SIZE gives a range smaller than the configured physical granule size in [GPCCR_EL3.PGS](#), then the effective value of SIZE is taken to be the size configured by [GPCCR_EL3.PGS](#).

If [GPCCR_EL3.PGS](#) is configured to a reserved value, no TLB entries are required to be invalidated.

Bits [43:40]

Reserved, RES0.

Address, bits [39:0]

The starting address for the range of the maintenance instruction.

This field is decoded with reference to the value of [GPCCR_EL3.PGS](#) to give BaseADDR as follows:

| GPCCR_EL3.PGS | BaseADDR |
|---------------|----------------------------|
| 0b00 (4KB) | BaseADDR[51:12] = Xt[39:0] |
| 0b10 (16KB) | BaseADDR[51:14] = Xt[39:2] |
| 0b01 (64KB) | BaseADDR[51:16] = Xt[39:4] |

Other bits of BaseADDR are treated as zero, to give the effective value of BaseADDR.

If the effective value of BaseADDR is not aligned to the size of the effective value of SIZE, no TLB entries are required to be invalidated.

If [GPCCR_EL3.PGS](#) is configured to a reserved value, no TLB entries are required to be invalidated.

Executing the TLBI RPAOS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RPAOS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b110 | 0b1000 | 0b0100 | 0b011 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    AArch64.TLBI_RPA(TLBILevel_Any, X[t], Shareability_0SH);

```

TLBI RVAAE1, TLBI RVAAE1NXS, TLB Range Invalidate by VA, All ASID, EL1

The TLBI RVAAE1, TLBI RVAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAAE1, TLBI RVAAE1NXS are UNDEFINED.

Attributes

TLBI RVAAE1, TLBI RVAAE1NXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|----|-----|----|----------|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | | | | | | | | | TG | SCALE | NUM | | | | | TTL | | BaseADDR | | | | | | | |
| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAAE1, TLBI RVAAE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAAE1{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b000 | 0b1000 | 0b0110 | 0b011 |

```

if PSTATE.EL == EL0 then

TLBI RVAAE1IS, TLBI RVAAE1ISNXS, TLB Range Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI RVAAE1IS, TLBI RVAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:

- If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
- If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAAE1IS, TLBI RVAAE1ISNXS are UNDEFINED.

