If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE2IS, TLBI VALE2ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE2IS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|

        TLBIlevel_Last, TLBI_ExcludeXS, X[t]);

```

TLBI VALE2OS, TLBI VALE2OSNXS, TLB Invalidate by VA, Last level, EL2, Outer Shareable

The TLBI VALE2OS, TLBI VALE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime for the Security state.
- If [HCR_EL2.E2H](#) == 0, the entry is from the final level of the translation table walk.
- If [HCR_EL2.E2H](#) == 1, one of the following applies:
 - The entry is a global entry from the final level of the translation table walk.
 - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of [SCR_EL3.NS](#) if FEAT_RME is not implemented, or [SCR_EL3.{NSE, NS}](#) if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VALE2OS, TLBI VALE2OSNXS are UNDEFINED.

Attributes

TLBI VALE2OS, TLBI VALE2OSNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ASID | | | | | | | | | | | | | | | | TTL | | | | VA[55:12] | | | | | | | | | | | |
| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

When [HCR_EL2.E2H](#) == 1:

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|--------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE2OS, TLBI VALE2OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE3IS, TLBI VALE3ISNXS, TLB Invalidate by VA, Last level, EL3, Inner Shareable

The TLBI VALE3IS, TLBI VALE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VALE3IS, TLBI VALE3ISNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|------------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE3IS, TLBI VALE3ISNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE3IS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b01 | 0b110 | 0b1000 | 0b0011 | 0b101 |

TLBI VALE3OS, TLBI VALE3OSNXS, TLB Invalidate by VA, Last level, EL3, Outer Shareable

The TLBI VALE3OS, TLBI VALE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from the final level of the translation table walk.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VALE3OS, TLBI VALE3OSNXS are UNDEFINED.

Attributes

TLBI VALE3OS, TLBI VALE3OSNXS is a 64-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| RES0 | | | | | | | | | | | | | | | | TTL | | | | VA[55:12] | | | | | | | | | | | | | |
| VA[55:12] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]

When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

| TTL | Meaning |
|------------|--|
| 0b00xx | No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0. |
| 0b01xx | The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |
| 0b10xx | The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3. |
| 0b11xx | The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3. |

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing the TLBI VALE3OS, TLBI VALE3OSNXS instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE3OS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|

TLBI VMALLE1, TLBI VMALLE1NXS, TLB Invalidate by VMID, All at stage 1, EL1

The TLBI VMALLE1, TLBI VMALLE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VMALLE1, TLBI VMALLE1NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI VMALLE1, TLBI VMALLE1NXS instruction

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.

- The instruction behaves as if the Rt field is set to 0b11111.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VMALLE1{, <Xt>}

TLBI VMALLE1IS, TLBI VMALLE1ISNXS, TLB Invalidate by VMID, All at stage 1, EL1, Inner Shareable

The TLBI VMALLE1IS, TLBI VMALLE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
 - If [HCR_EL2](#).{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

 - If [HCR_EL2](#).{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of [SCR_EL3](#).NS if FEAT_RME is not implemented, or [SCR_EL3](#).{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VMALLE1OS, TLBI VMALLE1OSNXS are UNDEFINED.

Attributes

TLBI VMALLE1OS, TLBI VMALLE1OSNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI VMALLE1OS, TLBI VMALLE1OSNXS instruction

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VMALLE1OS{, <Xt>}

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b01 | 0b000 | 0b1000 | 0b0001 | 0b000 |

```

TLBI VMALLS12E1, TLBI VMALLS12E1NXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1

The TLBI VMALLS12E1, TLBI VMALLS12E1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - If [SCR_EL3](#).{NSE, NS} is {0, 0}, then:
 - The entry would be required to translate an address using the Secure EL1&0 translation regime.
 - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
 - If [SCR_EL3](#).{NSE, NS} is {0, 1}, then:
 - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
 - If Non-secure EL2 is implemented, the entry would be used with the current VMID.
 - If [SCR_EL3](#).{NSE, NS} is {1, 1}, then:
 - The entry would be required to translate an address using the Realm EL1&0 translation regime.
 - The entry would be used with the current VMID.
- If FEAT_RME is not implemented, one of the following applies:
 - If [SCR_EL3](#).NS is 0, then:
 - The entry would be required to translate an address using the Secure EL1&0 translation regime.
 - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
 - If [SCR_EL3](#).NS is 1, then:
 - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
 - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

Attributes

TLBI VMALLS12E1, TLBI VMALLS12E1NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI VMALLS12E1, TLBI VMALLS12E1NXS instruction

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.

TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Inner Shareable

The TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - If [SCR_EL3](#).{NSE, NS} is {0, 0}, then:
 - The entry would be required to translate an address using the Secure EL1&0 translation regime.
 - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
 - If [SCR_EL3](#).{NSE, NS} is {0, 1}, then:
 - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
 - If Non-secure EL2 is implemented, the entry would be used with the current VMID.
 - If [SCR_EL3](#).{NSE, NS} is {1, 1}, then:
 - The entry would be required to translate an address using the Realm EL1&0 translation regime.
 - The entry would be used with the current VMID.
- If FEAT_RME is not implemented, one of the following applies:
 - If [SCR_EL3](#).NS is 0, then:
 - The entry would be required to translate an address using the Secure EL1&0 translation regime.
 - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
 - If [SCR_EL3](#).NS is 1, then:
 - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
 - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Inner Shareable

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

There are no configuration notes.

TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Outer Shareable

The TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
 - If [SCR_EL3](#).{NSE, NS} is {0, 0}, then:
 - The entry would be required to translate an address using the Secure EL1&0 translation regime.
 - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
 - If [SCR_EL3](#).{NSE, NS} is {0, 1}, then:
 - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
 - If Non-secure EL2 is implemented, the entry would be used with the current VMID.
 - If [SCR_EL3](#).{NSE, NS} is {1, 1}, then:
 - The entry would be required to translate an address using the Realm EL1&0 translation regime.
 - The entry would be used with the current VMID.
- If FEAT_RME is not implemented, one of the following applies:
 - If [SCR_EL3](#).NS is 0, then:
 - The entry would be required to translate an address using the Secure EL1&0 translation regime.
 - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
 - If [SCR_EL3](#).NS is 1, then:
 - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
 - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if [SCR_EL3](#).EEL2==1, then:

- A PE with [SCR_EL3](#).EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==0.
 - A PE with [SCR_EL3](#).EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with [SCR_EL3](#).EEL2==1.
 - A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.
-

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

TLBI VMALLS12E1IOS, TLBI VMALLS12E1OSNXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Outer Shareable

Both variants perform the same invalidation, but the TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented. Otherwise, direct accesses to TLBI VMALLS12E1IOS, TLBI VMALLS12E1OSNXS are UNDEFINED.

Attributes

TLBI VMALLS12E1IOS, TLBI VMALLS12E1OSNXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing the TLBI VMALLS12E1IOS, TLBI VMALLS12E1OSNXS instruction

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VMALLS12E1IOS{, <Xt>}

TPIDR2_EL0, EL0 Read/Write Software Thread ID Register 2

The TPIDR2_EL0 characteristics are:

Purpose

Provides a location where SME-aware software executing at EL0 can store thread identifying information, for context management purposes.

The PE makes no use of this register.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to TPIDR2_EL0 are UNDEFINED.

Attributes

TPIDR2_EL0 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

TRBBASER_EL1, Trace Buffer Base Address Register

The TRBBASER_EL1 characteristics are:

Purpose

Defines the base address for the trace buffer.

Configuration

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBBASER_EL1 are UNDEFINED.

Attributes

TRBBASER_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | BASE | | | | | | | | | | | | | | | | |
| BASE | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

BASE, bits [63:12]

Trace Buffer Base pointer address. (TRBBASER_EL1.BASE << 12) is the address of the first byte in the trace buffer. Bits [11:0] of the Base pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBBASER_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log₂(smallest implemented translation granule).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing TRBBASER_EL1

The PE might ignore a direct write to TRBBASER_EL1 if [TRBLIMITR_EL1](#).E == 1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBBASER_EL1

| op0 | op1 | CRn | CRm | op2 |

TRBIDR_EL1, Trace Buffer ID Register

The TRBIDR_EL1 characteristics are:

Purpose

Describes constraints on using the Trace Buffer Unit to software, including whether the Trace Buffer Unit can be programmed at the current Exception level.

Configuration

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBIDR_EL1 are UNDEFINED.

Attributes

TRBIDR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|------|----|----|----|-------|----|----|----|----|----|----|----|--|--|--|--|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | | | | |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | EA | | | | RES0 | | F | P | Align | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | | |

Bits [63:12]

Reserved, RES0.

EA, bits [11:8]

From Armv9.3:

External Abort handling. Describes how the PE manages External aborts on writes made by the Trace Buffer Unit to the trace buffer.

| EA | Meaning |
|--------|---|
| 0b0000 | Not described. |
| 0b0001 | The PE ignores External aborts on writes made by the Trace Buffer Unit. |
| 0b0010 | The External abort generates an SError interrupt at the PE. |

All other values are reserved.

From Armv9.3, the value 0b0000 is not permitted.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

Bits [7:6]

Reserved, RES0.

