When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

| RWOD | Meaning |
|------|--|
| 0b0 | Normal operation. |
| 0b1 | A read of a WO location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

| WRD | Meaning |
|-----|---|
| 0b0 | Normal operation. |
| 0b1 | A write to a reserved location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

| RRD | Meaning |
|-----|--|
| 0b0 | Normal operation. |
| 0b1 | A read of a reserved location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICD_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

GICD_STATUSR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|--------|------------------|
| GIC Distributor | Dist_base | 0x0010 | GICD_STATUSR (S) |

This interface is accessible as follows:

- When an access is Secure accesses to this register are **RW**.
- When FEAT_RME is implemented and IsAccessRoot() accesses to this register are **RW**.

| Component | Frame | Offset | Instance |
|-----------------|-----------|--------|-------------------|
| GIC Distributor | Dist_base | 0x0010 | GICD_STATUSR (NS) |

This interface is accessible as follows:

- When an access is Non-secure accesses to this register are **RW**.
- When FEAT_RME is implemented and IsAccessRealm() accesses to this register are **RAZ/WI**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICD_TYPER, Interrupt Controller Type Register

The GICD_TYPER characteristics are:

Purpose

Provides information about what features the GIC implementation supports. It indicates:

- Whether the GIC implementation supports two Security states.
- The maximum number of INTIDs that the GIC implementation supports.
- The number of PEs that can be used as interrupt targets.

Configuration

This register is available in all configurations of the GIC. When [GICD_CTLR.DS](#)==0, this register is Common.

Attributes

GICD_TYPER is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|-----|------|-----|--------|------|------|------|----------|--------------|-----|------|-----------|---------------|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ESPI_range | RSS | No1N | A3V | IDbits | DVIS | LPIS | MBIS | num_LPis | SecurityExtn | NMI | ESPI | CPUNumber | ITLinesNumber | | | | | | | | | | | | | | | | | | |

ESPI_range, bits [31:27]

When GICD_TYPER.ESPI == 1:

Indicates the maximum INTID in the Extended SPI range.

Maximum Extended SPI INTID is $(32 * (\text{ESPI_range} + 1) + 4095)$.

The ESPI_range field only indicates the maximum number of SPIs that the GIC implementation might support. This value determines the number of instances of the following interrupt registers:

- [GICD_IGROUPR<n>E](#).
- [GICD_ISENBALER<n>E](#).
- [GICD_ICENABLER<n>E](#).
- [GICD_ISPENDR<n>E](#).
- [GICD_ICPENDR<n>E](#).
- [GICD_ISACTIVER<n>E](#).
- [GICD_ICACTIVER<n>E](#).
- [GICD_IPRIORITYR<n>E](#).
- [GICD_ICFGR<n>E](#).
- [GICD_IROUTER<n>E](#).
- [GICD_IGRPMODR<n>E](#).

The GIC architecture does not require a GIC implementation to support a continuous range of SPI interrupt IDs. Software must check which SPI INTIDs are supported, up to the maximum value indicated by GICD_TYPER.ESPI_range.

Otherwise:

Reserved, RES0.

RSS, bit [26]

Range Selector Support.

| RSS | Meaning |
|------------|---|
| 0b0 | The IRI supports targeted SGIs with affinity level 0 values of 0 - 15. |
| 0b1 | The IRI supports targeted SGIs with affinity level 0 values of 0 - 255. |

No1N, bit [25]

Indicates whether 1 of N SPI interrupts are supported.

| No1N | Meaning |
|-------------|--|
| 0b0 | 1 of N SPI interrupts are supported. |
| 0b1 | 1 of N SPI interrupts are not supported. |

A3V, bit [24]

Affinity 3 valid. Indicates whether the Distributor supports nonzero values of Affinity level 3.

| A3V | Meaning |
|------------|--|
| 0b0 | The Distributor only supports zero values of Affinity level 3. |
| 0b1 | The Distributor supports nonzero values of Affinity level 3. |

IDbits, bits [23:19]

The number of interrupt identifier bits supported, minus one.

DVIS, bit [18]

When FEAT_GICv4 is implemented:

Indicates whether the implementation supports Direct Virtual LPI injection.

| DVIS | Meaning |
|-------------|---|
| 0b0 | The implementation does not support Direct Virtual LPI injection. |
| 0b1 | The implementation supports Direct Virtual LPI injection. |

Otherwise:

Reserved, RES0.

LPIS, bit [17]

Indicates whether the implementation supports LPIS.

| LPIS | Meaning |
|-------------|---|
| 0b0 | The implementation does not support LPIS. |
| 0b1 | The implementation supports LPIS. |

MBIS, bit [16]

Indicates whether the implementation supports message-based interrupts by writing to Distributor registers.

| MBIS | Meaning |
|-------------|---|
| 0b0 | The implementation does not support message-based interrupts by writing to Distributor registers. The GICD_CLRSPI_NSR , GICD_SETSPI_NSR , GICD_CLRSPI_SR , and GICD_SETSPI_SR registers are reserved. |
| 0b1 | The implementation supports message-based interrupts by writing to the GICD_CLRSPI_NSR , GICD_SETSPI_NSR , GICD_CLRSPI_SR , or GICD_SETSPI_SR registers. |

num_LPIs, bits [15:11]

Number of supported LPis.

- 0b00000 Number of LPis as indicated by GICD_TYPER.IDbits.
- All other values Number of LPis supported is $2^{(\text{num_LPis}+1)}$.
 - Available LPI INTIDs are $8192..(8192 + 2^{(\text{num_LPis}+1)} - 1)$.
 - This field cannot indicate a maximum LPI INTID greater than that indicated by GICD_TYPER.IDbits.

When the supported INTID width is less than 14 bits, this field is RES0 and no LPis are supported.

SecurityExtn, bit [10]

Indicates whether the GIC implementation supports two Security states:

When [GICD_CTLR.DS](#) == 1, this field is RAZ.

| SecurityExtn | Meaning |
|--------------|---|
| 0b0 | The GIC implementation supports only a single Security state. |
| 0b1 | The GIC implementation supports two Security states. |

NMI, bit [9]

Non-maskable Interrupts.

| NMI | Meaning |
|-----|--|
| 0b0 | Non-maskable interrupt property not supported. |
| 0b1 | Non-maskable interrupt property is supported. |

ESPI, bit [8]

Extended SPI.

| ESPI | Meaning |
|------|-------------------------------------|
| 0b0 | Extended SPI range not implemented. |
| 0b1 | Extended SPI range implemented. |

CPUNumber, bits [7:5]

Reports the number of PEs that can be used when affinity routing is not enabled, minus 1.

These PEs must be numbered contiguously from zero, but the relationship between this number and the affinity hierarchy from MPIDR is IMPLEMENTATION DEFINED. If the implementation does not support ARE being zero, this field is 000.

ITLinesNumber, bits [4:0]

For the INTID range 32 to 1019, indicates the maximum SPI supported.

If the value of this field is N, the maximum SPI INTID is $32(N+1)$ minus 1. For example, 00011 specifies that the maximum SPI INTID is 127.

Regardless of the range of INTIDs defined by this field, interrupt IDs 1020-1023 are reserved for special purposes.

A value of 0 indicates no SPIs are support.

The ITLinesNumber field only indicates the maximum number of SPIs that the GIC implementation might support. This value determines the number of instances of the following interrupt registers:

- [GICD_IGROUPR<n>](#).
- [GICD_ISENBALER<n>](#).
- [GICD_ICENABLER<n>](#).
- [GICD_ISPENDR<n>](#).
- [GICD_ICPENDR<n>](#).
- [GICD_ISACTIVER<n>](#).
- [GICD_ICACTIVER<n>](#).
- [GICD_IPRIORITYR<n>](#).
- [GICD_ITARGETSR<n>](#).
- [GICD_ICFGR<n>](#).
- [GICD_IROUTER<n>](#).
- [GICD_IGRPMODR<n>](#).

The GIC architecture does not require a GIC implementation to support a continuous range of SPI interrupt IDs. Software must check which SPI INTIDs are supported, up to the maximum value indicated by GICD_TYPER.ITLinesNumber.

Accessing GICD_TYPER

GICD_TYPER can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|--------|------------|
| GIC Distributor | Dist_base | 0x0004 | GICD_TYPER |

Accesses on this interface are **RO**.

GICD_TYPER2, Interrupt Controller Type Register 2

The GICD_TYPER2 characteristics are:

Purpose

Provides information about which features the GIC implementation supports.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GICD_TYPER2 are RES0.

When [GICD_CTLR.DS](#) == 0, this register is Common.

Attributes

GICD_TYPER2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|-----------|---|-----|------|---|-----|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | nASSGICap | | VIL | RES0 | | VID | | | |

Bits [31:9]

Reserved, RES0.

nASSGICap, bit [8]

Indicates whether SGIs can be configured to not have an active state.

| nASSGICap | Meaning |
|-----------|--|
| 0b0 | SGIs have an active state. |
| 0b1 | SGIs can be globally configured not to have an active state. |

This bit is RES0 on implementations that support two Security states.

VIL, bit [7]

Indicates whether 16 bits of vPEID are implemented.

| VIL | Meaning |
|-----|---|
| 0b0 | GIC supports 16-bit vPEID. |
| 0b1 | GIC supports GICD_TYPER2.VID + 1 bits of vPEID. |

Bits [6:5]

Reserved, RES0.

VID, bits [4:0]

When GICD_TYPER2.VIL == 1, the number of bits is equal to the bits of vPEID minus one.

When GICD_TYPER2.VIL == 0, this field is RES0.

Accessing GICD_TYPER2

GICD_TYPER2 can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|-----------|--------|-------------|
| GIC Distributor | Dist_base | 0x000C | GICD_TYPER2 |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICH_APR<n>, Active Priorities Registers, n = 0 - 3

The GICH_APR<n> characteristics are:

Purpose

These registers track which preemption levels are active in the virtual CPU interface, and indicate the current active priority. Corresponding bits are set to 1 in this register when an interrupt is acknowledged, based on [GICH_LR<n>](#). Priority, and the least significant bit set is cleared on EOI.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_APR<n> are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

The number of registers required depends on how many bits are implemented in [GICH_LR<n>](#). Priority:

- When 5 priority bits are implemented, 1 register is required (GICH_APR0).
- When 6 priority bits are implemented, 2 registers are required (GICH_APR0, GICH_APR1).
- When 7 priority bits are implemented, 4 registers are required (GICH_APR0, GICH_APR1, GICH_APR2, GICH_APR3).

Unimplemented registers are RAZ/WI.

Attributes

GICH_APR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

P<x>, bit [x], for x = 31 to 0

Active priorities. Possible values of each bit are:

| P<x> | Meaning |
|------|---|
| 0b0 | There is no interrupt active at the priority corresponding to that bit. |
| 0b1 | There is an interrupt active at the priority corresponding to that bit. |

The correspondence between priorities and bits depends on the number of bits of priority that are implemented.

If 5 bits of priority are implemented (bits [7:3] of priority), then there are 32 priority groups, and the active state of these priorities are held in GICH_APR0 in the bits corresponding to Priority[7:3].

If 6 bits of priority are implemented (bits [7:2] of priority), then there are 64 priority groups, and:

- The active state of priorities 0 - 124 are held in GICH_APR0 in the bits corresponding to 0:Priority[6:2].
- The active state of priorities 128 - 252 are held in GICH_APR1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of priority are implemented (bits [7:1] of priority), then there are 128 priority groups, and:

- The active state of priorities 0 - 62 are held in GICH_APR0 in the bits corresponding to 00:Priority[5:1].
- The active state of priorities 64 - 126 are held in GICH_APR1 in the bits corresponding to 01:Priority[5:1].
- The active state of priorities 128 - 190 are held in GICH_APR2 in the bits corresponding to 10:Priority[5:1].
- The active state of priorities 192 - 254 are held in GICH_APR3 in the bits corresponding to 11:Priority[5:1].

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing GICH_APR<n>

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- In AArch64:
 - For Group 0, [ICH_AP0R<n>_EL2](#).
 - For Group 1, [ICH_AP1R<n>_EL2](#).
- In AArch32:
 - For Group 0, [ICH_AP0R<n>](#).
 - For Group 1, [ICH_AP1R<n>](#).

GICH_APR<n> can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------------------|--------------------|-------------|
| GIC Virtual interface control | $0x00F0 + (4 * n)$ | GICH_APR<n> |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICH_EISR, End Interrupt Status Register

The GICH_EISR characteristics are:

Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_EISR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_EISR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----------|----------|----------|----------|----------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | Status15 | Status14 | Status13 | Status12 | Status11 | Status10 | Status9 | Status8 | Status7 | Status6 | Status5 | Status4 | Status3 | Status2 | Status1 | Status0 |

Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

EOI maintenance interrupt status for List register <n>:

| Status<n> | Meaning |
|-----------|--|
| 0b0 | GICH_LR<n> does not have an EOI maintenance interrupt. |
| 0b1 | GICH_LR<n> has an EOI maintenance interrupt that has not been handled. |

For any [GICH_LR<n>](#) register, the corresponding status bit is set to 1 if all of the following are true:

- [GICH_LR<n>](#).State is 0b00.
- [GICH_LR<n>](#).HW == 0.
- [GICH_LR<n>](#).EOI == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICH_EISR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICH_EISR](#) provides equivalent functionality.
- For AArch64 implementations, [ICH_EISR_EL2](#) provides equivalent functionality.

Bits corresponding to unimplemented List registers are RAZ.

GICH_EISR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------------------|--------|-----------|
| GIC Virtual interface control | 0x0020 | GICH_EISR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICH_ELRSR, Empty List Register Status Register

The GICH_ELRSR characteristics are:

Purpose

Indicates which List registers contain valid interrupts.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_ELRSR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_ELRSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----------|----------|----------|----------|----------|---------|---------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 |
| RES0 | | | | | | | | | | | | | | | | Status15 | Status14 | Status13 | Status12 | Status11 | Status10 | Status9 | Status8 | Status7 |

Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>:

| Status<n> | Meaning |
|-----------|---|
| 0b0 | GICH_LR<n> , if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt. |
| 0b1 | GICH_LR<n> does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt. |

For any [GICH_LR<n>](#) register, the corresponding status bit is set to 1 if [GICH_LR<n>](#).State is 0b00 and either:

- [GICH_LR<n>](#).HW == 1.
- [GICH_LR<n>](#).EOI == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 1.

Accessing GICH_ELRSR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICH_ELRSR](#) provides equivalent functionality.
- For AArch64 implementations, [ICH_ELRSR_EL2](#) provides equivalent functionality.

Bits corresponding to unimplemented List registers are RES0.

GICH_ELRSR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------------------|--------|------------|
| GIC Virtual interface control | 0x0030 | GICH_ELRSR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICH_HCR, Hypervisor Control Register

The GICH_HCR characteristics are:

Purpose

Controls the virtual CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_HCR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_HCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | |
|--|------|---|---|----------|----------|----------|----------|------|---------|-----|----|
| 3130292827262524232221201918171615141312111098 | | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |
| EOICount | RES0 | | | VGrp1DIE | VGrp1EIE | VGrp0DIE | VGrp0EIE | NPIE | LRENPIE | UIE | En |

EOICount, bits [31:27]

Counts the number of EOIs received that do not have a corresponding entry in the List registers. The virtual CPU interface increments this field automatically when a matching EOI is received. EOIs that do not clear a bit in [GICH_APR<n>](#) do not cause an increment. If an EOI occurs when the value of this field is 31, then the field wraps to 0.

The maintenance interrupt is asserted whenever this field is nonzero and GICH_HCR.LREN1E == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [26:8]

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is disabled:

| VGrp1DIE | Meaning |
|----------|--|
| 0b0 | Maintenance interrupt disabled. |
| 0b1 | Maintenance interrupt signaled when GICV_CTLR.EnableGrp1 == 0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is enabled:

| VGrp1EIE | Meaning |
|-----------------|--|
| 0b0 | Maintenance interrupt disabled. |
| 0b1 | Maintenance interrupt signaled when GICV_CTLR.EnableGrp1 == 1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is disabled:

| VGrp0DIE | Meaning |
|-----------------|--|
| 0b0 | Maintenance interrupt disabled. |
| 0b1 | Maintenance interrupt signaled when GICV_CTLR.EnableGrp0 == 0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is enabled:

| VGrp0EIE | Meaning |
|-----------------|--|
| 0b0 | Maintenance interrupt disabled. |
| 0b1 | Maintenance interrupt signaled when GICV_CTLR.EnableGrp0 == 1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NPIE, bit [3]

No Pending Interrupt Enable.

Enables the signaling of a maintenance interrupt while no pending interrupts are present in the List registers:

| NPIE | Meaning |
|-------------|---|
| 0b0 | Maintenance interrupt disabled. |
| 0b1 | Maintenance interrupt signaled while the List registers contain no interrupts in the pending state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable.

Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register for an EOI request:

| LRENPIE | Meaning |
|----------------|--|
| 0b0 | Maintenance interrupt disabled. |
| 0b1 | Maintenance interrupt signaled while GICH_HCR.EOICount is not 0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UIE, bit [1]

Underflow Interrupt Enable.

Enables the signaling of a maintenance interrupt when the List registers are either empty or hold only one valid entry.

| UIE | Meaning |
|------------|--|
| 0b0 | Maintenance interrupt disabled. |
| 0b1 | A maintenance interrupt is signaled if zero or one of the List register entries are marked as a valid interrupt. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

En, bit [0]

Enable.

Global enable bit for the virtual CPU interface.

| En | Meaning |
|-----------|--|
| 0b0 | Virtual CPU interface operation is disabled. |
| 0b1 | Virtual CPU interface operation is enabled. |

When this field is 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of [GICV_IAR](#) or [GICV_AIAR](#) returns a spurious interrupt ID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The VGrp1DIE, VGrp1EIE, VGrp0DIE, and VGrp0EIE fields permit the hypervisor to track the virtual CPU interfaces that are enabled. The hypervisor can then route interrupts that have multiple targets correctly and efficiently, without having to read the virtual CPU interface status.

See 'Maintenance interrupts' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069) and [GICH_MISR](#) for more information.

Accessing GICH_HCR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICH_HCR](#) provides equivalent functionality.
- For AArch64 implementations, [ICH_HCR_EL2](#) provides equivalent functionality.

GICH_HCR.En must be set to 1 for any virtual or maintenance interrupt to be asserted.

GICH_HCR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------------------|--------|----------|
| GIC Virtual interface control | 0x0000 | GICH_HCR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICH_LR<n>, List Registers, n = 0 - 15

The GICH_LR<n> characteristics are:

Purpose

These registers provide context information for the virtual CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_LR<n> are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

A maximum of 16 List registers can be provided. [GICH_VTR.ListRegs](#) defines the number implemented. Unimplemented List registers are RAZ/WI.

Attributes

GICH_LR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|-------|----------|----|----|----|----|------|----|----|--------|----|----|----|----|----|----|----|----|----|--------|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| HWGroup | | State | Priority | | | | | RES0 | | | pINTID | | | | | | | | | | vINTID | | | | | | | | | | |

HW, bit [31]

Indicates whether this virtual interrupt is a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt corresponding to the INTID:

| HW | Meaning |
|-----|--|
| 0b0 | This interrupt is triggered entirely in software. No notification is sent to the Distributor when the virtual interrupt is deactivated. |
| 0b1 | A hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using GICH_LR<n>.pINTID to indicate the physical interrupt identifier. If GICV_CTLR.EOImode == 0, this request corresponds to a write to GICV_EOIR or GICV_AEOIR , otherwise it corresponds to a write to GICV_DIR . |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Group, bit [30]

Indicates whether the interrupt is Group 0 or Group 1:

| Group | Meaning |
|-------|---|
| 0b0 | Group 0 virtual interrupt. GICV_CTLR.FIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and GICV_CTLR.EnableGrp0 enables signaling of this interrupt to the virtual machine. |
| 0b1 | Group 1 virtual interrupt, signaled as a virtual IRQ. GICV_CTLR.EnableGrp1 enables signaling of this interrupt to the virtual machine. |

Note

[GICV_CTLR.CBPR](#) controls whether [GICV_BPR](#) or [GICV_ABPR](#) determines if a pending Group 1 interrupt has sufficient priority to preempt current execution.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

State, bits [29:28]

The state of the interrupt. This field has one of the following values:

| State | Meaning |
|-------|--------------------|
| 0b00 | Inactive |
| 0b01 | Pending |
| 0b10 | Active |
| 0b11 | Active and pending |

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the inactive state are ignored, except for the purpose of generating virtual maintenance interrupts.

Note

For hardware interrupts, the active and pending state is held in the Distributor rather than the virtual CPU interface. A hypervisor must only use the active and pending state for software originated interrupts, which are typically associated with virtual devices, or for SGIs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Priority, bits [27:23]

The priority of this interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:20]

Reserved, RES0.

pINTID, bits [19:10]

The function of this field depends on the value of GICH_LR<n>.HW.

When GICH_LR<n>.HW == 0:

- Bit [19] indicates whether the interrupt triggers an EOI maintenance interrupt. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits [18:13] are reserved, SBZ.

- If the vINTID field value corresponds to an SGI (that is, 0-15), bits [12:10] contain the number of the requesting PE. This appears in the corresponding field of [GICV_IAR](#) or [GICV_AIAR](#). If the vINTID field value is not 0-15, this field must be cleared to 0.

When GICH_LR<n>.HW == 1:

- This field indicates the pINTID that the hypervisor forwards to the Distributor. This field is only required to implement enough bits to hold a valid value for the ID configuration. Any unused higher order bits are RAZ/WI.
- If the value of pINTID is 0-15 or 1020-1023, behavior is UNPREDICTABLE. If the value of pINTID is 16-31, this field applies to the PPI associated with this same PE as the virtual CPU interface requesting the deactivation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

vINTID, bits [9:0]

This INTID is returned to the VM when the interrupt is acknowledged through [GICV_IAR](#). Each valid interrupt stored in the List registers must have a unique vINTID for that virtual CPU interface. If the value of vINTID is 1020-1023, behavior is UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICH_LR<n>

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICH_LR<n>](#) provides equivalent functionality.
- For AArch64 implementations, [ICH_LR<n>_EL2](#) provides equivalent functionality.

GICH_LR<n> can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------------------|---------------------------|------------|
| GIC Virtual interface control | $0 \times 0100 + (4 * n)$ | GICH_LR<n> |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICH_MISR, Maintenance Interrupt Status Register

The GICH_MISR characteristics are:

Purpose

Indicates which maintenance interrupts are asserted.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_MISR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_MISR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|--------|----|--------|----|--------|----|--------|----|-----|----|-----|----|----|----|-----|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | VGrp1D | | VGrp1E | | VGrp0D | | VGrp0E | | NPL | | REN | | U | | EOI | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

VGrp1D, bit [7]

vPE Group 1 Disabled.

| VGrp1D | Meaning |
|--------|--|
| 0b0 | vPE Group 1 Disabled maintenance interrupt not asserted. |
| 0b1 | vPE Group 1 Disabled maintenance interrupt asserted. |

This maintenance interrupt is asserted when [GICH_HCR.VGrp1DIE](#) == 1 and [GICH_VMCR.VENG1](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp1E, bit [6]

vPE Group 1 Enabled.

| VGrp1E | Meaning |
|--------|---|
| 0b0 | vPE Group 1 Enabled maintenance interrupt not asserted. |
| 0b1 | vPE Group 1 Enabled maintenance interrupt asserted. |

This maintenance interrupt is asserted when [GICH_HCR.VGrp1EIE](#) == 1 and [GICH_VMCR.VENG1](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp0D, bit [5]

vPE Group 0 Disabled.

| VGrp0D | Meaning |
|--------|--|
| 0b0 | vPE Group 0 Disabled maintenance interrupt not asserted. |
| 0b1 | vPE Group 0 Disabled maintenance interrupt asserted. |

This maintenance interrupt is asserted when [GICH_HCR.VGrp0DIE](#) == 1 and [GICH_VMCR.VENG0](#) == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp0E, bit [4]

vPE Group 0 Enabled.

| VGrp0E | Meaning |
|--------|---|
| 0b0 | vPE Group 0 Enabled maintenance interrupt not asserted. |
| 0b1 | vPE Group 0 Enabled maintenance interrupt asserted. |

This maintenance interrupt is asserted when [GICH_HCR.VGrp0EIE](#) == 1 and [GICH_VMCR.VENG0](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

NP, bit [3]

No Pending.

| NP | Meaning |
|-----|--|
| 0b0 | No Pending maintenance interrupt not asserted. |
| 0b1 | No Pending maintenance interrupt asserted. |

This maintenance interrupt is asserted when [GICH_HCR.NPIE](#) == 1 and no List register is in the pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

LREN, bit [2]

List Register Entry Not Present.

| LREN | Meaning |
|------|---|
| 0b0 | List Register Entry Not Present maintenance interrupt not asserted. |
| 0b1 | List Register Entry Not Present maintenance interrupt asserted. |

This maintenance interrupt is asserted when [GICH_HCR.LRENPIE](#) == 1 and [GICH_HCR.EOICount](#) is nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

U, bit [1]

Underflow.

| U | Meaning |
|-----|---|
| 0b0 | Underflow maintenance interrupt not asserted. |
| 0b1 | Underflow maintenance interrupt asserted. |

This maintenance interrupt is asserted when [GICH_HCR](#).UIE == 1 and zero or one of the List register entries are marked as a valid interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EOI, bit [0]

End Of Interrupt.

| EOI | Meaning |
|-----|--|
| 0b0 | End Of Interrupt maintenance interrupt not asserted. |
| 0b1 | End Of Interrupt maintenance interrupt asserted. |

This maintenance interrupt is asserted when at least one bit in [GICH_EISR](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Note

A List register is in the pending state only if the corresponding [GICH_LR<n>](#) value is 0b01, that is, pending. The active and pending state is not included.

Accessing GICH_MISR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICH_MISR](#) provides equivalent functionality.
- For AArch64 implementations, [ICH_MISR_EL2](#) provides equivalent functionality.

A maintenance interrupt is asserted only if at least one bit is set to 1 in this register and if [GICH_HCR](#).En == 1.

GICH_MISR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------------------|--------|-----------|
| GIC Virtual interface control | 0x0010 | GICH_MISR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

GICH_VMCR, Virtual Machine Control Register

The GICH_VMCR characteristics are:

Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state. This register is updated when a virtual machine updates the virtual CPU interface registers.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_VMCR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_VMCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-------|----|-------|----|------|----|----|----|-------|----|------|----|-------|----|--------|----|--------|----|-------|---|-------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VPMR | | | | VBPR0 | | VBPR1 | | RES0 | | | | VEOIM | | RES0 | | VCBPR | | VFIQEn | | VAcKct | | VENG1 | | VENG0 | | | | | | | |

VPMR, bits [31:24]

Virtual priority mask. The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

This alias field is updated when a VM updates [GICV_PMR](#).Priority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 1.

This alias field is updated when a VM updates [GICV_BPR](#).Binary_Point.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 0.

This alias field is updated when a VM updates [GICV_ABPR](#).Binary_Point.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [17:10]

Reserved, RES0.

VEOIM, bit [9]

Virtual EOImode. Possible values of this bit are:

| VEOIM | Meaning |
|-------|---|
| 0b0 | A write of an INTID to GICV_EOIR or GICV_AEOIR drops the priority of the interrupt with that INTID, and also deactivates that interrupt. |
| 0b1 | A write of an INTID to GICV_EOIR or GICV_AEOIR only drops the priority of the interrupt with that INTID. Software must write to GICV_DIR to deactivate the interrupt. |

This alias field is updated when a VM updates [GICV_CTLR](#).EOImode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

| VCBPR | Meaning |
|-------|---|
| 0b0 | GICV_ABPR determines the preemption group for Group 1 interrupts. |
| 0b1 | GICV_BPR determines the preemption group for Group 1 interrupts. |

This alias field is updated when a VM updates [GICV_CTLR](#).CBPR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

| VFIQEn | Meaning |
|--------|---|
| 0b0 | Group 0 virtual interrupts are presented as virtual IRQs. |
| 0b1 | Group 0 virtual interrupts are presented as virtual FIQs. |

This alias field is updated when a VM updates [GICV_CTLR](#).FIQEn.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

| VAckCtl | Meaning |
|----------------|--|
| 0b0 | If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022. |
| 0b1 | If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt. |

This alias field is updated when a VM updates [GICV_CTLR.AckCtl](#).

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VENG1, bit [1]

Virtual interrupt enable, Group 1. Possible values of this bit are:

| VENG1 | Meaning |
|--------------|--|
| 0b0 | Group 1 virtual interrupts are disabled. |
| 0b1 | Group 1 virtual interrupts are enabled. |

This alias field is updated when a VM updates [GICV_CTLR.EnableGrp1](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VENG0, bit [0]

Virtual interrupt enable, Group 0. Possible values of this bit are:

| VENG0 | Meaning |
|--------------|--|
| 0b0 | Group 0 virtual interrupts are disabled. |
| 0b1 | Group 0 virtual interrupts are enabled. |

This alias field is updated when a VM updates [GICV_CTLR.EnableGrp0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Note

A List register is in the pending state only if the corresponding [GICH_LR<n>](#) value is 0b01, that is, pending. The active and pending state is not included.

Accessing GICH_VMCR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICH_VMCR](#) provides equivalent functionality.
- For AArch64 implementations, [ICH_VMCR_EL2](#) provides equivalent functionality.

GICH_VMCR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------------------|---------------|-----------------|
| GIC Virtual interface control | 0x0008 | GICH_VMCR |

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **RW**.

- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICH_VTR, Virtual Type Register

The GICH_VTR characteristics are:

Purpose

Indicates the number of implemented virtual priority bits and List registers.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_VTR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_VTR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|---------|----|----|--------|----|----|------|----|-----|------|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|----------|---|---|---|--|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |
| PRIbits | | | PREbits | | | IDbits | | | SEIS | | A3V | RES0 | | | | | | | | | | | | | | | | ListRegs | | | | | |

PRIbits, bits [31:29]

The number of virtual priority bits implemented, minus one.
An implementation must implement at least 32 levels of virtual priority (5 priority bits).

PREbits, bits [28:26]

The number of virtual preemption bits implemented, minus one.
An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).
The value of this field must be less than or equal to the value of GICH_VTR.PRIbits.

IDbits, bits [25:23]

The number of virtual interrupt identifier bits supported:

| IDbits | Meaning |
|--------|----------|
| 0b000 | 16 bits. |
| 0b001 | 24 bits. |

All other values are reserved.

SEIS, bit [22]

SEI support. Indicates whether the virtual CPU interface supports generation of SEIs:

| SEIS | Meaning |
|------|--|
| 0b0 | The virtual CPU interface logic does not support generation of SEIs. |
| 0b1 | The virtual CPU interface logic supports generation of SEIs. |

A3V, bit [21]

Affinity 3 valid. Possible values are:

| A3V | Meaning |
|------------|---|
| 0b0 | The virtual CPU interface logic only supports zero values of the Aff3 field in ICC_SGI0R_EL1 , ICC_SGI1R_EL1 , and ICC_ASGI1R_EL1 . |
| 0b1 | The virtual CPU interface logic supports nonzero values of the Aff3 field in ICC_SGI0R_EL1 , ICC_SGI1R_EL1 , and ICC_ASGI1R_EL1 . |

Bits [20:5]

Reserved, RES0.

ListRegs, bits [4:0]

The number of implemented List registers, minus one.

Accessing GICH_VTR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICH_VTR](#) provides equivalent functionality.
- For AArch64 implementations, [ICH_VTR_EL2](#) provides equivalent functionality.

GICH_VTR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-------------------------------|---------------|-----------------|
| GIC Virtual interface control | 0x0004 | GICH_VTR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICM_CLRSPI_NSR, Clear Non-secure SPI Pending Register

The GICM_CLRSPI_NSR characteristics are:

Purpose

Removes the pending state from a valid SPI if permitted by the Security state of the access and the [GICD_NSACR<n>](#) value for that SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

This register is present only when GICM_TYPER.CLR == 1. Otherwise, direct accesses to GICM_CLRSPI_NSR are RES0.

When [GICD_CTLR.DS](#) == 1, this register provides functionality for all SPIs.

Attributes

GICM_CLRSPI_NSR is a 32-bit register.

Field descriptions

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of [GICD_CLRSPI_NSR](#).

Accessing GICM_CLRSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding [GICD_NSACR<n>](#) register is less than 0b10.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can clear the pending state of any valid SPI.

GICM_CLRSPI_NSR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|----------|--------|-----------------|
| GIC Distributor | MSI_base | 0x0048 | GICM_CLRSPI_NSR |

Accesses on this interface are **WO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICM_CLRSPI_SR, Clear Secure SPI Pending Register

The GICM_CLRSPI_SR characteristics are:

Purpose

Removes the pending state from a valid SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

This register is present only when GICM_TYPER.SR == 1 and GICM_TYPER.CLR == 1. Otherwise, direct accesses to GICM_CLRSPI_SR are RES0.

When [GICD_CTLR.DS](#) == 1, this register is **WI**.

Attributes

GICM_CLRSPI_SR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | INTID | | | | | | | | | | | | | | | |

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of [GICD_CLRSPI_SR](#).

Accessing GICM_CLRSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICM_CLRSPI_SR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|----------|--------|----------------|
| GIC Distributor | MSI_base | 0x0058 | GICD_CLRSPI_SR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **WI**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **WO**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **WI**.

- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRoot() accesses to this register are **WO**.
- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRealm() accesses to this register are **WI**.

GICM_IIDR, Distributor Implementer Identification Register

The GICM_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the Distributor.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GICM_IIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|------|----|----|----|---------|----|----|----|----------|----|----|----|-------------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ProductID | | | | | | | | RES0 | | | | Variant | | | | Revision | | | | Implementer | | | | | | | | | | | |

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the Distributor:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

Accessing GICM_IIDR

GICM_IIDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|--------------------|----------|--------|-----------|
| GIC Distributor | MSI_base | 0x0FCC | GICM_IIDR |

Accesses on this interface are **RO**.

GICM_SETSPI_NSR, Set Non-secure SPI Pending Register

The GICM_SETSPI_NSR characteristics are:

Purpose

Adds the pending state to a valid SPI if permitted by the Security state of the access and the [GICD_NSACR<n>](#) value for that SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

When [GICD_CTLR.DS](#)==1, this register provides functionality for all SPIs.

Attributes

GICM_SETSPI_NSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | INTID | | | | | | | | | | | | | | | |

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of [GICD_SETSPI_NSR](#).

Accessing GICM_SETSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding [GICD_NSACR<n>](#) register is 0.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can set the pending state of any valid SPI.

GICM_SETSPI_NSR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|----------|--------|-----------------|
| GIC Distributor | MSI_base | 0x0040 | GICM_SETSPI_NSR |

Accesses on this interface are **WO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICM_SETSPI_SR, Set Secure SPI Pending Register

The GICM_SETSPI_SR characteristics are:

Purpose

Adds the pending state to a valid SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

This register is present only when GICM_TYPER.SR == 1. Otherwise, direct accesses to GICM_SETSPI_SR are RES0.

When [GICD_CTLR.DS](#)==1, this register is **WI**.

Attributes

GICM_SETSPI_SR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | INTID | | | | | | | | | | | | | | | |

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of [GICD_SETSPI_SR](#).

Accessing GICM_SETSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICM_SETSPI_SR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------------|----------|--------|----------------|
| GIC Distributor | MSI_base | 0x0050 | GICM_SETSPI_SR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **WI**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **WO**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **WI**.
- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRoot() accesses to this register are **WO**.

- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRealm() accesses to this register are **WI**.

GICM_TYPER, Distributor MSI Type Register

The GICM_TYPER characteristics are:

Purpose

Provides information about what features the GIC implementation supports.

Configuration

This register is available in all configurations of the GIC. When [GICD_CTLR.DS](#)=0, this register is Common.

Attributes

GICM_TYPER is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|-----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|---------|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Valid | CLR | SR | INTID | | | | | | | | | | | | | RES0 | | | | | NumSPis | | | | | | | | | | |

Valid, bit [31]

Reports whether GICM_TYPER content is valid.

| Valid | Meaning |
|-------|---|
| 0b0 | GICM_TYPER reports no information on the capabilities of the GICM frame, all other fields are RES0. |
| 0b1 | GICM_TYPER reports information on capabilities of GICM frame. |

CLR, bit [30]

Reports whether MSI clear registers are supported.

| CLR | Meaning |
|-----|--------------------------------------|
| 0b0 | MSI clear registers not implemented. |
| 0b1 | MSI clear registers implemented. |

SR, bit [29]

Reports whether Secure aliases of MSI registers are supported.

| SR | Meaning |
|-----|--|
| 0b0 | Secure aliases of MSI registers not implemented. |
| 0b1 | Secure aliases of MSI registers implemented. |

INTID, bits [28:16]

INTID of the first SPI assigned to this GICM frame.

Bits [15:11]

Reserved, RES0.

NumSPIs, bits [10:0]

Number of SPIs assigned to this GICM frame.

Accessing GICM_TYPER

GICM_TYPER can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|--------------------|----------|--------|------------|
| GIC Distributor | MSI_base | 0x0004 | GICM_TYPER |

Accesses on this interface are **RO**.

GICR_CLRLPIR, Clear LPI Pending Register

The GICR_CLRLPIR characteristics are:

Purpose

Clears the pending state of the specified LPI.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_CLRLPIR is a 64-bit register.

Field descriptions

When GICR_TYPER.DirectLPI == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | pINTID | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

pINTID, bits [31:0]

The INTID of the physical LPI.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER.IDbits](#) field. Unimplemented bits are RES0.

When GICR_TYPER.DirectLPI == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing GICR_CLRLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality of this register is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if any of the following apply:

- [GICR_CTLR](#).EnableLPIS == 0.
- The pINTID value specifies an unimplemented LPI.
- The pINTID value specifies an LPI that is not pending.

GICR_CLRLPIR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|----------------------|---------|--------|--------------|
| GIC Redistributor | RD_base | 0x0048 | GICR_CLRLPIR |

Accesses on this interface are **WO**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_CTLR, Redistributor Control Register

The GICR_CTLR characteristics are:

Purpose

Controls the operation of a Redistributor, and enables the signaling of LPIs by the Redistributor to the connected PE.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_CTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|------|-------|--------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| UWP | RES0 | DPG1S | DPG1NS | DPG0 | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

UWP, bit [31]

Upstream Write Pending. Read-only. Indicates whether all upstream writes have been communicated to the Distributor.

| UWP | Meaning |
|-----|---|
| 0b0 | The effects of all upstream writes have been communicated to the Distributor, including any Generate SGI packets. For more information, see 'Generate SGI (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069). |
| 0b1 | Not all the effects of upstream writes, including any Generate SGI packets, have been communicated to the Distributor. For more information, see 'Generate SGI (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069). |

Bits [30:27]

Reserved, RES0.

DPG1S, bit [26]

Disable Processor selection for Group 1 Secure interrupts. When [GICR_TYPER](#).DPGS == 1:

| DPG1S | Meaning |
|-------|--|
| 0b0 | A Group 1 Secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Secure Group 1 interrupts are enabled. |
| 0b1 | A Group 1 Secure SPI configured to use the 1 of N distribution model cannot select this PE. |

When [GICR_TYPER](#).DPGS == 0 this bit is RAZ/WI.

When [GICD_CTLR](#).DS==1, this field is RAZ/WI. In GIC implementations that support two Security states, this field is only accessible by Secure accesses, and is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when [GICD_CTLR.ARE_S](#)==0.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

DPG1NS, bit [25]

Disable Processor selection for Group 1 Non-secure interrupts. When [GICR_TYPER.DPGS](#) == 1:

| DPG1NS | Meaning |
|--------|--|
| 0b0 | A Group 1 Non-secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Non-secure Group 1 interrupts are enabled. |
| 0b1 | A Group 1 Non-secure SPI configured to use the 1 of N distribution model cannot select this PE. |

When [GICR_TYPER.DPGS](#) == 0 this bit is RAZ/WI.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when [GICD_CTLR.ARE_NS](#)==0.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

DPG0, bit [24]

Disable Processor selection for Group 0 interrupts. When [GICR_TYPER.DPGS](#) == 1:

| DPG0 | Meaning |
|------|--|
| 0b0 | A Group 0 SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Group 0 interrupts are enabled. |
| 0b1 | A Group 0 SPI configured to use the 1 of N distribution model cannot select this PE. |

When [GICR_TYPER.DPGS](#) == 0 this bit is RAZ/WI.

When [GICD_CTLR.DS](#) == 1, this field is always accessible. In GIC implementations that support two Security states, this field is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when [GICD_CTLR.ARE_S](#) == 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Bits [23:4]

Reserved, RES0.

RWP, bit [3]

Register Write Pending. This bit indicates whether a register write for the current Security state is in progress or not.

| RWP | Meaning |
|-----|--|
| 0b0 | The effect of all previous writes to the following registers are visible to all agents in the system: <ul style="list-style-type: none"> GICR_ICENABLER0 GICR_CTLR.DPG1S GICR_CTLR.DPG1NS GICR_CTLR.DPG0 GICR_CTLR, which clears EnableLPis from 1 to 0. In FEAT_GICv4p1, GICR_VPROPBASER, which clears Valid from 1 to 0. |
| 0b1 | The effect of all previous writes to the following registers are not guaranteed by the architecture to be visible to all agents in the system while the changes are still being propagated: <ul style="list-style-type: none"> GICR_ICENABLER0 GICR_CTLR.DPG1S GICR_CTLR.DPG1NS GICR_CTLR.DPG0 GICR_CTLR, which clears EnableLPis from 1 to 0. In FEAT_GICv4p1, GICR_VPROPBASER, which clears Valid from 1 to 0. |

IR, bit [2]

LPI invalidate registers supported.

This bit is read-only.

| IR | Meaning |
|-----|---|
| 0b0 | This bit does not indicate whether the GICR_INVLPIR, GICR_INVALLR and GICR_SYNCRR are implemented or not. |
| 0b1 | GICR_INVLPIR, GICR_INVALLR and GICR_SYNCRR are implemented. |

If [GICR_TYPER.DirectLPI](#) is 1 or [GICR_TYPER.RVPEI](#) is 1, [GICR_INVLPIR](#), [GICR_INVALLR](#), and [GICR_SYNCRR](#) are always implemented.

Arm recommends that implementations report GICR_CTLR.IR as 1 in these cases.

CES, bit [1]

Clear Enable Supported.

This bit is read-only.

| CES | Meaning |
|-----|--|
| 0b0 | The IRI does not indicate whether GICR_CTLR.EnableLPis is RES1 once set. |
| 0b1 | GICR_CTLR.EnableLPis is not RES1 once set. |

Implementing GICR_CTLR.EnableLPis as programmable and not reporting GICR_CTLR.CES == 1 is deprecated.

Implementing GICR_CTLR.EnableLPis as RES1 once set is deprecated.

When GICR_CTLR.CES == 0, software cannot assume that GICR_CTLR.EnableLPis is programmable without observing the bit being cleared.

EnableLPis, bit [0]

In implementations where affinity routing is enabled for the Security state:

| EnableLPis | Meaning |
|------------|--|
| 0b0 | LPI support is disabled. Any doorbell interrupt generated as a result of a write to a virtual LPI register must be discarded, and any ITS translation requests or commands involving LPis in this Redistributor are ignored. |
| 0b1 | LPI support is enabled. |

Note

If [GICR_TYPER](#).PLPIS == 0, this field is RES0. If [GICD_CTLR](#).ARE_NS is written from 1 to 0 when this bit is 1, behavior is an IMPLEMENTATION DEFINED choice between clearing GICR_CTLR.EnableLPis to 0 or maintaining its current value.

When affinity routing is not enabled for the Non-secure state, this bit is RES0.

When written from 0 to 1, the Redistributor loads the LPI Pending table from memory to check for any pending interrupts.

After it has been written to 1, it is IMPLEMENTATION DEFINED whether the bit becomes RES1 or can be cleared by to 0.

Where the bit remains programmable:

- Software must observe GICR_CTLR.RWP==0 after clearing GICR_CTLR.EnableLPis from 1 to 0 before writing [GICR_PENDBASER](#) or [GICR_PROPBASER](#), otherwise behavior is UNPREDICTABLE.
- Software must observe GICR_CTLR.RWP==0 after clearing GICR_CTLR.EnableLPis from 1 to 0 before setting GICR_CTLR.EnableLPis to 1, otherwise behavior is UNPREDICTABLE.

Note

If one or more ITS is implemented, Arm strongly recommends that all LPis are mapped to another Redistributor before GICR_CTLR.EnableLPis is cleared to 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

The participation of a PE in the 1 of N distribution model for a given interrupt group is governed by the concatenation of [GICR_WAKER](#).ProcessorSleep, the appropriate [GICR_CTLR](#).DPG{1, 0} bit, and the PE interrupt group enable. The behavior options are:

| PS | DPG{1S, 1NS, 0} | Enable | PE Behavior |
|-----|-----------------|--------|--|
| 0b0 | 0b0 | 0b0 | The PE cannot be selected. |
| 0b0 | 0b0 | 0b1 | The PE can be selected. |
| 0b0 | 0b1 | * | The PE cannot be selected. |
| 0b1 | * | * | The PE cannot be selected when GICD_CTLR .E1NWF == 0. When GICD_CTLR .E1NWF == 1, the mechanism by which PEs are selected is IMPLEMENTATION DEFINED. |

If an SPI using the 1 of N distribution model has been forwarded to the PE, and a write to GICR_CTLR occurs that changes the DPG bit for the interrupt group of the SPI, the IRI must attempt to select a different target PE for the SPI. This might have no effect on the forwarded SPI if it has already been activated.

Accessing GICR_CTLR

GICR_CTLR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|---------|--------|-----------|
| GIC Redistributor | RD_base | 0x0000 | GICR_CTLR |

Accesses on this interface are **RW**.

GICR_ICACTIVER0, Interrupt Clear-Active Register 0

The GICR_ICACTIVER0 characteristics are:

Purpose

Deactivates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICACTIVER0 is a 32-bit register.

Field descriptions

| | | | | | | |
|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | Cle |
| Clear_active_bit31 | Clear_active_bit30 | Clear_active_bit29 | Clear_active_bit28 | Clear_active_bit27 | Clear_active_bit26 | Clear_active_bit25 |

Clear_active_bit<x>, bit [x], for x = 31 to 0

Removes the active state from interrupt number x. Reads and writes have the following behavior:

| Clear_active_bit<x> | Meaning |
|---------------------|--|
| 0b0 | If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICACTIVER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD_ICACTIVER<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD_ICACTIVER<n>](#).

When [GICD_CTLR](#).DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ICACTIVER0 can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|--------|-----------------|
| GIC Redistributor | SGI_base | 0x0380 | GICR_ICACTIVER0 |

Accesses on this interface are **RW**.

GICR_ICACTIVER<n>E, Interrupt Clear-Active Registers, n = 1 - 2

The GICR_ICACTIVER<n>E characteristics are:

Purpose

Removes the active state from the corresponding PPI.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICACTIVER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICACTIVER<n>E is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Clear_active_bit31 | Clear_active_bit30 | Clear_active_bit29 | Clear_active_bit28 | Clear_active_bit27 | Clear_active_bit26 | Clear_active_bit25 | Clear_active_bit24 | Clear_active_bit23 | Clear_active_bit22 | Clear_active_bit21 | Clear_active_bit20 | Clear_active_bit19 | Clear_active_bit18 | Clear_active_bit17 | Clear_active_bit16 | Clear_active_bit15 | Clear_active_bit14 | Clear_active_bit13 | Clear_active_bit12 | Clear_active_bit11 | Clear_active_bit10 | Clear_active_bit9 | Clear_active_bit8 | Clear_active_bit7 | Clear_active_bit6 | Clear_active_bit5 | Clear_active_bit4 | Clear_active_bit3 | Clear_active_bit2 | Clear_active_bit1 | Clear_active_bit0 |

Clear_active_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

| Clear_active_bit<x> | Meaning |
|---------------------|--|
| 0b0 | If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICACTIVER<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_ICACTIVER<n>E is $(0x200 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_ICACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICACTIVER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICACTIVER<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|------------------------|--------------------|
| GIC Redistributor | SGI_base | 0x0380 + (4 * n) | GICR_ICACTIVER<n>E |

Accesses on this interface are **RW**.

GICR_ICENABLER0, Interrupt Clear-Enable Register 0

The GICR_ICENABLER0 characteristics are:

Purpose

Disables forwarding of the corresponding SGI or PPI to the CPU interfaces.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICENABLER0 is a 32-bit register.

Field descriptions

| | | | | | |
|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 |
| Clear_enable_bit31 | Clear_enable_bit30 | Clear_enable_bit29 | Clear_enable_bit28 | Clear_enable_bit27 | Clear_enable_bit26 |

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For PPIs and SGIs, controls the forwarding of interrupt number x to the CPU interfaces. Reads and writes have the following behavior:

| Clear_enable_bit<x> | Meaning |
|---------------------|--|
| 0b0 | If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect. |
| 0b1 | If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICENABLER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICENABLER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD_ICENABLER<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD_ICENABLER<n>](#).

When [GICD_CTLR](#).DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ICENABLER0 can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|--------|-----------------|
| GIC Redistributor | SGI_base | 0x0180 | GICR_ICENABLER0 |

Accesses on this interface are **RW**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICR_ICENABLER<n>E, Interrupt Clear-Enable Registers, n = 1 - 2

The GICR_ICENABLER<n>E characteristics are:

Purpose

Disables forwarding of the corresponding PPI to the CPU interfaces.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICENABLER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICENABLER<n>E is a 32-bit register.

Field descriptions

| | | | | | |
|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 |
| Clear_enable_bit31 | Clear_enable_bit30 | Clear_enable_bit29 | Clear_enable_bit28 | Clear_enable_bit27 | Clear_enable_bit26 |

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For the extended PPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

| Clear_enable_bit<x> | Meaning |
|---------------------|--|
| 0b0 | If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect. |
| 0b1 | If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICENABLER<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_ICENABLER<n>E is $(0x180 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_ICENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICENABLER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICENABLER<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|------------------------|--------------------|
| GIC Redistributor | SGI_base | 0x0180 + (4 * n) | GICR_ICENABLER<n>E |

Accesses on this interface are **RW**.

GICR_ICFGR0, Interrupt Configuration Register 0

The GICR_ICFGR0 characteristics are:

Purpose

Determines whether the corresponding SGI is edge-triggered or level-sensitive.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICFGR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | |
|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 |
| Int_config15 | Int_config14 | Int_config13 | Int_config12 | Int_config11 | Int_config10 | Int_config9 | Int_config8 | Int_config7 | Int_config6 | Int_config5 | Int_config4 | Int_config3 | Int_config2 | Int_config1 | Int_config0 | Int_config0 | Int_config0 | Int_config0 |

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the is level-sensitive or edge-triggered.

| Int_config<x> | Meaning |
|---------------|---|
| 0b00 | Corresponding interrupt is level-sensitive. |
| 0b10 | Corresponding interrupt is edge-triggered. |

SGIs are always edge-triggered.

When the interrupt is visible to the current Security state, a read of this bit always returns the correct value to indicate the interrupt triggering method.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICFGR0

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=0.

When [GICD_CTLR.DS](#)=0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICR_ICFGR0 can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|--------|-------------|
| GIC Redistributor | SGI_base | 0x0C00 | GICR_ICFGR0 |

Accesses on this interface are **RW**.

GICR_ICFGR1, Interrupt Configuration Register 1

The GICR_ICFGR1 characteristics are:

Purpose

Determines whether the corresponding PPI is edge-triggered or level-sensitive.

Configuration

A copy of this register is provided for each Redistributor.

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

Changing Int_config when the interrupt is individually enabled is UNPREDICTABLE.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

Attributes

GICR_ICFGR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | |
|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 |
| Int_config15 | Int_config14 | Int_config13 | Int_config12 | Int_config11 | Int_config10 | Int_config9 | Int_config8 | Int_config7 | Int_config6 | Int_config5 | Int_config4 | Int_config3 | Int_config2 | Int_config1 | Int_config0 | Int_config0 | Int_config0 | Int_config0 |

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

| Int_config<x> | Meaning |
|---------------|---|
| 0b00 | Corresponding interrupt is level-sensitive. |
| 0b10 | Corresponding interrupt is edge-triggered. |

Int_config[0] (bit [2x]) is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICFGR1

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=1 .

When [GICD_CTLR.DS](#)=0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICR_ICFGR1 can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|-------|--------|----------|
|-----------|-------|--------|----------|

GICR_ICFGR1, Interrupt Configuration Register 1

| | | | |
|----------------------|----------|--------|-------------|
| GIC Redistributor | SGI_base | 0x0C04 | GICR_ICFGR1 |
|----------------------|----------|--------|-------------|

Accesses on this interface are **RW**.

GICR_ICFGR<n>E, Interrupt configuration registers, n = 2 - 5

The GICR_ICFGR<n>E characteristics are:

Purpose

Determines whether the corresponding PPI in the extended PPI range is edge-triggered or level-sensitive.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICFGR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICFGR<n>E is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | |
|--------------|--------------|--------------|--------------|--------------|--------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 |
| Int_config15 | Int_config14 | Int_config13 | Int_config12 | Int_config11 | Int_config10 | Int_config9 | Int_config8 | Int_config7 | Int_config6 | Int_config5 | Int_config4 | Int_config3 | Int_config2 | Int_config1 | Int_config0 | Int_config0 | Int_config0 | Int_config0 |

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

Int_config[0] (bit [2x]) is RES0.

| Int_config<x> | Meaning |
|---------------|---|
| 0b00 | The corresponding interrupt is level-sensitive. |
| 0b10 | The corresponding interrupt is edge-triggered. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For each supported extended PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

Accessing GICR_ICFGR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICFGR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICFGR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|-------|--------|----------|
|-----------|-------|--------|----------|

| | | | |
|----------------------|----------|---------------------|----------------|
| GIC Redistributor | SGI_base | 0x0C00 + (4 * n) | GICR_ICFGR<n>E |
|----------------------|----------|---------------------|----------------|

Accesses on this interface are **RW**.

GICR_ICPENDR0, Interrupt Clear-Pending Register 0

The GICR_ICPENDR0 characteristics are:

Purpose

Removes the pending state from the corresponding SGI or PPI.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICPENDR0 is a 32-bit register.

Field descriptions

| | | | | | |
|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 |
| Clear_pending_bit31 | Clear_pending_bit30 | Clear_pending_bit29 | Clear_pending_bit28 | Clear_pending_bit27 | Clear_pending_bit26 |

Clear_pending_bit<x>, bit [x], for x = 31 to 0

Removes the pending state from interrupt number x. Reads and writes have the following behavior:

| Clear_pending_bit<x> | Meaning |
|----------------------|--|
| 0b0 | If read, indicates that the corresponding interrupt is not pending. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: <ul style="list-style-type: none"> If the interrupt is not pending and is not active and pending. If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICPENDR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD_ICPENDR<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD_ICENABLER<n>](#).

When [GICD_CTLR.DS](#) == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ICPENDR0 can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|----------------------|----------|--------|---------------|
| GIC Redistributor | SGI_base | 0x0280 | GICR_ICPENDR0 |

Accesses on this interface are **RW**.

GICR_ICPENDR<n>E, Interrupt Clear-Pending Registers, n = 1 - 2

The GICR_ICPENDR<n>E characteristics are:

Purpose

Removes the pending state from the corresponding PPI.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ICPENDR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICPENDR<n>E is a 32-bit register.

Field descriptions

| | | | | | |
|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 |
| Clear_pending_bit31 | Clear_pending_bit30 | Clear_pending_bit29 | Clear_pending_bit28 | Clear_pending_bit27 | Clear_pending_bit26 |

Clear_pending_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the pending state to interrupt number x. Reads and writes have the following behavior:

| Clear_pending_bit<x> | Meaning |
|----------------------|--|
| 0b0 | If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: <ul style="list-style-type: none">• If the interrupt is not pending and is not active and pending.• If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICR_ICPENDR<n>E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICPENDR<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_ICPENDR<n>E is $(0x200 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_ICPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICPENDR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICPENDR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|--------------------|------------------|
| GIC Redistributor | SGI_base | $0x0280 + (4 * n)$ | GICR_ICPENDR<n>E |

Accesses on this interface are **RW**.

GICR_IGROUPR0, Interrupt Group Register 0

The GICR_IGROUPR0 characteristics are:

Purpose

Controls whether the corresponding SGI or PPI is in Group 0 or Group 1.

Configuration

This register is available in all GIC configurations. If the GIC implementation supports two Security states, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGROUPR0 is a 32-bit register.

Field descriptions

| | | | |
|--|--|--|--|
| 31 | 30 | 29 | |
| Redistributor_group_status_bit31 | Redistributor_group_status_bit30 | Redistributor_group_status_bit29 | Redistributor_group_status_bit28 |

Redistributor_group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit. In this register:

- Bits [31:16] are group status bits for PPIs.
- Bits [15:0] are group status bits for SGIs.

| Redistributor_group_status_bit<x> | Meaning |
|-----------------------------------|---|
| 0b0 | When GICD_CTLR.DS ==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS ==0, the corresponding interrupt is Secure. |
| 0b1 | When GICD_CTLR.DS ==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS ==0, the corresponding interrupt is Non-secure Group 1. |

When [GICD_CTLR.DS](#) == 0, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICR_IGRPMODR0](#) to form a 2-bit field that defines an interrupt group. The encoding of this field is at [GICR_IGRPMODR0](#).

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

The considerations for the reset value of this register are the same as those for [GICD_IGROUPR<n>](#) with n=0.

Accessing GICR_IGROUPR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGROUPR0, the corresponding bit is RES0 and equivalent functionality is provided by [GICD_IGROUPR<n>](#) with n=0.

When [GICD_CTLR.DS](#) == 0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IGROUPR0 can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|--------|---------------|
| GIC Redistributor | SGI_base | 0x0080 | GICR_IGROUPR0 |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_IGROUPR<n>E, Interrupt Group Registers, n = 1 - 2

The GICR_IGROUPR<n>E characteristics are:

Purpose

Controls whether the corresponding PPI is in Group 0 or Group 1.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_IGROUPR<n>E are RES0.

When [GICD_CTLR.DS](#)==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGROUPR<n>E is a 32-bit register.

Field descriptions

| | | | | | |
|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|------------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 |
| Group_status_bit31 | Group_status_bit30 | Group_status_bit29 | Group_status_bit28 | Group_status_bit27 | Group_status_bit26 |

Group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit.

| Group_status_bit<x> | Meaning |
|---------------------|---|
| 0b0 | When GICD_CTLR.DS ==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS ==0, the corresponding interrupt is Secure. |
| 0b1 | When GICD_CTLR.DS ==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS ==0, the corresponding interrupt is Non-secure Group 1. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGRPMODR<n>E to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICR_IGRPMODR<n>E.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGROUPR<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_IGROUPR<n>E is $(0x080 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_IGROUPR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGROUPR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_IGROUPR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|------------------------|------------------|
| GIC Redistributor | SGI_base | 0x0080 + (4 * n) | GICR_IGROUPR<n>E |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICR_IGRPMODR0, Interrupt Group Modifier Register 0

The GICR_IGRPMODR0 characteristics are:

Purpose

When [GICD_CTLR.DS](#)==0, this register together with the [GICR_IGROUPR0](#) register, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

When [GICD_CTLR.DS](#)==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGRPMODR0 is a 32-bit register.

Field descriptions

| | | | | | |
|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|
| 31 | 30 | 29 | 28 | 27 | |
| Group_modifier_bit31 | Group_modifier_bit30 | Group_modifier_bit29 | Group_modifier_bit28 | Group_modifier_bit27 | Group_modifier_bit26 |

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICR_IGROUPR0](#) to form a 2-bit field that defines an interrupt group:

| Group modifier bit | Group status bit | Definition | Short name |
|--------------------|------------------|---|------------|
| 0b0 | 0b0 | Secure Group 0 | G0S |
| 0b0 | 0b1 | Non-secure Group 1 | G1NS |
| 0b1 | 0b0 | Secure Group 1 | G1S |
| 0b1 | 0b1 | Reserved, treated as Non-secure Group 1 | - |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_IGRPMODR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR0, the corresponding bit is RES0 and equivalent functionality is provided by [GICD_IGRPMODR<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD_IGRPMODR<n>](#).

When [GICD_CTLR.ARE_S](#) == 0 or [GICD_CTLR.DS](#) == 1, GICR_IGRPMODR0 is RES0. An implementation can make this register RAZ/WI in this case.

When [GICD_CTLR.DS](#)==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IGRPMODR0 can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|----------------------|----------|--------|----------------|
| GIC Redistributor | SGI_base | 0x0D00 | GICR_IGRPMODR0 |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_IGRPMODR<n>E, Interrupt Group Modifier Registers, n = 1 - 2

The GICR_IGRPMODR<n>E characteristics are:

Purpose

When [GICD_CTLR.DS](#)==0, this register together with the GICR_IGROUPR<n>E registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_IGRPMODR<n>E are RES0.

When [GICD_CTLR.DS](#)==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGRPMODR<n>E is a 32-bit register.

Field descriptions

| | | | | | |
|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|
| 31 | 30 | 29 | 28 | 27 | |
| Group_modifier_bit31 | Group_modifier_bit30 | Group_modifier_bit29 | Group_modifier_bit28 | Group_modifier_bit27 | Group_modifier_bit26 |

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in [GICR_IGROUPR<n>E](#) to form a 2-bit field that defines an interrupt group:

| Group modifier bit | Group status bit | Definition | Short name |
|--------------------|------------------|---|------------|
| 0b0 | 0b0 | Secure Group 0 | G0S |
| 0b0 | 0b1 | Non-secure Group 1 | G1NS |
| 0b1 | 0b0 | Secure Group 1 | G1S |
| 0b1 | 0b1 | Reserved, treated as Non-secure Group 1 | - |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGRPMODR<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_IGRPMODR<n>E is $(0x000 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_IGRPMODR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_IGRPMODR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|------------------------|-------------------|
| GIC Redistributor | SGI_base | 0x0D00 + (4 * n) | GICR_IGRPMODR<n>E |

Accesses on this interface are **RW**.

GICR_IIDR, Redistributor Implementer Identification Register

The GICR_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the Redistributor.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GICR_IIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|------|----|----|----|---------|----|----|----|----------|----|----|----|-------------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ProductID | | | | | | | | RES0 | | | | Variant | | | | Revision | | | | Implementer | | | | | | | | | | | |

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the Redistributor:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

Accessing GICR_IIDR

GICR_IIDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|---------|--------|-----------|
| GIC Redistributor | RD_base | 0x0004 | GICR_IIDR |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_INMIR0, Non-maskable Interrupt Register for PPIs.

The GICR_INMIR0 characteristics are:

Purpose

Controls whether the corresponding PPI has the non-maskable property.

Configuration

This register is present only when FEAT_GICv3_NMI is implemented. Otherwise, direct accesses to GICR_INMIR0 are RES0.

When [GICD_TYPER.NMI](#) is 0, this register is RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_INMIR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | |
|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 |
| nmi31 | nmi30 | nmi29 | nmi28 | nmi27 | nmi26 | nmi25 | nmi24 | nmi23 | nmi22 | nmi21 | nmi20 | nmi19 | nmi18 | nmi17 | nmi16 | nmi15 | nmi14 |

nmi<x>, bit [x], for x = 31 to 0

Non-maskable property.

| nmi<x> | Meaning |
|--------|--|
| 0b0 | Interrupt does not have the non-maskable property. |
| 0b1 | Interrupt has the non-maskable property. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

Accessing GICR_INMIR0

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_INMIR0 can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|--------|-------------|
| GIC Redistributor | SGI_base | 0x0F80 | GICR_INMIR0 |

Accesses on this interface are **RW**.

GICR_INMIR<n>E, Non-maskable Interrupt Registers for Extended PPIs, x = 1 to 2., n = 1 - 2

The GICR_INMIR<n>E characteristics are:

Purpose

Controls whether the corresponding Extended PPI has the non-maskable property.

Configuration

This register is present only when FEAT_GICv3p1 is implemented and FEAT_GICv3_NMI is implemented. Otherwise, direct accesses to GICR_INMIR<n>E are RES0.

When [GICR_TYPER](#).PPInum is 0b0000 or [GICD_TYPER](#).NMI is 0, these registers are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_INMIR<n>E is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | |
|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 |
| nmi31 | nmi30 | nmi29 | nmi28 | nmi27 | nmi26 | nmi25 | nmi24 | nmi23 | nmi22 | nmi21 | nmi20 | nmi19 | nmi18 | nmi17 | nmi16 | nmi15 | nmi14 |

nmi<x>, bit [x], for x = 31 to 0

Non-maskable property.

| nmi<x> | Meaning |
|--------|--|
| 0b0 | Interrupt does not have the non-maskable property. |
| 0b1 | Interrupt has the non-maskable property. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

Accessing GICR_INMIR<n>E

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_INMIR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|------------------|----------------|
| GIC Redistributor | SGI_base | 0x0F80 + (4 * n) | GICR_INMIR<n>E |

Accesses on this interface are **RW**.

GICR_INVALLR, Redistributor Invalidate All Register

The GICR_INVALLR characteristics are:

Purpose

Invalidates any cached configuration data of all physical LPIs, causing the GIC to reload the interrupt configuration from the physical LPI Configuration table at the address specified by [GICR_PROPBASER](#).

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_INVALLR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| V | RES0 | | | | | | | | | | | | | | | vPEID | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

V, bit [63]
When FEAT_GICv4p1 is implemented:

Indicates whether the INTID is virtual or physical.

| V | Meaning |
|-----|-------------------------------------|
| 0b0 | Invalidate is for a physical INTID. |
| 0b1 | Invalidate is for a virtual INTID. |

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

vPEID, bits [47:32]
When FEAT_GICv4p1 is implemented:

When GICR_INVLPIR.V == 0, this field is RES0

When GICR_INVLPIR.V == 1, this field is the target vPEID of the invalidate.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER2.VIL](#) and [GICD_TYPER2.VID](#) fields. Unimplemented bits are RES0.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

Note

If any LPI has been forwarded to the PE and a valid write to GICR_INVALLR is received, the Redistributor must ensure it reloads its properties from memory. This has no effect on the forwarded LPI if it has already been activated.

Accessing GICR_INVALLR

This register is mandatory when any of the following are true:

- [GICR_TYPER](#).Direct is 1.
- [GICR_CTLR](#).IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

Writes to this register have no effect if no physical LPIs are currently stored in the local Redistributor cache.

GICR_INVALLR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|---------|--------|--------------|
| GIC Redistributor | RD_base | 0x00B0 | GICR_INVALLR |

Accesses on this interface are **WO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_INVLPIR, Redistributor Invalidate LPI Register

The GICR_INVLPIR characteristics are:

Purpose

Invalidates the cached configuration data of a specified LPI, causing the GIC to reload the interrupt configuration from the physical LPI Configuration table at the address specified by [GICR_PROPBASER](#).

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_INVLPIR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| V | RES0 | | | | | | | | | | | | | | | vPEID | | | | | | | | | | | | | | | |
| INTID | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

V, bit [63]
When FEAT_GICv4p1 is implemented:

Indicates whether the INTID is virtual or physical.

| V | Meaning |
|-----|-------------------------------------|
| 0b0 | Invalidate is for a physical INTID. |
| 0b1 | Invalidate is for a virtual INTID. |

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

vPEID, bits [47:32]
When FEAT_GICv4p1 is implemented:

When GICR_INVLPIR.V == 0, this field is RES0

When GICR_INVLPIR.V == 1, this field is the target vPEID of the invalidate.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER2.VIL](#) and [GICD_TYPER2.VID](#) fields. Unimplemented bits are RES0.

Otherwise:

Reserved, RES0.

INTID, bits [31:0]

The INTID of the physical LPI to be cleaned.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER](#).IDbits field. Unimplemented bits are RES0.

Note

If any LPI has been forwarded to the PE and a valid write to GICR_INVLPIR is received, the Redistributor must ensure it reloads its properties from memory and apply any changes by retrieving and reforwarding the LPI as required. This has no effect on the forwarded LPI if it has already been activated.

Accessing GICR_INVLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory when any of the following are true:

- [GICR_TYPER](#).Direct is 1.
- [GICR_CTLR](#).IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

Writes to this register have no effect if either:

- The specified LPI is not currently stored in the local Redistributor.
- The pINTID field corresponds to an unimplemented LPI.

GICR_INVLPIR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|---------|--------|--------------|

Accesses on this interface are **WO**.

GICR_IPRIORITYR<n>, Interrupt Priority Registers, n = 0 - 7

The GICR_IPRIORITYR<n> characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each SGI and PPI supported by the GIC.

Configuration

A copy of these registers is provided for each Redistributor.

These registers are configured as follows:

- GICR_IPRIORITYR0-GICR_IPRIORITYR3 store the priority of SGIs.
- GICR_IPRIORITYR4-GICR_IPRIORITYR7 store the priority of PPIs.

Attributes

GICR_IPRIORITYR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|--------------------|----|----|----|----|----|----|----|--------------------|----|----|----|----|----|---|---|--------------------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Priority_offset_3B | | | | | | | | Priority_offset_2B | | | | | | | | Priority_offset_1B | | | | | | | | Priority_offset_0B | | | | | | | |

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_IPRIORITYR<n>

These registers are used when affinity routing is enabled for the Security state of the interrupt. When affinity routing is not enabled the bits corresponding to the interrupt are RAZ/WI and [GICD_IPRIORITYR<n>](#) provides equivalent functionality.

These registers are used for SGIs and PPIs only. Equivalent functionality for SPIs is provided by [GICD_IPRIORITYR<n>](#).

These registers are byte-accessible.

When [GICD_CTLR](#).DS == 0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in 'Software accesses of interrupt priority' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IPRIORITYR<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|------------------|--------------------|
| GIC Redistributor | SGI_base | 0x0400 + (4 * n) | GICR_IPRIORITYR<n> |

Accesses on this interface are **RW**.

GICR_IPRIORITYR<n>E, Interrupt Priority Registers (extended PPI range), n = 8 - 23

The GICR_IPRIORITYR<n>E characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each extended PPI supported by the GIC.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_IPRIORITYR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IPRIORITYR<n>E is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|--------------------|----|----|----|----|----|----|----|--------------------|----|----|----|----|----|---|---|--------------------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Priority_offset_3B | | | | | | | | Priority_offset_2B | | | | | | | | Priority_offset_1B | | | | | | | | Priority_offset_0B | | | | | | | |

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IPRIORITYR<n> number, n, is given by $n = (m-1024) \text{ DIV } 4$.
- The offset of the required GICR_IPRIORITYR<n>E register is $(0x400 + (4*n))$.
- The byte offset of the required Priority field in this register is $m \text{ MOD } 4$, where:
 - Byte offset 0 refers to register bits [7:0].
 - Byte offset 1 refers to register bits [15:8].
 - Byte offset 2 refers to register bits [23:16].
 - Byte offset 3 refers to register bits [31:24].

Accessing GICR_IPRIORITYR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

GICR_IPRIORITYR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|------------------|---------------------|
| GIC Redistributor | SGI_base | 0x0400 + (4 * n) | GICR_IPRIORITYR<n>E |

Accesses on this interface are **RW**.

GICR_ISACTIVER0, Interrupt Set-Active Register 0

The GICR_ISACTIVER0 characteristics are:

Purpose

Activates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISACTIVER0 is a 32-bit register.

Field descriptions

| | | | | | | |
|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 |
| Set_active_bit31 | Set_active_bit30 | Set_active_bit29 | Set_active_bit28 | Set_active_bit27 | Set_active_bit26 | Set_active_bit25 |

Set_active_bit<x>, bit [x], for x = 31 to 0

Adds the active state to interrupt number x. Reads and writes have the following behavior:

| Set_active_bit<x> | Meaning |
|-------------------|---|
| 0b0 | If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ISACTIVER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD_ISACTIVER<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD_ISACTIVER<n>](#).

When [GICD_CTLR](#).DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISACTIVER0 can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|-------|--------|----------|
|-----------|-------|--------|----------|

GICR_ISACTIVER0, Interrupt Set-Active Register 0

| | | | |
|----------------------|----------|--------|-----------------|
| GIC Redistributor | SGI_base | 0x0300 | GICR_ISACTIVER0 |
|----------------------|----------|--------|-----------------|

Accesses on this interface are **RW**.

GICR_ISACTIVER<n>E, Interrupt Set-Active Registers, n = 1 - 2

The GICR_ISACTIVER<n>E characteristics are:

Purpose

Adds the active state to the corresponding PPI.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ISACTIVER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISACTIVER<n>E is a 32-bit register.

Field descriptions

| | | | | | | |
|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 |
| Set_active_bit31 | Set_active_bit30 | Set_active_bit29 | Set_active_bit28 | Set_active_bit27 | Set_active_bit26 | Set_active_bit25 |

Set_active_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

| Set_active_bit<x> | Meaning |
|-------------------|---|
| 0b0 | If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISACTIVER<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_ISACTIVER<n>E is $(0x200 + (4*n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_ISACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ISACTIVER<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|------------------|--------------------|
| GIC Redistributor | SGI_base | 0x0300 + (4 * n) | GICR_ISACTIVER<n>E |

Accesses on this interface are **RW**.

GICR_ISENABLER0, Interrupt Set-Enable Register 0

The GICR_ISENABLER0 characteristics are:

Purpose

Enables forwarding of the corresponding SGI or PPI to the CPU interfaces.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISENABLER0 is a 32-bit register.

Field descriptions

| | | | | | | |
|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 |
| Set_enable_bit31 | Set_enable_bit30 | Set_enable_bit29 | Set_enable_bit28 | Set_enable_bit27 | Set_enable_bit26 | Set_enable_bit25 |

Set_enable_bit<x>, bit [x], for x = 31 to 0

For PPIs and SGIs, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

| Set_enable_bit<x> | Meaning |
|-------------------|---|
| 0b0 | If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect. |
| 0b1 | If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Accessing GICR_ISENABLER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISENABLER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD_ISENABLER<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD_ISENABLER<n>](#).

When [GICD_CTLR](#).DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISENABLER0 can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|--------|-----------------|
| GIC Redistributor | SGI_base | 0x0100 | GICR_ISENABLER0 |

Accesses on this interface are **RW**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICR_ISENABLER<n>E, Interrupt Set-Enable Registers, n = 1 - 2

The GICR_ISENABLER<n>E characteristics are:

Purpose

Enables forwarding of the corresponding PPI to the CPU interfaces.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ISENABLER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISENABLER<n>E is a 32-bit register.