Attributes

TLBI RVAAE1IS, TLBI RVAAE1ISNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|-----|----|----------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | TG | SCALE | NUM | | | | TTL | | BaseADDR | | | | | | | |
| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAAE1IS, TLBI RVAAE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAAE1IS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b01 | 0b000 | 0b1000 | 0b0010 | 0b011 |

```

TLBI RVAAE1OS, TLBI RVAAE1OSNXS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI RVAAE1OS, TLBI RVAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:

TLBI RVAAE1OS, TLBI RVAAE1OSNXS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

- If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
- If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAAE1OS, TLBI RVAAE1OSNXS are UNDEFINED.

Attributes

TLBI RVAAE1OS, TLBI RVAAE1OSNXS is a 64-bit System instruction.

TLBI RVAALE1, TLBI RVAALE1NXS, TLB Range Invalidate by VA, All ASID, Last level, EL1

The TLBI RVAALE1, TLBI RVAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAALE1, TLBI RVAALE1NXS are UNDEFINED.

Attributes

TLBI RVAALE1, TLBI RVAALE1NXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|----|-----|----|----------|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | | | | | | | | | TG | SCALE | NUM | | | | | TTL | | BaseADDR | | | | | | | |
| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVAALE1IS, TLBI RVAALE1ISNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI RVAALE1IS, TLBI RVAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.

- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAALE1IS, TLBI RVAALE1ISNXS are UNDEFINED.

Attributes

TLBI RVAALE1IS, TLBI RVAALE1ISNXS is a 64-bit System instruction.

| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]
When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAALE1IS, TLBI RVAALE1ISNXS instruction

TLBI RVAALE1OS, TLBI RVAALE1OSNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBI RVAALE1OS, TLBI RVAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.

- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 00000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAALE1OS, TLBI RVAALE1OSNXS are UNDEFINED.

Attributes

TLBI RVAALE1OS, TLBI RVAALE1OSNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|-----|----|----------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | TG | SCALE | NUM | | | | TTL | | BaseADDR | | | | | | | |
| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]
When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAALE1OS, TLBI RVAALE1OSNXS instruction

TLBI RVAE1, TLBI RVAE1NXS, TLB Range Invalidate by VA, EL1

The TLBI RVAE1, TLBI RVAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE1, TLBI RVAE1NXS are UNDEFINED.

Attributes

TLBI RVAE1, TLBI RVAE1NXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|-----|----|----------|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| ASID | | | | | | | | | | | | | | | | TG | SCALE | NUM | | | | TTL | | BaseADDR | | | | | | | | |
| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|--|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE1, TLBI RVAE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE1{, <Xt>}

TLBI RVAE1IS, TLBI RVAE1ISNXS, TLB Range Invalidate by VA, EL1, Inner Shareable

The TLBI RVAE1IS, TLBI RVAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.

- For the 64K translation granule:
 - If $TTL == 01$ and $BaseADDR[41:16]$ is not equal to 000000000000000000000000.
 - If $TTL == 10$ and $BaseADDR[28:16]$ is not equal to 0000000000000000.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE1IS, TLBI RVAE1ISNXS are UNDEFINED.

Attributes

TLBI RVAE1IS, TLBI RVAE1ISNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|-----|----|----------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ASID | | | | | | | | | | | | | | | | TG | SCALE | NUM | | | | TTL | | BaseADDR | | | | | | | |
| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE1IS, TLBI RVAE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE1IS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b01 | 0b000 | 0b1000 | 0b0010 | 0b001 |

```

TLBI RVAE1OS, TLBI RVAE1OSNXS, TLB Range Invalidate by VA, EL1, Outer Shareable

The TLBI RVAE1OS, TLBI RVAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.

- For the 64K translation granule:
 - If $TTL == 01$ and $BaseADDR[41:16]$ is not equal to 000000000000000000000000.
 - If $TTL == 10$ and $BaseADDR[28:16]$ is not equal to 00000000000000.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE1OS, TLBI RVAE1OSNXS are UNDEFINED.

Attributes

TLBI RVAE1OS, TLBI RVAE1OSNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|-----|----|----------|----|----|----|----|----|----|----|

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

TLBI RVAE2, TLBI RVAE2NXS, TLB Range Invalidate by VA, EL2

The TLBI RVAE2, TLBI RVAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1)} * \text{Translation_Granule_Size})]$ using the EL2 or EL2&0 translation regime for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from any level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

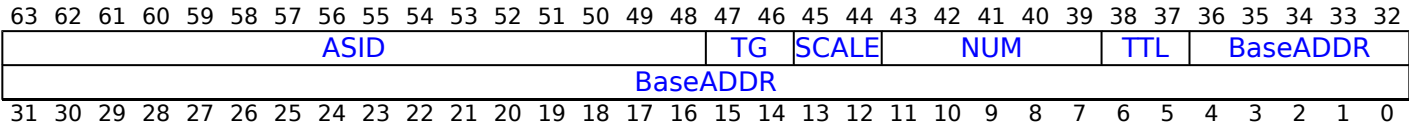

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE2, TLBI RVAE2NXS are UNDEFINED.

Attributes

TLBI RVAE2, TLBI RVAE2NXS is a 64-bit System instruction.