F, bit [5]

Flag updates. Describes how address translations performed by the Trace Buffer Unit manage the Access flag and dirty state.

| F | Meaning |
|-----|--|
| 0b0 | Hardware management of the Access flag and dirty state for accesses made by the Trace Buffer Unit is always disabled for all translation stages. |
| 0b1 | Hardware management of the Access flag and dirty state for accesses made by the Trace Buffer Unit is controlled in the same way as explicit memory accesses in the trace buffer owning translation regime. |

Note

If hardware management of the Access flag is disabled for a stage of translation, an access to a Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor and might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

From Armv9.3, the value 0 is not permitted.

Access to this field is **RO**.

P, bit [4]

Programming not allowed. When read at EL3, this field reads as zero. Otherwise, indicates that the trace buffer is owned by a higher Exception level or another Security state. Defined values are:

| P | Meaning |
|-----|--------------------------|
| 0b0 | Programming is allowed. |
| 0b1 | Programming not allowed. |

The value read from this field depends on the current Exception level and the Effective values of [MDCR_EL3.NSTB](#), [MDCR_EL3.NSTBE](#), and [MDCR_EL2.E2TB](#):

- If EL3 is implemented, and the owning Security state is Secure state, this field reads as one from:
 - Non-secure EL1 and Non-secure EL2.
 - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
 - If Secure EL2 is implemented and enabled, and [MDCR_EL2.E2TB](#) is 0b00, Secure EL1.
- If EL3 is implemented, and the owning Security state is Non-secure state, this field reads as one from:
 - Secure EL1.
 - If Secure EL2 is implemented, Secure EL2.
 - If EL2 is implemented and [MDCR_EL2.E2TB](#) is 0b00, Non-secure EL1.
 - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
- If FEAT_RME is implemented, and the owning Security state is Realm state, this field reads as one from:
 - Non-secure EL1 and Non-secure EL2.
 - Secure EL1 and Secure EL2.
 - If [MDCR_EL2.E2TB](#) is 0b00, Realm EL1.
- If EL3 is not implemented, EL2 is implemented, and [MDCR_EL2.E2TB](#) is 0b00, this field reads as one from EL1.
- Otherwise, this field reads as zero.

Align, bits [3:0]

Defines the minimum alignment constraint for writes to [TRBPTR_EL1](#) and [TRBTRG_EL1](#). Defined values are:

| Align | Meaning |
|--------|-------------|
| 0b0000 | Byte. |
| 0b0001 | Halfword. |
| 0b0010 | Word. |
| 0b0011 | Doubleword. |
| 0b0100 | 16 bytes. |
| 0b0101 | 32 bytes. |
| 0b0110 | 64 bytes. |
| 0b0111 | 128 bytes. |
| 0b1000 | 256 bytes. |
| 0b1001 | 512 bytes. |
| 0b1010 | 1KB. |
| 0b1011 | 2KB. |

All other values are reserved.

Access to this field is **RO**.