Field descriptions

| | | | | | | |
|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 |
| Set_enable_bit31 | Set_enable_bit30 | Set_enable_bit29 | Set_enable_bit28 | Set_enable_bit27 | Set_enable_bit26 | Set_enable_bit25 |

Set_enable_bit<x>, bit [x], for x = 31 to 0

For the extended PPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

| Set_enable_bit<x> | Meaning |
|-------------------|---|
| 0b0 | If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect. |
| 0b1 | If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISENABLER<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_ISENABLER<n>E is $(0 \times 100 + (4 \times n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_ISENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISENABLER<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)=0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ISENABLER<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|----------------------|----------|------------------------|--------------------|
| GIC Redistributor | SGI_base | 0x0100 + (4 * n) | GICR_ISENABLER<n>E |

Accesses on this interface are **RW**.

GICR_ISPENDR0, Interrupt Set-Pending Register 0

The GICR_ISPENDR0 characteristics are:

Purpose

Adds the pending state to the corresponding SGI or PPI.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISPENDR0 is a 32-bit register.

Field descriptions

| | | | | | | |
|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|--------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | Se |
| Set_pending_bit31 | Set_pending_bit30 | Set_pending_bit29 | Set_pending_bit28 | Set_pending_bit27 | Set_pending_bit26 | Se |

Set_pending_bit<x>, bit [x], for x = 31 to 0

For PPIs and SGIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

| Set_pending_bit<x> | Meaning |
|--------------------|---|
| 0b0 | If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: <ul style="list-style-type: none">If the interrupt is already pending because of a write to GICR_ISPENDR0.If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ISPENDR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by [GICD_ISPENDR<n>](#) with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by [GICD_ISPENDR<n>](#).

When [GICD_CTLR](#).DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISPENDR0 can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|----------------------|----------|--------|---------------|
| GIC Redistributor | SGI_base | 0x0200 | GICR_ISPENDR0 |

Accesses on this interface are **RW**.

GICR_ISPENDR<n>E, Interrupt Set-Pending Registers, n = 1 - 2

The GICR_ISPENDR<n>E characteristics are:

Purpose

Adds the pending state to the corresponding PPI.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_ISPENDR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISPENDR<n>E is a 32-bit register.

Field descriptions

| | | | | | | |
|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|----|
| 31 | 30 | 29 | 28 | 27 | 26 | Se |
| Set_pending_bit31 | Set_pending_bit30 | Set_pending_bit29 | Set_pending_bit28 | Set_pending_bit27 | Set_pending_bit26 | Se |

Set_pending_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

| Set_pending_bit<x> | Meaning |
|--------------------|--|
| 0b0 | If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect. |
| 0b1 | If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: <ul style="list-style-type: none">• If the interrupt is already pending because of a write to GICR_ISPENDR<n>E.• If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISPENDR<n>E number, n, is given by $n = (m-1024) \text{ DIV } 32$.
- The offset of the required GICR_ISPENDR<n>E is $(0 \times 200 + (4 \times n))$.
- The bit number of the required group modifier bit in this register is $(m-1024) \text{ MOD } 32$.

Accessing GICR_ISPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISPENDR<n>E, the corresponding bit is RES0.

When [GICD_CTLR.DS](#)==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ISPENDR<n>E can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|----------|------------------------|------------------|
| GIC Redistributor | SIG_base | 0x0200 + (4 * n) | GICR_ISPENDR<n>E |

Accesses on this interface are **RW**.

GICR_MPAMIDR, Report maximum PARTID and PMG Register

The GICR_MPAMIDR characteristics are:

Purpose

Reports the maximum support PARTID and PMG values.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_MPAMIDR are RES0.

A copy of this register is provided for each Redistributor.

When [GICR_TYPER](#).MPAM==0, this register is RES0.

Attributes

GICR_MPAMIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|-----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | PMGmax | | | | | | | | PARTIDmax | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

PMGmax, bits [23:16]

Maximum PMG value supported.

PARTIDmax, bits [15:0]

Maximum PARTID value supported.

Accessing GICR_MPAMIDR

GICR_MPAMIDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|---------|--------|--------------|
| GIC Redistributor | RD_base | 0x0018 | GICR_MPAMIDR |

Accesses on this interface are **RO**.

GICR_NSACR, Non-secure Access Control Register

The GICR_NSACR characteristics are:

Purpose

Enables Secure software to permit Non-secure software to create SGIs targeting the PE connected to this Redistributor by writing to [ICC_SGI1R_EL1](#), [ICC_ASGI1R_EL1](#) or [ICC_SGI0R_EL1](#).

For more information, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Configuration

For a description on when a write to [ICC_SGI0R_EL1](#), [ICC_SGI1R_EL1](#) or [ICC_ASGI1R_EL1](#) is permitted to generate an interrupt, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

GICR_NSACR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | |
|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|----------------------------|----------------------------|----------------------------|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 |
| NS_access15 | NS_access14 | NS_access13 | NS_access12 | NS_access11 | NS_access10 | NS_access9 | NS_access8 | NS_access7 | | | | | | | | | |

NS_access<x>, bits [2x+1:2x], for x = 15 to 0

Configures the level of Non-secure access permitted when the SGI is in Secure Group 0 or Secure Group 1, as defined from [GICR_IGROUPRO](#) and [GICR_IGRPMODR0](#). A field is provided for each SGI. The possible values of each 2-bit field are:

| NS_access<x> | Meaning |
|--------------|---|
| 0b00 | Non-secure writes are not permitted to generate Secure Group 0 SGIs or Secure Group 1 SGIs. |
| 0b01 | Non-secure writes are permitted to generate a Secure Group 0 SGI. |
| 0b10 | As 0b01, but additionally Non-secure writes to are permitted to generate a Secure Group 1 SGI. |
| 0b11 | Reserved. If the field is programmed to the reserved value, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the valid values. However, to maintain the principle that as the value increases additional accesses are permitted Arm strongly recommends that implementations treat this value as 0b10. It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the valid value chosen. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_NSACR

This register is used when affinity routing is enabled. When affinity routing is not enabled for the Security state of the interrupt, [GICD_NSACR<n>](#) with n=0 provides equivalent functionality.

This register does not support PPIs.

GICR_NSACR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|----------------------|----------|--------|------------|
| GIC Redistributor | SGI_base | 0x0E00 | GICR_NSACR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **RAZ/WI**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **RW**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **RAZ/WI**.
- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRoot() accesses to this register are **RW**.
- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRealm() accesses to this register are **RAZ/WI**.

GICR_PARTIDR, Set PARTID and PMG Register

The GICR_PARTIDR characteristics are:

Purpose

Sets the PARTID and PMG values used for memory accesses by the Redistributor.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GICR_PARTIDR are RES0.

A copy of this register is provided for each Redistributor.

When [GICR_TYPER](#).MPAM==0, this register is RES0.

Attributes

GICR_PARTIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | PMG | | | | | | | | PARTID | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

PMG value used when Redistributor accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PMG values in the range 0 to PMG_MAX are stateful or RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

PARTID, bits [15:0]

PARTID value used when Redistributor accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PARTID values in the range 0 to PARTID_MAX are stateful or RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Accessing GICR_PARTIDR

GICR_PARTIDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|----------------------|---------|--------|--------------|
| GIC Redistributor | RD_base | 0x001C | GICR_PARTIDR |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICR_PENDBASER, Redistributor LPI Pending Table Base Address Register

The GICR_PENDBASER characteristics are:

Purpose

Specifies the base address of the LPI Pending table, and the Shareability and Cacheability of accesses to the LPI Pending table.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_PENDBASER is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------|-----|------|------------|----|----|----|------|----|----|----|------------------|----|----|----|----|------|----|--------------|----|------------|----|------|----|----|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | PTZ | RES0 | OuterCache | | | | RES0 | | | | Physical_Address | | | | | | | | | | | | | | | | | | | | | |
| Physical_Address | | | | | | | | | | | | | | | | RES0 | | Shareability | | InnerCache | | RES0 | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bit [63]

Reserved, RES0.

PTZ, bit [62]

Pending Table Zero. Indicates to the Redistributor whether the LPI Pending table is zero when [GICR_CTLR.EnableLPIs](#) == 1.

This field is WO, and reads as 0.

| PTZ | Meaning |
|-----|---|
| 0b0 | The LPI Pending table is not zero, and contains live data. |
| 0b1 | The LPI Pending table is zero. Software must ensure the LPI Pending table is zero before this value is written. |

Bits [61:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Pending table.

| OuterCache | Meaning |
|------------|---|
| 0b000 | Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability. |
| 0b001 | Normal Outer Non-cacheable. |
| 0b010 | Normal Outer Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Outer Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Outer Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Outer Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-back. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:16]

Bits [51:16] of the physical address containing the LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Pending table.

| Shareability | Meaning |
|--------------|----------------------------|
| 0b00 | Non-shareable. |
| 0b01 | Inner Shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Reserved. Treated as 0b00. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Pending table.

| InnerCache | Meaning |
|------------|--|
| 0b000 | Device-nGnRnE. |
| 0b001 | Normal Inner Non-cacheable. |
| 0b010 | Normal Inner Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Inner Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Inner Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Inner Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Inner Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Inner Cacheable Read-allocate, Write-allocate, Write-back. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:0]

Reserved, RES0.

Accessing GICR_PENDBASER

Having the GICR_PENDBASER OuterCache, Shareability or InnerCache fields programmed to different values on different Redistributors with [GICR_CTLR.EnableLPIs == 1](#) in the system is UNPREDICTABLE.

Changing GICR_PENDBASER with [GICR_CTLR.EnableLPIs == 1](#) is UNPREDICTABLE.

GICR_PENDBASER can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|---------|--------|----------------|
| GIC Redistributor | RD_base | 0x0078 | GICR_PENDBASER |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICR_PROPBASER, Redistributor Properties Base Address Register

The GICR_PROPBASER characteristics are:

Purpose

Specifies the base address of the LPI Configuration table, and the Shareability and Cacheability of accesses to the LPI Configuration table.

Configuration

A copy of this register is provided for each Redistributor.

An implementation might make this register RO, for example to correspond to an LPI Configuration table in read-only memory.

Attributes

GICR_PROPBASER is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------|----|----|----|------------|----|----|----|------|----|----|----|------------------|----|----|----|--------------|----|----|----|------------|----|----|----|------|----|----|----|--------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | OuterCache | | | | RES0 | | | | Physical_Address | | | | | | | | | | | | | | | | | | | |
| Physical_Address | | | | | | | | | | | | | | | | Shareability | | | | InnerCache | | | | RES0 | | | | IDbits | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table.

| OuterCache | Meaning |
|------------|---|
| 0b000 | Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability. |
| 0b001 | Normal Outer Non-cacheable. |
| 0b010 | Normal Outer Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Outer Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Outer Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Outer Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-back. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table.

| Shareability | Meaning |
|--------------|----------------------------|
| 0b00 | Non-shareable. |
| 0b01 | Inner Shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Reserved. Treated as 0b00. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table.

| InnerCache | Meaning |
|------------|--|
| 0b000 | Device-nGnRnE. |
| 0b001 | Normal Inner Non-cacheable. |
| 0b010 | Normal Inner Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Inner Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Inner Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Inner Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Inner Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Inner Cacheable Read-allocate, Write-allocate, Write-back. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IDbits, bits [4:0]

The number of bits of LPI INTID supported, minus one, by the LPI Configuration table starting at Physical_Address.

If the value of this field is larger than the value of [GICD_TYPER.IDbits](#), the [GICD_TYPER.IDbits](#) value applies.

If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all physical LPis are out of range.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_PROPBASER

It is IMPLEMENTATION DEFINED whether GICR_PROPBASER can be set to different values on different Redistributors. [GICR_TYPER.CommonLPIAff](#) identifies the Redistributors that must have GICR_PROPBASER set to the same values whenever [GICR_CTLR.EnableLPIs](#) == 1.

Setting different values in different copies of GICR_PROPBASER on Redistributors that are required to use a common LPI Configuration table when [GICR_CTLR.EnableLPIs](#) == 1 leads to UNPREDICTABLE behavior.

Other restrictions apply when a Redistributor caches information from GICR_PROPBASER. For more information, see 'LPI Configuration tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

GICR_PROPBASER can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|---------|--------|----------------|
| GIC Redistributor | RD_base | 0x0070 | GICR_PROPBASER |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_SETLPIR, Set LPI Pending Register

The GICR_SETLPIR characteristics are:

Purpose

Generates an LPI by setting the pending state of the specified LPI.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_SETLPIR is a 64-bit register.

Field descriptions

When GICR_TYPER.DirectLPI == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | pINTID | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

pINTID, bits [31:0]

The INTID of the physical LPI to be generated.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER.IDbits](#) field. Unimplemented bits are RES0.

When GICR_TYPER.DirectLPI == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing GICR_SETLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPis and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if either:

- The pINTID field corresponds to an LPI that is already pending.
- The pINTID field corresponds to an unimplemented LPI.
- [GICR_CTLR.EnableLPis == 0](#).

GICR_SETLPIR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|----------------------|---------|--------|--------------|
| GIC Redistributor | RD_base | 0x0040 | GICR_SETLPIR |

Accesses on this interface are **WO**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICR_STATUSR, Error Reporting Status Register

The GICR_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

A copy of this register is provided for each Redistributor.

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

Attributes

GICR_STATUSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|------|----|-----|---|-----|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | WROD | | | | RWOD | | WRD | | RRD | | | | | | | |

Bits [31:4]

Reserved, RES0.

WROD, bit [3]

Write to an RO location.

| WROD | Meaning |
|------|--|
| 0b0 | Normal operation. |
| 0b1 | A write to an RO location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

| RWOD | Meaning |
|------|--|
| 0b0 | Normal operation. |
| 0b1 | A read of a WO location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

| WRD | Meaning |
|-----|---|
| 0b0 | Normal operation. |
| 0b1 | A write to a reserved location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

| RRD | Meaning |
|-----|--|
| 0b0 | Normal operation. |
| 0b1 | A read of a reserved location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICR_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

GICR_STATUSR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|---------|--------|------------------|
| GIC Redistributor | RD_base | 0x0010 | GICR_STATUSR (S) |

This interface is accessible as follows:

- When an access is Secure accesses to this register are **RW**.
- When FEAT_RME is implemented and IsAccessRoot() accesses to this register are **RW**.

| Component | Frame | Offset | Instance |
|-------------------|---------|--------|-------------------|
| GIC Redistributor | RD_base | 0x0010 | GICR_STATUSR (NS) |

This interface is accessible as follows:

- When an access is Non-secure accesses to this register are **RW**.
- When FEAT_RME is implemented and IsAccessRealm() accesses to this register are **RW**.

GICR_SYNCR, Redistributor Synchronize Register

The GICR_SYNCR characteristics are:

Purpose

Indicates completion of register based invalidate operations.

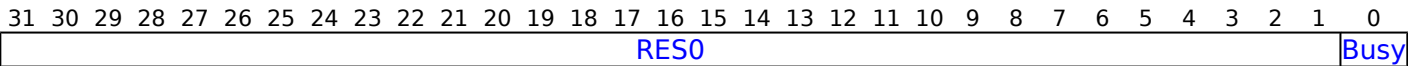

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_SYNCR is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

Busy, bit [0]

Indicates completion of invalidation operations

| Busy | Meaning |
|------|--|
| 0b0 | No operations are in progress. |
| 0b1 | A write is in progress to one or more of the following registers: <ul style="list-style-type: none">GICR_INVLPIR.GICR_INVALLR.GICv3, GICR_CLRLPIR. |

This field tracks operations initiated on the same Redistributor.

Accessing GICR_SYNCR

When this register is accessed, it is optional that an implementation might wait until all operations are complete before returning a value, in which case GICR_SYNCR.Busy is always 0.

This register is mandatory when any of the following are true:

- GICR_TYPER.Direct is 1.
- GICR_CTLR.IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

GICR_SYNCR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|-------|--------|----------|
|-----------|-------|--------|----------|

GICR_SYNCR, Redistributor Synchronize Register

| | | | |
|----------------------|---------|--------|------------|
| GIC Redistributor | RD_base | 0x00C0 | GICR_SYNCR |
|----------------------|---------|--------|------------|

Accesses on this interface are **RO**.

GICR_TYPER, Redistributor Type Register

The GICR_TYPER characteristics are:

Purpose

Provides information about the configuration of this Redistributor.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_TYPER is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------|-----|------|--------|-----|-----|------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|------|------|------|--------|-----|-------|-------|-------|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| Affinity_Value | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| PPI | num | VSGI | Common | LPI | Aff | Processor_Number | | | | | | | | | | | | | | | | RV | PEID | MPAM | DPGS | Last | Direct | LPI | Dirty | VLPIS | PLPIS |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Affinity_Value, bits [63:32]

The identity of the PE associated with this Redistributor.

Bits [63:56] provide Aff3, the Affinity level 3 value for the Redistributor.

Bits [55:48] provide Aff2, the Affinity level 2 value for the Redistributor.

Bits [47:40] provide Aff1, the Affinity level 1 value for the Redistributor.

Bits [39:32] provide Aff0, the Affinity level 0 value for the Redistributor.

PPInum, bits [31:27]

When FEAT_GICv3p1 is implemented:

The value derived from this field specifies the maximum PPI INTID that a GIC implementation can support. An implementation might not implement all PPIs up to this maximum.

| PPInum | Meaning |
|---------|----------------------------|
| 0b00000 | Maximum PPI INTID is 31. |
| 0b00001 | Maximum PPI INTID is 1087. |
| 0b00010 | Maximum PPI INTID is 1119. |

All other values are reserved.

Otherwise:

Reserved, RES0.

VSGI, bit [26]

When FEAT_GICv4p1 is implemented:

Indicates whether vSGIs are supported.

| VSGI | Meaning |
|------|---|
| 0b0 | Direct injection of SGIs not supported. |
| 0b1 | Direct injection of SGIs supported. |

Otherwise:

Reserved, RES0.

CommonLPIAff, bits [25:24]

The affinity level at which Redistributors share an LPI Configuration table.

| CommonLPIAff | Meaning |
|--------------|--|
| 0b00 | All Redistributors must share an LPI Configuration table. |
| 0b01 | All Redistributors with the same Aff3 value must share an LPI Configuration table. |
| 0b10 | All Redistributors with the same Aff3.Aff2 value must share an LPI Configuration table. |
| 0b11 | All Redistributors with the same Aff3.Aff2.Aff1 value must share an LPI Configuration table. |

Processor_Number, bits [23:8]

A unique identifier for the PE. When [GITS_TYPER](#).PTA == 0, an ITS uses this field to identify the interrupt target.

When affinity routing is disabled for a Security state, this field indicates which [GICD_ITARGETSR<n>](#) corresponds to this Redistributor.

RVPEID, bit [7]

When FEAT_GICv4p1 is implemented:

Indicates how the resident vPE is specified.

| RVPEID | Meaning |
|--------|---|
| 0b0 | GICR_VPENDBASER records the address of the vPE's Virtual Pending Table. |
| 0b1 | GICR_VPENDBASER records vPEID. |

Otherwise:

Reserved, RES0.

MPAM, bit [6]

When FEAT_GICv3p1 is implemented:

MPAM

| MPAM | Meaning |
|------|---------------------|
| 0b0 | MPAM not supported. |
| 0b1 | MPAM supported. |

Otherwise:

Reserved, RES0.

DPGS, bit [5]

Sets support for [GICR_CTLR](#).DPG* bits.

| DPGS | Meaning |
|------|--|
| 0b0 | GICR_CTLR.DPG* bits are not supported. |
| 0b1 | GICR_CTLR.DPG* bits are supported. |

Last, bit [4]

Indicates whether this Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

| Last | Meaning |
|------|---|
| 0b0 | This Redistributor is not the highest-numbered Redistributor in a series of contiguous Redistributor pages. |
| 0b1 | This Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages. |

DirectLPI, bit [3]

Indicates whether this Redistributor supports direct injection of LPIs.

| DirectLPI | Meaning |
|-----------|--|
| 0b0 | This Redistributor does not support direct injection of LPIs. The GICR_SETLPIR , GICR_CLRLPIR , GICR_INVLPPIR , GICR_INVALLR , and GICR_SYNCR registers are either not implemented, or have an IMPLEMENTATION DEFINED purpose. |
| 0b1 | This Redistributor supports direct injection of LPIs. The GICR_SETLPIR , GICR_CLRLPIR , GICR_INVLPPIR , GICR_INVALLR , and GICR_SYNCR registers are implemented. |

Dirty, bit [2]

Controls the functionality of [GICR_VPENDBASER](#). Dirty.

| Dirty | Meaning |
|-------|---|
| 0b0 | GICR_VPENDBASER .Dirty is UNKNOWN when GICR_VPENDBASER .Valid == 1. |
| 0b1 | GICR_VPENDBASER .Dirty indicates when the Virtual Pending Table has been parsed when GICR_VPENDBASER .Valid is written from 0 to 1. |

When [GICR_TYPER.VLPIS](#) == 0, this field is RES0.

Note

In GICv4p1 implementations this field is RES1.

VLPIS, bit [1]

Indicates whether the GIC implementation supports virtual LPIs and the direct injection of virtual LPIs.

| VLPIS | Meaning |
|-------|---|
| 0b0 | The implementation does not support virtual LPIs or the direct injection of virtual LPIs. |
| 0b1 | The implementation supports virtual LPIs and the direct injection of virtual LPIs. |

Note

In GICv3 implementations this field is RES0.

PLPIS, bit [0]

Indicates whether the GIC implementation supports physical LPis.

| PLPIS | Meaning |
|-------|--|
| 0b0 | The implementation does not support physical LPis. |
| 0b1 | The implementation supports physical LPis. |

Accessing GICR_TYPER

GICR_TYPER can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|---------|--------|------------|
| GIC Redistributor | RD_base | 0x0008 | GICR_TYPER |

Accesses on this interface are **RO**.

GICR_VPENDBASER, Virtual Redistributor LPI Pending Table Base Address Register

The GICR_VPENDBASER characteristics are:

Purpose

Specifies the base address of the memory that holds the virtual LPI Pending table for the currently scheduled virtual machine.

Configuration

Attributes

GICR_VPENDBASER is a 64-bit register.

Field descriptions

When FEAT_GICv4 is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------|------|-------------|-------|------|------------|------|------------------|----|----|----|----|----|----|----|------|--------------|------------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| Valid | IDAI | PendingLast | Dirty | RES0 | OuterCache | RES0 | Physical Address | | | | | | | | | | | | | | | | | | | | | | | | |
| Physical Address | | | | | | | | | | | | | | | RES0 | Shareability | InnerCache | RES0 | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Valid, bit [63]

This bit controls whether the virtual LPI Pending table is valid.

| Valid | Meaning |
|-------|--|
| 0b0 | The virtual LPI Pending table is not valid. No vPE is scheduled. |
| 0b1 | The virtual LPI Pending table is valid. A vPE is scheduled. |

Setting GICR_VPENDBASER.Valid == 1 when the associated CPU interface does not implement FEAT_GICv4 is UNPREDICTABLE.

Note

Software can determine whether a PE supports FEAT_GICv3 or FEAT_GICv4 by reading ID_AA64PFR0_EL1.

Writing a new value to any bit of GICR_VPENDBASER, other than GICR_VPENDBASER.Valid, when GICR_VPENDBASER.Valid==1 is UNPREDICTABLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

IDAI, bit [62]

Implementation Defined Area Invalid. Indicates whether the IMPLEMENTATION DEFINED area in the virtual LPI Pending table is valid.

| IDAI | Meaning |
|------|--|
| 0b0 | The IMPLEMENTATION DEFINED area is valid. |
| 0b1 | The IMPLEMENTATION DEFINED area is invalid and all pending interrupt information is held in the architecturally defined part of the virtual LPI Pending table. |

For more information, see 'LPI Pending tables' and 'Virtual LPI Configuration tables and virtual LPI Pending tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

PendingLast, bit [61]

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR_VPENDBASER.Valid has been written from 1 to 0 and is otherwise UNKNOWN.

| PendingLast | Meaning |
|-------------|---|
| 0b0 | There are no pending and enabled interrupts for the last scheduled vPE. |
| 0b1 | There is at least one pending interrupt for the last scheduled vPE. It is IMPLEMENTATION DEFINED whether this bit is set when the only pending interrupts for the last scheduled vPE are not enabled. Arm deprecates setting PendingLast to 1 when the only pending interrupts for the last scheduled virtual machine are not enabled. |

When the GICR_VPENDBASER.Valid bit is written from 0 to 1, this bit is RES1.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Dirty, bit [60]

When GICR_VPENDBASER.Valid == 0:

Indicates whether a de-scheduling operation is in progress.

This field is read-only.

| Dirty | Meaning |
|-------|--|
| 0b0 | No de-scheduling operation in process. |
| 0b1 | De-scheduling operation in process. |

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty==1.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

When GICR_VPENDBASER.Valid == 1 and GICR_TYPER.Dirty == 1:

This field is read-only. Reports whether the Virtual Pending table has been parsed.

| Dirty | Meaning |
|-------|---|
| 0b0 | Parsing of the Virtual Pending Table has completed. |
| 0b1 | Parsing of the Virtual Pending Table has not completed. |

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Otherwise:

This field is read-only. This field is UNKNOWN.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Bit [59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to virtual LPI Pending tables of vPEs targeting this Redistributor.

| OuterCache | Meaning |
|------------|---|
| 0b000 | Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability. |
| 0b001 | Normal Outer Non-cacheable. |
| 0b010 | Normal Outer Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Outer Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Outer Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Outer Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-back. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the OuterCacheability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:16]

Bits [51:16] of the physical address containing the virtual LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the virtual LPI Pending table.

| Shareability | Meaning |
|--------------|----------------------------|
| 0b00 | Non-shareable. |
| 0b01 | Inner Shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Reserved. Treated as 0b00. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the Shareability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the virtual LPI Pending table.

| InnerCache | Meaning |
|------------|--|
| 0b000 | Device-nGnRnE. |
| 0b001 | Normal Inner Non-cacheable. |
| 0b010 | Normal Inner Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Inner Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Inner Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Inner Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Inner Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Inner Cacheable Read-allocate, Write-allocate, Write-back. |

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the InnerCacheability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:0]

Reserved, RES0.

When FEAT_GICv4p1 is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----------|-------------|-------|---------|---------|------|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| Valid | Doorbell | PendingLast | Dirty | VGrp0En | VGrp1En | RES0 | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | vPEID | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Valid, bit [63]

This bit controls whether a vPE is scheduled:

| Valid | Meaning |
|-------|--|
| 0b0 | The virtual LPI Pending table is not valid. No vPE is scheduled. |
| 0b1 | The virtual LPI Pending table is valid. A vPE is scheduled. |

Setting GICR_VPENDBASER.Valid == 1 when the associated CPU interface does not implement FEAT_GICv4 is UNPREDICTABLE.

Note

Software can determine whether a PE supports FEAT_GICv3 or FEAT_GICv4 by reading ID_AA64PFR0_EL1.

Writing a new value to any bit of GICR_VPENDBASER, other than GICR_VPENDBASER.Valid, when GICR_VPENDBASER.Valid==1 is UNPREDICTABLE.

Setting GICR_VPENDBASER.Valid to 1 is UNPREDICTABLE if [GICR_VPROPBASER](#).Valid == 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Doorbell, bit [62]

When GICR_VPENDBASER.Valid is written from 1 to 0, this bit controls whether a default doorbell interrupt is requested for the descheduled vPE.

| Doorbell | Meaning |
|----------|--------------------------------|
| 0b0 | No default doorbell requested. |
| 0b1 | Default doorbell requested. |

When GICR_VPENDBASER.Valid is written from 1 to 0, if there are outstanding enabled pending interrupts then this bit is treated as 0.

When GICR_VPENDBASER.Valid is written from 1 to 0, if GICR_VPENDBASER.PendingLast is written as 1 then this bit is treated as 0.

When GICR_VPENDBASER.Valid == 1, reads return an UNKNOWN value.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

PendingLast, bit [61]

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR_VPENDBASER.Valid is written from 1 to 0 and is otherwise UNKNOWN.

| PendingLast | Meaning |
|-------------|---|
| 0b0 | There are no pending and enabled interrupts for the last scheduled vPE. |
| 0b1 | There is at least one pending and enabled interrupt for the last scheduled vPE. |

When the GICR_VPENDBASER.Valid bit is written from 0 to 1, this bit is RES1.

When GICR_VPENDBASER.Valid is written from 1 to 0, if GICR_VPENDBASER.PendingLast is written as 1, then this bit is set to an UNKNOWN value.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Dirty, bit [60]**When GICR_VPENDBASER.Valid == 0:**

Read-only. Indicates whether a de-scheduling operation is in progress.

| Dirty | Meaning |
|-------|---|
| 0b0 | No de-scheduling operation in progress. |
| 0b1 | De-scheduling operation in progress. |

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Otherwise:

Read-only. Reports whether the Virtual Pending table has been parsed.

| Dirty | Meaning |
|-------|---|
| 0b0 | Parsing of the Virtual Pending Table is complete. |
| 0b1 | Parsing of the Virtual Pending Table has not completed. |

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

VGrp0En, bit [59]

Enable virtual Group 0 interrupts.

| VGrp0En | Meaning |
|---------|--|
| 0b0 | Forwarding of virtual Group 0 interrupts disabled. |
| 0b1 | Forwarding of virtual Group 0 interrupts enabled. |

Writing a new value to VGrp0En while [GICR_VPENDBASER.Valid==1](#) is CONSTRAINED UNPREDICTABLE:

- The update is ignored.
- The update is ignored for all purposes other than a direct read of the register.
- The virtual group enable is updated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

VGrp1En, bit [58]

Enable virtual Group 1 interrupts.

| VGrp1En | Meaning |
|---------|--|
| 0b0 | Forwarding of virtual Group 1 interrupts disabled. |
| 0b1 | Forwarding of virtual Group 1 interrupts enabled. |

Writing a new value to VGrp1En while [GICR_VPENDBASER.Valid==1](#) is CONSTRAINED UNPREDICTABLE:

- The update is ignored.
- The update is ignored for all purposes other than a direct read of the register.
- The virtual group enable is updated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [57:16]

Reserved, RES0.

vPEID, bits [15:0]

When GICR_VPENDBASER.Valid == 1, ID of scheduled vPE.

When GICR_VPENDBASER.Valid == 1, if GICR_VPENDBASER.vPEID is set to a value greater than the configured vPEID width, the behavior of this field is CONSTRAINED UNPREDICTABLE:

- GICR_VPENDBASER.vPEID is treated as having an UNKNOWN valid value for all purposes other than a direct read of the register.
- GICR_VPENDBASER.Valid is treated as being set to 0 for all purposes other than a direct read of the register.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER2.VIL](#) and [GICD_TYPER2.VID](#) fields, unimplemented bits are RES0.

Accessing GICR_VPENDBASER

The effect of a write to this register is not guaranteed to be visible throughout the affinity hierarchy, as indicated by [GICR_CTLR.RWP](#) == 0.

GICR_VPENDBASER can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|-----------|--------|-----------------|
| GIC Redistributor | VLPI_base | 0x0078 | GICR_VPENDBASER |

Accesses on this interface are **RW**.

GICR_VPROPBASER, Virtual Redistributor Properties Base Address Register

The GICR_VPROPBASER characteristics are:

Purpose

Specifies the base address of the memory that holds the virtual LPI Configuration table for the currently scheduled virtual machine.

Configuration

This register is provided in FEAT_GICv4 implementations only.

Attributes

GICR_VPROPBASER is a 64-bit register.

Field descriptions

When FEAT_GICv4 is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------|----|----|----|----|------------|----|----|------|----|----|----|------------------|----|----|----|----|----|----|----|--------------|----|------------|----|----|------|----|----|--------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | OuterCache | | | RES0 | | | | Physical_Address | | | | | | | | | | | | | | | | | | | |
| Physical_Address | | | | | | | | | | | | | | | | | | | | Shareability | | InnerCache | | | RES0 | | | IDbits | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table.

| OuterCache | Meaning |
|------------|---|
| 0b000 | Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability. |
| 0b001 | Normal Outer Non-cacheable. |
| 0b010 | Normal Outer Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Outer Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Outer Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Outer Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-back. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the virtual LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table.

| Shareability | Meaning |
|--------------|----------------------------|
| 0b00 | Non-shareable. |
| 0b01 | Inner Shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Reserved. Treated as 0b00. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table.

| InnerCache | Meaning |
|------------|--|
| 0b000 | Device-nGnRnE. |
| 0b001 | Normal Inner Non-cacheable. |
| 0b010 | Normal Inner Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Inner Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Inner Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Inner Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Inner Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Inner Cacheable Read-allocate, Write-allocate, Write-back. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IDbits, bits [4:0]

The number of bits of virtual LPI INTID supported, minus one.

If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all virtual LPIs are out of range.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

When FEAT_GICv4p1 is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------|------|------------|------------|----------|-----------|----|------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|--------------|------------|------|----|----|----|----|----|----|----|----|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| Valid | RES0 | Entry_Size | OuterCache | Indirect | Page_Size | Z | Physical Address | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Physical Address | | | | | | | | | | | | | | | | | | | | | Shareability | InnerCache | Size | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

Valid, bit [63]

This bit controls whether the vPE Configuration Table is valid.

| Valid | Meaning |
|-------|---|
| 0b0 | The vPE Configuration table is not valid. |
| 0b1 | The vPE Configuration table is valid. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Bit [62]

Reserved, RES0.

Entry_Size, bits [61:59]

Specifies the number 64-bit doublewords per table entry, minus one.

This bit is read-only.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the table.

| OuterCache | Meaning |
|------------|---|
| 0b000 | Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability. |
| 0b001 | Normal Outer Non-cacheable. |
| 0b010 | Normal Outer Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Outer Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Outer Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Outer Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-back. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Indirect, bit [55]

This field indicates whether GICR_VPROPBASER specifies a single, flat table or a two-level table where the first level contains a list of descriptors.

| Indirect | Meaning |
|----------|--|
| 0b0 | Single Level. The Size field indicates the number of pages used to store data associated with each table entry. |
| 0b1 | Two Level. The Size field indicates the number of pages that contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used. |

This field is RAZ/WI for GIC implementations that only support flat tables.

If the supported vPEID width indicated by [GICD_TYPER2.VIL](#) and [GICD_TYPER2.VID](#), and the smallest page size that is supported result in a single level table that requires multiple pages, then implementing this bit as RAZ/WI is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Page_Size, bits [54:53]

The following values indicate the size of page that the translation table uses:

| Page_Size | Meaning |
|-----------|----------------------------|
| 0b00 | 4KB. |
| 0b01 | 16KB. |
| 0b10 | 64KB. |
| 0b11 | Reserved. Treated as 0b10. |

Note

If the GIC implementation supports only a single, fixed page size, this field might be RO.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Z, bit [52]

When GICR_VPROPBASER.Valid is written from 0 to 1, GICR_VPROPBASER.Z indicates whether the vPE Configuration table is known to contain all zeros.

| Z | Meaning |
|-----|--|
| 0b0 | The vPE Configuration table is not zero, and contains live data. |
| 0b1 | The vPE Configuration table is zero. |

Setting GICR_VPROPBASER.Z to 0 causes the IRI to reload configuration from memory

When GICR_VPROPBASER.Valid is written from 0 to 1, if GICR_VPROPBASER.Z==1 behavior is UNPREDICTABLE if the allocated memory does not contain all zeros.

This field is WO, and reads as 0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table.

| Shareability | Meaning |
|--------------|----------------------------|
| 0b00 | Non-shareable. |
| 0b01 | Inner Shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Reserved. Treated as 0b00. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table.

| InnerCache | Meaning |
|------------|--|
| 0b000 | Device-nGnRnE. |
| 0b001 | Normal Inner Non-cacheable. |
| 0b010 | Normal Inner Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Inner Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Inner Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Inner Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Inner Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Inner Cacheable Read-allocate, Write-allocate, Write-back. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Size, bits [6:0]

The number of pages of physical memory allocated to the table, minus one.

[GICR_VPROPBASER](#).Page_Size specifies the size of each page.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing GICR_VPROPBASER

GICR_VPROPBASER can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|-----------|--------|-----------------|
| GIC Redistributor | VLPI_base | 0x0070 | GICR_VPROPBASER |

Accesses on this interface are **RW**.

GICR_VSGIPENDR, Redistributor virtual SGI pending state register

The GICR_VSGIPENDR characteristics are:

Purpose

Requests the pending state of virtual SGIs for a specified vPE.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GICR_VSGIPENDR are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_VSGIPENDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Busy | | RES0 | | | | | | | | | | | | | | Pending | | | | | | | | | | | | | | | |

Busy, bit [31]

ID of target vPEID

| Busy | Meaning |
|------|---|
| 0b0 | Query of virtual SGI state not in progress. |
| 0b1 | Query of virtual SGI state in progress. |

Bits [30:16]

Reserved, RES0.

Pending, bits [15:0]

Pending state of virtual SGIs for requested vPEID.

This field is UNKNOWN when [GICR_VSGIPENDR](#).Busy == 1

Accessing GICR_VSGIPENDR

64-bit access only.

GICR_VSGIPENDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|-----------|--------|----------------|
| GIC Redistributor | VLPI_base | 0x0088 | GICR_VSGIPENDR |

Accesses on this interface are **RO**.

GICR_VSGIR, Redistributor virtual SGI pending state request register

The GICR_VSGIR characteristics are:

Purpose

Requests the pending state of virtual SGIs for a specified vPE.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GICR_VSGIR are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_VSGIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | vPEID | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

vPEID, bits [15:0]

ID of target vPE

Writing this field is CONSTRAINED UNPREDICTABLE when [GICR_VSGIPENDR](#).Busy == 1, with either the write ignored or a new query started.

Writing a value greater than the configured vPEID width behaviour is CONSTRAINED UNPREDICTABLE:

- GICR_VPENDBASER.vPEID is treated as having an UNKNOWN valid value for all purposes other than a direct read of the register.
- GICR_VPENDBASER.Valid is treated as being set to 0 for all purposes other than a direct read of the register.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER2](#).VIL and [GICD_TYPER2](#).VID fields. Unimplemented bits are RES0.

Accessing GICR_VSGIR

64-bit access only.

GICR_VSGIR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|-------|--------|----------|
|-----------|-------|--------|----------|

GICR_VSGIR, Redistributor virtual SGI pending state request register

| | | | |
|----------------------|-----------|--------|------------|
| GIC Redistributor | VLPI_base | 0x0080 | GICR_VSGIR |
|----------------------|-----------|--------|------------|

Accesses on this interface are **WO**.

GICR_WAKER, Redistributor Wake Register

The GICR_WAKER characteristics are:

Purpose

Permits software to control the behavior of the WakeRequest power management signal corresponding to the Redistributor. Power management operations follow the rules in 'Power management' in in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_WAKER is a 32-bit register.

Field descriptions

| | | | | |
|---------------------------|---|----------------|----------------|---------------------------|
| 31 | 3029282726252423222120191817161514131211109876543 | 2 | 1 | 0 |
| IMPLEMENTATION DEFINED | RES0 | ChildrenAsleep | ProcessorSleep | IMPLEMENTATION DEFINED |

IMPLEMENTATION DEFINED, bit [31]

IMPLEMENTATION DEFINED.

Bits [30:3]

Reserved, RES0.

ChildrenAsleep, bit [2]

Read-only. Indicates whether the connected PE is quiescent:

| ChildrenAsleep | Meaning |
|----------------|---|
| 0b0 | An interface to the connected PE might be active. |
| 0b1 | All interfaces to the connected PE are quiescent. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 1.

ProcessorSleep, bit [1]

Indicates whether the Redistributor can assert the **WakeRequest** signal:

| ProcessorSleep | Meaning |
|----------------|---|
| 0b0 | This PE is not in, and is not entering, a low power state. |
| 0b1 | <p>The PE is either in, or is in the process of entering, a low power state.</p> <p>All interrupts that arrive at the Redistributor:</p> <ul style="list-style-type: none"> • Assert a WakeRequest signal. • Are held in the pending state at the Redistributor, and are not communicated to the CPU interface. <hr/> <p>Note</p> <p>When ProcessorSleep == 1, the Redistributor must ensure that any interrupts that are pending on the CPU interface are released.</p> <hr/> <p>For an implementation that is using the GIC Stream Protocol Interface:</p> <ul style="list-style-type: none"> • A Quiesce command puts the interface between the Redistributor and the CPU interface in a quiescent state. For more information, see 'Quiesce (IRI)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069). • A Release command releases any interrupts that are pending on the CPU interface. For more information, see 'Release (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069). |

Note

Before powering down a PE, software must set this bit to 1 and wait until ChildrenAsleep == 1. After powering up a PE, or following a failed powerdown, software must set this bit to 0 and wait until ChildrenAsleep == 0.

Changing ProcessorSleep from 1 to 0 when ChildrenAsleep is not 1 results in UNPREDICTABLE behavior.

Changing ProcessorSleep from 0 to 1 when the Enable for each interrupt group in the associated CPU interface is not 0 results in UNPREDICTABLE behavior.

The reset behavior of this field is:

- On a GIC reset, this field resets to 1.

IMPLEMENTATION DEFINED, bit [0]

IMPLEMENTATION DEFINED.

Accessing GICR_WAKER

To ensure a Redistributor is quiescent, software must write to GICR_WAKER with ProcessorSleep == 1, then poll the register until ChildrenAsleep == 1.

Resetting the connected PE when GICR_WAKER.ProcessorSleep==0 or GICR_WAKER.ChildrenAsleep==0, can lead to UNPREDICTABLE behaviour in the IRI.

Resetting the IRI when GICR_WAKER.ProcessorSleep==0 or GICR_WAKER.ChildrenAsleep==0 can lead to UNPREDICTABLE behaviour in the connected PE.

GICR_WAKER can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-------------------|---------|--------|------------|
| GIC Redistributor | RD_base | 0x0014 | GICR_WAKER |

This interface is accessible as follows:

- When GICD_CTLR.DS == 1 accesses to this register are **RW**.
- When GICD_CTLR.DS == 0 and an access is Secure accesses to this register are **RW**.
- When GICD_CTLR.DS == 0 and an access is Non-secure accesses to this register are **RAZ/WI**.
- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRoot() accesses to this register are **RW**.
- When GICD_CTLR.DS == 0, FEAT_RME is implemented and IsAccessRealm() accesses to this register are **RAZ/WI**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICV_ABPR, Virtual Machine Aliased Binary Point Register

The GICV_ABPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

This register corresponds to [GICC_ABPR](#) in the physical CPU interface.

Note

[GICH_LR<n>](#).Group determines whether a virtual interrupt is Group 0 or Group 1.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_ABPR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_ABPR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | Binary_Point | | | | | | | | | | | | | |

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

The Binary_Point field of this register is aliased to [GICH_VMCR.VBPR1](#).

Accessing GICV_ABPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_BPR1](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_BPR1_EL1](#) provides equivalent functionality.

The value contained in this register is one greater than the actual applied binary point value, as described in 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This register is used for Group 1 interrupts when [GICV_CTLR](#).CBPR == 0. [GICV_BPR](#) provides equivalent functionality for Group 0 interrupts, and for Group 1 interrupts when [GICV_CTLR](#).CBPR == 1.

GICV_ABPR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|-----------|
| GIC Virtual CPU interface | 0x001C | GICV_ABPR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_AEOIR, Virtual Machine Aliased End Of Interrupt Register

The GICV_AEOIR characteristics are:

Purpose

A write to this register performs a priority drop for the specified Group 1 virtual interrupt and, if [GICV_CTLR.EOImode](#) == 0, also deactivates the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_AEOIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_AEOIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A successful EOI request means that:

- The highest priority bit in [GICH_APR<n>](#) is cleared, causing the running priority to drop.
- If the appropriate [GICV_CTLR.EOImode](#) bit == 0, the interrupt is deactivated in the corresponding List register. If the INTID corresponds to a hardware interrupt, the interrupt is also deactivated in the Distributor.

Note

Only Group 1 interrupts can target the hypervisor, and therefore only Group 1 interrupts are deactivated in the Distributor.

A write to this register is UNPREDICTABLE if the INTID corresponds to a Group 0 interrupt. In addition, the following GICv2 UNPREDICTABLE cases require specific actions:

- If highest active priority is Group 0 and the identified interrupt is in the List Registers and it matches the highest active priority. When EL2 is using System registers and [ICH_VTR_EL2](#).SEIS is 1, an IMPLEMENTATION DEFINED SEI might be generated, otherwise GICv3 implementations must ignore such writes.
- If the identified interrupt is in the List Registers, and the HW bit is 1, and the interrupt to be deactivated is an SGI (that is, the value of Physical_ID is between 0 and 15). GICv3 implementations must perform the deactivate operation. This means that a GICv3 implementation in legacy operation must ensure only a single SGI is active for a PE.
- If the identified interrupt is in the List Registers, and the HW bit is 1, and the corresponding pINTID field value is between 1020 and 1023, indicating a special purpose INTID. GICv3 implementations must not perform a deactivate operation but must still change the state of the List register as appropriate. When EL2 is using System registers and [ICH_VTR_EL2](#).SEIS is 1, an implementation might generate a system error.

Accessing GICV_AEOIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_EOIR1](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_EOIR1_EL1](#) provides equivalent functionality.

This register is used for Group 1 interrupts only. [GICV_EOIR](#) provides equivalent functionality for Group 0 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_AEOIR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|------------|
| GIC Virtual CPU interface | 0x0024 | GICV_AEOIR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_AHPPIR, Virtual Machine Aliased Highest Priority Pending Interrupt Register

The GICV_AHPPIR characteristics are:

Purpose

Provides the INTID of the highest priority pending Group 1 virtual interrupt in the List registers.

This register corresponds to the physical CPU interface register [GICC_AHPPIR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_AHPPIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_AHPPIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

A read of this register returns the spurious INTID 1023 if any of the following are true:

- There are no pending interrupts of sufficiently high priority value to be signaled to the PE.
- The highest priority pending interrupt is in Group 0.

Accessing GICV_AHPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_HPPIR1](#) provides equivalent functionality.

- For AArch64 implementations, [ICC_HPPIR1_EL1](#) provides equivalent functionality.

This register is used for Group 1 interrupts only. [GICV_HPPIR](#) provides equivalent functionality for Group 0 interrupts.

The register does not return the INTID of an interrupt that is active and pending.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_AHPPIR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|-------------|
| GIC Virtual CPU interface | 0x0028 | GICV_AHPPIR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICV_AIAR, Virtual Machine Aliased Interrupt Acknowledge Register

The GICV_AIAR characteristics are:

Purpose

Provides the INTID of the signaled Group 1 virtual interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

This register corresponds to the physical CPU interface register [GICC_AIAR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_AIAR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_AIAR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

The operation of this register is similar to the operation of [GICV_IAR](#). When a vPE reads this register, the corresponding [GICH_LR<n>](#).Group field is checked to determine whether the interrupt is in Group 0 or Group 1:

- If the interrupt is Group 0, the spurious INTID 1023 is returned and the interrupt is not acknowledged.
- If the interrupt is Group 1, the INTID is returned. The List register entry is updated to active state, and the appropriate bit in [GICH_APR<n>](#) is set to 1.

A read of this register returns the spurious INTID 1023 if any of the following are true:

- When the virtual CPU interface is enabled and [GICH_HCR](#).En == 1:

- There are no pending interrupts of sufficiently high priority value to be signaled to the PE.
- The highest priority pending interrupt is in Group 0.
- Interrupt signaling by the virtual CPU interface is disabled.

Accessing GICV_AIAR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_IAR1](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_IAR1_EL1](#) provides equivalent functionality.

This register is used for Group 1 interrupts only. [GICV_IAR](#) provides equivalent functionality for Group 0 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_AIAR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|-----------|
| GIC Virtual CPU interface | 0x0020 | GICV_AIAR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICV_APR<n>, Virtual Machine Active Priorities Registers, n = 0 - 3

The GICV_APR<n> characteristics are:

Purpose

Provides information about interrupt active priorities.
These registers correspond to the physical CPU interface registers [GICC_APR<n>](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_APR<n> are RES0.
When System register access is disabled for EL2, these registers access [GICH_APR<n>](#), and all active priorities for virtual machines are held in [GICH_APR<n>](#) regardless of interrupt group.
When System register access is enabled for EL2, these registers access [ICH_AP1R<n>_EL2](#), and all active priorities for virtual machines are held in [ICH_AP1R<n>_EL2](#) regardless of interrupt group.

Attributes

GICV_APR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|---------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

P<x>, bit [x], for x = 31 to 0

Provides information about active priorities for the virtual machine.
See [GICH_APR<n>](#) and [ICH_AP1R<n>_EL2](#) for the correspondence between priorities and bits.

Accessing GICV_APR<n>

If System register access is not enabled for EL2, these registers access [GICH_APR<n>](#). If System register access is enabled for EL2, these registers access [ICH_AP1R<n>_EL2](#). All active priority mapped guests are held in the accessed registers, regardless of interrupt group.

GICV_APR<n> can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|------------------|-------------|
| GIC Virtual CPU interface | 0x00D0 + (4 * n) | GICV_APR<n> |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

GICV_BPR, Virtual Machine Binary Point Register

The GICV_BPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

This register corresponds to [GICC_BPR](#) in the physical CPU interface.

Note

[GICH_LR<n>](#).Group determines whether a virtual interrupt is Group 0 or Group 1.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_BPR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

When [GICV_CTLR](#).CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

Attributes

GICV_BPR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | Binary Point | | | | | | | | | | | | | |

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see 'ICC_BPR0_EL1 Binary Point for Group 1 interrupts when CBPR == 1, or for Group 0 interrupts' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The Binary_Point field of this register is aliased to [GICH_VMCR](#).VBPR0.

Accessing GICV_BPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_BPR0](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_BPR0_EL1](#) provides equivalent functionality.

GICV_BPR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|----------|
| GIC Virtual CPU interface | 0x0008 | GICV_BPR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GICV_CTLR, Virtual Machine Control Register

The GICV_CTLR characteristics are:

Purpose

Controls the behavior of virtual interrupts.

This register corresponds to the physical CPU interface register [GICC_CTLR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_CTLR are RES0.

This register is available when a GIC implementation supports interrupt virtualization.

Attributes

GICV_CTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|---------|----|------|----|------|----|-------|----|--------|----|------------|----|------------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | EOImode | | RES0 | | CBPR | | FIQEn | | AckCtl | | EnableGrp1 | | EnableGrp0 | | | | | | | | | |

Bits [31:10]

Reserved, RES0.

EOImode, bit [9]

Controls the behavior associated with the [GICV_EOIR](#), [GICV_AEOIR](#), and [GICV_DIR](#) registers:

| EOImode | Meaning |
|---------|---|
| 0b0 | Writes to GICV_EOIR and GICV_AEOIR perform priority drop and deactivate interrupt operations simultaneously. Behavior on a write to GICV_DIR is unpredictable. When it has completed processing the interrupt, the virtual machine writes to GICV_EOIR or GICV_AEOIR to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the physical Distributor. |
| 0b1 | Writes to GICV_EOIR and GICV_AEOIR perform priority drop operation only. Writes to GICV_DIR perform deactivate interrupt operation only. When it has completed processing the interrupt, the virtual machine writes to GICV_DIR to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the Distributor. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

CBPR, bit [4]

Controls whether [GICV_BPR](#) affects both Group 0 and Group 1 interrupts:

| CBPR | Meaning |
|------|--|
| 0b0 | GICV_BPR affects Group 0 virtual interrupts only. GICV_ABPR affects Group 1 virtual interrupts only. |
| 0b1 | GICV_BPR affects both Group 0 and Group 1 virtual interrupts. |

For more information, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIQEn, bit [3]

FIQ Enable. Controls whether Group 0 virtual interrupts are presented as virtual FIQs:

| FIQEn | Meaning |
|-------|---|
| 0b0 | Group 0 virtual interrupts are presented as virtual IRQs. |
| 0b1 | Group 0 virtual interrupts are presented as virtual FIQs. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AckCtl, bit [2]

Arm deprecates use of this bit. Arm strongly recommends that software is written to operate with this bit always cleared to 0.

Acknowledge control. When the highest priority interrupt is Group 1, determines whether [GICV_IAR](#) causes the CPU interface to acknowledge the interrupt or returns the spurious identifier 1022, and whether [GICV_HPPIR](#) returns the interrupt ID or the special identifier 1022.

| AckCtl | Meaning |
|--------|---|
| 0b0 | If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an interrupt ID of 1022. |
| 0b1 | If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the interrupt ID of the corresponding interrupt. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EnableGrp1, bit [1]

Enables the signaling of Group 1 virtual interrupts by the virtual CPU interface to the virtual machine:

| EnableGrp1 | Meaning |
|------------|--|
| 0b0 | Signaling of Group 1 interrupts is disabled. |
| 0b1 | Signaling of Group 1 interrupts is enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enables the signaling of Group 0 virtual interrupts by the virtual CPU interface to the virtual machine:

| EnableGrp0 | Meaning |
|------------|--|
| 0b0 | Signaling of Group 0 interrupts is disabled. |
| 0b1 | Signaling of Group 0 interrupts is enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICV_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_CTLR](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_CTLR_EL1](#) provides equivalent functionality.

GICV_CTLR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|-----------|
| GIC Virtual CPU interface | 0x0000 | GICV_CTLR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_DIR, Virtual Machine Deactivate Interrupt Register

The GICV_DIR characteristics are:

Purpose

Deactivates a specified virtual interrupt in the [GICH_LR<n>](#) List registers.

This register corresponds to the physical CPU interface register [GICC_DIR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_DIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_DIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

When the virtual machine writes to this register, the specified interrupt in the List registers is changed from active to inactive, or from active and pending to pending. If the specified interrupt is present in the List registers but is not in either the active or active and pending states, the effect is UNPREDICTABLE. If the specified interrupt is not present in the List registers, [GICH_HCR](#).EOICount is incremented, potentially generating a maintenance interrupt.

Note

If the specified interrupt is not present in the List registers, the virtual machine cannot recover the INTID. Therefore, the hypervisor must ensure that, when [GICV_CTLR](#).EOImode == 1, no more than one active interrupt is

transferred from the List registers into a software list. If more than one active interrupt that is not stored in the List registers exists, the hypervisor must handle accesses to GICV_DIR in software, typically by trapping these accesses.

If the corresponding [GICH_LR<n>.HW == 1](#), indicating a hardware interrupt, then a deactivate request is sent to the physical Distributor, identifying the physical INTID from the corresponding field in the List register. This effect is identical to a Non-secure write to [GICC_DIR](#) from the PE having that physical INTID. This means that if the corresponding physical interrupt is marked as Group 0, the request is ignored.

Note

Interrupt deactivation using this register is based on the provided INTID, with no requirement to deactivate interrupts in any particular order. A single register is therefore used to deactivate both Group 0 and Group 1 interrupts.

Accessing GICV_DIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_DIR](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_DIR_EL1](#) provides equivalent functionality.

Writes to this register are valid only when [GICV_CTLR.EOImode == 1](#). Writes to this register are otherwise UNPREDICTABLE.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_DIR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|----------|
| GIC Virtual CPU interface | 0x1000 | GICV_DIR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_EOIR, Virtual Machine End Of Interrupt Register

The GICV_EOIR characteristics are:

Purpose

A write to this register performs a priority drop for the specified Group 0 virtual interrupt and, if [GICV_CTLR.EOImode](#) == 0, also deactivates the interrupt.

This register corresponds to the physical CPU interface register [GICC_EOIR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_EOIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_EOIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

The behavior of this register depends on the setting of [GICV_CTLR.EOImode](#):

| GICV_CTLR.EOImode | Behavior |
|-----------------------------------|---|
| 0b0 | Both the priority drop and the deactivate interrupt effects occur |
| 0b1 | Only the priority drop effect occurs. |

A successful EOI request means that:

- The highest priority bit in [GICH_APR<n>](#) is cleared, causing the running priority to drop.
- If the appropriate [GICV_CTLR.EOImode](#) bit == 0, the interrupt is deactivated in the corresponding List register [GICH_LR<n>](#). If [GICH_LR<n>.HW](#) == 1, indicating the INTID corresponds to a hardware interrupt,

a deactivate request is also sent to the physical Distributor, identifying the physical INTID from the corresponding field in the List register. This effect is identical to a Non-secure write to [GICC_DIR](#) from the PE having that physical INTID. This means that if the corresponding physical interrupt is marked as Group 0, and [GICD_CTLR.DS](#) == 0, the deactivation request is ignored. See [GICC_EOIR](#) for more information.

Note

Only Group 1 interrupts can target the hypervisor, and therefore only Group 1 interrupts are deactivated in the Distributor.

Accessing GICV_EOIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_EOIR0](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_EOIR0_EL1](#) provides equivalent functionality.

This register is used for Group 0 interrupts only. [GICV_AEOIR](#) provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_EOIR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|-----------|
| GIC Virtual CPU interface | 0x0010 | GICV_EOIR |

This interface is accessible as follows:

- When [GICD_CTLR.DS](#) == 0 accesses to this register are **WO**.
- When an access is Secure accesses to this register are **WO**.
- When an access is Non-secure accesses to this register are **WO**.

GICV_HPPIR, Virtual Machine Highest Priority Pending Interrupt Register

The GICV_HPPIR characteristics are:

Purpose

Provides the INTID of the highest priority pending Group 0 virtual interrupt in the List registers.

This register corresponds to the physical CPU interface register [GICC_HPPIR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_HPPIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_HPPIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Reads of the GICC_HPPIR that do not return a valid INTID return a spurious INTID, 1022 or 1023. See 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

| Highest priority pending interrupt Group | GICV_HPPIR read | GICV_CTLR.AckCtl | Returned INTID |
|--|-----------------|----------------------------------|-------------------------|
| 1 | Non-secure | x | ID of Group 1 interrupt |
| 1 | Secure | 0 | 1022 |
| 1 | Secure | 1 | ID of Group 1 interrupt |
| 0 | Non-secure | x | 1023 |
| 0 | Secure | x | ID of Group 0 interrupt |
| No pending interrupts | x | x | 1023 |

If the CPU interface supports only a single Security state, the entries that apply to Secure reads describe the behavior.

Accessing GICV_HPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_HPPIR0](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_HPPIR0_EL1](#) provides equivalent functionality.

This register is used for Group 0 interrupts only. [GICV_AHPPIR](#) provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_HPPIR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|------------|
| GIC Virtual CPU interface | 0x0018 | GICV_HPPIR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

GICV_IAR, Virtual Machine Interrupt Acknowledge Register

The GICV_IAR characteristics are:

Purpose

Provides the INTID of the signaled Group 0 virtual interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

This register corresponds to the physical CPU interface register [GICC_IAR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_IAR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_IAR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

When the virtual machine writes to this register, the virtual CPU interface acknowledges the highest priority pending virtual interrupt and sets the state in the corresponding List register to active. The appropriate bit in the active priorities register [GICH_APR<n>](#) is set to 1.

If [GICH_LR<n>](#).HW == 0, indicating that the interrupt is software-triggered, then bits [12:10] of [GICH_LR<n>](#) are returned in bits [12:10] of GICV_IAR. Otherwise bits [12:10] are RES0.

A read of this register returns the spurious INTID 1023 if either of the following is true:

- There are no pending interrupts of sufficiently high priority value to be signaled to the PE with the virtual CPU interface enabled and [GICH_HCR](#).En == 1.
- Interrupt signaling by the virtual CPU interface is disabled.

A read of this register returns the spurious INTID 1022 if the highest priority pending interrupt is Group 1 and [GICV_CTLR](#).AckCtl == 0.

Accessing GICV_IAR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_IAR0](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_IAR0_EL1](#) provides equivalent functionality.

This register is used for Group 0 interrupts only. [GICV_AIAR](#) provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_IAR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|----------|
| GIC Virtual CPU interface | 0x000C | GICV_IAR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

GICV_IIDR, Virtual Machine CPU Interface Identification Register

The GICV_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the virtual CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_IIDR are RES0.

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

Attributes

GICV_IIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----------------------|----|----|----|----------|----|----|----|-------------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ProductID | | | | | | | | | | | | Architecture_version | | | | Revision | | | | Implementer | | | | | | | | | | | |

ProductID, bits [31:20]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture_version, bits [19:16]

The version of the GIC architecture that is implemented.

| Architecture_version | Meaning |
|----------------------|---|
| 0b0001 | GICv1. |
| 0b0010 | GICv2. |
| 0b0011 | GICv3 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1. |
| 0b0100 | GICv4 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1. |

Other values are reserved.

Revision, bits [15:12]

Revision number for the CPU interface.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the CPU interface.

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

Accessing GICV_IIDR

GICV_IIDR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|-----------|
| GIC Virtual CPU interface | 0x00FC | GICV_IIDR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_PMR, Virtual Machine Priority Mask Register

The GICV_PMR characteristics are:

Purpose

This register provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

Note

Higher interrupt priority corresponds to a lower value of the Priority field.

This register corresponds to the physical CPU interface register [GICC_PMR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_PMR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

The Priority field of this register is aliased to [GICH_VMCR.VMPR](#), to enable state to be switched easily between virtual machines during context-switching.

Attributes

GICV_PMR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|----------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | Priority | | | | | | | |

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = 0b0.
- For 64 supported levels, bits [1:0] = 0b00.
- For 32 supported levels, bits [2:0] = 0b000.
- For 16 supported levels, bits [3:0] = 0b0000.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICV_PMR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_PMR](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_PMR_EL1](#) provides equivalent functionality.

GICV_PMR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|----------|
| GIC Virtual CPU interface | 0x0004 | GICV_PMR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_RPR, Virtual Machine Running Priority Register

The GICV_RPR characteristics are:

Purpose

This register indicates the running priority of the virtual CPU interface.

This register corresponds to the physical CPU interface register [GICC_RPR](#).

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_RPR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_RPR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|----------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | Priority | | | | | | | |

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the virtual CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR was set to the minimum value.

Accessing GICV_RPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, [ICC_RPR](#) provides equivalent functionality.
- For AArch64 implementations, [ICC_RPR_EL1](#) provides equivalent functionality.

Depending on the implementation, if no bits are set to 1 in [GICH_APR<n>](#), indicating no active virtual interrupts in the virtual CPU interface, the priority reads as 0xFF or 0xF8 to reflect the number of supported interrupt priority bits defined by [GICH_VTR](#).PRIbits.

GICV_RPR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|----------|
| GIC Virtual CPU interface | 0x0014 | GICV_RPR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RO**.
- When an access is Secure accesses to this register are **RO**.
- When an access is Non-secure accesses to this register are **RO**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GICV_STATUSR, Virtual Machine Error Reporting Status Register

The GICV_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_STATUSR are RES0.

In systems where this register is implemented, Arm expects that when a virtual machine is scheduled, the hypervisor ensures that this register is cleared to 0. The hypervisor might check for illegal accesses when the virtual machine is unscheduled.

Attributes

GICV_STATUSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|------|------|-----|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | WROD | RWOD | WRD | RRD |

Bits [31:4]

Reserved, RES0.

WROD, bit [3]

Write to an RO location.

| WROD | Meaning |
|------|--|
| 0b0 | Normal operation. |
| 0b1 | A write to an RO location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

| RWOD | Meaning |
|------|--|
| 0b0 | Normal operation. |
| 0b1 | A read of a WO location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

| WRD | Meaning |
|-----|---|
| 0b0 | Normal operation. |
| 0b1 | A write to a reserved location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

| RRD | Meaning |
|-----|--|
| 0b0 | Normal operation. |
| 0b1 | A read of a reserved location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICV_STATUSR

This is an optional register. If the register is implemented, [GICC_STATUSR](#) must also be implemented. If the register is not implemented, the location is RAZ/WI.

This register is used only when System register access is not enabled. If System register access is enabled, this register is not updated. Equivalent function might be provided by appropriate traps and exceptions.

GICV_STATUSR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------------|--------|--------------|
| GIC Virtual CPU interface | 0x002C | GICV_STATUSR |

This interface is accessible as follows:

- When GICD_CTLR.DS == 0 accesses to this register are **RW**.
- When an access is Secure accesses to this register are **RW**.
- When an access is Non-secure accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_BASER<n>, ITS Translation Table Descriptors, n = 0 - 7

The GITS_BASER<n> characteristics are:

Purpose

Specifies the base address and size of the ITS translation tables.

Configuration

A copy of this register is provided for each ITS translation table.

Bits [63:32] and bits [31:0] are accessible independently.

A maximum of 8 GITS_BASER<n> registers can be provided. Unimplemented registers are RES0.

When [GITS_CTLR.Enabled](#) == 1 or [GITS_CTLR.Quiescent](#) == 0, writing this register is UNPREDICTABLE.

Attributes

GITS_BASER<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------|----------|------------|------|------------|------------|------------------|----|----|----|----|----|----|----|----|----|--------------|----|-----------|----|------|----|----|----|----|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| Valid | Indirect | InnerCache | Type | OuterCache | Entry_Size | Physical_Address | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Physical_Address | | | | | | | | | | | | | | | | Shareability | | Page_Size | | Size | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Valid, bit [63]

Indicates whether software has allocated memory for the translation table:

| Valid | Meaning |
|-------|--|
| 0b0 | No memory is allocated for the translation table. The ITS discards any writes to the interrupt translation page when either: <ul style="list-style-type: none"> GITS_BASER<n>.Type specifies any valid table entry type other than interrupt collections, that is, any value other than 0b100. GITS_BASER<n>.Type specifies an interrupt collection and GITS_TYPER.HCC == 0. |
| 0b1 | Memory is allocated to the translation table. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Indirect, bit [62]

This field indicates whether an implemented register specifies a single, flat table or a two-level table where the first level contains a list of descriptors.

| Indirect | Meaning |
|----------|---|
| 0b0 | Single Level. The Size field indicates the number of pages used by the ITS to store data associated with each table entry. |
| 0b1 | Two Level. The Size field indicates the number of pages which contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used. |

For more information, see 'The ITS tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field is RAZ/WI for GIC implementations that only support flat tables. If the maximum width of the scaling factor that is identified by GITS_BASER<n>.Type and the smallest page size that is supported result in a single level table that requires multiple pages, then implementing this bit as RAZ/WI is DEPRECATED.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [61:59]

Indicates the Inner Cacheability attributes of accesses to the table. The possible values of this field are:

| InnerCache | Meaning |
|------------|--|
| 0b000 | Device-nGnRnE. |
| 0b001 | Normal Inner Non-cacheable. |
| 0b010 | Normal Inner Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Inner Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Inner Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Inner Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Inner Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Inner Cacheable Read-allocate, Write-allocate, Write-back. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Type, bits [58:56]

Read only. Specifies the type of entity that requires entries in the corresponding translation table. The possible values of the field are:

| Type | Meaning |
|-------|--|
| 0b000 | Unimplemented. This register does not correspond to a translation table. |
| 0b001 | Devices. This register corresponds to a translation table that scales with the width of the DeviceID. Only a single GITS_BASER<n> register reports this type. |
| 0b010 | vPEs. FEAT_GICv4 only. This register corresponds to a translation table that scales with the number of vPEs in the system. The translation table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of vPEs in the system. Only a single GITS_BASER<n> register reports this type. |
| 0b100 | Interrupt collections. This register corresponds to a translation table that scales with the number of interrupt collections in the system. The translation table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of interrupt collections. Not more than one GITS_BASER<n> register will report this type. |

Other values are reserved.

For FEAT_GICv4p1, the registers are allocated as follows:

- GITS_BASER0.Type is 0b001 (Device).
- GITS_BASER1.Type is either 0b100 (Collection Table) or 0b000 (Unimplemented).
- GITS_BASER2.Type is either 0b010 (vPE) or 0b000 (Unimplemented).
- GITS_BASER<n>.Type, where 'n' is in the range 3 to 7, is 0b000 (Unimplemented).

For FEAT_GICv3, FEAT_GICv3p1, and FEAT_GICv4, Arm recommends that the GITS_BASER<n> use the same allocations.

Other allocations of Type values are deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

OuterCache, bits [55:53]

Indicates the Outer Cacheability attributes of accesses to the table. The possible values of this field are:

| OuterCache | Meaning |
|------------|---|
| 0b000 | Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability. |
| 0b001 | Normal Outer Non-cacheable. |
| 0b010 | Normal Outer Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Outer Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Outer Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Outer Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-back. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Entry_Size, bits [52:48]

Read-only. Specifies the number of bytes per translation table entry, minus one.

Physical_Address, bits [47:12]

Physical Address. When Page_Size is 4KB or 16KB:

- Bits [51:48] of the base physical address are zero.
- This field provides bits[47:12] of the base physical address of the table.
- Bits[11:0] of the base physical address are zero.
- The address must be aligned to the size specified in the Page Size field. Otherwise the effect is CONSTRAINED UNPREDICTABLE, and can be one of the following:
 - Bits[X:12], where X is derived from the page size, are treated as zero.
 - The value of bits[X:12] are used when calculating the address of a table access.

When Page_Size is 64KB:

- Bits[47:16] of the register provide bits[47:16] of the base physical address of the table.
- Bits[15:12] of the register provide bits[51:48] of the base physical address of the table.
- Bits[15:0] of the base physical address are 0.

In implementations that support fewer than 52 bits of physical address, any unimplemented upper bits might be RAZ/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the table. The possible values of this field are:

| Shareability | Meaning |
|--------------|----------------------------|
| 0b00 | Non-shareable. |
| 0b01 | Inner Shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Reserved. Treated as 0b00. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Page_Size, bits [9:8]

The size of page that the translation table uses:

| Page_Size | Meaning |
|-----------|----------------------------|
| 0b00 | 4KB. |
| 0b01 | 16KB. |
| 0b10 | 64KB. |
| 0b11 | Reserved. Treated as 0b10. |

Note

If the GIC implementation supports only a single, fixed page size, this field might be RO.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Size, bits [7:0]

The number of pages of physical memory allocated to the table, minus one. GITS_BASER<n>.Page_Size specifies the size of each page.

If GITS_BASER<n>.Type == 0, this field is RAZ/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GITS_BASER<n>

GITS_BASER<n> can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------------|------------------|---------------|
| GIC ITS control | 0x0100 + (8 * n) | GITS_BASER<n> |

Accesses on this interface are **RW**.

GITS_CBASER, ITS Command Queue Descriptor

The GITS_CBASER characteristics are:

Purpose

Specifies the base address and size of the ITS command queue.

Configuration

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CBASER is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|------|------------|------|------------|------|------------------|----|----|----|----|--------------|----|----|----|----|----|----|----|----|----|----|------------------|------|----|----|----|----|----|----|----|----|--|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | |
| Valid | RES0 | InnerCache | RES0 | OuterCache | RES0 | Physical_Address | | | | | | | | | | | | | | | | Physical_Address | | | | | | | | | | | | |
| | | | | | | | | | | | Shareability | | | | | | | | | | | RES0 | Size | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | |

Valid, bit [63]

Indicates whether software has allocated memory for the command queue:

| Valid | Meaning |
|-------|---|
| 0b0 | No memory is allocated for the command queue. |
| 0b1 | Memory is allocated to the command queue. |

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Bit [62]

Reserved, RES0.

InnerCache, bits [61:59]

Indicates the Inner Cacheability attributes of accesses to the command queue. The possible values of this field are:

| InnerCache | Meaning |
|------------|--|
| 0b000 | Device-nGnRnE. |
| 0b001 | Normal Inner Non-cacheable. |
| 0b010 | Normal Inner Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Inner Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Inner Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Inner Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Inner Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Inner Cacheable Read-allocate, Write-allocate, Write-back. |

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [58:56]

Reserved, RES0.

OuterCache, bits [55:53]

Indicates the Outer Cacheability attributes of accesses to the command queue. The possible values of this field are:

| OuterCache | Meaning |
|------------|---|
| 0b000 | Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability. |
| 0b001 | Normal Outer Non-cacheable. |
| 0b010 | Normal Outer Cacheable Read-allocate, Write-through. |
| 0b011 | Normal Outer Cacheable Read-allocate, Write-back. |
| 0b100 | Normal Outer Cacheable Write-allocate, Write-through. |
| 0b101 | Normal Outer Cacheable Write-allocate, Write-back. |
| 0b110 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-through. |
| 0b111 | Normal Outer Cacheable Read-allocate, Write-allocate, Write-back. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bit [52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the base physical address of the command queue. Bits [11:0] of the base address are 0.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

If bits [15:12] are not all zeros, behavior is a CONSTRAINED UNPREDICTABLE choice:

- Bits [15:12] are treated as if all the bits are zero. The value read back from those bits is either the value written or zero.
- The result of the calculation of an address for a command queue read can be corrupted.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the command queue. The possible values of this field are:

| Shareability | Meaning |
|--------------|----------------------------|
| 0b00 | Non-shareable. |
| 0b01 | Inner Shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Reserved. Treated as 0b00. |

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [9:8]

Reserved, RES0.

Size, bits [7:0]

The number of 4KB pages of physical memory allocated to the command queue, minus one.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

The command queue is a circular buffer and wraps at Physical Address [47:0] + (4096 * (Size + 1)).

Note

When this register is successfully written, the value of [GITS_CREADR](#) is set to zero.

Accessing GITS_CBASER

When [GITS_CTLR.Enabled](#) == 1 or [GITS_CTLR.Quiescent](#) == 0, writing this register is UNPREDICTABLE.

GITS_CBASER can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------------|--------|-------------|
| GIC ITS control | 0x0080 | GITS_CBASER |

Accesses on this interface are **RW**.

GITS_CREADR, ITS Read Register

The GITS_CREADR characteristics are:

Purpose

Specifies the offset from [GITS_CBASER](#) where the ITS reads the next ITS command.

Configuration

This register is cleared to 0 when a value is written to [GITS_CBASER](#).

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CREADR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|------|----|----|----|----|----|----|----|------|----|----|----|---------|----|----|----|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | Offset | | | | | | | | | | | | RES0 | | | | Stalled | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

Bits [63:20]

Reserved, RES0.

Offset, bits [19:5]

Bits [19:5] of the offset from [GITS_CBASER](#). Bits [4:0] of the offset are zero.

Bits [4:1]

Reserved, RES0.

Stalled, bit [0]

Reports whether the processing of commands is stalled because of a command error.

| Stalled | Meaning |
|---------|--|
| 0b0 | ITS command queue is not stalled because of a command error. |
| 0b1 | ITS command queue is stalled because of a command error. |

For more information, see 'The ITS command interface' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accessing GITS_CREADR

GITS_CREADR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
|-----------|--------|----------|

GITS_CREADR, ITS Read Register

| | | |
|-----------------|--------|-------------|
| GIC ITS control | 0x0090 | GITS_CREADR |
|-----------------|--------|-------------|

Accesses on this interface are **RO**.

GITS_CTLR, ITS Control Register

The GITS_CTLR characteristics are:

Purpose

Controls the operation of an ITS.

Configuration

The ITS_Number (bits [7:4]) and bit [1] fields apply only in FEAT_GICv4 implementations, and are RES0 in FEAT_GICv3 implementations.

Attributes

GITS_CTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|------------|----|----|----|------|------|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Quiescent | RES0 | | | | | | | | | | | | | | | | UMSIlrq | ITS_Number | | | | RES0 | ImDe | Enabled | | | | | | | |

Quiescent, bit [31]

Read-only. Indicates completion of all ITS operations when GITS_CTLR.Enabled == 0.

| Quiescent | Meaning |
|-----------|--|
| 0b0 | The ITS is not quiescent and cannot be powered down. |
| 0b1 | The ITS is quiescent and can be powered down. |

For the ITS to be considered inactive, there must be no transactions in progress. In addition, all operations required to ensure that mapping data is consistent with external memory must be complete.