Field descriptions

ASID, bits [63:48]
When HCR_EL2.E2H == 1:

- ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
- Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
- If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE2, TLBI RVAE2NXS instruction

TLBI RVAE2IS, TLBI RVAE2ISNXS, TLB Range Invalidate by VA, EL2, Inner Shareable

The TLBI RVAE2IS, TLBI RVAE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1)} * \text{Translation_Granule_Size})]$ using the EL2 or EL2&0 translation regime for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from any level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If $\text{TTL} == 01$ and $\text{BaseADDR}[29:12]$ is not equal to 00000000000000000000.
 - If $\text{TTL} == 10$ and $\text{BaseADDR}[20:12]$ is not equal to 000000000.
- For the 16K translation granule:
 - If $\text{TTL} == 10$ and $\text{BaseADDR}[24:14]$ is not equal to 000000000000.
- For the 64K translation granule:
 - If $\text{TTL} == 01$ and $\text{BaseADDR}[41:16]$ is not equal to 00000000000000000000000000000000.
 - If $\text{TTL} == 10$ and $\text{BaseADDR}[28:16]$ is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

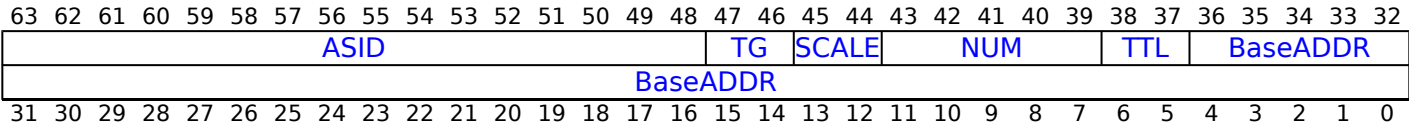

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE2IS, TLBI RVAE2ISNXS are UNDEFINED.

Attributes

TLBI RVAE2IS, TLBI RVAE2ISNXS is a 64-bit System instruction.

Field descriptions

ASID, bits [63:48]
When HCR_EL2.E2H == 1:

- ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.
- Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.
- If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

- Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |

TLBI RVAE2OS, TLBI RVAE2OSNXS, TLB Range Invalidate by VA, EL2, Outer Shareable

The TLBI RVAE2OS, TLBI RVAE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1)} * \text{Translation_Granule_Size})]$ using the EL2 or EL2&0 translation regime for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from any level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE2OS, TLBI RVAE2OSNXS are UNDEFINED.

Attributes

TLBI RVAE2OS, TLBI RVAE2OSNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|-----|----|----------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ASID | | | | | | | | | | | | | | | | TG | SCALE | NUM | | | | TTL | | BaseADDR | | | | | | | |
| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|--|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE2OS, TLBI RVAE2OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE2OS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|

TLBI RVAE3, TLBI RVAE3NXS, TLB Range Invalidate by VA, EL3

The TLBI RVAE3, TLBI RVAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1)} * \text{Translation_Granule_Size})]$.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If $\text{TTL} == 01$ and $\text{BaseADDR}[29:12]$ is not equal to 00000000000000000000.
 - If $\text{TTL} == 10$ and $\text{BaseADDR}[20:12]$ is not equal to 000000000.
- For the 16K translation granule:
 - If $\text{TTL} == 10$ and $\text{BaseADDR}[24:14]$ is not equal to 000000000000.
- For the 64K translation granule:
 - If $\text{TTL} == 01$ and $\text{BaseADDR}[41:16]$ is not equal to 00000000000000000000000000000000.
 - If $\text{TTL} == 10$ and $\text{BaseADDR}[28:16]$ is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE3, TLBI RVAE3NXS are UNDEFINED.

Attributes

TLBI RVAE3, TLBI RVAE3NXS is a 64-bit System instruction.