Accessing TRBIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBIDR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b1001 | 0b1011 | 0b111 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && (!HaveEL(EL3) || SCR_EL3.FGTEn == '1') && HDFGRTR_EL2.TRBIDR_EL1 == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        return TRBIDR_EL1;
elsif PSTATE.EL == EL2 then
    return TRBIDR_EL1;
elsif PSTATE.EL == EL3 then
    return TRBIDR_EL1;

```

TRBLIMITR_EL1, Trace Buffer Limit Address Register

The TRBLIMITR_EL1 characteristics are:

Purpose

Defines the top address for the trace buffer, and controls the trace buffer modes and enable.

Configuration

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBLIMITR_EL1 are UNDEFINED.

Attributes

TRBLIMITR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|-------|----|----|----|----|----|-----|----|----|----|----|----|----|----|----|----|--|--|--|--|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | | | | |
| | | | | | | | | | | | | | | | | LIMIT | | | | | | | | | | | | | | | | | | | | | |
| LIMIT | | | | | | | | | | | | RES0 | | | | | | | | | | nVM | TM | FM | E | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | | |

LIMIT, bits [63:12]

Trace Buffer Limit pointer address. (TRBLIMITR_EL1.LIMIT << 12) is the address of the last byte in the trace buffer plus one. Bits [11:0] of the Limit pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBLIMITR_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value $\text{Log}_2(\text{smallest implemented translation granule})$.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [11:6]

Reserved, RES0.

nVM, bit [5]

Address mode.

| nVM | Meaning |
|-----|--|
| 0b0 | The trace buffer pointers are virtual addresses. |
| 0b1 | The trace buffer pointers are: <ul style="list-style-type: none"> Physical address in the owning security state if the owning translation regime has no stage 2 translation. Intermediate physical addresses in the owning security state if the owning translation regime has stage 2 translations. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

TM, bits [4:3]

Trigger mode.

| TM | Meaning |
|-----------|---|
| 0b00 | Stop on trigger. Flush then stop collection and raise maintenance interrupt on Trigger Event. |
| 0b01 | IRQ on trigger. Continue collection and raise maintenance interrupt on Trigger Event. |
| 0b11 | Ignore trigger. Continue collection and do not raise maintenance interrupt on Trigger Event. |

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

FM, bits [2:1]

Trace buffer mode.

| FM | Meaning |
|-----------|---|
| 0b00 | Fill mode. Stop collection and raise maintenance interrupt on current write pointer wrap. |
| 0b01 | Wrap mode. Continue collection and raise maintenance interrupt on current write pointer wrap. |
| 0b11 | Circular Buffer mode. Continue collection and do not raise maintenance interrupt on current write pointer wrap. |

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Trace Buffer Unit enable.

| E | Meaning |
|----------|--|
| 0b0 | Trace Buffer Unit disabled. |
| 0b1 | Trace Buffer Unit enabled by this control. |

Regardless of the value of this field, the Trace Buffer Unit is disabled when SelfHostedTraceEnabled() == FALSE. All output is discarded by the Trace Buffer Unit when it is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing TRBLIMITR_EL1

The PE might ignore a direct write to TRBLIMITR_EL1, other than a direct write that modifies TRBLIMITR_EL1.E, if TRBLIMITR_EL1.E == 1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBLIMITR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b11 | 0b000 | 0b1001 | 0b1011 | 0b000 |

TRBMAR_EL1, Trace Buffer Memory Attribute Register

The TRBMAR_EL1 characteristics are:

Purpose

Controls Trace Buffer Unit accesses to memory.

If the trace buffer pointers specify virtual addresses, the address properties are defined by the translation tables and this register is ignored.

Configuration

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBMAR_EL1 are UNDEFINED.

Attributes

TRBMAR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|----|----|----|-----------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:10]

Reserved, RES0.

SH, bits [9:8]

Trace buffer shareability domain. Defines the shareability domain for Normal memory used by the trace buffer.

| SH | Meaning |
|------|------------------|
| 0b00 | Non-shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

All other values are reserved.

This field is ignored when TRBMAR_EL1.Attr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Attr[7:4], bits [7:4]
When TRBMAR_EL1.Attr[3:0] == 0b0000:

Trace buffer memory type and attributes. Defines the memory type and, for Normal memory, the cacheability attributes, for memory addressed by the trace buffer.

| Attr[7:4] | Meaning | Applies when |
|-----------|---|-------------------------------|
| 0b0000 | Device-nGnRnE memory. | |
| 0b0100 | Normal memory, Inner Non-cacheable, Outer Non-cacheable with the XS attribute set to 0. | When FEAT_XS is implemented |
| 0b1010 | Normal memory, Inner Write-through Cacheable, Outer Write-through Cacheable, Non-transient, Read-Allocate with the XS attribute set to 0. | When FEAT_XS is implemented |
| 0b1111 | Tagged Normal memory, Outer Write-Back Non-transient, Read-allocate Write-allocate. | When FEAT_MTE2 is implemented |

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trace buffer memory type and attributes. Defines the memory type and, for Normal memory, the Outer cacheability attributes, for memory addressed by the trace buffer.

| Attr[7:4] | Meaning |
|-----------|---|
| 0b0000 | Device memory. The Device memory type is defined by TRBMAR_EL1.Attr[3:0]. |
| 0b0001 | Normal memory, Outer Write-Through Transient, Write-allocate. |
| 0b0010 | Normal memory, Outer Write-Through Transient, Read-allocate. |
| 0b0011 | Normal memory, Outer Write-Through Transient, Read-allocate Write-allocate. |
| 0b0100 | Normal memory, Outer Non-cacheable. |
| 0b0101 | Normal memory, Outer Write-Back Transient, Write-allocate. |
| 0b0110 | Normal memory, Outer Write-Back Transient, Read-allocate. |
| 0b0111 | Normal memory, Outer Write-Back Transient, Read-allocate Write-allocate. |
| 0b1000 | Normal memory, Outer Write-Through Non-transient, No allocate. |
| 0b1001 | Normal memory, Outer Write-Through Non-transient, Write-allocate. |
| 0b1010 | Normal memory, Outer Write-Through Non-transient, Read-allocate. |
| 0b1011 | Normal memory, Outer Write-Through Non-transient, Read-allocate Write-allocate. |
| 0b1100 | Normal memory, Outer Write-Back Non-transient, No allocate. |
| 0b1101 | Normal memory, Outer Write-Back Non-transient, Write-allocate. |
| 0b1110 | Normal memory, Outer Write-Back Non-transient, Read-allocate. |
| 0b1111 | Normal memory, Outer Write-Back Non-transient, Read-allocate Write-allocate. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Attr[3:0], bits [3:0]**When TRBMAR_EL1.Attr[7:4] == 0b0000:**

Trace buffer memory attributes. Defines the Device memory attributes for memory addressed by the trace buffer.

| Attr[3:0] | Meaning | Applies when |
|-----------|--|-----------------------------|
| 0b0000 | Device-nGnRnE memory. | |
| 0b0100 | Device-nGnRE memory. | |
| 0b1000 | Device-nGRE memory. | |
| 0b1100 | Device-GRE memory. | |
| 0b0001 | Device-nGnRnE memory with the XS attribute set to 0. | When FEAT_XS is implemented |
| 0b0101 | Device-nGnRE memory with the XS attribute set to 0. | When FEAT_XS is implemented |
| 0b1001 | Device-nGRE memory with the XS attribute set to 0. | When FEAT_XS is implemented |
| 0b1101 | Device-GRE memory with the XS attribute set to 0. | When FEAT_XS is implemented |

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trace buffer memory attributes. Defines the Inner cacheability attributes for memory addressed by the trace buffer.

| Attr[3:0] | Meaning | Applies when |
|-----------|---|--|
| 0b0000 | The memory type is defined by TRBMAR_EL1.Attr[7:4]. | When FEAT_MTE is implemented or FEAT_XS is implemented |
| 0b0001 | Normal memory, Inner Write-Through Transient, Write-allocate. | |
| 0b0010 | Normal memory, Inner Write-Through Transient, Read-allocate. | |
| 0b0011 | Normal memory, Inner Write-Through Transient, Read-allocate Write-allocate. | |
| 0b0100 | Normal memory, Inner Non-cacheable. | |
| 0b0101 | Normal memory, Inner Write-Back Transient, Write-allocate. | |
| 0b0110 | Normal memory, Inner Write-Back Transient, Read-allocate. | |
| 0b0111 | Normal memory, Inner Write-Back Transient, Read-allocate Write-allocate. | |
| 0b1000 | Normal memory, Inner Write-Through Non-transient, No allocate. | |
| 0b1001 | Normal memory, Inner Write-Through Non-transient, Write-allocate. | |
| 0b1010 | Normal memory, Inner Write-Through Non-transient, Read-allocate. | |
| 0b1011 | Normal memory, Inner Write-Through Non-transient, Read-allocate Write-allocate. | |
| 0b1100 | Normal memory, Inner Write-Back Non-transient, No allocate. | |
| 0b1101 | Normal memory, Inner Write-Back Non-transient, Write-allocate. | |
| 0b1110 | Normal memory, Inner Write-Back Non-transient, Read-allocate. | |
| 0b1111 | Normal memory, Inner Write-Back Non-transient, Read-allocate Write-allocate. | |

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBMAR_EL1

| | | | | | | | | | | | | | | | | PTR | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | PTR | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

PTR, bits [63:0]

Trace Buffer current write pointer address.

Defines the virtual address of the next entry to be written to the trace buffer.

The architecture places restrictions on the values that software can write to the pointer.

Note

As a result of the restrictions an implementation might treat some of PTR[M:0] as RES0, where M is defined by [TRBIDR_EL1](#).Align.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBPTR_EL1

The PE might ignore a direct write to TRBPTR_EL1 if [TRBLIMITR_EL1](#).E == 1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBPTR_EL1

| op0 | op1 | CRn | CRm | op2 |

TRBSR_EL1, Trace Buffer Status/syndrome Register

The TRBSR_EL1 characteristics are:

Purpose

Provides syndrome information to software for a trace buffer management event.

Configuration

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBSR_EL1 are UNDEFINED.

Attributes

TRBSR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|------|----|----|----|-----|-----|------|------|----|----|------|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| EC | | | | | | RES0 | | | | IRQ | TRG | WRAP | RES0 | EA | S | RES0 | MSS | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

EC, bits [31:26]

Event class. Top-level description of the cause of the trace buffer management event.

| EC | Meaning | MSS | Applies when |
|----------|--|--|------------------------------|
| 0b000000 | Other trace buffer management event. All trace buffer management events other than those described by the other defined Event class codes. | MSS encoding for other trace buffer management events | |
| 0b011110 | Granule Protection Check fault, other than GPF, on write to trace buffer. | MSS encoding for Granule Protection Check fault | When FEAT_RME is implemented |
| 0b011111 | Buffer management event for IMPLEMENTATION DEFINED reason. | MSS encoding for Buffer management event for IMPLEMENTATION DEFINED reason | |
| 0b100100 | Stage 1 Data Abort on write to trace buffer. | MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer | |
| 0b100101 | Stage 2 Data Abort on write to trace buffer. | MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer | |

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [25:23]

Reserved, RES0.

IRQ, bit [22]

Maintenance interrupt status.

| IRQ | Meaning |
|-----|--|
| 0b0 | Maintenance interrupt is not asserted. |
| 0b1 | Maintenance interrupt is asserted. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

TRG, bit [21]

Triggered.

| TRG | Meaning |
|-----|--|
| 0b0 | No Detected Trigger has been observed since this field was last cleared to zero. |
| 0b1 | A Detected Trigger has been observed since this field was last cleared to zero. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

WRAP, bit [20]

Wrapped.

| WRAP | Meaning |
|-------------|--|
| 0b0 | The current write pointer has not wrapped since this field was last cleared to zero. |
| 0b1 | The current write pointer has wrapped since this field was last cleared to zero. |

For each byte of trace the Trace Buffer Unit Accepts and writes to the trace buffer at the address in the current write pointer, if the current write pointer is equal to the Limit pointer minus one, the current write pointer is wrapped by setting it to the Base pointer, and this field is set to 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

EA, bit [18]

External Abort.

| EA | Meaning |
|-----------|--|
| 0b0 | An External Abort has not been asserted. |
| 0b1 | An External Abort has been asserted and detected by the Trace Buffer Unit. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When the PE never sets this field as the result of an External Abort, access to this field is **RES0**.
- Otherwise, access to this field is **RW**.

S, bit [17]

Stopped.

| S | Meaning |
|----------|----------------------------------|
| 0b0 | Collection has not been stopped. |
| 0b1 | Collection is stopped. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [16]

Reserved, RES0.

MSS, bits [15:0]

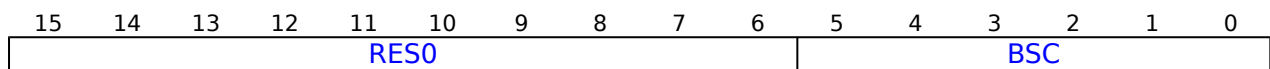

Management Event Specific Syndrome. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for other trace buffer management events

Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Trace buffer status code.

| BSC | Meaning |
|----------|---|
| 0b000000 | Collection not stopped. |
| 0b000001 | Trace buffer filled. Collection stopped because the current write pointer wrapped to the base pointer and the trace buffer mode is Fill mode. |
| 0b000010 | Trigger Event. Collection stopped because of a Trigger Event. See TRBTRG_EL1 for more information. |

All other values are reserved.

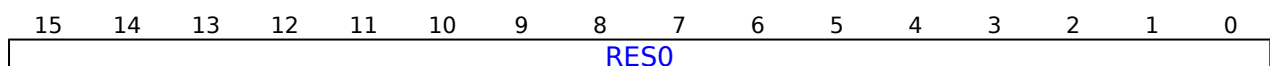

MSS encoding for Buffer management event for IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

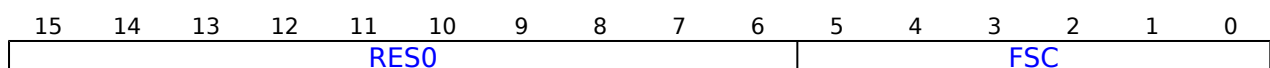

MSS encoding for Granule Protection Check fault

Bits [15:0]

Reserved, RES0.

MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer

Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code.

| FSC | Meaning | Applies when |
|------------|---|--|
| 0b000000 | Address size fault, level 0 of translation or translation table base register. | |
| 0b000001 | Address size fault, level 1. | |
| 0b000010 | Address size fault, level 2. | |
| 0b000011 | Address size fault, level 3. | |
| 0b000100 | Translation fault, level 0. | |
| 0b000101 | Translation fault, level 1. | |
| 0b000110 | Translation fault, level 2. | |
| 0b000111 | Translation fault, level 3. | |
| 0b001001 | Access flag fault, level 1. | |
| 0b001010 | Access flag fault, level 2. | |
| 0b001011 | Access flag fault, level 3. | |
| 0b001000 | Access flag fault, level 0. | When FEAT_LPA2 is implemented |
| 0b001100 | Permission fault, level 0. | When FEAT_LPA2 is implemented |
| 0b001101 | Permission fault, level 1. | |
| 0b001110 | Permission fault, level 2. | |
| 0b001111 | Permission fault, level 3. | |
| 0b010000 | Synchronous External abort, not on translation table walk or hardware update of translation table. | |
| 0b010001 | Asynchronous External abort. | |
| 0b010011 | Synchronous External abort on translation table walk or hardware update of translation table, level -1. | When FEAT_LPA2 is implemented |
| 0b010100 | Synchronous External abort on translation table walk or hardware update of translation table, level 0. | |
| 0b010101 | Synchronous External abort on translation table walk or hardware update of translation table, level 1. | |
| 0b010110 | Synchronous External abort on translation table walk or hardware update of translation table, level 2. | |
| 0b010111 | Synchronous External abort on translation table walk or hardware update of translation table, level 3. | |
| 0b011011 | Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1. | When FEAT_LPA2 is implemented and FEAT_RAS is not implemented |
| 0b100001 | Alignment fault. | |
| 0b100011 | Granule Protection Fault on translation table walk or hardware update of translation table, level -1. | When FEAT_RME is implemented and FEAT_LPA2 is implemented |
| 0b100100 | Granule Protection Fault on translation table walk or hardware update of translation table, level 0. | When FEAT_RME is implemented |
| 0b100101 | Granule Protection Fault on translation table walk or hardware update of translation table, level 1. | When FEAT_RME is implemented |

| | | |
|----------|--|---------------------------------|
| 0b100110 | Granule Protection Fault on translation table walk or hardware update of translation table, level 2. | When FEAT_RME is implemented |
| 0b100111 | Granule Protection Fault on translation table walk or hardware update of translation table, level 3. | When FEAT_RME is implemented |
| 0b101000 | Granule Protection Fault, not on translation table walk or hardware update of translation table. | When FEAT_RME is implemented |
| 0b101001 | Address size fault, level -1. | When FEAT_LPA2 is implemented |
| 0b101011 | Translation fault, level -1. | When FEAT_LPA2 is implemented |
| 0b110000 | TLB conflict abort. | When FEAT_HAFDBS is implemented |
| 0b110001 | Unsupported atomic hardware update fault. | |

All other values are reserved.

Accessing TRBSR_EL1

The PE might ignore a direct write to TRBSR_EL1 if [TRBLIMITR_EL1.E](#) == 1.

Accesses to this register use the following encodings in the System register encoding space:

TRBTRG_EL1, Trace Buffer Trigger Counter Register

The TRBTRG_EL1 characteristics are:

Purpose

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

Configuration

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBTRG_EL1 are UNDEFINED.

Attributes

TRBTRG_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:32]

Reserved, RES0.

TRG, bits [31:0]

Trigger count.

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

TRBTRG_EL1 decrements by 1 for every byte of trace written to the trace buffer when all of the following are true:

- TRBTRG_EL1 is nonzero.
- [TRBSR_EL1](#).TRG is 1.

The architecture places restrictions on the values that software can write to the counter.

Note

As a result of the restrictions an implementation might treat some of TRG[M:0] as RES0, where M is defined by [TRBIDR_EL1](#).Align.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBTRG_EL1

The PE might ignore a direct write to TRBTRG_EL1 if [TRBLIMITR_EL1](#).E == 1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBTRG_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|

TRCACATR<n>, Address Comparator Access Type Register <n>, n = 0 - 15

The TRCACATR<n> characteristics are:

Purpose

Defines the type of access for the corresponding [TRCACVR<n>](#) Register. This register configures the context type, Exception levels, alignment, masking that is applied by the Address Comparator, and how the Address Comparator behaves when it is one half of an Address Range Comparator.

Configuration

AArch64 System register TRCACATR<n> bits [63:0] are architecturally mapped to External register [TRCACATR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS * 2 > n. Otherwise, direct accesses to TRCACATR<n> are UNDEFINED.

Attributes

TRCACATR<n> is a 64-bit register.

EXLEVEL_RL_EL2, bit [18]

When TRCIDR6.EXLEVEL_RL_EL2 == 1:

Realm EL2 address comparison control. Controls whether a comparison can occur at EL2 in Realm state.

| EXLEVEL_RL_EL2 | Meaning |
|----------------|--|
| 0b0 | When TRCACATR<n>.EXLEVEL_NS_EL2 is 0 the Address Comparator performs comparisons in Realm EL2. When TRCACATR<n>.EXLEVEL_NS_EL2 is 1 the Address Comparator does not perform comparisons in Realm EL2. |
| 0b1 | When TRCACATR<n>.EXLEVEL_NS_EL2 is 0 the Address Comparator does not perform comparisons in Realm EL2. When TRCACATR<n>.EXLEVEL_NS_EL2 is 1 the Address Comparator performs comparisons in Realm EL2. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [17]**When TRCIDR6.EXLEVEL_RL_EL1 == 1:**

Realm EL1 address comparison control. Controls whether a comparison can occur at EL1 in Realm state.

| EXLEVEL_RL_EL1 | Meaning |
|----------------|--|
| 0b0 | When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator performs comparisons in Realm EL1. When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator does not perform comparisons in Realm EL1. |
| 0b1 | When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator does not perform comparisons in Realm EL1. When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator performs comparisons in Realm EL1. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [16]**When TRCIDR6.EXLEVEL_RL_EL0 == 1:**

Realm EL0 address comparison control. Controls whether a comparison can occur at EL0 in Realm state.

| EXLEVEL_RL_EL0 | Meaning |
|----------------|--|
| 0b0 | When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator performs comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator does not perform comparisons in Realm EL0. |
| 0b1 | When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator does not perform comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator performs comparisons in Realm EL0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [14]**When Non-secure EL2 is implemented:**

Non-secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Non-secure state.

| EXLEVEL_NS_EL2 | Meaning |
|----------------|--|
| 0b0 | The Address Comparator performs comparisons in Non-secure EL2. |
| 0b1 | The Address Comparator does not perform comparisons in Non-secure EL2. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [13]**When Non-secure EL1 is implemented:**

Non-secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Non-secure state.

| EXLEVEL_NS_EL1 | Meaning |
|----------------|--|
| 0b0 | The Address Comparator performs comparisons in Non-secure EL1. |
| 0b1 | The Address Comparator does not perform comparisons in Non-secure EL1. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [12]**When Non-secure EL0 is implemented:**

Non-secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Non-secure state.

| EXLEVEL_NS_EL0 | Meaning |
|----------------|--|
| 0b0 | The Address Comparator performs comparisons in Non-secure EL0. |
| 0b1 | The Address Comparator does not perform comparisons in Non-secure EL0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [11]**When EL3 is implemented:**

EL3 address comparison control. Controls whether a comparison can occur at EL3.

| EXLEVEL_S_EL3 | Meaning |
|----------------------|---|
| 0b0 | The Address Comparator performs comparisons in EL3. |
| 0b1 | The Address Comparator does not perform comparisons in EL3. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [10]**When EL2 is implemented and FEAT_SEL2 is implemented:**

Secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Secure state.

| EXLEVEL_S_EL2 | Meaning |
|----------------------|--|
| 0b0 | The Address Comparator performs comparisons in Secure EL2. |
| 0b1 | The Address Comparator does not perform comparisons in Secure EL2. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [9]**When Secure EL1 is implemented:**

Secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Secure state.

| EXLEVEL_S_EL1 | Meaning |
|----------------------|--|
| 0b0 | The Address Comparator performs comparisons in Secure EL1. |
| 0b1 | The Address Comparator does not perform comparisons in Secure EL1. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [8]**When Secure EL0 is implemented:**

Secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Secure state.

| EXLEVEL S EL0 | Meaning |
|---------------|--|
| 0b0 | The Address Comparator performs comparisons in Secure EL0. |
| 0b1 | The Address Comparator does not perform comparisons in Secure EL0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

CONTEXT, bits [6:4]

When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:

Selects a Context Identifier Comparator or Virtual Context Identifier Comparator:

| CONTEXT | Meaning | Applies when |
|---------|---------------|--|
| 0b000 | Comparator 0. | |
| 0b001 | Comparator 1. | When TRCIDR4.NUMCIDC > 0b0001 or TRCIDR4.NUMVMIDC > 0b0001 |
| 0b010 | Comparator 2. | When TRCIDR4.NUMCIDC > 0b0010 or TRCIDR4.NUMVMIDC > 0b0010 |
| 0b011 | Comparator 3. | When TRCIDR4.NUMCIDC > 0b0011 or TRCIDR4.NUMVMIDC > 0b0011 |
| 0b100 | Comparator 4. | When TRCIDR4.NUMCIDC > 0b0100 or TRCIDR4.NUMVMIDC > 0b0100 |
| 0b101 | Comparator 5. | When TRCIDR4.NUMCIDC > 0b0101 or TRCIDR4.NUMVMIDC > 0b0101 |
| 0b110 | Comparator 6. | When TRCIDR4.NUMCIDC > 0b0110 or TRCIDR4.NUMVMIDC > 0b0110 |
| 0b111 | Comparator 7. | When TRCIDR4.NUMCIDC > 0b0111 or TRCIDR4.NUMVMIDC > 0b0111 |

The width of this field is dependent on the maximum number of Context Identifier Comparators or Virtual Context Identifier Comparators implemented. Unimplemented bits are RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CONTEXTTYPE, bits [3:2]

When TRCIDR4.NUMCIDC != 0b0000 or TRCIDR4.NUMVMIDC != 0b0000:

Controls whether the Address Comparator is dependent on a Context Identifier Comparator, a Virtual Context Identifier Comparator, or both comparisons.

| CONTEXTTYPE | Meaning | Applies when |
|-------------|---|---|
| 0b00 | The Address Comparator is not dependent on the Context Identifier Comparators or Virtual Context Identifier Comparators. | |
| 0b01 | The Address Comparator is dependent on the Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Context Identifier Comparator and the address comparison match. | When TRCIDR4.NUMCIDC != 0b0000 |
| 0b10 | The Address Comparator is dependent on the Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Virtual Context Identifier Comparator and the address comparison match. | When TRCIDR4.NUMVMIDC != 0b0000 |
| 0b11 | The Address Comparator is dependent on the Context Identifier Comparator and Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if the Context Identifier Comparator, the Virtual Context Identifier Comparator, and address comparison all match. | When TRCIDR4.NUMCIDC != 0b0000 and TRCIDR4.NUMVMIDC != 0b0000 |

If [TRCIDR4.NUMCIDC](#) == 0b0000, then bit [2] is RES0.

If [TRCIDR4.NUMVMIDC](#) == 0b0000, then bit [3] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [1:0]

Reserved, RES0.

Accessing TRCACATR<n>

Must be programmed if any of the following are true:

- [TRCBBCTLR](#).RANGE[n/2] == 1.
- [TRCRSCTLR<a>](#).GROUP == 0b0100 and [TRCRSCTLR<a>](#).SAC[n] == 1.
- [TRCRSCTLR<a>](#).GROUP == 0b0101 and [TRCRSCTLR<a>](#).ARC[n/2] == 1.
- [TRCVIIECTLR](#).EXCLUDE[n/2] == 1.
- [TRCVIIECTLR](#).INCLUDE[n/2] == 1.
- [TRCVISSCTLR](#).START[n] == 1.
- [TRCVISSCTLR](#).STOP[n] == 1.
- TRCSSCCR<>.ARC[n/2] == 1.
- TRCSSCCR<>.SAC[n] == 1.
- [TRCQCTLR](#).RANGE[n/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCACATR<n>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|------------|-----------|
| 0b10 | 0b001 | 0b0010 | n[2:0]:0b0 | 0b01:n[3] |