Note

In distributed GIC implementations, this bit is set to 1 only after the ITS forwards any operations that have not yet been completed to the Redistributors and receives confirmation that all such operations have reached the appropriate Redistributor.

In FEAT_GICv3, FEAT_GICv3p1, and FEAT_GICv4, when GITS_CTLR.Enabled == 1, the value of GITS_CTLR.Quiescent is UNKNOWN.

In FEAT_GICv4p1, when GITS_CTLR.Enabled == 1, the value of GITS_CTLR.Quiescent reads as 1 until the write to Enabled has taken effect and then reads as 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to 1.

Bits [30:9]

Reserved, RES0.

UMSIlrq, bit [8]

Unmapped MSI reporting interrupt enable.

| UMSlirq | Meaning |
|---------|--|
| 0b0 | The ITS does not assert an interrupt signal when GITS_STATUSR.UMSI is 1. |
| 0b1 | The ITS asserts an interrupt signal when GITS_STATUSR.UMSI is 1. |

If [GITS_TYPER.UMSlirq](#) is 0, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

ITS_Number, bits [7:4]

In FEAT_GICv3 implementations this field is RES0.

In FEAT_GICv4 implementations with more than one ITS instance, this field indicates the ITS number for use with 'VMOVP GICv4.0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

It is IMPLEMENTATION DEFINED whether this field is programmable or RO.

If this field is programmable, changing this field when [GITS_CTLR.Quiescent](#) == 0 or [GITS_CTLR.Enabled](#) == 1 is UNPREDICTABLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [3:2]

Reserved, RES0.

ImDe, bit [1]

In GICv3 implementations, this bit is RES0.

In GICv4 implementations, this bit is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Enabled, bit [0]

Controls whether the ITS is enabled:

| Enabled | Meaning |
|---------|--|
| 0b0 | The ITS is not enabled. Writes to GITS_TRANSLATER are ignored and no further command queue entries are processed. |
| 0b1 | The ITS is enabled. Writes to GITS_TRANSLATER result in interrupt translations and the command queue is processed. |

If a write to this register changes this field from 1 to 0, the ITS must ensure that both:

- Any caches containing mapping data are made consistent with external memory.
- [GITS_CTLR.Quiescent](#) == 0 until all caches are consistent with external memory.

Changing [GITS_CTLR.Enabled](#) from 0 to 1 when [GITS_CTLR.Quiescent](#) is 0 results in UNPREDICTABLE behavior.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Accessing GITS_CTLR

GITS_CTLR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------------|--------|-----------|
| GIC ITS control | 0x0000 | GITS_CTLR |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_CWRITER, ITS Write Register

The GITS_CWRITER characteristics are:

Purpose

Specifies the offset from [GITS_CBASER](#) where software writes the next ITS command.

Configuration

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CWRITER is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | Offset | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:20]

Reserved, RES0.

Offset, bits [19:5]

Bits [19:5] of the offset from [GITS_CBASER](#). Bits [4:0] of the offset are zero.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [4:1]

Reserved, RES0.

Retry, bit [0]

Writing this bit has the following effects:

| Retry | Meaning |
|---|--|
| 0b0 | No effect on the processing commands by the ITS. |
| 0b1 | Restarts the processing of commands by the ITS if it stalled because of a command error. |
| Note | |
| If the processing of commands is not stalled because of a command error, writing 1 to this bit has no effect. | |

When read, this bit is RES0.

For more information, see 'The ITS command interface' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If GITS_CWRITER is written with a value outside of the valid range specified by [GITS_CBASER.Physical_Address](#) and [GITS_CBASER.Size](#), behavior is a CONSTRAINED UNPREDICTABLE choice, as follows:

- The command queue is considered invalid, and no further commands are processed until GITS_CWRITER is written with a value that is in the valid range.
- The value is treated as a valid UNKNOWN value.

An implementation might choose to report a system error in an IMPLEMENTATION DEFINED manner.

Accessing GITS_CWRITER

GITS_CWRITER can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------------|--------|--------------|
| GIC ITS control | 0x0088 | GITS_CWRITER |

Accesses on this interface are **RW**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GITS_IIDR, ITS Identification Register

The GITS_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the ITS.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GITS_IIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|------|----|----|----|---------|----|----|----|----------|----|----|----|-------------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ProductID | | | | | | | | RES0 | | | | Variant | | | | Revision | | | | Implementer | | | | | | | | | | | |

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the ITS:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.

- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

Accessing GITS_IIDR

GITS_IIDR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------------|--------|-----------|
| GIC ITS control | 0x0004 | GITS_IIDR |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_MPAMIDR, Report maximum PARTID and PMG Register

The GITS_MPAMIDR characteristics are:

Purpose

Reports the maximum support PARTID and PMG values.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GITS_MPAMIDR are RES0.

A copy of this register is provided for each ITS.

When [GITS_TYPER](#).MPAM==0, this register is RES0.

Attributes

GITS_MPAMIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|-----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | PMGmax | | | | | | | | PARTIDmax | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

PMGmax, bits [23:16]

Maximum PMG value supported.

PARTIDmax, bits [15:0]

Maximum PARTID value supported.

Accessing GITS_MPAMIDR

GITS_MPAMIDR can be accessed through the memory-mapped interfaces:

| Component | Offset |
|-----------------|--------|
| GIC ITS control | 0x0010 |

Accesses on this interface are **RO**.

GITS_MPIDR, Report ITS's affinity.

The GITS_MPIDR characteristics are:

Purpose

Reports ITS's affinity when the vPE Table is shared with Redistributors.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GITS_MPIDR are RES0.

A copy of this register is provided for each ITS.

When [GITS_TYPER](#).SVPET==0, this register is RES0.

Attributes

GITS_MPIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Aff3 | | | | | | | | Aff2 | | | | | | | | Aff1 | | | | | | | | RES0 | | | | | | | |

Aff3, bits [31:24]

The Affinity level 3 value for the ITS.

Aff2, bits [23:16]

The Affinity level 2 value for the ITS.

Aff1, bits [15:8]

The Affinity level 1 value for the ITS.

Bits [7:0]

Reserved, RES0.

Accessing GITS_MPIDR

GITS_MPIDR can be accessed through the memory-mapped interfaces:

| Component | Offset |
|-----------------|--------|
| GIC ITS control | 0x0018 |

Accesses on this interface are **RO**.

GITS_PARTIDR, Set PARTID and PMG Register

The GITS_PARTIDR characteristics are:

Purpose

Sets the PARTID and PMG values used for memory accesses by the ITS.

Configuration

This register is present only when FEAT_GICv3p1 is implemented. Otherwise, direct accesses to GITS_PARTIDR are RES0.

A copy of this register is provided for each ITS.

When [GITS_TYPER](#).MPAM==0, this register is RES0.

Attributes

GITS_PARTIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | PMG | | | | | | | | PARTID | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

PMG value used when ITS accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PMG values in the range 0 to PMG_MAX are stateful or RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

PARTID, bits [15:0]

PARTID value used when ITS accesses memory.

It is IMPLEMENTATION DEFINED whether bits not needed to represent PARTID values in the range 0 to PARTID_MAX are stateful or RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to 0.

Accessing GITS_PARTIDR

GITS_PARTIDR can be accessed through the memory-mapped interfaces:

| Component | Offset |
|-----------------|--------|
| GIC ITS control | 0x0014 |

Accesses on this interface are **RW**.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GITS_SGIR, ITS SGI Register

The GITS_SGIR characteristics are:

Purpose

Written by software to signal a virtual SGI for translation by the ITS.

Configuration

This register is present only when FEAT_GICv4p1 is implemented. Otherwise, direct accesses to GITS_SGIR are RES0.

This register is provided only in FEAT_GICv4p1 implementations.

Attributes

GITS_SGIR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| RES0 | | | | | | | | | | | | | | | | vPEID | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | vINTID | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

Bits [63:48]

Reserved, RES0.

vPEID, bits [47:32]

ID of target vPEID.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the [GICD_TYPER2.VIL](#) and [GICD_TYPER2.VID](#) fields. Unimplemented bits are RES0.

Bits [31:4]

Reserved, RES0.

vINTID, bits [3:0]

INTID of virtual SGI.

Accessing GITS_SGIR

64-bit access only.

GITS_SGIR can be accessed through the memory-mapped interfaces:

| Component | Offset |
|-----------------|---------|
| GIC ITS control | 0x20020 |

Accesses on this interface are **WO**.

GITS_STATUSR, ITS Error Reporting Status Register

The GITS_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.
- Unmapped MSIs.

Configuration

Attributes

GITS_STATUSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|----------|----|------|------|------|-----|-----|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | Syndrome | | | | Overflow | | UMSI | WROD | RWOD | WRD | RRD | | | | | | | | | |

Bits [31:10]

Reserved, RES0.

Syndrome, bits [9:6]

Syndrome for the MSI that set GITS_STATUSR.UMSI to 1.

| Syndrome | Meaning |
|----------|------------------------|
| 0b0000 | Unknown reason. |
| 0b0010 | DeviceID out of range. |
| 0b0011 | DeviceID unmapped. |
| 0b0100 | EventID out of range. |
| 0b0101 | EventID unmapped. |
| 0b0111 | Collection unmapped. |
| 0b1001 | vPEID unmapped. |

An implementation might not support reporting all syndromes, and might report 0b0000 for any cause.

This field is UNKNOWN when GITS_STATUSR.UMSI is 0.

Overflow, bit [5]

Reports whether an unmapped MSI has been received while GITS_STATUSR.UMSI is 1.

| Overflow | Meaning |
|----------|---|
| 0b0 | No unmapped MSIs have been received since GITS_STATUSR.UMSI set to 1. |
| 0b1 | At least one unmapped MSIs have been received since GITS_STATUSR.UMSI set to 1. |

A software write of 1 to the bit clears it. A write of any other value is ignored.

If [GITS_TYPER](#).UMSI is 0, this field is RES0.

UMSI, bit [4]

Reports whether an unmapped MSI has been received

An unmapped MSI is defined as an MSI arriving at [GITS_TRANSLATER](#) for which there is insufficient mapping information for it to be forwarded to a Redistributor.

It is IMPLEMENTATION DEFINED whether an INT command can be reported as an unmapped MSI.

| UMSI | Meaning |
|------|--------------------------------------|
| 0b0 | No unmapped MSIs have been received. |
| 0b1 | Unmapped MSI received. |

A software write of 1 to the bit clears it. A write of any other value is ignored.

If [GITS_TYPER](#).UMSI is 0, this field is RES0.

WROD, bit [3]

Write to an RO location.

| WROD | Meaning |
|------|--|
| 0b0 | Normal operation. |
| 0b1 | A write to an RO location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

| RWOD | Meaning |
|------|--|
| 0b0 | Normal operation. |
| 0b1 | A read of a WO location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

| WRD | Meaning |
|-----|---|
| 0b0 | Normal operation. |
| 0b1 | A write to a reserved location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

| RRD | Meaning |
|-----|--|
| 0b0 | Normal operation. |
| 0b1 | A read of a reserved location has been detected. |

When a violation is detected, software must write 1 to this register to reset it.

Accessing GITS_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

GITS_STATUSR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------------|--------|--------------|
| GIC ITS control | 0x0040 | GITS_STATUSR |

Accesses on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

GITS_TRANSLATER, ITS Translation Register

The GITS_TRANSLATER characteristics are:

Purpose

Written by a requesting Device to signal an interrupt for translation by the ITS.

Configuration

This register is at the same offset as [GICD_SETSPI_NSR](#) in the Distributor, and is at the same offset as [GICR_SETLPIR](#) in the Redistributor.

Attributes

GITS_TRANSLATER is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| EventID | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

EventID, bits [31:0]

An identifier corresponding to the interrupt to be translated.

Note

The size of the EventID is DeviceID specific, and set when the DeviceID is mapped to an ITT (using MAPD).

The number of EventID bits implemented is reported by [GITS_TYPER.ID_bits](#). If a write specifies non-zero identifiers bits outside this range behavior is a CONSTRAINED UNPREDICTABLE choice between:

- Non-zero identifier bits outside the supported range are ignored.
- The write is ignored.

The DeviceID presented to an ITS is used to index a device table. The device table maps the DeviceID to an interrupt translation table for that device.

Accessing GITS_TRANSLATER

16-bit access to bits [15:0] of this register must be supported. When this register is written by a 16-bit transaction, bits [31:16] are written as zero.

Implementations must ensure that:

- A unique DeviceID is provided for each requesting device, and the DeviceID is presented to the ITS when a write to this register occurs in a manner that cannot be spoofed by any agent capable of performing writes.
- The DeviceID presented corresponds to the DeviceID field in the ITS commands.

Writes to this register are ignored if any of the following are true:

- [GITS_CTLR.Enabled](#) == 0.
- The presented DeviceID is not mapped to an Interrupt Translation Table.
- The DeviceID is larger than the supported size.
- The DeviceID is mapped to an Interrupt Translation Table, but the EventID is outside the range specified by MAPD.

- The EventID is mapped to an Interrupt Translation Table and the EventID is within the range specified by MAPD, but the EventID is unmapped.

Translation requests that result from writes to this register are subject to certain ordering rules. For more information, see 'Ordering of translations with the output to ITS commands' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

GITS_TRANSLATER can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|---------------------|--------|-----------------|
| GIC ITS translation | 0x0040 | GITS_TRANSLATER |

Accesses on this interface are **WO**.

GITS_TYPER, ITS Type Register

The GITS_TYPER characteristics are:

Purpose

Specifies the features that an ITS supports.

Configuration

Attributes

GITS_TYPER is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------------|--|--|--|------|--|---------|--|---------|--|--|--|---------|--|-----|------|----------------|------|--------|------|---------------------------|------|-------|-------|-----|------|----|----|----|----|----|----|--|---|
| 636261605958575655545352 | | | | | | | | | | | | | | | | 51 | 50 | 494847 | | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | | 3 |
| RES0 | | | | | | | | | | | | | | INV | UMSI | irq | UMSI | in | DPET | VMAPP | VSGI | IMPAM | VMOVP | CIL | CIDb | | | | | | | | |
| HCC | | | | RES0 | | PTASEIS | | Devbits | | | | ID_bits | | | | ITT_entry_size | | | | IMPLEMENTATION DEFINED | | C | | | | | | | | | | | |
| 313029282726252423222120 | | | | | | | | | | | | | | | | 19 | 18 | 171615 | | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | | |

Bits [63:47]

Reserved, RES0.

INV, bit [46]

ITS cache invalidation behavior on disable.

| INV | Meaning |
|-----|---|
| 0b0 | It is IMPLEMENTATION DEFINED whether ITS caches are invalidated on clearing GITS_CTLR.Enabled and GITS_BASER<n>.Valid . |
| 0b1 | ITS caches are invalidated on clearing GITS_CTLR.Enabled and GITS_BASER<n>.Valid . |

If GITS_TYPER.INV is 1, after the following sequence:

- GITS_CTLR.Enabled written to 0.
- A read of GITS_CTLR.Quiescent returns 1.
- GITS_BASER<n>.Valid written to 0.

There is no cached information from the ITS memory structure pointed to by [GITS_BASER<n>](#).

UMSlrq, bit [45]

Indicates support for generating an interrupt on receiving unmapped MSI.

| UMSIrq | Meaning |
|--------|--|
| 0b0 | Interrupt on unmapped MSI not supported. |
| 0b1 | Interrupt on unmapped MSI is supported. |

If GITS_TYPER.UMSI is 0, this field is RES0.

UMSI, bit [44]

Indicates support for reporting receipt of unmapped MSIs.

| UMSI | Meaning |
|------|--|
| 0b0 | Reporting of unmapped MSIs is not supported. |
| 0b1 | Reporting of unmapped MSIs is supported. |

nID, bit [43]

When FEAT_GICv4p1 is implemented:

nID

| nID | Meaning |
|-----|--|
| 0b0 | Individual doorbell interrupt supported. |
| 0b1 | Individual doorbell interrupt not supported. |

Otherwise:

Reserved, RES0.

SVPET, bits [42:41]

When FEAT_GICv4p1 is implemented:

SVPET

| SVPET | Meaning |
|-------|---|
| 0b00 | vPE Table is not shared with Redistributors. |
| 0b01 | vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR.Aff3. |
| 0b10 | vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3 and Aff2. |
| 0b11 | vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3, Aff2 and Aff1. |

Otherwise:

Reserved, RES0.

VMAPP, bit [40]

When FEAT_GICv4p1 is implemented:

VMAPP

| VMAPP | Meaning |
|-------|------------------------------------|
| 0b0 | FEAT_GICv4 VMAPP command layout. |
| 0b1 | FEAT_GICv4p1 VMAPP command layout. |

Otherwise:

Reserved, RES0.

VSGI, bit [39]

When FEAT_GICv4p1 is implemented:

VSGI

| VSGI | Meaning |
|------|--|
| 0b0 | Direct injection of SGIs is not supported. |
| 0b1 | Direct injection of SGIs is supported. |

Otherwise:

Reserved, RES0.

MPAM, bit [38]

When FEAT_GICv3p1 is implemented:

MPAM

| MPAM | Meaning |
|------|------------------------|
| 0b0 | MPAM is not supported. |
| 0b1 | MPAM is supported. |

Otherwise:

Reserved, RES0.

VMOVP, bit [37]

Indicates the form of the VMOVP command.

| VMOVP | Meaning |
|-------|---|
| 0b0 | When moving a vPE, software must issue a VMOVP on all ITSs that have mappings for that vPE. The ITSList and Sequence Number fields in the VMOVP command must ensure synchronization, otherwise behavior is UNPREDICTABLE. |
| 0b1 | When moving a vPE, software must only issue a VMOVP on one of the ITSs that has a mapping for that vPE. The ITSList and Sequence Number fields in the VMOVP command are RES0. |

CIL, bit [36]

Collection ID Limit.

| CIL | Meaning |
|-----|--|
| 0b0 | ITS supports 16-bit Collection ID, GITS_TYPER.CIDbits is RES0. |
| 0b1 | GITS_TYPER.CIDbits indicates supported Collection ID size |

In implementations that do not support Collections in external memory, this bit is RES0 and the number of Collections supported is reported by [GITS_TYPER.HCC](#).

CIDbits, bits [35:32]

Number of Collection ID bits.

- The number of bits of Collection ID minus one.
- When [GITS_TYPER.CIL](#) == 0, this field is RES0.

HCC, bits [31:24]

Hardware Collection Count. The number of interrupt collections supported by the ITS without provisioning of external memory.

Note

Collections held in hardware are unmapped at reset.

Bits [23:20]

Reserved, RES0.

PTA, bit [19]

Physical Target Addresses. Indicates the format of the target address:

| PTA | Meaning |
|-----|--|
| 0b0 | The target address corresponds to the PE number specified by GICR_TYPER.Processor_Number . |
| 0b1 | The target address corresponds to the base physical address of the required Redistributor. |

For more information, see 'RDbase' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

SEIS, bit [18]

SEI support. Indicates whether the virtual CPU interface supports generation of SEIs:

| SEIS | Meaning |
|------|--|
| 0b0 | The ITS does not support local generation of SEIs. |
| 0b1 | The ITS supports local generation of SEIs. |

Devbits, bits [17:13]

The number of DeviceID bits implemented, minus one.

ID_bits, bits [12:8]

The number of EventID bits implemented, minus one.

ITT_entry_size, bits [7:4]

Read-only. Indicates the number of bytes per translation table entry, minus one.

For more information about the ITS command 'MAPD', see MAPD.

IMPLEMENTATION DEFINED, bit [3]

IMPLEMENTATION DEFINED.

CCT, bit [2]

Cumulative Collection Tables.

| CCT | Meaning |
|-----|--|
| 0b0 | The total number of supported collections is determined by the number of collections held in memory only. |
| 0b1 | The total number of supported collections is determined by number of collections that are held in memory and the number indicated by GITS_TYPER.HCC. |

If GITS_TYPER.HCC == 0, or if memory backed collections are not supported (all [GITS_BASER<n>.Type](#) != 100), this bit is RES0.

Virtual, bit [1]**When FEAT_GICv4 is implemented:**

Indicates whether the ITS supports virtual LPIs and direct injection of virtual LPIs:

| Virtual | Meaning |
|---------|--|
| 0b0 | The ITS does not support virtual LPIs or direct injection of virtual LPIs. |
| 0b1 | The ITS supports virtual LPIs and direct injection of virtual LPIs. |

Otherwise:

Reserved, RES0.

Physical, bit [0]

Indicates whether the ITS supports physical LPIs:

| Physical | Meaning |
|----------|---|
| 0b0 | The ITS does not support physical LPIs. |
| 0b1 | The ITS supports physical LPIs. |

This field is RES1, indicating that the ITS supports physical LPIs.

Accessing GITS_TYPER**GITS_TYPER can be accessed through the memory-mapped interfaces:**

| Component | Offset | Instance |
|-----------------|--------|------------|
| GIC ITS control | 0x0008 | GITS_TYPER |

Accesses on this interface are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

GITS_UMSIR, ITS Unmapped MSI register

The GITS_UMSIR characteristics are:

Purpose

Provides the DeviceID and EventID of the unmapped MSI that set [GITS_STATUSR](#).UMSI.

Configuration

This register is present only when GITS_TYPER.UMSI == 1. Otherwise, direct accesses to GITS_UMSIR are RES0.

Attributes

GITS_UMSIR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| DeviceID | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| EventID | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

DeviceID, bits [63:32]

DeviceID of MSI that set [GITS_STATUSR](#).UMSI to 1.

If [GITS_STATUSR](#).UMSI is 0, this field is UNKNOWN.

EventID, bits [31:0]

EventID of MSI that set [GITS_STATUSR](#).UMSI to 1.

If [GITS_STATUSR](#).UMSI is 0, this field is UNKNOWN.

Accessing GITS_UMSIR

GITS_UMSIR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------------|--------|------------|
| GIC ITS control | 0x0048 | GITS_UMSIR |

Accesses on this interface are **RO**.

MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [MIDR_EL1\[31:0\]](#).

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [MIDR\[31:0\]](#).

It is IMPLEMENTATION DEFINED whether MIDR_EL1 is implemented in the Core power domain or in the Debug power domain.

Attributes

MIDR_EL1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|---------|----|----|----|--------------|----|----|----|---------|----|----|----|----|----|---|---|----------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Implementer | | | | | | | | Variant | | | | Architecture | | | | PartNum | | | | | | | | Revision | | | | | | | |

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

| Implementer | Meaning |
|-------------|--|
| 0x00 | Reserved for software use. |
| 0x41 | Arm Limited. |
| 0x42 | Broadcom Corporation. |
| 0x43 | Cavium Inc. |
| 0x44 | Digital Equipment Corporation. |
| 0x46 | Fujitsu Ltd. |
| 0x49 | Infineon Technologies AG. |
| 0x4D | Motorola or Freescale Semiconductor Inc. |
| 0x4E | NVIDIA Corporation. |
| 0x50 | Applied Micro Circuits Corporation. |
| 0x51 | Qualcomm Inc. |
| 0x56 | Marvell International Ltd. |
| 0x69 | Intel Corporation. |
| 0xC0 | Ampere Computing. |

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is **RO**.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Architecture, bits [19:16]

Architecture version. Defined values are:

| Architecture | Meaning |
|--------------|---|
| 0b0001 | Armv4. |
| 0b0010 | Armv4T. |
| 0b0011 | Armv5 (obsolete). |
| 0b0100 | Armv5T. |
| 0b0101 | Armv5TE. |
| 0b0110 | Armv5TEJ. |
| 0b0111 | Armv6. |
| 0b1111 | Architectural features are individually identified in the ID * registers. |

All other values are reserved.

Access to this field is **RO**.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing MIDR_EL1

MIDR_EL1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| Debug | 0xD00 | MIDR_EL1 |

This interface is accessible as follows:

- When IsCorePowered() and !DoubleLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **IMPDEF**.

MPAMCFG_CASSOC, MPAM Cache Maximum Associativity Partition Configuration Register

The MPAMCFG_CASSOC characteristics are:

Purpose

The MPAMCFG_CASSOC is a 32-bit read/write register that controls the maximum fraction of the cache associativity that the PARTID selected by [MPAMCFG_PART_SEL](#) is permitted to allocate.

MPAMCFG_CASSOC_s controls the cache maximum associativity for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CASSOC_ns controls the cache maximum associativity for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CASSOC_rl controls the cache maximum associativity for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CASSOC_rt controls the cache maximum associativity for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_CASSOC is IMPLEMENTATION DEFINED.

This register is present only when [MPAMF_IDR.HAS_CCAP_PART](#) == 1, (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and [MPAMF_CCAP_IDR.HAS_CASSOC](#) == 1. Otherwise, direct accesses to MPAMCFG_CASSOC are RES0.

Attributes

MPAMCFG_CASSOC is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | CASSOC | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

CASSOC, bits [15:0]

Maximum cache associativity usage in fixed-point fraction format by the partition selected by [MPAMCFG_PART_SEL](#). The fraction represents the portion of the cache associativity that the PARTID is permitted to allocate. CASSOC controls the fraction of associativity in each associativity grouping of the cache. In a set associative cache, CASSOC applies to the fraction of the ways in each set.

The implemented width of the fixed-point fraction is given in [MPAMF_CCAP_IDR.CASSOC_WD](#). Unimplemented bits within the field are RAZ/WI. The implemented bits of the CASSOC field are always the most significant bits of the field.

The fixed-point fraction CASSOC is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the cache that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_CASSOC

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_CASSOC_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_CASSOC_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_CASSOC_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_CASSOC_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_CASSOC_s, MPAMCFG_CASSOC_ns, MPAMCFG_CASSOC_rt, and MPAMCFG_CASSOC_rl must be separate registers:

- The Secure instance (MPAMCFG_CASSOC_s) accesses the cache maximum associativity partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_CASSOC_ns) accesses the cache maximum associativity partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_CASSOC_rt) accesses the cache maximum associativity partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_CASSOC_rl) accesses the cache maximum associativity partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CASSOC access the cache maximum associativity partitioning configuration settings for the cache resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CASSOC access the cache maximum associativity partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CASSOC access the cache maximum associativity partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CASSOC access the cache maximum associativity partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_CASSOC can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|------------------|
| MPAM | MPAMF_BASE_s | 0x0118 | MPAMCFG_CASSOC_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_ns | 0x0118 | MPAMCFG_CASSOC_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_rt | 0x0118 | MPAMCFG_CASSOC_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_rl | 0x0118 | MPAMCFG_CASSOC_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_CMAX, MPAM Cache Maximum Capacity Partition Configuration Register

The MPAMCFG_CMAX characteristics are:

Purpose

The MPAMCFG_CMAX is a 32-bit read/write register that controls the maximum fraction of the cache capacity that the PARTID selected by [MPAMCFG_PART_SEL](#) is permitted to allocate.

MPAMCFG_CMAX_s controls the cache maximum capacity for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CMAX_ns controls the cache maximum capacity for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CMAX_rt controls the cache maximum capacity for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CMAX_rl controls the cache maximum capacity for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_CMAX is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_CCAP_PART == 1 and MPAMF_CCAP_IDR.NO_CMAX == 0. Otherwise, direct accesses to MPAMCFG_CMAX are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_CMAX is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SOFTLIM | | | | | | | | | | | | | | | | CMAX | | | | | | | | | | | | | | | |

SOFTLIM, bit [31]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CCAP_IDR.HAS_CMAX_SOFTLIM == 1:

Soft limiting of CMAX. Soft limiting allows some allocations by a PARTID when its cache use is above the CMAX maximum cache capacity.

| SOFTLIM | Meaning |
|---------|--|
| 0b0 | When CMAX cache capacity is exceeded, the partition is not allowed to increase its cache capacity usage. It is only permitted to replace a line that was previously occupied by a line allocated by that PARTID. |
| 0b1 | When CMAX cache capacity is exceeded, the partition is permitted to allocate capacity beyond CMAX, but only from invalid lines or lines belonging to disabled PARTIDs. |

Otherwise:

Reserved, RES0.

Bits [30:16]

Reserved, RES0.

CMAX, bits [15:0]

Maximum cache capacity usage in fixed-point fraction format by the partition selected by [MPAMCFG_PART_SEL](#). The fraction represents the portion of the total cache capacity that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in [MPAMF_CCAP_IDR](#).CMAX_WD. Unimplemented bits within the field are RAZ/WI. The implemented bits of the CMAX field are always the most significant bits of the field.

The fixed-point fraction CMAX is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the cache that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_CMAX

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_CMAX_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_CMAX_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_CMAX_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_CMAX_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_CMAX_s, MPAMCFG_CMAX_ns, MPAMCFG_CMAX_rt, and MPAMCFG_CMAX_rl must be separate registers:

- The Secure instance (MPAMCFG_CMAX_s) accesses the cache capacity partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_CMAX_ns) accesses the cache capacity partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_CMAX_rt) accesses the cache capacity partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_CMAX_rl) accesses the cache capacity partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the cache resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_CMAX can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|----------------|
| MPAM | MPAMF_BASE_s | 0x0108 | MPAMCFG_CMAX_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------|
| MPAM | MPAMF_BASE_ns | 0x0108 | MPAMCFG_CMAX_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------|
| MPAM | MPAMF_BASE_rt | 0x0108 | MPAMCFG_CMAX_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------|
| MPAM | MPAMF_BASE_rl | 0x0108 | MPAMCFG_CMAX_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_CMIN, MPAM Cache Minimum Capacity Partition Configuration Register

The MPAMCFG_CMIN characteristics are:

Purpose

The MPAMCFG_CMIN is a 32-bit read/write register that controls the fraction of the cache capacity that the PARTID selected by [MPAMCFG_PART_SEL](#) has priority to allocate.

MPAMCFG_CMIN_s controls the cache minimum capacity for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CMIN_ns controls the cache minimum capacity for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CMIN_rl controls the cache minimum capacity for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CMIN_rt controls the cache minimum capacity for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_CMIN is IMPLEMENTATION DEFINED.

This register is present only when [MPAMF_IDR.HAS_CCAP_PART](#) == 1, (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and [MPAMF_CCAP_IDR.HAS_CMIN](#) == 1. Otherwise, direct accesses to MPAMCFG_CMIN are RES0.

Attributes

MPAMCFG_CMIN is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | CMIN | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

CMIN, bits [15:0]

Minimum cache capacity usage in fixed-point fraction format by the partition selected by [MPAMCFG_PART_SEL](#). The fraction represents the portion of the total cache capacity that the PARTID has priority to allocate.

The implemented width of the fixed-point fraction is the same as the width of [MPAMCFG_CMAX](#).CMAX which is given in [MPAMF_CCAP_IDR.CMAX_WD](#). Unimplemented bits within the field are RAZ/WI. The implemented bits of the CMIN field are always the most significant bits of the field.

The fixed-point fraction CMIN is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the cache that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_CMIN

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_CMIN_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_CMIN_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_CMIN_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_CMIN_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_CMIN_s, MPAMCFG_CMIN_ns, MPAMCFG_CMIN_rt, and MPAMCFG_CMIN_rl must be separate registers:

- The Secure instance (MPAMCFG_CMIN_s) accesses the cache minimum capacity partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_CMIN_ns) accesses the cache minimum capacity partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_CMIN_rt) accesses the cache minimum capacity partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_CMIN_rl) accesses the cache minimum capacity partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CMIN access the cache minimum capacity partitioning configuration settings for the cache resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CMIN access the cache minimum capacity partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CMIN access the cache minimum capacity partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CMIN access the cache minimum capacity partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_CMIN can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|----------------|
| MPAM | MPAMF_BASE_s | 0x0110 | MPAMCFG_CMIN_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------|
| MPAM | MPAMF_BASE_ns | 0x0110 | MPAMCFG_CMIN_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------|
| MPAM | MPAMF_BASE_rt | 0x0110 | MPAMCFG_CMIN_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------|
| MPAM | MPAMF_BASE_rl | 0x0110 | MPAMCFG_CMIN_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_CPBM<n>, MPAM Cache Portion Bitmap Partition Configuration Register, n = 0 - 1023

The MPAMCFG_CPBM<n> characteristics are:

Purpose

The MPAMCFG_CPBM<n> register array gives access to the cache portion bitmap. Each register in the array is a read/write register that configures the cache portions numbered from <n * 32> to <31 + (n * 32)> that a PARTID is allowed to allocate.

After setting [MPAMCFG_PART_SEL](#) with a PARTID, software writes to the MPAMCFG_CPBM<n> register to configure which cache portions the PARTID is allowed to allocate.

The MPAMCFG_CPBM<n> register that contains the bitmap bit corresponding to cache portion p has n equal to $p[15:5]$. The field, P<x>, of that MPAMCFG_CPBM<n> register that contains the bitmap bit corresponding to cache portion p has x equal to $p[4:0]$.

MPAMCFG_CPBM<n>_s controls cache portions for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CPBM<n>_ns controls the cache portions for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CPBM<n>_rt controls cache portions for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_CPBM<n>_rl controls the cache portions for the Realm PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_CPBM<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CPOR_PART == 1. Otherwise, direct accesses to MPAMCFG_CPBM<n> are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_CPBM<n> is a 32-bit register.

Field descriptions

| 31 | 30 | 29 | 28 | 27 | 26 | 25 |
|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|
| P<32 * n + 31> | P<32 * n + 30> | P<32 * n + 29> | P<32 * n + 28> | P<32 * n + 27> | P<32 * n + 26> | P<32 * n + 25> |

P<x + (n * 32)>, bit [x], for x = 31 to 0

Portion allocation control bit. Each cache portion allocation control bit, MPAMCFG_CPBM<n>.P<x>, grants permission to the PARTID selected by [MPAMCFG_PART_SEL](#) to allocate cache lines within cache portion <x + (n * 32)>.

| P<x + (n * 32)> | Meaning |
|------------------------------|--|
| 0b0 | The PARTID is not permitted to allocate into cache portion <x + (n * 32)>. |
| 0b1 | The PARTID is permitted to allocate within cache portion <x + (n * 32)>. |

The number of bits in the cache portion partitioning bit map of this component is given in [MPAMF_CPOR_IDR.CPBM_WD](#). CPBM_WD contains a value from 1 to 2^{15} , inclusive. Values of CPBM_WD greater than 32 require an array of 32-bit [MPAMCFG_CPBM<n>](#) registers to access the cache portion bitmap, up to 1024 registers.

Bits MPAMCFG_CPBM<n>.P<x + (n * 32)>, where <x + (n * 32)> is greater than or equal to CPBM_WD, are RES0:

- If $n > \text{MPAMF_CPOR_IDR.CPBM_WD}[15:5]$, the entire 32 P<x> are RES0.
- If $n == \text{MPAMF_CPOR_IDR.CPBM_WD}[15:5]$, bits [31: CPBM_WD[4:0]] are RES0 and the remaining bits are valid.
- If $n < \text{MPAMF_CPOR_IDR.CPBM_WD}[15:5]$, the entire 32 P<x> are valid.

Accessing MPAMCFG_CPBM<n>

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_CPBM<n>_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_CPBM<n>_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_CPBM<n>_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_CPBM<n>_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_CPBM<n>_s, MPAMCFG_CPBM<n>_ns, MPAMCFG_CPBM<n>_rt, and MPAMCFG_CPBM<n>_rl must be separate registers:

- The Secure instance (MPAMCFG_CPBM<n>_s) accesses the cache portion bitmap used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_CPBM<n>_ns) accesses the cache portion bitmap used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_CPBM<n>_rt) accesses the cache portion bitmap used for Root PARTIDs.
- The Realm instance (MPAMCFG_CPBM<n>_rl) accesses the cache portion bitmap used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the cache resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_CPBM<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|------------------|-------------------|
| MPAM | MPAMF_BASE_s | 0x1000 + (4 * n) | MPAMCFG_CPBM<n>_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|------------------|--------------------|
| MPAM | MPAMF_BASE_ns | 0x1000 + (4 * n) | MPAMCFG_CPBM<n>_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|------------------------|--------------------|
| MPAM | MPAMF_BASE_rt | 0x1000 + (4 * n) | MPAMCFG_CPBM<n>_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|------------------------|--------------------|
| MPAM | MPAMF_BASE_rl | 0x1000 + (4 * n) | MPAMCFG_CPBM<n>_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_DIS, MPAM Partition Configuration Disable Register

The MPAMCFG_DIS characteristics are:

Purpose

Disables a PARTID configuration as set in other MPAMCFG registers.

MPAMCFG_DIS_s disables a Secure PARTID. MPAMCFG_DIS_ns disables a Non-secure PARTID. MPAMCFG_DIS_rl disables a Realm PARTID. MPAMCFG_DIS_rt disables a Root PARTID.

Configuration

The power domain of MPAMCFG_DIS is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_ENDIS == 1. Otherwise, direct accesses to MPAMCFG_DIS are RES0.

Attributes

MPAMCFG_DIS is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NFU | RES0 | | | | | | | | | | | | | | | PARTID | | | | | | | | | | | | | | | |

NFU, bit [31]

No Future Use.

| NFU | Meaning |
|-----|--|
| 0b0 | Control settings of the disabled PARTID must be retained. |
| 0b1 | Control settings of the disabled PARTID may take an UNKNOWN value. |

Bits [30:16]

Reserved, RES0.

PARTID, bits [15:0]

Selects the PARTID to disable.

Accessing MPAMCFG_DIS

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_DIS_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_DIS_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_DIS_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_DIS_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_DIS_s, MPAMCFG_DIS_ns, MPAMCFG_DIS_rt, and MPAMCFG_DIS_rl must be separate registers:

- The Secure instance (MPAMCFG_DIS_s) accesses the PARTID disable used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_DIS_ns) accesses the PARTID disable used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_DIS_rt) accesses the PARTID disable used for Root PARTIDs.
- The Realm instance (MPAMCFG_DIS_rl) accesses the PARTID disable used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_DIS access the PARTID disable configuration settings for the PARTID disable resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_DIS access the PARTID disable configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_DIS access the PARTID disable configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_DIS access the PARTID disable configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_DIS can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|---------------|
| MPAM | MPAMF_BASE_s | 0x0310 | MPAMCFG_DIS_s |

Accesses on this interface are **WO/RAZ**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------|
| MPAM | MPAMF_BASE_ns | 0x0310 | MPAMCFG_DIS_ns |

Accesses on this interface are **WO/RAZ**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------|
| MPAM | MPAMF_BASE_rt | 0x0310 | MPAMCFG_DIS_rt |

When FEAT_RME is implemented access on this interface are **WO/RAZ**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------|
| MPAM | MPAMF_BASE_rl | 0x0310 | MPAMCFG_DIS_rl |

When FEAT_RME is implemented access on this interface are **WO/RAZ**.

MPAMCFG_EN, MPAM Partition Configuration Enable Register

The MPAMCFG_EN characteristics are:

Purpose

Enables a PARTID configuration as set in other MPAMCFG registers.

MPAMCFG_EN_s enables a Secure PARTID. MPAMCFG_EN_ns enables a Non-secure PARTID. MPAMCFG_EN_rl enables a Realm PARTID. MPAMCFG_EN_rt enables a Root PARTID.

Configuration

The power domain of MPAMCFG_EN is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_ENDIS == 1. Otherwise, direct accesses to MPAMCFG_EN are RES0.

Attributes

MPAMCFG_EN is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | PARTID | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

PARTID, bits [15:0]

Selects the PARTID to enable.

Accessing MPAMCFG_EN

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_EN_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_EN_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_EN_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_EN_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_EN_s, MPAMCFG_EN_ns, MPAMCFG_EN_rt, and MPAMCFG_EN_rl must be separate registers:

- The Secure instance (MPAMCFG_EN_s) accesses the PARTID enable used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_EN_ns) accesses the PARTID enable used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_EN_rt) accesses the PARTID enable used for Root PARTIDs.
- The Realm instance (MPAMCFG_EN_rl) accesses the PARTID enable used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_EN access the PARTID enable configuration settings for the PARTID enable resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_EN access the PARTID enable configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_EN access the PARTID enable configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_EN access the PARTID enable configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_EN can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|--------------|
| MPAM | MPAMF_BASE_s | 0x0300 | MPAMCFG_EN_s |

Accesses on this interface are **WO/RAZ**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_ns | 0x0300 | MPAMCFG_EN_ns |

Accesses on this interface are **WO/RAZ**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_rt | 0x0300 | MPAMCFG_EN_rt |

When FEAT_RME is implemented access on this interface are **WO/RAZ**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_rl | 0x0300 | MPAMCFG_EN_rl |

When FEAT_RME is implemented access on this interface are **WO/RAZ**.

MPAMCFG_EN_FLAGS, MPAM Partition Configuration Enable Flags Register

The MPAMCFG_EN_FLAGS characteristics are:

Purpose

Enable flags for 32 PARTIDs.

MPAMCFG_EN_FLAGS_s gives read/write access to 32 Secure PARTIDs. MPAMCFG_EN_FLAGS_ns gives read/write access to 32 Non-secure PARTIDs. MPAMCFG_EN_FLAGS_rl gives read/write access to 32 Realm PARTIDs. MPAMCFG_EN_FLAGS_rt gives read/write access to 32 Root PARTIDs.

Configuration

The power domain of MPAMCFG_EN_FLAGS is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_ENDIS == 1. Otherwise, direct accesses to MPAMCFG_EN_FLAGS are RES0.

Attributes

MPAMCFG_EN_FLAGS is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | |
|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 |
| EN31 | EN30 | EN29 | EN28 | EN27 | EN26 | EN25 | EN24 | EN23 | EN22 | EN21 | EN20 | EN19 | EN18 | EN17 | EN16 | EN15 | EN14 | EN13 | EN12 | EN11 |

EN<x>, bit [x], for x = 31 to 0

PARTID Enable flags. The group of flags accessed is selected by [MPAMCFG_PART_SEL](#).PARTID & 0x0000001F in bit [0] to [MPAMCFG_PART_SEL](#).PARTID | 0x0000001F in bit [31].

| EN<x> | Meaning |
|-------|-------------------------|
| 0b0 | The PARTID is disabled. |
| 0b1 | The PARTID is enabled. |

Each bit in [MPAMCFG_EN_FLAGS](#) gives access to the same state as controlled by [MPAMCFG_EN](#) and [MPAMCFG_DIS](#).

Bits MPAMCFG_EN_FLAGS.EN<x>, where ([MPAMCFG_PART_SEL](#).PARTID & 0x0000001F) + x is greater than [MPAMF_IDR](#).PARTID_MAX, are not required to be implemented.

As with other partitioning controls, the enable flag for PARTID 0 must be reset to 0b1 (enabled).

Accessing MPAMCFG_EN_FLAGS

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_EN_FLAGS_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_EN_FLAGS_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_EN_FLAGS_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_EN_FLAGS_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_EN_FLAGS_s, MPAMCFG_EN_FLAGS_ns, MPAMCFG_EN_FLAGS_rt, and MPAMCFG_EN_FLAGS_rl must be separate registers:

- The Secure instance (MPAMCFG_EN_FLAGS_s) accesses the PARTID enable used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_EN_FLAGS_ns) accesses the PARTID enable used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_EN_FLAGS_rt) accesses the PARTID enable used for Root PARTIDs.
- The Realm instance (MPAMCFG_EN_FLAGS_rl) accesses the PARTID enable used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_EN_FLAGS access the PARTID enable configuration settings for the PARTID enable resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_EN_FLAGS access the PARTID enable configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_EN_FLAGS access the PARTID enable configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_EN_FLAGS access the PARTID enable configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_EN_FLAGS can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|--------------------|
| MPAM | MPAMF_BASE_s | 0x0320 | MPAMCFG_EN_FLAGS_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------|
| MPAM | MPAMF_BASE_ns | 0x0320 | MPAMCFG_EN_FLAGS_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------|
| MPAM | MPAMF_BASE_rt | 0x0320 | MPAMCFG_EN_FLAGS_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------|
| MPAM | MPAMF_BASE_rl | 0x0320 | MPAMCFG_EN_FLAGS_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_INTPARTID, MPAM Internal PARTID Narrowing Configuration Register

The MPAMCFG_INTPARTID characteristics are:

Purpose

MPAMCFG_INTPARTID is a 32-bit read/write register that controls the mapping of the PARTID selected by [MPAMCFG_PART_SEL](#) into a narrower internal PARTID (intPARTID).

MPAMCFG_INTPARTID_s controls the mapping for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_INTPARTID_ns controls the mapping for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_INTPARTID_rt controls the mapping for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_INTPARTID_rl controls the mapping for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

The MPAMCFG_INTPARTID register associates the request PARTID (reqPARTID) in the [MPAMCFG_PART_SEL](#) register with an internal PARTID (intPARTID) in this register. To set that association, store reqPARTID into the [MPAMCFG_PART_SEL](#) register and then store the intPARTID into the MPAMCFG_INTPARTID register. To read the association, store reqPARTID into the MPAMCFG_PART_SEL register and then read MPAMCFG_INTPARTID.

If the intPARTID stored into MPAMCFG_INTPARTID is out-of-range or does not have the INTERNAL bit set, the association of reqPARTID to intPARTID is not written and [MPAMF_ESR](#) is set to indicate an intPARTID_Range error.

If [MPAMCFG_PART_SEL](#).INTERNAL is 1 when MPAMCFG_INTPARTID is read or written, [MPAMF_ESR](#) is set to indicate an Unexpected_INTERNAL error.

Configuration

The power domain of MPAMCFG_INTPARTID is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PARTID_NRW == 1. Otherwise, direct accesses to MPAMCFG_INTPARTID are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_INTPARTID is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|-----------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | INTERNAL | | INTPARTID | | | | | | | | | | | | | |

Bits [31:17]

Reserved, RES0.

INTERNAL, bit [16]

Internal PARTID flag.

This bit must be 1 when written to the register. If written as 0, the write will not update the reqPARTID to intPARTID association.

On a read of this register, the bit will always read the value last written.

INTPARTID, bits [15:0]

This field contains the intPARTID mapped to the reqPARTID in [MPAMCFG_PART_SEL](#).

The maximum intPARTID supported is [MPAMF_PARTID_NRW_IDR](#).INTPARTID_MAX.

Accessing MPAMCFG_INTPARTID

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_INTPARTID_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_INTPARTID_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_INTPARTID_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_INTPARTID_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_INTPARTID_s, MPAMCFG_INTPARTID_ns, MPAMCFG_INTPARTID_rt, and MPAMCFG_INTPARTID_rl must be separate registers:

- The Secure instance (MPAMCFG_INTPARTID_s) accesses the PARTID narrowing used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_INTPARTID_ns) accesses the PARTID narrowing used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_INTPARTID_rt) accesses the PARTID narrowing used for Root PARTIDs.
- The Realm instance (MPAMCFG_INTPARTID_rl) accesses the PARTID narrowing used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_INTPARTID access the PARTID narrowing configuration settings without being affected by [MPAMCFG_PART_SEL](#).RIS.

Loads and stores to MPAMCFG_INTPARTID access the PARTID narrowing configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_INTPARTID can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|---------------------|
| MPAM | MPAMF_BASE_s | 0x0600 | MPAMCFG_INTPARTID_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_ns | 0x0600 | MPAMCFG_INTPARTID_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_rt | 0x0600 | MPAMCFG_INTPARTID_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_rl | 0x0600 | MPAMCFG_INTPARTID_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_MBW_MAX, MPAM Memory Bandwidth Maximum Partition Configuration Register

The MPAMCFG_MBW_MAX characteristics are:

Purpose

MPAMCFG_MBW_MAX is a 32-bit read/write register that controls the maximum fraction of memory bandwidth that the PARTID selected by [MPAMCFG_PART_SEL](#) is permitted to use.

MPAMCFG_MBW_MAX_s controls maximum bandwidth for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MAX_ns controls the maximum bandwidth for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MAX_rt controls the maximum bandwidth for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MAX_rl controls the maximum bandwidth for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

A PARTID that has used more than MAX is given no access to additional bandwidth if HARDLIM == 1 or is given additional bandwidth only if there are no requests from PARTIDs that have not exceeded their MAX if HARDLIM == 0.

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_MAX is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_MAX == 1. Otherwise, direct accesses to MPAMCFG_MBW_MAX are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_MAX is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------|----|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|---------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| HARDLIM | | RES0 | | | | | | | | | | | | | | MAX | | | | | | | | | | | | | | | |

HARDLIM, bit [31]

Hard bandwidth limiting.

| HARDLIM | Meaning |
|---------|---|
| 0b0 | When MAX bandwidth is exceeded, the partition contends with a low preference for downstream bandwidth beyond MAX. |
| 0b1 | When MAX bandwidth is exceeded, the partition does not use any more bandwidth until the memory bandwidth measurement for the partition falls below MAX. |

Bits [30:16]

Reserved, RES0.

MAX, bits [15:0]

Memory maximum bandwidth allocated to the partition selected by [MPAMCFG_PART_SEL](#). MAX is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in [MPAMF_MBW_IDR.BWA_WD](#). Unimplemented bits are RAZ/WI. The implemented bits of the MAX field are always to the left of the field. For example, if BWA_WD = 3, the implemented bits are MPAMCFG_MBW_MAX[15:13] and MPAMCFG_MBW_MAX[12:0] are unimplemented.

The fixed-point fraction MAX is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the bandwidth that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_MBW_MAX

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_MBW_MAX_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_MAX_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_MAX_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_MAX_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_MAX_s, MPAMCFG_MBW_MAX_ns, MPAMCFG_MBW_MAX_rt, and MPAMCFG_MBW_MAX_rl must be separate registers:

- The Secure instance (MPAMCFG_MBW_MAX_s) accesses the memory maximum bandwidth partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_MAX_ns) accesses the memory maximum bandwidth partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_MAX_rt) accesses the memory maximum bandwidth partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_MAX_rl) accesses the memory maximum bandwidth partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_MBW_MAX can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|-------------------|
| MPAM | MPAMF_BASE_s | 0x0208 | MPAMCFG_MBW_MAX_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_ns | 0x0208 | MPAMCFG_MBW_MAX_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|-------|--------|----------|
|-----------|-------|--------|----------|

| | | | |
|------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_rt | 0x0208 | MPAMCFG_MBW_MAX_rt |
|------|---------------|--------|--------------------|

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_rl | 0x0208 | MPAMCFG_MBW_MAX_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_MBW_MIN, MPAM Memory Bandwidth Minimum Partition Configuration Register

The MPAMCFG_MBW_MIN characteristics are:

Purpose

MPAMCFG_MBW_MIN is a 32-bit read/write register that controls the minimum fraction of memory bandwidth that the PARTID selected by [MPAMCFG_PART_SEL](#) is permitted to use.

MPAMCFG_MBW_MIN_s controls the minimum bandwidth for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MIN_ns controls the minimum bandwidth for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MIN_rt controls the minimum bandwidth for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_MIN_rl controls the minimum bandwidth for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

A PARTID that has used less than MIN is given preferential access to bandwidth.

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_MBW_MIN is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_MIN == 1. Otherwise, direct accesses to MPAMCFG_MBW_MIN are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_MIN is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| RES0 | | | | | | | | | | | | | | | | MIN | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

MIN, bits [15:0]

Memory minimum bandwidth allocated to the partition selected by [MPAMCFG_PART_SEL](#). MIN is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in [MPAMF_MBW_IDR.BWA_WD](#). Unimplemented bits are RAZ/WI. The implemented bits of the MIN field are always to the left of the field. For example, if BWA_WD = 4, the implemented bits are MPAMCFG_MBW_MIN[15:12] and MPAMCFG_MBW_MIN[11:0] are unimplemented.

The fixed-point fraction MIN is less than 1. The implied binary point is between bits 15 and 16. This representation has as the largest fraction of the bandwidth that can be represented in an implementation with w implemented bits is 1.0 minus one half to the power w.

Accessing MPAMCFG_MBW_MIN

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_MBW_MIN_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_MIN_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_MIN_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_MIN_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_MIN_s, MPAMCFG_MBW_MIN_ns, MPAMCFG_MBW_MIN_rt, and MPAMCFG_MBW_MIN_rl must be separate registers:

- The Secure instance (MPAMCFG_MBW_MIN_s) accesses the memory minimum bandwidth partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_MIN_ns) accesses the memory minimum bandwidth partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_MIN_rt) accesses the memory minimum bandwidth partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_MIN_rl) accesses the memory minimum bandwidth partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_MBW_MIN can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|-------------------|
| MPAM | MPAMF_BASE_s | 0x0200 | MPAMCFG_MBW_MIN_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_ns | 0x0200 | MPAMCFG_MBW_MIN_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_rt | 0x0200 | MPAMCFG_MBW_MIN_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_rl | 0x0200 | MPAMCFG_MBW_MIN_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_MBW_PBM<n>, MPAM Bandwidth Portion Bitmap Partition Configuration Register, n = 0 - 127

The MPAMCFG_MBW_PBM<n> characteristics are:

Purpose

The MPAMCFG_MBW_PBM<n> register array gives access to the memory bandwidth portion bitmap. Each register in the array is a read/write register that configures the bandwidth portions <32 * n> to <(32 * n) + 31> that a PARTID is allowed to allocate.

After setting [MPAMCFG_PART_SEL](#) with a PARTID, software writes to one or more of the MPAMCFG_MBW_PBM<n> registers to configure which bandwidth portions the PARTID is allowed to allocate.

The MPAMCFG_MBW_PBM<n> register that contains the bitmap bit corresponding to memory bandwidth portion p has n equal to $p[11:5]$. The field, $P<x + (32 * n)>$ of that MPAMCFG_MBW_PBM<n> register that contains the bitmap bit corresponding to memory bandwidth portion p has x equal to $p[4:0]$.

The MPAMCFG_MBW_PBM<n>_s registers control the bandwidth portion bitmap for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). The MPAMCFG_MBW_PBM<n>_ns registers control the bandwidth portion bitmap for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). The MPAMCFG_MBW_PBM<n>_rt registers control the bandwidth portion bitmap for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). The MPAMCFG_MBW_PBM<n>_rl registers control the bandwidth portion bitmap for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_MBW_PBM<n> is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_PBM == 1. Otherwise, direct accesses to MPAMCFG_MBW_PBM<n> are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_PBM<n> is a 32-bit register.

Field descriptions

| 31 | 30 | 29 | 28 | 27 | 26 | 25 |
|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|
| P<32 * n + 31> | P<32 * n + 30> | P<32 * n + 29> | P<32 * n + 28> | P<32 * n + 27> | P<32 * n + 26> | P<32 * n + 25> |

P<x + (32 * n)>, bit [x], for x = 31 to 0

Portion allocation control bit. Each bandwidth portion allocation control bit MPAMCFG_MBW_PBM<n>.P<x + (32 * n)> grants permission to the PARTID selected by [MPAMCFG_PART_SEL](#) to allocate bandwidth within bandwidth portion <x + (32 * n)>.

| P<x + (32 * n)> | Meaning |
|-----------------|--|
| 0b0 | The PARTID is not permitted to allocate into bandwidth portion <x + (32 * n)>. |
| 0b1 | The PARTID is permitted to allocate within bandwidth portion <x + (32 * n)>. |

MPAMCFG_MBW_PBM<n>, MPAM Bandwidth Portion Bitmap Partition Configuration Register, n = 0 - 127

The number of bits in the bandwidth portion partitioning bit map of this component is given in [MPAMF_MBW_IDR.BWPBM_WD](#). BWPBM_WD contains a value from 1 to 2^{12} , inclusive. Values of BWPBM_WD greater than 32 require a group of 32-bit registers to access the bandwidth portion bitmap, up to 128 32-bit registers.

Bits MPAMCFG_MBW_PBM<n>.P<x + (32 * n)>>, where <x + (32 * n)> is greater than or equal to BWPBM_WD are RES0:

- If $n > \text{MPAMF_MBW_IDR.BWPBM_WD}[11:5]$, the entire 32 P<x> are RES0.
- If $n == \text{MPAMF_MBW_IDR.BWPBM_WD}[11:5]$, bits [31: BWPBM_WD[4:0]] are RES0 and the remaining bits are valid.
- If $n < \text{MPAMF_MBW_IDR.BWPBM_WD}[11:5]$, the entire 32 P<x> are valid.

Accessing MPAMCFG_MBW_PBM<n>

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_MBW_PBM<n>_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_PBM<n>_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_PBM<n>_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_PBM<n>_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_PBM<n>_s, MPAMCFG_MBW_PBM<n>_ns, MPAMCFG_MBW_PBM<n>_rt, and MPAMCFG_MBW_PBM<n>_rl must be separate registers:

- The Secure instance (MPAMCFG_MBW_PBM<n>_s) accesses the memory bandwidth portion bitmap used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_PBM<n>_ns) accesses the memory bandwidth portion bitmap used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_PBM<n>_rt) accesses the memory bandwidth portion bitmap used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_PBM<n>_rl) accesses the memory bandwidth portion bitmap used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

When RIS is not implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#), and [MPAMCFG_PART_SEL.INTERNAL](#) must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#), and [MPAMCFG_PART_SEL.INTERNAL](#) must be 0.

MPAMCFG_MBW_PBM<n> can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|------------------|----------------------|
| MPAM | MPAMF_BASE_s | 0x2000 + (4 * n) | MPAMCFG_MBW_PBM<n>_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|------------------|-----------------------|
| MPAM | MPAMF_BASE_ns | 0x2000 + (4 * n) | MPAMCFG_MBW_PBM<n>_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|------------------------|-----------------------|
| MPAM | MPAMF_BASE_rt | 0x2000 + (4 * n) | MPAMCFG_MBW_PBM<n>_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|------------------------|-----------------------|
| MPAM | MPAMF_BASE_rl | 0x2000 + (4 * n) | MPAMCFG_MBW_PBM<n>_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_MBW_PROP, MPAM Memory Bandwidth Proportional Stride Partition Configuration Register

The MPAMCFG_MBW_PROP characteristics are:

Purpose

Controls the proportional stride of memory bandwidth that the PARTID selected by [MPAMCFG_PART_SEL](#) uses.

MPAMCFG_MBW_PROP_s controls the bandwidth proportional stride for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_PROP_ns controls the bandwidth proportional stride for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_PROP_rt controls the bandwidth proportional stride for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_PROP_rl controls the bandwidth proportional stride for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

Proportional stride is a relative cost of bandwidth requested by one PARTID in relation to the costs of the bandwidths requested by each other PARTID also competing to use the bandwidth.

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_MBW_PROP is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MBW_PART == 1 and MPAMF_MBW_IDR.HAS_PROP == 1. Otherwise, direct accesses to MPAMCFG_MBW_PROP are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_PROP is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| EN | RES0 | | | | | | | | | | | | | | | STRIDEM1 | | | | | | | | | | | | | | | |

EN, bit [31]

Enable proportional stride bandwidth partitioning.

| EN | Meaning |
|-----|---|
| 0b0 | The selected partition is not regulated by proportional stride bandwidth partitioning. |
| 0b1 | The selected partition has bandwidth usage regulated by proportional stride bandwidth partitioning as controlled by STRIDEM1. |

Bits [30:16]

Reserved, RES0.

STRIDEM1, bits [15:0]

Memory bandwidth stride minus 1 allocated to the partition selected by [MPAMCFG_PART_SEL](#). STRIDEM1 represents the normalized cost of bandwidth consumption by the partition.

The proportional stride partitioning control parameter is an unsigned integer representing the normalized cost to a partition for consuming bandwidth. Larger values have a larger cost and correspond to a lesser allocation of bandwidth while smaller values indicate a lesser cost and therefore a higher allocation of bandwidth.

The implemented width of STRIDEM1 is given in MPAMF_MBW_IDR.BWA_WD.

Accessing MPAMCFG_MBW_PROP

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_MBW_PROP_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_PROP_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_PROP_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_PROP_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_PROP_s, MPAMCFG_MBW_PROP_ns, MPAMCFG_MBW_PROP_rt, and MPAMCFG_MBW_PROP_rl must be separate registers:

- The Secure instance (MPAMCFG_MBW_PROP_s) accesses the memory proportional stride bandwidth partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_PROP_ns) accesses the memory proportional stride bandwidth partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_PROP_rt) accesses the memory proportional stride bandwidth partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_PROP_rl) accesses the memory proportional stride bandwidth partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_MBW_PROP can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|--------------------|
| MPAM | MPAMF_BASE_s | 0x0500 | MPAMCFG_MBW_PROP_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------|
| MPAM | MPAMF_BASE_ns | 0x0500 | MPAMCFG_MBW_PROP_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------|
| MPAM | MPAMF_BASE_rt | 0x0500 | MPAMCFG_MBW_PROP_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------|
| MPAM | MPAMF_BASE_r1 | 0x0500 | MPAMCFG_MBW_PROP_r1 |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_MBW_WINWD, MPAM Memory Bandwidth Partitioning Window Width Configuration Register

The MPAMCFG_MBW_WINWD characteristics are:

Purpose

MPAMCFG_MBW_WINWD is a 32-bit register that shows and sets the value of the window width for the PARTID in [MPAMCFG_PART_SEL](#).

MPAMCFG_MBW_WINWD_s reads and controls the bandwidth control window width for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_WINWD_ns reads and controls the bandwidth control window width for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_WINWD_rt reads and controls the bandwidth control window width for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_MBW_WINWD_rl reads and controls the bandwidth control window width for the Real PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

MPAMCFG_MBW_WINWD is read-only if [MPAMF_MBW_IDR](#).WINDWR == 0, and the window width is set by the hardware, even if variable.

MPAMCFG_MBW_WINWD is read/write if [MPAMF_MBW_IDR](#).WINDWR == 1, permitting configuration of the window width for each PARTID independently on hardware that supports this functionality.

If [MPAMF_IDR](#).HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_WINWD is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_MBW_PART == 1. Otherwise, direct accesses to MPAMCFG_MBW_WINWD are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_WINWD is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|---------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | US INT | | | | | | | | US FRAC | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

US_INT, bits [23:8]

Window width, integer microseconds.

This field reads (and sets) the integer part of the window width in microseconds for the PARTID selected by [MPAMCFG_PART_SEL](#).

US_FRAC, bits [7:0]

Window width, fractional microseconds.

This field reads (and sets) the fractional part of the window width in microseconds for the PARTID selected by [MPAMCFG_PART_SEL](#).

Accessing MPAMCFG_MBW_WINWD

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_MBW_WINWD_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_WINWD_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_WINWD_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_WINWD_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_MBW_WINWD_s, MPAMCFG_MBW_WINWD_ns, MPAMCFG_MBW_WINWD_rt, and MPAMCFG_MBW_WINWD_rl must be separate registers:

- The Secure instance (MPAMCFG_MBW_WINWD_s) accesses the window width used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_WINWD_ns) accesses the window width used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_WINWD_rt) accesses the window width used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_WINWD_rl) accesses the window width used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_MBW_WINWD can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|---------------------|
| MPAM | MPAMF_BASE_s | 0x0220 | MPAMCFG_MBW_WINWD_s |

This interface is accessible as follows:

- When MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are **RO**.
- When MPAMF_MBW_IDR.WINDWR == 1 accesses to this register are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_ns | 0x0220 | MPAMCFG_MBW_WINWD_ns |

This interface is accessible as follows:

- When MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are **RO**.
- When MPAMF_MBW_IDR.WINDWR == 1 accesses to this register are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_rt | 0x0220 | MPAMCFG_MBW_WINWD_rt |

This interface is accessible as follows:

- When FEAT_RME is implemented and MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are **RO**.
- When FEAT_RME is implemented and MPAMF_MBW_IDR.WINDWR == 1 accesses to this register are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_rl | 0x0220 | MPAMCFG_MBW_WINWD_rl |

This interface is accessible as follows:

- When FEAT_RME is implemented and MPAMF_MBW_IDR.WINDWR == 0 accesses to this register are **RO**.
- When FEAT_RME is implemented and MPAMF_MBW_IDR.WINDWR == 1 accesses to this register are **RW**.

MPAMCFG_PART_SEL, MPAM Partition Configuration Selection Register

The MPAMCFG_PART_SEL characteristics are:

Purpose

Selects a partition ID to configure.

MPAMCFG_PART_SEL_s selects a Secure PARTID to configure. MPAMCFG_PART_SEL_ns selects a Non-secure PARTID to configure. MPAMCFG_PART_SEL_rt selects a Root PARTID to configure. MPAMCFG_PART_SEL_rl selects a Realm PARTID to configure.

After setting this register with a PARTID, software (usually a hypervisor) can perform a series of accesses to MPAMCFG registers to configure parameters for MPAM resource controls to use when requests have that PARTID.

Configuration

The power domain of MPAMCFG_PART_SEL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and (MPAMF_IDR.HAS_CCAP_PART == 1, or MPAMF_IDR.HAS_CPOR_PART == 1, or MPAMF_IDR.HAS_MBW_PART == 1, or MPAMF_IDR.HAS_PRI_PART == 1, or MPAMF_IDR.HAS_PARTID_NRW == 1, or (MPAMF_IDR.EXT == 0 and MPAMF_IDR.HAS_IMPL_IDR == 1) or (MPAMF_IDR.EXT == 1, MPAMF_IDR.HAS_IMPL_IDR == 1 and MPAMF_IDR.NO_IMPL_PART == 0)). Otherwise, direct accesses to MPAMCFG_PART_SEL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_PART_SEL is a 32-bit register.

Reserved, RES0.

RIS, bits [27:24]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MPAMCFG registers and describe with MPAMF ID registers.

Otherwise:

Reserved, RES0.

Bits [23:17]

Reserved, RES0.

INTERNAL, bit [16]

Internal PARTID.

If [MPAMF_IDR.HAS_PARTID_NRW](#) = 0, this field is RAZ/WI.

If [MPAMF_IDR.HAS_PARTID_NRW](#) = 1:

| INTERNAL | Meaning |
|----------|--|
| 0b0 | PARTID_SEL is interpreted as a request PARTID and ignored except for use with MPAMCFG_INTPARTID register access. |
| 0b1 | PARTID_SEL is interpreted as an internal PARTID and used for access to MPAMCFG control settings except for MPAMCFG_INTPARTID . |

If PARTID narrowing is implemented as indicated by [MPAMF_IDR.HAS_PARTID_NRW](#) = 1, when accessing other MPAMCFG registers the value of the MPAMCFG_PART_SEL.INTERNAL bit is checked for these conditions:

- When the [MPAMCFG_INTPARTID](#) register is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 0, an Unexpected_INTERNAL error is set in [MPAMF_ESR](#).
- When an MPAMCFG register other than [MPAMCFG_INTPARTID](#) is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 1, [MPAMF_ESR](#) is set to indicate an intPARTID_Range error.

In either error case listed here, the value returned by a read operation is UNPREDICTABLE, and the control settings are not affected by a write.

PARTID_SEL, bits [15:0]

Selects the partition ID to configure.

Reads and writes to other MPAMCFG registers are indexed by PARTID_SEL and by the NS bit used to access MPAMCFG_PART_SEL to access the configuration for a single partition.

Accessing MPAMCFG_PART_SEL

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MPAMCFG_PART_SEL_s must be accessible from the Secure MPAM feature page. MPAMCFG_PART_SEL_ns must be accessible from the Non-secure MPAM feature page.

MPAMCFG_PART_SEL_s and MPAMCFG_PART_SEL_ns must be separate registers. The Secure instance (MPAMCFG_PART_SEL_s) accesses the PARTID selector used for Secure PARTIDs, and the Non-secure instance (MPAMCFG_PART_SEL_ns) accesses the PARTID selector used for Non-secure PARTIDs.

MPAMCFG_PART_SEL can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|--------------------|
| MPAM | MPAMF_BASE_s | 0x0100 | MPAMCFG_PART_SEL_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------|
| MPAM | MPAMF_BASE_ns | 0x0100 | MPAMCFG_PART_SEL_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------|
| MPAM | MPAMF_BASE_rt | 0x0100 | MPAMCFG_PART_SEL_rt |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMCFG_PART_SEL, MPAM Partition Configuration Selection Register

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------|
| MPAM | MPAMF_BASE_r1 | 0x0100 | MPAMCFG_PART_SEL_r1 |

When FEAT_RME is implemented access on this interface are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

MPAMCFG_PRI, MPAM Priority Partition Configuration Register

The MPAMCFG_PRI characteristics are:

Purpose

Controls the internal and downstream priority of requests attributed to the PARTID selected by [MPAMCFG_PART_SEL](#).

MPAMCFG_PRI_s controls the priorities for the Secure PARTID selected by the Secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_PRI_ns controls the priorities for the Non-secure PARTID selected by the Non-secure instance of [MPAMCFG_PART_SEL](#). MPAMCFG_PRI_rt controls the priorities for the Root PARTID selected by the Root instance of [MPAMCFG_PART_SEL](#). MPAMCFG_PRI_rl controls the priorities for the Realm PARTID selected by the Realm instance of [MPAMCFG_PART_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the control settings accessed are those of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#) and the PARTID selected by [MPAMCFG_PART_SEL.PARTID_SEL](#).

Configuration

The power domain of MPAMCFG_PRI is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PRI_PART == 1. Otherwise, direct accesses to MPAMCFG_PRI are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_PRI is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DSPRI | | | | | | | | | | | | | | | | INTPRI | | | | | | | | | | | | | | | |

DSPRI, bits [31:16]

Downstream priority.

If [MPAMF_PRI_IDR.HAS_DSPRI](#) == 0, bits of this field are RES0 as this field is not used.

If [MPAMF_PRI_IDR.HAS_DSPRI](#) == 1, this field is a priority value applied to downstream communications from this MSC for transactions of the partition selected by [MPAMCFG_PART_SEL](#).

The implemented width of this field is [MPAMF_PRI_IDR.DSPRI_WD](#) bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of [MPAMF_PRI_IDR.DSPRI_0_IS_LOW](#).

INTPRI, bits [15:0]

Internal priority.

If [MPAMF_PRI_IDR.HAS_INTPRI](#) == 0, bits of this field are RES0 as this field is not used.

If [MPAMF_PRI_IDR.HAS_INTPRI](#) == 1, this field is a priority value applied internally inside this MSC for transactions of the partition selected by [MPAMCFG_PART_SEL](#).

The implemented width of this field is [MPAMF_PRI_IDR.INTPRI_WD](#) bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of [MPAMF_PRI_IDR.INTPRI_0_IS_LOW](#).

Accessing MPAMCFG_PRI

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_PRI_s must be accessible from the Secure MPAM feature page.
- MPAMCFG_PRI_ns must be accessible from the Non-secure MPAM feature page.
- MPAMCFG_PRI_rt must be accessible from the Root MPAM feature page.
- MPAMCFG_PRI_rl must be accessible from the Realm MPAM feature page.

MPAMCFG_PRI_s, MPAMCFG_PRI_ns, MPAMCFG_PRI_rt, and MPAMCFG_PRI_rl must be separate registers:

- The Secure instance (MPAMCFG_PRI_s) accesses the priority partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_PRI_ns) accesses the priority partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_PRI_rt) accesses the priority partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_PRI_rl) accesses the priority partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the priority resource instance selected by [MPAMCFG_PART_SEL](#).RIS and the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the internal PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the request PARTID selected by [MPAMCFG_PART_SEL](#).PARTID_SEL, and [MPAMCFG_PART_SEL](#).INTERNAL must be 0.

MPAMCFG_PRI can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|---------------|
| MPAM | MPAMF_BASE_s | 0x0400 | MPAMCFG_PRI_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------|
| MPAM | MPAMF_BASE_ns | 0x0400 | MPAMCFG_PRI_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------|
| MPAM | MPAMF_BASE_rt | 0x0400 | MPAMCFG_PRI_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------|
| MPAM | MPAMF_BASE_rl | 0x0400 | MPAMCFG_PRI_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_AIDR, MPAM Architecture Identification Register

The MPAMF_AIDR characteristics are:

Purpose

Identifies the version of the MPAM architecture that this MSC implements.

Note: The following values are defined for bits [7:0]:

- 0x01 == MPAM architecture v0.1
- 0x10 == MPAM architecture v1.0
- 0x11 == MPAM architecture v1.1

Configuration

The power domain of MPAMF_AIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_AIDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_AIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|--------------|---|---|---|--------------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | RES0 | | | | | | | | | | | | ArchMajorRev | | | | ArchMinorRev | | | |

Bits [31:8]

Reserved, RES0.

ArchMajorRev, bits [7:4]

Major revision of the MPAM architecture implemented by the MSC.

This table shows the only valid combinations of MPAM version numbers in an MSC. FORCE_NS functionality is only available in MPAM v0.1.

| ArchMajorRev | ArchMinorRev | MPAMv | Available |
|--------------|--------------|-------|--------------------------------------|
| 0 | 0 | | None. |
| 0 | 1 | v0.1 | MPAMv1.0 + MPAMv1.1 + FORCE_NS |
| 1 | 0 | v1.0 | MPAMv1.0 |
| 1 | 1 | v1.1 | MPAMv1.0 + MPAMv1.1 - FORCE_NS |

Use of MPAMv0.1 in MSCs is restricted to limited circumstances. The MSC must be able to initiate requests in the Secure address space which have MPAM PARTID forced to the Non-secure space with that forcing not controllable or observable by the software that configures the device for Secure requests. Please contact Arm before setting MPAMF_AIDR to report MPAMv0.1.

ArchMinorRev, bits [3:0]

Minor revision of the MPAM architecture implemented by the MSC.

See the table in the description of the ArchMajorRev field in this register.

Accessing MPAMF_AIDR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_AIDR is read-only.

MPAMF_AIDR must be readable from the Secure, Non-secure, Root, and Realm MPAM feature pages.

MPAMF_AIDR must have the same contents in the Secure, Non-secure, Root, and Realm MPAM feature pages.

MPAMF_AIDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|--------------|
| MPAM | MPAMF_BASE_s | 0x0020 | MPAMF_AIDR_s |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_ns | 0x0020 | MPAMF_AIDR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_rt | 0x0020 | MPAMF_AIDR_rt |

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_rl | 0x0020 | MPAMF_AIDR_rl |

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_CCAP_IDR, MPAM Features Cache Capacity Partitioning ID register

The MPAMF_CCAP_IDR characteristics are:

Purpose

Indicates the number of fractional bits in [MPAMCFG_CMAX](#).CMAX.

MPAMF_CCAP_IDR_s indicates the number of fractional bits in the Secure instance of [MPAMCFG_CMAX](#).
MPAMF_CCAP_IDR_ns indicates the number of fractional bits in the Non-secure instance of [MPAMCFG_CMAX](#).
MPAMF_CCAP_IDR_rt indicates the number of fractional bits in the Root cache capacity control settings register field, [MPAMCFG_CMAX](#).CMAX. MPAMF_CCAP_IDR_rl indicates the number of fractional bits in the Realm cache capacity control settings register field, [MPAMCFG_CMAX](#).CMAX.

When [MPAMF_IDR](#).HAS_RIS is 1, some fields in this register give information for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. The description of every field that is affected by [MPAMCFG_PART_SEL](#).RIS has information within the field description.