TLBI RVAE3IS, TLBI RVAE3ISNXS, TLB Range Invalidate by VA, EL3, Inner Shareable

The TLBI RVAE3IS, TLBI RVAE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If $TTL == 01$ and $BaseADDR[29:12]$ is not equal to 000000000000000000.
 - If $TTL == 10$ and $BaseADDR[20:12]$ is not equal to 000000000.
- For the 16K translation granule:
 - If $TTL == 10$ and $BaseADDR[24:14]$ is not equal to 00000000000.
- For the 64K translation granule:
 - If $TTL == 01$ and $BaseADDR[41:16]$ is not equal to 00000000000000000000000000000000.
 - If $TTL == 10$ and $BaseADDR[28:16]$ is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVAE3IS, TLBI RVAE3ISNXS are UNDEFINED.

Attributes

TLBI RVAE3IS, TLBI RVAE3ISNXS is a 64-bit System instruction.

TLBI RVAE3OS, TLBI RVAE3OSNXS, TLB Range Invalidate by VA, EL3, Outer Shareable

The TLBI RVAE3OS, TLBI RVAE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If $TTL == 01$ and $BaseADDR[29:12]$ is not equal to 000000000000000000.
 - If $TTL == 10$ and $BaseADDR[20:12]$ is not equal to 000000000.
- For the 16K translation granule:
 - If $TTL == 10$ and $BaseADDR[24:14]$ is not equal to 00000000000.
- For the 64K translation granule:
 - If $TTL == 01$ and $BaseADDR[41:16]$ is not equal to 00000000000000000000000000000000.
 - If $TTL == 10$ and $BaseADDR[28:16]$ is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVAE3OS, TLBI RVAE3OSNXS are UNDEFINED.

Attributes

TLBI RVAE3OS, TLBI RVAE3OSNXS is a 64-bit System instruction.

|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|-------|-----|----|----|----|-----|----|----------|----|----|----|----|----|----|----|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| RES0 | | | | | | | | | | | | | | | | TG | SCALE | NUM | | | | TTL | | BaseADDR | | | | | | | | | |
| | | | | | | | | | | | | | | | | BaseADDR | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|--|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL3.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVAE3OS, TLBI RVAE3OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE3OS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b110 | 0b1000 | 0b0101 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    AArch64.TLBI_RVA(SecurityStateAtEL(EL3), Regime_EL3, VMID[], Shareability_0SH, TLBIlevel_Any,
    TLBI_AllAttr, X[t]);

```

TLBI RVAE3OSNXS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b110 | 0b1001 | 0b0101 | 0b001 |