```

TRCACVR<n>, Address Comparator Value Register <n>, n = 0 - 15

The TRCACVR<n> characteristics are:

Purpose

Contains the address value.

Configuration

AArch64 System register TRCACVR<n> bits [63:0] are architecturally mapped to External register [TRCACVR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS * 2 > n. Otherwise, direct accesses to TRCACVR<n> are UNDEFINED.

Attributes

TRCACVR<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

ADDRESS, bits [63:0]

Address Value.

The Address Comparators can support implementations that use multiple address widths. When the trace unit compares the ADDRESS field with an address that has a width less than this field, then the address must be zero-extended to the ADDRESS field width. The trace unit then compares all implemented bits. For example, in a system that supports both 32-bit and 64-bit addresses, when the PE is in AArch32 state the comparator must zero-extend the 32-bit address and compare against the full 64 bits that are stored in the TRCACVR<n>. This requires that the trace analyzer always programs all implemented bits of the TRCACVR<n>.

The result of writing a value other than all zeros or all ones to ADDRESS at bits[63:P] is an UNKNOWN value, where P is defined as the maximum virtual address size supported by the PE.

The result of writing a value of all zeros or all ones to ADDRESS at bits[63:P] is the written value, and a read of the register returns the written value.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCACVR<n>

Must be programmed if any of the following are true:

- [TRCBBCTLR](#).RANGE[n/2] == 1.
- [TRCRSCTLR<a>](#).GROUP == 0b0100 and [TRCRSCTLR<a>](#).SAC[n] == 1.
- [TRCRSCTLR<a>](#).GROUP == 0b0101 and [TRCRSCTLR<a>](#).ARC[n/2] == 1.
- [TRCVIIETLR](#).EXCLUDE[n/2] == 1.
- [TRCVIIETLR](#).INCLUDE[n/2] == 1.

- [TRCVISSCTLR](#).START[n] == 1.
- [TRCVISSCTLR](#).STOP[n] == 1.
- TRCSSCCR<>.ARC[n/2] == 1.
- TRCSSCCR<>.SAC[n] == 1.
- [TRCQCTL](#)R.RANGE[n/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCACVR<n>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|------------|-----------|

TRCAUTHSTATUS, Authentication Status Register

The TRCAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

For additional information, see the CoreSight Architecture Specification.

Configuration

AArch64 System register TRCAUTHSTATUS bits [31:0] are architecturally mapped to External register [TRCAUTHSTATUS\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCAUTHSTATUS are UNDEFINED.

Attributes

TRCAUTHSTATUS is a 64-bit register.

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTNID.

RTID, bits [25:24]

Root invasive debug.

| RTID | Meaning |
|------|------------------|
| 0b00 | Not implemented. |

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLNID.

RLID, bits [13:12]

Realm invasive debug.

| RLID | Meaning |
|------|------------------|
| 0b00 | Not implemented. |

HNID, bits [11:10]

Hyp Non-invasive Debug. Indicates whether a separate enable control for EL2 non-invasive debug features is implemented and enabled.

| HNID | Meaning |
|------|---|
| 0b00 | Separate Hyp non-invasive debug enable not implemented, or EL2 non-invasive debug features not implemented. |
| 0b10 | Implemented and disabled. |
| 0b11 | Implemented and enabled. |

All other values are reserved.

This field reads as 0b00.

HID, bits [9:8]

Hyp Invasive Debug. Indicates whether a separate enable control for EL2 invasive debug features is implemented and enabled.

| HID | Meaning |
|------|---|
| 0b00 | Separate Hyp invasive debug enable not implemented, or EL2 invasive debug features not implemented. |
| 0b10 | Implemented and disabled. |
| 0b11 | Implemented and enabled. |

All other values are reserved.

This field reads as 0b00.

SNID, bits [7:6]

Secure Non-invasive Debug. Indicates whether Secure non-invasive debug features are implemented and enabled.

| SNID | Meaning |
|------|---|
| 0b00 | Secure non-invasive debug features not implemented. |
| 0b10 | Implemented and disabled. |
| 0b11 | Implemented and enabled. |

All other values are reserved.

When EL3 is implemented, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b00.

When EL3 is not implemented and the PE is Secure, this field takes the value 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

SID, bits [5:4]

Secure Invasive Debug. Indicates whether Secure invasive debug features are implemented and enabled.

| SID | Meaning |
|------|---|
| 0b00 | Secure invasive debug features not implemented. |
| 0b10 | Implemented and disabled. |
| 0b11 | Implemented and enabled. |

All other values are reserved.

This field reads as 0b00.

NSNID, bits [3:2]

Non-secure Non-invasive Debug. Indicates whether Non-secure non-invasive debug features are implemented and enabled.

| NSNID | Meaning |
|-------|---|
| 0b00 | Non-secure non-invasive debug features not implemented. |
| 0b10 | Implemented and disabled. |
| 0b11 | Implemented and enabled. |

All other values are reserved.

When EL3 is implemented, this field reads as 0b11.

When EL3 is not implemented and the PE is Non-secure, this field reads as 0b11.

When EL3 is not implemented and the PE is Secure, this field reads as 0b00.

NSID, bits [1:0]

Non-secure Invasive Debug. Indicates whether Non-secure invasive debug features are implemented and enabled.

| NSID | Meaning |
|------|---|
| 0b00 | Non-secure invasive debug features not implemented. |
| 0b10 | Implemented and disabled. |
| 0b11 | Implemented and enabled. |

All other values are reserved.

This field reads as 0b00.