Configuration

The power domain of MPAMF_CCAP_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CCAP_PART == 1. Otherwise, direct accesses to MPAMF_CCAP_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_CCAP_IDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------|----|----|----|---------|----|----|----|----------|----|----|----|------------|----|----|----|------|----|----|----|----|----|---|---|-----------|---|---|---|------|---|---|---|---------|--|--|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | |
| HAS CMAX_SOFTLIM | | | | NO CMAX | | | | HAS CMIN | | | | HAS CASSOC | | | | RES0 | | | | | | | | CASSOC WD | | | | RES0 | | | | CMAX WD | | | |

HAS_CMAX_SOFTLIM, bit [31]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Has soft limiting selection field in [MPAMCFG_CMAX](#).

| HAS_CMAX_SOFTLIM | Meaning |
|----------------------------------|--|
| 0b0 | If MPAMCFG_CMAX is implemented, it has no SOFTLIM field and the maximum capacity is controlled with a hard limit. |
| 0b1 | If MPAMCFG_CMAX is implemented, that register has a SOFTLIMIT field to select between hard or soft limiting to the CMAX parameter. |

If RIS is implemented, this field indicates selectable limiting for the cache maximum capacity control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

NO_CMAX, bit [30]**When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:**

Does not have CMAX partitioning.

| NO_CMAX | Meaning |
|---------|--|
| 0b0 | MPAMCFG_CMAX is implemented. |
| 0b1 | MPAMCFG_CMAX is not implemented. |

If RIS is implemented, this field indicates the absence of a cache maximum capacity partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

HAS_CMIN, bit [29]**When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:**

Has cache minimum capacity partitioning.

| HAS_CMIN | Meaning |
|----------|--|
| 0b0 | MPAMCFG_CMIN is not implemented. |
| 0b1 | MPAMCFG_CMIN is implemented. |

If RIS is implemented, this field indicates the presence of a cache minimum capacity partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

HAS_CASSOC, bit [28]**When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:**

Has cache maximum associativity partitioning.

| HAS_CASSOC | Meaning |
|------------|--|
| 0b0 | MPAMCFG_CASSOC is not implemented. |
| 0b1 | MPAMCFG_CASSOC is implemented. |

If RIS is implemented, this field indicates the presence of a cache maximum associativity partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

Bits [27:13]

Reserved, RES0.

CASSOC_WD, bits [12:8]**When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:**

Number of fractional bits implemented in the cache associativity partitioning control, [MPAMCFG_CASSOC](#).CASSOC, of this MSC. See [MPAMCFG_CASSOC](#).

If RIS is implemented, this field indicates the number of fractional bits in the cache capacity partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

Bits [7:6]

Reserved, RES0.

CMAX_WD, bits [5:0]

Number of fractional bits implemented in the cache capacity partitioning control, [MPAMCFG_CMAX](#).CMAX, of this device. See [MPAMCFG_CMAX](#).

This field must contain a value from 1 to 16, inclusive.

If RIS is implemented, this field indicates the number of fractional bits in the cache capacity partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_CCAP_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_CCAP_IDR is read-only.

MPAMF_CCAP_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_CCAP_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_CCAP_IDR_s is permitted to have either the same or different contents to MPAMF_CCAP_IDR_ns, MPAMF_CCAP_IDR_rt, or MPAMF_CCAP_IDR_rl.
- MPAMF_CCAP_IDR_ns is permitted to have either the same or different contents to MPAMF_CCAP_IDR_rt or MPAMF_CCAP_IDR_rl.
- MPAMF_CCAP_IDR_rt is permitted to have either the same or different contents to MPAMF_CCAP_IDR_rl.

There must be separate registers in the Secure (MPAMF_CCAP_IDR_s), Non-secure (MPAMF_CCAP_IDR_ns), Root (MPAMF_CCAP_IDR_rt), and Realm (MPAMF_CCAP_IDR_rl) MPAM feature pages.

When [MPAMF_IDR](#).HAS_RIS is 1, MPAMF_CCAP_IDR shows the configuration of cache capacity partitioning for the cache resource instance selected by [MPAMCFG_PART_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_CCAP_IDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|------------------|
| MPAM | MPAMF_BASE_s | 0x0038 | MPAMF_CCAP_IDR_s |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_ns | 0x0038 | MPAMF_CCAP_IDR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_rt | 0x0038 | MPAMF_CCAP_IDR_rt |

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|-------|--------|----------|
|-----------|-------|--------|----------|

| | | | |
|------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_r1 | 0x0038 | MPAMF_CCAP_IDR_r1 |
|------|---------------|--------|-------------------|

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_CPOR_IDR, MPAM Features Cache Portion Partitioning ID register

The MPAMF_CPOR_IDR characteristics are:

Purpose

Indicates the number of bits in [MPAMCFG_CPBM<n>](#).

MPAMF_CPOR_IDR_s indicates the number of bits in the Secure instance of [MPAMCFG_CPBM<n>](#).

MPAMF_CPOR_IDR_ns indicates the number of bits in the Non-secure instance of [MPAMCFG_CPBM<n>](#).

MPAMF_CPOR_IDR_rt indicates the number of bits in the Root instance of [MPAMCFG_CPBM<n>](#).

MPAMF_CPOR_IDR_rl indicates the number of bits in the Realm instance of [MPAMCFG_CPBM<n>](#).

When [MPAMF_IDR.HAS_RIS](#) is 1, some fields in this register give information for the resource instance selector, [MPAMCFG_PART_SEL](#).RIS. The description of every field that is affected by [MPAMCFG_PART_SEL](#).RIS has information within the field description.

Configuration

The power domain of MPAMF_CPOR_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_CPOR_PART == 1. Otherwise, direct accesses to MPAMF_CPOR_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_CPOR_IDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | CPBM_WD | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

CPBM_WD, bits [15:0]

Number of bits in the cache portion partitioning bit map of this device. See [MPAMCFG_CPBM<n>](#).

This field must contain a value from 1 to 32768, inclusive. Values greater than 32 require a group of 32-bit registers to access the CPBM, up to 1024 if CPBM_WD is the largest value.

If RIS is implemented, this field indicates the number bits in the cache portion bitmap for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_CPOR_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_CPOR_IDR is read-only.

MPAMF_CPOR_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_CPOR_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_CPOR_IDR_s is permitted to have either the same or different contents to MPAMF_CPOR_IDR_ns, MPAMF_CPOR_IDR_rt, or MPAMF_CPOR_IDR_rl.
- MPAMF_CPOR_IDR_ns is permitted to have either the same or different contents to MPAMF_CPOR_IDR_rt or MPAMF_CPOR_IDR_rl.
- MPAMF_CPOR_IDR_rt is permitted to have either the same or different contents to MPAMF_CPOR_IDR_rl.

There must be separate registers in the Secure (MPAMF_CPOR_IDR_s), Non-secure (MPAMF_CPOR_IDR_ns), Root (MPAMF_CPOR_IDR_rt), and Realm (MPAMF_CPOR_IDR_rl) MPAM feature pages.

When [MPAMF_IDR.HAS_RIS](#) is 1, MPAMF_CPOR_IDR shows the configuration of cache portion partitioning for the cache resource instance selected by [MPAMCFG_PART_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_CPOR_IDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|------------------|
| MPAM | MPAMF_BASE_s | 0x0030 | MPAMF_CPOR_IDR_s |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_ns | 0x0030 | MPAMF_CPOR_IDR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_rt | 0x0030 | MPAMF_CPOR_IDR_rt |

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_rl | 0x0030 | MPAMF_CPOR_IDR_rl |

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_CSUMON_IDR, MPAM Features Cache Storage Usage Monitoring ID register

The MPAMF_CSUMON_IDR characteristics are:

Purpose

Indicates the number of cache storage usage monitor instances and other properties of the CSU monitoring.

MPAMF_CSUMON_IDR_s indicates the number and properties of Secure cache storage usage monitoring.
MPAMF_CSUMON_IDR_ns indicates the number and properties of Non-secure cache storage usage monitoring.
MPAMF_CSUMON_IDR_rt indicates the number and properties of Root cache storage usage monitoring.
MPAMF_CSUMON_IDR_rl indicates the number and properties of Realm cache storage usage monitoring.

If [MPAMF_IDR](#).HAS_RIS is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by [MPAMCFG_PART_SEL](#).RIS. Fields that do not mention RIS are constant across all resource instances.

Configuration

The power domain of MPAMF_CSUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MPAMF_CSUMON_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_CSUMON_IDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------|--------|---------|------|----------------|----------|----------------|------------------------------|--|--|--|--|--|--|--|--|--|-----|--|--|--|--|--|--|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 2423222120191817161514131211 | | | | | | | | | | | | | | | | | |
| HAS_CAPTURE | CSU_RO | HAS_XCL | RES0 | HAS_OFLOW_LNKG | HAS_OFSR | HAS_OFLOW_CAPT | RES0 | | | | | | | | | | NUM | | | | | | | |

HAS_CAPTURE, bit [31]

The implementation supports copying an [MSMON_CSU](#) to the corresponding [MSMON_CSU_CAPTURE](#) on a capture event.

| HAS_CAPTURE | Meaning |
|-------------|--|
| 0b0 | MSMON_CSU_CAPTURE is not implemented and there is no support for capture events in the CSU monitor. |
| 0b1 | The MSMON_CSU_CAPTURE register is implemented and the CSU monitor supports the capture event behavior. |

If RIS is implemented, this field indicates that CSU monitor capture is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

CSU_RO, bit [30]

The implementation of [MSMON_CSU](#) is read-only.

| CSU_RO | Meaning |
|--------|--|
| 0b0 | MSMON_CSU is read/write. |
| 0b1 | MSMON_CSU is read-only. |

If RIS is implemented, this field indicates that the [MSMON_CSU](#) monitor register is read-only for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_XCL, bit [29]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Has filtering to exclude clean data and implements the [MSMON_CFG_CSU_FLT](#).XCL field.

| HAS_XCL | Meaning |
|---------|---|
| 0b0 | MSMON_CFG_CSU_FLT does not implement the XCL field. |
| 0b1 | MSMON_CFG_CSU_FLT implements the XCL field to exclude counting data in the clean state in the monitor instance. |

If RIS is implemented, this field indicates that the [MSMON_CFG_CSU_FLT](#).XCL field is implemented in the CSU monitor instances for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

Bit [28]

Reserved, RES0.

HAS_OFLOW_LNKG, bit [27]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Supports [MSMON_CFG_CSU_CTL](#).OFLOW_LNKG field to control how overflow on an instance affects other monitor instances in this MSC.

| HAS_OFLOW_LNKG | Meaning |
|----------------|--|
| 0b0 | Does not support CSU overflow linkage. |
| 0b1 | Supports CSU overflow linkage and the MSMON_CFG_CSU_CTL .OFLOW_LNKG field. |

If RIS is implemented, this field indicates that [MSMON_CFG_CSU_CTL](#).OFLOW_LNKG is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

HAS_OFSR, bit [26]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

The CSU monitor overflow status bitmap register, [MSMON_CSU_OFSR](#), is implemented.

| HAS_OFSR | Meaning |
|----------|---|
| 0b0 | MSMON_CSU_OFSR register is not implemented. |
| 0b1 | MSMON_CSU_OFSR register is implemented. |

If RIS is implemented, this field indicates that CSU monitor overflow status bitmap register is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

HAS_OFLOW_CAPT, bit [25]

When **FEAT_MPAMv0p1** is implemented or **FEAT_MPAMv1p1** is implemented:

Supports [MSMON_CFG_CSU_CTL](#).OFLOW_CAPT field to transfer the CSU monitor instance to its capture register on an overflow or overflow linkage event.

| HAS_OFLOW_CAPT | Meaning |
|----------------|---|
| 0b0 | Does not support capture on overflow. |
| 0b1 | Supports capture on overflow and the MSMON_CFG_CSU_CTL .OFLOW_CAPT field. |

If RIS is implemented, this field indicates that [MSMON_CFG_CSU_CTL](#).OFLOW_CAPT is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

Bits [24:16]

Reserved, RES0.

NUM_MON, bits [15:0]

The number of cache storage usage monitor instances implemented.

The largest [MSMON_CFG_MON_SEL](#).MON_SEL value is NUM_MON minus 1.

If RIS is implemented, this field indicates the number of CSU monitor instances implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_CSUMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_CSUMON_IDR is read-only.

MPAMF_CSUMON_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_CSUMON_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_CSUMON_IDR_s is permitted to have either the same or different contents to MPAMF_CSUMON_IDR_ns, MPAMF_CSUMON_IDR_rt, or MPAMF_CSUMON_IDR_rl.
- MPAMF_CSUMON_IDR_ns is permitted to have either the same or different contents to MPAMF_CSUMON_IDR_rt or MPAMF_CSUMON_IDR_rl.
- MPAMF_CSUMON_IDR_rt is permitted to have either the same or different contents to MPAMF_CSUMON_IDR_rl.

There must be separate registers in the Secure (MPAMF_CSUMON_IDR_s), Non-secure (MPAMF_CSUMON_IDR_ns), Root (MPAMF_CSUMON_IDR_rt), and Realm (MPAMF_CSUMON_IDR_rl) MPAM feature pages.

When [MPAMF_IDR](#).HAS_RIS is 1, MPAMF_CSUMON_IDR shows the configuration of cache storage usage monitoring for the cache resource instance selected by [MPAMCFG_PART_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF_CSUMON_IDR is not affected by [MSMON_CFG_MON_SEL](#).RIS.

MPAMF_CSUMON_IDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|-------|--------|----------|
|-----------|-------|--------|----------|

| | | | |
|------|--------------|--------|--------------------|
| MPAM | MPAMF_BASE_s | 0x0088 | MPAMF_CSUMON_IDR_s |
|------|--------------|--------|--------------------|

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------|
| MPAM | MPAMF_BASE_ns | 0x0088 | MPAMF_CSUMON_IDR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------|
| MPAM | MPAMF_BASE_rt | 0x0088 | MPAMF_CSUMON_IDR_rt |

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------|
| MPAM | MPAMF_BASE_rl | 0x0088 | MPAMF_CSUMON_IDR_rl |

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_ECR, MPAM Error Control Register

The MPAMF_ECR characteristics are:

Purpose

MPAMF_ECR is a 32-bit read/write register that controls MPAM error interrupts for this MSC.

MPAMF_ECR_s controls Secure MPAM error handling. MPAMF_ECR_ns controls Non-secure MPAM error handling. MPAMF_ECR_rt controls Root MPAM error handling. MPAMF_ECR_rl controls Realm MPAM error handling.

Configuration

The power domain of MPAMF_ECR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_ECR are RES0.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the [MPAMF_ESR](#) and MPAMF_ECR must be RAZ/WI.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ECR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|-------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | INTEN |

Bits [31:1]

Reserved, RES0.

INTEN, bit [0]

Interrupt Enable.

| INTEN | Meaning |
|-------|---|
| 0b0 | MPAM error interrupts are not signaled. |
| 0b1 | MPAM error interrupts are signaled. |

Accessing MPAMF_ECR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMF_ECR_s must be accessible from the Secure MPAM feature page.
- MPAMF_ECR_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ECR_rt must be accessible from the Root MPAM feature page.
- MPAMF_ECR_rl must be accessible from the Realm MPAM feature page.

MPAMF_ECR_s, MPAMF_ECR_ns, MPAMF_ECR_rt, and MPAMF_ECR_rl must be separate registers:

- The Secure instance (MPAMF_ECR_s) accesses the error interrupt controls used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ECR_ns) accesses the error interrupt controls used for Non-secure PARTIDs.
- The Root instance (MPAMF_ECR_rt) accesses the error interrupt controls used for Root PARTIDs.
- The Realm instance (MPAMF_ECR_rl) accesses the error interrupt controls used for Realm PARTIDs.

MPAMF_ECR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|-------------|
| MPAM | MPAMF_BASE_s | 0x00F0 | MPAMF_ECR_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------|
| MPAM | MPAMF_BASE_ns | 0x00F0 | MPAMF_ECR_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------|
| MPAM | MPAMF_BASE_rt | 0x00F0 | MPAMF_ECR_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------|
| MPAM | MPAMF_BASE_rl | 0x00F0 | MPAMF_ECR_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_ERR_MSI_ADDR_H, MPAM Error MSI High-part Address Register

The MPAMF_ERR_MSI_ADDR_H characteristics are:

Purpose

MPAMF_ERR_MSI_ADDR_H is a 32-bit read/write register for the high part of the MPAM error MSI address.

MPAMF_ERR_MSI_ADDR_H_s is the high part of the MSI write address for error interrupts related to Secure PARTIDs. MPAMF_ERR_MSI_ADDR_H_ns is the high part of the MSI write address for error interrupts related to Non-secure PARTIDs. MPAMF_ERR_MSI_ADDR_H_rt is the high part of the MSI write address for error interrupts related to Root PARTIDs. MPAMF_ERR_MSI_ADDR_H_rl is the high part of the MSI write address for error interrupts related to Realm PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_ADDR_H is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_ADDR_H are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ADDR_H is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | MSI_ADDR_H | | | | | | | | | | | | | | | | | | | |

Bits [31:20]

Reserved, RES0.

MSI_ADDR_H, bits [19:0]

MSI write address bits[51:32].

Accessing MPAMF_ERR_MSI_ADDR_H

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMF_ERR_MSI_ADDR_H_s must be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_ADDR_H_s, MPAMF_ERR_MSI_ADDR_H_ns, MPAMF_ERR_MSI_ADDR_H_rt, and MPAMF_ERR_MSI_ADDR_H_rl must be separate registers:

- The Secure instance (MPAMF_ERR_MSI_ADDR_H_s) accesses the high part of the memory address for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ADDR_H_ns) accesses the high part of the memory address for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ADDR_H_rt) accesses the high part of the memory address for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ADDR_H_rl) accesses the high part of the memory address for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_ADDR_H can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|------------------------|
| MPAM | MPAMF_BASE_s | 0x00E4 | MPAMF_ERR_MSI_ADDR_H_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_ns | 0x00E4 | MPAMF_ERR_MSI_ADDR_H_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_rt | 0x00E4 | MPAMF_ERR_MSI_ADDR_H_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_rl | 0x00E4 | MPAMF_ERR_MSI_ADDR_H_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_ERR_MSI_ADDR_L, MPAM Error MSI Low-part Address Register

The MPAMF_ERR_MSI_ADDR_L characteristics are:

Purpose

MPAMF_ERR_MSI_ADDR_L is a 32-bit read/write register for the low part of the MPAM error MSI address.

MPAMF_ERR_MSI_ADDR_L_s is the low part of the MSI write address for error interrupts related to Secure PARTIDs. MPAMF_ERR_MSI_ADDR_L_ns is the low part of the MSI write address for error interrupts related to Non-secure PARTIDs. MPAMF_ERR_MSI_ADDR_L_rt is the low part of the MSI write address for error interrupts related to Root PARTIDs. MPAMF_ERR_MSI_ADDR_L_rl is the low part of the MSI write address for error interrupts related to Realm PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_ADDR_L is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_ADDR_L are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ADDR_L is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MSI_ADDR_L | | | | | | | | | | | | | | | | | | Bits[1:0] | | | | | | | | | | | | | |

MSI_ADDR_L, bits [31:2]

MSI write address bits[31:2].

Bits [1:0]

Reads as 0b00.

Access to this field is **RO**.

Accessing MPAMF_ERR_MSI_ADDR_L

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMF_ERR_MSI_ADDR_L_s must be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_L_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_L_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_ADDR_L_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_ADDR_L_s, MPAMF_ERR_MSI_ADDR_L_ns, MPAMF_ERR_MSI_ADDR_L_rt, and MPAMF_ERR_MSI_ADDR_L_rl must be separate registers:

- The Secure instance (MPAMF_ERR_MSI_ADDR_L_s) accesses the low part of the memory address for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ADDR_L_ns) accesses the low part of the memory address for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ADDR_L_rt) accesses the low part of the memory address for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ADDR_L_rl) accesses the low part of the memory address for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_ADDR_L can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|------------------------|
| MPAM | MPAMF_BASE_s | 0x00E0 | MPAMF_ERR_MSI_ADDR_L_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_ns | 0x00E0 | MPAMF_ERR_MSI_ADDR_L_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_rt | 0x00E0 | MPAMF_ERR_MSI_ADDR_L_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_rl | 0x00E0 | MPAMF_ERR_MSI_ADDR_L_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_ERR_MSI_ATTR, MPAM Error MSI Write Attributes Register

The MPAMF_ERR_MSI_ATTR characteristics are:

Purpose

MPAMF_ERR_MSI_ATTR is a 32-bit read/write register that controls MPAM error MSI write attributes for MPAM errors in this MSC.

MPAMF_ERR_MSI_ATTR_s controls the attributes of Secure MPAM error MSI writes. MPAMF_ERR_MSI_ATTR_ns controls the attributes of Non-secure MPAM error MSI writes. MPAMF_ERR_MSI_ATTR_rt controls the attributes of Root MPAM error MSI writes. MPAMF_ERR_MSI_ATTR_rl controls the attributes of Realm MPAM error MSI writes.

Configuration

The power domain of MPAMF_ERR_MSI_ATTR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_ATTR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ATTR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|--------|-------------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|-------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | MSI_SH | MSI_MEMATTR | RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | MSIEN |

Bits [31:30]

Reserved, RES0.

MSI_SH, bits [29:28]

Sharability attribute of MSI writes.

| MSI_SH | Meaning |
|--------|--------------------------------------|
| 0b00 | Non-shareable. |
| 0b01 | Reserved, CONSTRAINED UNPREDICTABLE. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

When MPAMF_ERR_MSI_ATTR.MSI_MEMATTR specifies a Device memory type, the contents of this field are IGNORED and Shareability is effectively Outer Shareable.

MSI_MEMATTR, bits [27:24]

Memory attributes of MSI writes.

Note: This encoding matches the VMSAv8-64 stage 2 MemAttr[3:0] field as described in the Arm ARM, except that the following encodings are Reserved (not UNPREDICTABLE) and behave as DEvice-nGnRnE: 0b0100, 0b1000, and 0b1100.

| MSI_MEMATTR | Meaning |
|-------------|--|
| 0b0000 | Device-nGnRnE. |
| 0b0001 | Device-nGnRE. |
| 0b0010 | Device-nGRE. |
| 0b0011 | Device-GRE. |
| 0b0100 | Reserved. Behave as Device-nGnRnE, 0b0000. |
| 0b0101 | Normal Inner Non-cacheable, Outer Non-cacheable. |
| 0b0110 | Normal Inner Write-Through Cacheable, Outer Non-cacheable. |
| 0b0111 | Normal Inner Write-Back Cacheable, Outer Non-cacheable. |
| 0b1000 | Reserved. Behave as Device-nGnRnE, 0b0000. |
| 0b1001 | Normal Inner Non-Cachable, Outer Write-Through Cacheable. |
| 0b1010 | Normal Inner Write-Through Cacheable, Outer Write-Through Cacheable. |
| 0b1011 | Normal Inner Write-Back Cacheable, Outer Write-Through Cacheable. |
| 0b1100 | Reserved. Behave as Device-nGnRnE, 0b0000. |
| 0b1101 | Normal Inner Non-cacheable, Outer Write-Back Cacheable. |
| 0b1110 | Normal Inner Write-Through Cacheable, Outer Write-Back Cacheable. |
| 0b1111 | Normal Inner Write-Back Cacheable, Outer Write-Back Cacheable. |

When this field specifies a Device memory type, the contents of MPAMF_ERR_MSI_ATTR.MSI_SH are IGNORED and Shareability is effectively Outer Shareable.

Device types may be implemented as any Device type with more than 'n' characters. For example, if this field is set to 0b0010, an implementation may treat the MSI write as the specified type, Device-nGRE, or as Device-nGnRE or as Device-nGnRnE.

Reserved encodings 0b0100, 0b1000, and 0b1100 must be implemented to behave the same as the 0b0000 encoding.

Bits [23:1]

Reserved, RES0.

MSIEN, bit [0]

Error interrupt MSI Enable.

| MSIEN | Meaning |
|-------|---|
| 0b0 | MPAM error MSI writes are not generated to signal enabled MPAM error interrupts. When error MSI writes are disabled, hardwired error interrupts could be generated. |
| 0b1 | MPAM error MSI writes are generated to signal enabled MPAM error interrupts. When error MSI writes are enabled, hardwired error interrupts are not generated. |

The value of this field affects whether hardwired error interrupts are generated.

The reset behavior of this field is:

- On a MSC reset, this field resets to 0.

Accessing MPAMF_ERR_MSI_ATTR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMF_ERR_MSI_ATTR_s must be accessible from the Secure MPAM feature page.

- MPAMF_ERR_MSI_ATTR_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_ATTR_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_ATTR_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_ATTR_s, MPAMF_ERR_MSI_ATTR_ns, MPAMF_ERR_MSI_ATTR_rt, and MPAMF_ERR_MSI_ATTR_rl must be separate registers:

- The Secure instance (MPAMF_ERR_MSI_ATTR_s) accesses the memory access attributes for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ATTR_ns) accesses the memory access attributes for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ATTR_rt) accesses the memory access attributes for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ATTR_rl) accesses the memory access attributes for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_ATTR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|----------------------|
| MPAM | MPAMF_BASE_s | 0x00EC | MPAMF_ERR_MSI_ATTR_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_ns | 0x00EC | MPAMF_ERR_MSI_ATTR_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_rt | 0x00EC | MPAMF_ERR_MSI_ATTR_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_rl | 0x00EC | MPAMF_ERR_MSI_ATTR_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_ERR_MSI_DATA, MPAM Error MSI Data Register

The MPAMF_ERR_MSI_DATA characteristics are:

Purpose

MPAMF_ERR_MSI_DATA is a 32-bit read/write register for the MPAM error MSI data.

MPAMF_ERR_MSI_DATA_s is the data for the MSI write for error interrupts related to Secure PARTIDs.

MPAMF_ERR_MSI_DATA_ns is the data for the MSI write for error interrupts related to Non-secure PARTIDs.

MPAMF_ERR_MSI_DATA_rt is the data for the MSI write for error interrupts related to Root PARTIDs.

MPAMF_ERR_MSI_DATA_rl is the data for the MSI write for error interrupts related to Realm PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_DATA is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_DATA are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_DATA is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | MSI_DATA | | | | | | | | | | | | | | | |

MSI_DATA, bits [31:0]

MSI data to be written to ITS to signal an MSI.

Accessing MPAMF_ERR_MSI_DATA

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMF_ERR_MSI_DATA_s must be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_DATA_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_DATA_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_DATA_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_DATA_s, MPAMF_ERR_MSI_DATA_ns, MPAMF_ERR_MSI_DATA_rt, and MPAMF_ERR_MSI_DATA_rl must be separate registers:

- The Secure instance (MPAMF_ERR_MSI_DATA_s) accesses the data for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_DATA_ns) accesses the data for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_DATA_rt) accesses the data for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_DATA_rl) accesses the data for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_DATA can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|----------------------|
| MPAM | MPAMF_BASE_s | 0x00E8 | MPAMF_ERR_MSI_DATA_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_ns | 0x00E8 | MPAMF_ERR_MSI_DATA_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_rt | 0x00E8 | MPAMF_ERR_MSI_DATA_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_rl | 0x00E8 | MPAMF_ERR_MSI_DATA_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_ERR_MSI_MPAM, MPAM Error MSI Write MPAM Information Register

The MPAMF_ERR_MSI_MPAM characteristics are:

Purpose

MPAMF_ERR_MSI_MPAM is a 32-bit read/write register that sets the MPAM information for error MSI write attributes for MPAM errors in this MSC.

MPAMF_ERR_MSI_MPAM_s controls MPAM information labeling of Secure MPAM error MSI writes.

MPAMF_ERR_MSI_MPAM_ns controls MPAM information labeling of Non-secure MPAM error MSI writes.

MPAMF_ERR_MSI_MPAM_rt controls MPAM information labeling of Root MPAM error MSI writes.

MPAMF_ERR_MSI_MPAM_rl controls MPAM information labeling of Realm MPAM error MSI writes.

Configuration

The power domain of MPAMF_ERR_MSI_MPAM is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_ERR_MSI == 1. Otherwise, direct accesses to MPAMF_ERR_MSI_MPAM are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_MPAM is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | PMG | | | | | | | | PARTID | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group property for PARTID MSC error interrupt write.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition ID for MSC error interrupt write.

The PARTID in this register is in the Secure PARTID space in the MPAMF_ERR_MSI_MPAM_s instance and in the Non-secure PARTID space in the MPAMF_ERR_MSI_MPAM_ns instance of this register.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMF_ERR_MSI_MPAM

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMF_ERR_MSI_MPAM_s must be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_MPAM_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_MPAM_rt must be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_MPAM_rl must be accessible from the Realm MPAM feature page.

MPAMF_ERR_MSI_MPAM_s, MPAMF_ERR_MSI_MPAM_ns, MPAMF_ERR_MSI_MPAM_rt, and MPAMF_ERR_MSI_MPAM_rl must be separate registers:

- The Secure instance (MPAMF_ERR_MSI_MPAM_s) accesses the MPAM information for MSI write request to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_MPAM_ns) accesses the MPAM information for MSI write request to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_MPAM_rt) accesses the MPAM information for MSI write request to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_MPAM_rl) accesses the MPAM information for MSI write request to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_MPAM can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|----------------------|
| MPAM | MPAMF_BASE_s | 0x00DC | MPAMF_ERR_MSI_MPAM_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_ns | 0x00DC | MPAMF_ERR_MSI_MPAM_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_rt | 0x00DC | MPAMF_ERR_MSI_MPAM_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_rl | 0x00DC | MPAMF_ERR_MSI_MPAM_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_ESR, MPAM Error Status Register

The MPAMF_ESR characteristics are:

Purpose

Indicates MPAM error status for this MSC.

MPAMF_ESR_s reports Secure MPAM errors. MPAMF_ESR_ns reports Non-secure MPAM errors. MPAMF_ESR_rt reports Root MPAM errors. MPAMF_ESR_rl reports Realm MPAM errors.

Software should write this register after reading the status of an error to reset ERRCODE to 0x0000 and OVRWR to 0 so that future errors are not reported with OVRWR set.

Configuration

The power domain of MPAMF_ESR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_ESR are RES0.

MPAMF_ESR is 64-bit register when MPAM v0.1 or v1.1 is implemented and MPAMF_IDR.HAS_EXTD_ESR == 1.

Otherwise, MPAMF_ESR is a 32-bit register.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the MPAMF_ESR and [MPAMF_ECR](#) must be RAZ/WI.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ESR is a:

- 64-bit register when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_EXTD_ESR == 1
- 32-bit register otherwise

Field descriptions

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_EXTD_ESR == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|------|---------|-----|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| OVRWR | RES0 | ERRCODE | PMG | | | | | | | | | | | | PARTID_MON | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:36]

Reserved, RES0.

RIS, bits [35:32]

When MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. Where applicable to the ERRCODE, captures the RIS value for the error.

Otherwise:

Reserved, RES0.

OVRWR, bit [31]

Overwritten.

If 0 and ERRCODE == 0b0000, no errors have occurred.

If 0 and ERRCODE is non-zero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is non-zero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is zero must not be produced by hardware and is only reached when software writes this combination into this register.

Bits [30:28]

Reserved, RES0.

ERRCODE, bits [27:24]

Error code.

| ERRCODE | Meaning |
|---------|-------------------------|
| 0b0000 | No error. |
| 0b0001 | PARTID_SEL_Range. |
| 0b0010 | Req_PARTID_Range. |
| 0b0011 | MSMONCFG_ID_RANGE. |
| 0b0100 | Req_PMG_Range. |
| 0b0101 | Monitor_Range. |
| 0b0110 | intPARTID_Range. |
| 0b0111 | Unexpected_INTERNAL. |
| 0b1000 | Undefined_RIS_PART_SEL. |
| 0b1001 | RIS_No_Control. |
| 0b1010 | Undefined_RIS_MON_SEL. |
| 0b1011 | RIS_No_Monitor. |
| 0b1100 | Reserved. |
| 0b1101 | Reserved. |
| 0b1110 | Reserved. |
| 0b1111 | Reserved. |

PMG, bits [23:16]

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to 0x00 on an error that does not capture PMG.

PARTID_MON, bits [15:0]

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|------|---------|-----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| OVRWR | RES0 | ERRCODE | PMG | | | | | | | | | | PARTID_MON | | | | | | | | | | | | | | | | | | |

OVRWR, bit [31]

Overwritten.

If 0 and ERRCODE == 0b0000, no errors have occurred.

If 0 and ERRCODE is non-zero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is non-zero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is 0 must not be produced by hardware and is only reached when software writes this combination into this register.

Bits [30:28]

Reserved, RES0.

ERRCODE, bits [27:24]

Error code.

| ERRCODE | Meaning |
|---------|----------------------|
| 0b0000 | No error. |
| 0b0001 | PARTID_SEL_Range. |
| 0b0010 | Req_PARTID_Range. |
| 0b0011 | MSMONCFG_ID_RANGE. |
| 0b0100 | Req_PMG_Range. |
| 0b0101 | Monitor_Range. |
| 0b0110 | intPARTID_Range. |
| 0b0111 | Unexpected_INTERNAL. |
| 0b1000 | Reserved. |
| 0b1001 | Reserved. |
| 0b1010 | Reserved. |
| 0b1011 | Reserved. |
| 0b1100 | Reserved. |
| 0b1101 | Reserved. |
| 0b1110 | Reserved. |
| 0b1111 | Reserved. |

PMG, bits [23:16]

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to 0x00 on an error that does not capture PMG.

PARTID_MON, bits [15:0]

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0x0000.

Accessing MPAMF_ESR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMF_ESR_s must be accessible from the Secure MPAM feature page.
- MPAMF_ESR_ns must be accessible from the Non-secure MPAM feature page.
- MPAMF_ESR_rt must be accessible from the Root MPAM feature page.

- MPAMF_ESR_rl must be accessible from the Realm MPAM feature page.

MPAMF_ESR_s, MPAMF_ESR_ns, MPAMF_ESR_rt, and MPAMF_ESR_rl must be separate registers:

- The Secure instance (MPAMF_ESR_s) accesses the error status used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ESR_ns) accesses the error status used for Non-secure PARTIDs.
- The Root instance (MPAMF_ESR_rt) accesses the error status used for Root PARTIDs.
- The Realm instance (MPAMF_ESR_rl) accesses the error status used for Realm PARTIDs.

MPAMF_ESR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|-------------|
| MPAM | MPAMF_BASE_s | 0x00F8 | MPAMF_ESR_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------|
| MPAM | MPAMF_BASE_ns | 0x00F8 | MPAMF_ESR_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------|
| MPAM | MPAMF_BASE_rt | 0x00F8 | MPAMF_ESR_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------|
| MPAM | MPAMF_BASE_rl | 0x00F8 | MPAMF_ESR_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MPAMF_IDR, MPAM Features Identification Register

The MPAMF_IDR characteristics are:

Purpose

Indicates which memory partitioning and monitoring features are present on this MSC.

MPAMF_IDR_s indicates the MPAM features accessed from the Secure MPAM feature page. MPAMF_IDR_ns indicates the MPAM features accessed from the Non-secure MPAM feature page. MPAMF_IDR_rt indicates the MPAM features accessed from the Root MPAM feature page. MPAMF_IDR_rl indicates the MPAM features accessed from the Realm MPAM feature page.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. The description of every field that is affected by [MPAMCFG_PART_SEL](#).RIS has that information within the field description.

Configuration

The power domain of MPAMF_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_IDR are RES0.

MPAMF_IDR is 64-bit register when MPAM v0.1 or v1.1 is implemented.

Otherwise, MPAMF_IDR is a 32-bit register.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_IDR is a:

- 64-bit register when FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented
- 32-bit register otherwise

Field descriptions

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 |
|----------------|-----------|------------------|--------------|--------------|---------------|---------------|----|----|
| RES0 | | | | RIS_MAX | | | | |
| HAS_PARTID_NRW | HAS_MSMON | HAS_IMPL_IDR_EXT | HAS_PRI_PART | HAS_MBW_PART | HAS_CPOR_PART | HAS_CCAP_PART | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 |

Bits [63:60]

Reserved, RES0.

RIS_MAX, bits [59:56]

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Maximum RIS value supported in [MPAMCFG_PART_SEL](#). Must be 0b0000 if [MPAMF_IDR](#).HAS_RIS == 0.

Otherwise:

Reserved, RES0.

Bits [55:44]

Reserved, RES0.

HAS_NFU, bit [43]

When FEAT_MPAMv1p1 is implemented or FEAT_MPAMv0p1 is implemented:

Has No Future Use field in [MPAMCFG_DIS](#). Indicates that [MPAMCFG_DIS](#).NFU is implemented.

| HAS_NFU | Meaning |
|---------|---|
| 0b0 | MPAMCFG_DIS .NFU is not implemented. A PARTID disabled through access to MPAMCFG_DIS must preserve the control settings of the disabled PARTID. |
| 0b1 | Implements MPAMCFG_DIS .NFU. A PARTID disabled with NFU as 1 may have its control settings forgotten. |

If [MPAMF_IDR](#).HAS_ENDIS is 0b0, this field must also be 0b0.

This field must be the same in each instance of this register and for any value in [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

HAS_ENDIS, bit [42]

When FEAT_MPAMv1p1 is implemented or FEAT_MPAMv0p1 is implemented:

Has PARTID enable and disable. Indicates that this MSC supports PARTID disable and enable via [MPAMCFG_DIS](#), [MPAMCFG_EN](#) and [MPAMCFG_EN_FLAGS](#) registers.

| HAS_ENDIS | Meaning |
|-----------|--|
| 0b0 | Does not support PARTID enable and disable functionality, and MPAMCFG_EN , MPAMCFG_DIS and MPAMCFG_EN_FLAGS registers are not implemented. |
| 0b1 | Supports PARTID enable and disable through the MPAMCFG_EN , MPAMCFG_DIS and MPAMCFG_EN_FLAGS registers. |

All three registers must be implemented when this field is 1, [MPAMCFG_EN](#), [MPAMCFG_DIS](#), and [MPAMCFG_EN_FLAGS](#).

This field must be the same in each instance of this register and for any value in [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

SP4, bit [41]

When FEAT_RME is implemented:

Indicates whether this MSC supports 4 PARTID spaces.

| SP4 | Meaning |
|-----|---------------------------------------|
| 0b0 | This MSC supports two PARTID spaces. |
| 0b1 | This MSC supports four PARTID spaces. |

This field must read the same in each instance of this register and for any value in [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

HAS_ERR_MSI, bit [40]When **MPAMF_IDR.EXT** == 1:

Has support for MSI writes to signal MPAM error interrupts. These registers are implemented: [MPAMF_ERR_MSI_ADDR_L](#), [MPAMF_ERR_MSI_ADDR_H](#), [MPAMF_ERR_MSI_ATTR](#), [MPAMF_ERR_MSI_DATA](#), and [MPAMF_ERR_MSI_MPAM](#).

| HAS_ERR_MSI | Meaning |
|--------------------|---|
| 0b0 | MPAMF_ERR_MSI_ADDR_L , MPAMF_ERR_MSI_ADDR_H , MPAMF_ERR_MSI_ATTR , MPAMF_ERR_MSI_DATA , and MPAMF_ERR_MSI_MPAM registers are not implemented. |
| 0b1 | MPAMF_ERR_MSI_ADDR_L , MPAMF_ERR_MSI_ADDR_H , MPAMF_ERR_MSI_ATTR , MPAMF_ERR_MSI_DATA , and MPAMF_ERR_MSI_MPAM are implemented and can be used to generate writes to signal error interrupts. |

If [MPAMF_IDR.HAS_ESR](#) is 0, this bit must also be 0.

Otherwise:

Reserved, RES0.

HAS_ESR, bit [39]When **MPAMF_IDR.EXT** == 1:

[MPAMF_ESR](#) is implemented.

| HAS_ESR | Meaning |
|----------------|--|
| 0b0 | MPAMF_ESR , MPAMF_ECR , and MPAM error handling are not implemented. |
| 0b1 | MPAMF_ESR , MPAMF_ECR , and MPAM error handling are implemented. |

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the [MPAMF_ESR](#) and [MPAMF_ECR](#) must be RAZ/WI.

Otherwise:

Reserved, RES0.

HAS_EXTD_ESR, bit [38]When **MPAMF_IDR.EXT** == 1:

[MPAMF_ESR](#) is 64 bits.

| HAS_EXTD_ESR | Meaning |
|---------------------|---------------------------------------|
| 0b0 | MPAMF_ESR is 32 bits. |
| 0b1 | MPAMF_ESR is 64 bits. |

When [MPAMF_IDR.HAS_RIS](#) and [MPAMF_IDR.HAS_ESR](#), this field must be 1.

Otherwise:

Reserved, RES0.

NO_IMPL_MSMON, bit [37]

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_IMPL_IDR == 1:

[MPAMF_IMPL_IDR](#) defines no IMPLEMENTATION DEFINED resource monitors.

| NO_IMPL_MSMON | Meaning |
|---------------|--|
| 0b0 | MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource monitor. |
| 0b1 | MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource monitors. |

If RIS is implemented, this field indicates the presence of IMPLEMENTATION DEFINED resource monitors described in [MPAMF_IMPL_IDR](#) for the selected resource instance.

Otherwise:

Reserved, RES0.

NO_IMPL_PART, bit [36]

When MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_IMPL_IDR == 1:

[MPAMF_IMPL_IDR](#) defines no IMPLEMENTATION DEFINED resource controls.

| NO_IMPL_PART | Meaning |
|--------------|--|
| 0b0 | MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource control. |
| 0b1 | MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource controls. |

If RIS is implemented, this field indicates the presence of IMPLEMENTATION DEFINED resource controls described in [MPAMF_IMPL_IDR](#) for the selected resource instance.

Otherwise:

Reserved, RES0.

Bits [35:33]

Reserved, RES0.

HAS_RIS, bit [32]

When MPAMF_IDR.EXT == 1:

Has resource instance selector. Indicates that [MPAMCFG_PART_SEL](#) contains the RIS field that selects a resource instance to control.

| HAS_RIS | Meaning |
|---------|---|
| 0b0 | MPAMCFG_PART_SEL does not implement the MPAMCFG_PART_SEL .RIS field or multiple resource instance support. |
| 0b1 | MPAMCFG_PART_SEL implements the MPAMCFG_PART_SEL .RIS field and MPAM resource instance numbers up to and including MPAMF_IDR.RIS_MAX. |

Otherwise:

Reserved, RES0.

HAS_PARTID_NRW, bit [31]

Has PARTID narrowing.

| HAS_PARTID_NRW | Meaning |
|-----------------------|--|
| 0b0 | Does not have MPAMF_PARTID_NRW_IDR , MPAMCFG_INTPARTID , or intPARTID mapping support. |
| 0b1 | Supports the MPAMF_PARTID_NRW_IDR , MPAMCFG_INTPARTID registers. |

HAS_MSMON, bit [30]

Has resource Monitors. Indicates whether this MSC has MPAM resource monitors.

| HAS_MSMON | Meaning |
|------------------|---|
| 0b0 | Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR . |
| 0b1 | Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR . |

HAS_IMPL_IDR, bit [29]

Has [MPAMF_IMPL_IDR](#). Indicates whether this MSC has the IMPLEMENTATION SPECIFIC MPAM features register, [MPAMF_IMPL_IDR](#).

| HAS_IMPL_IDR | Meaning |
|---------------------|--|
| 0b0 | Does not have MPAMF_IMPL_IDR . |
| 0b1 | Has MPAMF_IMPL_IDR . |

EXT, bit [28]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Extended MPAMF_IDR.

| EXT | Meaning |
|------------|--|
| 0b0 | MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits. |
| 0b1 | MPAMF_IDR has bits defined in [63:32]. The register is 64-bits. |

Otherwise:

Reserved, RES0.

HAS_PRI_PART, bit [27]

Has Priority Partitioning. Indicates that MPAM priority partitioning is implemented and [MPAMF_PRI_IDR](#) exists.

| HAS_PRI_PART | Meaning |
|---------------------|--|
| 0b0 | Does not support priority partitioning or have MPAMF_PRI_IDR . |
| 0b1 | Has priority partitioning and MPAMF_PRI_IDR . |

If RIS is implemented, this field indicates the presence of priority partitioning resource controls as described in [MPAMF_PRI_IDR](#) for the selected resource instance.

HAS_MBW_PART, bit [26]

Has Memory Bandwidth Partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and [MPAMF_MBW_IDR](#).

| HAS_MBW_PART | Meaning |
|--------------|--|
| 0b0 | Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register. |
| 0b1 | Has MPAMF_MBW_IDR register. |

If RIS is implemented, this field indicates the presence of memory bandwidth partitioning resource controls as described in [MPAMF_MBW_IDR](#) for the selected resource instance.

HAS_CPOR_PART, bit [25]

Has Cache Portion Partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and [MPAMF_CPOR_IDR](#).

| HAS_CPOR_PART | Meaning |
|---------------|---|
| 0b0 | Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPB<n> registers. |
| 0b1 | Has MPAMF_CPOR_IDR and MPAMCFG_CPB<n> registers. |

If RIS is implemented, this field indicates the presence of cache portion partitioning resource controls as described in [MPAMF_CPOR_IDR](#) for the selected resource instance.

HAS_CCAP_PART, bit [24]

Has Cache Capacity Partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the [MPAMF_CCAP_IDR](#) and [MPAMCFG_CMAX](#) registers.

| HAS_CCAP_PART | Meaning |
|---------------|---|
| 0b0 | Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers. |
| 0b1 | Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers. |

If RIS is implemented, this field indicates the presence of cache capacity partitioning resource controls as described in [MPAMF_CPOR_IDR](#) for the selected resource instance.

PMG_MAX, bits [23:16]

Maximum supported value of PMG.

The value of this field is permitted to vary between the instances of [MPAM_IDR](#), each reporting the maximum supported PMG value in the PARTID space associated with that instance.

In [MPAMF_IDR_s](#), this field is permitted to report the maximum PMG value for the Non-secure PARTID space or for the Secure PARTID space. The maximum PMG value for the Secure PARTID space can be read from [MPAMF_SIDR.PMG_MAX](#).

PARTID_MAX, bits [15:0]

Maximum supported value of PARTID.

The value of this field is permitted to vary between the instances of [MPAM_IDR](#), each reporting the maximum supported PARTID value in the PARTID space associated with that instance.

In [MPAMF_IDR_s](#), this field is permitted to report the maximum PARTID value for the Non-secure PARTID space or for the Secure PARTID space. The maximum PARTID value for the Secure PARTID space can be read from [MPAMF_SIDR.PARTID_MAX](#).

Otherwise:

| | | | | | | | | |
|--------------------------------|---------------------------|------------------------------|---------------------|------------------------------|------------------------------|-------------------------------|-------------------------------|--------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 |
| HAS_PARTID_NRW | HAS_MSMON | HAS_IMPL_IDR | EXT | HAS_PRI_PART | HAS_MBW_PART | HAS_CPOR_PART | HAS_CCAP_PART | HAS_CMAX |

HAS_PARTID_NRW, bit [31]

Has PARTID Narrowing.

| HAS_PARTID_NRW | Meaning |
|-----------------------|--|
| 0b0 | Does not have MPAMF_PARTID_NRW_IDR , MPAMCFG_INTPARTID , or intPARTID mapping support. |
| 0b1 | Supports the MPAMF_PARTID_NRW_IDR , MPAMCFG_INTPARTID registers. |

HAS_MSMON, bit [30]

Has resource Monitors. Indicates whether this MSC has MPAM resource monitors.

| HAS_MSMON | Meaning |
|------------------|---|
| 0b0 | Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR . |
| 0b1 | Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR . |

HAS_IMPL_IDR, bit [29]

Has [MPAMF_IMPL_IDR](#). Indicates whether this MSC has the IMPLEMENTATION SPECIFIC MPAM features register, [MPAMF_IMPL_IDR](#).

| HAS_IMPL_IDR | Meaning |
|---------------------|--|
| 0b0 | Does not have MPAMF_IMPL_IDR . |
| 0b1 | Has MPAMF_IMPL_IDR . |

EXT, bit [28]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Extended MPAMF_IDR.

| EXT | Meaning |
|------------|--|
| 0b0 | MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits. |
| 0b1 | MPAMF_IDR has bits defined in [63:32]. The register is 64-bits. |

Otherwise:

Reserved, RES0.

HAS_PRI_PART, bit [27]

Has Priority Partitioning. Indicates whether this MSC implements MPAM priority partitioning and [MPAMF_PRI_IDR](#).

| HAS_PRI_PART | Meaning |
|---------------------|--|
| 0b0 | Does not support priority partitioning or have MPAMF_PRI_IDR . |
| 0b1 | Has MPAMF_PRI_IDR . |

HAS_MBW_PART, bit [26]

Has Memory Bandwidth Partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and [MPAMF_MBW_IDR](#).

| HAS_MBW_PART | Meaning |
|--------------|--|
| 0b0 | Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register. |
| 0b1 | Has MPAMF_MBW_IDR register. |

HAS_CPOR_PART, bit [25]

Has Cache Portion Partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and [MPAMF_CPOR_IDR](#).

| HAS_CPOR_PART | Meaning |
|---------------|--|
| 0b0 | Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPBm<n> registers. |
| 0b1 | Has MPAMF_CPOR_IDR and MPAMCFG_CPBm<n> registers. |

HAS_CCAP_PART, bit [24]

Has Cache Capacity Partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the [MPAMF_CCAP_IDR](#) and [MPAMCFG_CMAX](#) registers.

| HAS_CCAP_PART | Meaning |
|---------------|---|
| 0b0 | Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers. |
| 0b1 | Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers. |

PMG_MAX, bits [23:16]

Maximum supported value of PMG.

The value of this field is permitted to vary between the instances of [MPAM_IDR](#), each reporting the maximum supported PMG value in the PARTID space associated with that instance.

In [MPAMF_IDR_s](#) this field is permitted to report the maximum PMG value for the Non-secure PARTID space or for the Secure PARTID space. The maximum PMG value for the Secure PARTID space can be read from [MPAMF_SIDR.PMG_MAX](#).

PARTID_MAX, bits [15:0]

Maximum supported value of PARTID.

The value of this field is permitted to vary between the instances of [MPAM_IDR](#), each reporting the maximum supported PARTID value in the PARTID space associated with that instance.

In [MPAMF_IDR_s](#) this field is permitted to report the maximum PARTID value for the Non-secure PARTID space or for the Secure PARTID space. The maximum PARTID value for the Secure PARTID space can be read from [MPAMF_SIDR.PARTID_MAX](#).

Accessing MPAMF_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

[MPAMF_IDR](#) is read-only.

[MPAMF_IDR](#) must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

[MPAMF_IDR](#) is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- [MPAMF_IDR_s](#) is permitted to have either the same or different contents to [MPAMF_IDR_ns](#), [MPAMF_IDR_rt](#), or [MPAMF_IDR_rl](#).

- MPAMF_IDR_ns is permitted to have either the same or different contents to MPAMF_IDR_rt or MPAMF_IDR_rl.
- MPAMF_IDR_rt is permitted to have either the same or different contents to MPAMF_IDR_rl.

There must be separate registers in the Secure (MPAMF_IDR_s), Non-secure (MPAMF_IDR_ns), Root (MPAMF_IDR_rt), and Realm (MPAMF_IDR_rl) MPAM feature pages.

When [MPAMF_IDR.HAS_RIS](#) is 1, MPAMF_IDR shows the configuration of MSC MPAM for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_IDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|-------------|
| MPAM | MPAMF_BASE_s | 0x0000 | MPAMF_IDR_s |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------|
| MPAM | MPAMF_BASE_ns | 0x0000 | MPAMF_IDR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------|
| MPAM | MPAMF_BASE_rt | 0x0000 | MPAMF_IDR_rt |

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------|
| MPAM | MPAMF_BASE_rl | 0x0000 | MPAMF_IDR_rl |

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_IIDR, MPAM Implementation Identification Register

The MPAMF_IIDR characteristics are:

Purpose

Uniquely identifies the MSC implementation by the combination of implementer, product ID, variant, and revision.

Configuration

The power domain of MPAMF_IIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_IIDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_IIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----|----------|----|----|----|-------------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ProductID | | | | | | | | | | | | Variant | | | | Revision | | | | Implementer | | | | | | | | | | | |

ProductID, bits [31:20]

The MSC implementer as identified in the MPAMF_IIDR.Implementer field must assure each product has a unique ProductID from any other with the same Implementer value.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [19:16]

This field distinguishes product variants or major revisions of the product.

Note

Implementations of ProductID with differing software interfaces are expected to have different values in the MPAMF_IIDR.Variant field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [15:12]

This field distinguishes minor revisions of the product.

Note

This field is intended to differentiate product revisions that are minor changes and are largely software compatible with previous revisions.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the MPAM MSC.

[11:8] must contain the JEP106 continuation code of the implementer.

[7] must always be 0.

[6:0] must contain the JEP106 identity code of the implementer.

For an Arm implementation, bits[11:0] are 0x43B.

Accessing MPAMF_IIDR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_IIDR is read-only.

MPAMF_IIDR must be readable from the Secure, Non-secure, Root, and Realm MPAM feature pages.

MPAMF_IIDR must have the same contents in the Secure, Non-secure, Root, and Realm MPAM feature pages.

MPAMF_IIDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|--------------|
| MPAM | MPAMF_BASE_s | 0x0018 | MPAMF_IIDR_s |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_ns | 0x0018 | MPAMF_IIDR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_rt | 0x0018 | MPAMF_IIDR_rt |

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_rl | 0x0018 | MPAMF_IIDR_rl |

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_IMPL_IDR, MPAM Implementation-Specific Partitioning Feature Identification Register

The MPAMF_IMPL_IDR characteristics are:

Purpose

Indicates the implementation-defined partitioning and monitoring features and parameters of the MSC.

MPAMF_IMPL_IDR_s indicates IMPLEMENTATION DEFINED partitioning and monitoring features accessed from the Secure MPAM feature page. MPAMF_IMPL_IDR_ns indicates those accessed from the Non-secure MPAM feature page. MPAMF_IMPL_IDR_rt indicates IMPLEMENTATION DEFINED partitioning and monitoring features accessed from the Root MPAM feature page. MPAMF_IMPL_IDR_rl indicates those accessed from the Realm MPAM feature page.

If [MPAMF_IDR.HAS_RIS](#) is 1, this register gives the implementation-specific features and parameters of the resource instance selected by [MPAMCFG_PART_SEL.RIS](#) for any features that are specific to the resource.

Configuration

The power domain of MPAMF_IMPL_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_IMPL_IDR == 1. Otherwise, direct accesses to MPAMF_IMPL_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_IMPL_IDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | IMPLFEAT | | | | | | | | | | | | | | | |

IMPLFEAT, bits [31:0]

All 32 bits of this register are available to be used as the implementer sees fit to indicate the presence of IMPLEMENTATION DEFINED MPAM features in this MSC and to give additional implementation-specific read-only information about the parameters of implementation-specific MPAM features to software.

If RIS is implemented, this register indicates the implementation-specific features and parameters of the resource instance selected by [MPAMCFG_PART_SEL.RIS](#).

Accessing MPAMF_IMPL_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_IMPL_IDR is read-only.

MPAMF_IMPL_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_IMPL_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_IMPL_IDR_s is permitted to have either the same or different contents to MPAMF_IMPL_IDR_ns, MPAMF_IMPL_IDR_rt, or MPAMF_IMPL_IDR_rl.

- MPAMF_IMPL_IDR_ns is permitted to have either the same or different contents to MPAMF_IMPL_IDR_rt or MPAMF_IMPL_IDR_rl.
- MPAMF_IMPL_IDR_rt is permitted to have either the same or different contents to MPAMF_IMPL_IDR_rl.

There must be separate registers in the Secure (MPAMF_IMPL_IDR_s), Non-secure (MPAMF_IMPL_IDR_ns), Root (MPAMF_IMPL_IDR_rt), and Realm (MPAMF_IMPL_IDR_rl) MPAM feature pages.

When [MPAMF_IDR.HAS_RIS](#) is 1, MPAMF_IMPL_IDR shows the configuration of implementation-specific features for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_IMPL_IDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|------------------|
| MPAM | MPAMF_BASE_s | 0x0028 | MPAMF_IMPL_IDR_s |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_ns | 0x0028 | MPAMF_IMPL_IDR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_rt | 0x0028 | MPAMF_IMPL_IDR_rt |

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_rl | 0x0028 | MPAMF_IMPL_IDR_rl |

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_MBW_IDR, MPAM Memory Bandwidth Partitioning Identification Register

The MPAMF_MBW_IDR characteristics are:

Purpose

Indicates which MPAM bandwidth partitioning features are present on this MSC.

MPAMF_MBW_IDR_s indicates bandwidth partitioning features accessed from the Secure MPAM feature page.
 MPAMF_MBW_IDR_ns indicates bandwidth partitioning features accessed from the Non-secure MPAM feature page.
 MPAMF_MBW_IDR_rt indicates bandwidth partitioning features accessed from the Root MPAM feature page.
 MPAMF_MBW_IDR_rl indicates bandwidth partitioning features accessed from the Realm MPAM feature page.

When [MPAMF_IDR.HAS_RIS](#) is 1, some fields in this register give information for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#). The description of every field that is affected by [MPAMCFG_PART_SEL.RIS](#) has that information within the field description.

Configuration

The power domain of MPAMF_MBW_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_MBW_PART == 1. Otherwise, direct accesses to MPAMF_MBW_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MBW_IDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:29]

Reserved, RES0.

BWPBM_WD, bits [28:16]

Bandwidth portion bitmap width.

The number of bandwidth portion bits in the [MPAMCFG_MBW_PBM<n>](#) register array.

If MPAMF_MBW_IDR.HAS_PBM is 1, this field must contain a value from 1 to 4096, inclusive. Values greater than 32 require a group of 32-bit registers to access the BWPBM, up to 128 if BWPBM_WD is the largest value.

If MPAMF_MBW_IDR.HAS_PBM is 0, this field must be ignored by software.

If RIS is implemented, this field indicates the width of the memory bandwidth portion bitmap partitioning control for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#).

Bit [15]

Reserved, RES0.

WINDWR, bit [14]

Indicates the bandwidth accounting period register is writable.

| WINDWR | Meaning |
|---------------|---|
| 0b0 | The bandwidth accounting period is readable from MPAMCFG_MBW_WINWD which might be fixed or vary due to clock rate reconfiguration of the memory channel or memory controller. |
| 0b1 | The bandwidth accounting width is readable and writable per partition in MPAMCFG_MBW_WINWD . |

HAS_PROP, bit [13]

Indicates that this MSC implements proportional stride bandwidth partitioning and the [MPAMCFG_MBW_PROP](#) register can be accessed.

| HAS_PROP | Meaning |
|-----------------|--|
| 0b0 | There is no memory bandwidth proportional stride control and the MPAMCFG_MBW_PROP register is RES0. |
| 0b1 | The proportional stride memory bandwidth partitioning scheme is supported and the MPAMCFG_MBW_PROP register can be accessed. |

If RIS is implemented, this field indicates the presence of the memory bandwidth proportional stride partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_PBM, bit [12]

Indicates that bandwidth portion partitioning is implemented and the [MPAMCFG_MBW_PBM<n>](#) register array can be accessed.

| HAS_PBM | Meaning |
|----------------|--|
| 0b0 | There is no memory bandwidth portion control and the MPAMCFG_MBW_PBM<n> is RES0. |
| 0b1 | The memory bandwidth portion allocation scheme exists and the MPAMCFG_MBW_PBM<n> register can be accessed. |

If RIS is implemented, this field indicates the presence of the memory bandwidth portion partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_MAX, bit [11]

Indicates that this MSC implements maximum bandwidth partitioning and the [MPAMCFG_MBW_MAX](#) register can be accessed.

| HAS_MAX | Meaning |
|----------------|---|
| 0b0 | There is no maximum memory bandwidth control and the MPAMCFG_MBW_MAX register is RES0. |
| 0b1 | The maximum memory bandwidth allocation scheme is supported and the MPAMCFG_MBW_MAX register can be accessed. |

If RIS is implemented, this field indicates the presence of the maximum bandwidth partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_MIN, bit [10]

Indicates that this MSC implements minimum bandwidth partitioning and the [MPAMCFG_MBW_MIN](#) register can be accessed.

| HAS_MIN | Meaning |
|---------|---|
| 0b0 | There is no minimum memory bandwidth control and the MPAMCFG_MBW_MIN register is RES0. |
| 0b1 | The minimum memory bandwidth allocation scheme is supported and the MPAMCFG_MBW_MIN register can be accessed. |

If RIS is implemented, this field indicates the presence of the minimum bandwidth partitioning control for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [9:6]

Reserved, RES0.

BWA_WD, bits [5:0]

Number of implemented bits in the bandwidth allocation fields: MIN, MAX, and STRIDE. See [MPAMCFG_MBW_MIN](#), [MPAMCFG_MBW_MAX](#), and [MPAMCFG_MBW_PROP](#).

In any of these bandwidth allocation fields exist, this field must have a value from 1 to 16, inclusive. Otherwise, it is permitted to be 0.

If RIS is implemented, this field indicates the number of implemented bits in the bandwidth allocation control fields for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_MBW_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_MBW_IDR is read-only.

MPAMF_MBW_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_MBW_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_MBW_IDR_s is permitted to have either the same or different contents to MPAMF_MBW_IDR_ns, MPAMF_MBW_IDR_rt, or MPAMF_MBW_IDR_rl.
- MPAMF_MBW_IDR_ns is permitted to have either the same or different contents to MPAMF_MBW_IDR_rt or MPAMF_MBW_IDR_rl.
- MPAMF_MBW_IDR_rt is permitted to have either the same or different contents to MPAMF_MBW_IDR_rl.

There must be separate registers in the Secure (MPAMF_MBW_IDR_s), Non-secure (MPAMF_MBW_IDR_ns), Root (MPAMF_MBW_IDR_rt), and Realm (MPAMF_MBW_IDR_rl) MPAM feature pages.

When [MPAMF_IDR](#).HAS_RIS is 1, MPAMF_MBW_IDR shows the configuration of memory bandwidth partitioning for the bandwidth resource instance selected by [MPAMCFG_PART_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_MBW_IDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|-----------------|
| MPAM | MPAMF_BASE_s | 0x0040 | MPAMF_MBW_IDR_s |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|------------------|
| MPAM | MPAMF_BASE_ns | 0x0040 | MPAMF_MBW_IDR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|-------|--------|----------|
|-----------|-------|--------|----------|

| | | | |
|------|---------------|--------|------------------|
| MPAM | MPAMF_BASE_rt | 0x0040 | MPAMF_MBW_IDR_rt |
|------|---------------|--------|------------------|

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|------------------|
| MPAM | MPAMF_BASE_rl | 0x0040 | MPAMF_MBW_IDR_rl |

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_MBWUMON_IDR, MPAM Features Memory Bandwidth Usage Monitoring ID register

The MPAMF_MBWUMON_IDR characteristics are:

Purpose

Indicates the number of memory bandwidth usage monitor instances implemented. This register also indicates several properties of MBWU monitoring, including whether the implementation supports capture, scaling, or long counters.

MPAMF_MBWUMON_IDR_s indicates the number of Secure memory bandwidth usage monitor instances.

MPAMF_MBWUMON_IDR_ns indicates the number of Non-secure memory bandwidth usage monitor instances.

MPAMF_MBWUMON_IDR_rt indicates the number of Root memory bandwidth usage monitor instances.

MPAMF_MBWUMON_IDR_rl indicates the number of Realm memory bandwidth usage monitor instances.

If [MPAMF_IDR.HAS_RIS](#) is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#). Fields that do not mention RIS are constant across all resource instances.

Configuration

The power domain of MPAMF_MBWUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MPAMF_MBWUMON_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MBWUMON_IDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------------|--------------------------|---------------------|--------------------------|--------------------------------|--------------------------|--------------------------------|----------------------|-----------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| HAS_CAPTURE | HAS_LONG | LWD | HAS_RWBW | HAS_OFLOW_LNKG | HAS_OFSR | HAS_OFLOW_CAPT | RES0 | SCALE | | | | | | | | | | | | | | | | | | | | | | | |

HAS_CAPTURE, bit [31]

The implementation supports copying an [MSMON_MBWU](#) to the corresponding [MSMON_MBWU_CAPTURE](#) on a capture event.

| HAS_CAPTURE | Meaning |
|-------------|--|
| 0b0 | MSMON_MBWU_CAPTURE is not implemented and there is no support for capture events in the MBWU monitor. |
| 0b1 | The MSMON_MBWU_CAPTURE register is implemented and the MBWU monitor supports the capture event behavior. |

If RIS is implemented, this field indicates that MBWU monitor capture is implemented for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#).

If MPAMF_MBWUMON_IDR.HAS_LONG is 1, this also indicates that [MSMON_MBWU_L_CAPTURE](#) is implemented.

HAS_LONG, bit [30]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Indicates whether [MSMON_MBWU_L](#) is implemented.

If HAS_CAPTURE is 1, indicates whether [MSMON_MBWU_L_CAPTURE](#) is implemented.

| HAS_LONG | Meaning |
|----------|--|
| 0b0 | Does not implement MSMON_MBWU_L or MSMON_MBWU_L_CAPTURE . |
| 0b1 | Implements MSMON_MBWU_L . If HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE is also implemented. |

If RIS is implemented, this field indicates that the long MBWU monitor is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

If MPAMF_MBWUMON_IDR.HAS_CAPTURE is 1, this also indicates that [MSMON_MBWU_L_CAPTURE](#) is implemented.

Otherwise:

Reserved, RES0.

LWD, bit [29]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Long register VALUE width.

If [MPAMF_MBWUMON_IDR](#).HAS_LONG is 0, [MPAMF_MBWUMON_IDR](#).LWD must also be 0.

| LWD | Meaning |
|-----|--|
| 0b0 | If MPAMF_MBWUMON_IDR .HAS_LONG is 1, MSMON_MBWU_L has 44-bit VALUE field in bits [43:0]. Bits [62:44] are RES0. If HAS_LONG is 1 and MPAMF_MBWUMON_IDR .HAS_CAPTURE is 1, MSMON_MBWU_L_CAPTURE also has 44-bit VALUE field in bits [43:0]. |
| 0b1 | MSMON_MBWU_L has 63-bit VALUE field in bits [62:0]. If MPAMF_MBWUMON_IDR .HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE also has 63-bit VALUE field in bits [62:0]. |

If RIS is implemented, this field indicates the length of the [MSMON_MBWU_L](#).VALUE field implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

HAS_RWBW, bit [28]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Read/write bandwidth selection is implemented in [MSMON_CFG_MBWU_FLT](#).

| HAS_RWBW | Meaning |
|----------|--|
| 0b0 | Read/write bandwidth selection is not implemented. |
| 0b1 | Read/write bandwidth selection is implemented. |

If RIS is implemented, this field indicates whether read/write bandwidth collection selection is available in [MSMON_CFG_MBWU_FLT](#) for resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

HAS_OFLOW_LNKG, bit [27]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Supports [MSMON_CFG_MBWU_CTL](#).OFLOW_LNKG field to control how overflow on an instance affects other monitor instances in this MSC.

| HAS_OFLOW_LNKG | Meaning |
|----------------|--|
| 0b0 | Does not support MBWU overflow linkage. |
| 0b1 | Supports MBWU overflow linkage and the MSMON_CFG_MBWU_CTL .OFLOW_LNKG field. |

If RIS is implemented, this field indicates that [MSMON_CFG_MBWU_CTL](#).OFLOW_LNKG is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

HAS_OFSR, bit [26]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

The MBWU monitor overflow status bitmap register, [MSMON_MBWU_OFSR](#), is implemented.

| HAS_OFSR | Meaning |
|----------|--|
| 0b0 | MSMON_MBWU_OFSR register is not implemented. |
| 0b1 | MSMON_MBWU_OFSR register is implemented. |

If RIS is implemented, this field indicates that MBWU monitor overflow status bitmap register is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

HAS_OFLOW_CAPT, bit [25]

Supports [MSMON_CFG_MBWU_CTL](#).OFLOW_CAPT field to transfer the MBWU monitor instance to its capture register on an overflow or overflow linkage event.

| HAS_OFLOW_CAPT | Meaning |
|----------------|---|
| 0b0 | Does not support MBWU capture on overflow. |
| 0b1 | Supports MBWU capture on overflow and the MSMON_CFG_MBWU_CTL .OFLOW_CAPT field. |

If RIS is implemented, this field indicates that [MSMON_CFG_MBWU_CTL](#).OFLOW_CAPT is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [24:21]

Reserved, RES0.

SCALE, bits [20:16]

Scaling of [MSMON_MBWU.VALUE](#) in bits. If scaling is enabled by [MSMON_CFG_MBWU_CTL.SCLEN](#), the byte count in the VALUE field has been shifted by SCALE bits to the right.

| SCALE | Meaning |
|---------|---|
| 0b00000 | Scaling is not implemented. |
| 0bxxxxx | Other values are right shift count when scaling is enabled. |

If RIS is implemented, this field indicates the scale value for [MSMON_MBWU.VALUE](#) field for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#).

NUM_MON, bits [15:0]

The number of memory bandwidth usage monitor instances implemented. The largest monitor instance selector, [MSMON_CFG_MON_SEL.MON_SEL](#), is NUM_MON minus 1.

If RIS is implemented, this field indicates the number of MBWU monitor instances for [MSMON_MBWU.VALUE](#) field for the resource instance selected by [MPAMCFG_PART_SEL.RIS](#).

Accessing MPAMF_MBWUMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_MBWUMON_IDR is read-only.

MPAMF_MBWUMON_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_MBWUMON_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_MBWUMON_IDR_s is permitted to have either the same or different contents to MPAMF_MBWUMON_IDR_ns, MPAMF_MBWUMON_IDR_rt, or MPAMF_MBWUMON_IDR_rl.
- MPAMF_MBWUMON_IDR_ns is permitted to have either the same or different contents to MPAMF_MBWUMON_IDR_rt or MPAMF_MBWUMON_IDR_rl.
- MPAMF_MBWUMON_IDR_rt is permitted to have either the same or different contents to MPAMF_MBWUMON_IDR_rl.

There must be separate registers in the Secure (MPAMF_MBWUMON_IDR_s), Non-secure (MPAMF_MBWUMON_IDR_ns), Root (MPAMF_MBWUMON_IDR_rt), and Realm (MPAMF_MBWUMON_IDR_rl) MPAM feature pages.

When [MPAMF_IDR.HAS_RIS](#) is 1, MPAMF_MBWUMON_IDR shows the configuration of memory bandwidth monitoring for the bandwidth resource instance selected by [MPAMCFG_PART_SEL.RIS](#). Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF_MBWUMON_IDR is not affected by [MSMON_CFG_MON_SEL.RIS](#).

MPAMF_MBWUMON_IDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|---------------------|
| MPAM | MPAMF_BASE_s | 0x0090 | MPAMF_MBWUMON_IDR_s |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_ns | 0x0090 | MPAMF_MBWUMON_IDR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_rt | 0x0090 | MPAMF_MBWUMON_IDR_rt |

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_rl | 0x0090 | MPAMF_MBWUMON_IDR_rl |

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_MSMON_IDR, MPAM Resource Monitoring Identification Register

The MPAMF_MSMON_IDR characteristics are:

Purpose

Indicates which MPAM monitoring features are present on this MSC.

MPAMF_MSMON_IDR_s indicates Secure monitoring features. MPAMF_MSMON_IDR_ns indicates Non-secure monitoring features. MPAMF_MSMON_IDR_rt indicates Root monitoring features. MPAMF_MSMON_IDR_rl indicates Realm monitoring features.

If [MPAMF_IDR.HAS_RIS](#) is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by [MPAMCFG_PART_SEL.RIS](#). Fields that do not mention RIS are constant across all resource instances.

Configuration

The power domain of MPAMF_MSMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_MSMON == 1. Otherwise, direct accesses to MPAMF_MSMON_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MSMON_IDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | |
|---------------------|-----------------|-------------|--------------|------|----|----|----|----|----|-------------|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 |
| HAS_LOCAL_CAPT_EVNT | NO_HW_OFLW_INTR | HAS_OFLW_MS | HAS_OFLOW_SR | RES0 | | | | | | MSMON_MBWUM | | | | |

HAS_LOCAL_CAPT_EVNT, bit [31]

Has local capture event generator. Indicates whether this MSC has the MPAM local capture event generator and the [MSMON_CAPT_EVNT](#) register.

| HAS_LOCAL_CAPT_EVNT | Meaning |
|---------------------|---|
| 0b0 | Does not support MPAM local capture event generator or MSMON_CAPT_EVNT . |
| 0b1 | Supports the MPAM local capture event generator and the MSMON_CAPT_EVNT register. |

NO_HW_OFLW_INTR, bit [30]

When FEAT_MPAMv1p1 is implemented:

Does not have hardwired MPAM monitor overflow interrupt.

| NO_HW_OFLW_INTR | Meaning |
|-----------------|--|
| 0b0 | Supports generating a hardwired interrupt to signal MPAM monitor overflow. |
| 0b1 | No support for a hardwired interrupt to signal MPAM monitor overflow. |

If this field is 0, the MSC supports generating a hardwired interrupt for monitor overflow events.

If this field is 0 and the HAS_OFLW_MSI field in this register is 1, the MSC supports generating both hardwired interrupts and MSI writes to signal interrupts.

Otherwise:

Reserved, RES0.

HAS_OFLW_MSI, bit [29]

When FEAT_MPAMv1p1 is implemented:

Has support for MSI writes to signal MPAM monitor overflow interrupts. These registers are implemented: [MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#) and [MSMON_OFLOW_MSI_MPAM](#).

| HAS_OFLW_MSI | Meaning |
|--------------|---|
| 0b0 | MSMON_OFLOW_MSI_ADDR_L , MSMON_OFLOW_MSI_ADDR_H , MSMON_OFLOW_MSI_ATTR , MSMON_OFLOW_MSI_DATA and MSMON_OFLOW_MSI_MPAM registers are not implemented. |
| 0b1 | MSMON_OFLOW_MSI_ADDR_L , MSMON_OFLOW_MSI_ADDR_H , MSMON_OFLOW_MSI_ATTR , MSMON_OFLOW_MSI_DATA and MSMON_OFLOW_MSI_ATTR are implemented and can be used to generate writes to signal MPAM monitor overflow interrupts. |

If [MPAMF_MSMON_IDR.NO_HW_OFLW_INTR](#) is 1 and this bit is 0, this MSC does not support monitor overflow interrupts.

Otherwise:

Reserved, RES0.

HAS_OFLOW_SR, bit [28]

When FEAT_MPAMv1p1 is implemented:

Has MPAM monitor overflow status register [MSMON_OFLOW_SR](#).

| HAS_OFLOW_SR | Meaning |
|--------------|--|
| 0b0 | Does not have MSMON_OFLOW_SR . |
| 0b1 | Supports MSMON_OFLOW_SR . |

Otherwise:

Reserved, RES0.