```

if !IsFeatureImplemented(FEAT_XS) then
    UNDEFINED;
elsif PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    AArch64.TLBI_RVA(SecurityStateAtEL(EL3), Regime_EL3, VMID[], Shareability_0SH, TLBIlevel_Any,
    TLBI_ExcludeXS, X[t]);

```

TLBI RVALE1, TLBI RVALE1NXS, TLB Range Invalidate by VA, Last level, EL1

The TLBI RVALE1, TLBI RVALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidation of TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE1, TLBI RVALE1NXS are UNDEFINED.

Attributes

TLBI RVALE1, TLBI RVALE1NXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|----|-----|----|----------|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| ASID | | | | | | | | | | | | | | | | TG | SCALE | NUM | | | | | TTL | | BaseADDR | | | | | | | |
| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE1, TLBI RVALE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE1{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b01 | 0b000 | 0b1000 | 0b0110 | 0b101 |

TLBI RVALE1IS, TLBI RVALE1ISNXS, TLB Range Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI RVALE1IS, TLBI RVALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:

- If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
- If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE1IS, TLBI RVALE1ISNXS are UNDEFINED.

Attributes

TLBI RVALE1IS, TLBI RVALE1ISNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|-----|----|----------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ASID | | | | | | | | | | | | | | | | TG | SCALE | NUM | | | | TTL | | BaseADDR | | | | | | | |
| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------------|--|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE1IS, TLBI RVALE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE1IS{, <Xt>}

TLBI RVALE1OS, TLBI RVALE1OSNXS, TLB Range Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI RVALE1OS, TLBI RVALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1)} * \text{Translation_Granule_Size})]$.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 0000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:

- If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
- If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE1OS, TLBI RVALE1OSNXS are UNDEFINED.

Attributes

TLBI RVALE1OS, TLBI RVALE1OSNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|-----|----|----------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ASID | | | | | | | | | | | | | | | | TG | SCALE | NUM | | | | TTL | | BaseADDR | | | | | | | |
| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL1.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE1OS, TLBI RVALE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE1OS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|

TLBI RVALE2, TLBI RVALE2NXS, TLB Range Invalidate by VA, Last level, EL2

The TLBI RVALE2, TLBI RVALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1)} * \text{Translation_Granule_Size})]$ using the EL2 or EL2&0 translation regime for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from the final level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE2, TLBI RVALE2NXS are UNDEFINED.

Attributes

TLBI RVALE2, TLBI RVALE2NXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE2, TLBI RVALE2NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE2{, <Xt>}

TLBI RVALE2IS, TLBI RVALE2ISNXS, TLB Range Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI RVALE2IS, TLBI RVALE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1)} * \text{Translation_Granule_Size})]$ using the EL2 or EL2&0 translation regime for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from the final level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE2IS, TLBI RVALE2ISNXS are UNDEFINED.

Attributes

TLBI RVALE2IS, TLBI RVALE2ISNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|-----|----|----------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ASID | | | | | | | | | | | | | | | | TG | SCALE | NUM | | | | TTL | | BaseADDR | | | | | | | |
| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE2IS, TLBI RVALE2ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE2IS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |

TLBI RVALE2OS, TLBI RVALE2OSNXS, TLB Range Invalidate by VA, Last level, EL2, Outer Shareable

The TLBI RVALE2OS, TLBI RVALE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA in the specified range determined by the formula $[\text{BaseADDR} \leq \text{VA} < \text{BaseADDR} + ((\text{NUM} + 1) * 2^{(5 * \text{SCALE} + 1)} * \text{Translation_Granule_Size})]$ using the EL2 or EL2&0 translation regime for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from the final level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If TTL==01 and BaseADDR[29:12] is not equal to 00000000000000000000.
 - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
 - If TTL==10 and BaseADDR[24:14] is not equal to 000000000000.
- For the 64K translation granule:
 - If TTL==01 and BaseADDR[41:16] is not equal to 00000000000000000000000000000000.
 - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE2OS, TLBI RVALE2OSNXS are UNDEFINED.

Attributes

TLBI RVALE2OS, TLBI RVALE2OSNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|-----|----|----|----------|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ASID | | | | | | | | | | | | | | | | TG | SCALE | NUM | | | | TTL | | | BaseADDR | | | | | | |
| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

When HCR_EL2.E2H == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|---|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]**When FEAT_LPA2 is implemented and TCR_EL2.DS == 1:**

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE2OS, TLBI RVALE2OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE2OS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|

TLBI RVALE3, TLBI RVALE3NXS, TLB Range Invalidate by VA, Last level, EL3

The TLBI RVALE3, TLBI RVALE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If $TTL == 01$ and $BaseADDR[29:12]$ is not equal to 00000000000000000000.
 - If $TTL == 10$ and $BaseADDR[20:12]$ is not equal to 000000000.
- For the 16K translation granule:
 - If $TTL == 10$ and $BaseADDR[24:14]$ is not equal to 000000000000.
- For the 64K translation granule:
 - If $TTL == 01$ and $BaseADDR[41:16]$ is not equal to 00000000000000000000000000000000.
 - If $TTL == 10$ and $BaseADDR[28:16]$ is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE3, TLBI RVALE3NXS are UNDEFINED.

Attributes

TLBI RVALE3, TLBI RVALE3NXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|-----|----|----|----|-----|----|----------|----|----|----|----|----|----|----|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| RES0 | | | | | | | | | | | | | | | | TG | SCALE | NUM | | | | TTL | | BaseADDR | | | | | | | | | |
| BaseADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|--|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL3.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE3, TLBI RVALE3NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE3{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b110 | 0b1000 | 0b0110 | 0b101 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    AArch64.TLBI_RVA(SecurityStateAtEL(EL3), Regime_EL3, VMID[], Shareability_NSH, TLBIlevel_Last,
    TLBI_AllAttr, X[t]);
```