Accessing TRCAUTHSTATUS

For implementations that support multiple access mechanisms, different access mechanisms can return different values for reads of TRCAUTHSTATUS if the authentication signals have changed and that change has not yet been synchronized by a Context synchronization event. This scenario can happen if, for example, the external debugger view is implemented separately from the system instruction view to allow for separate power domains, and so observes changes on the signals differently.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCAUTHSTATUS

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0111 | 0b1110 | 0b110 |

```

if PSTATE.EL == EL0 then

Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Accessing TRCAUXCTLR

If this register is nonzero then it might cause the behavior of a trace unit to contradict this architecture specification. See the documentation of the specific implementation for information about the IMPLEMENTATION DEFINED support for this register.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCAUXCTLR

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b0110 | 0b000 |

TRCBBCTLR, Branch Broadcast Control Register

The TRCBBCTLR characteristics are:

Purpose

Controls the regions in the memory map where branch broadcasting is active.

Configuration

AArch64 System register TRCBBCTLR bits [31:0] are architecturally mapped to External register [TRCBBCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, TRCIDR0.TRCBB == 1 and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCBBCTLR are UNDEFINED.

Attributes

TRCBBCTLR is a 64-bit register.

Field descriptions

| | | | | | | | | | | |
|--|----|----|----|------|----------|----------|----------|----------|----------|----------|
| 6362616059585756555453525150494847464544434241 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | | | |
| RES0 | | | | | | | | | | |
| RES0 | | | | MODE | RANGE[7] | RANGE[6] | RANGE[5] | RANGE[4] | RANGE[3] | RANGE[2] |
| 31302928272625242322212019181716151413121110 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | | |

Bits [63:9]

Reserved, RES0.

MODE, bit [8]

Mode.

| MODE | Meaning |
|------|---|
| 0b0 | Exclude Mode. Branch broadcasting is not active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then branch broadcasting is active for all instructions. |
| 0b1 | Include Mode. Branch broadcasting is active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then the behavior of the trace unit is CONSTRAINED UNPREDICTABLE. That is, the trace unit might or might not consider any instructions to be in a branch broadcasting region. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Address range field.

Selects whether Address Range Comparator <m> is used with branch broadcasting.

| RANGE[<m>] | Meaning |
|------------|---|
| 0b0 | The address range that Address Range Comparator <m> defines, is not selected. |
| 0b1 | The address range that Address Range Comparator <m> defines, is selected. |

This bit is RES0 if $m \geq \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCBBCTLR

Must be programmed if `TRCCONFIGR.BB == 1`.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCBBCTLR

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b1111 | 0b000 |

Bits [63:12]

Reserved, RES0.

THRESHOLD, bits [11:0]

Sets the threshold value for instruction trace cycle counting.

The minimum threshold value that can be programmed into THRESHOLD is given in [TRCIDR3.CCITMIN](#). If the THRESHOLD value is smaller than the value in [TRCIDR3.CCITMIN](#) then the behavior is CONSTRAINED UNPREDICTABLE. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

Writing a value of zero when [TRCCONFIGR.CCI](#) enables instruction trace cycle counting results in CONSTRAINED UNPREDICTABLE behavior. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCCCTLR

Must be programmed if [TRCCONFIGR.CCI](#) == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCCCTLR

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b1110 | 0b000 |

```

Bits [63:32]

COMP3[<m>], bit [m+24], for m = 7 to 0
When TRCIDR4.NUMCIDC > 3:

This bit is RES0 if $m \geq \text{TRCIDR2.CIDSIZE}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0**When TRCIDR4.NUMCIDC > 2:**

TRCCIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR2. Each bit in this field corresponds to a byte in TRCCIDCVR2.

| COMP2[<m>] | Meaning |
|------------|---|
| 0b0 | The trace unit includes TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison. |
| 0b1 | The trace unit ignores TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0**When TRCIDR4.NUMCIDC > 1:**

TRCCIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR1. Each bit in this field corresponds to a byte in TRCCIDCVR1.

| COMP1[<m>] | Meaning |
|------------|---|
| 0b0 | The trace unit includes TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison. |
| 0b1 | The trace unit ignores TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0**When TRCIDR4.NUMCIDC > 0:**

TRCCIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR0. Each bit in this field corresponds to a byte in TRCCIDCVR0.

| COMP0[<m>] | Meaning |
|------------|---|
| 0b0 | The trace unit includes TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison. |
| 0b1 | The trace unit ignores TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTLR0

If software uses the [TRCCIDCVR<n>](#) registers, for n = 0 to 3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCCIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCCIDCVR<n>](#) is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCIDCCTLR0

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0011 | 0b0000 | 0b010 |

COMP6[<m>], bit [m+16], for m = 7 to 0**When TRCIDR4.NUMCIDC > 6:**

TRCCIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR6. Each bit in this field corresponds to a byte in TRCCIDCVR6.

| COMP6[<m>] | Meaning |
|------------|---|
| 0b0 | The trace unit includes TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison. |
| 0b1 | The trace unit ignores TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0**When TRCIDR4.NUMCIDC > 5:**

TRCCIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR5. Each bit in this field corresponds to a byte in TRCCIDCVR5.

| COMP5[<m>] | Meaning |
|------------|---|
| 0b0 | The trace unit includes TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison. |
| 0b1 | The trace unit ignores TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0**When TRCIDR4.NUMCIDC > 4:**

TRCCIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR4. Each bit in this field corresponds to a byte in TRCCIDCVR4.

| COMP4[<m>] | Meaning |
|------------|---|
| 0b0 | The trace unit includes TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison. |
| 0b1 | The trace unit ignores TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.CIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTLR1

If software uses the [TRCCIDCVR<n>](#) registers, for n = 4 to 7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCCIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCCIDCVR<n>](#) is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCVR<n>, Context Identifier Comparator Value Registers <n>, n = 0 - 7

The TRCCIDCVR<n> characteristics are:

Purpose

Contains a Context identifier value.

Configuration

AArch64 System register TRCCIDCVR<n> bits [63:0] are architecturally mapped to External register [TRCCIDCVR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMCIDC > n. Otherwise, direct accesses to TRCCIDCVR<n> are UNDEFINED.

Attributes

TRCCIDCVR<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | VALUE | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | VALUE | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

VALUE, bits [63:0]

Context identifier value. The width of this field is indicated by [TRCIDR2.CIDSIZE](#). Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Context identifier is zero until the PE updates the Context identifier.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCIDCVR<n>

Must be programmed if any of the following are true:

- [TRCRSCTLR<a>.GROUP](#) == 0b0110 and [TRCRSCTLR<a>.CID\[n\]](#) == 1.
- [TRCACATR<a>.CONTEXTTYPE](#) == 0b01 or 0b11 and [TRCACATR<a>.CONTEXT](#) == n.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCIDCVR<n>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|------------|-------|
| 0b10 | 0b001 | 0b0011 | n[2:0]:0b0 | 0b000 |

TRCCLAIMCLR, Claim Tag Clear Register

The TRCCLAIMCLR characteristics are:

Purpose

In conjunction with [TRCCLAIMSET](#), provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

AArch64 System register TRCCLAIMCLR bits [31:0] are architecturally mapped to External register [TRCCLAIMCLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCLAIMCLR are UNDEFINED.

Attributes

TRCCLAIMCLR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | |
|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 |
| CLR[31] | CLR[30] | CLR[29] | CLR[28] | CLR[27] | CLR[26] | CLR[25] | CLR[24] | CLR[23] | CLR[22] | CLR[21] | CLR[20] | CLR[19] | CLR[18] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 |

Bits [63:32]

Reserved, RES0.

CLR[<m>], bit [m], for m = 31 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

| CLR[<m>] | Meaning |
|----------|---|
| 0b0 | On a read: Claim Tag bit <m> is not set. On a write: Ignored. |
| 0b1 | On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0. |

The number of Claim Tag bits implemented is indicated in [TRCCLAIMSET](#).

This bit reads-as-zero and ignores writes if m > the number of Claim Tag bits.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Access to this field is **W1C**.

TRCCLAIMSET, Claim Tag Set Register

The TRCLAIMSET characteristics are:

Purpose

In conjunction with [TRCCLAIMCLR](#), provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

AArch64 System register TRCCLAIMSET bits [31:0] are architecturally mapped to External register [TRCCLAIMSET\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCLAIMSET are UNDEFINED.

The number of claim tag bits implemented is IMPLEMENTATION DEFINED. Arm recommends that implementations support a minimum of four claim tag bits, that is, SET[3:0] reads as 0b1111.

Attributes

TRCLAIMSET is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | |
|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 |

Bits [63:18]

Reserved, RES0.

CNTCHAIN, bit [17]

For TRCCNTCTLR3 and TRCCNTCTLR1, this field controls whether the Counter decrements when a reload event occurs for Counter <n-1>.

| CNTCHAIN | Meaning |
|----------|--|
| 0b0 | The Counter does not decrement when a reload event for Counter <n-1> occurs. |
| 0b1 | Counter <n> decrements when a reload event for Counter <n-1> occurs. This concatenates Counter <n> and Counter <n-1>, to provide a larger count value. |

CNTCHAIN is not implemented for TRCCNTCTLR0 and TRCCNTCTLR2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDSELF, bit [16]

Controls whether a reload event occurs for the Counter, when the Counter reaches zero.

| RLDSELF | Meaning |
|----------------|--|
| 0b0 | Normal mode. The Counter is in Normal mode. |
| 0b1 | Self-reload mode. The Counter is in Self-reload mode. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDEVENT_TYPE, bit [15]

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes a reload event for Counter <n>.

| RLDEVENT_TYPE | Meaning |
|----------------------|---|
| 0b0 | A single Resource Selector. TRCCNTCTLR<n>.RLDEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.RLDEVENT.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

RLDEVENT_SEL, bits [12:8]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.TYPE controls whether TRCCNTCTLR<n>.RLDEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes a reload event for Counter <n>.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

CNTEVENT_TYPE, bit [7]

Chooses the type of Resource Selector.