Bits [27:18]

Reserved, RES0.

MSMON_MBWU, bit [17]

Memory bandwidth usage monitoring. Indicates whether MPAM monitoring for Memory Bandwidth Usage by PARTID and PMG is implemented and whether the following bandwidth usage registers are accessible:

- [MPAMF_MBWUMON_IDR](#), [MSMON_CFG_MBWU_CTL](#), [MSMON_CFG_MBWU_FLT](#), [MSMON_MBWU](#).
- The optional [MSMON_MBWU_CAPTURE](#).
- If MPAM v0.1 or MPAM v1.1 is implemented, the optional [MSMON_MBWU_L](#) and the optional [MSMON_MBWU_L_CAPTURE](#).

| MSMON_MBWU | Meaning |
|------------|---|
| 0b0 | Does not have monitoring for memory bandwidth usage and does not use the bandwidth usage registers. |
| 0b1 | Has monitoring of memory bandwidth usage and uses the bandwidth usage registers. |

If RIS is implemented, this field indicates that memory bandwidth usage monitoring is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS as described in [MPAMF_MBWUMON_IDR](#).

MSMON_CSU, bit [16]

Cache storage usage monitoring. Indicates whether MPAM monitoring of cache storage usage by PARTID and PMG is implemented and the following registers are accessible:

- [MPAMF_CSUMON_IDR](#), [MSMON_CFG_CSU_CTL](#), [MSMON_CFG_CSU_FLT](#), [MSMON_CSU](#).
- The optional [MSMON_CSU_CAPTURE](#).

| MSMON_CSU | Meaning |
|-----------|--|
| 0b0 | Does not have monitoring for cache storage usage or the MPAMF_CSUMON_IDR , MSMON_CFG_CSU_CTL , MSMON_CFG_CSU_FLT , MSMON_CSU or MSMON_CSU_CAPTURE registers. |
| 0b1 | Has monitoring of cache storage usage and the MPAMF_CSUMON_IDR , MSMON_CFG_CSU_CTL , MSMON_CFG_CSU_FLT , MSMON_CSU and optional MSMON_CSU_CAPTURE registers. |

If RIS is implemented, this field indicates that cache storage usage monitoring is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS as described in [MPAMF_CSUMON_IDR](#).

Bits [15:0]

Reserved, RES0.

Accessing MPAMF_MSMON_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_MSMON_IDR is read-only.

MPAMF_MSMON_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_MSMON_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_MSMON_IDR_s is permitted to have either the same or different contents to MPAMF_MSMON_IDR_ns, MPAMF_MSMON_IDR_rt, or MPAMF_MSMON_IDR_rl.
- MPAMF_MSMON_IDR_ns is permitted to have either the same or different contents to MPAMF_MSMON_IDR_rt or MPAMF_MSMON_IDR_rl.
- MPAMF_MSMON_IDR_rt is permitted to have either the same or different contents to MPAMF_MSMON_IDR_rl.

There must be separate registers in the Secure (MPAMF_MSMON_IDR_s), Non-secure (MPAMF_MSMON_IDR_ns), Root (MPAMF_MSMON_IDR_rt), and Realm (MPAMF_MSMON_IDR_rl) MPAM feature pages.

When [MPAMF_IDR](#).HAS_RIS is 1, MPAMF_MSMON_IDR shows the configuration of memory system monitoring for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

Access to MPAMF_MSMON_IDR is not affected by [MSMON_CFG_MON_SEL](#).RIS.

MPAMF_MSMON_IDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|-------------------|
| MPAM | MPAMF_BASE_s | 0x0080 | MPAMF_MSMON_IDR_s |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_ns | 0x0080 | MPAMF_MSMON_IDR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_rt | 0x0080 | MPAMF_MSMON_IDR_rt |

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_rl | 0x0080 | MPAMF_MSMON_IDR_rl |

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_PARTID_NRW_IDR, MPAM PARTID Narrowing ID register

The MPAMF_PARTID_NRW_IDR characteristics are:

Purpose

Indicates the largest internal PARTID for this MSC.

MPAMF_PARTID_NRW_IDR_s indicates the largest Secure internal PARTID. MPAMF_PARTID_NRW_IDR_ns indicates the largest Non-secure internal PARTID.

When FEAT_RME is implemented: MPAMF_PARTID_NRW_rt indicates the largest Root internal PARTID. MPAMF_PARTID_NRW_rl indicates the largest Realm internal PARTID.

PARTID narrowing is global to the MSC and does not vary by resource instance.

Configuration

The power domain of MPAMF_PARTID_NRW_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PARTID_NRW == 1. Otherwise, direct accesses to MPAMF_PARTID_NRW_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_PARTID_NRW_IDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | INTPARTID_MAX | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

INTPARTID_MAX, bits [15:0]

The largest intPARTID supported in this MSC.

Accessing MPAMF_PARTID_NRW_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_PARTID_NRW_IDR is read-only.

MPAMF_PARTID_NRW_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_PARTID_NRW_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_PARTID_NRW_IDR_s is permitted to have either the same or different contents to MPAMF_PARTID_NRW_IDR_ns, MPAMF_PARTID_NRW_IDR_rt, or MPAMF_PARTID_NRW_IDR_rl.

- MPAMF_PARTID_NRW_IDR_ns is permitted to have either the same or different contents to MPAMF_PARTID_NRW_IDR_rt or MPAMF_PARTID_NRW_IDR_rl.
- MPAMF_PARTID_NRW_IDR_rt is permitted to have either the same or different contents to MPAMF_PARTID_NRW_IDR_rl.

There must be separate registers in the Secure (MPAMF_PARTID_NRW_IDR_s), Non-secure (MPAMF_PARTID_NRW_IDR_ns), Root (MPAMF_PARTID_NRW_IDR_rt), and Realm (MPAMF_PARTID_NRW_IDR_rl) MPAM feature pages.

MPAMF_PARTID_NRW_IDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|------------------------|
| MPAM | MPAMF_BASE_s | 0x0050 | MPAMF_PARTID_NRW_IDR_s |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_ns | 0x0050 | MPAMF_PARTID_NRW_IDR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_rt | 0x0050 | MPAMF_PARTID_NRW_IDR_rt |

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_rl | 0x0050 | MPAMF_PARTID_NRW_IDR_rl |

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_PRI_IDR, MPAM Priority Partitioning Identification Register

The MPAMF_PRI_IDR characteristics are:

Purpose

Indicates which MPAM priority partitioning features are present on this MSC.

MPAMF_PRI_IDR_s indicates priority partitioning features accessed from the Secure MPAM feature page.

MPAMF_PRI_IDR_ns indicates priority partitioning features accessed from the Non-secure MPAM feature page.

MPAMF_PRI_IDR_rt indicates priority partitioning features accessed from the Root MPAM feature page.

MPAMF_PRI_IDR_rl indicates priority partitioning features accessed from the Realm MPAM feature page.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. The description of every field that is affected by [MPAMCFG_PART_SEL](#).RIS has that information within the field description.

Configuration

The power domain of MPAMF_PRI_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and MPAMF_IDR.HAS_PRI_PART == 1. Otherwise, direct accesses to MPAMF_PRI_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_PRI_IDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----------|------|----------------|-----------|------|-----------|------|-----------------|------------|------|-----------------|------------|------|-----------------|------------|------|-----------------|------------|------|-----------------|------------|------|-----------------|------------|------|-----------------|------------|------|-----------------|------------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | DSPRI_WD | RES0 | DSPRI_0_IS_LOW | HAS_DSPRI | RES0 | INTPRI_WD | RES0 | INTPRI_0_IS_LOW | HAS_INTPRI | RES0 | INTPRI_0_IS_LOW | HAS_INTPRI | RES0 | INTPRI_0_IS_LOW | HAS_INTPRI | RES0 | INTPRI_0_IS_LOW | HAS_INTPRI | RES0 | INTPRI_0_IS_LOW | HAS_INTPRI | RES0 | INTPRI_0_IS_LOW | HAS_INTPRI | RES0 | INTPRI_0_IS_LOW | HAS_INTPRI | RES0 | INTPRI_0_IS_LOW | HAS_INTPRI | RES0 |

Bits [31:26]

Reserved, RES0.

DSPRI_WD, bits [25:20]

Number of implemented bits in the downstream priority field (DSPRI) of [MPAMCFG_PRI](#).

If HAS_DSPRI == 1, this field must contain a value from 1 to 16, inclusive.

If HAS_DSPRI == 0, this field must be 0.

If RIS is implemented, this field indicates the number of downstream priority bits for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [19:18]

Reserved, RES0.

DSPRI_0_IS_LOW, bit [17]

Indicates whether 0 in [MPAMCFG_PRI](#).DSPRI is the lowest or the highest downstream priority.

| DSPRI_0_IS_LOW | Meaning |
|-----------------------|---|
| 0b0 | In the MPAMCFG_PRI .DSPRI field, a value of 0 means the highest priority. |
| 0b1 | In the MPAMCFG_PRI .DSPRI field, a value of 0 means the lowest priority. |

If RIS is implemented, this field indicates that 0 is the lowest downstream priority for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_DSPRI, bit [16]

Indicates that the [MPAMCFG_PRI](#) register implements the DSPRI field.

| HAS_DSPRI | Meaning |
|------------------|--|
| 0b0 | This MSC supports priority partitioning, but does not implement a downstream priority (DSPRI) field in the MPAMCFG_PRI register. |
| 0b1 | This MSC supports downstream priority partitioning and implements the downstream priority (DSPRI) field in the MPAMCFG_PRI register. |

If RIS is implemented, this field indicates that downstream priority is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [15:10]

Reserved, RES0.

INTPRI_WD, bits [9:4]

Number of implemented bits in the internal priority field (INTPRI) in the [MPAMCFG_PRI](#) register.

If HAS_INTPRI == 1, this field must contain a value from 1 to 16, inclusive.

If HAS_INTPRI == 0, this field must be 0.

If RIS is implemented, this field indicates the number of internal priority bits for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Bits [3:2]

Reserved, RES0.

INTPRI_0_IS_LOW, bit [1]

Indicates whether 0 in [MPAMCFG_PRI](#).INTPRI is the lowest or the highest internal priority.

| INTPRI_0_IS_LOW | Meaning |
|------------------------|--|
| 0b0 | In the MPAMCFG_PRI .INTPRI field, a value of 0 means the highest priority. |
| 0b1 | In the MPAMCFG_PRI .INTPRI field, a value of 0 means the lowest priority. |

If RIS is implemented, this field indicates that 0 is the lowest internal priority for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

HAS_INTPRI, bit [0]

Indicates that this MSC implements the INTPRI field in the [MPAMCFG_PRI](#) register.

| HAS_INTPRI | Meaning |
|------------|---|
| 0b0 | This MSC supports priority partitioning, but does not implement the internal priority (INTPRI) field in the MPAMCFG_PRI register. |
| 0b1 | This MSC supports internal priority partitioning and implements the internal priority (INTPRI) field in the MPAMCFG_PRI register. |

If RIS is implemented, this field indicates that internal priority is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Accessing MPAMF_PRI_IDR

This register is within the MPAM feature page memory frames. In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.

MPAMF_PRI_IDR is read-only.

MPAMF_PRI_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

MPAMF_PRI_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_PRI_IDR_s is permitted to have either the same or different contents to MPAMF_PRI_IDR_ns, MPAMF_PRI_IDR_rt, or MPAMF_PRI_IDR_rl.
- MPAMF_PRI_IDR_ns is permitted to have either the same or different contents to MPAMF_PRI_IDR_rt or MPAMF_PRI_IDR_rl.
- MPAMF_PRI_IDR_rt is permitted to have either the same or different contents to MPAMF_PRI_IDR_rl.

There must be separate registers in the Secure (MPAMF_PRI_IDR_s), Non-secure (MPAMF_PRI_IDR_ns), Root (MPAMF_PRI_IDR_rt), and Realm (MPAMF_PRI_IDR_rl) MPAM feature pages.

When [MPAMF_IDR](#).HAS_RIS is 1, MPAMF_PRI_IDR shows the configuration of priority partitioning for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_PRI_IDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|-----------------|
| MPAM | MPAMF_BASE_s | 0x0048 | MPAMF_PRI_IDR_s |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|------------------|
| MPAM | MPAMF_BASE_ns | 0x0048 | MPAMF_PRI_IDR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|------------------|
| MPAM | MPAMF_BASE_rt | 0x0048 | MPAMF_PRI_IDR_rt |

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|------------------|
| MPAM | MPAMF_BASE_rl | 0x0048 | MPAMF_PRI_IDR_rl |

When FEAT_RME is implemented access on this interface are **RO**.

MPAMF_SIDR, MPAM Features Secure Identification Register

The MPAMF_SIDR characteristics are:

Purpose

The MPAMF_SIDR is a 32-bit read-only register that indicates the maximum Secure PARTID and Secure PMG on this MSC.

Configuration

The power domain of MPAMF_SIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMF_SIDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_SIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-----------|----|----|----|----|----|----|----|--------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | S_PMG_MAX | | | | | | | | S_PARTID_MAX | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

S_PMG_MAX, bits [23:16]

Maximum value of Secure PMG supported by this component.

S_PARTID_MAX, bits [15:0]

Maximum value of Secure PARTID supported by this component.

Accessing MPAMF_SIDR

This register is only within the Secure MPAM feature page memory frame.

MPAMF_SIDR is read-only.

MPAMF_SIDR must only be readable from the Secure MPAM feature page. If the system or the MSC does not support the Secure address map, this register must not be accessible.

MPAMF_SIDR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|--------------|
| MPAM | MPAMF_BASE_s | 0x0008 | MPAMF_SIDR_s |

Accesses on this interface are **RO**.

MSMON_CAPT_EVNT, MPAM Capture Event Generation Register

The MSMON_CAPT_EVNT characteristics are:

Purpose

Generates a local capture event when written with bit[0] as 1.

MSMON_CAPT_EVNT_s generates local capture events for Secure monitor instances only or for Secure and Non-secure monitor instances. MSMON_CAPT_EVNT_ns generates local capture events for Non-secure monitor instances only. MSMON_CAPT_EVNT_rt generates local capture events for Root monitor instances only or for Root, Secure, Realm, and Non-secure monitor instances. MSMON_CAPT_EVNT_rl generates local capture events for Realm monitor instances or for for Realm monitor instances or Realm and Non-secure monitor instances.

Configuration

The power domain of MSMON_CAPT_EVNT is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.HAS_LOCAL_CAPT_EVNT == 1. Otherwise, direct accesses to MSMON_CAPT_EVNT are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CAPT_EVNT is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|-----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | ALL | | NOW | | | | | | | | | | | | | |

Bits [31:2]

Reserved, RES0.

ALL, bit [1]

In the Secure instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Secure and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.
- If ALL is written as 0 and NOW is written as 1, signal a capture event to Secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.

In the Non-secure instance of this register, this bit is RAZ/WI.

In the Root instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Root, Realm, Secure, and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.
- If ALL is written as 0 and NOW is written as 1, signal a capture event to Root monitor instances within this MSC that are configured with CAPT_EVNT = 7.

In the Realm instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Realm and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.

- If ALL is written as 0 and NOW is written as 1, signal a capture event to Realm monitor instances within this MSC that are configured with CAPT_EVNT = 7.

This bit always reads as zero.

| ALL | Meaning |
|-----|---|
| 0b0 | Send capture event only to monitor instances in the same MPAM feature page as this register. |
| 0b1 | Send capture event to monitor instances in certain MPAM feature pages as described in the ALL field of this register. |

NOW, bit [0]

When written as 1, this bit causes an event to those monitor instances described in the ALL field that have CAPT_EVNT set to the value of 7.

When this bit is written as 0, no event is signaled.

This bit always reads as zero.

Accessing MSMON_CAPT_EVNT

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CAPT_EVNT_s must be accessible from the Secure MPAM feature page. MSMON_CAPT_EVNT_ns must be accessible from the Non-secure MPAM feature page.

MSMON_CAPT_EVNT_s and MSMON_CAPT_EVNT_ns must be separate registers. The Secure instance (MSMON_CAPT_EVNT_s) can generate local capture events for Secure monitor instances only or for Secure and Non-secure monitor instances, and the Non-secure instance (MSMON_CAPT_EVNT_ns) can generate local capture events for Non-secure monitor instances only.

MSMON_CAPT_EVNT can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|-------------------|
| MPAM | MPAMF_BASE_s | 0x0808 | MSMON_CAPT_EVNT_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_ns | 0x0808 | MSMON_CAPT_EVNT_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_rt | 0x0808 | MSMON_CAPT_EVNT_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_rl | 0x0808 | MSMON_CAPT_EVNT_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CFG_CSU_CTL, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Control Register

The MSMON_CFG_CSU_CTL characteristics are:

Purpose

Controls the CSU monitor selected by [MSMON_CFG_MON_SEL](#).

MSMON_CFG_CSU_CTL_s controls the Secure cache storage usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_CTL_ns controls Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_CTL_rt controls the monitor configuration for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_CTL_rl controls the monitor configuration for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance configuration accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL](#).RIS and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

Configuration

The power domain of MSMON_CFG_CSU_CTL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CFG_CSU_CTL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_CSU_CTL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | |
|--------------------|---------------------------|----------------------------|------------------------------|----------------------------|---------------------------|----------------------------|-------------------------|----------------------|----------------------------|---------------------|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 |
| EN | CAPT_EVNT | CAPT_RESET | OFLOW_STATUS | OFLOW_INTR | OFLOW_FRZ | OFLOW_CAPT | SUBTYPE | RES0 | CEVNT_OFLW | MAT | | | |

EN, bit [31]

Enabled.

| EN | Meaning |
|-----|--|
| 0b0 | The monitor instance is disabled and must not collect any information. |
| 0b1 | The monitor instance is enabled to collect information according to the configuration of the instance. |

CAPT_EVNT, bits [30:28]

Capture event selector.

Select the event that triggers capture from the following:

| CAPT_EVNT | Meaning |
|------------------|---|
| 0b000 | No capture event is triggered. |
| 0b001 | External capture event 1 (optional, but recommended) |
| 0b010 | External capture event 2 (optional) |
| 0b011 | External capture event 3 (optional) |
| 0b100 | External capture event 4 (optional) |
| 0b101 | External capture event 5 (optional) |
| 0b110 | External capture event 6 (optional) |
| 0b111 | Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the Security state of this monitor. (optional) |

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

If capture is not implemented for the CSU monitor type as indicated by [MPAMF_CSUMON_IDR](#).HAS_CAPTURE = 0, this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset after capture.

Controls whether the value of [MSMON_CSU](#) is reset to zero immediately after being copied to [MSMON_CSU_CAPTURE](#).

| CAPT_RESET | Meaning |
|-------------------|----------------------------------|
| 0b0 | Monitor is not reset on capture. |
| 0b1 | Monitor is reset on capture. |

If capture is not implemented for the CSU monitor type as indicated by [MPAMF_CSUMON_IDR](#).HAS_CAPTURE = 0, this field is RAZ/WI.

Because the CSU monitor type produces a measurement rather than a count, it might not make sense to ever reset the value after a capture. If there is no reason to ever reset a CSU monitor, this field is RAZ/WI.

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of [MSMON_CSU](#) has overflowed.

If [MPAMF_CSUMON_IDR](#).HAS_OFLOW_CAPT is 1 or [MPAMF_CSUMON_IDR](#).HAS_OFLOW_LNKG is 1, then a store to [MSMON_CSU](#) when this field is 1 resets this field to 0.

| OFLOW_STATUS | Meaning |
|---------------------|---|
| 0b0 | No overflow has occurred. |
| 0b1 | At least one overflow has occurred since this bit was last written to zero. |

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

OFLOW_INTR, bit [25]

Overflow Interrupt.

Controls whether an overflow interrupt is generated when the value of [MSMON_CSU](#) has overflowed.

| OFLOW_INTR | Meaning |
|-------------------|--|
| 0b0 | No interrupt is signaled on an overflow of MSMON_CSU . |
| 0b1 | On overflow, an implementation-specific interrupt is signaled. |

If OFLOW_INTR is not supported by the implementation, this field is RAZ/WI.

OFLOW_FRZ, bit [24]

Freeze Monitor on Overflow.

Controls whether the value of [MSMON_CSU](#) freezes on an overflow.

| OFLOW_FRZ | Meaning |
|-----------|--|
| 0b0 | Monitor count wraps on overflow. |
| 0b1 | Monitor count freezes on overflow. The frozen value might be 0 or another value if the monitor overflowed with an increment larger than 1. |

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

OFLOW_CAPT, bit [23]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_OFLOW_CAPT == 1:

Capture Monitor on Overflow.

Controls whether the value of [MSMON_CSU](#) is captured on an overflow or an overflow linkage event.

| OFLOW_CAPT | Meaning |
|------------|---|
| 0b0 | Monitor is not captured on an overflow or when affected by an overflow linkage event. |
| 0b1 | Monitor is captured on an overflow or when affected by an overflow linkage event. If OFLOW_FRZ is 1, the monitor does not continue to count after the overflow or overflow linkage event. If CAPT_RESET is 1, the monitor instance resets to 0. |

If RIS is implemented, this field indicates that [MSMON_CFG_CSU_CTL](#).OFLOW_CAPT is implemented for the resource instance selected by [MPAMCFG_PART_SEL](#).RIS.

Otherwise:

Reserved, RES0.

SUBTYPE, bits [22:20]

Subtype. Type of cache storage usage counted by this monitor.

This field is not currently used for CSU monitors, but reserved for future use.

This field is RAZ/WI.

Bit [19]

Reserved, RES0.

CEVNT_OFLW, bit [18]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_OFLOW_LNKG == 1:

Capture Event performs overflow behavior.

Selects whether a capture event matching the CAPT_EVNT field performs the overflow behavior or the capture behavior.

| CEVNT_OFLW | Meaning |
|------------|--|
| 0b0 | On a capture event matching the CAPT_EVNT field, the capture behaviors are performed. |
| 0b1 | On a capture event matching the CAPT_EVNT field, the overflow behaviors are performed. |

Otherwise:

Reserved, RES0.

MATCH_PMG, bit [17]

Match PMG.

Controls whether the monitor measures only storage used with PMG matching [MSMON_CFG_CSU_FLT.PMG](#).

| MATCH_PMG | Meaning |
|------------------|--|
| 0b0 | The monitor measures storage used with any PMG value. |
| 0b1 | The monitor only measures storage used with the PMG value matching MSMON_CFG_CSU_FLT.PMG . |

If MATCH_PMG is 1 and MATCH_PARTID is 0, it is CONSTRAINED UNPREDICTABLE whether the monitor instance:

- Measures the storage used with matching PMG and with any PARTID.
- Measures no storage usage, that is, [MSMON_CSU.VALUE](#) is zero.
- Measures the storage used with matching PMG and PARTID, that is, treats MATCH_PARTID as == 1.

MATCH_PARTID, bit [16]

Match PARTID.

Controls whether the monitor measures only storage used with PARTID matching [MSMON_CFG_CSU_FLT.PARTID](#).

| MATCH_PARTID | Meaning |
|---------------------|--|
| 0b0 | The monitor measures storage used with any PARTID value. |
| 0b1 | The monitor only measures storage used with the PARTID value matching MSMON_CFG_CSU_FLT.PARTID . |

Bits [15:11]

Reserved, RES0.

OFLOW_LNKG, bits [10:8]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_OFLOW_LNKG == 1:

Overflow linkage event.

Controls signaling of a capture event on overflow of this monitor instance.

| OFLOW_LNKG | Meaning |
|-------------------|--|
| 0b000 | Overflow of the monitor instance only affects this monitor instance. |
| 0b001 | Overflow of this monitor instance signals Capture Event 1. |
| 0b010 | Overflow of this monitor instance signals Capture Event 2. |
| 0b011 | Overflow of this monitor instance signals Capture Event 3. |
| 0b100 | Overflow of this monitor instance signals Capture Event 4. |
| 0b101 | Overflow of this monitor instance signals Capture Event 5. |
| 0b110 | Overflow of this monitor instance signals Capture Event 6. |
| 0b111 | Reserved. |

Otherwise:

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code. The CSU monitor is TYPE = 0x43.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x43.

Access to this field is **RO**.

Accessing MSMON_CFG_CSU_CTL

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_CFG_CSU_CTL_s must be accessible from the Secure MPAM feature page.
- MSMON_CFG_CSU_CTL_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_CSU_CTL_rt must be accessible from the Root MPAM feature page.
- MSMON_CFG_CSU_CTL_rl must be accessible from the Realm MPAM feature page.

MSMON_CFG_CSU_CTL_s, MSMON_CFG_CSU_CTL_ns, MSMON_CFG_CSU_CTL_rt, and MSMON_CFG_CSU_CTL_rl must be separate registers:

- The Secure instance (MSMON_CFG_CSU_CTL_s) accesses the cache storage usage monitor controls used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_CSU_CTL_ns) accesses the cache storage usage monitor controls used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_CSU_CTL_rt) accesses the cache storage usage monitor controls used for Root PARTIDs.
- The Realm instance (MSMON_CFG_CSU_CTL_rl) accesses the cache storage usage monitor controls used for Realm PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CFG_CSU_CTL can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|---------------------|
| MPAM | MPAMF_BASE_s | 0x0818 | MSMON_CFG_CSU_CTL_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_ns | 0x0818 | MSMON_CFG_CSU_CTL_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_rt | 0x0818 | MSMON_CFG_CSU_CTL_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |

|-----------|-------|--------|----------|

| | | | |
|------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_r1 | 0x0818 | MSMON_CFG_CSU_CTL_r1 |
|------|---------------|--------|----------------------|

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CFG_CSU_FLT, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Filter Register

The MSMON_CFG_CSU_FLT characteristics are:

Purpose

Configures PARTID and PMG to measure or count in the CSU monitor selected by [MSMON_CFG_MON_SEL](#).

MSMON_CFG_CSU_FLT_s sets filter conditions for the Secure cache storage usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_CTL_ns sets filter conditions for the Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_FLT_rt sets the filter conditions for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_FLT_rl sets the filter conditions for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_CFG_CSU_FLT is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_CSU == 1. Otherwise, direct accesses to MSMON_CFG_CSU_FLT are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_CSU_FLT is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|----|----|----|----------------------|----|----|----|----|----|----|----|---------------------|----|----|----|------------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| XCL | | | | RES0 | | | | | | | | PMG | | | | PARTID | | | | | | | | | | | | | | | |

XCL, bit [31]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_XCL == 1:

Exclude Clean. The monitor instance does not count cache storage used by lines in an unmodified cache state.

| XCL | Meaning |
|-----|---|
| 0b0 | Monitor instance counts cache storage in modified and unmodified cache lines. |
| 0b1 | Monitor instance counts cache storage in modified cache lines only. |

Otherwise:

Reserved, RES0.

Bits [30:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter cache storage usage monitoring.

If [MSMON_CFG_CSU_CTL.MATCH_PMG](#) is 0, this field is not used to match cache storage to a PMG and the contents of this field is ignored.

If [MSMON_CFG_CSU_CTL.MATCH_PMG](#) is 1 and [MSMON_CFG_CSU_CTL.MATCH_PARTID](#) is 1, the monitor instance selected by [MSMON_CFG_MON_SEL](#) measures or counts cache storage labeled with PMG equal to this field and PARTID equal to the PARTID field.

If [MSMON_CFG_CSU_CTL.MATCH_PMG](#) is 1 and [MSMON_CFG_CSU_CTL.MATCH_PARTID](#) is 0, the behavior of the monitor instance selected by [MSMON_CFG_MON_SEL](#) is CONSTRAINED UNPREDICTABLE. See [MSMON_CFG_CSU_CTL.MATCH_PMG](#) for more information.

PARTID, bits [15:0]

Partition ID to filter cache storage usage monitoring.

If [MSMON_CFG_CSU_CTL.MATCH_PARTID](#) is 0 and [MSMON_CFG_CSU_CTL.MATCH_PMG](#) is 0, the monitor measures all allocated cache storage.

If [MSMON_CFG_CSU_CTL.MATCH_PARTID](#) is 0 and [MSMON_CFG_CSU_CTL.MATCH_PMG](#) is 1, the behavior of the monitor is CONSTRAINED UNPREDICTABLE. See the description of [MSMON_CFG_CSU_CTL.MATCH_PMG](#).

If [MSMON_CFG_CSU_CTL.MATCH_PARTID](#) is 1 and [MSMON_CFG_CSU_CTL.MATCH_PMG](#) is 0, the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts cache storage labeled with PARTID equal to this field.

If [MSMON_CFG_CSU_CTL.MATCH_PARTID](#) is 1 and [MSMON_CFG_CSU_CTL.MATCH_PMG](#) is 1, the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts cache storage labeled with PARTID equal to this field and PMG equal to the PMG field.

Accessing MSMON_CFG_CSU_FLT

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- [MSMON_CFG_CSU_FLT_s](#) must be accessible from the Secure MPAM feature page.
- [MSMON_CFG_CSU_FLT_ns](#) must be accessible from the Non-secure MPAM feature page.
- [MSMON_CFG_CSU_FLT_rt](#) must be accessible from the Root MPAM feature page.
- [MSMON_CFG_CSU_FLT_rl](#) must be accessible from the Realm MPAM feature page.

[MSMON_CFG_CSU_FLT_s](#), [MSMON_CFG_CSU_FLT_ns](#), [MSMON_CFG_CSU_FLT_rt](#), and [MSMON_CFG_CSU_FLT_rl](#) must be separate registers:

- The Secure instance ([MSMON_CFG_CSU_FLT_s](#)) accesses the PARTID and PMG matching for a cache storage usage monitor used for Secure PARTIDs.
- The Non-secure instance ([MSMON_CFG_CSU_FLT_ns](#)) accesses the PARTID and PMG matching for a cache storage usage monitor used for Non-secure PARTIDs.
- The Root instance ([MSMON_CFG_CSU_FLT_rt](#)) accesses the PARTID and PMG matching for a cache storage usage monitor used for Root PARTIDs.
- The Realm instance ([MSMON_CFG_CSU_FLT_rl](#)) accesses the PARTID and PMG matching for a cache storage usage monitor used for Realm PARTIDs.

When RIS is implemented, loads and stores to [MSMON_CFG_CSU_FLT](#) access the monitor configuration settings for the resource instance selected by [MSMON_CFG_MON_SEL.RIS](#) and the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

When RIS is not implemented, loads and stores to [MSMON_CFG_CSU_FLT](#) access the monitor configuration settings for the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

MSMON_CFG_CSU_FLT can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|---------------------|
| MPAM | MPAMF_BASE_s | 0x0810 | MSMON_CFG_CSU_FLT_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_ns | 0x0810 | MSMON_CFG_CSU_FLT_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_rt | 0x0810 | MSMON_CFG_CSU_FLT_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_rl | 0x0810 | MSMON_CFG_CSU_FLT_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CFG_MBWU_CTL, MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Control Register

The MSMON_CFG_MBWU_CTL characteristics are:

Purpose

Controls the MBWU monitor selected by [MSMON_CFG_MON_SEL](#).

MSMON_CFG_MBWU_CTL_s controls the Secure memory bandwidth usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_MBWU_CTL_ns controls Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_MBWU_CTL_rt controls the monitor configuration for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_MBWU_CTL_rl controls the monitor configuration for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance configuration accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL](#).RIS and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

Configuration

The power domain of MSMON_CFG_MBWU_CTL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_CFG_MBWU_CTL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MBWU_CTL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | |
|--------------------|---------------------------|----------------------------|------------------------------|----------------------------|---------------------------|----------------------------|-------------------------|-----------------------|----------------------------|--------------------|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 |
| EN | CAPT_EVNT | CAPT_RESET | OFLOW_STATUS | OFLOW_INTR | OFLOW_FRZ | OFLOW_CAPT | SUBTYPE | SCLEN | CEVNT_OFLW | MA | | | |

EN, bit [31]

Enabled.

| EN | Meaning |
|-----|--|
| 0b0 | The monitor instance is disabled and must not collect any information. |
| 0b1 | The monitor instance is enabled to collect information according to the configuration of the instance. |

CAPT_EVNT, bits [30:28]

Capture event selector.

When the selected capture event occurs, [MSMON_MBWU](#) of the monitor instance is copied to [MSMON_MBWU_CAPTURE](#) of the same instance. If the long counter is also implemented, [MSMON_MBWU_L](#) is also copied to [MSMON_MBWU_L_CAPTURE](#).

Select the event that triggers capture from the following:

| CAPT_EVNT | Meaning |
|-----------|---|
| 0b000 | No capture event is triggered. |
| 0b001 | External capture event 1 (optional, but recommended) |
| 0b010 | External capture event 2 (optional) |
| 0b011 | External capture event 3 (optional) |
| 0b100 | External capture event 4 (optional) |
| 0b101 | External capture event 5 (optional) |
| 0b110 | External capture event 6 (optional) |
| 0b111 | Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the Security state of this monitor. (optional) |

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

If capture is not implemented for the MBWU monitor type as indicated by [MPAMF_MBWUMON_IDR](#).HAS_CAPTURE = 0, this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset [MSMON_MBWU](#).VALUE after capture.

Controls whether the VALUE field of the monitor instance is reset to zero immediately after being copied to the corresponding capture register.

| CAPT_RESET | Meaning |
|------------|--|
| 0b0 | MSMON_MBWU .VALUE field of the monitor instance is not reset on capture. |
| 0b1 | MSMON_MBWU .VALUE field of the monitor instance is reset on capture. |

If capture is not implemented for the MBWU monitor type as indicated by [MPAMF_MBWUMON_IDR](#).HAS_CAPTURE = 0, this field is RAZ/WI.

This control bit affects both [MSMON_MBWU](#) and [MSMON_MBWU_L](#) in implementations that include [MSMON_MBWU_L](#).

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of [MSMON_MBWU](#) has overflowed.

| OFLOW_STATUS | Meaning |
|--------------|---|
| 0b0 | MSMON_MBWU .VALUE has not overflowed. |
| 0b1 | MSMON_MBWU .VALUE has overflowed at least once since this bit was last written to zero. |

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

Overflow status for [MSMON_MBWU_L](#).VALUE is reported in [MSMON_CFG_MBWU_CTL](#).OFLOW_STATUS_L.

If [MPAMF_MBWUMON_IDR](#).HAS_OFLOW_CAPT is 1 or [MPAMF_MBWUMON_IDR](#).HAS_OFLOW_LNKG is 1, then a store to [MSMON_MBWU](#) when this field is 1 resets this field to 0.

OFLOW_INTR, bit [25]

Enable interrupt on overflow of [MSMON_MBWU](#).VALUE.

| OFLOW_INTR | Meaning |
|------------|---|
| 0b0 | No interrupt is signaled on an overflow of MSMON_MBWU .VALUE. |
| 0b1 | An implementation-specific interrupt is signaled on an overflow of MSMON_MBWU .VALUE. |

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

If overflow interrupt is not supported by the MSC implementation, this field is RAZ/WI.

Interrupt enable for overflow of [MSMON_MBWU_L](#).VALUE is controlled by [MSMON_CFG_MBWU_CTL.OFLOW_INTR_L](#).

OFLOW_FRZ, bit [24]

Freeze monitor instance on overflow.

Controls whether [MSMON_MBWU](#).VALUE field of the monitor instance freezes on an overflow.

| OFLOW_FRZ | Meaning |
|-----------|---|
| 0b0 | MSMON_MBWU .VALUE field of the monitor instance wraps on overflow. |
| 0b1 | MSMON_MBWU .VALUE field of the monitor instance freezes on overflow. If the increment that caused the overflow was 1, the frozen value is the post-increment value of 0. If the increment that caused the overflow was larger than 1, the frozen value of the monitor might be 0 or a larger value less than the final increment. |

If overflow is not possible for the instance of the MBWU monitor in the implementation, this field is RAZ/WI.

This control bit affects both [MSMON_MBWU](#) and [MSMON_MBWU_L](#) in implementations that include [MSMON_MBWU_L](#).

OFLOW_CAPT, bit [23]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_OFLOW_CAPT == 1:

Capture Monitor on Overflow.

Controls whether the value of [MSMON_MBWU](#) is captured on an overflow or an overflow linkage event.

| OFLOW_CAPT | Meaning |
|------------|---|
| 0b0 | Monitor register MSMON_MBWU is not captured on an overflow or when affected by an overflow linkage event. |
| 0b1 | Monitor register MSMON_MBWU is captured on an overflow or when affected by an overflow linkage event. If OFLOW_FRZ is 1, the monitor does not continue to count after the overflow or overflow linkage event. If CAPT_RESET is 1, the monitor instance resets to 0. |

If this bit is 1, this monitor instance treats an overflow of this monitor instance as a private capture event.

If this bit is 1, this monitor instance also treats overflow linkage events for which it qualifies as a private capture event.

Otherwise:

Reserved, RES0.

SUBTYPE, bits [22:20]

Subtype. Type of bandwidth counted by this monitor.

This field is not currently used for MBWU monitors, but reserved for future use.

This field is RAZ/WI.

SCLEN, bit [19]

[MSMON_MBWU.VALUE](#) Scaling Enable.

Enables scaling of [MSMON_MBWU.VALUE](#) by [MPAMF_MBWUMON_IDR.SCALE](#).

| SCLEN | Meaning |
|-------|--|
| 0b0 | MSMON_MBWU.VALUE has bytes counted by the monitor instance. |
| 0b1 | MSMON_MBWU.VALUE has bytes counted by the monitor instance, shifted right by MPAMF_MBWUMON_IDR.SCALE . |

CEVNT_OFLW, bit [18]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_OFLOW_LNKG == 1:

Capture Event performs overflow behavior.

Selects whether a capture event matching the CAPT_EVNT field perform the overflow behavior or the capture behavior.

| CEVNT_OFLW | Meaning |
|------------|---|
| 0b0 | On a capture event matching the CAPT_EVNT field the capture behaviors are performed. |
| 0b1 | On a capture event matching the CAPT_EVNT field the overflow behaviors are performed. |

Otherwise:

Reserved, RES0.

MATCH_PMG, bit [17]

Match PMG.

Controls whether the monitor instance only counts data transferred with PMG matching [MSMON_CFG_MBWU_FLT.PMG](#).

| MATCH_PMG | Meaning |
|-----------|--|
| 0b0 | The monitor instance counts data transferred with any PMG value. |
| 0b1 | The monitor instance only counts data transferred with the PMG value matching MSMON_CFG_MBWU_FLT.PMG . |

MATCH_PARTID, bit [16]

Match PARTID.

Controls whether the monitor instance counts only data transferred with PARTID matching [MSMON_CFG_MBWU_FLT.PARTID](#).

| MATCH_PARTID | Meaning |
|--------------|--|
| 0b0 | The monitor instance counts data transferred with any PARTID value. |
| 0b1 | The monitor instance only counts data transferred with the PARTID value matching MSMON_CFG_MBWU_FLT.PARTID . |

OFLOW_STATUS_L, bit [15]

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Overflow Status of [MSMON_MBWU_L.VALUE](#) of the monitor instance.

Indicates whether [MSMON_MBWU_L.VALUE](#) has overflowed.

| OFLOW_STATUS_L | Meaning |
|----------------|---|
| 0b0 | MSMON_MBWU_L .VALUE has not overflowed. |
| 0b1 | MSMON_MBWU_L .VALUE has overflowed at least once since this bit was last written to zero. |

If [MPAMF_MBWUMON_IDR](#).HAS_LONG == 0, this bit is RES0.

Overflow status of [MSMON_MBWU](#).VALUE is reported in [MSMON_CFG_MBWU_CTL](#).OFLOW_STATUS.

If [MPAMF_MBWUMON_IDR](#).HAS_OFLOW_CAPT is 1 or [MPAMF_MBWUMON_IDR](#).HAS_OFLOW_LNKG is 1, then a store to [MSMON_MBWU_L](#) when this field is 1 resets this field to 0.

Otherwise:

Reserved, RES0.

OFLOW_INTR_L, bit [14]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and [MPAMF_MBWUMON_IDR](#).HAS_LONG == 1:

Overflow Interrupt for [MSMON_MBWU_L](#).

Controls whether an MPAM overflow interrupt is generated when [MSMON_MBWU_L](#).VALUE overflows.

| OFLOW_INTR_L | Meaning |
|--------------|--|
| 0b0 | No interrupt is signaled on an overflow of MSMON_MBWU_L .VALUE. |
| 0b1 | An implementation-specific interrupt is signaled on overflow of MSMON_MBWU_L .VALUE. |

If overflow is not possible for an MBWU monitor in the MSC implementation, this field is RAZ/WI.

If the overflow interrupt is not supported by the MSC implementation, this field is RAZ/WI.

Otherwise:

Reserved, RES0.

OFLOW_CAPT_L, bit [13]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), [MPAMF_MBWUMON_IDR](#).HAS_LONG == 1 and [MPAMF_MBWUMON_IDR](#).HAS_OFLOW_CAPT == 1:

Capture Long Monitor on Overflow.

Controls whether [MSMON_MBWU_L](#) is captured on an overflow or an overflow linkage event.

| OFLOW_CAPT_L | Meaning |
|--------------|---|
| 0b0 | Monitor register MSMON_MBWU_L is not captured on an overflow or when affected by an overflow linkage event. |
| 0b1 | Monitor register MSMON_MBWU_L is captured on an overflow or when affected by an overflow linkage event. If OFLOW_FRZ is 1, the monitor does not continue to count after the overflow or overflow linkage event. If CAPT_RESET is 1, the monitor instance resets to 0. |

If this bit is 1, this monitor instance treats an overflow of this monitor instance as a private capture event.

If this bit is 1, this monitor instance also treats overflow linkage events for which it qualifies as a private capture event.

Otherwise:

Reserved, RES0.

Bits [12:11]

Reserved, RES0.

OFLOW_CAPT_L, bits [10:8]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_OFLOW_LNKG == 1:

Overflow linkage event.

Controls signaling of a capture event on overflow of this monitor instance.

| OFLOW_CAPT_L | Meaning |
|--------------|--|
| 0b000 | Overflow of the monitor instance only affects this monitor instance. |
| 0b001 | Overflow of this monitor instance signals Capture Event 1. |
| 0b010 | Overflow of this monitor instance signals Capture Event 2. |
| 0b011 | Overflow of this monitor instance signals Capture Event 3. |
| 0b100 | Overflow of this monitor instance signals Capture Event 4. |
| 0b101 | Overflow of this monitor instance signals Capture Event 5. |
| 0b110 | Overflow of this monitor instance signals Capture Event 6. |
| 0b111 | Reserved. |

Otherwise:

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code. The MBWU monitor is TYPE = 0x42.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x42.

Access to this field is **RO**.

Accessing MSMON_CFG_MBWU_CTL

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_CFG_MBWU_CTL_s must be accessible from the Secure MPAM feature page.
- MSMON_CFG_MBWU_CTL_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_MBWU_CTL_rt must be accessible from the Root MPAM feature page.
- MSMON_CFG_MBWU_CTL_rl must be accessible from the Realm MPAM feature page.

MSMON_CFG_MBWU_CTL_s, MSMON_CFG_MBWU_CTL_ns, MSMON_CFG_MBWU_CTL_rt, and MSMON_CFG_MBWU_CTL_rl must be separate registers:

- The Secure instance (MSMON_CFG_MBWU_CTL_s) accesses the memory bandwidth usage monitor controls used for Secure PARTIDs.

- The Non-secure instance (MSMON_CFG_MBWU_CTL_ns) accesses the memory bandwidth usage monitor controls used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_MBWU_CTL_rt) accesses the memory bandwidth usage monitor controls used for Root PARTIDs.
- The Realm instance (MSMON_CFG_MBWU_CTL_rl) accesses the memory bandwidth usage monitor controls used for Realm PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_MBWU_CTL access the monitor configuration settings for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_MBWU_CTL access the monitor configuration settings for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CFG_MBWU_CTL can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|----------------------|
| MPAM | MPAMF_BASE_s | 0x0828 | MSMON_CFG_MBWU_CTL_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_ns | 0x0828 | MSMON_CFG_MBWU_CTL_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_rt | 0x0828 | MSMON_CFG_MBWU_CTL_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_rl | 0x0828 | MSMON_CFG_MBWU_CTL_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CFG_MBWU_FLT, MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Filter Register

The MSMON_CFG_MBWU_FLT characteristics are:

Purpose

Controls PARTID and PMG to measure or count in the MBWU monitor selected by [MSMON_CFG_MON_SEL](#).

MSMON_CFG_MBWU_FLT_s sets filter conditions for the Secure memory bandwidth usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_MBWU_CTL_ns sets filter conditions for the Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_FLT_rt sets the filter conditions for the Root PARTID selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CFG_CSU_FLT_rl sets the filter conditions for the Realm PARTID selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_CFG_MBWU_FLT is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_CFG_MBWU_FLT are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MBWU_FLT is a 32-bit register.

Field descriptions

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|------|----|----|----|----|----|----|----|-----|----|----|----|----|----|----|----|--------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RWBW | | RES0 | | | | | | | | PMG | | | | | | | | PARTID | | | | | | | | | | | | | |

RW filtering.

RWBW, bits [31:30]

When [MPAMF_MBWUMON_IDR.HAS_RWBW](#) == 1:

Read/write bandwidth filter. Configures the selected monitor instance to count all bandwidth, only read bandwidth or only write bandwidth.

| RWBW | Meaning |
|------|---|
| 0b00 | Monitor instance counts read bandwidth and write bandwidth. |
| 0b01 | Monitor instance counts write bandwidth only. |
| 0b10 | Monitor instance counts read bandwidth only. |
| 0b11 | Reserved. |

Otherwise:

Reserved, RES0.

Bits [29:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If [MSMON_CFG_MBWU_CTL.MATCH_PMG](#) == 0, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If [MSMON_CFG_MBWU_CTL.MATCH_PMG](#) == 1, the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts memory bandwidth labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If [MSMON_CFG_MBWU_CTL.MATCH_PARTID](#) == 0, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If [MSMON_CFG_MBWU_CTL.MATCH_PARTID](#) == 1, the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts memory bandwidth labeled with PARTID equal to this field.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| RES0 | | | | | | | | PMG | | | | | | | | PARTID | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If [MSMON_CFG_MBWU_CTL.MATCH_PMG](#) == 0, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If [MSMON_CFG_MBWU_CTL.MATCH_PMG](#) == 1, the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts memory bandwidth labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If [MSMON_CFG_MBWU_CTL.MATCH_PARTID](#) == 0, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If [MSMON_CFG_MBWU_CTL.MATCH_PARTID](#) == 1, the monitor selected by [MSMON_CFG_MON_SEL](#) measures or counts memory bandwidth labeled with PARTID equal to this field.

Accessing MSMON_CFG_MBWU_FLT

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_CFG_MBWU_FLT_s must be accessible from the Secure MPAM feature page.
- MSMON_CFG_MBWU_FLT_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_MBWU_FLT_rt must be accessible from the Root MPAM feature page.
- MSMON_CFG_MBWU_FLT_rl must be accessible from the Realm MPAM feature page.

MSMON_CFG_MBWU_FLT_s, MSMON_CFG_MBWU_FLT_ns, MSMON_CFG_MBWU_FLT_rt, and MSMON_CFG_MBWU_FLT_rl must be separate registers:

- The Secure instance (MSMON_CFG_MBWU_FLT_s) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_MBWU_FLT_ns) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_MBWU_FLT_rt) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_CFG_MBWU_FLT_rl) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, loads and stores to MSMON_CFG_MBWU_FLT access the monitor configuration settings for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, loads and stores to MSMON_CFG_MBWU_FLT access the monitor configuration settings for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CFG_MBWU_FLT can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|----------------------|
| MPAM | MPAMF_BASE_s | 0x0820 | MSMON_CFG_MBWU_FLT_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_ns | 0x0820 | MSMON_CFG_MBWU_FLT_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_rt | 0x0820 | MSMON_CFG_MBWU_FLT_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_rl | 0x0820 | MSMON_CFG_MBWU_FLT_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CFG_MON_SEL, MPAM Monitor Instance Selection Register

The MSMON_CFG_MON_SEL characteristics are:

Purpose

Selects a monitor instance to access through the MSMON configuration and counter registers.

MSMON_CFG_MON_SEL_s selects a Secure monitor instance to access via the Secure MPAM feature page.
 MSMON_CFG_MON_SEL_ns selects a Non-secure monitor instance to access via the Non-secure MPAM feature page.
 MSMON_CFG_MON_SEL_rt selects a Root monitor instance to access via the Root MPAM feature page.
 MSMON_CFG_MON_SEL_rl selects a Realm monitor instance to access via the Realm MPAM feature page.

Note

Different performance monitoring features within an MSC could have different numbers of monitor instances. See the NUM_MON field in the corresponding ID register. This means that a monitor out-of-bounds error might be signaled when an MSMON_CFG register is accessed because the value in MSMON_CFG_MON_SEL.MON_SEL is too large for the particular monitoring feature.

To configure a monitor, set MON_SEL in this register to the index of the monitor instance to configure, then write to the MSMON_CFG_x register to set the configuration of the monitor. At a later time, read the monitor register (for example, MSMON_MBWU) to get the value of the monitor.

Configuration

The power domain of MSMON_CFG_MON_SEL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented and (MPAMF_IDR.HAS_MSMON == 1, or (MPAMF_IDR.HAS_IMPL_IDR == 1 and MPAMF_IDR.EXT == 0) or (MPAMF_IDR.HAS_IMPL_IDR == 1, MPAMF_IDR.EXT == 1 and MPAMF_IDR.NO_IMPL_MSMON == 0)). Otherwise, direct accesses to MSMON_CFG_MON_SEL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MON_SEL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-----|----|----|----|------|----|----|----|----|----|----|----|---------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | RIS | | | | RES0 | | | | | | | | MON_SEL | | | | | | | | | | | | | | | |

Bits [31:28]

Reserved, RES0.

RIS, bits [27:24]

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_IDR.EXT == 1 and MPAMF_IDR.HAS_RIS == 1:

Resource Instance Selector. RIS selects one resource to configure through MSMON_CFG registers.

Otherwise:

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

MON_SEL, bits [15:0]

Selects the monitor instance to configure or read.

Reads and writes to other MSMON registers are indexed by MON_SEL and by the NS bit used to access MSMON_CFG_MON_SEL to access the configuration for a single monitor.

Accessing MSMON_CFG_MON_SEL

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_CFG_MON_SEL_s must be accessible from the Secure MPAM feature page.
- MSMON_CFG_MON_SEL_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_MON_SEL_rt must be accessible from the Root MPAM feature page.
- MSMON_CFG_MON_SEL_rl must be accessible from the Realm MPAM feature page.

MSMON_CFG_MON_SEL_s, MSMON_CFG_MON_SEL_ns, MSMON_CFG_MON_SEL_rt, and MSMON_CFG_MON_SEL_rl must be separate registers:

- The Secure instance (MSMON_CFG_MON_SEL_s) accesses the monitor instance selector used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_MON_SEL_ns) accesses the monitor instance selector used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_MON_SEL_rt) accesses the monitor instance selector used for Root PARTIDs.
- The Realm instance (MSMON_CFG_MON_SEL_rl) accesses the monitor instance selector used for Realm PARTIDs.

MSMON_CFG_MON_SEL can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|---------------------|
| MPAM | MPAMF_BASE_s | 0x0800 | MSMON_CFG_MON_SEL_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_ns | 0x0800 | MSMON_CFG_MON_SEL_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_rt | 0x0800 | MSMON_CFG_MON_SEL_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_rl | 0x0800 | MSMON_CFG_MON_SEL_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CSU, MPAM Cache Storage Usage Monitor Register

The MSMON_CSU characteristics are:

Purpose

Accesses the CSU monitor instance selected by [MSMON_CFG_MON_SEL](#).

MSMON_CSU_s is a Secure cache storage usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CSU_ns is a Non-secure cache storage usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CSU_rt is a Root cache storage usage monitor instance selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CSU_rl is a Realm cache storage usage monitor instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_CSU is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, [MPAMF_IDR.HAS_MSMON](#) == 1 and [MPAMF_MSMON_IDR.MSMON_CSU](#) == 1. Otherwise, direct accesses to MSMON_CSU are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NRDY | | | | | | | | | | | | | | | | VALUE | | | | | | | | | | | | | | | |

NRDY, bit [31]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

| NRDY | Meaning |
|------|--|
| 0b0 | The monitor instance is ready and the MSMON_CSU.VALUE field is accurate. |
| 0b1 | The monitor instance is not ready and the contents of the MSMON_CSU.VALUE field might be inaccurate or otherwise not represent the actual cache storage usage. |

VALUE, bits [30:0]

Cache storage usage measurement value if MSMON_CSU.NRDY is 0. Invalid if MSMON_CSU.NRDY is 1.

VALUE is the cache storage usage measured in bytes meeting the criteria set in [MSMON_CFG_CSU_FLT](#) and [MSMON_CFG_CSU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

Accessing MSMON_CSU

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_CSU_s must be accessible from the Secure MPAM feature page.
- MSMON_CSU_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CSU_rt must be accessible from the Root MPAM feature page.
- MSMON_CSU_rl must be accessible from the Realm MPAM feature page.

MSMON_CSU_s, MSMON_CSU_ns, MSMON_CSU_rt, and MSMON_CSU_rl must be separate registers:

- The Secure instance (MSMON_CSU_s) accesses the cache storage usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSU_ns) accesses the cache storage usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CSU_rt) accesses the cache storage usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_CSU_rl) accesses the cache storage usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to MSMON_CSU access the cache storage usage monitor monitor instance for the cache resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to MSMON_CSU access the cache storage usage monitor monitor instance for the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CSU can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|-------------|
| MPAM | MPAMF_BASE_s | 0x0840 | MSMON_CSU_s |

This interface is accessible as follows:

- When MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are **RW**.
- When MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------|
| MPAM | MPAMF_BASE_ns | 0x0840 | MSMON_CSU_ns |

This interface is accessible as follows:

- When MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are **RW**.
- When MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------|
| MPAM | MPAMF_BASE_rt | 0x0840 | MSMON_CSU_rt |

This interface is accessible as follows:

- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are **RW**.
- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------|
| MPAM | MPAMF_BASE_rl | 0x0840 | MSMON_CSU_rl |

This interface is accessible as follows:

- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == 0 accesses to this register are **RW**.
- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == 1 accesses to this register are **RO**.

MSMON_CSU_CAPTURE, MPAM Cache Storage Usage Monitor Capture Register

The MSMON_CSU_CAPTURE characteristics are:

Purpose

MSMON_CSU_CAPTURE is a 32-bit read-write register that accesses the captured [MSMON_CSU](#) monitor instance selected by [MSMON_CFG_MON_SEL](#).

MSMON_CSU_CAPTURE_s is the Secure cache storage usage monitor capture instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CSU_CAPTURE_ns is the Non-secure cache storage usage monitor capture instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_CSU_CAPTURE_rt is a Root cache storage usage monitor capture instance selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_CSU_CAPTURE_rl is a Realm cache storage usage monitor capture instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance capture register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_CSU_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_CSU == 1 and MPAMF_CSUMON_IDR.HAS_CAPTURE == 1. Otherwise, direct accesses to MSMON_CSU_CAPTURE are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU_CAPTURE is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NRDY | | | | | | | | | | | | | | | | VALUE | | | | | | | | | | | | | | | |

NRDY, bit [31]

Not Ready. Indicates whether the captured monitor value has possibly inaccurate data.

| NRDY | Meaning |
|------|--|
| 0b0 | The captured monitor instance was ready and the MSMON_CSU_CAPTURE.VALUE field is accurate. |
| 0b1 | The captured monitor instance was not ready and the contents of the MSMON_CSU_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual cache storage usage. |

VALUE, bits [30:0]

Captured cache storage usage measurement if MSMON_CSU_CAPTURE.NRDY is 0. Invalid if MSMON_CSU_CAPTURE.NRDY is 1.

VALUE is the captured cache storage usage measurement in bytes meeting the criteria set in [MSMON_CFG_CSU_FLT](#) and [MSMON_CFG_CSU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

Accessing MSMON_CSU_CAPTURE

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- `MSMON_CSU_CAPTURE_s` must be accessible from the Secure MPAM feature page.
- `MSMON_CSU_CAPTURE_ns` must be accessible from the Non-secure MPAM feature page.
- `MSMON_CSU_CAPTURE_rt` must be accessible from the Root MPAM feature page.
- `MSMON_CSU_CAPTURE_rl` must be accessible from the Realm MPAM feature page.

`MSMON_CSU_CAPTURE_s`, `MSMON_CSU_CAPTURE_ns`, `MSMON_CSU_CAPTURE_rt`, and `MSMON_CSU_CAPTURE_rl` must be separate registers:

- The Secure instance (`MSMON_CSU_CAPTURE_s`) accesses the captured cache storage usage monitor used for Secure PARTIDs.
- The Non-secure instance (`MSMON_CSU_CAPTURE_ns`) accesses the captured cache storage usage monitor used for Non-secure PARTIDs.
- The Root instance (`MSMON_CSU_CAPTURE_rt`) accesses the captured cache storage usage monitor used for Root PARTIDs.
- The Realm instance (`MSMON_CSU_CAPTURE_rl`) accesses the captured cache storage usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to `MSMON_CSU_CAPTURE` access the monitor instance for the cache resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to `MSMON_CSU_CAPTURE` access the monitor instance for the cache storage usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_CSU_CAPTURE can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|---------------------|
| MPAM | MPAMF_BASE_s | 0x0848 | MSMON_CSU_CAPTURE_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_ns | 0x0848 | MSMON_CSU_CAPTURE_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_rt | 0x0848 | MSMON_CSU_CAPTURE_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|----------------------|
| MPAM | MPAMF_BASE_rl | 0x0848 | MSMON_CSU_CAPTURE_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_CSU_OFSR, MPAM CSU Monitor Overflow Status Register

The MSMON_CSU_OFSR characteristics are:

Purpose

MSMON_CSU_OFSR is a 32-bit read-only register that shows bitmap of CSU monitor instance overflow status for a contiguous group of 32 monitor instances.

MSMON_CSU_OFSR_s gives a bitmap of pending CSU overflow status for 32 Secure CSU monitor instances.
 MSMON_CSU_OFSR_ns gives a bitmap of pending CSU overflow status for 32 Non-secure CSU monitor instances.
 MSMON_CSU_OFSR_rt gives a bitmap of pending CSU overflow status for 32 Root CSU monitor instances.
 MSMON_CSU_OFSR_rl gives a bitmap of pending CSU overflow status for 32 Realm CSU monitor instances.

Configuration

The power domain of MSMON_CSU_OFSR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_CSUMON_IDR.HAS_OFSR == 1. Otherwise, direct accesses to MSMON_CSU_OFSR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU_OFSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | |
|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 |
| OFPND31 | OFPND30 | OFPND29 | OFPND28 | OFPND27 | OFPND26 | OFPND25 | OFPND24 | OFPND23 | OFPND22 | OFPND21 | OFPND20 |

OFPND<i>, bit [i], for i = 31 to 0

Overflow status bitmap for CSU monitor instances. The RIS and the contiguous range of CSU monitor instances are set in [MSMON_CFG_MON_SEL](#). i of 0 corresponds to the CSU monitor instance [MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0](#).

| OFPND<i> | Meaning |
|----------|---|
| 0b0 | CSU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) does not have a pending overflow. |
| 0b1 | CSU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) has a pending overflow. |

After reading [MSMON_OFLOW_SR](#) to determine that a CSU monitor instance has a pending overflow and which RIS values have pending overflows, an interrupt service routine could poll groups of 32 monitor instances in a RIS for pending monitors by reading this bitmap and incrementing [MSMON_CFG_MON_SEL.MON_SEL](#) by 32.

Accessing MSMON_CSU_OFSR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_CSU_OFSR_s must be accessible from the Secure MPAM feature page.
- MSMON_CSU_OFSR_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_CSU_OFSR_rt must be accessible from the Root MPAM feature page.
- MSMON_CSU_OFSR_rl must be accessible from the Realm MPAM feature page.

MSMON_CSU_OFSR_s, MSMON_CSU_OFSR_ns, MSMON_CSU_OFSR_rt, and MSMON_CSU_OFSR_rl must be separate registers:

- The Secure instance (MSMON_CSU_OFSR_s) accesses the CSU monitor overflow status bitmap used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSU_OFSR_ns) accesses the CSU monitor overflow status bitmap used for Non-secure PARTIDs.
- The Root instance (MSMON_CSU_OFSR_rt) accesses the CSU monitor overflow status bitmap used for Root PARTIDs.
- The Realm instance (MSMON_CSU_OFSR_rl) accesses the CSU monitor overflow status bitmap used for Realm PARTIDs.

MSMON_CSU_OFSR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|------------------|
| MPAM | MPAMF_BASE_s | 0x0858 | MSMON_CSU_OFSR_s |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_ns | 0x0858 | MSMON_CSU_OFSR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_rt | 0x0858 | MSMON_CSU_OFSR_rt |

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_rl | 0x0858 | MSMON_CSU_OFSR_rl |

When FEAT_RME is implemented access on this interface are **RO**.

MSMON_MBWU, MPAM Memory Bandwidth Usage Monitor Register

The MSMON_MBWU characteristics are:

Purpose

Accesses the monitor instance selected by [MSMON_CFG_MON_SEL](#).

MSMON_MBWU_s is the Secure memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_s. MSMON_MBWU_ns is the Non-secure memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_ns. MSMON_MBWU_rt is the Root memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_rt. MSMON_MBWU_rl is the Realm memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL_rl.

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL](#).RIS and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

Configuration

The power domain of MSMON_MBWU is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1 and MPAMF_MSMON_IDR.MSMON_MBWU == 1. Otherwise, direct accesses to MSMON_MBWU are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NRDY | | VALUE | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

NRDY, bit [31]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

| NRDY | Meaning |
|------|--|
| 0b0 | The monitor instance is ready and the MSMON_MBWU.VALUE field is accurate. |
| 0b1 | The monitor instance is not ready and the contents of the MSMON_MBWU.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage. |

VALUE, bits [30:0]

Memory bandwidth usage counter value if MSMON_MBWU.NRDY is 0. Invalid if MSMON_MBWU.NRDY is 1.

VALUE is the scaled count of bytes transferred since the monitor was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

If [MSMON_CFG_MBWU_CTL](#).SCLEN enables scaling, the count in VALUE is the number of bytes shifted right by [MPAMF_MBWUMON_IDR](#).SCALE bit positions and rounded.

Accessing MSMON_MBWU

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_MBWU_s must be accessible from the Secure MPAM feature page.
- MSMON_MBWU_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_rt must be accessible from the Root MPAM feature page.
- MSMON_MBWU_rl must be accessible from the Realm MPAM feature page.

MSMON_MBWU_s, MSMON_MBWU_ns, MSMON_MBWU_rt, and MSMON_MBWU_rl must be separate registers:

- The Secure instance (MSMON_MBWU_s) accesses the memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_ns) accesses the memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_rt) accesses the memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_rl) accesses the memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU access the memory bandwidth usage monitor instance for the resource instance selected by [MSMON_CFG_MON_SEL](#). RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU access the memory bandwidth usage monitor instance for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_MBWU can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|--------------|
| MPAM | MPAMF_BASE_s | 0x0860 | MSMON_MBWU_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_ns | 0x0860 | MSMON_MBWU_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_rt | 0x0860 | MSMON_MBWU_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_rl | 0x0860 | MSMON_MBWU_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_MBWU_CAPTURE, MPAM Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU_CAPTURE characteristics are:

Purpose

Accesses the captured MSMON_MBWU monitor instance selected by [MSMON_CFG_MON_SEL](#).

MSMON_MBWU_CAPTURE_s is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_MBWU_CAPTURE_ns is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#).

MSMON_MBWU_CAPTURE_rt is the Root memory bandwidth usage monitor capture instance selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_MBWU_CAPTURE_rl is the Realm memory bandwidth usage monitor capture instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance capture register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_MBWU_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1 and MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1. Otherwise, direct accesses to MSMON_MBWU_CAPTURE are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_CAPTURE is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NRDY | | | | | | | | | | | | | | | | VALUE | | | | | | | | | | | | | | | |

NRDY, bit [31]

Not Ready. The captured NRDY bit from the corresponding instance of [MSMON_MBWU](#). This bit indicates whether the captured monitor value has possibly inaccurate data.

| NRDY | Meaning |
|------|--|
| 0b0 | The captured monitor instance was ready and the MSMON_MBWU_CAPTURE.VALUE field is accurate. |
| 0b1 | The captured monitor instance was not ready and the contents of the MSMON_MBWU_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage. |

VALUE, bits [30:0]

Captured memory bandwidth usage counter value if MSMON_MBWU_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_CAPTURE.NRDY is 1.

VALUE is the captured VALUE field from the corresponding instance of [MSMON_MBWU](#), the count of bytes transferred since the monitor was last reset that meet the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

VALUE captures the [MSMON_MBWU](#).VALUE and preserves any scaling that had been performed on the VALUE field in that register.

Accessing MSMON_MBWU_CAPTURE

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- [MSMON_MBWU_CAPTURE_s](#) must be accessible from the Secure MPAM feature page.
- [MSMON_MBWU_CAPTURE_ns](#) must be accessible from the Non-secure MPAM feature page.
- [MSMON_MBWU_CAPTURE_rt](#) must be accessible from the Root MPAM feature page.
- [MSMON_MBWU_CAPTURE_rl](#) must be accessible from the Realm MPAM feature page.

[MSMON_MBWU_CAPTURE_s](#), [MSMON_MBWU_CAPTURE_ns](#), [MSMON_MBWU_CAPTURE_rt](#), and [MSMON_MBWU_CAPTURE_rl](#) must be separate registers:

- The Secure instance ([MSMON_MBWU_CAPTURE_s](#)) accesses the captured memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance ([MSMON_MBWU_CAPTURE_ns](#)) accesses the captured memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance ([MSMON_MBWU_CAPTURE_rt](#)) accesses the captured memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance ([MSMON_MBWU_CAPTURE_rl](#)) accesses the captured memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to [MSMON_MBWU_CAPTURE](#) access the monitor instance for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to [MSMON_MBWU_CAPTURE](#) access the monitor instance for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_MBWU_CAPTURE can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|----------------------|
| MPAM | MPAMF_BASE_s | 0x0868 | MSMON_MBWU_CAPTURE_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_ns | 0x0868 | MSMON_MBWU_CAPTURE_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_rt | 0x0868 | MSMON_MBWU_CAPTURE_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_rl | 0x0868 | MSMON_MBWU_CAPTURE_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_MBWU_L, MPAM Long Memory Bandwidth Usage Monitor Register

The MSMON_MBWU_L characteristics are:

Purpose

Accesses the monitor instance selected by [MSMON_CFG_MON_SEL](#).

MSMON_MBWU_L_s is the Secure long memory bandwidth usage monitor instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_MBWU_L_ns is the Non-secure long memory bandwidth usage monitor instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_MBWU_L_rt is the Root long memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#)_rt. MSMON_MBWU_L_rl is the Realm long memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#)_rl.

If [MPAMF_IDR](#).HAS_RIS is 1, the monitor instance long monitor register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL](#).RIS and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

Configuration

The power domain of MSMON_MBWU_L is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1 and MPAMF_MBWUMON_IDR.HAS_LONG == 1. Otherwise, direct accesses to MSMON_MBWU_L are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_L is a 64-bit register.

Field descriptions

When MPAMF_MBWUMON_IDR.LWD == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| NRDY | RES0 | | | | | | | | | | | | | | | | VALUE | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

NRDY, bit [63]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

| NRDY | Meaning |
|------|--|
| 0b0 | The monitor instance is ready and the MSMON_MBWU_L.VALUE field is accurate. |
| 0b1 | The monitor instance is not ready and the contents of the MSMON_MBWU_L.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage. |

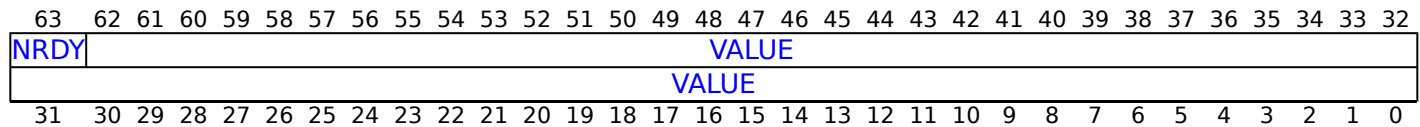

Bits [62:44]

Reserved, RES0.

VALUE, bits [43:0]

Long (44-bit) memory bandwidth usage counter value if MSMON_MBWU_L.NRDY is 0. Invalid if MSMON_MBWU_L.NRDY is 1.

VALUE is the long count of bytes transferred since the monitor was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

When MPAMF_MBWUMON_IDR.LWD == 1:**NRDY, bit [63]**

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

| NRDY | Meaning |
|------|--|
| 0b0 | The monitor instance is ready and the MSMON_MBWU_L.VALUE field is accurate. |
| 0b1 | The monitor instance is not ready and the contents of the MSMON_MBWU_L.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage. |

VALUE, bits [62:0]

Long (63-bit) memory bandwidth usage counter value if MSMON_MBWU_L.NRDY is 0. Invalid if MSMON_MBWU_L.NRDY is 1.

VALUE is the long count of bytes transferred since the monitor instance was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

Accessing MSMON_MBWU_L

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_MBWU_L_s must be accessible from the Secure MPAM feature page.
- MSMON_MBWU_L_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_L_rt must be accessible from the Root MPAM feature page.
- MSMON_MBWU_L_rl must be accessible from the Realm MPAM feature page.

MSMON_MBWU_L_s, MSMON_MBWU_L_ns, MSMON_MBWU_L_rt, and MSMON_MBWU_L_rl must be separate registers:

- The Secure instance (MSMON_MBWU_L_s) accesses the long memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_L_ns) accesses the long memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_L_rt) accesses the long memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_L_rl) accesses the long memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU_L access the long memory bandwidth usage monitor instance for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU_L access the long memory bandwidth usage monitor instance for the monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_MBWU_L can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|--------------|
| MPAM | MPAMF_BASE_s | 0x0880 | MSMON_MBWU_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_ns | 0x0880 | MSMON_MBWU_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_rt | 0x0880 | MSMON_MBWU_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------|
| MPAM | MPAMF_BASE_rl | 0x0880 | MSMON_MBWU_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_MBWU_L_CAPTURE, MPAM Long Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU_L_CAPTURE characteristics are:

Purpose

Accesses the captured [MSMON_MBWU_L](#) monitor instance selected by [MSMON_CFG_MON_SEL](#).

MSMON_MBWU_L_CAPTURE_s is the Secure long memory bandwidth usage monitor capture instance selected by the Secure instance of [MSMON_CFG_MON_SEL](#). MSMON_MBWU_L_CAPTURE_ns is the Non-secure long memory bandwidth usage monitor capture instance selected by the Non-secure instance of [MSMON_CFG_MON_SEL](#). MSMON_MBWU_L_CAPTURE_rt is the Root long memory bandwidth usage monitor capture instance selected by the Root instance of [MSMON_CFG_MON_SEL](#). MSMON_MBWU_L_CAPTURE_rl is the Realm long memory bandwidth usage monitor capture instance selected by the Realm instance of [MSMON_CFG_MON_SEL](#).

If [MPAMF_IDR.HAS_RIS](#) is 1, the monitor instance long capture register accessed is for the resource instance currently selected by [MSMON_CFG_MON_SEL.RIS](#) and the monitor instance of that resource instance selected by [MSMON_CFG_MON_SEL.MON_SEL](#).

Configuration

The power domain of MSMON_MBWU_L_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM is implemented, MPAMF_IDR.HAS_MSMON == 1, MPAMF_MSMON_IDR.MSMON_MBWU == 1, MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1 and MPAMF_MBWUMON_IDR.HAS_LONG == 1. Otherwise, direct accesses to MSMON_MBWU_L_CAPTURE are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_L_CAPTURE is a 64-bit register.

Field descriptions

When MPAMF_MBWUMON_IDR.LWD == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| NRDY | RES0 | | | | | | | | | | | | | | | | | | | | VALUE | | | | | | | | | | | |
| VALUE | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

| NRDY | Meaning |
|------|--|
| 0b0 | The captured monitor instance was ready and the MSMON_MBWU_L_CAPTURE.VALUE field is accurate. |
| 0b1 | The captured monitor instance was not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage. |

Bits [62:44]

Reserved, RES0.

VALUE, bits [43:0]

Captured long memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY is 1.

VALUE is the captured 44-bit count of bytes transferred since the monitor instance was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

When MPAMF_MBWUMON_IDR.LWD == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| NRDY | VALUE | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| VALUE | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

| NRDY | Meaning |
|------|--|
| 0b0 | The captured monitor instance was ready and the MSMON_MBWU_L_CAPTURE.VALUE field is accurate. |
| 0b1 | The captured monitor instance was not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage. |

VALUE, bits [62:0]

The captured long memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY is 1.

VALUE is the captured 63-bit count of bytes transferred since the monitor instance was last reset that met the criteria set in [MSMON_CFG_MBWU_FLT](#) and [MSMON_CFG_MBWU_CTL](#) for the monitor instance selected by [MSMON_CFG_MON_SEL](#).

Accessing MSMON_MBWU_L_CAPTURE

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_MBWU_L_CAPTURE_s must be accessible from the Secure MPAM feature page.
- MSMON_MBWU_L_CAPTURE_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_L_CAPTURE_rt must be accessible from the Root MPAM feature page.
- MSMON_MBWU_L_CAPTURE_rl must be accessible from the Realm MPAM feature page.

MSMON_MBWU_L_CAPTURE_s, MSMON_MBWU_L_CAPTURE_ns, MSMON_MBWU_L_CAPTURE_rt, and MSMON_MBWU_L_CAPTURE_rl must be separate registers:

- The Secure instance (MSMON_MBWU_L_CAPTURE_s) accesses the captured long memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_L_CAPTURE_ns) accesses the captured long memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_L_CAPTURE_rt) accesses the captured long memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_L_CAPTURE_rl) accesses the captured long memory bandwidth usage monitor used for Realm PARTIDs.

When RIS is implemented, reads and writes to MSMON_MBWU_L_CAPTURE access the monitor instance for the bandwidth resource instance selected by [MSMON_CFG_MON_SEL](#).RIS and the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

When RIS is not implemented, reads and writes to MSMON_MBWU_L_CAPTURE access the monitor instance for the memory bandwidth usage monitor instance selected by [MSMON_CFG_MON_SEL](#).MON_SEL.

MSMON_MBWU_L_CAPTURE can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|----------------------|
| MPAM | MPAMF_BASE_s | 0x0890 | MSMON_MBWU_CAPTURE_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_ns | 0x0890 | MSMON_MBWU_CAPTURE_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_rt | 0x0890 | MSMON_MBWU_CAPTURE_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-----------------------|
| MPAM | MPAMF_BASE_rl | 0x0890 | MSMON_MBWU_CAPTURE_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_MBWU_OFSR, MPAM MBWU Monitor Overflow Status Register

The MSMON_MBWU_OFSR characteristics are:

Purpose

MSMON_MBWU_OFSR is a 32-bit read-only register that shows bitmap of MBWU monitor instance overflow status for a contiguous group of 32 monitor instances.