TLBI RVALE3NXS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |

TLBI RVALE3IS, TLBI RVALE3ISNXS, TLB Range Invalidate by VA, Last level, EL3, Inner Shareable

The TLBI RVALE3IS, TLBI RVALE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If $TTL == 01$ and $BaseADDR[29:12]$ is not equal to 000000000000000000.
 - If $TTL == 10$ and $BaseADDR[20:12]$ is not equal to 000000000.
- For the 16K translation granule:
 - If $TTL == 10$ and $BaseADDR[24:14]$ is not equal to 00000000000.
- For the 64K translation granule:
 - If $TTL == 01$ and $BaseADDR[41:16]$ is not equal to 00000000000000000000000000000000.
 - If $TTL == 10$ and $BaseADDR[28:16]$ is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented. Otherwise, direct accesses to TLBI RVALE3IS, TLBI RVALE3ISNXS are UNDEFINED.

Attributes

TLBI RVALE3IS, TLBI RVALE3ISNXS is a 64-bit System instruction.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|--|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL3.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing the TLBI RVALE3IS, TLBI RVALE3ISNXS instruction

TLBI RVALE3OS, TLBI RVALE3OSNXS, TLB Range Invalidate by VA, Last level, EL3, Outer Shareable

The TLBI RVALE3OS, TLBI RVALE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.
- The entry is within the address range determined by the formula $[BaseADDR \leq VA < BaseADDR + ((NUM + 1) * 2^{(5 * SCALE + 1)} * Translation_Granule_Size)]$.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

The range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
 - If $TTL == 01$ and $BaseADDR[29:12]$ is not equal to 000000000000000000.
 - If $TTL == 10$ and $BaseADDR[20:12]$ is not equal to 000000000.
- For the 16K translation granule:
 - If $TTL == 10$ and $BaseADDR[24:14]$ is not equal to 00000000000.
- For the 64K translation granule:
 - If $TTL == 01$ and $BaseADDR[41:16]$ is not equal to 00000000000000000000000000000000.
 - If $TTL == 10$ and $BaseADDR[28:16]$ is not equal to 0000000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI RVALE3OS, TLBI RVALE3OSNXS are UNDEFINED.

Attributes

TLBI RVALE3OS, TLBI RVALE3OSNXS is a 64-bit System instruction.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

| TG | Meaning |
|------|--------------------------|
| 0b00 | Reserved. |
| 0b01 | 4K translation granule. |
| 0b10 | 16K translation granule. |
| 0b11 | 64K translation granule. |

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate entries in the range that match the level described by the TTL hint.

| TTL | Meaning |
|------|--|
| 0b00 | The entries in the range can be using any level for the translation table entries. |
| 0b01 | All entries to invalidate are Level 1 translation table entries. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00. |
| 0b10 | All entries to invalidate are Level 2 translation table entries. |
| 0b11 | All entries to invalidate are Level 3 translation table entries. |

BaseADDR, bits [36:0]

When FEAT_LPA2 is implemented and TCR_EL3.DS == 1:

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI VAAE1, TLBI VAAE1NXS, TLB Invalidate by VA, All ASID, EL1

The TLBI VAAE1, TLBI VAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAAE1, TLBI VAAE1NXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|

| RES0 | | | | | | | | | | | | | | | | TTL | | | | VA[55:12] | | | | | | | | | | | |
| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]**When FEAT_TTL is implemented:**

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|------------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAAE1, TLBI VAAE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAAE1{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b01 | 0b000 | 0b1000 | 0b0111 | 0b011 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;

TLBI VAAE1IS, TLBI VAAE1ISNXS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI VAAE1IS, TLBI VAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAAE1IS, TLBI VAAE1ISNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| RES0 | | | | | | | | | | | | | | | | TTL | | | | VA[55:12] | | | | | | | | | | | | | |
| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAAE1IS, TLBI VAAE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAAE1IS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|

TLBI VAAE1OS, TLBI VAAE1OSNXS, TLB Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI VAAE1OS, TLBI VAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAAE1OS, TLBI VAAE1OSNXS are UNDEFINED.