Selects an event, that when it occurs causes Counter <n> to decrement.

| CNTEVENT_TYPE | Meaning |
|---------------|---|
| 0b0 | A single Resource Selector. TRCCNTCTLR<n>.CNTEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.CNTEVENT.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

CNTEVENT_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.TYPE controls whether TRCCNTCTLR<n>.CNTEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Selects an event, that when it occurs causes Counter <n> to decrement.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTCTLR<n>

Must be programmed if [TRCRSCTLR<a>.GROUP == 0b0010](#) and [TRCRSCTLR<a>.COUNTERS\[n\] == 1](#).

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCNTCTLR<n>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|-------------|-------|
| 0b10 | 0b001 | 0b0000 | 0b01:n[1:0] | 0b101 |

TRCCNTRLDVR<n>, Counter Reload Value Register <n>, n = 0 - 3

The TRCCNTRLDVR<n> characteristics are:

Purpose

This sets or returns the reload count value for Counter <n>.

Configuration

AArch64 System register TRCCNTRLDVR<n> bits [31:0] are architecturally mapped to External register [TRCCNTRLDVR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMCNTR > n. Otherwise, direct accesses to TRCCNTRLDVR<n> are UNDEFINED.

Attributes

TRCCNTRLDVR<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:16]

Reserved, RES0.

VALUE, bits [15:0]

Contains the reload value for Counter <n>. When a reload event occurs for Counter <n> then the trace unit copies the VALUE<n> field into Counter <n>.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTRLDVR<n>

Must be programmed if [TRCRSCTLR<a>](#).GROUP == 0b0010 and [TRCRSCTLR<a>](#).COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

TRCCONFIGR, Trace Configuration Register

The TRCCONFIGR characteristics are:

Purpose

Controls the tracing options.

Configuration

AArch64 System register TRCCONFIGR bits [31:0] are architecturally mapped to External register [TRCCONFIGR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCCONFIGR are UNDEFINED.

Attributes

TRCCONFIGR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| RES0 | | | | | | | | | | | | | | | | VMIDOPT | QE | RSTS | RES0 | | | VMID | CID | RES0 | CCI | BB | RES0 | RES1 | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:16]

Reserved, RES0.

VMIDOPT, bit [15]

When TRCIDR2.VMIDOPT == 0b01:

Virtual context identifier selection control.

| VMIDOPT | Meaning |
|---------|---|
| 0b0 | VTTBR_EL2 .VMID is used as the Virtual context identifier. |
| 0b1 | CONTEXTIDR_EL2 .PROCID is used as the Virtual context identifier. |

When TRCIDR2.VMIDOPT == 0b00:

Reserved, RES0.

Virtual context identifier selection control.

[VTTBR_EL2](#).VMID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == 0b10:

Reserved, RES1.

Virtual context identifier selection control.

[CONTEXTIDR_EL2](#).PROCID is used as the Virtual context identifier.

Otherwise:

Reserved, RES0.

QE, bits [14:13]

When TRCIDR0.QSUPP == 0b01:

Q element generation control.

| QE | Meaning |
|------|---|
| 0b00 | Q elements are disabled. |
| 0b01 | Q elements with instruction counts are enabled. |
| | Q elements without instruction counts are disabled. |

All other values are reserved.

When TRCIDR0.QSUPP == 0b10:

Q element generation control.

| QE | Meaning |
|------|--|
| 0b00 | Q elements are disabled. |
| 0b11 | Q elements with instruction counts are enabled. |
| | Q elements without instruction counts are enabled. |

All other values are reserved.

When TRCIDR0.QSUPP == 0b11:

Q element generation control.

| QE | Meaning |
|------|---|
| 0b00 | Q elements are disabled. |
| 0b01 | Q elements with instruction counts are enabled. |
| | Q elements without instruction counts are disabled. |
| 0b11 | Q elements with instruction counts are enabled. |
| | Q elements without instruction counts are enabled. |

All other values are reserved.

Otherwise:

Reserved, RES0.

RS, bit [12]

When TRCIDR0.RETSTACK == 1:

Return stack control.

| RS | Meaning |
|-----|---------------------------|
| 0b0 | Return stack is disabled. |
| 0b1 | Return stack is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TS, bit [11]

When TRCIDR0.TSSIZE != 0b000000:

Global timestamp tracing control.

| TS | Meaning |
|-----|---------------------------------------|
| 0b0 | Global timestamp tracing is disabled. |
| 0b1 | Global timestamp tracing is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [10:8]

Reserved, RES0.

VMID, bit [7]

When TRCIDR2.VMIDSIZE != 0b000000:

Virtual context identifier tracing control.

| VMID | Meaning |
|------|---|
| 0b0 | Virtual context identifier tracing is disabled. |
| 0b1 | Virtual context identifier tracing is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CID, bit [6]

When TRCIDR2.CIDSIZE != 0b000000:

Context identifier tracing control.

| CID | Meaning |
|-----|---|
| 0b0 | Context identifier tracing is disabled. |
| 0b1 | Context identifier tracing is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

CCI, bit [4]

When **TRCIDR0.TRCCCI == 1**:

Cycle counting instruction tracing control.

| CCI | Meaning |
|-----|---|
| 0b0 | Cycle counting instruction tracing is disabled. |
| 0b1 | Cycle counting instruction tracing is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BB, bit [3]

When **TRCIDR0.TRCBB == 1**:

Branch broadcasting control.

| BB | Meaning |
|-----|----------------------------------|
| 0b0 | Branch broadcasting is disabled. |
| 0b1 | Branch broadcasting is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [2:1]

Reserved, RES0.

Bit [0]

Reserved, RES1.

Accessing TRCCONFIGR

Must always be programmed.

TRCCONFIGR.QE must be set to 0b00 if TRCCONFIGR.BB is not 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCONFIGR

| | | | | |
|-----|-----|-----|-----|-----|
| op0 | op1 | CRn | CRm | op2 |
|-----|-----|-----|-----|-----|

| | | | | |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b0100 | 0b000 |
|------|-------|--------|--------|-------|

TRCDEVARCH, Device Architecture Register

The TRCDEVARCH characteristics are:

Purpose

Provides discovery information for the component.
For additional information, see the CoreSight Architecture Specification.

Configuration

AArch64 System register TRCDEVARCH bits [31:0] are architecturally mapped to External register [TRCDEVARCH\[31:0\]](#).
This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCDEVARCH are UNDEFINED.

Attributes

TRCDEVARCH is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------|----|----|----|----|----|----|----|----|----|----|---------|----------|----|----|----|---------|----|----|----|----------|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| ARCHITECT | | | | | | | | | | | PRESENT | REVISION | | | | ARCHVER | | | | ARCHPART | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

| ARCHITECT | Meaning |
|---------------|--|
| 0b01000111011 | JEP106 continuation code 0x4, ID code 0x3B. Arm Limited. |

Other values are defined by the JEDEC JEP106 standard.

This field reads as 0x23B.

PRESENT, bit [20]

DEVARCH Present. Defines that the DEVARCH register is present.

| PRESENT | Meaning |
|---------|--|
| 0b0 | Device Architecture information not present. |
| 0b1 | Device Architecture information present. |

This field reads as 1.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

| REVISION | Meaning |
|----------|------------------------|
| 0b0000 | ETEv1.0, FEAT_ETE. |
| 0b0001 | ETEv1.1, FEAT_ETEv1p1. |
| 0b0010 | ETEv1.2, FEAT_ETEv1p2. |

All other values are reserved.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

| ARCHVER | Meaning |
|---------|---------|
| 0b0101 | ETEv1. |

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0x5.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

| ARCHPART | Meaning |
|----------|----------------------------|
| 0xA13 | Arm PE trace architecture. |

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA13.

TRCEVENTCTL0R, Event Control 0 Register

The TRCEVENTCTL0R characteristics are:

Purpose

Controls the generation of ETEEvents.

Configuration

AArch64 System register TRCEVENTCTL0R bits [31:0] are architecturally mapped to External register [TRCEVENTCTL0R\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMRSPAIR != 0b0000. Otherwise, direct accesses to TRCEVENTCTL0R are UNDEFINED.

Attributes

TRCEVENTCTL0R is a 64-bit register.

Bits [63:32]

Reserved, RES0.

EVENT3_TYPE, bit [31]

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b11:

Chooses the type of Resource Selector.

| EVENT3_TYPE | Meaning |
|-------------|---|
| 0b0 | A single Resource Selector. TRCEVENTCTL0R.EVENT3.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT3.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:29]

Reserved, RES0.

EVENT3_SEL, bits [28:24]

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b11:

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.TYPE controls whether TRCEVENTCTL0R.EVENT3.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R](#).INSTEN[3] == 1, then Event element 3 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT2_TYPE, bit [23]

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b10:

Chooses the type of Resource Selector.

| EVENT2_TYPE | Meaning |
|-------------|---|
| 0b0 | A single Resource Selector. TRCEVENTCTL0R.EVENT2.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT2.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [22:21]

Reserved, RES0.

EVENT2_SEL, bits [20:16]**When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b10:**

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.TYPE controls whether TRCEVENTCTL0R.EVENT2.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R](#).INSTEN[2] == 1, then Event element 2 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT1_TYPE, bit [15]**When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b01:**

Chooses the type of Resource Selector.

| EVENT1_TYPE | Meaning |
|-------------|---|
| 0b0 | A single Resource Selector. TRCEVENTCTL0R.EVENT1.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT1.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [14:13]

Reserved, RES0.