MSMON_MBWU_OFSR_s gives a bitmap of pending MBWU overflow status for 32 Secure MBWU monitor instances. MSMON_MBWU_OFSR_ns gives a bitmap of pending MBWU overflow status for 32 Non-secure MBWU monitor instances. MSMON_MBWU_OFSR_rt gives a bitmap of pending MBWU overflow status for 32 Root MBWU monitor instances. MSMON_MBWU_OFSR_rl gives a bitmap of pending MBWU overflow status for 32 Realm MBWU monitor instances.

Configuration

The power domain of MSMON_MBWU_OFSR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_MBWUMON_IDR.HAS_OFSR == 1. Otherwise, direct accesses to MSMON_MBWU_OFSR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_OFSR is a 32-bit register.

|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 |
| OFPND31 | OFPND30 | OFPND29 | OFPND28 | OFPND27 | OFPND26 | OFPND25 | OFPND24 | OFPND23 | OFPND22 | OFPND21 | OFPND20 |

OFPND<i>, bit [i], for i = 31 to 0

Overflow status bitmap for MBWU monitor instances. The RIS and the contiguous range of MBWU monitor instances are set in [MSMON_CFG_MON_SEL](#). i of 0 corresponds to the MBWU monitor instance [MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0](#).

| OFPND<i> | Meaning |
|----------|--|
| 0b0 | MBWU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) does not have a pending overflow. |
| 0b1 | MBWU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) has a pending overflow. |

After reading [MSMON_OFLOW_SR](#) to determine that an MBWU monitor instance has a pending overflow and which RIS values have pending overflows, an interrupt service routine could poll groups of 32 monitor instances in a RIS for pending monitors by reading this bitmap and incrementing [MSMON_CFG_MON_SEL.MON_SEL](#) by 32.

A pending overflow may be in either the [MSMON_CFG_MBWU_CTL.OFLOW_STATUS](#) or [MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L](#) field.

Accessing MSMON_MBWU_OFSR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_MBWU_OFSR_s must be accessible from the Secure MPAM feature page.
- MSMON_MBWU_OFSR_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_OFSR_rt must be accessible from the Root MPAM feature page.
- MSMON_MBWU_OFSR_rl must be accessible from the Realm MPAM feature page.

MSMON_MBWU_OFSR_s, MSMON_MBWU_OFSR_ns, MSMON_MBWU_OFSR_rt, and MSMON_MBWU_OFSR_rl must be separate registers:

- The Secure instance (MSMON_MBWU_OFSR_s) accesses the MBWU monitor overflow status bitmap used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_OFSR_ns) accesses the MBWU monitor overflow status bitmap used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_OFSR_rt) accesses the MBWU monitor overflow status bitmap used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_OFSR_rl) accesses the MBWU monitor overflow status bitmap used for Realm PARTIDs.

MSMON_MBWU_OFSR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|-------------------|
| MPAM | MPAMF_BASE_s | 0x0898 | MSMON_MBWU_OFSR_s |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_ns | 0x0898 | MSMON_MBWU_OFSR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_rt | 0x0898 | MSMON_MBWU_OFSR_rt |

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------|
| MPAM | MPAMF_BASE_rl | 0x0898 | MSMON_MBWU_OFSR_rl |

When FEAT_RME is implemented access on this interface are **RO**.

MSMON_OFLOW_MSI_ADDR_H, MPAM Monitor Overflow MSI Write High-part Address Register

The MSMON_OFLOW_MSI_ADDR_H characteristics are:

Purpose

MSMON_OFLOW_MSI_ADDR_H is a 32-bit read/write register for the high part of the MPAM monitor overflow MSI address.

MSMON_OFLOW_MSI_ADDR_H_s is the high part of the MSI write address for monitor overflow interrupts from Secure monitor instances. MSMON_OFLOW_MSI_ADDR_H_ns is the high part of the MSI write address for monitor overflow interrupts from Non-secure monitor instances. MSMON_OFLOW_MSI_ADDR_H_rt is the high part of the MSI write address for monitor overflow interrupts from Root monitor instances. MSMON_OFLOW_MSI_ADDR_H_rl is the high part of the MSI write address for monitor overflow interrupts from Realm monitor instances.

Configuration

The power domain of MSMON_OFLOW_MSI_ADDR_H is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_ADDR_H are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_ADDR_H is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | MSI_ADDR_H | | | | | | | | | | | | | | | | | | | |

Bits [31:20]

Reserved, RES0.

MSI_ADDR_H, bits [19:0]

MSI write address bits[51:32].

Accessing MSMON_OFLOW_MSI_ADDR_H

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_OFLOW_MSI_ADDR_H_s must be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_ADDR_H_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_ADDR_H_rt must be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_ADDR_H_rl must be accessible from the Realm MPAM feature page.

MSMON_OFLW_MSI_ADDR_H_s, MSMON_OFLW_MSI_ADDR_H_ns, MSMON_OFLW_MSI_ADDR_H_rt, and MSMON_OFLW_MSI_ADDR_H_rl must be separate registers:

- The Secure instance (MSMON_OFLW_MSI_ADDR_H_s) accesses the high part of the monitor overflow MSI write address of Secure monitors.
- The Non-secure instance (MSMON_OFLW_MSI_ADDR_H_ns) accesses the high part of the monitor overflow MSI write address of Non-secure monitors.
- The Root instance (MSMON_OFLW_MSI_ADDR_H_rt) accesses the high part of the monitor overflow MSI write address of Root monitors.
- The Realm instance (MSMON_OFLW_MSI_ADDR_H_rl) accesses the high part of the monitor overflow MSI write address of Realm monitors.

MSMON_OFLOW_MSI_ADDR_H can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|-------------------------|
| MPAM | MPAMF_BASE_s | 0x08E4 | MSMON_OFLW_MSI_ADDR_H_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------------|
| MPAM | MPAMF_BASE_ns | 0x08E4 | MSMON_OFLW_MSI_ADDR_H_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------------|
| MPAM | MPAMF_BASE_rt | 0x08E4 | MSMON_OFLW_MSI_ADDR_H_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|--------------------------|
| MPAM | MPAMF_BASE_rl | 0x08E4 | MSMON_OFLW_MSI_ADDR_H_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_OFLOW_MSI_ADDR_L, MPAM Monitor Overflow MSI Low-part Address Register

The MSMON_OFLOW_MSI_ADDR_L characteristics are:

Purpose

MSMON_OFLOW_MSI_ADDR_L is a 32-bit read/write register for the low part of the MPAM monitor MSI address.

MSMON_OFLOW_MSI_ADDR_L_s is the low part of the MSI write address for overflow interrupts from Secure monitor instances. MSMON_OFLOW_MSI_ADDR_L_ns is the low part of the MSI write address for overflow interrupts from Non-secure monitor instances. MSMON_OFLOW_MSI_ADDR_L_rt is the low part of the MSI write address for overflow interrupts from Root monitor instances. MSMON_OFLOW_MSI_ADDR_L_rl is the low part of the MSI write address for overflow interrupts from Realm monitor instances.

Configuration

The power domain of MSMON_OFLOW_MSI_ADDR_L is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_ADDR_L are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_ADDR_L is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|-----------|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MSI_ADDR_L | | | | | | | | | | | | | | | | | | | | | | | | | | | | | Bits[1:0] | | |

MSI_ADDR_L, bits [31:2]

MSI write address bits[31:2].

Bits [1:0]

Reads as 0b00.

Access to this field is **RO**.

Accessing MSMON_OFLOW_MSI_ADDR_L

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_OFLOW_MSI_ADDR_L_s must be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_ADDR_L_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_ADDR_L_rt must be accessible from the Root MPAM feature page.

- MSMON_OFLOW_MSI_ADDR_L_rl must be accessible from the Realm MPAM feature page.

MSMON_OFLOW_MSI_ADDR_L_s, MSMON_OFLOW_MSI_ADDR_L_ns, MSMON_OFLOW_MSI_ADDR_L_rt, and MSMON_OFLOW_MSI_ADDR_L_rl must be separate registers:

- The Secure instance (MSMON_OFLOW_MSI_ADDR_L_s) accesses the low part of the overflow MSI write address used for Secure PARTIDs.
- The Non-secure instance (MSMON_OFLOW_MSI_ADDR_L_ns) accesses the low part of the overflow MSI write address used for Non-secure PARTIDs.
- The Root instance (MSMON_OFLOW_MSI_ADDR_L_rt) accesses the low part of the overflow MSI write address used for Root PARTIDs.
- The Realm instance (MSMON_OFLOW_MSI_ADDR_L_rl) accesses the low part of the overflow MSI write address used for Realm PARTIDs.

MSMON_OFLOW_MSI_ADDR_L can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|--------------------------|
| MPAM | MPAMF_BASE_s | 0x08E0 | MSMON_OFLOW_MSI_ADDR_L_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------------|
| MPAM | MPAMF_BASE_ns | 0x08E0 | MSMON_OFLOW_MSI_ADDR_L_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------------|
| MPAM | MPAMF_BASE_rt | 0x08E0 | MSMON_OFLOW_MSI_ADDR_L_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|---------------------------|
| MPAM | MPAMF_BASE_rl | 0x08E0 | MSMON_OFLOW_MSI_ADDR_L_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_OFLOW_MSI_ATTR, MPAM Monitor Overflow MSI Write Attributes Register

The MSMON_OFLOW_MSI_ATTR characteristics are:

Purpose

MSMON_OFLOW_MSI_ATTR is a 32-bit read/write register that controls MPAM monitor overflow MSI write attributes for MPAM monitor overflows in this MSC.

MSMON_OFLOW_MSI_ATTR_s controls Secure MPAM monitor overflow MSI writes. MSMON_OFLOW_MSI_ATTR_ns controls Non-secure MPAM monitor overflow MSI writes. MSMON_OFLOW_MSI_ATTR_rt controls Root MPAM monitor overflow MSI writes. MSMON_OFLOW_MSI_ATTR_rl controls Realm MPAM monitor overflow MSI writes.

Configuration

The power domain of MSMON_OFLOW_MSI_ATTR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_ATTR are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_ATTR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|--------|-------------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | MSI_SH | MSI_MEMATTR | RES0 | | | | | | | | | | | | | | | | MSIEN | | | | | | | | | | | | |

Bits [31:30]

Reserved, RES0.

MSI_SH, bits [29:28]

Sharability attribute of MSI writes.

| MSI_SH | Meaning |
|--------|--------------------------------------|
| 0b00 | Non-shareable. |
| 0b01 | Reserved, CONSTRAINED UNPREDICTABLE. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

When MSMON_OFLOW_MSI_ATTR.MSI_MEMATTR specifies a Device memory type, the contents of this field are IGNORED and Shareability is effectively Outer Shareable.

MSI_MEMATTR, bits [27:24]

Memory attributes of MSI writes.

Note: This encoding matches the VMSAv8-64 stage 2 MemAttr[3:0] field as described in the Arm ARM, except that the following encodings are Reserved (not UNPREDICTABLE) and behave as Device-nGnRnE: 0b0100, 0b1000, and 0b1100.

| MSI_MEMATTR | Meaning |
|-------------|---|
| 0b0000 | Device-nGnRnE. |
| 0b0001 | Device-nGnRE. |
| 0b0010 | Device-nGRE. |
| 0b0011 | Device-GRE. |
| 0b0100 | Reserved. Behave as Device-nGnRnE, 0b0000. |
| 0b0101 | Normal Inner Non-cacheable, Outer Non-cacheable. |
| 0b0110 | Normal Inner Write-Through Cacheable, Outer Non-cacheable. |
| 0b0111 | Normal Inner Write-Back Cacheable, Outer Non-cacheable. |
| 0b1000 | Reserved. Behave as Device-nGnRnE, 0b0000. |
| 0b1001 | Normal Inner Non-Cachable, Outer Write-Through Cacheable. |
| 0b1010 | Normal Inner Write-Through Cacheable, Outer Write-Through Cachable. |
| 0b1011 | Normal Inner Write-Back Cacheable, Outer Write-Through Cachable. |
| 0b1100 | Reserved. Behave as Device-nGnRnE, 0b0000. |
| 0b1101 | Normal Inner Non-cacheable, Outer Write-Back Cacheable. |
| 0b1110 | Normal Inner Write-Through Cacheable, Outer Write-Back Cacheable. |
| 0b1111 | Normal Inner Write-Back Cacheable, Outer Write-Back Cacheable. |

When this field specifies a Device memory type, the contents of MSMON_OFLOW_MSI_ATTR.MSI_SH are IGNORED and Shareability is effectively Outer Shareable.

Device types may be implemented as any Device type with more n characters. For example, if this field is set to 0b0010, an implementation may treat the MSI write as the specified type, Device-nGRE, or as Device-nGnRE or as Device-nGnRnE.

Reserved encodings 0b0100, 0b1000, and 0b1100 must be implemented to behave the same as the 0b0000 encoding.

Bits [23:1]

Reserved, RES0.

MSIEN, bit [0]

Monitor overflow MSI write enable.

| MSIEN | Meaning |
|-------|---|
| 0b0 | MPAM monitor overflow MSI writes are not generated to signal enabled MPAM monitor overflow interrupts. When monitor overflow MSI writes are disabled, hardwired monitor overflow interrupt could be generated if hardwired monitor overflow interrupt is implemented. |
| 0b1 | MPAM monitor overflow MSI writes are generated to signal enabled MPAM monitor overflow interrupts. When monitor overflow MSI writes are enabled, hardwired monitor overflow interrupts are not generated. |

This enable affects whether a hardwired overflow interrupt is generated.

The reset behavior of this field is:

- On a MSC reset, this field resets to 0.

Accessing MSMON_OFLOW_MSI_ATTR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_OFLOW_MSI_ATTR_s must be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_ATTR_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_ATTR_rt must be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_ATTR_rl must be accessible from the Realm MPAM feature page.

MSMON_OFLOW_MSI_ATTR_s, MSMON_OFLOW_MSI_ATTR_ns, MSMON_OFLOW_MSI_ATTR_rt, and MSMON_OFLOW_MSI_ATTR_rl must be separate registers:

- The Secure instance (MSMON_OFLOW_MSI_ATTR_s) accesses the monitor overflow MSI write attributes of Secure monitors.
- The Non-secure instance (MSMON_OFLOW_MSI_ATTR_ns) accesses the monitor overflow MSI write attributes of Non-secure monitors.
- The Root instance (MSMON_OFLOW_MSI_ATTR_rt) accesses the monitor overflow MSI write attributes of Root monitors.
- The Realm instance (MSMON_OFLOW_MSI_ATTR_rl) accesses the monitor overflow MSI write attributes of Realm monitors.

MSMON_OFLOW_MSI_ATTR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|------------------------|
| MPAM | MPAMF_BASE_s | 0x08EC | MSMON_OFLOW_MSI_ATTR_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_ns | 0x08EC | MSMON_OFLOW_MSI_ATTR_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_rt | 0x08EC | MSMON_OFLOW_MSI_ATTR_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_rl | 0x08EC | MSMON_OFLOW_MSI_ATTR_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_OFLOW_MSI_DATA, MPAM Monitor Overflow MSI Write Data Register

The MSMON_OFLOW_MSI_DATA characteristics are:

Purpose

MSMON_OFLOW_MSI_DATA is a 32-bit read/write register for the MPAM monitor overflow MSI data.

MSMON_OFLOW_MSI_DATA_s is the data for the MSI write for monitor overflow from Secure monitor instances. MSMON_OFLOW_MSI_DATA_ns is the data for the MSI writes for monitor overflow interrupts from Non-secure monitor instances. MSMON_OFLOW_MSI_DATA_rt is the data for the MSI write for monitor overflow from Root monitor instances. MSMON_OFLOW_MSI_DATA_rl is the data for the MSI writes for monitor overflow interrupts from Realm monitor instances.

Configuration

The power domain of MSMON_OFLOW_MSI_DATA is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_DATA are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_DATA is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| MSI_DATA | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

MSI_DATA, bits [31:0]

MSI write data word.

Accessing MSMON_OFLOW_MSI_DATA

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_OFLOW_MSI_DATA_s must be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_DATA_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_DATA_rt must be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_DATA_rl must be accessible from the Realm MPAM feature page.

MSMON_OFLOW_MSI_DATA_s, MSMON_OFLOW_MSI_DATA_ns, MSMON_OFLOW_MSI_DATA_rt, and MSMON_OFLOW_MSI_DATA_rl must be separate registers:

- The Secure instance (MSMON_OFLOW_MSI_DATA_s) accesses the monitor overflow MSI write data of Secure monitors.

- The Non-secure instance (MSMON_OFLOW_MSI_DATA_ns) accesses the monitor overflow MSI write data of Non-secure monitors.
- The Root instance (MSMON_OFLOW_MSI_DATA_rt) accesses the monitor overflow MSI write data of Root monitors.
- The Realm instance (MSMON_OFLOW_MSI_DATA_rl) accesses the monitor overflow MSI write data of Realm monitors.

MSMON_OFLOW_MSI_DATA can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|------------------------|
| MPAM | MPAMF_BASE_s | 0x08E8 | MSMON_OFLOW_MSI_DATA_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_ns | 0x08E8 | MSMON_OFLOW_MSI_DATA_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_rt | 0x08E8 | MSMON_OFLOW_MSI_DATA_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_rl | 0x08E8 | MSMON_OFLOW_MSI_DATA_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_OFLOW_MSI_MPAM, MPAM Monitor Overflow MSI Write MPAM Information Register

The MSMON_OFLOW_MSI_MPAM characteristics are:

Purpose

MSMON_OFLOW_MSI_MPAM is a 32-bit read/write register that sets the MPAM information for a monitor overflow MSI write.

MSMON_OFLOW_MSI_MPAM_s controls MPAM information labeling of Secure monitor overflow MSI writes.
 MSMON_OFLOW_MSI_MPAM_ns controls MPAM information labeling of Non-secure monitor overflow MSI writes.
 MSMON_OFLOW_MSI_MPAM_rt controls MPAM information labeling of Root monitor overflow MSI writes.
 MSMON_OFLOW_MSI_MPAM_rl controls MPAM information labeling of Realm monitor overflow MSI writes.

Configuration

The power domain of MSMON_OFLOW_MSI_MPAM is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p1 is implemented and MPAMF_MSMON_IDR.HAS_OFLW_MSI == 1. Otherwise, direct accesses to MSMON_OFLOW_MSI_MPAM are RES0.

[MSMON_OFLOW_MSI_ADDR_L](#), [MSMON_OFLOW_MSI_ADDR_H](#), [MSMON_OFLOW_MSI_ATTR](#), [MSMON_OFLOW_MSI_DATA](#), and [MSMON_OFLOW_MSI_MPAM](#) must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_MPAM is a 32-bit register.

Field descriptions

|------|----|----|----|----|----|----|----|-----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | PMG | | | | | | | | PARTID | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group property for an MSC monitor overflow MSI write.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition ID for an MSC monitor overflow MSI write.

The PARTID in this field is in the Secure PARTID space in the MSMON_OFLOW_MSI_MPAM_s instance and in the Non-secure PARTID space in the MSMON_OFLOW_MSI_MPAM_ns instance of this register.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

Accessing MSMON_OFLOW_MSI_MPAM

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_OFLOW_MSI_MPAM_s must be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_MPAM_ns must be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_MPAM_rt must be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_MPAM_rl must be accessible from the Realm MPAM feature page.

MSMON_OFLOW_MSI_MPAM_s, MSMON_OFLOW_MSI_MPAM_ns, MSMON_OFLOW_MSI_MPAM_rt, and MSMON_OFLOW_MSI_MPAM_rl must be separate registers:

- The Secure instance (MSMON_OFLOW_MSI_MPAM_s) accesses the monitor overflow MSI MPAM information of Secure monitors.
- The Non-secure instance (MSMON_OFLOW_MSI_MPAM_ns) accesses the monitor overflow MSI MPAM information of Non-secure monitors.
- The Root instance (MSMON_OFLOW_MSI_MPAM_rt) accesses the monitor overflow MSI MPAM information of Root monitors.
- The Realm instance (MSMON_OFLOW_MSI_MPAM_rl) accesses the monitor overflow MSI MPAM information of Realm monitors.

MSMON_OFLOW_MSI_MPAM can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|------------------------|
| MPAM | MPAMF_BASE_s | 0x08DC | MSMON_OFLOW_MSI_MPAM_s |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_ns | 0x08DC | MSMON_OFLOW_MSI_MPAM_ns |

Accesses on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_rt | 0x08DC | MSMON_OFLOW_MSI_MPAM_rt |

When FEAT_RME is implemented access on this interface are **RW**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------------|
| MPAM | MPAMF_BASE_rl | 0x08DC | MSMON_OFLOW_MSI_MPAM_rl |

When FEAT_RME is implemented access on this interface are **RW**.

MSMON_OFLOW_SR, MPAM Monitor Overflow Status Register

The MSMON_OFLOW_SR characteristics are:

Purpose

MSMON_OFLOW_SR is a 32-bit read-only register that shows MPAM monitor overflow status for this MSC.

MSMON_OFLOW_SR_s gives the status of overflows of Secure MPAM monitors. MSMON_OFLOW_SR_ns gives the status of overflows of Non-secure MPAM monitors. MSMON_OFLOW_SR_rt gives the status of overflows of Root MPAM monitors. MSMON_OFLOW_SR_rl gives the status of overflows of Realm MPAM monitors.

Configuration

The power domain of MSMON_OFLOW_SR is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_MSMON_IDR.HAS_OFLOW_SR == 1. Otherwise, direct accesses to MSMON_OFLOW_SR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_SR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------|----------------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|-----------|-----------|-----------|-----------|-----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CSU_OFLOW_PND | MBWU_OFLOW_PND | RES0 | | | | | | | | | | | | | | RIS_PND15 | RIS_PND14 | RIS_PND13 | RIS_PND12 | RIS_PND11 | RIS_PND10 | RIS_PND9 | RIS_PND8 | RIS_PND7 | RIS_PND6 | RIS_PND5 | RIS_PND4 | RIS_PND3 | RIS_PND2 | RIS_PND1 | RIS_PND0 |

CSU_OFLOW_PND, bit [31]

At least one cache storage usage monitor has OFLOW_STATUS of 1 in [MSMON_CFG_CSU_CTL](#).

| CSU_OFLOW_PND | Meaning |
|---------------|--|
| 0b0 | There are no cache storage usage monitor instances where MSMON_CFG_CSU_CTL .OFLOW_STATUS is 1. |
| 0b1 | MSMON_CFG_CSU_CTL for at least one of the cache storage usage monitor instances has OFLOW_STATUS set to 1. |

This field clears when [MSMON_CFG_CSU_CTL](#).OFLOW_STATUS has been reset to 0 for all CSU monitor instances in this MSC.

MBWU_OFLOW_PND, bit [30]

At least one memory bandwidth usage monitor instance has OFLOW_STATUS or OFLOW_STATUS_L of 1 in [MSMON_CFG_MBWU_CTL](#).

| MBWU_OFLOW_PND | Meaning |
|----------------|---|
| 0b0 | There are no memory bandwidth usage monitor instances where MSMON_CFG_MBWU_CTL.OFLOW_STATUS is 1. |
| 0b1 | MSMON_CFG_MBWU_CTL for at least one of the memory bandwidth usage monitor instances has either OFLOW_STATUS or OFLOW_STATUS_L set to 1. |

This field clears when [MSMON_CFG_MBWU_CTL.OFLOW_STATUS](#) and [MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L](#) have been reset to 0 for all MBWU monitor instances in this MSC.

Bits [29:16]

Reserved, RES0.

RIS_PND<r>, bit [r], for r = 15 to 0

Overflow status by RIS.

| RIS_PND<r> | Meaning |
|------------|--|
| 0b0 | RIS r has no unread overflows of any type of monitor. |
| 0b1 | RIS r has at least one unread overflow in at least one of the monitor types. |

Combined with the CSU_OFLOW_PND and MBWU_OFLOW_PND flags in this register, an interrupt service routine could poll only the monitor types indicated in monitors for the resource instances flagged in this field.

Bit r is set when any monitor instance of any type in resource instance r has OFLOW_STATUS or OFLOW_STATUS_L set to 1.

Accessing MSMON_OFLOW_SR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- [MSMON_OFLOW_SR_s](#) must be accessible from the Secure MPAM feature page.
- [MSMON_OFLOW_SR_ns](#) must be accessible from the Non-secure MPAM feature page.
- [MSMON_OFLOW_SR_rt](#) must be accessible from the Root MPAM feature page.
- [MSMON_OFLOW_SR_rl](#) must be accessible from the Realm MPAM feature page.

[MSMON_OFLOW_SR_s](#), [MSMON_OFLOW_SR_ns](#), [MSMON_OFLOW_SR_rt](#), and [MSMON_OFLOW_SR_rl](#) must be separate registers:

- The Secure instance ([MSMON_OFLOW_SR_s](#)) accesses the monitor overflow status summary of Secure monitors.
- The Non-secure instance ([MSMON_OFLOW_SR_ns](#)) accesses the monitor overflow status summary of Non-secure monitors.
- The Root instance ([MSMON_OFLOW_SR_rt](#)) accesses the monitor overflow status summary of Root monitors.
- The Realm instance ([MSMON_OFLOW_SR_rl](#)) accesses the monitor overflow status summary of Realm monitors.

MSMON_OFLOW_SR can be accessed through the memory-mapped interfaces:

| Component | Frame | Offset | Instance |
|-----------|--------------|--------|------------------|
| MPAM | MPAMF_BASE_s | 0x08F0 | MSMON_OFLOW_SR_s |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_ns | 0x08F0 | MSMON_OFLOW_SR_ns |

Accesses on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_rt | 0x08F0 | MSMON_OFLOW_SR_rt |

When FEAT_RME is implemented access on this interface are **RO**.

| Component | Frame | Offset | Instance |
|-----------|---------------|--------|-------------------|
| MPAM | MPAMF_BASE_rl | 0x08F0 | MSMON_OFLOW_SR_rl |

When FEAT_RME is implemented access on this interface are **RO**.

OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS Lock.

Configuration

External register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [OSLAR_EL1\[31:0\]](#).

OSLAR_EL1 is in the Core power domain.

The OS Lock can also be locked or unlocked using [DBGOSLAR](#).

If FEAT_Debugv8p2 is not implemented, it is IMPLEMENTATION DEFINED whether external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

If FEAT_Debugv8p2 is implemented, external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

Attributes

OSLAR_EL1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | OSLK | | | | | | | | | | | | | | | |

Bits [31:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use [EDPRSR.OSLK](#) to check the current status of the lock.

Accessing OSLAR_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalDebugAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

OSLAR_EL1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| Debug | 0x300 | OSLAR_EL1 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), AllowExternalDebugAccess() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), AllowExternalDebugAccess() and !SoftwareLockStatus() accesses to this register are **WO**.
- When IsCorePowered(), !DoubleLockStatus(), !AllowExternalDebugAccess() and FEAT_Debugv8p2 is not implemented accesses to this register are **IMPDEF**.
- Otherwise accesses to this register generate an error response.

PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. Arm recommends that this register is implemented.

Attributes

PMAUTHSTATUS is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-------|------|------|----|----|----|-------|------|------|----|----|----|------|-----|-------|------|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | RTNID | RTID | RES0 | | | | RLNID | RLID | RES0 | | | | SNID | SID | NSNID | NSID | | | | | | | | | | | | |

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTNID.

RTID, bits [25:24]

Root invasive debug.

| RTID | Meaning |
|------|------------------|
| 0b00 | Not implemented. |

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLNID.

RLID, bits [13:12]

Realm invasive debug.

| RLID | Meaning |
|------|------------------|
| 0b00 | Not implemented. |

Bits [11:8]

Reserved, RES0.

SNID, bits [7:6]

Holds the same value as [DBGAUTHSTATUS_EL1](#).SNID.

SID, bits [5:4]

Secure invasive debug. Possible values of this field are:

| SID | Meaning |
|------|------------------|
| 0b00 | Not implemented. |

All other values are reserved.

NSNID, bits [3:2]

Holds the same value as [DBGAUTHSTATUS_EL1](#).NSNID.

NSID, bits [1:0]

Non-secure invasive debug. Possible values of this field are:

| NSID | Meaning |
|------|------------------|
| 0b00 | Not implemented. |

All other values are reserved.

Accessing PMAUTHSTATUS

PMAUTHSTATUS can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|--------------|
| PMU | 0xFB8 | PMAUTHSTATUS |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, [PMCCNTR_EL0](#), increments.

Configuration

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMCCFILTR_EL0\[31:0\]](#).

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCCFILTR\[31:0\]](#).

PMCCFILTR_EL0 is in the Core power domain.

On a Warm or Cold reset, RW fields in this register reset to:

- Architecturally UNKNOWN values if the reset is to an Exception level that is using AArch64.
- 0 if the reset is to an Exception level that is using AArch32.

The register is not affected by an External debug reset.

Attributes

PMCCFILTR_EL0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|-----|-----|-----|----|------|----|------|-----|-----|-----|------|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| P | U | NSK | NSU | NSH | M | RES0 | SH | RES0 | RLK | RLU | RLH | RES0 | | | | | | | | | | | | | | | | | | | |

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMCCFILTR_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMCCFILTR_EL0.RLK bit.

| P | Meaning |
|-----|-----------------------------|
| 0b0 | Count cycles in EL1. |
| 0b1 | Do not count cycles in EL1. |

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMCCFILTR_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMCCFILTR_EL0.RLU bit.

| U | Meaning |
|-----|-----------------------------|
| 0b0 | Count cycles in EL0. |
| 0b1 | Do not count cycles in EL0. |

NSK, bit [29]**When EL3 is implemented:**

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Non-secure EL1 are counted.

Otherwise, cycles in Non-secure EL1 are not counted.

Otherwise:

Reserved, RES0.

NSU, bit [28]**When EL3 is implemented:**

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Non-secure EL0 are counted.

Otherwise, cycles in Non-secure EL0 are not counted.

Otherwise:

Reserved, RES0.

NSH, bit [27]**When EL2 is implemented:**

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMCCFILTR_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMCCFILTR_EL0.RLH bit.

| NSH | Meaning |
|-----|-----------------------------|
| 0b0 | Do not count cycles in EL2. |
| 0b1 | Count cycles in EL2. |

Otherwise:

Reserved, RES0.

M, bit [26]**When EL3 is implemented:**

Secure EL3 filtering bit.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Secure EL3 are counted.

Otherwise, cycles in Secure EL3 are not counted.

Most applications can ignore this field and set its value to 0.

Note

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]

When FEAT_SEL2 is implemented and EL3 is implemented:

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Secure EL2 are counted.

Otherwise, cycles in Secure EL2 are not counted.

If Secure EL2 is disabled, this field is RES0.

Note

This field is not visible in the AArch32 [PMCCFILTR](#) System register.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

RLK, bit [22]

When FEAT_RME is implemented:

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.P bit, cycles in Realm EL1 are counted.

Otherwise, cycles in Realm EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]

When FEAT_RME is implemented:

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMCCFILTR_EL0.U bit, cycles in Realm EL0 are counted.

Otherwise, cycles in Realm EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]**When FEAT_RME is implemented:**

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMCCFILTR_EL0.NSH bit, cycles in Realm EL2 are counted.

Otherwise, cycles in Realm EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCFILTR_EL0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|---------------|
| PMU | 0x47C | PMCCFILTR_EL0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. For more information, see 'Time as measured by the Performance Monitors cycle counter'.

[PMCCFILTR_EL0](#) determines the modes and states in which the PMCCNTR_EL0 can increment.

Configuration

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register [PMCCNTR_EL0\[63:0\]](#).

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register [PMCCNTR\[63:0\]](#).

PMCCNTR_EL0 is in the Core power domain.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | CCNT | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | CCNT | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

CCNT, bits [63:0]

Cycle count. Depending on the values of [PMCR_EL0](#).{LC,D}, the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to [PMCR_EL0](#).C sets this field to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCCNTR_EL0 can be accessed through the external debug interface:

| Component | Offset | Instance | Range |
|-----------|--------|----------|-------|
|-----------|--------|----------|-------|

| | | | |
|-----|-------|-------------|------|
| PMU | 0x0F8 | PMCCNTR_EL0 | 31:0 |
|-----|-------|-------------|------|

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

| Component | Offset | Instance | Range |
|-----------|--------|-------------|-------|
| PMU | 0x0FC | PMCCNTR_EL0 | 63:32 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Note

This view of the register was previously called PMCEID0_EL0.

Configuration

External register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID0_EL0\[31:0\]](#).

External register PMCEID0 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID0\[31:0\]](#).

PMCEID0 is in the Core power domain.

Attributes

PMCEID0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|---------------------|---------------------|---------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 |
| ID31 | ID30 | ID29 | ID28 | ID27 | ID26 | ID25 | ID24 | ID23 | ID22 | ID21 | ID20 | ID19 | ID18 | ID17 | ID16 | ID15 | ID14 | ID13 | ID12 | ID11 | ID10 | ID9 | ID8 | ID7 |

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

| ID<n> | Meaning |
|-------|--|
| 0b0 | The Common event is not implemented, or not counted. |
| 0b1 | The Common event is implemented. |

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID0

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xE20 | PMCEID0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x020 to 0x03F.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Note

This view of the register was previously called PMCEID1_EL0.

Configuration

External register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID1_EL0\[31:0\]](#).

External register PMCEID1 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID1\[31:0\]](#).

PMCEID1 is in the Core power domain.

Attributes

PMCEID1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|---------------------|---------------------|---------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 |
| ID31 | ID30 | ID29 | ID28 | ID27 | ID26 | ID25 | ID24 | ID23 | ID22 | ID21 | ID20 | ID19 | ID18 | ID17 | ID16 | ID15 | ID14 | ID13 | ID12 | ID11 | ID10 | ID9 | ID8 | ID7 |

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event (0x0020 + n).

For each bit:

| ID<n> | Meaning |
|-------|--|
| 0b0 | The Common event is not implemented, or not counted. |
| 0b1 | The Common event is implemented. |

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID1

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xE24 | PMCEID1 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Configuration

External register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID0_EL0\[63:32\]](#).

External register PMCEID2 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID2\[31:0\]](#).

PMCEID2 is in the Core power domain.

This register is present only when FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are RES0.

Attributes

PMCEID2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | |
|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 |
| IDHi31 | IDHi30 | IDHi29 | IDHi28 | IDHi27 | IDHi26 | IDHi25 | IDHi24 | IDHi23 | IDHi22 | IDHi21 | IDHi20 | IDHi19 | IDHi18 | IDHi17 | IDHi16 | IDHi15 |

IDHi<n>, bit [n], for n = 31 to 0

IDHi[n] corresponds to Common event (0x4000 + n).

For each bit:

| IDHi<n> | Meaning |
|---------|--|
| 0b0 | The Common event is not implemented, or not counted. |
| 0b1 | The Common event is implemented. |

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU

features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID2

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID2 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xE28 | PMCEID2 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Configuration

External register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register [PMCEID1_EL0\[63:32\]](#).

External register PMCEID3 bits [31:0] are architecturally mapped to AArch32 System register [PMCEID3\[31:0\]](#).

PMCEID3 is in the Core power domain.

This register is present only when FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are RES0.

Attributes

PMCEID3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | |
|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 |
| IDhi31 | IDhi30 | IDhi29 | IDhi28 | IDhi27 | IDhi26 | IDhi25 | IDhi24 | IDhi23 | IDhi22 | IDhi21 | IDhi20 | IDhi19 | IDhi18 | IDhi17 | IDhi16 | IDhi15 |

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to Common event (0x4020 + n).

For each bit:

| IDhi<n> | Meaning |
|---------|--|
| 0b0 | The Common event is not implemented, or not counted. |
| 0b1 | The Common event is implemented. |

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU

features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID3

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCEID3 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xE2C | PMCEID3 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

Purpose

Contains PMU-specific configuration data.

Configuration

PMCFGR is in the Core power domain.

Attributes

PMCFGR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|----|----|----|------|----|----|----|-----|----|----|----|------|-----|------|----|-----|----|------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NCG | | | | RES0 | | | | FZO | | | | RES0 | UEN | WTNA | EX | CCD | CC | SIZE | | | | N | | | | | | | | | |

NCG, bits [31:28]

This feature is not supported, so this field is RAZ.

Reads as 0b0000.

Access to this field is **RO**.

Bits [27:22]

Reserved, RES0.

FZO, bit [21]

Freeze-on-overflow supported. Defined values are:

| FZO | Meaning |
|-----|--|
| 0b0 | Freeze-on-overflow mechanism is not supported. PMCR_ELO .FZO is RES0. |
| 0b1 | Freeze-on-overflow mechanism is supported. PMCR_ELO .FZO is RW. |

FEAT_PMUv3p7 implements the functionality added by the value 0b1.

From Armv8.7, if FEAT_PMUv3 is implemented, the only permitted value is 0b1.

Bit [20]

Reserved, RES0.

UEN, bit [19]

User-mode Enable Register supported. [PMUSERENR_ELO](#) is not visible in the external debug interface, so this bit is RAZ.

Reads as 0b0.

Access to this field is **RO**.

WT, bit [18]

This feature is not supported, so this bit is RAZ.

Reads as 0b0.

Access to this field is **RO**.

NA, bit [17]

This feature is not supported, so this bit is RAZ.

Reads as 0b0.

Access to this field is **RO**.

EX, bit [16]

Export supported. Value is IMPLEMENTATION DEFINED.

| EX | Meaning |
|-----|--|
| 0b0 | PMCR_ELO .X is RES0. |
| 0b1 | PMCR_ELO .X is read/write. |

Access to this field is **RO**.

CCD, bit [15]

Cycle counter has prescale.

This is RES1 if AArch32 is supported, and RAZ otherwise.

| CCD | Meaning |
|-----|--|
| 0b0 | PMCR_ELO .D is RES0. |
| 0b1 | PMCR_ELO .D is read/write. |

CC, bit [14]

Dedicated cycle counter (counter 31) supported.

Reads as 0b1.

Access to this field is **RO**.

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8, the largest counter is 64-bits, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8, the counters are a doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is **RO**.

N, bits [7:0]

Number of counters implemented in addition to the cycle counter, [PMCCNTR_EL0](#). The maximum number of event counters is 31.

| N | Meaning |
|------|---|
| 0x00 | Only PMCCNTR_EL0 implemented. |
| 0x01 | PMCCNTR_EL0 plus one event counter implemented. |

and so on up to 0b00011111, which indicates [PMCCNTR_EL0](#) and 31 event counters implemented.

Accessing PMCFGR

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCFGR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xE00 | PMCFGR |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and AllowExternalPMUAccess() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCID1SR, CONTEXTIDR_EL1 Sample Register

The PMCID1SR characteristics are:

Purpose

Contains the sampled value of [CONTEXTIDR_EL1](#), captured on reading [PMPCSR](#)[31:0].

Configuration

PMCID1SR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMCID1SR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID](#).PCSample.

Attributes

PMCID1SR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CONTEXTIDR_EL1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

CONTEXTIDR_EL1, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent [PMPCSR](#) sample. When the most recent [PMPCSR](#) sample was generated:

- If EL1 is using AArch64, then the Context ID is sampled from [CONTEXTIDR_EL1](#).
- If EL1 is using AArch32, then the Context ID is sampled from [CONTEXTIDR](#).
- If EL3 is implemented and is using AArch32, then [CONTEXTIDR](#) is a banked register and PMCID1SR samples the current banked copy of [CONTEXTIDR](#) for the Security state that is associated with the most recent [PMPCSR](#) sample.

Because the value written to PMCID1SR is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether PMCID1SR is set to the original or new value if [PMPCSR](#) samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCID1SR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

PMCID1SR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0x208 | PMCID1SR |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0x228 | PMCID1SR |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMCID2SR, CONTEXTIDR_EL2 Sample Register

The PMCID2SR characteristics are:

Purpose

Contains the sampled value of [CONTEXTIDR_EL2](#), captured on reading [PMPCSR](#)[31:0].

Configuration

PMCID2SR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMCID2SR are RES0.

Note

If FEAT_PCSRv8p2 is not implemented, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID](#).PCSample.

Attributes

PMCID2SR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CONTEXTIDR_EL2 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of [CONTEXTIDR_EL2](#) that is associated with the most recent [PMPCSR](#) sample. When the most recent [PMPCSR](#) sample is generated:

- If the PE is not executing at EL3, EL2 is using AArch64, and EL2 is enabled in the current Security state, then this field is set to the Context ID sampled from [CONTEXTIDR_EL2](#).
- Otherwise, this field is set to an UNKNOWN value.

Because the value written to PMCID2SR is an indirect read of [CONTEXTIDR_EL2](#), it is CONSTRAINED UNPREDICTABLE whether PMCID2SR is set to the original or new value if [PMPCSR](#) samples:

- An instruction that writes to [CONTEXTIDR_EL2](#).
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCID2SR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

PMCID2SR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0x22C | PMCID2SR |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL_0 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is **RO**.

Accessing PMCIDR0

PMCIDR0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xFF0 | PMCIDR0 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMCIDR1, Performance Monitors Component Identification Register 1

The PMCIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---------|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | CLASS | | | PRMBL_1 | | | | |

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

| CLASS | Meaning |
|--------|----------------------|
| 0b1001 | CoreSight component. |

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Reads as 0b0000.

Access to this field is **RO**.

Accessing PMCIDR1

PMCIDR1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xFF4 | PMCIDR1 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMCIDR2, Performance Monitors Component Identification Register 2

The PMCIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL_2 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is **RO**.

Accessing PMCIDR2

PMCIDR2 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xFF8 | PMCIDR2 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMCIDR3, Performance Monitors Component Identification Register 3

The PMCIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL_3 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is **RO**.

Accessing PMCIDR3

PMCIDR3 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xFFC | PMCIDR3 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

Purpose

Disables the Cycle Count Register, [PMCCNTR_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

Configuration

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENCLR_EL0\[31:0\]](#).

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENCLR\[31:0\]](#).

PMCNTENCLR_EL0 is in the Core power domain.

Attributes

PMCNTENCLR_EL0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| C | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

C, bit [31]

[PMCCNTR_EL0](#) disable bit. Disables the cycle counter register. Possible values are:

| C | Meaning |
|-----|--|
| 0b0 | When read, means the cycle counter is disabled. When written, has no effect. |
| 0b1 | When read, means the cycle counter is enabled. When written, disables the cycle counter. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter disable bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are RAZ/WI.

| P<n> | Meaning |
|------|--|
| 0b0 | When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect. |
| 0b1 | When read, means that PMEVCNTR<n>_EL0 is enabled. When written, disables PMEVCNTR<n>_EL0 . |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENCLR_ELO

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENCLR_ELO can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------------|
| PMU | 0xC20 | PMCNTENCLR_ELO |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

Purpose

Enables the Cycle Count Register, [PMCCNTR_EL0](#), and any implemented event counters [PMEVCNTR<n>](#). Reading this register shows which counters are enabled.

Configuration

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMCNTENSET_EL0\[31:0\]](#).

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMCNTENSET\[31:0\]](#).

PMCNTENSET_EL0 is in the Core power domain.

Attributes

PMCNTENSET_EL0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| C | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

C, bit [31]

[PMCCNTR_EL0](#) enable bit. Enables the cycle counter register. Possible values are:

| C | Meaning |
|-----|---|
| 0b0 | When read, means the cycle counter is disabled. When written, has no effect. |
| 0b1 | When read, means the cycle counter is enabled. When written, enables the cycle counter. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter enable bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are RAZ/WI.

| P<n> | Meaning |
|------|---|
| 0b0 | When read, means that PMEVCNTR<n>_EL0 is disabled. When written, has no effect. |
| 0b1 | When read, means that PMEVCNTR<n>_EL0 event counter is enabled. When written, enables PMEVCNTR<n>_EL0 . |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCNTENSET_ELO

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCNTENSET_ELO can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------------|
| PMU | 0xC00 | PMCNTENSET_ELO |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch32 System register [PMCR\[7:0\]](#).

External register PMCR_EL0 bits [7:0] are architecturally mapped to AArch64 System register [PMCR_EL0\[7:0\]](#).

PMCR_EL0 is in the Core power domain.

This register is only partially mapped to the internal [PMCR](#) System register. An external agent must use other means to discover the information held in [PMCR\[31:11\]](#), such as accessing [PMCFGR](#) and the ID registers.

Attributes

PMCR_EL0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|----|----|----|------|----|------|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RAZ/WI | | | | | | | | | | | RES0 | FZ | RES0 | LP | LC | DP | X | D | C | P | E | | | | | | | | | | |

Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

Bit [10]

Reserved, RES0.

FZO, bit [9]

When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

| FZO | Meaning |
|-----|---|
| 0b0 | Do not freeze on overflow. |
| 0b1 | Event counter PMEVCNTR<n>_EL0 does not count when PMOVSCLR_EL0 [(PMN-1):0] is nonzero and n is in the range of affected event counters. |

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters and [PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]

When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

| LP | Meaning |
|-----|--|
| 0b0 | Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [31:0]. |
| 0b1 | Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0 [63:0]. |

If PMN is not 0, this bit affects the operation of event counters in the range [0 .. (PMN-1)].

The field does not affect the operation of other event counters and [PMCCNTR_EL0](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

Otherwise:

Reserved, RES0.

LC, bit [6]

When AArch32 is supported:

Long cycle counter enable. Determines when unsigned overflow is recorded by the cycle counter overflow bit.

| LC | Meaning |
|-----|--|
| 0b0 | Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0 [31:0]. |
| 0b1 | Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0 [63:0]. |

Arm deprecates use of [PMCR_EL0](#).LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]

When EL3 is implemented or (FEAT_PMUv3p1 is implemented and EL2 is implemented):

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

| DP | Meaning |
|-----|---|
| 0b0 | Cycle counting by PMCCNTR_EL0 is not affected by this mechanism. |
| 0b1 | Cycle counting by PMCCNTR_EL0 is disabled in prohibited regions: <ul style="list-style-type: none"> If FEAT_PMUv3p1 is implemented, EL2 is implemented, and MDCR_EL2.HPMD is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL2. If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL3. If EL3 is implemented, MDCR_EL3.SPME is 0, and either FEAT_PMUv3p7 is not implemented or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR_EL0 is disabled at EL3 and in Secure state. <p>If MDCR_EL2.HPMN is not 0, this is when event counting by event counters in the range [0..(MDCR_EL2.HPMN-1)] is prohibited.</p> |

For more information, see 'Prohibiting event counting'.

The reset behavior of this field is:

- On a Warm reset:
 - When the implementation only supports execution in AArch32 state, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]

When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

| X | Meaning |
|-----|-------------------------------------|
| 0b0 | Do not export events. |
| 0b1 | Export events where not prohibited. |

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device, for example to an OPTIONAL PE trace unit.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]**When AArch32 is supported:**

Clock divider.

| D | Meaning |
|-----|--|
| 0b0 | When enabled, PMCCNTR_EL0 counts every clock cycle. |
| 0b1 | When enabled, PMCCNTR_EL0 counts once every 64 clock cycles. |

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

When this register has an architecturally-defined reset value, if this field is implemented as an RW field it resets to:

- A value that is architecturally UNKNOWN if the reset is into an Exception level that is using AArch64.
- 0 if the reset is into an Exception level that is using AArch32.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this bit are:

| C | Meaning |
|-----|--|
| 0b0 | No action. |
| 0b1 | Reset PMCCNTR_EL0 to zero. |

Note

Resetting [PMCCNTR_EL0](#) does not change the cycle counter overflow bit. If FEAT_PMUv3p5 is implemented, the value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is **WO/RAZ**.

P, bit [1]

Event counter reset. The effects of writing to this bit are:

| P | Meaning |
|-----|--|
| 0b0 | No action. |
| 0b1 | Reset all event counters, not including PMCCNTR_EL0 , to zero. |

Note

Resetting the event counters does not change the event counter overflow bits. If FEAT_PMUv3p5 is implemented, the value of [MDCR_EL2.HLP](#), or PMCR_EL0.LP is ignored and bits [63:0] of all affected event counters are reset.

Access to this field is **WO/RAZ**.

E, bit [0]

Enable.

In the description of this field:

- If EL2 is implemented and is using AArch32, PMN is [HDCR](#).HPMN.
- If EL2 is implemented and is using AArch64, PMN is [MDCR_EL2](#).HPMN.
- If EL2 is not implemented, PMN is PMCR_EL0.N.

| E | Meaning |
|-----|--|
| 0b0 | PMCCNTR_EL0 is disabled and event counters PMEVCNTR<n>_EL0 , where n is in the range of affected event counters, are disabled. |
| 0b1 | PMCCNTR_EL0 and event counters PMEVCNTR<n>_EL0 , where n is in the range of affected event counters, are enabled by PMCNTENSET_EL0 . |

If PMN is not 0, this field affects the operation of event counters in the range [0 .. (PMN-1)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing PMCR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMCR_EL0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xE04 | PMCR_EL0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------------------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | MPIDR_EL1 lo | | | | | | | | | | | | | | | |

MPIDR_EL1lo, bits [31:0]

[MPIDR_EL1](#) low half. Read-only copy of the low half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing PMDEVAFF0

PMDEVAFF0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| PMU | 0xFA8 | PMDEVAFF0 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE [MPIDR_EL1](#) register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required if the external interface to the PMU is implemented.

Attributes

PMDEVAFF1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------------------------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | | MPIDR_EL1hi | | | | | | | | | | | | | | |

MPIDR_EL1hi, bits [31:0]

[MPIDR_EL1](#) high half. Read-only copy of the high half of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing PMDEVAFF1

PMDEVAFF1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| PMU | 0xFAC | PMDEVAFF1 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the Performance Monitor component.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVARCH is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|---------|----------|----|----|----|---------|----|----|----|----------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ARCHITECT | | | | | | | | | | | PRESENT | REVISION | | | | ARCHVER | | | | ARCHPART | | | | | | | | | | | |

ARCHITECT, bits [31:21]

Defines the architecture of the component. For Performance Monitors, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0x4.

Bits [27:21] are the JEP106 ID code, 0x3B.

Reads as 0b01000111011.

Access to this field is **RO**.

PRESENT, bit [20]

Indicates that the DEVARCH is present.

Reads as 0b1.

Access to this field is **RO**.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For Performance Monitors, the revision defined by Armv8 is 0x0.

All other values are reserved.

Reads as 0b0000.

Access to this field is **RO**.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

All other values are reserved.

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHVER is PMDEVARCH.ARCHID[15:12].

Reads as 0b0010.

Access to this field is **RO**.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

| ARCHPART | Meaning | Applies when |
|----------|---|--------------|
| 0xA16 | Armv8-A PE performance monitors. | |
| 0xA26 | Armv8-A PE performance monitors, including the 64-bit programmers' model extension. | From Armv8.8 |

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHPART is PMDEVARCH.ARCHID[11:0].

Access to this field is **RO**.

Accessing PMDEVARCH

PMDEVARCH can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| PMU | 0xFBC | PMDEVARCH |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

PMDEVID, Performance Monitors Device ID register

The PMDEVID characteristics are:

Purpose

Provides information about features of the Performance Monitors implementation.

Configuration

If FEAT_DoPD is implemented, this register is in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required from Armv8.2 and in any implementation that includes FEAT_PCSRv8p2. Otherwise, its location is RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID.PCSample](#).

Attributes

PMDEVID is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|----------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | PCSample | | | |

Bits [31:4]

Reserved, RES0.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using Performance Monitors registers.

| PCSample | Meaning |
|----------|--|
| 0b0000 | PC Sample-based Profiling Extension is not implemented in the Performance Monitors register space. |
| 0b0001 | PC Sample-based Profiling Extension is implemented in the Performance Monitors register space. |

All other values are reserved.

FEAT_PCSRv8p2 implements the functionality identified by the value 0b0001.

Accessing PMDEVID

PMDEVID can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
|-----------|--------|----------|

| | | |
|-----|-------|---------|
| PMU | 0xFC8 | PMDEVID |
|-----|-------|---------|

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's performance monitor interface.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVTYPE is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-----|---|---|---|-------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | SUB | | | | MAJOR | | | |

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as 0b0001.

Access to this field is **RO**.

MAJOR, bits [3:0]

Major type. Indicates this is a performance monitor component.

Reads as 0b0110.

Access to this field is **RO**.

Accessing PMDEVTYPE

PMDEVTYPE can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| PMU | 0xFCC | PMDEVTYPE |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.

- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMEVCNTR<n>_EL0\[31:0\]](#).

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVCNTR<n>\[31:0\]](#).

PMEVCNTR<n>_EL0 is in the Core power domain.

Attributes

PMEVCNTR<n>_EL0 is a:

- 64-bit register when FEAT_PMUv3p5 is implemented
- 32-bit register otherwise

Field descriptions

When FEAT_PMUv3p5 is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| Event counter n | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Event counter n | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If the highest implemented Exception level is using AArch32, the optional external interface to the performance monitors is implemented, and the [PMCR](#).LP and [HDCR](#).HLP bits are RAZ/WI, then locations in the external interface to the performance monitors that map to PMEVCNTR<n>_EL0[63:32] return UNKNOWN values on reads.

If the implementation does not support AArch64, bits [63:32] of the event counters are not required to be implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Event counter n | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>_EL0

External accesses to the performance monitors ignore [PMUSERENR_EL0](#) and, if implemented, [MDCR_EL2](#).{TPM, TPMCR, HPMN} and [MDCR_EL3](#).TPM. This means that all counters are accessible regardless of the current Exception level or privilege of the access.

If FEAT_PMuV3p5 is not implemented, when IsCorePowered(), DoubleLockStatus(), OSLockStatus() or !AllowExternalPMUAccess(), 32-bit accesses to 0x004+8×n have a CONSTRAINED UNPREDICTABLE behavior.

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVCNTR<n>_EL0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|-----------------|
| PMU | 0x000 + (8 * n) | PMEVCNTR<n>_EL0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMEVFILTR<n>, Performance Monitors Event Type Select Register <n>, n = 0 - 30

The PMEVFILTR<n> characteristics are:

Purpose

External access to [PMEVTYPER<n>_EL0](#)[63:32].

Configuration

External register PMEVFILTR<n> bits [31:0] are architecturally mapped to AArch64 System register [PMEVTYPER<n>_EL0](#)[63:32] when AArch64 is supported.

PMEVFILTR<n> is in the Core power domain.

This register is present only when FEAT_PMUv3_TH is implemented. Otherwise, direct accesses to PMEVFILTR<n> are RES0.

Note

If FEAT_Debugv8p4 is implemented, the OPTIONAL Software Lock is not implemented.

If FEAT_DoPD is implemented, FEAT_DoubleLock is not implemented.

Attributes

PMEVFILTR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TC | | | RES0 | | | | | | | | | | | | | | | | | | TH | | | | | | | | | | |

TC, bits [31:29]
When FEAT_PMUv3_TH is implemented:

Threshold Control. Defines the threshold function. In the description of this field, the value V is the value the event specified by [PMEVTYPER<n>_EL0](#) would increment the counter by on a processor cycle if the threshold function is disabled. Comparisons treat V and PMEVFILTR<n>.TH as unsigned integer values.

| TC | Meaning |
|-------|--|
| 0b000 | Not-equal. The counter increments by V on each processor cycle when V is not equal to PMEVFILTR<n>.TH. If PMEVFILTR<n>.TH is zero, the threshold function is disabled. |
| 0b001 | Not-equal, count. The counter increments by 1 on each processor cycle when V is not equal to PMEVFILTR<n>.TH. |
| 0b010 | Equals. The counter increments by V on each processor cycle when V is equal to PMEVFILTR<n>.TH. |
| 0b011 | Equals, count. The counter increments by 1 on each processor cycle when V is equal to PMEVFILTR<n>.TH. |
| 0b100 | Greater-than-or-equal. The counter increments by V on each processor cycle when V is PMEVFILTR<n>.TH or more. |
| 0b101 | Greater-than-or-equal, count. The counter increments by 1 on each processor cycle when V is PMEVFILTR<n>.TH or more. |
| 0b110 | Less-than. The counter increments by V on each processor cycle when V is less than PMEVFILTR<n>.TH. |
| 0b111 | Less-than, count. The counter increments by 1 on each processor cycle when V is less than PMEVFILTR<n>.TH. |

The reset behavior of this field is:

- On a Warm reset:
 - When AArch32 is supported, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [28:12]

Reserved, RES0.

TH, bits [11:0]

When FEAT_PMUv3_TH is implemented:

Threshold value. Provides the unsigned value for the threshold function defined by PMEVFILTR<n>.TC.

If PMEVFILTR<n>.TC is 0b000 and PMEVFILTR<n>.TH is zero, then the threshold function is disabled.

If [PMMIR](#).THWIDTH is less than 12, then bits PMEVFILTR<n>.TH[11:[PMMIR](#).THWIDTH] are RES0. This accounts for the behavior when writing a value greater-than-or-equal-to $2^{(\text{PMMIR.THWIDTH})}$.

The reset behavior of this field is:

- On a Warm reset:
 - When AArch32 is supported, this field resets to 0.
 - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing PMEVFILTR<n>

PMEVFILTR<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|--------------|
| PMU | 0xA00 + (4 * n) | PMEVFILTR<n> |

This interface is accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus() or !AllowExternalPMUAccess() accesses to this register generate an error response.
- When SoftwareLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMEVTYPER<n>_EL0\[31:0\]](#).

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMEVTYPER<n>\[31:0\]](#).

PMEVTYPER<n>_EL0 is in the Core power domain.

If event counter n is not implemented:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess(), accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

Attributes

PMEVTYPER<n>_EL0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|-----|-----|-----|----|----|----|----|-----|-----|-----|------|----|----|----|-----------------|----|----|----|----|----|---------------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| P | U | NSK | NSU | NSH | M | MT | SH | T | RLK | RLU | RLH | RES0 | | | | evtCount[15:10] | | | | | | evtCount[9:0] | | | | | | | | | |

P, bit [31]

Privileged filtering bit. Controls counting in EL1.

If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the PMEVTYPER<n>_EL0.NSK bit.

If FEAT_RME is implemented, then counting in Realm EL1 is further controlled by the PMEVTYPER<n>_EL0.RLK bit.

| P | Meaning |
|-----|-----------------------------|
| 0b0 | Count events in EL1. |
| 0b1 | Do not count events in EL1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [30]

User filtering bit. Controls counting in EL0.

If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the PMEVTYPER<n>_EL0.NSU bit.

If FEAT_RME is implemented, then counting in Realm EL0 is further controlled by the PMEVTYPER<n>_EL0.RLU bit.

| U | Meaning |
|-----|-----------------------------|
| 0b0 | Count events in EL0. |
| 0b1 | Do not count events in EL0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]

When EL3 is implemented:

Non-secure EL1 (kernel) modes filtering bit. Controls counting in Non-secure EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Non-secure EL1 are counted.

Otherwise, events in Non-secure EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]

When EL3 is implemented:

Non-secure EL0 (Unprivileged) filtering bit. Controls counting in Non-secure EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Non-secure EL0 are counted.

Otherwise, events in Non-secure EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]

When EL2 is implemented:

EL2 (Hypervisor) filtering bit. Controls counting in EL2.

If FEAT_SEL2 and EL3 are implemented, counting in Secure EL2 is further controlled by the PMEVTYPER<n>_EL0.SH bit.

If FEAT_RME is implemented, then counting in Realm EL2 is further controlled by the PMEVTYPER<n>_EL0.RLH bit.

| NSH | Meaning |
|-----|-----------------------------|
| 0b0 | Do not count events in EL2. |
| 0b1 | Count events in EL2. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]

When EL3 is implemented:

EL3 filtering bit.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in EL3 are counted.

Otherwise, events in EL3 are not counted.

Most applications can ignore this field and set its value to 0b0.

Note

This field is not visible in the AArch32 [PMEVTYPER<n>](#) System register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]

When (FEAT_MTPMU is implemented and enabled) or an IMPLEMENTATION DEFINED multi-threaded PMU Extension is implemented:

Multithreading.

| MT | Meaning |
|-----|--|
| 0b0 | Count events only on controlling PE. |
| 0b1 | Count events from any PE with the same affinity at level 1 and above as this PE. |

Note

- When the lowest level of affinity consists of logical PEs that are implemented using a multi-threading type approach, an implementation is described as multi-threaded. That is, the performance of PEs at the lowest affinity level is highly interdependent.
- Events from a different thread of a multithreaded implementation are not Attributable to the thread counting the event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]**When FEAT_SEL2 is implemented and EL3 is implemented:**

Secure EL2 filtering.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Secure EL2 are counted.

Otherwise, events in Secure EL2 are not counted.

Note

This field is not visible in the AArch32 [PMEVTYPER<n>](#) System register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

T, bit [23]**When FEAT_TME is implemented:**

Transactional state filtering bit. Controls counting in Transactional state.

| T | Meaning |
|-----|--|
| 0b0 | This bit has no effect on the filtering of events. |
| 0b1 | Do not count events in Transactional state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLK, bit [22]**When FEAT_RME is implemented:**

Realm EL1 (kernel) filtering bit. Controls counting in Realm EL1.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.P bit, events in Realm EL1 are counted.

Otherwise, events in Realm EL1 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]**When FEAT_RME is implemented:**

Realm EL0 (unprivileged) filtering bit. Controls counting in Realm EL0.

If the value of this bit is equal to the value of the PMEVTYPER<n>_EL0.U bit, events in Realm EL0 are counted.

Otherwise, events in Realm EL0 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]

When FEAT_RME is implemented:

Realm EL2 filtering bit. Controls counting in Realm EL2.

If the value of this bit is not equal to the value of the PMEVTYPER<n>_EL0.NSH bit, events in Realm EL2 are counted.

Otherwise, events in Realm EL2 are not counted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]

When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count. The event number of the event that is counted by event counter [PMEVCNTR<n>_EL0](#).

Software must program this field with an event that is supported by the PE being programmed.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.

Otherwise, if PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range 0x4000 to 0x403F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted, and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

Arm recommends that for all values that represent reserved or unsupported events, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMEVTYPER<n>_EL0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|------------------|
| PMU | 0x400 + (4 * n) | PMEVTYPER<n>_EL0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

Purpose

Disables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR_EL0](#), and the event counters [PMEVCNTR<n>_EL0](#). Reading the register shows which overflow interrupt requests are enabled.

Configuration

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register [PMINTENCLR_EL1\[31:0\]](#).

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENCLR\[31:0\]](#).

PMINTENCLR_EL1 is in the Core power domain.

Attributes

PMINTENCLR_EL1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| C | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

C, bit [31]

[PMCCNTR_EL0](#) overflow interrupt request disable bit. Possible values are:

| C | Meaning |
|-----|--|
| 0b0 | When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect. |
| 0b1 | When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request disable bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are RAZ/WI.

| P<n> | Meaning |
|------|---|
| 0b0 | When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect. |
| 0b1 | When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR<n>_EL0 interrupt request. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENCLR_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENCLR_EL1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------------|
| PMU | 0xC60 | PMINTENCLR_EL1 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, [PMCCNTR_EL0](#), and the event counters [PMEVCNTR<n>_EL0](#). Reading the register shows which overflow interrupt requests are enabled.

Configuration

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register [PMINTENSET_EL1\[31:0\]](#).

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register [PMINTENSET\[31:0\]](#).

PMINTENSET_EL1 is in the Core power domain.

Attributes

PMINTENSET_EL1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| C | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

C, bit [31]

[PMCCNTR_EL0](#) overflow interrupt request enable bit. Possible values are:

| C | Meaning |
|-----|---|
| 0b0 | When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect. |
| 0b1 | When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow interrupt request enable bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are RAZ/WI.

| P<n> | Meaning |
|------|--|
| 0b0 | When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is disabled. When written, has no effect. |
| 0b1 | When read, means that the PMEVCNTR<n>_EL0 event counter interrupt request is enabled. When written, enables the PMEVCNTR<n>_EL0 interrupt request. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMINTENSET_EL1

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMINTENSET_EL1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------------|
| PMU | 0xC40 | PMINTENSET_EL1 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

Purpose

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

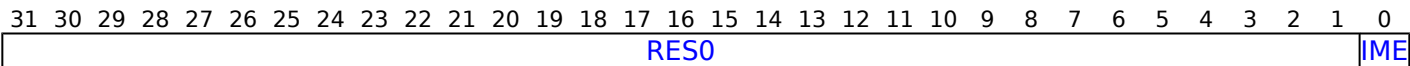

It is IMPLEMENTATION DEFINED whether PMITCTRL is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

PMITCTRL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

| IME | Meaning |
|-----|---------------------------|
| 0b0 | Normal operation. |
| 0b1 | Integration mode enabled. |

The following resets apply:

- If the register is implemented in the Core power domain:
 - On a Cold reset, this field resets to 0.
 - On an External debug reset, the value of this field is unchanged.
 - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
 - On a Cold reset, the value of this field is unchanged.
 - On an External debug reset, this field resets to 0.
 - On a Warm reset, the value of this field is unchanged.

Accessing PMITCTRL

PMITCTRL can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xF00 | PMITCTRL |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register are **IMPDEF**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

Purpose

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and [PMLSR](#) to check the current status of the lock.

Attributes

PMLAR is a 32-bit register.

Field descriptions

When Software Lock is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | KEY | | | | | | | | | | | | | | | |

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing PMLAR

PMLAR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xFB0 | PMLAR |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

Purpose

Indicates the current status of the software lock for Performance Monitors registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses [PMLAR](#) to set or clear the lock, and PMLSR to check the current status of the lock.

Attributes

PMLSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|-----|-----|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | nTT | SLK | SLI |

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required.

Reads as 0b0.

Access to this field is **RO**.

SLK, bit [1]

When Software Lock is implemented and FEAT_DoPD is not implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

| SLK | Meaning |
|-----|---|
| 0b0 | Lock clear. Writes are permitted to this component's registers. |
| 0b1 | Lock set. Writes to this component's registers are ignored, and reads have no side effects. |

The reset behavior of this field is:

- On an External debug reset, this field resets to 1.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

| SLI | Meaning |
|-----|--|
| 0b0 | Software Lock not implemented or not memory-mapped access. |
| 0b1 | Software Lock implemented and memory-mapped access. |

Accessing PMLSR

PMLSR can be accessed through the memory-mapped interfaces:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xFB4 | PMLSR |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation.

Configuration

PMMIR is in the Core power domain.

This register is present only when FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are RES0.

Attributes

PMMIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|---------|----|----|----|-----------|----|----|----|-----------|----|----|----|----|----|-------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | THWIDTH | | | | BUS_WIDTH | | | | BUS_SLOTS | | | | | | SLOTS | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

THWIDTH, bits [23:20]

[PMEVFILTR<n>_TH](#) width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the [PMEVFILTR<n>_TH](#) field.

| THWIDTH | Meaning |
|---------|--|
| 0b0000 | FEAT_PMUv3_TH is not implemented. |
| 0b0001 | 1 bit. PMEVFILTR<n>_TH [11:1] are RES0. |
| 0b0010 | 2 bits. PMEVFILTR<n>_TH [11:2] are RES0. |
| 0b0011 | 3 bits. PMEVFILTR<n>_TH [11:3] are RES0. |
| 0b0100 | 4 bits. PMEVFILTR<n>_TH [11:4] are RES0. |
| 0b0101 | 5 bits. PMEVFILTR<n>_TH [11:5] are RES0. |
| 0b0110 | 6 bits. PMEVFILTR<n>_TH [11:6] are RES0. |
| 0b0111 | 7 bits. PMEVFILTR<n>_TH [11:7] are RES0. |
| 0b1000 | 8 bits. PMEVFILTR<n>_TH [11:8] are RES0. |
| 0b1001 | 9 bits. PMEVFILTR<n>_TH [11:9] are RES0. |
| 0b1010 | 10 bits. PMEVFILTR<n>_TH [11:10] are RES0. |
| 0b1011 | 11 bits. PMEVFILTR<n>_TH [11] is RES0. |
| 0b1100 | 12 bits. |

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to [PMEVFILTR<n>_TH](#) is $2^{(\text{PMMIR.THWIDTH})}$ minus one.

Access to this field is **RO**.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as $\text{Log}_2(\text{number of bytes})$, plus one. Defined values are:

| BUS_WIDTH | Meaning |
|------------------|-----------------------------------|
| 0b0000 | The information is not available. |
| 0b0011 | Four bytes. |
| 0b0100 | 8 bytes. |
| 0b0101 | 16 bytes. |
| 0b0110 | 32 bytes. |
| 0b0111 | 64 bytes. |
| 0b1000 | 128 bytes. |
| 0b1001 | 256 bytes. |
| 0b1010 | 512 bytes. |
| 0b1011 | 1024 bytes. |
| 0b1100 | 2048 bytes. |

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

Access to this field is **RO**.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment by in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMMIR

If the Core power domain is off or in a low-power state, access on this interface returns an Error.

PMMIR can be accessed through the external debug interface:

| Component | Offset | Instance |
|------------------|---------------|-----------------|
| PMU | 0xE40 | PMMIR |

This interface is accessible as follows:

- When !IsCorePowered(), or DoubleLockStatus(), or OSLockStatus() or !AllowExternalPMUAccess() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

PMOVSLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSLR_EL0 characteristics are:

Purpose

Contains the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#). Writing to this register clears these bits.

Configuration

External register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMOVSLR_EL0\[31:0\]](#).

External register PMOVSLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSR\[31:0\]](#).

PMOVSLR_EL0 is in the Core power domain.

Attributes

PMOVSLR_EL0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| C | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

C, bit [31]

Cycle counter overflow clear bit.

| C | Meaning |
|-----|--|
| 0b0 | When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect. |
| 0b1 | When read, means the cycle counter has overflowed since this bit was last cleared. When written, clears the cycle counter overflow bit to 0. |

[PMCR_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow clear bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR](#).N is less than 31, bits [30:[PMCFGR](#).N] are RAZ/WI.

| P<n> | Meaning |
|------|---|
| 0b0 | When read, means that PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect. |
| 0b1 | When read, means that PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, clears the PMEVCNTR<n>_EL0 overflow bit to 0. |

If FEAT_PMUv3p5 is implemented, [MDCR_EL2.HLP](#) and [PMCR_EL0.LP](#) control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>_EL0](#)[31:0] or unsigned overflow of [PMEVCNTR<n>_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSLR_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSLR_EL0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-------------|
| PMU | 0xC80 | PMOVSLR_EL0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSSET_EL0 characteristics are:

Purpose

Sets the state of the overflow bit for the Cycle Count Register, [PMCCNTR_EL0](#), and each of the implemented event counters [PMEVCNTR<n>](#).

Configuration

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMOVSSET_EL0\[31:0\]](#).

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMOVSSETI\[31:0\]](#).

PMOVSSET_EL0 is in the Core power domain.

Attributes

PMOVSSET_EL0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| C | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

C, bit [31]

Cycle counter overflow set bit.

| C | Meaning |
|-----|--|
| 0b0 | When read, means the cycle counter has not overflowed since this bit was last cleared. When written, has no effect. |
| 0b1 | When read, means the cycle counter has overflowed since this bit was last cleared. When written, sets the cycle counter overflow bit to 1. |

[PMCR_EL0](#).LC controls whether an overflow is detected from unsigned overflow of [PMCCNTR_EL0](#)[31:0] or unsigned overflow of [PMCCNTR_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<n>, bit [n], for n = 30 to 0

Event counter overflow set bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR](#).N is less than 31, bits [30:[PMCFGR](#).N] are RAZ/WI.

| P<n> | Meaning |
|------|---|
| 0b0 | When read, means that PMEVCNTR<n>_EL0 has not overflowed since this bit was last cleared. When written, has no effect. |
| 0b1 | When read, means that PMEVCNTR<n>_EL0 has overflowed since this bit was last cleared. When written, sets the PMEVCNTR<n>_EL0 overflow bit to 1. |

If FEAT_PMUv3p5 is implemented, [MDCR_EL2.HLP](#) and [PMCR_EL0.LP](#) control whether an overflow is detected from unsigned overflow of [PMEVCNTR<n>_EL0](#)[31:0] or unsigned overflow of [PMEVCNTR<n>_EL0](#)[63:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMOVSSET_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMOVSSET_EL0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|--------------|
| PMU | 0xCC0 | PMOVSSET_EL0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **RO**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **RW**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

PMPCSR, Program Counter Sample Register

The PMPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configuration

PMPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMPCSR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID](#).PCSample.

Support for 64-bit atomic reads is IMPLEMENTATION DEFINED. If 64-bit atomic reads are implemented, a 64-bit read of PMPCSR has the same side-effect as a 32-bit read of PMCSR[31:0] followed by a 32-bit read of PMPCSR[63:32], returning the combined value. For example, if the PE is in Debug state then a 64-bit atomic read returns bits[31:0] == 0xFFFFFFFF and bits[63:32] UNKNOWN.

Attributes

PMPCSR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------|----|----|-----|------|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| NS | EL | T | NSE | RES0 | PCSample[55:32] | | | | | | | | | | | | | | | | | | | | | | | | | | |
| PCSample[31:0] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

NS, bit [63]

When FEAT_RME is implemented:

Together with the NSE field, indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

| NSE | NS | Meaning |
|-----|-----|-------------|
| 0b0 | 0b0 | Secure. |
| 0b0 | 0b1 | Non-secure. |
| 0b1 | 0b0 | Root. |
| 0b1 | 0b1 | Realm. |

Otherwise:

Non-secure state sample. Indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

| NS | Meaning |
|-----|----------------------------------|
| 0b0 | Sample is from Secure state. |
| 0b1 | Sample is from Non-secure state. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

| EL | Meaning |
|------|---------------------|
| 0b00 | Sample is from EL0. |
| 0b01 | Sample is from EL1. |
| 0b10 | Sample is from EL2. |
| 0b11 | Sample is from EL3. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

T, bit [60]

When FEAT_TME is implemented:

Transactional state of the sample. Indicates the Transactional state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

| T | Meaning |
|-----|---|
| 0b0 | Sample is from Non-transactional state. |
| 0b1 | Sample is from Transactional state. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSE, bit [59]

When FEAT_RME is implemented:

Together with the NS field, indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

For a description of the values derived by evaluating NS and NSE together, see PMPCSR.NS.

Otherwise:

Reserved, RES0.

Bits [58:56]

Reserved, RES0.

PCSample[55:32], bits [55:32]

Bits[55:32] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PCSample[31:0], bits [31:0]

Bits[31:0] of the sampled instruction address value.

PMPCSR[31:0] reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of PMPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

PMPCSR[31:0] reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of PMPCSR[31:0].

For the cases where a read of PMPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#) to UNKNOWN values.