Attributes

TLBI VAAE1OS, TLBI VAAE1OSNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| RES0 | | | | | | | | | | | | | | | | TTL | | | | VA[55:12] | | | | | | | | | | | | | |
| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAAE1OS, TLBI VAAE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAAE1OS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b000 | 0b1000 | 0b0001 | 0b011 |

TLBI VAALE1, TLBI VAALE1NXS, TLB Invalidate by VA, All ASID, Last level, EL1

The TLBI VAALE1, TLBI VAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAALE1, TLBI VAALE1NXS is a 64-bit System instruction.

Field descriptions

| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]**When FEAT_TTL is implemented:**

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|------------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAALE1, TLBI VAALE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAALE1{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b01 | 0b000 | 0b1000 | 0b0111 | 0b111 |

TLBI VAALE1IS, TLBI VAALE1ISNXS, TLB Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI VAALE1IS, TLBI VAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAALE1IS, TLBI VAALE1ISNXS instruction

TLBI VAALE1OS, TLBI VAALE1OSNXS, TLB Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBI VAALE1OS, TLBI VAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAALE1OS, TLBI VAALE1OSNXS are UNDEFINED.

Attributes

TLBI VAALE1OS, TLBI VAALE1OSNXS is a 64-bit System instruction.

Field descriptions

| RES0 | | | | | | | | | | | | | | | | TTL | | | | VA[55:12] | | | | | | | | | | | | | |
| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAALE1OS, TLBI VAALE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAALE1OS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b000 | 0b1000 | 0b0001 | 0b111 |

TLBI VAE1, TLBI VAE1NXS, TLB Invalidate by VA, EL1

The TLBI VAE1, TLBI VAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAE1, TLBI VAE1NXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ASID | | | | | | | | | | | | | | | | TTL | | | | VA[55:12] | | | | | | | | | | | |
| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|------------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE1, TLBI VAE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE1{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b000 | 0b1000 | 0b0111 | 0b001 |

```

TLBI VAE1IS, TLBI VAE1ISNXS, TLB Invalidate by VA, EL1, Inner Shareable

The TLBI VAE1IS, TLBI VAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAE1IS, TLBI VAE1ISNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| ASID | | | | | | | | | | | | | | | | TTL | | | | VA[55:12] | | | | | | | | | | | | | |
| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE1IS, TLBI VAE1ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE1IS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b000 | 0b1000 | 0b0011 | 0b001 |

TLBI VAE1OS, TLBI VAE1OSNXS, TLB Invalidate by VA, EL1, Outer Shareable

The TLBI VAE1OS, TLBI VAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAE1OS, TLBI VAE1OSNXS are UNDEFINED.

Attributes

TLBI VAE1OS, TLBI VAE1OSNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| ASID | | | | | | | | | | | | | | | | TTL | | | | VA[55:12] | | | | | | | | | | | | | |
| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE1OS, TLBI VAE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE1OS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b000 | 0b1000 | 0b0001 | 0b001 |

TLBI VAE2, TLBI VAE2NXS, TLB Invalidate by VA, EL2

The TLBI VAE2, TLBI VAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from any level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAE2, TLBI VAE2NXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ASID | | | | | | | | | | | | | | | | TTL | | | | VA[55:12] | | | | | | | | | | | |
| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE2, TLBI VAE2NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE2{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b100 | 0b1000 | 0b0111 | 0b001 |

        TLBILevel_Any, TLBI_ExcludeXS, X[t]);
    else
        AArch64.TLBI_VA(SecurityStateAtEL(EL2), Regime_EL2, VMID[], Shareability_NSH,
        TLBILevel_Any, TLBI_ExcludeXS, X[t]);