Otherwise, a read of PMPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#). The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

For a read of PMPCSR[31:0] from the memory-mapped interface, if PMLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and PMPCSR[63:32], [PMCID1SR](#), [PMCID2SR](#), and [PMVIDSR](#) are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

PMPCSR can be accessed through the external debug interface:

| Component | Offset | Instance | Range |
|-----------|--------|----------|-------|
| PMU | 0x200 | PMPCSR | 31:0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

| Component | Offset | Instance | Range |
|-----------|--------|----------|-------|
| PMU | 0x204 | PMPCSR | 63:32 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

| Component | Offset | Instance | Range |
|-----------|--------|----------|-------|
| PMU | 0x220 | PMPCSR | 31:0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.

- Otherwise accesses to this register generate an error response.

| Component | Offset | Instance | Range |
|-----------|--------|----------|-------|
| PMU | 0x224 | PMPCSR | 63:32 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|--------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PART_0 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, least significant byte.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMPIDR0

PMPIDR0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xFE0 | PMPIDR0 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---|--------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | DES_0 | | | | PART_1 | | | |

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, least significant nibble of JEP106 ID code. For Arm Limited, this field is 0b1011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, most significant nibble.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMPIDR1

PMPIDR1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xFE4 | PMPIDR1 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:52; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

PMPIDR2, Performance Monitors Peripheral Identification Register 2

The PMPIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|-------|----|-------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | REVISION | | | | JEDEC | | DES_1 | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

Indicates a JEP106 identity code is used.

Reads as 0b1.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For Arm Limited, this field is 0b011.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMPIDR2

PMPIDR2 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0xFE8 | PMPIDR2 |

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|--------|---|---|---|------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | RES0 | | | | | | | | | | | | REVAND | | | | CMOD | | | |

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Part minor revision. Parts using [PMPIDR2](#).REVISION as an extension to the Part number must use this field as a major revision number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer modified. Indicates someone other than the Designer has modified the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMPIDR3

PMPIDR3 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
|-----------|--------|----------|

| | | |
|-----|-------|---------|
| PMU | 0xFEC | PMPIDR3 |
|-----|-------|---------|

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

Implementation of this register is OPTIONAL.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR4 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|------|---|---|---|-------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | RES0 | | | | | | | | | | | | SIZE | | | | DES_2 | | | |

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code, least significant nibble. For Arm Limited, this field is 0b0100.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing PMPIDR4

PMPIDR4 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
|-----------|--------|----------|

| | | |
|-----|-------|---------|
| PMU | 0xFD0 | PMPIDR4 |
|-----|-------|---------|

This interface is accessible as follows:

- When FEAT_DoPD is not implemented or IsCorePowered() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see 'SW_INCR'.

Configuration

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch64 System register [PMSWINC_EL0\[31:0\]](#).

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register [PMSWINC\[31:0\]](#).

PMSWINC_EL0 is in the Core power domain.

Implementation of this register is OPTIONAL.

If this register is implemented, use of it is deprecated.

If 1 is written to bit [n] from the external debug interface, it is CONSTRAINED UNPREDICTABLE whether or not a SW_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

Attributes

PMSWINC_EL0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

Bit [31]

Reserved, RES0.

P<n>, bit [n], for n = 30 to 0

Event counter software increment bit for [PMEVCNTR<n>_EL0](#).

If [PMCFGR.N](#) is less than 31, bits [30:[PMCFGR.N](#)] are WI.

| P<n> | Meaning |
|------|---|
| 0b0 | No action. The write to this bit is ignored. |
| 0b1 | It is CONSTRAINED UNPREDICTABLE whether a SW_INCR event is generated for event counter n. |

Accessing PMSWINC_EL0

Note

SoftwareLockStatus() depends on the type of access attempted and AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

PMSWINC_EL0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-------------|
| PMU | 0xCA0 | PMSWINC_EL0 |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and SoftwareLockStatus() accesses to this register are **WI**.
- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalPMUAccess() and !SoftwareLockStatus() accesses to this register are **WO**.
- Otherwise accesses to this register generate an error response.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

PMVIDSR, VMID Sample Register

The PMVIDSR characteristics are:

Purpose

Contains the sampled VMID value that is captured on reading [PMPCSR](#)[31:0].

Configuration

PMVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8p2 is implemented and EL2 is implemented. Otherwise, direct accesses to PMVIDSR are RES0.

Note

Before Armv8.2, the PC Sample-based Profiling Extension can be implemented in the external debug register space, as indicated by the value of [EDDEVID](#).PCSample.

Attributes

PMVIDSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|---|---|------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | VMID[15:8] | | | | | | | | VMID | | | | | | | |

Bits [31:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When FEAT_VMID16 is implemented:

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]

VMID sample. The VMID associated with the most recent [PMPCSR](#) sample. When the most recent [PMPCSR](#) sample was generated:

- This field is set to an UNKNOWN value if any of the following apply:
 - EL2 is disabled in the current Security state.
 - The PE is executing at EL2.

- EL2 is enabled in the current Security state, the PE is executing at EL0, EL2 is using AArch64, HCR_EL2.E2H == 1, and HCR_EL2.TGE == 1.
- Otherwise:
 - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or [VTCR_EL2.VS](#) is 1, this field is set to [VTTBR_EL2.VMID](#).
 - If EL2 is using AArch64, FEAT_VMID16 is implemented, and [VTCR_EL2.VS](#) is 0, PMVIDSR.VMID[7:0] is set to [VTTBR_EL2.VMID\[7:0\]](#) and PMVIDSR.VMID[15:8] is RES0.
 - If EL2 is using AArch32, this field is set to [VTTBR.VMID](#).

Because the value written to PMVIDR is an indirect read of the VMID value, it is CONSTRAINED UNPREDICTABLE whether PMVIDSR is set to the original or new value if [PMPCSR](#) samples:

- An instruction that writes to the VMID value.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

PMVIDSR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| PMU | 0x20C | PMVIDSR |

This interface is accessible as follows:

- When IsCorePowered(), !DoubleLockStatus() and !OSLockStatus() accesses to this register are **RO**.
- Otherwise accesses to this register generate an error response.

TRCACATR<n>, Address Comparator Access Type Register <n>, n = 0 - 15

The TRCACATR<n> characteristics are:

Purpose

Defines the type of access for the corresponding [TRCACVR<n>](#) Register. This register configures the context type, Exception levels, alignment, masking that is applied by the Address Comparator, and how the Address Comparator behaves when it is one half of an Address Range Comparator.

Configuration

External register TRCACATR<n> bits [63:0] are architecturally mapped to AArch64 System register [TRCACATR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS * 2 > n. Otherwise, direct accesses to TRCACATR<n> are RES0.

Attributes

TRCACATR<n> is a 64-bit register.

Field descriptions

| | | | | | | |
|----------------------------|----|----|----|----|----|----|
| 63626160595857565554535251 | 50 | 49 | 48 | 47 | 46 | 45 |

| 31302928272625242322212019 | 18 | 17 | 16 | 15 | 14 | 13 |

Bits [63:19]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [18]

When TRCIDR6.EXLEVEL_RL_EL2 == 1:

Realm EL2 address comparison control. Controls whether a comparison can occur at EL2 in Realm state.

| EXLEVEL_RL_EL2 | Meaning |
|----------------|--|
| 0b0 | When TRCACATR<n>.EXLEVEL_NS_EL2 is 0 the Address Comparator performs comparisons in Realm EL2. When TRCACATR<n>.EXLEVEL_NS_EL2 is 1 the Address Comparator does not perform comparisons in Realm EL2. |
| 0b1 | When TRCACATR<n>.EXLEVEL_NS_EL2 is 0 the Address Comparator does not perform comparisons in Realm EL2. When TRCACATR<n>.EXLEVEL_NS_EL2 is 1 the Address Comparator performs comparisons in Realm EL2. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [17]**When TRCIDR6.EXLEVEL_RL_EL1 == 1:**

Realm EL1 address comparison control. Controls whether a comparison can occur at EL1 in Realm state.

| EXLEVEL_RL_EL1 | Meaning |
|----------------|--|
| 0b0 | When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator performs comparisons in Realm EL1. When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator does not perform comparisons in Realm EL1. |
| 0b1 | When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator does not perform comparisons in Realm EL1. When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator performs comparisons in Realm EL1. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [16]**When TRCIDR6.EXLEVEL_RL_EL0 == 1:**

Realm EL0 address comparison control. Controls whether a comparison can occur at EL0 in Realm state.

| EXLEVEL_RL_EL0 | Meaning |
|----------------|--|
| 0b0 | When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator performs comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator does not perform comparisons in Realm EL0. |
| 0b1 | When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator does not perform comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator performs comparisons in Realm EL0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [14]**When Non-secure EL2 is implemented:**

Non-secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Non-secure state.

| EXLEVEL_NS_EL2 | Meaning |
|----------------|--|
| 0b0 | The Address Comparator performs comparisons in Non-secure EL2. |
| 0b1 | The Address Comparator does not perform comparisons in Non-secure EL2. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [13]**When Non-secure EL1 is implemented:**

Non-secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Non-secure state.

| EXLEVEL_NS_EL1 | Meaning |
|----------------|--|
| 0b0 | The Address Comparator performs comparisons in Non-secure EL1. |
| 0b1 | The Address Comparator does not perform comparisons in Non-secure EL1. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [12]**When Non-secure EL0 is implemented:**

Non-secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Non-secure state.

| EXLEVEL_NS_EL0 | Meaning |
|----------------|--|
| 0b0 | The Address Comparator performs comparisons in Non-secure EL0. |
| 0b1 | The Address Comparator does not perform comparisons in Non-secure EL0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [11]**When EL3 is implemented:**

EL3 address comparison control. Controls whether a comparison can occur at EL3.

| EXLEVEL_S_EL3 | Meaning |
|----------------------|---|
| 0b0 | The Address Comparator performs comparisons in EL3. |
| 0b1 | The Address Comparator does not perform comparisons in EL3. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [10]**When EL2 is implemented and FEAT_SEL2 is implemented:**

Secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Secure state.

| EXLEVEL_S_EL2 | Meaning |
|----------------------|--|
| 0b0 | The Address Comparator performs comparisons in Secure EL2. |
| 0b1 | The Address Comparator does not perform comparisons in Secure EL2. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [9]**When Secure EL1 is implemented:**

Secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Secure state.

| EXLEVEL_S_EL1 | Meaning |
|----------------------|--|
| 0b0 | The Address Comparator performs comparisons in Secure EL1. |
| 0b1 | The Address Comparator does not perform comparisons in Secure EL1. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [8]**When Secure EL0 is implemented:**

Secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Secure state.

| EXLEVEL S EL0 | Meaning |
|---------------|--|
| 0b0 | The Address Comparator performs comparisons in Secure EL0. |
| 0b1 | The Address Comparator does not perform comparisons in Secure EL0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

CONTEXT, bits [6:4]

When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:

Selects a Context Identifier Comparator or Virtual Context Identifier Comparator:

| CONTEXT | Meaning | Applies when |
|---------|---------------|--|
| 0b000 | Comparator 0. | |
| 0b001 | Comparator 1. | When TRCIDR4.NUMCIDC > 0b0001 or TRCIDR4.NUMVMIDC > 0b0001 |
| 0b010 | Comparator 2. | When TRCIDR4.NUMCIDC > 0b0010 or TRCIDR4.NUMVMIDC > 0b0010 |
| 0b011 | Comparator 3. | When TRCIDR4.NUMCIDC > 0b0011 or TRCIDR4.NUMVMIDC > 0b0011 |
| 0b100 | Comparator 4. | When TRCIDR4.NUMCIDC > 0b0100 or TRCIDR4.NUMVMIDC > 0b0100 |
| 0b101 | Comparator 5. | When TRCIDR4.NUMCIDC > 0b0101 or TRCIDR4.NUMVMIDC > 0b0101 |
| 0b110 | Comparator 6. | When TRCIDR4.NUMCIDC > 0b0110 or TRCIDR4.NUMVMIDC > 0b0110 |
| 0b111 | Comparator 7. | When TRCIDR4.NUMCIDC > 0b0111 or TRCIDR4.NUMVMIDC > 0b0111 |

The width of this field is dependent on the maximum number of Context Identifier Comparators or Virtual Context Identifier Comparators implemented. Unimplemented bits are RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CONTEXTTYPE, bits [3:2]

When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:

Controls whether the Address Comparator is dependent on a Context Identifier Comparator, a Virtual Context Identifier Comparator, or both comparisons.

| CONTEXTTYPE | Meaning | Applies when |
|-------------|---|---|
| 0b00 | The Address Comparator is not dependent on the Context Identifier Comparators or Virtual Context Identifier Comparators. | |
| 0b01 | The Address Comparator is dependent on the Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Context Identifier Comparator and the address comparison match. | When TRCIDR4.NUMCIDC != 0b0000 |
| 0b10 | The Address Comparator is dependent on the Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Virtual Context Identifier Comparator and the address comparison match. | When TRCIDR4.NUMVMIDC != 0b0000 |
| 0b11 | The Address Comparator is dependent on the Context Identifier Comparator and Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if the Context Identifier Comparator, the Virtual Context Identifier Comparator, and address comparison all match. | When TRCIDR4.NUMCIDC != 0b0000 and TRCIDR4.NUMVMIDC != 0b0000 |

If [TRCIDR4.NUMCIDC](#) == 0b0000, then bit [2] is RES0.

If [TRCIDR4.NUMVMIDC](#) == 0b0000, then bit [3] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [1:0]

Reserved, RES0.

Accessing TRCACATR<n>

Must be programmed if any of the following are true:

- [TRCBBCTL](#)R.RANGE[n/2] == 1.
- [TRCRSCTL](#)R<a>.GROUP == 0b0100 and [TRCRSCTL](#)R<a>.SAC[n] == 1.
- [TRCRSCTL](#)R<a>.GROUP == 0b0101 and [TRCRSCTL](#)R<a>.ARC[n/2] == 1.
- [TRCVIIECTL](#)R.EXCLUDE[n/2] == 1.
- [TRCVIIECTL](#)R.INCLUDE[n/2] == 1.
- [TRCVISSCTL](#)R.START[n] == 1.
- [TRCVISSCTL](#)R.STOP[n] == 1.
- TRCSSCCR<>.ARC[n/2] == 1.
- TRCSSCCR<>.SAC[n] == 1.
- [TRCQCTL](#)R.RANGE[n/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCACATR<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|-------------|
| ETE | 0x480 + (8 * n) | TRCACATR<n> |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCACVR<n>, Address Comparator Value Register <n>, n = 0 - 15

The TRCACVR<n> characteristics are:

Purpose

Contains the address value.

Configuration

External register TRCACVR<n> bits [63:0] are architecturally mapped to AArch64 System register [TRCACVR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS * 2 > n. Otherwise, direct accesses to TRCACVR<n> are RES0.

Attributes

TRCACVR<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ADDRESS | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| ADDRESS | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ADDRESS, bits [63:0]

Address Value.

The Address Comparators can support implementations that use multiple address widths. When the trace unit compares the ADDRESS field with an address that has a width less than this field, then the address must be zero-extended to the ADDRESS field width. The trace unit then compares all implemented bits. For example, in a system that supports both 32-bit and 64-bit addresses, when the PE is in AArch32 state the comparator must zero-extend the 32-bit address and compare against the full 64 bits that are stored in the TRCACVR<n>. This requires that the trace analyzer always programs all implemented bits of the TRCACVR<n>.

The result of writing a value other than all zeros or all ones to ADDRESS at bits[63:P] is an UNKNOWN value, where P is defined as the maximum virtual address size supported by the PE.

The result of writing a value of all zeros or all ones to ADDRESS at bits[63:P] is the written value, and a read of the register returns the written value.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCACVR<n>

Must be programmed if any of the following are true:

- [TRCBBCTLR](#).RANGE[n/2] == 1.
- [TRCRSCTLR<a>](#).GROUP == 0b0100 and [TRCRSCTLR<a>](#).SAC[n] == 1.
- [TRCRSCTLR<a>](#).GROUP == 0b0101 and [TRCRSCTLR<a>](#).ARC[n/2] == 1.
- [TRCVIIECTLR](#).EXCLUDE[n/2] == 1.
- [TRCVIIECTLR](#).INCLUDE[n/2] == 1.

- [TRCVISSCTLR](#).START[n] == 1.
- [TRCVISSCTLR](#).STOP[n] == 1.
- TRCSSCCR<>.ARC[n/2] == 1.
- TRCSSCCR<>.SAC[n] == 1.
- [TRCQCTLR](#).RANGE[n/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCACVR<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|------------|
| ETE | 0x400 + (8 * n) | TRCACVR<n> |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCAUTHSTATUS, Authentication Status Register

The TRCAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCAUTHSTATUS bits [31:0] are architecturally mapped to AArch64 System register [TRCAUTHSTATUS\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCAUTHSTATUS are RES0.

Attributes

TRCAUTHSTATUS is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTNID.

RTID, bits [25:24]

Root invasive debug.

| RTID | Meaning |
|------|------------------|
| 0b00 | Not implemented. |

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLNID.

RLID, bits [13:12]

Realm invasive debug.

| RLID | Meaning |
|------|------------------|
| 0b00 | Not implemented. |

HNID, bits [11:10]

Hyp Non-invasive Debug. Indicates whether a separate enable control for EL2 non-invasive debug features is implemented and enabled.

| HNID | Meaning |
|------|---|
| 0b00 | Separate Hyp non-invasive debug enable not implemented, or EL2 non-invasive debug features not implemented. |
| 0b10 | Implemented and disabled. |
| 0b11 | Implemented and enabled. |

All other values are reserved.

This field reads as 0b00.

HID, bits [9:8]

Hyp Invasive Debug. Indicates whether a separate enable control for EL2 invasive debug features is implemented and enabled.

| HID | Meaning |
|------|---|
| 0b00 | Separate Hyp invasive debug enable not implemented, or EL2 invasive debug features not implemented. |
| 0b10 | Implemented and disabled. |
| 0b11 | Implemented and enabled. |

All other values are reserved.

This field reads as 0b00.

SNID, bits [7:6]

Secure Non-invasive Debug. Indicates whether Secure non-invasive debug features are implemented and enabled.

| SNID | Meaning |
|------|---|
| 0b00 | Secure non-invasive debug features not implemented. |
| 0b10 | Implemented and disabled. |
| 0b11 | Implemented and enabled. |

All other values are reserved.

When EL3 is implemented, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b00.

When EL3 is not implemented and the PE is Secure, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

SID, bits [5:4]

Secure Invasive Debug. Indicates whether Secure invasive debug features are implemented and enabled.

| SID | Meaning |
|------|---|
| 0b00 | Secure invasive debug features not implemented. |
| 0b10 | Implemented and disabled. |
| 0b11 | Implemented and enabled. |

All other values are reserved.

This field reads as 0b00.

NSNID, bits [3:2]

Non-secure Non-invasive Debug. Indicates whether Non-secure non-invasive debug features are implemented and enabled.

| NSNID | Meaning |
|-------|---|
| 0b00 | Non-secure non-invasive debug features not implemented. |
| 0b10 | Implemented and disabled. |
| 0b11 | Implemented and enabled. |

All other values are reserved.

When EL3 is implemented, this field reads as 0b11.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b11.

When EL3 is not implemented and the PE is Secure, this field reads as 0b00.

NSID, bits [1:0]

Non-secure Invasive Debug. Indicates whether Non-secure invasive debug features are implemented and enabled.

| NSID | Meaning |
|------|---|
| 0b00 | Non-secure invasive debug features not implemented. |
| 0b10 | Implemented and disabled. |
| 0b11 | Implemented and enabled. |

All other values are reserved.

This field reads as 0b00.

Accessing TRCAUTHSTATUS

For implementations that support multiple access mechanisms, different access mechanisms can return different values for reads of TRCAUTHSTATUS if the authentication signals have changed and that change has not yet been synchronized by a Context synchronization event. This scenario can happen if, for example, the external debugger view is implemented separately from the system instruction view to allow for separate power domains, and so observes changes on the signals differently.

External debugger accesses to this register are unaffected by the OS Lock.

TRCAUTHSTATUS can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|---------------|
| ETE | 0xFB8 | TRCAUTHSTATUS |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCAUXCTLR, Auxiliary Control Register

The TRCAUXCTLR characteristics are:

Purpose

The function of this register is IMPLEMENTATION DEFINED.

Configuration

External register TRCAUXCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCAUXCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCAUXCTLR are RES0.

Attributes

TRCAUXCTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Accessing TRCAUXCTLR

If this register is nonzero then it might cause the behavior of a trace unit to contradict this architecture specification. See the documentation of the specific implementation for information about the IMPLEMENTATION DEFINED support for this register.

TRCAUXCTLR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|------------|
| ETE | 0x018 | TRCAUXCTLR |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCBBCTLR, Branch Broadcast Control Register

The TRCBBCTLR characteristics are:

Purpose

Controls the regions in the memory map where branch broadcasting is active.

Configuration

External register TRCBBCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCBBCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, TRCIDR0.TRCBB == 1 and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCBBCTLR are RES0.

Attributes

TRCBBCTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|------|----|----------|----|----------|----|----------|----|----------|----|----------|----|----------|---|----------|---|----------|---|----------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | MODE | | RANGE[7] | | RANGE[6] | | RANGE[5] | | RANGE[4] | | RANGE[3] | | RANGE[2] | | RANGE[1] | | RANGE[0] | | RANGE[0] | | | |

Bits [31:9]

Reserved, RES0.

MODE, bit [8]

Mode.

| MODE | Meaning |
|------|---|
| 0b0 | Exclude Mode. Branch broadcasting is not active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then branch broadcasting is active for all instructions. |
| 0b1 | Include Mode. Branch broadcasting is active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then the behavior of the trace unit is CONSTRAINED UNPREDICTABLE. That is, the trace unit might or might not consider any instructions to be in a branch broadcasting region. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Address range field.

Selects whether Address Range Comparator <m> is used with branch broadcasting.

| RANGE[<m>] | Meaning |
|-------------------------|---|
| 0b0 | The address range that Address Range Comparator <m> defines, is not selected. |
| 0b1 | The address range that Address Range Comparator <m> defines, is selected. |

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCBBCTL

Must be programmed if [TRCCONFIGR](#).BB == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCBBCTL can be accessed through the external debug interface:

| Component | Offset | Instance |
|------------------|---------------|-----------------|
| ETE | 0x03C | TRCBBCTL |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCCCTLR, Cycle Count Control Register

The TRCCCCTLR characteristics are:

Purpose

Set the threshold value for cycle counting.

Configuration

External register TRCCCCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCCCCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR0.TRCCCI == 1. Otherwise, direct accesses to TRCCCCTLR are RES0.

Attributes

TRCCCCTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|----|---|---|---|---|---|---|---|---|---|---|--|--|--|--|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | THRESHOLD | | | | | | | | | | | | | | | | |

Bits [31:12]

Reserved, RES0.

THRESHOLD, bits [11:0]

Sets the threshold value for instruction trace cycle counting.

The minimum threshold value that can be programmed into THRESHOLD is given in [TRCIDR3.CCITMIN](#). If the THRESHOLD value is smaller than the value in [TRCIDR3.CCITMIN](#) then the behavior is CONSTRAINED UNPREDICTABLE. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

Writing a value of zero when [TRCONFIGR.CCI](#) enables instruction trace cycle counting results in CONSTRAINED UNPREDICTABLE behavior. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCCCTLR

Must be programmed if [TRCONFIGR.CCI](#) == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCCCTLR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| ETE | 0x038 | TRCCCCTLR |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCIDCCTL0, Context Identifier Comparator Control Register 0

The TRCCIDCCTL0 characteristics are:

Purpose

Contains Context identifier mask values for the [TRCCIDCVR<n>](#) registers, for n = 0 to 3.

Configuration

External register TRCCIDCCTL0 bits [31:0] are architecturally mapped to AArch64 System register [TRCCIDCCTL0\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMCIDC > 0x0 and TRCIDR2.CIDSIZE > 0b00000. Otherwise, direct accesses to TRCCIDCCTL0 are RES0.

Attributes

TRCCIDCCTL0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | |
|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | |
| COMP3[7] | COMP3[6] | COMP3[5] | COMP3[4] | COMP3[3] | COMP3[2] | COMP3[1] | COMP3[0] | COMP2[7] | COMP2[6] | COMP2[5] | COMP2[4] |

COMP3[<m>], bit [m+24], for m = 7 to 0
When TRCIDR4.NUMCIDC > 3:

TRCCIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR3. Each bit in this field corresponds to a byte in TRCCIDCVR3.

| COMP3[<m>] | Meaning |
|------------|---|
| 0b0 | The trace unit includes TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison. |
| 0b1 | The trace unit ignores TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0
When TRCIDR4.NUMCIDC > 2:

TRCCIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR2. Each bit in this field corresponds to a byte in TRCCIDCVR2.

| COMP2[<m>] | Meaning |
|------------|---|
| 0b0 | The trace unit includes TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison. |
| 0b1 | The trace unit ignores TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0

When TRCIDR4.NUMCIDC > 1:

TRCCIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR1. Each bit in this field corresponds to a byte in TRCCIDCVR1.

| COMP1[<m>] | Meaning |
|------------|---|
| 0b0 | The trace unit includes TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison. |
| 0b1 | The trace unit ignores TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0

When TRCIDR4.NUMCIDC > 0:

TRCCIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR0. Each bit in this field corresponds to a byte in TRCCIDCVR0.

| COMP0[<m>] | Meaning |
|------------|---|
| 0b0 | The trace unit includes TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison. |
| 0b1 | The trace unit ignores TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTL0

If software uses the [TRCCIDCVR<n>](#) registers, for n = 0 to 3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCCIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCCIDCVR<n>](#) is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCCTL0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-------------|
| ETE | 0x680 | TRCCIDCCTL0 |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCIDCCTL1, Context Identifier Comparator Control Register 1

The TRCCIDCCTL1 characteristics are:

Purpose

Contains Context identifier mask values for the [TRCCIDCVR<n>](#) registers, for n = 4 to 7.

Configuration

External register TRCCIDCCTL1 bits [31:0] are architecturally mapped to AArch64 System register [TRCCIDCCTL1\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMCIDC > 0x4 and TRCIDR2.CIDSIZE > 0b00000. Otherwise, direct accesses to TRCCIDCCTL1 are RES0.

Attributes

TRCCIDCCTL1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | |
|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | |
| COMP7[7] | COMP7[6] | COMP7[5] | COMP7[4] | COMP7[3] | COMP7[2] | COMP7[1] | COMP7[0] | COMP6[7] | COMP6[6] | COMP6[5] | COMP6[4] |

COMP7[<m>], bit [m+24], for m = 7 to 0
When TRCIDR4.NUMCIDC > 7:

TRCCIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR7. Each bit in this field corresponds to a byte in TRCCIDCVR7.

| COMP7[<m>] | Meaning |
|------------|---|
| 0b0 | The trace unit includes TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison. |
| 0b1 | The trace unit ignores TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0
When TRCIDR4.NUMCIDC > 6:

TRCCIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR6. Each bit in this field corresponds to a byte in TRCCIDCVR6.

| COMP6[<m>] | Meaning |
|------------|---|
| 0b0 | The trace unit includes TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison. |
| 0b1 | The trace unit ignores TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0

When TRCIDR4.NUMCICD > 5:

TRCCIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR5. Each bit in this field corresponds to a byte in TRCCIDCVR5.

| COMP5[<m>] | Meaning |
|------------|---|
| 0b0 | The trace unit includes TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison. |
| 0b1 | The trace unit ignores TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0

When TRCIDR4.NUMCICD > 4:

TRCCIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR4. Each bit in this field corresponds to a byte in TRCCIDCVR4.

| COMP4[<m>] | Meaning |
|------------|---|
| 0b0 | The trace unit includes TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison. |
| 0b1 | The trace unit ignores TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTLR1

If software uses the [TRCCIDCVR<n>](#) registers, for n = 4 to 7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCCIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCCIDCVR<n>](#) is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCCTLR1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|--------------|
| ETE | 0x684 | TRCCIDCCTLR1 |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCIDCVR<n>, Context Identifier Comparator Value Registers <n>, n = 0 - 7

The TRCCIDCVR<n> characteristics are:

Purpose

Contains a Context identifier value.

Configuration

External register TRCCIDCVR<n> bits [63:0] are architecturally mapped to AArch64 System register [TRCCIDCVR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMCIDC > n. Otherwise, direct accesses to TRCCIDCVR<n> are RES0.

Attributes

TRCCIDCVR<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | VALUE | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | VALUE | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

VALUE, bits [63:0]

Context identifier value. The width of this field is indicated by [TRCIDR2.CIDSIZE](#). Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Context identifier is zero until the PE updates the Context identifier.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCIDCVR<n>

Must be programmed if any of the following are true:

- [TRCRSCTLR<a>.GROUP](#) == 0b0110 and [TRCRSCTLR<a>.CID\[n\]](#) == 1.
- [TRCACATR<a>.CONTEXTTYPE](#) == 0b01 or 0b11 and [TRCACATR<a>.CONTEXT](#) == n.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCVR<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|--------------|
| ETE | 0x600 + (8 * n) | TRCCIDCVR<n> |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.

- Otherwise accesses to this register are **RW**.

TRCCIDR0, Component Identification Register 0

The TRCCIDR0 characteristics are:

Purpose

Provides discovery information about the component.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCIDR0 are RES0.

Attributes

TRCCIDR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL_0 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Component identification preamble, segment 0.
Reads as 0x0D.
Access to this field is **RO**.

Accessing TRCCIDR0

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFF0 | TRCCIDR0 |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCCIDR1, Component Identification Register 1

The TRCCIDR1 characteristics are:

Purpose

Provides discovery information about the component.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCIDR1 are RES0.

Attributes

TRCCIDR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---------|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | CLASS | | | PRMBL_1 | | | | |

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

| CLASS | Meaning |
|--------|-----------------------|
| 0b1001 | CoreSight peripheral. |

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

PRMBL_1, bits [3:0]

Component identification preamble, segment 1.

Reads as 0b0000.

Access to this field is **RO**.

Accessing TRCCIDR1

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFF4 | TRCCIDR1 |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCCIDR2, Component Identification Register 2

The TRCCIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCIDR2 are RES0.

Attributes

TRCCIDR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL_2 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Component identification preamble, segment 2.

Reads as 0x05.

Access to this field is **RO**.

Accessing TRCCIDR2

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR2 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFF8 | TRCCIDR2 |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCCIDR3, Component Identification Register 3

The TRCCIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCIDR3 are RES0.

Attributes

TRCCIDR3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PRMBL_3 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Component identification preamble, segment 3.

Reads as 0xB1.

Access to this field is **RO**.

Accessing TRCCIDR3

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR3 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFFC | TRCCIDR3 |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCCLAIMCLR, Claim Tag Clear Register

The TRCCLAIMCLR characteristics are:

Purpose

In conjunction with [TRCCLAIMSET](#), provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCCLAIMCLR bits [31:0] are architecturally mapped to AArch64 System register [TRCCLAIMCLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCLAIMCLR are RES0.

Attributes

TRCCLAIMCLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | |
|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 |
| CLR[31] | CLR[30] | CLR[29] | CLR[28] | CLR[27] | CLR[26] | CLR[25] | CLR[24] | CLR[23] | CLR[22] | CLR[21] | CLR[20] | CLR[19] | CLR[18] |

CLR[<m>], bit [m], for m = 31 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

| CLR[<m>] | Meaning |
|----------|---|
| 0b0 | On a read: Claim Tag bit <m> is not set. On a write: Ignored. |
| 0b1 | On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0. |

The number of Claim Tag bits implemented is indicated in [TRCCLAIMSET](#).

This bit reads-as-zero and ignores writes if m > the number of Claim Tag bits.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Access to this field is **W1C**.

Accessing TRCCLAIMCLR

TRCCLAIMCLR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-------------|
| ETE | 0xFA4 | TRCCLAIMCLR |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCLAIMSET, Claim Tag Set Register

The TRCCLAIMSET characteristics are:

Purpose

In conjunction with [TRCCLAIMCLR](#), provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCCLAIMSET bits [31:0] are architecturally mapped to AArch64 System register [TRCCLAIMSET\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCLAIMSET are RES0.

The number of claim tag bits implemented is IMPLEMENTATION DEFINED. Arm recommends that implementations support a minimum of four claim tag bits, that is, SET[3:0] reads as 0b1111.

Attributes

TRCCLAIMSET is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SET[31] | SET[30] | SET[29] | SET[28] | SET[27] | SET[26] | SET[25] | SET[24] | SET[23] | SET[22] | SET[21] | SET[20] | SET[19] | SET[18] | SET[17] | SET[16] | SET[15] | SET[14] | SET[13] | SET[12] | SET[11] | SET[10] | SET[9] | SET[8] | SET[7] | SET[6] | SET[5] | SET[4] | SET[3] | SET[2] | SET[1] | SET[0] |

SET[<m>], bit [m], for m = 31 to 0

Claim Tag Set. Indicates whether Claim Tag bit <m> is implemented, and is used to set Claim Tag bit <m> to 1.

| SET[<m>] | Meaning |
|----------|---|
| 0b0 | On a read: Claim Tag bit <m> is not implemented. On a write: Ignored. |
| 0b1 | On a read: Claim Tag bit <m> is implemented. On a write: Set Claim Tag bit <m> to 1. |

This bit reads-as-zero and ignores writes if m > the number of Claim Tag bits.

Access to this field is **RAO/W1S**.

Accessing TRCCLAIMSET

TRCCLAIMSET can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-------------|
| ETE | 0xFA0 | TRCCLAIMSET |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCNTCTLR<n>, Counter Control Register <n>, n = 0 - 3

The TRCCNTCTLR<n> characteristics are:

Purpose

Controls the operation of Counter <n>.

Configuration

External register TRCCNTCTLR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCCNTCTLR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMCNTR > n. Otherwise, direct accesses to TRCCNTCTLR<n> are RES0.

Attributes

TRCCNTCTLR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|---------|---------------|------|--------------|---------------|------|--------------|------|--------------|------|--------------|------|--------------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 |
| RES0 | | | | | | | | | | | | | | CNTCHAIN | RLDSELF | RLDEVENT_TYPE | RES0 | RLDEVENT_SEL | CNTEVENT_TYPE | RES0 | CNTEVENT_SEL | RES0 | CNTEVENT_SEL | RES0 | CNTEVENT_SEL | RES0 | CNTEVENT_SEL | RES0 |

Bits [31:18]

Reserved, RES0.

CNTCHAIN, bit [17]

For TRCCNTCTLR3 and TRCCNTCTLR1, this field controls whether the Counter decrements when a reload event occurs for Counter <n-1>.

| CNTCHAIN | Meaning |
|----------|--|
| 0b0 | The Counter does not decrement when a reload event for Counter <n-1> occurs. |
| 0b1 | Counter <n> decrements when a reload event for Counter <n-1> occurs. This concatenates Counter <n> and Counter <n-1>, to provide a larger count value. |

CNTCHAIN is not implemented for TRCCNTCTLR0 and TRCCNTCTLR2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDSELF, bit [16]

Controls whether a reload event occurs for the Counter, when the Counter reaches zero.

| RLDSELF | Meaning |
|---------|--|
| 0b0 | Normal mode. The Counter is in Normal mode. |
| 0b1 | Self-reload mode. The Counter is in Self-reload mode. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDEVENT_TYPE, bit [15]

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes a reload event for Counter <n>.

| RLDEVENT_TYPE | Meaning |
|---------------|---|
| 0b0 | A single Resource Selector. TRCCNTCTLR<n>.RLDEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.RLDEVENT.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

RLDEVENT_SEL, bits [12:8]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.TYPE controls whether TRCCNTCTLR<n>.RLDEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes a reload event for Counter <n>.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

CNTEVENT_TYPE, bit [7]

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes Counter <n> to decrement.

| CNTEVENT_TYPE | Meaning |
|---------------|---|
| 0b0 | A single Resource Selector. TRCCNTCTLR<n>.CNTEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.CNTEVENT.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

CNTEVENT_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.TYPE controls whether TRCCNTCTLR<n>.CNTEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes Counter <n> to decrement.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTCTLR<n>

Must be programmed if [TRCRSCTLR<a>.GROUP == 0b0010](#) and [TRCRSCTLR<a>.COUNTERS\[n\] == 1](#).

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCNTCTLR<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|---------------|
| ETE | 0x150 + (4 * n) | TRCCNTCTLR<n> |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCNTRLDVR<n>, Counter Reload Value Register <n>, n = 0 - 3

The TRCCNTRLDVR<n> characteristics are:

Purpose

This sets or returns the reload count value for Counter <n>.

Configuration

External register TRCCNTRLDVR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCCNTRLDVR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMCNTR > n. Otherwise, direct accesses to TRCCNTRLDVR<n> are RES0.

Attributes

TRCCNTRLDVR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | VALUE | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

VALUE, bits [15:0]

Contains the reload value for Counter <n>. When a reload event occurs for Counter <n> then the trace unit copies the VALUE<n> field into Counter <n>.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTRLDVR<n>

Must be programmed if [TRCRSCTLR<a>](#).GROUP == 0b0010 and [TRCRSCTLR<a>](#).COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCNTRLDVR<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|----------------|
| ETE | 0x140 + (4 * n) | TRCCNTRLDVR<n> |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCNTVR<n>, Counter Value Register <n>, n = 0 - 3

The TRCCNTVR<n> characteristics are:

Purpose

This sets or returns the value of Counter <n>.

Configuration

External register TRCCNTVR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCCNTVR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMCNTR > n. Otherwise, direct accesses to TRCCNTVR<n> are RES0.

Attributes

TRCCNTVR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | VALUE | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

VALUE, bits [15:0]

Contains the count value of Counter.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTVR<n>

Must be programmed if [TRCRSCTLR<a>](#).GROUP == 0b0010 and [TRCRSCTLR<a>](#).COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCCNTVR<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|-------------|
| ETE | 0x160 + (4 * n) | TRCCNTVR<n> |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCCNTVR<n>, Counter Value Register <n>, n = 0 - 3

TRCCONFIGR, Trace Configuration Register

The TRCCONFIGR characteristics are:

Purpose

Controls the tracing options.

Configuration

External register TRCCONFIGR bits [31:0] are architecturally mapped to AArch64 System register [TRCCONFIGR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCONFIGR are RES0.

Attributes

TRCCONFIGR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|------|------|---------|------|-----|----|------|------|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | VMIDOPT | QE | RSTS | RES0 | VMIDCID | RES0 | CCI | BB | RES0 | RES1 | | | | | | |

Bits [31:16]

Reserved, RES0.

VMIDOPT, bit [15]

When TRCIDR2.VMIDOPT == 0b01:

Virtual context identifier selection control.

| VMIDOPT | Meaning |
|---------|---|
| 0b0 | VTTBR_EL2 .VMID is used as the Virtual context identifier. |
| 0b1 | CONTEXTIDR_EL2 .PROCID is used as the Virtual context identifier. |

When TRCIDR2.VMIDOPT == 0b00:

Reserved, RES0.

Virtual context identifier selection control.

[VTTBR_EL2](#).VMID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == 0b10:

Reserved, RES1.

Virtual context identifier selection control.

[CONTEXTIDR_EL2](#).PROCID is used as the Virtual context identifier.

Otherwise:

Reserved, RES0.

QE, bits [14:13]

When TRCIDR0.QSUPP == 0b01:

Q element generation control.

| QE | Meaning |
|------|---|
| 0b00 | Q elements are disabled. |
| 0b01 | Q elements with instruction counts are enabled. |
| | Q elements without instruction counts are disabled. |

All other values are reserved.

When TRCIDR0.QSUPP == 0b10:

Q element generation control.

| QE | Meaning |
|------|--|
| 0b00 | Q elements are disabled. |
| 0b11 | Q elements with instruction counts are enabled. |
| | Q elements without instruction counts are enabled. |

All other values are reserved.

When TRCIDR0.QSUPP == 0b11:

Q element generation control.

| QE | Meaning |
|------|---|
| 0b00 | Q elements are disabled. |
| 0b01 | Q elements with instruction counts are enabled. |
| | Q elements without instruction counts are disabled. |
| 0b11 | Q elements with instruction counts are enabled. |
| | Q elements without instruction counts are enabled. |

All other values are reserved.

Otherwise:

Reserved, RES0.

RS, bit [12]

When TRCIDR0.RETSTACK == 1:

Return stack control.

| RS | Meaning |
|-----|---------------------------|
| 0b0 | Return stack is disabled. |
| 0b1 | Return stack is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TS, bit [11]

When TRCIDR0.TSSIZE != 0b000000:

Global timestamp tracing control.

| TS | Meaning |
|-----|---------------------------------------|
| 0b0 | Global timestamp tracing is disabled. |
| 0b1 | Global timestamp tracing is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [10:8]

Reserved, RES0.

VMID, bit [7]

When TRCIDR2.VMIDSIZE != 0b000000:

Virtual context identifier tracing control.

| VMID | Meaning |
|------|---|
| 0b0 | Virtual context identifier tracing is disabled. |
| 0b1 | Virtual context identifier tracing is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CID, bit [6]

When TRCIDR2.CIDSIZE != 0b000000:

Context identifier tracing control.

| CID | Meaning |
|-----|---|
| 0b0 | Context identifier tracing is disabled. |
| 0b1 | Context identifier tracing is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

CCI, bit [4]

When **TRCIDR0.TRCCCI == 1**:

Cycle counting instruction tracing control.

| CCI | Meaning |
|-----|---|
| 0b0 | Cycle counting instruction tracing is disabled. |
| 0b1 | Cycle counting instruction tracing is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BB, bit [3]

When **TRCIDR0.TRCBB == 1**:

Branch broadcasting control.

| BB | Meaning |
|-----|----------------------------------|
| 0b0 | Branch broadcasting is disabled. |
| 0b1 | Branch broadcasting is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [2:1]

Reserved, RES0.

Bit [0]

Reserved, RES1.

Accessing TRCCONFIGR

Must always be programmed.

TRCCONFIGR.QE must be set to 0b00 if TRCCONFIGR.BB is not 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCONFIGR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|------------|
| ETE | 0x010 | TRCCONFIGR |

This interface is accessible as follows:

- When OSLockStatus(), or !IsTraceCorePowered() or !AllowExternalTraceAccess() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCDEVAFF, Device Affinity Register

The TRCDEVAFF characteristics are:

Purpose

For additional information, see the CoreSight Architecture Specification.

Reads the same value as the [MPIDR_EL1](#) register for the PE that this trace unit has affinity with.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVAFF are RES0.

Attributes

TRCDEVAFF is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | | MPIDR_EL1 | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | MPIDR_EL1 | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

MPIDR_EL1, bits [63:0]

Read-only copy of [MPIDR_EL1](#), as seen from the highest implemented Exception level.

Accessing TRCDEVAFF

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVAFF can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| ETE | 0xFA8 | TRCDEVAFF |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCDEVARCH, Device Architecture Register

The TRCDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCDEVARCH bits [31:0] are architecturally mapped to AArch64 System register [TRCDEVARCH\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVARCH are RES0.

Attributes

TRCDEVARCH is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|---------|----------|----|----|----|---------|----|----|----|----------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ARCHITECT | | | | | | | | | | | PRESENT | REVISION | | | | ARCHVER | | | | ARCHPART | | | | | | | | | | | |

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

| ARCHITECT | Meaning |
|---------------|--|
| 0b01000111011 | JEP106 continuation code 0x4, ID code 0x3B. Arm Limited. |

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

PRESENT, bit [20]

DEVARCH Present. Defines that the DEVARCH register is present.

| PRESENT | Meaning |
|---------|--|
| 0b0 | Device Architecture information not present. |
| 0b1 | Device Architecture information present. |

This field reads as 1.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

| REVISION | Meaning |
|----------|------------------------|
| 0b0000 | ETEv1.0, FEAT_ETE. |
| 0b0001 | ETEv1.1, FEAT_ETEv1p1. |
| 0b0010 | ETEv1.2, FEAT_ETEv1p2. |

All other values are reserved.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

| ARCHVER | Meaning |
|---------|---------|
| 0b0101 | ETEv1. |

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0x5.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

| ARCHPART | Meaning |
|----------|----------------------------|
| 0xA13 | Arm PE trace architecture. |

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA13.

Accessing TRCDEVARCH

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVARCH can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|------------|
| ETE | 0xFBC | TRCDEVARCH |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCDEVID, Device Configuration Register

The TRCDEVID characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCDEVID bits [31:0] are architecturally mapped to AArch64 System register [TRCDEVID\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVID are RES0.

Attributes

TRCDEVID is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |

Bits [31:0]

Reserved, RES0.

Accessing TRCDEVID

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVID can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFC8 | TRCDEVID |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCDEVID1, Device Configuration Register 1

The TRCDEVID1 characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVID1 are RES0.

Attributes

TRCDEVID1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |

Bits [31:0]

Reserved, RES0.

Accessing TRCDEVID1

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVID1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| ETE | 0xFC4 | TRCDEVID1 |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCDEVID2, Device Configuration Register 2

The TRCDEVID2 characteristics are:

Purpose

Provides discovery information for the component.
For additional information, see the CoreSight Architecture Specification.

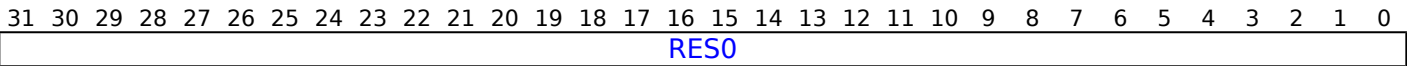

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVID2 are RES0.

Attributes

TRCDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCDEVID2

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVID2 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| ETE | 0xFC0 | TRCDEVID2 |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCDEVTYPE, Device Type Register

The TRCDEVTYPE characteristics are:

Purpose

Provides discovery information for the component. If the part number field is not recognized, a debugger can report the information that is provided by TRCDEVTYPE about the component instead.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVTYPE are RES0.

Attributes

TRCDEVTYPE is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|-----|---|---|-------|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | RES0 | | | | | | | | | | | | SUB | | | MAJOR | | | | |

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Component sub-type.

| SUB | Meaning |
|--------|---|
| 0b0001 | When MAJOR == 0x3 (Trace source): Associated with a PE. |

This field reads as 0x1.

MAJOR, bits [3:0]

Component major type.

| MAJOR | Meaning |
|--------|---------------|
| 0b0011 | Trace source. |

Other values are defined by the CoreSight Architecture.

This field reads as 0x3.

Accessing TRCDEVTYPE

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVTYPE can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
|-----------|--------|----------|

TRCDEVTYPE, Device Type Register

| | | |
|-----|-------|------------|
| ETE | 0xFCC | TRCDEVTYPE |
|-----|-------|------------|

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCEVENTCTL0R, Event Control 0 Register

The TRCEVENTCTL0R characteristics are:

Purpose

Controls the generation of ETEEvents.

Configuration

External register TRCEVENTCTL0R bits [31:0] are architecturally mapped to AArch64 System register [TRCEVENTCTL0R\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMRSPAIR != 0b0000. Otherwise, direct accesses to TRCEVENTCTL0R are RES0.

Attributes

TRCEVENTCTL0R is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------------|----------------------|----------------------------|-----------------------------|----------------------|----------------------------|-----------------------------|----------------------|----------------------------|-----------------------------|----------------------|----------------------------|-----------------------------|----------------------|----------------------------|-----------------------------|----------------------|----------------------------|-----------------------------|----------------------|----------------------------|-----------------------------|----------------------|----------------------------|-----------------------------|----------------------|----------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 |
| EVENT3_TYPE | RES0 | EVENT3_SEL | EVENT2_TYPE | RES0 | EVENT2_SEL | EVENT1_TYPE | RES0 | EVENT1_SEL | EVENT0_TYPE | RES0 | EVENT0_SEL | EVENT0_TYPE | RES0 | EVENT0_SEL | EVENT0_TYPE | RES0 | EVENT0_SEL | EVENT0_TYPE | RES0 | EVENT0_SEL | EVENT0_TYPE | RES0 | EVENT0_SEL | EVENT0_TYPE | RES0 | EVENT0_SEL |

EVENT3_TYPE, bit [31]

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b11:

Chooses the type of Resource Selector.

| EVENT3_TYPE | Meaning |
|-------------|---|
| 0b0 | A single Resource Selector. TRCEVENTCTL0R.EVENT3.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT3.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:29]

Reserved, RES0.

EVENT3_SEL, bits [28:24]**When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b11:**

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.TYPE controls whether TRCEVENTCTL0R.EVENT3.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R](#).INSTEN[3] == 1, then Event element 3 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT2_TYPE, bit [23]**When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b10:**

Chooses the type of Resource Selector.

| EVENT2_TYPE | Meaning |
|-------------|---|
| 0b0 | A single Resource Selector. TRCEVENTCTL0R.EVENT2.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT2.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [22:21]

Reserved, RES0.

EVENT2_SEL, bits [20:16]**When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b10:**

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.TYPE controls whether TRCEVENTCTL0R.EVENT2.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R](#).INSTEN[2] == 1, then Event element 2 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT1_TYPE, bit [15]

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b01:

Chooses the type of Resource Selector.

| EVENT1_TYPE | Meaning |
|-------------|---|
| 0b0 | A single Resource Selector. TRCEVENTCTL0R.EVENT1.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT1.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [14:13]

Reserved, RES0.

EVENT1_SEL, bits [12:8]

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b01:

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.TYPE controls whether TRCEVENTCTL0R.EVENT1.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R](#).INSTEN[1] == 1, then Event element 1 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT0_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b00:

Chooses the type of Resource Selector.

| EVENT0_TYPE | Meaning |
|-------------|---|
| 0b0 | A single Resource Selector. TRCEVENTCTL0R.EVENT0.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT0.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT0_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b00:

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.TYPE controls whether TRCEVENTCTL0R.EVENT0.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R](#).INSTEN[0] == 1, then Event element 0 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCEVENTCTL0R

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCEVENTCTL0R can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|---------------|
| ETE | 0x020 | TRCEVENTCTL0R |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCEVENTCTL1R, Event Control 1 Register

The TRCEVENTCTL1R characteristics are:

Purpose

Controls the behavior of the ETEEvents that [TRCEVENTCTL0R](#) selects.

Configuration

External register TRCEVENTCTL1R bits [31:0] are architecturally mapped to AArch64 System register [TRCEVENTCTL1R\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCEVENTCTL1R are RES0.

Attributes

TRCEVENTCTL1R is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|----|-----|------|-----------|-----------|-----------|-----------|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | LPOVERRIDE | | ATB | RES0 | INSTEN[3] | INSTEN[2] | INSTEN[1] | INSTEN[0] | | | | | | | | |

Bits [31:13]

Reserved, RES0.

LPOVERRIDE, bit [12]

When TRCIDR5.LPOVERRIDE == 1:

Low-power Override Mode select.

| LPOVERRIDE | Meaning |
|------------|--|
| 0b0 | Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state. |
| 0b1 | Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation. |

Otherwise:

Reserved, RES0.

ATB, bit [11]

When TRCIDR5.ATBTRIG == 1:

AMBA Trace Bus (ATB) trigger enable.

If a CoreSight ATB interface is implemented then when ETEEvent 0 occurs the trace unit sets:

- ATID == 0x7D.
- ATDATA to the value of [TRCTRACEIDR](#).

If the width of ATDATA is greater than the width of [TRCTraceIDR](#).TRACEID then the trace unit zeros the upper ATDATA bits.

If ETEEvent 0 is programmed to occur based on program execution, such as an Address Comparator, the ATB trigger might not be inserted into the ATB stream at the same time as any trace generated by that program execution is output by the trace unit. Typically, the generated trace might be buffered in a trace unit which means that the ATB trigger would be output before the associated trace is output.

If ETEEvent 0 is asserted multiple times in close succession, the trace unit is required to generate an ATB trigger for the first assertion, but might ignore one or more of the subsequent assertions. Arm recommends that the window in which ETEEvent 0 is ignored is limited only by the time taken to output an ATB trigger.

| ATB | Meaning |
|-----|--------------------------|
| 0b0 | ATB trigger is disabled. |
| 0b1 | ATB trigger is enabled. |

Otherwise:

Reserved, RES0.

Bits [10:4]

Reserved, RES0.

INSTEN[<m>], bit [m], for m = 3 to 0

Event element control.

| INSTEN[<m>] | Meaning |
|-------------|--|
| 0b0 | The trace unit does not generate an Event element <m>. |
| 0b1 | The trace unit generates an Event element <m>. |

This bit is RES0 if m >= the number indicated by [TRCIDR0](#).NUMEVENT.

Accessing TRCEVENTCTL1R

Must be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCEVENTCTL1R can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|---------------|
| ETE | 0x024 | TRCEVENTCTL1R |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCEXTINSELR<n>, External Input Select Register <n>, n = 0 - 3

The TRCEXTINSELR<n> characteristics are:

Purpose

Use this to set, or read, which External Inputs are resources to the trace unit.

The name TRCEXTINSELR is an alias of TRCEXTINSELR0.

Configuration

External register TRCEXTINSELR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCEXTINSELR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMEXTINSEL > n. Otherwise, direct accesses to TRCEXTINSELR<n> are RES0.

Attributes

TRCEXTINSELR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | evtCount | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

PMU event to select.

The event number as defined by the Arm ARM.

Software must program this field with a PMU event that is supported by the PE being programmed.

There are three ranges of PMU event numbers:

- PMU event numbers in the range 0x0000 to 0x003F are common architectural and microarchitectural events.
- PMU event numbers in the range 0x0040 to 0x00BF are Arm recommended common architectural and microarchitectural PMU events.
- PMU event numbers in the range 0x00C0 to 0x03FF are IMPLEMENTATION DEFINED PMU events.

If evtCount is programmed to a PMU event that is reserved or not supported by the PE, the behavior depends on the PMU event type:

- For the range 0x0000 to 0x003F, then the PMU event is not active, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED PMU events, it is UNPREDICTABLE what PMU event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

UNPREDICTABLE means the PMU event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include a PMU event from a set of common IMPLEMENTATION DEFINED PMU events, then no PMU event is counted and the value read back on evtCount is the value written.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCEXTINSELN<n>

Must be programmed if any of the following is true: [TRCRSCTLN<a>](#).GROUP == 0b0000 and [TRCRSCTLN<a>](#).EXTIN[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCEXTINSELN<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|-----------------|
| ETE | 0x120 + (4 * n) | TRCEXTINSELN<n> |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCIDR0, ID Register 0

The TRCIDR0 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR0 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR0\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR0 are RES0.

Attributes

TRCIDR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | |
|------|-----------|---------|--------|--------|------|-----------|-------|-------|----------|----------|----------|----|----|----|----|----|----|----|----|----|----|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 |
| RES0 | COMMTRANS | COMMOPT | TSSIZE | TSMARK | RES0 | TRCEXDATA | QSUPP | QFILT | CONDTYPE | NUMEVENT | RETSTACK | | | | | | | | | | | |

Bit [31]

Reserved, RES0.

COMMTRANS, bit [30]

Transaction Start element behavior.

| COMMTRANS | Meaning |
|-----------|---|
| 0b0 | Transaction Start elements are P0 elements. |
| 0b1 | Transaction Start elements are not P0 elements. |

COMMOPT, bit [29]

Indicates the contents and encodings of Cycle count packets.

| COMMOPT | Meaning |
|---------|----------------|
| 0b0 | Commit mode 0. |
| 0b1 | Commit mode 1. |

The Commit mode defines the contents and encodings of Cycle Count packets, in particular how Commit elements are indicated by these packets. See the descriptions of these packets for more details.

Accessing this field has the following behavior:

- **RAO/WI** if all of the following are true:
 - TRCIDR0.TRCCCI == 1
 - TRCIDR8.MAXSPEC == 0x0
- When TRCIDR0.TRCCCI == 0, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

TSSIZE, bits [28:24]

Indicates that the trace unit implements Global timestamping and the size of the timestamp value.

| TSSIZE | Meaning |
|---------------|--|
| 0b000000 | Global timestamping not implemented. |
| 0b01000 | Global timestamping implemented with a 64-bit timestamp value. |

All other values are reserved.

This field reads as 0b01000.

TSMARK, bit [23]

When FEAT_ETEv1p1 is implemented:

Indicates whether Timestamp Marker elements are generated.

| TSMARK | Meaning |
|---------------|--|
| 0b0 | Timestamp Marker elements are not generated. |
| 0b1 | Timestamp Marker elements are generated. |

Otherwise:

Reserved, RES0.

Bits [22:18]

Reserved, RES0.

TRCEXDATA, bit [17]

When TRCIDR0.TRCDATA != 0b00:

Indicates if the trace unit implements tracing of data transfers for exceptions and exception returns. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

| TRCEXDATA | Meaning |
|------------------|---|
| 0b0 | Tracing of data transfers for exceptions and exception returns not implemented. |
| 0b1 | Tracing of data transfers for exceptions and exception returns implemented. |

Otherwise:

Reserved, RES0.

QSUPP, bits [16:15]

Indicates that the trace unit implements Q element support.

| QSUPP | Meaning |
|--------------|---|
| 0b00 | Q element support is not implemented. |
| 0b01 | Q element support is implemented, and only supports Q elements with instruction counts. |
| 0b10 | Q element support is implemented, and only supports Q elements without instruction counts. |
| 0b11 | Q element support is implemented, and supports: <ul style="list-style-type: none"> Q elements with instruction counts. Q elements without instruction counts. |

QFILT, bit [14]

Indicates if the trace unit implements Q element filtering.

| QFILT | Meaning |
|-------|---|
| 0b0 | Q element filtering is not implemented. |
| 0b1 | Q element filtering is implemented. |

If TRCIDR0.QSUPP == 0b00 then this field is 0.

CONDTYPE, bits [13:12]

When TRCIDR0.TRCOND == 1:

Indicates how conditional instructions are traced. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

| CONDTYPE | Meaning |
|----------|---|
| 0b00 | Conditional instructions are traced with an indication of whether they pass or fail their condition code check. |
| 0b01 | Conditional instructions are traced with an indication of the APSR condition flags. |

All other values are reserved.

Otherwise:

Reserved, RES0.

NUMEVENT, bits [11:10]

When TRCIDR4.NUMRSPAIR == 0b0000:

Indicates the number of ETEEvents implemented.

| NUMEVENT | Meaning |
|----------|--------------------------------------|
| 0b00 | The trace unit supports 0 ETEEvents. |

All other values are reserved.

When TRCIDR4.NUMRSPAIR != 0b0000:

Indicates the number of ETEEvents implemented.

| NUMEVENT | Meaning |
|----------|--------------------------------------|
| 0b00 | The trace unit supports 1 ETEEvent. |
| 0b01 | The trace unit supports 2 ETEEvents. |
| 0b10 | The trace unit supports 3 ETEEvents. |
| 0b11 | The trace unit supports 4 ETEEvents. |

Otherwise:

Reserved, RES0.

RETSTACK, bit [9]

Indicates if the trace unit supports the return stack.

| RETSTACK | Meaning |
|----------|-------------------------------|
| 0b0 | Return stack not implemented. |
| 0b1 | Return stack implemented. |

Bit [8]

Reserved, RES0.

TRCCCI, bit [7]

Indicates if the trace unit implements cycle counting.

| TRCCCI | Meaning |
|--------|---------------------------------|
| 0b0 | Cycle counting not implemented. |
| 0b1 | Cycle counting implemented. |

This field reads as 1.

TRCCOND, bit [6]

Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.

| TRCCOND | Meaning |
|---------|--|
| 0b0 | Conditional instruction tracing not implemented. |
| 0b1 | Conditional instruction tracing implemented. |

This field reads as 0.

TRCBB, bit [5]

Indicates if the trace unit implements branch broadcasting.

| TRCBB | Meaning |
|-------|--------------------------------------|
| 0b0 | Branch broadcasting not implemented. |
| 0b1 | Branch broadcasting implemented. |

This field reads as 1.

TRCDATA, bits [4:3]

Indicates if the trace unit implements data tracing. Data tracing is not implemented in ETE and this field is reserved for other trace architectures.

| TRCDATA | Meaning |
|---------|-------------------------------|
| 0b00 | Data tracing not implemented. |
| 0b11 | Data tracing implemented. |

All other values are reserved.

This field reads as 0b00.

INSTP0, bits [2:1]

Indicates if load and store instructions are P0 instructions. Load and store instructions as P0 instructions is not implemented in ETE and this field is reserved for other trace architectures.

| INSTP0 | Meaning |
|--------|--|
| 0b00 | Load and store instructions are not P0 instructions. |
| 0b11 | Load and store instructions are P0 instructions. |

All other values are reserved.

This field reads as 0b00.

Bit [0]

Reserved, RES1.

Accessing TRCIDR0

TRCIDR0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x1E0 | TRCIDR0 |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCIDR1, ID Register 1

The TRCIDR1 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR1 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR1\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR1 are RES0.

Attributes

TRCIDR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------------|----|----|----|----|----|----|----|----------------------|----|----|----|----|----|----|----|----------------------|----|----|----|----------------------------|----|---|---|----------------------------|---|---|---|--------------------------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| DESIGNER | | | | | | | | RES0 | | | | | | | | RES1 | | | | TRCARCHMAJ | | | | TRCARCHMIN | | | | REVISION | | | |

DESIGNER, bits [31:24]

Indicates which company designed the trace unit. The permitted values of this field are the same as [MIDR_EL1](#).Implementer.

Bits [23:16]

Reserved, RES0.

Bits [15:12]

Reserved, RES1.

TRCARCHMAJ, bits [11:8]

Major architecture version.

| TRCARCHMAJ | Meaning |
|------------|---|
| 0b1111 | If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH . |

All other values are reserved.

This field reads as 0b1111.

TRCARCHMIN, bits [7:4]

Minor architecture version.

| TRCARCHMIN | Meaning |
|------------|---|
| 0b1111 | If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH . |

All other values are reserved.

This field reads as 0b1111.

REVISION, bits [3:0]

Implementation revision.

Returns an IMPLEMENTATION DEFINED value that identifies the revision of the trace unit.

Arm deprecates any use of this field and recommends that implementations set this field to zero.

Accessing TRCIDR1

TRCIDR1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x1E4 | TRCIDR1 |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR10, ID Register 10

The TRCIDR10 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR10 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR10\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR10 are RES0.

Attributes

TRCIDR10 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NUMP1KEY | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

NUMP1KEY, bits [31:0]

When TRCIDR0.TRCDATA != 0b00:

Indicates the number of P1 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

Accessing TRCIDR10

TRCIDR10 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x188 | TRCIDR10 |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR11, ID Register 11

The TRCIDR11 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR11 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR11\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR11 are RES0.

Attributes

TRCIDR11 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NUMP1SPC | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

NUMP1SPC, bits [31:0]
When TRCIDR0.TRCDATA != 0b00:

Indicates the number of special P1 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

Accessing TRCIDR11

TRCIDR11 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x18C | TRCIDR11 |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR12, ID Register 12

The TRCIDR12 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR12 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR12\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR12 are RES0.

Attributes

TRCIDR12 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NUMCONDKEY | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

NUMCONDKEY, bits [31:0]

When TRCIDR0.TRCCOND == 1:

Indicates the number of conditional instruction right-hand keys. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

Accessing TRCIDR12

TRCIDR12 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x190 | TRCIDR12 |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR13, ID Register 13

The TRCIDR13 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR13 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR13\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR13 are RES0.

Attributes

TRCIDR13 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NUMCONDSPC | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

NUMCONDSPC, bits [31:0]

When TRCIDR0.TRCCOND == 1:

Indicates the number of special conditional instruction right-hand keys. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

Accessing TRCIDR13

TRCIDR13 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x194 | TRCIDR13 |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR2, ID Register 2

The TRCIDR2 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR2 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR2\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR2 are RES0.

Attributes

TRCIDR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------|-------------------------|----|------------------------|----|----|----|----|------------------------|----|----|----|----|------------------------|----|----|----|--------------------------|----|----|----|----|-------------------------|---|---|---|---|---|---|---|---|------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| WFXMODE | VMIDOPT | | CCSIZE | | | | | DVSIZE | | | | | DASIZE | | | | VMIDSIZE | | | | | CIDSIZE | | | | | | | | | IASIZE |

WFXMODE, bit [31]

Indicates whether WFI and WFE instructions are classified as P0 instructions:

| WFXMODE | Meaning |
|---------|---|
| 0b0 | WFI and WFE instructions are not classified as P0 instructions. |
| 0b1 | WFI and WFE instructions are classified as P0 instructions. |

VMIDOPT, bits [30:29]

Indicates the options for Virtual context identifier selection.

| VMIDOPT | Meaning |
|---------|--|
| 0b00 | Virtual context identifier selection not supported. TRCCONFIGR .VMIDOPT is RES0. |
| 0b01 | Virtual context identifier selection supported. TRCCONFIGR .VMIDOPT is implemented. |
| 0b10 | Virtual context identifier selection not supported. TRCCONFIGR .VMIDOPT is RES1. |

All other values are reserved.

If TRCIDR2.VMIDSIZE == 0b000000 then this field is 0b00.

If TRCIDR2.VMIDSIZE != 0b000000 then this field is 0b10.

CCSIZE, bits [28:25]

When TRCIDR0.TRCCCI == 1:

Indicates the size of the cycle counter.

| CCSIZE | Meaning |
|---------------|---|
| 0b0000 | The cycle counter is 12 bits in length. |
| 0b0001 | The cycle counter is 13 bits in length. |
| 0b0010 | The cycle counter is 14 bits in length. |
| 0b0011 | The cycle counter is 15 bits in length. |
| 0b0100 | The cycle counter is 16 bits in length. |
| 0b0101 | The cycle counter is 17 bits in length. |
| 0b0110 | The cycle counter is 18 bits in length. |
| 0b0111 | The cycle counter is 19 bits in length. |
| 0b1000 | The cycle counter is 20 bits in length. |

All other values are reserved.

Otherwise:

Reserved, RES0.

DVSIZE, bits [24:20]

When TRCIDR0.TRCDATA != 0b00:

Indicates the data value size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

| DVSIZE | Meaning |
|---------------|---|
| 0b00000 | Data value tracing not implemented. |
| 0b00100 | Data value tracing has a maximum of 32-bit data values. |
| 0b01000 | Data value tracing has a maximum of 64-bit data values. |

All other values are reserved.

Otherwise:

Reserved, RES0.

DASIZE, bits [19:15]

When TRCIDR0.TRCDATA != 0b00:

Indicates the data address size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

| DASIZE | Meaning |
|---------------|--|
| 0b00000 | Data address tracing not implemented. |
| 0b00100 | Data address tracing has a maximum of 32-bit data addresses. |
| 0b01000 | Data address tracing has a maximum of 64-bit data addresses. |

All other values are reserved.

Otherwise:

Reserved, RES0.

VMIDSIZE, bits [14:10]

Indicates the trace unit Virtual context identifier size.

| VMIDSIZE | Meaning |
|-----------------|--|
| 0b00000 | Virtual context identifier tracing is not supported. |
| 0b00001 | 8-bit Virtual context identifier size. |
| 0b00010 | 16-bit Virtual context identifier size. |
| 0b00100 | 32-bit Virtual context identifier size. |

All other values are reserved.

If the PE does not implement EL2 then this field is 0b00000.

If the PE implements EL2 then this field is 0b00100.

CIDSIZE, bits [9:5]

Indicates the Context identifier size.

| CIDSIZE | Meaning |
|----------------|--|
| 0b00000 | Context identifier tracing is not supported. |
| 0b00100 | 32-bit Context identifier size. |

All other values are reserved.

This field reads as 0b00100.

IASIZE, bits [4:0]

Virtual instruction address size.

| IASIZE | Meaning |
|---------------|---|
| 0b00100 | Maximum of 32-bit instruction address size. |
| 0b01000 | Maximum of 64-bit instruction address size. |

All other values are reserved.

This field reads as 0b01000.

Accessing TRCIDR2

TRCIDR2 can be accessed through the external debug interface:

| Component | Offset | Instance |
|------------------|---------------|-----------------|
| ETE | 0x1E8 | TRCIDR2 |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR3, ID Register 3

The TRCIDR3 characteristics are:

Purpose

Returns the base architecture of the trace unit.

Configuration

External register TRCIDR3 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR3\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR3 are RES0.

Attributes

TRCIDR3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | |
|----------------------------|------------------------------|--------------------------|--------------------------|------------------------|------------------------|----------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|--------------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 |
| NOOVERFLOW | NUMPROC[2:0] | SYSSTALL | STALLCTL | SYNCPR | TRCERR | RES0 | EXLEVEL_NS_EL2 | EXLEVEL_NS_EL1 | EXLEVEL_NS_EL0 | EXLEVEL_NS_EL0 | EXLEVEL_NS_EL0 |

NOOVERFLOW, bit [31]

Indicates if overflow prevention is implemented.

| NOOVERFLOW | Meaning |
|------------|---|
| 0b0 | Overflow prevention is not implemented. |
| 0b1 | Overflow prevention is implemented. |

If TRCIDR3.STALLCTL == 0 then this field is 0.

NUMPROC, bits [13:12, 30:28]

Indicates the number of PEs available for tracing.

| NUMPROC | Meaning |
|---------|----------------------------------|
| 0b00000 | The trace unit can trace one PE. |

This field reads as 0b00000.

The NUMPROC field is split as follows:

- NUMPROC[2:0] is TRCIDR3[30:28].
- NUMPROC[4:3] is TRCIDR3[13:12].

SYSSTALL, bit [27]

Indicates if stalling of the PE is permitted.

| SYSSTALL | Meaning |
|----------|--------------------------------------|
| 0b0 | Stalling of the PE is not permitted. |
| 0b1 | Stalling of the PE is permitted. |

The value of this field might be dynamic and change based on system conditions.

If TRCIDR3.STALLCTL == 0 then this field is 0.

STALLCTL, bit [26]

Indicates if trace unit implements stalling of the PE.

| STALLCTL | Meaning |
|----------|--|
| 0b0 | Stalling of the PE is not implemented. |
| 0b1 | Stalling of the PE is implemented. |

SYNCPR, bit [25]

Indicates if an implementation has a fixed synchronization period.

| SYNCPR | Meaning |
|--------|--|
| 0b0 | TRCSYNCPR is read-write so software can change the synchronization period. |
| 0b1 | TRCSYNCPR is read-only so the synchronization period is fixed. |

This field reads as 0.

TRCERR, bit [24]

Indicates forced tracing of System Error exceptions is implemented.

| TRCERR | Meaning |
|--------|---|
| 0b0 | Forced tracing of System Error exceptions is not implemented. |
| 0b1 | Forced tracing of System Error exceptions is implemented. |

This field reads as 1.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]

Indicates if Non-secure EL2 is implemented.

| EXLEVEL_NS_EL2 | Meaning |
|----------------|------------------------------------|
| 0b0 | Non-secure EL2 is not implemented. |
| 0b1 | Non-secure EL2 is implemented. |

EXLEVEL_NS_EL1, bit [21]

Indicates if Non-secure EL1 is implemented.

| EXLEVEL_NS_EL1 | Meaning |
|----------------|------------------------------------|
| 0b0 | Non-secure EL1 is not implemented. |
| 0b1 | Non-secure EL1 is implemented. |

EXLEVEL_NS_EL0, bit [20]

Indicates if Non-secure EL0 is implemented.

| EXLEVEL_NS_EL0 | Meaning |
|----------------|------------------------------------|
| 0b0 | Non-secure EL0 is not implemented. |
| 0b1 | Non-secure EL0 is implemented. |

EXLEVEL_S_EL3, bit [19]

Indicates if EL3 is implemented.

| EXLEVEL_S_EL3 | Meaning |
|---------------|-------------------------|
| 0b0 | EL3 is not implemented. |
| 0b1 | EL3 is implemented. |

EXLEVEL_S_EL2, bit [18]

Indicates if Secure EL2 is implemented.

| EXLEVEL_S_EL2 | Meaning |
|---------------|--------------------------------|
| 0b0 | Secure EL2 is not implemented. |
| 0b1 | Secure EL2 is implemented. |

EXLEVEL_S_EL1, bit [17]

Indicates if Secure EL1 is implemented.

| EXLEVEL_S_EL1 | Meaning |
|---------------|--------------------------------|
| 0b0 | Secure EL1 is not implemented. |
| 0b1 | Secure EL1 is implemented. |

EXLEVEL_S_EL0, bit [16]

Indicates if Secure EL0 is implemented.

| EXLEVEL_S_EL0 | Meaning |
|---------------|--------------------------------|
| 0b0 | Secure EL0 is not implemented. |
| 0b1 | Secure EL0 is implemented. |

Bits [15:14]

Reserved, RES0.

CCITMIN, bits [11:0]

Indicates the minimum value that can be programmed in [TRCCCCTLR.THRESHOLD](#).

If [TRCIDR0.TRCCCI](#) == 1 then the minimum value of this field is 0x001.

If [TRCIDR0.TRCCCI](#) == 0 then this field is zero.

Accessing TRCIDR3

TRCIDR3 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x1EC | TRCIDR3 |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR4, ID Register 4

The TRCIDR4 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR4 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR4\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR4 are RES0.

Attributes

TRCIDR4 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------------|-------------------------|-------------------------|---------------------------|-----------------------|----------------------|-------------------------|------------------------|----------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NUMVMIDC | NUMCIDC | NUMSSCC | NUMRSPAIR | NUMPC | RES0 | SUPPDAC | NUMDVC | NUMACPAIRS | | | | | | | | | | | | | | | | | | | | | | | |

NUMVMIDC, bits [31:28]

Indicates the number of Virtual Context Identifier Comparators that are available for tracing.

| NUMVMIDC | Meaning |
|----------|--|
| 0b0000 | No Virtual Context Identifier Comparators are available. |
| 0b0001 | The implementation has one Virtual Context Identifier Comparator. |
| 0b0010 | The implementation has two Virtual Context Identifier Comparators. |
| 0b0011 | The implementation has three Virtual Context Identifier Comparators. |
| 0b0100 | The implementation has four Virtual Context Identifier Comparators. |
| 0b0101 | The implementation has five Virtual Context Identifier Comparators. |
| 0b0110 | The implementation has six Virtual Context Identifier Comparators. |
| 0b0111 | The implementation has seven Virtual Context Identifier Comparators. |
| 0b1000 | The implementation has eight Virtual Context Identifier Comparators. |

All other values are reserved.

NUMCIDC, bits [27:24]

Indicates the number of Context Identifier Comparators that are available for tracing.

| NUMC IDC | Meaning |
|----------|--|
| 0b0000 | No Context Identifier Comparators are available. |
| 0b0001 | The implementation has one Context Identifier Comparator. |
| 0b0010 | The implementation has two Context Identifier Comparators. |
| 0b0011 | The implementation has three Context Identifier Comparators. |
| 0b0100 | The implementation has four Context Identifier Comparators. |
| 0b0101 | The implementation has five Context Identifier Comparators. |
| 0b0110 | The implementation has six Context Identifier Comparators. |
| 0b0111 | The implementation has seven Context Identifier Comparators. |
| 0b1000 | The implementation has eight Context Identifier Comparators. |

All other values are reserved.