```

TLBI VAE2IS, TLBI VAE2ISNXS, TLB Invalidate by VA, EL2, Inner Shareable

The TLBI VAE2IS, TLBI VAE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from any level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAE2IS, TLBI VAE2ISNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ASID | | | | | | | | | | | | | | | | TTL | | | | VA[55:12] | | | | | | | | | | | |
| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|------------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE2IS, TLBI VAE2ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

```

TLBI VAE2OS, TLBI VAE2OSNXS, TLB Invalidate by VA, EL2, Outer Shareable

The TLBI VAE2OS, TLBI VAE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from any level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAE2OS, TLBI VAE2OSNXS are UNDEFINED.

Attributes

TLBI VAE2OS, TLBI VAE2OSNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|--|--|

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

ASID, bits [63:48]**When HCR_EL2.E2H == 1:**

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]**When FEAT_TTL is implemented:**

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|------------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE2OS, TLBI VAE2OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE2OS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b100 | 0b1000 | 0b0001 | 0b001 |

TLBI VAE3, TLBI VAE3NXS, TLB Invalidate by VA, EL3

The TLBI VAE3, TLBI VAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAE3, TLBI VAE3NXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | TTL | | | | VA[55:12] | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | VA[55:12] | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|------------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VAE3, TLBI VAE3NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE3{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|

TLBI VAE3IS, TLBI VAE3ISNXS, TLB Invalidate by VA, EL3, Inner Shareable

The TLBI VAE3IS, TLBI VAE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VAE3IS, TLBI VAE3ISNXS is a 64-bit System instruction.

TLBI VAE3OS, TLBI VAE3OSNXS, TLB Invalidate by VA, EL3, Outer Shareable

The TLBI VAE3OS, TLBI VAE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VAE3OS, TLBI VAE3OSNXS are UNDEFINED.

Attributes

TLBI VAE3OS, TLBI VAE3OSNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

TLBI VALE1, TLBI VALE1NXS, TLB Invalidate by VA, Last level, EL1

The TLBI VALE1, TLBI VALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VALE1, TLBI VALE1NXS is a 64-bit System instruction.

| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|------------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE1, TLBI VALE1NXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE1{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b000 | 0b1000 | 0b0111 | 0b101 |

```

TLBI VALE1IS, TLBI VALE1ISNXS, TLB Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI VALE1IS, TLBI VALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VALE1IS, TLBI VALE1ISNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |

| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE1IS, TLBI VALE1ISNXS instruction

TLBI VALE1OS, TLBI VALE1OSNXS, TLB Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI VALE1OS, TLBI VALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA, and one of the following applies:
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VALE1OS, TLBI VALE1OSNXS are UNDEFINED.

Attributes

TLBI VALE1OS, TLBI VALE1OSNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| ASID | | | | | | | | | | | | | | | | TTL | | | | VA[55:12] | | | | | | | | | | | | | |
| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE1OS, TLBI VALE1OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE1OS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |

TLBI VALE2, TLBI VALE2NXS, TLB Invalidate by VA, Last level, EL2

The TLBI VALE2, TLBI VALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from the final level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VALE2, TLBI VALE2NXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ASID | | | | | | | | | | | | | | | | TTL | | | | VA[55:12] | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | VA[55:12] | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

When [HCR_EL2.E2H](#) == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

```

TLBI VALE2IS, TLBI VALE2ISNXS, TLB Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI VALE2IS, TLBI VALE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from the final level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VALE2IS, TLBI VALE2ISNXS is a 64-bit System instruction.