NUMSSCC, bits [23:20]

Indicates the number of Single-shot Comparator Controls that are available for tracing.

| NUMSSCC | Meaning |
|---------|---|
| 0b0000 | No Single-shot Comparator Controls are available. |
| 0b0001 | The implementation has one Single-shot Comparator Control. |
| 0b0010 | The implementation has two Single-shot Comparator Controls. |
| 0b0011 | The implementation has three Single-shot Comparator Controls. |
| 0b0100 | The implementation has four Single-shot Comparator Controls. |
| 0b0101 | The implementation has five Single-shot Comparator Controls. |
| 0b0110 | The implementation has six Single-shot Comparator Controls. |
| 0b0111 | The implementation has seven Single-shot Comparator Controls. |
| 0b1000 | The implementation has eight Single-shot Comparator Controls. |

All other values are reserved.

NUMRSPAIR, bits [19:16]

Indicates the number of resource selector pairs that are available for tracing.

| NUMRSPAIR | Meaning |
|-----------|--|
| 0b0000 | The implementation has zero resource selectors. |
| 0b0001 | The implementation has two resource selector pairs. |
| 0b0010 | The implementation has three resource selector pairs. |
| 0b0011 | The implementation has four resource selector pairs. |
| 0b0100 | The implementation has five resource selector pairs. |
| 0b0101 | The implementation has six resource selector pairs. |
| 0b0110 | The implementation has seven resource selector pairs. |
| 0b0111 | The implementation has eight resource selector pairs. |
| 0b1000 | The implementation has nine resource selector pairs. |
| 0b1001 | The implementation has ten resource selector pairs. |
| 0b1010 | The implementation has eleven resource selector pairs. |
| 0b1011 | The implementation has twelve resource selector pairs. |
| 0b1100 | The implementation has thirteen resource selector pairs. |
| 0b1101 | The implementation has fourteen resource selector pairs. |
| 0b1110 | The implementation has fifteen resource selector pairs. |
| 0b1111 | The implementation has sixteen resource selector pairs. |

All other values are reserved.

NUMPC, bits [15:12]

Indicates the number of PE Comparator Inputs that are available for tracing.

| NUMPC | Meaning |
|--------|--|
| 0b0000 | No PE Comparator Inputs are available. |
| 0b0001 | The implementation has one PE Comparator Input. |
| 0b0010 | The implementation has two PE Comparator Inputs. |
| 0b0011 | The implementation has three PE Comparator Inputs. |
| 0b0100 | The implementation has four PE Comparator Inputs. |
| 0b0101 | The implementation has five PE Comparator Inputs. |
| 0b0110 | The implementation has six PE Comparator Inputs. |
| 0b0111 | The implementation has seven PE Comparator Inputs. |
| 0b1000 | The implementation has eight PE Comparator Inputs. |

All other values are reserved.

Bits [11:9]

Reserved, RES0.

SUPPDAC, bit [8]

When TRCIDR4.NUMACPAIRS != 0b0000:

Indicates whether data address comparisons are implemented. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

| SUPPDAC | Meaning |
|---------|---|
| 0b0 | Data address comparisons not implemented. |
| 0b1 | Data address comparisons implemented. |

This field reads as 0.

Otherwise:

Reserved, RES0.

NUMDVC, bits [7:4]

Indicates the number of data value comparators. Data value comparators are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

| NUMDVC | Meaning |
|--------|---|
| 0b0000 | No data value comparators implemented. |
| 0b0001 | One data value comparator implemented. |
| 0b0010 | Two data value comparators implemented. |
| 0b0011 | Three data value comparators implemented. |
| 0b0100 | Four data value comparators implemented. |
| 0b0101 | Five data value comparators implemented. |
| 0b0110 | Six data value comparators implemented. |
| 0b0111 | Seven data value comparators implemented. |
| 0b1000 | Eight data value comparators implemented. |

All other values are reserved.

This field reads as 0b0000.

NUMACPAIRS, bits [3:0]

Indicates the number of Address Comparator pairs that are available for tracing.

| NUMACPAIRS | Meaning |
|------------|--|
| 0b0000 | No Address Comparator pairs are available. |
| 0b0001 | The implementation has one Address Comparator pair. |
| 0b0010 | The implementation has two Address Comparator pairs. |
| 0b0011 | The implementation has three Address Comparator pairs. |
| 0b0100 | The implementation has four Address Comparator pairs. |
| 0b0101 | The implementation has five Address Comparator pairs. |
| 0b0110 | The implementation has six Address Comparator pairs. |
| 0b0111 | The implementation has seven Address Comparator pairs. |
| 0b1000 | The implementation has eight Address Comparator pairs. |

All other values are reserved.

Accessing TRCIDR4

TRCIDR4 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x1F0 | TRCIDR4 |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR5, ID Register 5

The TRCIDR5 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR5 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR5\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR5 are RES0.

Attributes

TRCIDR5 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|----------------------|----------------------------|-------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|----------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | NUMCNTR | NUMCNTR | NUMCNTR | NUMCNTR | NUMCNTR | NUMCNTR | NUMCNTR | RES0 | LPOVERRIDE | ATBTRIG | TRACEIDSIZE | TRACEIDSIZE | TRACEIDSIZE | TRACEIDSIZE | TRACEIDSIZE | TRACEIDSIZE | TRACEIDSIZE | TRACEIDSIZE | TRACEIDSIZE | RES0 | NUMEXTINSEL | NUMEXTINSEL | NUMEXTINSEL | NUMEXTINSEL | NUMEXTINSEL | NUMEXTINSEL | NUMEXTINSEL | NUMEXTINSEL | NUMEXTINSEL | NUMEXTINSEL | NUMEXTINSEL |

Bit [31]

Reserved, RES0.

NUMCNTR, bits [30:28]

Indicates the number of Counters that are available for tracing.

| NUMCNTR | Meaning |
|---------|-----------------------------|
| 0b000 | No Counters are available. |
| 0b001 | One Counter implemented. |
| 0b010 | Two Counters implemented. |
| 0b011 | Three Counters implemented. |
| 0b100 | Four Counters implemented. |

All other values are reserved.

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0b000.

NUMSEQSTATE, bits [27:25]

Indicates if the Sequencer is implemented and the number of Sequencer states that are implemented.

| NUMSEQSTATE | Meaning |
|-------------|--|
| 0b000 | The Sequencer is not implemented. |
| 0b100 | Four Sequencer states are implemented. |

All other values are reserved.

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0b000.

Bit [24]

Reserved, RES0.

LPOVERRIDE, bit [23]

Indicates support for Low-power Override Mode.

| LPOVERRIDE | Meaning |
|-------------------|--|
| 0b0 | The trace unit does not support Low-power Override Mode. |
| 0b1 | The trace unit supports Low-power Override Mode. |

ATBTRIG, bit [22]

Indicates if the implementation can support ATB triggers.

| ATBTRIG | Meaning |
|----------------|---|
| 0b0 | The implementation does not support ATB triggers. |
| 0b1 | The implementation supports ATB triggers. |

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0.

TRACEIDSIZE, bits [21:16]

Indicates the trace ID width.

| TRACEIDSIZE | Meaning |
|--------------------|--|
| 0b000000 | The external trace interface is not implemented. |
| 0b000111 | The implementation supports a 7-bit trace ID. |

All other values are reserved.

Note that AMBA ATB requires a 7-bit trace ID width.

Bits [15:12]

Reserved, RES0.

NUMEXTINSEL, bits [11:9]

Indicates how many External Input Selector resources are implemented.

| NUMEXTINSEL | Meaning |
|--------------------|---|
| 0b000 | No External Input Selector resources are available. |
| 0b001 | 1 External Input Selector resource is available. |
| 0b010 | 2 External Input Selector resources are available. |
| 0b011 | 3 External Input Selector resources are available. |
| 0b100 | 4 External Input Selector resources are available. |

All other values are reserved.

NUMEXTIN, bits [8:0]

Indicates how many External Inputs are implemented.

| NUMEXTIN | Meaning |
|-----------------|------------------------------|
| 0b11111111 | Unified PMU event selection. |

All other values are reserved.

Accessing TRCIDR5

TRCIDR5 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x1F4 | TRCIDR5 |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIDR6, ID Register 6

The TRCIDR6 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR6 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR6\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR6 are RES0.

Attributes

TRCIDR6 is a 32-bit register.

Field descriptions

| | | | |
|---|--------------------------------|--------------------------------|--------------------------------|
| 313029282726252423222120191817161514131211109876543 | 2 | 1 | 0 |
| RES0 | EXLEVEL_RL_EL2 | EXLEVEL_RL_EL1 | EXLEVEL_RL_EL0 |

Bits [31:3]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [2]

Indicates if Realm EL2 is implemented.

| EXLEVEL_RL_EL2 | Meaning |
|----------------|-------------------------------|
| 0b0 | Realm EL2 is not implemented. |
| 0b1 | Realm EL2 is implemented. |

EXLEVEL_RL_EL1, bit [1]

Indicates if Realm EL1 is implemented.

| EXLEVEL_RL_EL1 | Meaning |
|----------------|-------------------------------|
| 0b0 | Realm EL1 is not implemented. |
| 0b1 | Realm EL1 is implemented. |

EXLEVEL_RL_EL0, bit [0]

Indicates if Realm EL0 is implemented.

| EXLEVEL_RL_EL0 | Meaning |
|----------------|-------------------------------|
| 0b0 | Realm EL0 is not implemented. |
| 0b1 | Realm EL0 is implemented. |

Accessing TRCIDR6

TRCIDR6 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x1F8 | TRCIDR6 |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCIDR7, ID Register 7

The TRCIDR7 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR7 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR7\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR7 are RES0.

Attributes

TRCIDR7 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |

Bits [31:0]

Reserved, RES0.

Accessing TRCIDR7

TRCIDR7 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x1FC | TRCIDR7 |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCIDR8, ID Register 8

The TRCIDR8 characteristics are:

Purpose

Returns the maximum speculation depth of the instruction trace element stream.

Configuration

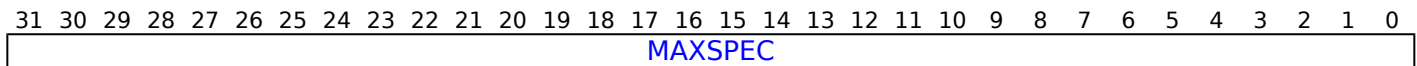

External register TRCIDR8 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR8\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR8 are RES0.

Attributes

TRCIDR8 is a 32-bit register.

Field descriptions

MAXSPEC, bits [31:0]

Indicates the maximum speculation depth of the instruction trace element stream. This is the maximum number of P0 elements in the trace element stream that can be speculative at any time.

Accessing TRCIDR8

TRCIDR8 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x180 | TRCIDR8 |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCIDR9, ID Register 9

The TRCIDR9 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR9 bits [31:0] are architecturally mapped to AArch64 System register [TRCIDR9\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR9 are RES0.

Attributes

TRCIDR9 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NUMPOKEY | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

NUMPOKEY, bits [31:0]

When TRCIDR0.TRCDATA != 0b00:

Indicates the number of P0 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

Otherwise:

Reserved, RES0.

Accessing TRCIDR9

TRCIDR9 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x184 | TRCIDR9 |

This interface is accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCIMSPEC0, IMP DEF Register 0

The TRCIMSPEC0 characteristics are:

Purpose

TRCIMSPEC0 shows the presence of any IMPLEMENTATION DEFINED features, and provides an interface to enable the features that are provided.

Configuration

External register TRCIMSPEC0 bits [31:0] are architecturally mapped to AArch64 System register [TRCIMSPEC0\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIMSPEC0 are RES0.

Attributes

TRCIMSPEC0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|----|---|---------|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | EN | | SUPPORT | | | | | |

Bits [31:8]

Reserved, RES0.

EN, bits [7:4]

When TRCIMSPEC0.SUPPORT != 0b0000:

Enable. Controls whether the IMPLEMENTATION DEFINED features are enabled.

| EN | Meaning |
|--------|--|
| 0b0000 | The IMPLEMENTATION DEFINED features are not enabled. The trace unit must behave as if the IMPLEMENTATION DEFINED features are not supported. |
| 0b0001 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b0010 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b0011 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b0100 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b0101 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b0110 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b0111 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1000 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1001 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1010 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1011 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1100 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1101 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1110 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1111 | The trace unit behavior is IMPLEMENTATION DEFINED. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SUPPORT, bits [3:0]

Indicates whether the implementation supports IMPLEMENTATION DEFINED features.

| SUPPORT | Meaning |
|---------|---|
| 0b0000 | No IMPLEMENTATION DEFINED features are supported. |
| 0b0001 | IMPLEMENTATION DEFINED features are supported. |
| 0b0010 | IMPLEMENTATION DEFINED features are supported. |
| 0b0011 | IMPLEMENTATION DEFINED features are supported. |
| 0b0100 | IMPLEMENTATION DEFINED features are supported. |
| 0b0101 | IMPLEMENTATION DEFINED features are supported. |
| 0b0110 | IMPLEMENTATION DEFINED features are supported. |

| 0b1111 | IMPLEMENTATION DEFINED features are supported. |

Use of nonzero values requires written permission from Arm.

Access to this field is **RO**.

Accessing TRCIMSPEC0

TRCIMSPEC0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|------------|
| ETE | 0x1C0 | TRCIMSPEC0 |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCIMSPEC<n>, IMP DEF Register <n>, n = 1 - 7

The TRCIMSPEC<n> characteristics are:

Purpose

These registers might return information that is specific to an implementation, or enable features specific to an implementation to be programmed. The product Technical Reference Manual describes these registers.

Configuration

External register TRCIMSPEC<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCIMSPEC<n>\[31:0\]](#).

This register is present only when the trace unit implements this OPTIONAL register and FEAT_ETE is implemented. Otherwise, direct accesses to TRCIMSPEC<n> are RES0.

Attributes

TRCIMSPEC<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

Accessing TRCIMSPEC<n>

TRCIMSPEC<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-------------------|--------------|
| ETE | $0x1C0 + (4 * n)$ | TRCIMSPEC<n> |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCITCTRL, Integration Mode Control Register

The TRCITCTRL characteristics are:

Purpose

A component can use TRCITCTRL to dynamically switch between functional mode and integration mode. In integration mode, topology detection is enabled. After switching to integration mode and performing integration tests or topology detection, reset the system to ensure correct behavior of CoreSight and other connected system components.

For additional information, see the CoreSight Architecture Specification.

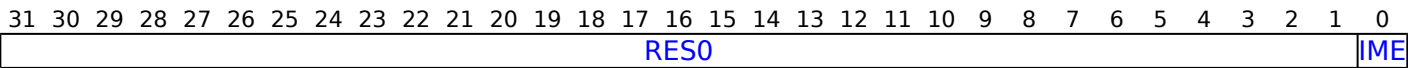

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCITCTRL are RES0.

Attributes

TRCITCTRL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]

When topology detection or integration functionality is implemented:

Integration Mode Enable.

| IME | Meaning |
|-----|--|
| 0b0 | Component functional mode. |
| 0b1 | Component integration mode. Support for topology detection and integration testing is enabled. |

Otherwise:

Reserved, RES0.

Accessing TRCITCTRL

External debugger accesses to this register are IMPLEMENTATION DEFINED when the trace unit is not in the Idle state.

TRCITCTRL can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| ETE | 0xF00 | TRCITCTRL |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCLAR, Lock Access Register

The TRCLAR characteristics are:

Purpose

Used to lock and unlock the Software Lock.

Note that ETE does not implement the Software Lock.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCLAR are RES0.

Attributes

TRCLAR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | KEY | | | | | | | | | | | | | | | |

KEY, bits [31:0]

When Software Lock is implemented:

Software Lock Key.

A value of 0xC5ACCE55 unlocks the Software Lock.

Any other value locks the Software Lock.

Otherwise:

Reserved, RES0.

Accessing TRCLAR

External debugger accesses to this register are unaffected by the OS Lock.

TRCLAR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFB0 | TRCLAR |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **WO**.

TRCLSR, Lock Status Register

The TRCLSR characteristics are:

Purpose

Indicates whether the Software Lock is implemented, and the current status of the Software Lock.
For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCLSR are RES0.

Attributes

TRCLSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|-----|---|-----|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | nTT | | | SLK | | SLI | | | | | | | | |

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Software lock size.

Reads as 0b0.

Access to this field is **RO**.

SLK, bit [1]

The current Software Lock status.

| SLK | Meaning |
|-----|--|
| 0b0 | Software Lock is unlocked. |
| 0b1 | Software Lock is locked. Writes to the other registers in this component, except for the TRCLAR , are ignored. |

This field reads as 0.

SLI, bit [0]

Indicates whether the Software Lock is implemented.

| SLI | Meaning |
|-----|---|
| 0b0 | Software Lock is not implemented. Writes to the TRCLAR are ignored. |
| 0b1 | Software Lock is implemented. |

This field reads as 0.

Accessing TRCLSR

External debugger accesses to this register are unaffected by the OS Lock.

TRCLSR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFB4 | TRCLSR |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCOSLSR, Trace OS Lock Status Register

The TRCOSLSR characteristics are:

Purpose

Returns the status of the Trace OS Lock.

Configuration

External register TRCOSLSR bits [31:0] are architecturally mapped to AArch64 System register [TRCOSLSR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCOSLSR are RES0.

Attributes

TRCOSLSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|-----------|---|------|---|------|---|---------|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | OSLM[2:1] | | RES0 | | OSLK | | OSLM[0] | |

Bits [31:5]

Reserved, RES0.

OSLM, bits [4:3, 0]

OS Lock model.

| OSLM | Meaning |
|-------|---|
| 0b000 | Trace OS Lock is not implemented. |
| 0b010 | Trace OS Lock is implemented. |
| 0b100 | Trace OS Lock is not implemented, and the trace unit is controlled by the PE OS Lock. |

All other values are reserved.

This field reads as 0b100.

The OSLM field is split as follows:

- OSLM[2:1] is TRCOSLSR[4:3].
- OSLM[0] is TRCOSLSR[0].

Bit [2]

Reserved, RES0.

OSLK, bit [1]

OS Lock status.

| OSLK | Meaning |
|------|--------------------------|
| 0b0 | The OS Lock is unlocked. |
| 0b1 | The OS Lock is locked. |

Note that this field indicates the state of the PE OS Lock.

Accessing TRCOSLSR

External debugger accesses to this register are unaffected by the OS Lock.

TRCOSLSR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x304 | TRCOSLSR |

This interface is accessible as follows:

- When !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCPDCR, PowerDown Control Register

The TRCPDCR characteristics are:

Purpose

Requests the system to provide power to the trace unit.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPDCR are RES0.

Attributes

TRCPDCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|----|------|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | PU | RES0 | | |

Bits [31:4]

Reserved, RES0.

PU, bit [3]

Power Up Request.

| PU | Meaning |
|-----|---|
| 0b0 | The system can remove power from the trace unit core power domain, or requests for power to the trace unit core power domain are implemented outside of the trace unit. |
| 0b1 | The system must provide power to the trace unit core power domain. |

This field is RES0.

Bits [2:0]

Reserved, RES0.

Accessing TRCPDCR

External debugger accesses to this register are unaffected by the OS Lock.

TRCPDCR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x310 | TRCPDCR |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCPDSR, PowerDown Status Register

The TRCPDSR characteristics are:

Purpose

Indicates the power status of the trace unit.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPDSR are RES0.

Attributes

TRCPDSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|------|----|------|----|----------|---|-------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | RES0 | | | | | | OSLK | | RES0 | | STICKYPD | | POWER | | | | | | | |

Bits [31:6]

Reserved, RES0.

OSLK, bit [5]

OS Lock Status.

| OSLK | Meaning |
|------|--------------------------|
| 0b0 | The OS Lock is unlocked. |
| 0b1 | The OS Lock is locked. |

Note that this field indicates the state of the PE OS Lock.

Bits [4:2]

Reserved, RES0.

STICKYPD, bit [1]

Sticky powerdown status. Indicates whether the trace register state is valid.

| STICKYPD | Meaning |
|----------|---|
| 0b0 | The state of TRCOSLSR and the trace registers are valid. |
| 0b1 | The state of TRCOSLSR and the trace registers might not be valid. |

This field is set to 1 if the power to the trace unit core power domain is removed and the trace unit register state is not valid.

The STICKYPD field is read-sensitive. On a read of the TRCPDSR, this field is cleared to 0 after the register has been read.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 1.

POWER, bit [0]

Power Status.

| POWER | Meaning |
|--------------|---|
| 0b0 | The trace unit core power domain is not powered. All trace unit registers are not accessible and they all return an error response. |
| 0b1 | The trace unit core power domain is powered. Trace unit registers are accessible. |

Access to this field is **RAO/WI**.

Accessing TRCPDSR

External debugger accesses to this register are unaffected by the OS Lock.

TRCPDSR can be accessed through the external debug interface:

| Component | Offset | Instance |
|------------------|---------------|-----------------|
| ETE | 0x314 | TRCPDSR |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCPIDR0, Peripheral Identification Register 0

The TRCPIDR0 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR0 are RES0.

Attributes

TRCPIDR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|--------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | PART_0 | | | | | | | |

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, bits [7:0].

The part number is selected by the designer of the component, and is stored in [TRCPIDR1](#).PART_1 and TRCPIDR0.PART_0.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCPIDR0

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR0 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFE0 | TRCPIDR0 |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCPIDR1, Peripheral Identification Register 1

The TRCPIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR1 are RES0.

Attributes

TRCPIDR1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|--------|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | DES 0 | | | PART 1 | | | | |

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0]. TRCPIDR1.DES_0 and [TRCPIDR2.DES_1](#) together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

PART_1, bits [3:0]

Part number, bits [11:8].

The part number is selected by the designer of the component, and is stored in TRCPIDR1.PART_1 and [TRCPIDR0.PART_0](#).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCPIDR1

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFE4 | TRCPIDR1 |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCPIDR2, Peripheral Identification Register 2

The TRCPIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR2 are RES0.

Attributes

TRCPIDR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|----------|---|---|---|-------|---|-------|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | RES0 | | | | | | | | | | | | REVISION | | | | JEDEC | | DES 1 | |

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Component major revision. TRCPIDR2.REVISION and [TRCPIDR3.REVAND](#) together form the revision number of the component, with TRCPIDR2.REVISION being the most significant part and [TRCPIDR3.REVAND](#) the least significant part. When a component is changed, TRCPIDR2.REVISION or [TRCPIDR3.REVAND](#) are increased to ensure that software can differentiate the different revisions of the component. [TRCPIDR3.REVAND](#) should be set to 0b0000 when TRCPIDR2.REVISION is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is **RO**.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4]. [TRCPIDR1.DES_0](#) and TRCPIDR2.DES_1 together form the JEDEC-assigned JEP106 identification code for the designer of the component. The parity bit in the JEP106 identification code is not included. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 identification code is 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCPIDR2

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR2 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFE8 | TRCPIDR2 |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCPIDR3, Peripheral Identification Register 3

The TRCPIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR3 are RES0.

Attributes

TRCPIDR3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|--------|---|---|---|------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | RES0 | | | | | | | | | | | | REVAND | | | | CMOD | | | |

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Component minor revision. [TRCPIDR2.REVISION](#) and TRCPIDR3.REVAND together form the revision number of the component, with [TRCPIDR2.REVISION](#) being the most significant part and TRCPIDR3.REVAND the least significant part. When a component is changed, [TRCPIDR2.REVISION](#) or TRCPIDR3.REVAND are increased to ensure that software can differentiate the different revisions of the component. TRCPIDR3.REVAND should be set to 0b0000 when [TRCPIDR2.REVISION](#) is increased.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CMOD, bits [3:0]

Customer Modified.

Indicates the component has been modified.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same non-zero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is non-zero, they might not be identical, even though they have the same Unique Component Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCPIDR3

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR3 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFEC | TRCPIDR3 |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

TRCPIDR4, Peripheral Identification Register 4

The TRCPIDR4 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR4 are RES0.

Attributes

TRCPIDR4 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|---|---|---|------|---|---|-------|---|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | SIZE | | | DES 2 | | |

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component.

The distance from the start of the address space used by this component to the end of the component identification registers.

A value of 0b0000 means one of the following is true:

- The component uses a single 4KB block.
- The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.

Any other value means the component occupies $2^{\text{TRCPIDR4.SIZE}}$ 4KB blocks.

Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

Reads as 0b0000.

Access to this field is **RO**.

DES_2, bits [3:0]

Designer, JEP106 continuation code. This is the JEDEC-assigned JEP106 bank identifier for the designer of the component, minus 1. The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component. To obtain a number, or to see the assignment of these codes, contact JEDEC <http://www.jedec.org>.

Note

For a component designed by Arm Limited, the JEP106 bank is 5, meaning this field has the value 0x4.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing TRCPIDR4

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR4 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFD0 | TRCPIDR4 |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCPIDR5, Peripheral Identification Register 5

The TRCPIDR5 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR5 are RES0.

Attributes

TRCPIDR5 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |

Bits [31:0]

Reserved, RES0.

Accessing TRCPIDR5

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR5 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFD4 | TRCPIDR5 |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCPIDR6, Peripheral Identification Register 6

The TRCPIDR6 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR6 are RES0.

Attributes

TRCPIDR6 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |

Bits [31:0]

Reserved, RES0.

Accessing TRCPIDR6

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR6 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFD8 | TRCPIDR6 |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCPIDR7, Peripheral Identification Register 7

The TRCPIDR7 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPIDR7 are RES0.

Attributes

TRCPIDR7 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |

Bits [31:0]

Reserved, RES0.

Accessing TRCPIDR7

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR7 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0xFDC | TRCPIDR7 |

This interface is accessible as follows:

- When !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCPRGCTLR, Programming Control Register

The TRCPRGCTLR characteristics are:

Purpose

Enables the trace unit.

Configuration

External register TRCPRGCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCPRGCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPRGCTLR are RES0.

Attributes

TRCPRGCTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | EN |

Bits [31:1]

Reserved, RES0.

EN, bit [0]

Trace unit enable.

| EN | Meaning |
|-----|-----------------------------|
| 0b0 | The trace unit is disabled. |
| 0b1 | The trace unit is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Accessing TRCPRGCTLR

Must be programmed.

TRCPRGCTLR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|------------|
| ETE | 0x004 | TRCPRGCTLR |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCQCTLR, Q Element Control Register

The TRCQCTLR characteristics are:

Purpose

Controls when Q elements are enabled.

Configuration

External register TRCQCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCQCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR0.QFILT == 1. Otherwise, direct accesses to TRCQCTLR are RES0.

Attributes

TRCQCTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|------|----------|----------|----------|----------|----------|----------|----------|----------|----|----|----|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 |
| RES0 | | | | | | | | | | MODE | RANGE[7] | RANGE[6] | RANGE[5] | RANGE[4] | RANGE[3] | RANGE[2] | RANGE[1] | RANGE[0] | | | | | | | | | | | |

Bits [31:9]

Reserved, RES0.

MODE, bit [8]

Selects whether the Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:

| MODE | Meaning |
|------|--|
| 0b0 | Exclude mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit must not generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map. |
| 0b1 | Include Mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0 then Q elements are disabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Specifies whether Address Range Comparator <m> controls Q elements.

| RANGE[<m>] | Meaning |
|-------------------------|---|
| 0b0 | The address range that Address Range Comparator <m> defines, is not selected. |
| 0b1 | The address range that Address Range Comparator <m> defines, is selected. |

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCQCTLR

Must be programmed if [TRCCONFIGR](#).QE != 0b00.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCQCTLR can be accessed through the external debug interface:

| Component | Offset | Instance |
|------------------|---------------|-----------------|
| ETE | 0x044 | TRCQCTLR |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCRSCTLR<n>, Resource Selection Control Register <n>, n = 2 - 31

The TRCRSCTLR<n> characteristics are:

Purpose

Controls the selection of the resources in the trace unit.

Configuration

External register TRCRSCTLR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCRSCTLR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and $((\text{TRCIDR4.NUMRSPAIR} + 1) * 2) > n$. Otherwise, direct accesses to TRCRSCTLR<n> are RES0.

Resource selector 0 always returns FALSE.

Resource selector 1 always returns TRUE.

Resource selectors are implemented in pairs. Each odd numbered resource selector is part of a pair with the even numbered resource selector that is numbered as one less than it. For example, resource selectors 2 and 3 form a pair.

Attributes

TRCRSCTLR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|---------|-----|-------|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | PAIRINV | INV | GROUP | | | | SELECT | | | | | | | | | | | | | | | |

Bits [31:22]

Reserved, RES0.

PAIRINV, bit [21]

When n is even:

Controls whether the combined result from a resource selector pair is inverted.

| PAIRINV | Meaning |
|---------|--|
| 0b0 | Do not invert the combined output of the 2 resource selectors. |
| 0b1 | Invert the combined output of the 2 resource selectors. |

If:

- A is the register TRCRSCTLR<n>.
- B is the register TRCRSCTLR<n+1>.

Then the combined output of the 2 resource selectors A and B depends on the value of (A.PAIRINV, A.INV, B.INV) as follows:

- 0b000 -> A and B.
- 0b001 -> Reserved.
- 0b010 -> not(A) and B.
- 0b011 -> not(A) and not(B).

- 0b100 -> not(A) or not(B).
- 0b101 -> not(A) or B.
- 0b110 -> Reserved.
- 0b111 -> A or B.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

INV, bit [20]

Controls whether the resource, that TRCRSCTLR<n>.GROUP and TRCRSCTLR<n>.SELECT selects, is inverted.

| INV | Meaning |
|-----|--|
| 0b0 | Do not invert the output of this selector. |
| 0b1 | Invert the output of this selector. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

GROUP, bits [19:16]

Selects a group of resources.

| GROUP | Meaning | SELECT |
|--------|---|--|
| 0b0000 | External Input Selectors. | SELECT encoding for External Input Selectors |
| 0b0001 | PE Comparator Inputs. | SELECT encoding for PE Comparator Inputs |
| 0b0010 | Counters and Sequencer. | SELECT encoding for Counters and Sequencer |
| 0b0011 | Single-shot Comparator Controls. | SELECT encoding for Single-shot Comparator Controls |
| 0b0100 | Single Address Comparators. | SELECT encoding for Single Address Comparators |
| 0b0101 | Address Range Comparators. | SELECT encoding for Address Range Comparators |
| 0b0110 | Context Identifier Comparators. | SELECT encoding for Context Identifier Comparators |
| 0b0111 | Virtual Context Identifier Comparators. | SELECT encoding for Virtual Context Identifier Comparators |

All other values are reserved.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT, bits [15:0]

Resource Specific Controls. Contains the controls specific to the resource group selected by GROUP, described in the following sections.

SELECT encoding for External Input Selectors

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|---|---|---|---|---|---|----------|----------|----------|----------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | EXTIN[3] | EXTIN[2] | EXTIN[1] | EXTIN[0] |

Bits [15:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

Selects one or more External Inputs.

| EXTIN[<m>] | Meaning |
|------------|-------------------|
| 0b0 | Ignore EXTIN <m>. |
| 0b1 | Select EXTIN <m>. |

This bit is RES0 if m >= [TRCIDR5](#).NUMEXTINSEL.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for PE Comparator Inputs

| | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|---|---|------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| | | | | | | | | RES0 | PECOMP[7] | PECOMP[6] | PECOMP[5] | PECOMP[4] | PECOMP[3] | PECOMP[2] | PECOMP[1] | PECOMP[0] |

Bits [15:8]

Reserved, RES0.

PECOMP[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs.

| PECOMP[<m>] | Meaning |
|-------------|---------------------------------|
| 0b0 | Ignore PE Comparator Input <m>. |
| 0b1 | Select PE Comparator Input <m>. |

This bit is RES0 if m >= [TRCIDR4](#).NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Counters and Sequencer

| | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|---|---|------|--------------|--------------|--------------|--------------|-------------|-------------|-------------|-------------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | | | |
| | | | | | | | | RES0 | SEQUENCER[3] | SEQUENCER[2] | SEQUENCER[1] | SEQUENCER[0] | COUNTERS[3] | COUNTERS[2] | COUNTERS[1] | COUNTERS[0] |

Bits [15:8]

Reserved, RES0.

SEQUENCER[<m>], bit [m+4], for m = 3 to 0

Sequencer states.

| SEQUENCER[<m>] | Meaning |
|----------------|-----------------------------|
| 0b0 | Ignore Sequencer state <m>. |
| 0b1 | Select Sequencer state <m>. |

This bit is RES0 if m >= [TRCIDR5](#).NUMSEQSTATE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COUNTERS[<m>], bit [m], for m = 3 to 0

Counters resources at zero.

| COUNTERS[<m>] | Meaning |
|---------------|-----------------------------|
| 0b0 | Ignore Counter <m>. |
| 0b1 | Select Counter <m> is zero. |

This bit is RES0 if m >= [TRCIDR5](#).NUMCNTR.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single-shot Comparator Controls

| | | | | | | | | | | | | | | | |
|------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | SINGLE_SHOT[7] | SINGLE_SHOT[6] | SINGLE_SHOT[5] | SINGLE_SHOT[4] | SINGLE_SHOT[3] | SINGLE_SHOT[2] | SINGLE_SHOT[1] | SINGLE_SHOT[0] | SINGLE_SHOT[7] | SINGLE_SHOT[6] | SINGLE_SHOT[5] | SINGLE_SHOT[4] | SINGLE_SHOT[3] | SINGLE_SHOT[2] | SINGLE_SHOT[1] |

Bits [15:8]

Reserved, RES0.

SINGLE_SHOT[<m>], bit [m], for m = 7 to 0

Selects one or more Single-shot Comparator Controls.

| SINGLE_SHOT[<m>] | Meaning |
|------------------|--|
| 0b0 | Ignore Single-shot Comparator Control <m>. |
| 0b1 | Select Single-shot Comparator Control <m>. |

This bit is RES0 if m >= [TRCIDR4](#).NUMSSCC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single Address Comparators

| | | | | | | | | | | | | | | | |
|---------|---------|---------|---------|---------|---------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SAC[15] | SAC[14] | SAC[13] | SAC[12] | SAC[11] | SAC[10] | SAC[9] | SAC[8] | SAC[7] | SAC[6] | SAC[5] | SAC[4] | SAC[3] | SAC[2] | SAC[1] | SAC[0] |

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators.

| SAC[<m>] | Meaning |
|----------|---------------------------------------|
| 0b0 | Ignore Single Address Comparator <m>. |
| 0b1 | Select Single Address Comparator <m>. |

This bit is RES0 if m >= 2 × [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Address Range Comparators

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|---|---|--------|--------|--------|--------|--------|--------|--------|--------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | ARC[7] | ARC[6] | ARC[5] | ARC[4] | ARC[3] | ARC[2] | ARC[1] | ARC[0] |

Bits [15:8]

Reserved, RES0.

ARC[<m>], bit [m], for m = 7 to 0

Selects one or more Address Range Comparators.

| ARC[<m>] | Meaning |
|----------|--------------------------------------|
| 0b0 | Ignore Address Range Comparator <m>. |
| 0b1 | Select Address Range Comparator <m>. |

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Context Identifier Comparators

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|---|---|--------|--------|--------|--------|--------|--------|--------|--------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | CID[7] | CID[6] | CID[5] | CID[4] | CID[3] | CID[2] | CID[1] | CID[0] |

Bits [15:8]

Reserved, RES0.

CID[<m>], bit [m], for m = 7 to 0

Selects one or more Context Identifier Comparators.

| CID[<m>] | Meaning |
|----------|---|
| 0b0 | Ignore Context Identifier Comparator <m>. |
| 0b1 | Select Context Identifier Comparator <m>. |

This bit is RES0 if m >= [TRCIDR4](#).NUMCIDC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Virtual Context Identifier Comparators

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|---|---|---------|---------|---------|---------|---------|---------|---------|---------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | VMID[7] | VMID[6] | VMID[5] | VMID[4] | VMID[3] | VMID[2] | VMID[1] | VMID[0] |

Bits [15:8]

Reserved, RES0.

VMID[<m>], bit [m], for m = 7 to 0

Selects one or more Virtual Context Identifier Comparators.

| VMID[<m>] | Meaning |
|-----------|---|
| 0b0 | Ignore Virtual Context Identifier Comparator <m>. |
| 0b1 | Select Virtual Context Identifier Comparator <m>. |

This bit is RES0 if m >= [TRCIDR4.NUMVMIDC](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCRSCTLR<n>

Must be programmed if any of the following are true:

- [TRCCNTCTLR<a>.RLDEVENT](#).TYPE == 0 and [TRCCNTCTLR<a>.RLDEVENT](#).SEL == n.
- [TRCCNTCTLR<a>.RLDEVENT](#).TYPE == 1 and [TRCCNTCTLR<a>.RLDEVENT](#).SEL == n/2.
- [TRCCNTCTLR<a>.CNTEVENT](#).TYPE == 0 and [TRCCNTCTLR<a>.CNTEVENT](#).SEL == n.
- [TRCCNTCTLR<a>.CNTEVENT](#).TYPE == 1 and [TRCCNTCTLR<a>.CNTEVENT](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT0](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT0](#).SEL == n.
- [TRCEVENTCTL0R.EVENT0](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT0](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT1](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT1](#).SEL == n.
- [TRCEVENTCTL0R.EVENT1](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT1](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT2](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT2](#).SEL == n.
- [TRCEVENTCTL0R.EVENT2](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT2](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT3](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT3](#).SEL == n.
- [TRCEVENTCTL0R.EVENT3](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT3](#).SEL == n/2.
- [TRCSEQEVR<a>.B](#).TYPE == 0 and [TRCSEQEVR<a>.B](#).SEL == n.
- [TRCSEQEVR<a>.B](#).TYPE == 1 and [TRCSEQEVR<a>.B](#).SEL == n/2.
- [TRCSEQEVR<a>.F](#).TYPE == 0 and [TRCSEQEVR<a>.F](#).SEL == n.
- [TRCSEQEVR<a>.F](#).TYPE == 1 and [TRCSEQEVR<a>.F](#).SEL == n/2.
- [TRCSEQRSTEVR.RST](#).TYPE == 0 and [TRCSEQRSTEVR.RST](#).SEL == n.
- [TRCSEQRSTEVR.RST](#).TYPE == 1 and [TRCSEQRSTEVR.RST](#).SEL == n/2.
- [TRCTSCTLR.EVENT](#).TYPE == 0 and [TRCTSCTLR.EVENT](#).SEL == n.
- [TRCTSCTLR.EVENT](#).TYPE == 1 and [TRCTSCTLR.EVENT](#).SEL == n/2.
- [TRCVICTLR.EVENT](#).TYPE == 0 and [TRCVICTLR.EVENT](#).SEL == n.
- [TRCVICTLR.EVENT](#).TYPE == 1 and [TRCVICTLR.EVENT](#).SEL == n/2.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCRSCTLR<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|--------------|
| ETE | 0x200 + (4 * n) | TRCRSCTLR<n> |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCRSR, Resources Status Register

The TRCRSR characteristics are:

Purpose

Use this to set, or read, the status of the resources.

Configuration

External register TRCRSR bits [31:0] are architecturally mapped to AArch64 System register [TRCRSR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCRSR are RES0.

Attributes

TRCRSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----------|----------|----------|----------|------|----------|----------|----------|----------|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | TA | EVENT[3] | EVENT[2] | EVENT[1] | EVENT[0] | RES0 | EXTIN[3] | EXTIN[2] | EXTIN[1] | EXTIN[0] | | | | | | | | | | |

Bits [31:13]

Reserved, RES0.

TA, bit [12]

Tracing active.

| TA | Meaning |
|-----|------------------------|
| 0b0 | Tracing is not active. |
| 0b1 | Tracing is active. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

EVENT[<m>], bit [m+8], for m = 3 to 0

Untraced status of ETEEvents.

| EVENT[<m>] | Meaning |
|------------|--|
| 0b0 | An ETEEvent <m> has not occurred. |
| 0b1 | An ETEEvent <m> has occurred while the resources were in the Paused state. |

This bit is RES0 if [TRCIDR4](#).NUMRSPAIR == 0 || m > [TRCIDR0](#).NUMEVENT.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

The sticky status of the External Input Selectors.

| EXTIN[<m>] | Meaning |
|-------------------------|---|
| 0b0 | An event selected by External Input Selector <m> has not occurred. |
| 0b1 | At least one event selected by External Input Selector <m> has occurred while the resources were in the Paused state. |

This bit is RES0 if m >= [TRCIDR5.NUMEXTINSEL](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCRSR

Must always be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCRSR can be accessed through the external debug interface:

| Component | Offset | Instance |
|------------------|---------------|-----------------|
| ETE | 0x028 | TRCRSR |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCSEQEVR<n>, Sequencer State Transition Control Register <n>, n = 0 - 2

The TRCSEQEVR<n> characteristics are:

Purpose

Moves the Sequencer state:

- Backwards, from state n+1 to state n when a programmed resource event occurs.
- Forwards, from state n to state n+1 when a programmed resource event occurs.

Configuration

External register TRCSEQEVR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCSEQEVR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQEVR<n> are RES0.

Attributes

TRCSEQEVR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|------|----|-------|----|---|---|--------|---|------|---|-------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | B_TYPE | | RES0 | | B_SEL | | | | F_TYPE | | RES0 | | F_SEL | | | |

Bits [31:16]

Reserved, RES0.

B_TYPE, bit [15]

Chooses the type of Resource Selector.

Backward field. Defines whether the backward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == 0x14 then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

| B_TYPE | Meaning |
|--------|---|
| 0b0 | A single Resource Selector. TRCSEQEVR<n>.B.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.B.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.B.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

B_SEL, bits [12:8]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.B.TYPE controls whether TRCSEQEVR<n>.B.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Backward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

F_TYPE, bit [7]

Chooses the type of Resource Selector.

Backward field. Defines whether the forward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == 0x12 then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

| F_TYPE | Meaning |
|---------------|---|
| 0b0 | A single Resource Selector. TRCSEQEVR<n>.F.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.F.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.F.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

F_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.F.TYPE controls whether TRCSEQEVR<n>.F.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Forward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQEVR<n>

Must be programmed if [TRCRSCTLR<a>.GROUP == 0b0010](#) and [TRCRSCTLR<a>.SEQUENCER != 0b0000](#).

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSEQEVR<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-------------------|--------------|
| ETE | $0x100 + (4 * n)$ | TRCSEQEVR<n> |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCSEQRSTEVR, Sequencer Reset Control Register

The TRCSEQRSTEVR characteristics are:

Purpose

Moves the Sequencer to state 0 when a programmed resource event occurs.

Configuration

External register TRCSEQRSTEVR bits [31:0] are architecturally mapped to AArch64 System register [TRCSEQRSTEVR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQRSTEVR are RES0.

Attributes

TRCSEQRSTEVR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----------|----|------|----|---------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | RST TYPE | | RES0 | | RST SEL | | | | | | | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

RST_TYPE, bit [7]

Chooses the type of Resource Selector.

| RST_TYPE | Meaning |
|----------|--|
| 0b0 | A single Resource Selector. TRCSEQRSTEVR.RST.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCSEQRSTEVR.RST.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQRSTEVR.RST.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

RST_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQRSTEVR.RST.TYPE controls whether TRCSEQRSTEVR.RST.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQRSTEV

Must be programmed if [TRCRSCTLR<a>.GROUP == 0b0010](#) and [TRCRSCTLR<a>.SEQUENCER != 0b0000](#).

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSEQRSTEV can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-------------|
| ETE | 0x118 | TRCSEQRSTEV |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCSEQSTR, Sequencer State Register

The TRCSEQSTR characteristics are:

Purpose

Use this to set, or read, the Sequencer state.

Configuration

External register TRCSEQSTR bits [31:0] are architecturally mapped to AArch64 System register [TRCSEQSTR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQSTR are RES0.

Attributes

TRCSEQSTR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|-------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | STATE |

Bits [31:2]

Reserved, RES0.

STATE, bits [1:0]

Set or returns the state of the Sequencer.

| STATE | Meaning |
|-------|----------|
| 0b00 | State 0. |
| 0b01 | State 1. |
| 0b10 | State 2. |
| 0b11 | State 3. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQSTR

Must be programmed if [TRCRSCTLR<a>.GROUP](#) == 0b0010 and [TRCRSCTLR<a>.SEQUENCER](#) != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSEQSTR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| ETE | 0x11C | TRCSEQSTR |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCSSCCR<n>, Single-shot Comparator Control Register <n>, n = 0 - 7

The TRCSSCCR<n> characteristics are:

Purpose

Controls the corresponding Single-shot Comparator Control resource.

Configuration

External register TRCSSCCR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCSSCCR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMSSCC > n. Otherwise, direct accesses to TRCSSCCR<n> are RES0.

Attributes

TRCSSCCR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|------|-----|--------|--------|--------|--------|--------|--------|--------|--------|---------|---------|---------|---------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | |
| | | | | | | | RES0 | RST | ARC[7] | ARC[6] | ARC[5] | ARC[4] | ARC[3] | ARC[2] | ARC[1] | ARC[0] | SAC[15] | SAC[14] | SAC[13] | SAC[12] | SAC[11] |

Bits [31:25]

Reserved, RES0.

RST, bit [24]

Selects the Single-shot Comparator Control mode.

| RST | Meaning |
|-----|--|
| 0b0 | The Single-shot Comparator Control is in single-shot mode. |
| 0b1 | The Single-shot Comparator Control is in multi-shot mode. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

ARC[<m>], bit [m+16], for m = 7 to 0

Selects one or more Address Range Comparators for Single-shot control.

| ARC[<m>] | Meaning |
|----------|--|
| 0b0 | The Address Range Comparator <m>, is not selected for Single-shot control. |
| 0b1 | The Address Range Comparator <m>, is selected for Single-shot control. |

This bit is RES0 if m >= [TRCIDR4.NUMACPAIRS](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators for Single-shot control.

| SAC[<m>] | Meaning |
|-----------------------|---|
| 0b0 | The Single Address Comparator <m>, is not selected for Single-shot control. |
| 0b1 | The Single Address Comparator <m>, is selected for Single-shot control. |

This bit is RES0 if $m \geq 2 \times \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSSCCR<n>

Must be programmed if any [TRCRSCTLR<a>](#).GROUP == 0b0011 and [TRCRSCTLR<a>](#).SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSSCCR<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|------------------|-------------------|-----------------|
| ETE | $0x280 + (4 * n)$ | TRCSSCCR<n> |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

Copyright © 2010-2021 Arm Limited or its affiliates. All rights reserved. This document is Non-Confidential.

TRCSSCSR<n>, Single-shot Comparator Control Status Register <n>, n = 0 - 7

The TRCSSCSR<n> characteristics are:

Purpose

Returns the status of the corresponding Single-shot Comparator Control.

Configuration

External register TRCSSCSR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCSSCSR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMSSCC > n. Otherwise, direct accesses to TRCSSCSR<n> are RES0.

Attributes

TRCSSCSR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|---------|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|-----|---|-----|---|------|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |
| STATUS | | PENDING | | RES0 | | | | | | | | | | | | | | | | | | | | | | | | PCD | | VDA | | INST | |

STATUS, bit [31]

Single-shot Comparator Control status. Indicates if any of the comparators selected by this Single-shot Comparator control have matched. The selected comparators are defined by [TRCSSCCR<n>.ARC](#), [TRCSSCCR<n>.SAC](#), and [TRCSSPCICR<n>.PC](#).

| STATUS | Meaning |
|--------|---|
| 0b0 | No match has occurred. When the first match occurs, this field takes a value of 1. It remains at 1 until explicitly modified by a write to this register. |
| 0b1 | One or more matches has occurred. If TRCSSCCR<n>.RST == 0 then: <ul style="list-style-type: none"> There is only one match and no more matches are possible. Software must reset this field to 0 to re-enable the Single-shot Comparator Control. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

PENDING, bit [30]

Single-shot pending status. The Single-shot Comparator Control fired while the resources were in the Paused state.

| PENDING | Meaning |
|---------|-----------------------------------|
| 0b0 | No match has occurred. |
| 0b1 | One or more matches has occurred. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [29:4]

Reserved, RES0.

PC, bit [3]

PE Comparator Input support. Indicates if the Single-shot Comparator Control supports PE Comparator Inputs.

| PC | Meaning |
|-----|--|
| 0b0 | This Single-shot Comparator Control does not support PE Comparator Inputs. Selecting any PE Comparator Inputs using the associated TRCSSPCICR<n> results in CONSTRAINED UNPREDICTABLE behavior of the Single-shot Comparator Control resource. The Single-shot Comparator Control might match unexpectedly or might not match. |
| 0b1 | This Single-shot Comparator Control supports PE Comparator Inputs. |

Access to this field is **RO**.

DV, bit [2]

Data value comparator support. Data value comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

| DV | Meaning |
|-----|--|
| 0b0 | This Single-shot Comparator Control does not support data value comparisons. |
| 0b1 | This Single-shot Comparator Control supports data value comparisons. |

This field reads as 0.

Access to this field is **RO**.

DA, bit [1]

Data Address Comparator support. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

| DA | Meaning |
|-----|--|
| 0b0 | This Single-shot Comparator Control does not support data address comparisons. |
| 0b1 | This Single-shot Comparator Control supports data address comparisons. |

This field reads as 0.

Access to this field is **RO**.

INST, bit [0]

Instruction Address Comparator support. Indicates if the Single-shot Comparator Control supports instruction address comparisons.

| INST | Meaning |
|------|---|
| 0b0 | This Single-shot Comparator Control does not support instruction address comparisons. |
| 0b1 | This Single-shot Comparator Control supports instruction address comparisons. |

This field reads as 1.

Access to this field is **RO**.

Accessing TRCSSCSR<n>

Must be programmed if [TRCRSCTLR<a>](#).GROUP == 0b0011 and [TRCRSCTLR<a>](#).SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSSCSR<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|-------------|
| ETE | 0x2A0 + (4 * n) | TRCSSCSR<n> |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCSSPCICR<n>, Single-shot Processing Element Comparator Input Control Register <n>, n = 0 - 7

The TRCSSPCICR<n> characteristics are:

Purpose

Returns the status of the corresponding Single-shot Comparator Control.

Configuration

External register TRCSSPCICR<n> bits [31:0] are architecturally mapped to AArch64 System register [TRCSSPCICR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMSSCC > n, TRCIDR4.NUMPC > 0b0000 and TRCSSCSR<n>.PC == 1. Otherwise, direct accesses to TRCSSPCICR<n> are RES0.

Attributes

TRCSSPCICR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|--|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | PC[7]PC[6]PC[5]PC[4]PC[3]PC[2]PC[1]PC[0] | | | | | | | | | | | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

PC[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs for Single-shot control.

| PC[<m>] | Meaning |
|---------|---|
| 0b0 | The single PE Comparator Input <m>, is not selected as for Single-shot control. |
| 0b1 | The single PE Comparator Input <m>, is selected as for Single-shot control. |

This bit is RES0 if m >= [TRCIDR4](#).NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSSPCICR<n>

Must be programmed if implemented and any [TRCRSCTLR<a>](#).GROUP == 0b0011 and [TRCRSCTLR<a>](#).SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSSPCICR<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-------------------|---------------|
| ETE | $0x2C0 + (4 * n)$ | TRCSSPCICR<n> |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCSTALLCTLR, Stall Control Register

The TRCSTALLCTLR characteristics are:

Purpose

Enables trace unit functionality that prevents trace unit buffer overflows.

Configuration

External register TRCSTALLCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCSTALLCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR3.STALLCTL == 1. Otherwise, direct accesses to TRCSTALLCTLR are RES0.

Attributes

TRCSTALLCTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|----|------|----|--------|----|------|----|-------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | NOOVERFLOW | | RES0 | | ISTALL | | RES0 | | LEVEL | | | | | | | | | |

Bits [31:14]

Reserved, RES0.

NOOVERFLOW, bit [13]

When TRCIDR3.NOOVERFLOW == 1:

Trace overflow prevention.

| NOOVERFLOW | Meaning |
|------------|--|
| 0b0 | Trace unit buffer overflow prevention is disabled. |
| 0b1 | Trace unit buffer overflow prevention is enabled. |

Note that enabling this feature might cause a significant performance impact.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

ISTALL, bit [8]

Instruction stall control. Controls if a trace unit can stall the PE when the trace buffer space is less than LEVEL.

| ISTALL | Meaning |
|--------|---------------------------------------|
| 0b0 | The trace unit must not stall the PE. |
| 0b1 | The trace unit can stall the PE. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

LEVEL, bits [3:0]

Threshold level field. The field can support 16 monotonic levels from 0b0000 to 0b1111.

The value 0b0000 defines the Minimal invasion level. This setting has a greater risk of a trace unit buffer overflow.

The value 0b1111 defines the Maximum invasion level. This setting has a reduced risk of a trace unit buffer overflow.

Note that for some implementations, invasion might occur at the minimal invasion level.

One or more of the least significant bits of LEVEL are permitted to be RES0. Arm recommends that LEVEL[3:2] are fully implemented. Arm strongly recommends that LEVEL[3] is always implemented. If one or more bits are RES0 and are written with a non-zero value, the effective value of LEVEL is rounded down to the nearest power of 2 value which has the RES0 bits as zero. For example, if LEVEL[1:0] are RES0 and a value of 0b1110 is written to LEVEL, the effective value of LEVEL is 0b1100.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSTALLCTLR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSTALLCTLR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|--------------|
| ETE | 0x02C | TRCSTALLCTLR |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCSTATR, Trace Status Register

The TRCSTATR characteristics are:

Purpose

Returns the trace unit status.

Configuration

External register TRCSTATR bits [31:0] are architecturally mapped to AArch64 System register [TRCSTATR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCSTATR are RES0.

Attributes

TRCSTATR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|----------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | PMSTABLE | IDLE |

Bits [31:2]

Reserved, RES0.

PMSTABLE, bit [1]

Programmers' model stable.

| PMSTABLE | Meaning |
|----------|---------------------------------------|
| 0b0 | The programmers' model is not stable. |
| 0b1 | The programmers' model is stable. |

Accessing this field has the following behavior:

- When the trace unit is enabled, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

IDLE, bit [0]

Idle status.

| IDLE | Meaning |
|------|-----------------------------|
| 0b0 | The trace unit is not idle. |
| 0b1 | The trace unit is idle. |

Accessing TRCSTATR

TRCSTATR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x00C | TRCSTATR |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RO**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCSYNCPR, Synchronization Period Register

The TRCSYNCPR characteristics are:

Purpose

Controls how often trace protocol synchronization requests occur.

Configuration

External register TRCSYNCPR bits [31:0] are architecturally mapped to AArch64 System register [TRCSYNCPR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCSYNCPR are RES0.

Attributes

TRCSYNCPR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | PERIOD | | | | | | | | | | | | | |

Bits [31:5]

Reserved, RES0.

PERIOD, bits [4:0]

Defines the number of bytes of trace between each periodic trace protocol synchronization request.

| PERIOD | Meaning |
|---------|--|
| 0b00000 | Trace protocol synchronization is disabled. |
| 0b01000 | Trace protocol synchronization request occurs after 2^8 bytes of trace. |
| 0b01001 | Trace protocol synchronization request occurs after 2^9 bytes of trace. |
| 0b01010 | Trace protocol synchronization request occurs after 2^{10} bytes of trace. |
| 0b01011 | Trace protocol synchronization request occurs after 2^{11} bytes of trace. |
| 0b01100 | Trace protocol synchronization request occurs after 2^{12} bytes of trace. |
| 0b01101 | Trace protocol synchronization request occurs after 2^{13} bytes of trace. |
| 0b01110 | Trace protocol synchronization request occurs after 2^{14} bytes of trace. |
| 0b01111 | Trace protocol synchronization request occurs after 2^{15} bytes of trace. |
| 0b10000 | Trace protocol synchronization request occurs after 2^{16} bytes of trace. |
| 0b10001 | Trace protocol synchronization request occurs after 2^{17} bytes of trace. |
| 0b10010 | Trace protocol synchronization request occurs after 2^{18} bytes of trace. |
| 0b10011 | Trace protocol synchronization request occurs after 2^{19} bytes of trace. |
| 0b10100 | Trace protocol synchronization request occurs after 2^{20} bytes of trace. |

Other values are reserved. If a reserved value is programmed into PERIOD, then the behavior of the synchronization period counter is CONSTRAINED UNPREDICTABLE and one of the following behaviors occurs:

- No trace protocol synchronization requests are generated by this counter.
- Trace protocol synchronization requests occur at the specified period.
- Trace protocol synchronization requests occur at some other UNKNOWN period which can vary.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSYNCP

Must be programmed if [TRCIDR3](#).SYNCP == 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSYNCP can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|----------|
| ETE | 0x034 | TRCSYNCP |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCTRACEIDR, Trace ID Register

The TRCTRACEIDR characteristics are:

Purpose

Sets the trace ID for instruction trace.

Configuration

External register TRCTRACEIDR bits [31:0] are architecturally mapped to AArch64 System register [TRCTRACEIDR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCTRACEIDR are RES0.

Attributes

TRCTRACEIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | TRACEID | | | | | | | |

Bits [31:7]

Reserved, RES0.

TRACEID, bits [6:0]

Trace ID field. Sets the trace ID value for instruction trace. The width of the field is indicated by the value of [TRCIDR5](#).TRACEIDSIZE. Unimplemented bits are RES0.

If an implementation supports AMBA ATB, then:

- The width of the field is 7 bits.
- Writing a reserved trace ID value does not affect behavior of the trace unit but it might cause UNPREDICTABLE behavior of the trace capture infrastructure.

See the AMBA ATB Protocol Specification for information about which ATID values are reserved.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCTRACEIDR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCTRACEIDR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-------------|
| ETE | 0x040 | TRCTRACEIDR |

This interface is accessible as follows:

- When OSLockStatus(), or !IsTraceCorePowered() or !AllowExternalTraceAccess() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

TRCTSCTLR, Timestamp Control Register

The TRCTSCTLR characteristics are:

Purpose

Controls the insertion of global timestamps in the trace stream.

Configuration

External register TRCTSCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCTSCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR0.TSSIZE != 0b00000. Otherwise, direct accesses to TRCTSCTLR are RES0.

Attributes

TRCTSCTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|------|----|-----------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | EVENT_TYPE | | | | RES0 | | EVENT_SEL | | | | | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

EVENT_TYPE, bit [7]
When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

| EVENT_TYPE | Meaning |
|------------|--|
| 0b0 | A single Resource Selector. TRCTSCTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCTSCTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCTSCTLR.EVENT.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT_SEL, bits [4:0]**When TRCIDR4.NUMRSPAIR != 0b0000:**

Defines the selected Resource Selector or pair of Resource Selectors. TRCTSCTLR.EVENT.TYPE controls whether TRCTSCTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCTSCTLR

Must be programmed if [TRCCONFIGR.TS](#) == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCTSCTLR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| ETE | 0x030 | TRCTSCTLR |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCVICTLR, ViewInst Main Control Register

The TRCVICTLR characteristics are:

Purpose

Controls instruction trace filtering.

Configuration

External register TRCVICTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCVICTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCVICTLR are RES0.

Attributes

TRCVICTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | |
|------|----------------|----------------|----------------|------|----------------|----------------|----------------|----------------|----------------|----------------|------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 |
| RES0 | EXLEVEL_RL_EL2 | EXLEVEL_RL_EL1 | EXLEVEL_RL_EL0 | RES0 | EXLEVEL_NS_EL2 | EXLEVEL_NS_EL1 | EXLEVEL_NS_EL0 | EXLEVEL_RL_EL2 | EXLEVEL_RL_EL1 | EXLEVEL_RL_EL0 | RES0 |

Bits [31:27]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [26]

When TRCIDR6.EXLEVEL_RL_EL2 == 1:

Filter instruction trace for EL2 in Realm state.

| EXLEVEL_RL_EL2 | Meaning |
|----------------|--|
| 0b0 | When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit generates instruction trace for EL2 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit does not generate instruction trace for EL2 in Realm state. |
| 0b1 | When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit does not generate instruction trace for EL2 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit generates instruction trace for EL2 in Realm state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [25]**When TRCIDR6.EXLEVEL_RL_EL1 == 1:**

Filter instruction trace for EL1 in Realm state.

| EXLEVEL_RL_EL1 | Meaning |
|----------------|--|
| 0b0 | When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit generates instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit does not generate instruction trace for EL1 in Realm state. |
| 0b1 | When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit does not generate instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit generates instruction trace for EL1 in Realm state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [24]**When TRCIDR6.EXLEVEL_RL_EL0 == 1:**

Filter instruction trace for EL0 in Realm state.

| EXLEVEL_RL_EL0 | Meaning |
|----------------|--|
| 0b0 | When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit generates instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit does not generate instruction trace for EL0 in Realm state. |
| 0b1 | When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit does not generate instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit generates instruction trace for EL0 in Realm state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]**When Non-secure EL2 is implemented:**

Filter instruction trace for EL2 in Non-secure state.

| EXLEVEL_NS_EL2 | Meaning |
|----------------|---|
| 0b0 | The trace unit generates instruction trace for EL2 in Non-secure state. |
| 0b1 | The trace unit does not generate instruction trace for EL2 in Non-secure state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [21]

When Non-secure EL1 is implemented:

Filter instruction trace for EL1 in Non-secure state.

| EXLEVEL_NS_EL1 | Meaning |
|----------------|---|
| 0b0 | The trace unit generates instruction trace for EL1 in Non-secure state. |
| 0b1 | The trace unit does not generate instruction trace for EL1 in Non-secure state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_ELO, bit [20]

When Non-secure ELO is implemented:

Filter instruction trace for ELO in Non-secure state.

| EXLEVEL_NS_ELO | Meaning |
|----------------|---|
| 0b0 | The trace unit generates instruction trace for ELO in Non-secure state. |
| 0b1 | The trace unit does not generate instruction trace for ELO in Non-secure state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [19]

When EL3 is implemented:

Filter instruction trace for EL3.

| EXLEVEL_S_EL3 | Meaning |
|---------------|---|
| 0b0 | The trace unit generates instruction trace for EL3. |
| 0b1 | The trace unit does not generate instruction trace for EL3. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [18]

When EL2 is implemented and FEAT_SEL2 is implemented:

Filter instruction trace for EL2 in Secure state.

| EXLEVEL_S_EL2 | Meaning |
|---------------|---|
| 0b0 | The trace unit generates instruction trace for EL2 in Secure state. |
| 0b1 | The trace unit does not generate instruction trace for EL2 in Secure state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [17]

When Secure EL1 is implemented:

Filter instruction trace for EL1 in Secure state.

| EXLEVEL_S_EL1 | Meaning |
|---------------|---|
| 0b0 | The trace unit generates instruction trace for EL1 in Secure state. |
| 0b1 | The trace unit does not generate instruction trace for EL1 in Secure state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [16]

When Secure EL0 is implemented:

Filter instruction trace for EL0 in Secure state.

| EXLEVEL S_ELO | Meaning |
|---------------|---|
| 0b0 | The trace unit generates instruction trace for ELO in Secure state. |
| 0b1 | The trace unit does not generate instruction trace for ELO in Secure state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:12]

Reserved, RES0.

TRCERR, bit [11]

When TRCIDR3.TRCERR == 1:

Controls the forced tracing of System Error exceptions.

| TRCERR | Meaning |
|--------|--|
| 0b0 | Forced tracing of System Error exceptions is disabled. |
| 0b1 | Forced tracing of System Error exceptions is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCRESET, bit [10]

Controls the forced tracing of PE Resets.

| TRCRESET | Meaning |
|----------|--|
| 0b0 | Forced tracing of PE Resets is disabled. |
| 0b1 | Forced tracing of PE Resets is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SSSTATUS, bit [9]

ViewInst start/stop function status.

| SSSTATUS | Meaning |
|----------|---|
| 0b0 | Stopped State. The ViewInst start/stop function is in the stopped state. |
| 0b1 | Started State. The ViewInst start/stop function is in the started state. |

Before software enables the trace unit, it must write to this field to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this field to 1. Arm recommends that the value of this field is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR.SSSTATUS is UNKNOWN and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing [TRCPRGCTLR.EN](#) or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- RES1** if all of the following are true:
 - TRCIDR4.NUMACPAIRS == 0b0000
 - TRCIDR4.NUMPC == 0b0000
- Otherwise, access to this field is **RW**.

Bit [8]

Reserved, RES0.

EVENT_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

| EVENT_TYPE | Meaning |
|------------|--|
| 0b0 | A single Resource Selector. TRCVICTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCVICTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors. TRCVICTLR.EVENT.TYPE controls whether TRCVICTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

When TRCIDR4.NUMRSPAIR == 0b0000:

This field is reserved:

- Bits [4:1] are RES0.
- Bit [0] is RES1.

Otherwise:

Reserved, RES0.

Accessing TRCVICTLR

Must be programmed.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCVICTLR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-----------|
| ETE | 0x080 | TRCVICTLR |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCVIIECTLR, ViewInst Include/Exclude Control Register

The TRCVIIECTLR characteristics are:

Purpose

Use this to select, or read, the Address Range Comparators for the ViewInst include/exclude function.

Configuration

External register TRCVIIECTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCVIIECTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCVIIECTLR are RES0.

Attributes

TRCVIIECTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|------------|----|------------|----|------------|----|------------|----|------------|----|------------|----|------------|----|------------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | EXCLUDE[7] | | EXCLUDE[6] | | EXCLUDE[5] | | EXCLUDE[4] | | EXCLUDE[3] | | EXCLUDE[2] | | EXCLUDE[1] | | EXCLUDE[0] | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

EXCLUDE[<m>], bit [m+16], for m = 7 to 0

Exclude Address Range Comparator <m>. Selects whether Address Range Comparator <m> is in use with the ViewInst exclude function.

| EXCLUDE[<m>] | Meaning |
|--------------|---|
| 0b0 | The address range that Address Range Comparator <m> defines, is not selected for the ViewInst exclude function. |
| 0b1 | The address range that Address Range Comparator <m> defines, is selected for the ViewInst exclude function. |

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [15:8]

Reserved, RES0.

INCLUDE[<m>], bit [m], for m = 7 to 0

Include Address Range Comparator <m>.

Selects whether Address Range Comparator <m> is in use with the ViewInst include function.

Selecting no comparators for the ViewInst include function indicates that all instructions are included by default.

The ViewInst exclude function then indicates which ranges are excluded.

| INCLUDE[<m>] | Meaning |
|--------------|---|
| 0b0 | The address range that Address Range Comparator <m> defines, is not selected for the ViewInst include function. |
| 0b1 | The address range that Address Range Comparator <m> defines, is selected for the ViewInst include function. |

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVIIECTLR

Must be programmed if [TRCIDR4](#).NUMACPAIRS > 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVIIECTLR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-------------|
| ETE | 0x084 | TRCVIIECTLR |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCVIPCSSCTLR, ViewInst Start/Stop PE Comparator Control Register

The TRCVIPCSSCTLR characteristics are:

Purpose

Use this to select, or read, which PE Comparator Inputs can control the ViewInst start/stop function.

Configuration

External register TRCVIPCSSCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCVIPCSSCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMPC > 0b0000. Otherwise, direct accesses to TRCVIPCSSCTLR are RES0.

Attributes

TRCVIPCSSCTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|---------|---------|---------|---------|---------|---------|---------|---------|------|----|----|----|----|----|---|---|----------|----------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 |
| RES0 | | | | | | | | STOP[7] | STOP[6] | STOP[5] | STOP[4] | STOP[3] | STOP[2] | STOP[1] | STOP[0] | RES0 | | | | | | | | START[7] | START[6] |

Bits [31:24]

Reserved, RES0.

STOP[<m>], bit [m+16], for m = 7 to 0

Selects whether PE Comparator Input <m> is in use with ViewInst start/stop function, for the purpose of stopping trace.

| STOP[<m>] | Meaning |
|-----------|--|
| 0b0 | The PE Comparator Input <m>, is not selected as a stop resource. |
| 0b1 | The PE Comparator Input <m>, is selected as a stop resource. |

This bit is RES0 if m >= [TRCIDR4](#).NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [15:8]

Reserved, RES0.

START[<m>], bit [m], for m = 7 to 0

Selects whether PE Comparator Input <m> is in use with ViewInst start/stop function, for the purpose of starting trace.

| START[<m>] | Meaning |
|------------|---|
| 0b0 | The PE Comparator Input <m>, is not selected as a start resource. |
| 0b1 | The PE Comparator Input <m>, is selected as a start resource. |

This bit is RES0 if m >= [TRCIDR4](#).NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVIPCSSCTLR

Must be programmed if [TRCIDR4](#).NUMPC != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVIPCSSCTLR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|---------------|
| ETE | 0x08C | TRCVIPCSSCTLR |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCVISSCTLR, ViewInst Start/Stop Control Register

The TRCVISSCTLR characteristics are:

Purpose

Use this to select, or read, the Single Address Comparators for the ViewInst start/stop function.

Configuration

External register TRCVISSCTLR bits [31:0] are architecturally mapped to AArch64 System register [TRCVISSCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCVISSCTLR are RES0.

Attributes

TRCVISSCTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | |
|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 |
| STOP[15] | STOP[14] | STOP[13] | STOP[12] | STOP[11] | STOP[10] | STOP[9] | STOP[8] | STOP[7] | STOP[6] | STOP[5] | STOP[4] | STOP[3] |

STOP[<m>], bit [m+16], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of stopping trace.

| STOP[<m>] | Meaning |
|-----------|--|
| 0b0 | The Single Address Comparator <m>, is not selected as a stop resource. |
| 0b1 | The Single Address Comparator <m>, is selected as a stop resource. |

This bit is RES0 if $m \geq 2 \times \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

START[<m>], bit [m], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of starting trace.

| START[<m>] | Meaning |
|------------|---|
| 0b0 | The Single Address Comparator <m>, is not selected as a start resource. |
| 0b1 | The Single Address Comparator <m>, is selected as a start resource. |

This bit is RES0 if $m \geq 2 \times \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVISSCTLR

Must be programmed if [TRCIDR4](#).NUMACPAIRS > 0b0000.

For any 2 comparators selected for the ViewInst start/stop function, the comparator containing the lower address must be a lower numbered comparator.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVISSCTLR can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|-------------|
| ETE | 0x088 | TRCVISSCTLR |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCVMIDCCTRL0, Virtual Context Identifier Comparator Control Register 0

The TRCVMIDCTRL0 characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the [TRCVMIDCVR<n>](#) registers, where n=0-3.

Configuration

External register TRCVMIDCCTLRO bits [31:0] are architecturally mapped to AArch64 System register [TRCVMIDCCTLRO\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMVMIDC > 0x0 and TRCIDR2.VMIDSIZE > 0b000000. Otherwise, direct accesses to TRCVMIDCCTLR0 are RES0.

Attributes

TRCVMIDCTL0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | |
|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 |
| COMP3[7] | COMP3[6] | COMP3[5] | COMP3[4] | COMP3[3] | COMP3[2] | COMP3[1] | COMP3[0] | COMP2[7] | COMP2[6] | COMP2[5] |

COMP3[<m>], bit [m+24], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 3:

TRCVMIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR3. Each bit in this field corresponds to a byte in TRCVMIDCVR3.

| COMP3[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if $m \geq \text{TRCIDR2.VMIDSIZE}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 2:

TRCVMIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR2. Each bit in this field corresponds to a byte in TRCVMIDCVR2.

| COMP2[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 1:

TRCVMIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR1. Each bit in this field corresponds to a byte in TRCVMIDCVR1.

| COMP1[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 0:

TRCVMIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR0. Each bit in this field corresponds to a byte in TRCVMIDCVR0.

| COMP0[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCCTLRO

If software uses the [TRCVMIDCVR<n>](#) registers, where n=0-3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCVMIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCVMIDCVR<n>](#) is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVMIDCCTLRO can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|---------------|
| ETE | 0x688 | TRCVMIDCCTLRO |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCVMIDCTRL1, Virtual Context Identifier Comparator Control Register 1

The TRCVMIDCCTLR1 characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the [TRCVMIDCVR<n>](#) registers, where n=4-7.

Configuration

External register TRCVMIDCCTL1 bits [31:0] are architecturally mapped to AArch64 System register [TRCVMIDCCTL1\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMVMIDC > 0x4 and TRCIDR2.VMIDSIZE > 0b00000. Otherwise, direct accesses to TRCVMIDCCTLR1 are RES0.

Attributes

TRCVMIDCCTL1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | |
|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 |
| COMP7[7] | COMP7[6] | COMP7[5] | COMP7[4] | COMP7[3] | COMP7[2] | COMP7[1] | COMP7[0] | COMP6[7] | COMP6[6] | COMP6[5] |

COMP7[<m>], bit [m+24], for m = 7 to 0
When TRCIDR4.NUMVMIDC > 7:

TRCVMIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR7. Each bit in this field corresponds to a byte in TRCVMIDCVR7.

| COMP7[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if $m \geq \text{TRCIDR2.VMIDSIZE}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0
When TRCIDR4.NUMVMIDC > 6:

TRCVMIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR6. Each bit in this field corresponds to a byte in TRCVMIDCVR6.

| COMP6[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 5:

TRCVMIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR5. Each bit in this field corresponds to a byte in TRCVMIDCVR5.

| COMP5[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 4:

TRCVMIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR4. Each bit in this field corresponds to a byte in TRCVMIDCVR4.

| COMP4[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCCTLR1

If software uses the [TRCVMIDCVR<n>](#) registers, where n=4-7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCVMIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCVMIDCVR<n>](#) is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVMIDCCTLR1 can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|--------|---------------|
| ETE | 0x68C | TRCVMIDCCTLR1 |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.

TRCVMIDCVR<n>, Virtual Context Identifier Comparator Value Register <n>, n = 0 - 7

The TRCVMIDCVR<n> characteristics are:

Purpose

Contains the Virtual Context Identifier Comparator value.

Configuration

External register TRCVMIDCVR<n> bits [63:0] are architecturally mapped to AArch64 System register [TRCVMIDCVR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMVMIDC > n. Otherwise, direct accesses to TRCVMIDCVR<n> are RES0.

Attributes

TRCVMIDCVR<n> is a 64-bit register.

Field descriptions

VALUE, bits [63:0]

Virtual context identifier value. The width of this field is indicated by [TRCIDR2.VMIDSIZE](#). Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Virtual context identifier is zero until the PE updates the Virtual context identifier .

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVMIDCVR<n>

Must be programmed if any of the following are true:

- [TRCRSCTLR<a>](#).GROUP == 0b0111 and [TRCRSCTLR<a>](#).VMID[n] == 1.
- [TRCACATR<a>](#).CONTEXTTYPE == 0b10 or 0b11 and [TRCACATR<a>](#).CONTEXT == n.

TRCVMIDCVR<n> can be accessed through the external debug interface:

| Component | Offset | Instance |
|-----------|-----------------|---------------|
| ETE | 0x640 + (8 * n) | TRCVMIDCVR<n> |

This interface is accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess() or !IsTraceCorePowered() accesses to this register generate an error response.
- Otherwise accesses to this register are **RW**.