EVENT1_SEL, bits [12:8]**When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b01:**

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.TYPE controls whether TRCEVENTCTL0R.EVENT1.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R](#).INSTEN[1] == 1, then Event element 1 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT0_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b00:

Chooses the type of Resource Selector.

| EVENT0_TYPE | Meaning |
|-------------|---|
| 0b0 | A single Resource Selector. TRCEVENTCTL0R.EVENT0.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT0.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT0_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000 and TRCIDR0.NUMEVENT >= 0b00:

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.TYPE controls whether TRCEVENTCTL0R.EVENT0.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

When any of the selected resource events occurs and [TRCEVENTCTL1R](#).INSTEN[0] == 1, then Event element 0 is generated in the instruction trace element stream.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCEVENTCTL0R

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

TRCEVENTCTL1R, Event Control 1 Register

The TRCEVENTCTL1R characteristics are:

Purpose

Controls the behavior of the ETEEvents that [TRCEVENTCTL0R](#) selects.

Configuration

AArch64 System register TRCEVENTCTL1R bits [31:0] are architecturally mapped to External register [TRCEVENTCTL1R\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCEVENTCTL1R are UNDEFINED.

Attributes

TRCEVENTCTL1R is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|----|-----|----|------|----|----|----|----|----|-----------|----|-----------|----|-----------|----|-----------|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | LPOVERRIDE | | ATB | | RES0 | | | | | | INSTEN[3] | | INSTEN[2] | | INSTEN[1] | | INSTEN[0] | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

Bits [63:13]

Reserved, RES0.

LPOVERRIDE, bit [12]

When TRCIDR5.LPOVERRIDE == 1:

Low-power Override Mode select.

| LPOVERRIDE | Meaning |
|------------|--|
| 0b0 | Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state. |
| 0b1 | Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation. |

Otherwise:

Reserved, RES0.

ATB, bit [11]

When TRCIDR5.ATBTRIG == 1:

AMBA Trace Bus (ATB) trigger enable.

If a CoreSight ATB interface is implemented then when ETEEvent 0 occurs the trace unit sets:

- ATID == 0x7D.

- ATDATA to the value of [TRCTRACEIDR](#).

If the width of ATDATA is greater than the width of [TRCTRACEIDR](#).TRACEID then the trace unit zeros the upper ATDATA bits.

If ETEEvent 0 is programmed to occur based on program execution, such as an Address Comparator, the ATB trigger might not be inserted into the ATB stream at the same time as any trace generated by that program execution is output by the trace unit. Typically, the generated trace might be buffered in a trace unit which means that the ATB trigger would be output before the associated trace is output.

If ETEEvent 0 is asserted multiple times in close succession, the trace unit is required to generate an ATB trigger for the first assertion, but might ignore one or more of the subsequent assertions. Arm recommends that the window in which ETEEvent 0 is ignored is limited only by the time taken to output an ATB trigger.

| ATB | Meaning |
|-----|--------------------------|
| 0b0 | ATB trigger is disabled. |
| 0b1 | ATB trigger is enabled. |

Otherwise:

Reserved, RES0.

Bits [10:4]

Reserved, RES0.

INSTEN[<m>], bit [m], for m = 3 to 0

Event element control.

| INSTEN[<m>] | Meaning |
|-------------|--|
| 0b0 | The trace unit does not generate an Event element <m>. |
| 0b1 | The trace unit generates an Event element <m>. |

This bit is RES0 if m >= the number indicated by [TRCIDR0](#).NUMEVENT.

Accessing TRCEVENTCTL1R

Must be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCEVENTCTL1R

| op0 | op1 | CRn | CRm | op2 |

TRCEXTINSELN<n>, External Input Select Register <n>, n = 0 - 3

The TRCEXTINSELN<n> characteristics are:

Purpose

Use this to set, or read, which External Inputs are resources to the trace unit.

The name TRCEXTINSELN is an alias of TRCEXTINSELN0.

Configuration

AArch64 System register TRCEXTINSELN<n> bits [31:0] are architecturally mapped to External register [TRCEXTINSELN<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMEXTINSEL > n. Otherwise, direct accesses to TRCEXTINSELN<n> are UNDEFINED.

Attributes

TRCEXTINSELN<n> is a 64-bit register.

Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

PMU event to select.

The event number as defined by the Arm ARM.

Software must program this field with a PMU event that is supported by the PE being programmed.

There are three ranges of PMU event numbers:

- PMU event numbers in the range 0x0000 to 0x003F are common architectural and microarchitectural events.
- PMU event numbers in the range 0x0040 to 0x00BF are Arm recommended common architectural and microarchitectural PMU events.
- PMU event numbers in the range 0x00C0 to 0x03FF are IMPLEMENTATION DEFINED PMU events.

If evtCount is programmed to a PMU event that is reserved or not supported by the PE, the behavior depends on the PMU event type:

- For the range 0x0000 to 0x003F, then the PMU event is not active, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED PMU events, it is UNPREDICTABLE what PMU event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

UNPREDICTABLE means the PMU event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include a PMU event from a set of common IMPLEMENTATION_DEFINED PMU events, then no PMU event is counted and the value read back on evtCount is the value written.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCEXTINSELN<n>

Must be programmed if any of the following is true: [TRCRSCTLR<a>](#).GROUP == 0b0000 and [TRCRSCTLR<a>](#).EXTIN[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCEXTINSELN<n>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|-------------|-------|
| 0b10 | 0b001 | 0b0000 | 0b10:n[1:0] | 0b100 |

```

TRCIDR0, ID Register 0

The TRCIDR0 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

AArch64 System register TRCIDR0 bits [31:0] are architecturally mapped to External register [TRCIDR0\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR0 are UNDEFINED.

Attributes

TRCIDR0 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|-----------|---------|--------|--------|------|-----------|-------|-------|----------|----------|----------|----|----|----|----|----|----|------|----|----|----|----|--|--|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | | | | |
| | | | | | | | | | | | | | | | | | | RES0 | | | | | | | | |
| RES0 | COMMTRANS | COMMOPT | TSSIZE | TSMARK | RES0 | TRCEXDATA | QSUPP | QFILT | CONDTYPE | NUMEVENT | RETSTACK | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | | | | |

Bits [63:31]

Reserved, RES0.

COMMTRANS, bit [30]

Transaction Start element behavior.

| COMMTRANS | Meaning |
|-----------|---|
| 0b0 | Transaction Start elements are P0 elements. |
| 0b1 | Transaction Start elements are not P0 elements. |

COMMOPT, bit [29]

Indicates the contents and encodings of Cycle count packets.

| COMMOPT | Meaning |
|---------|----------------|
| 0b0 | Commit mode 0. |
| 0b1 | Commit mode 1. |

The Commit mode defines the contents and encodings of Cycle Count packets, in particular how Commit elements are indicated by these packets. See the descriptions of these packets for more details.

Accessing this field has the following behavior:

- **RAO/WI** if all of the following are true:
 - TRCIDR0.TRCCCI == 1
 - TRCIDR8.MAXSPEC == 0x0
- When TRCIDR0.TRCCCI == 0, access to this field is **RAZ/WI**.
- Otherwise, access to this field is **RO**.

TSSIZE, bits [28:24]

Indicates that the trace unit implements Global timestamping and the size of the timestamp value.

| TSSIZE | Meaning |
|---------------|--|
| 0b00000 | Global timestamping not implemented. |
| 0b01000 | Global timestamping implemented with a 64-bit timestamp value. |

All other values are reserved.

This field reads as 0b01000.

TSMARK, bit [23]

When FEAT_ETEv1p1 is implemented:

Indicates whether Timestamp Marker elements are generated.

| TSMARK | Meaning |
|---------------|--|
| 0b0 | Timestamp Marker elements are not generated. |
| 0b1 | Timestamp Marker elements are generated. |

Otherwise:

Reserved, RES0.

Bits [22:18]

Reserved, RES0.

TRCEXDATA, bit [17]

When TRCIDR0.TRCDATA != 0b00:

Indicates if the trace unit implements tracing of data transfers for exceptions and exception returns. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

| TRCEXDATA | Meaning |
|------------------|---|
| 0b0 | Tracing of data transfers for exceptions and exception returns not implemented. |
| 0b1 | Tracing of data transfers for exceptions and exception returns implemented. |

Otherwise:

Reserved, RES0.

QSUPP, bits [16:15]

Indicates that the trace unit implements Q element support.

| QSUPP | Meaning |
|--------------|---|
| 0b00 | Q element support is not implemented. |
| 0b01 | Q element support is implemented, and only supports Q elements with instruction counts. |
| 0b10 | Q element support is implemented, and only supports Q elements without instruction counts. |
| 0b11 | Q element support is implemented, and supports: <ul style="list-style-type: none"> Q elements with instruction counts. Q elements without instruction counts. |

QFILT, bit [14]

Indicates if the trace unit implements Q element filtering.

| QFILT | Meaning |
|-------|---|
| 0b0 | Q element filtering is not implemented. |
| 0b1 | Q element filtering is implemented. |

If TRCIDR0.QSUPP == 0b00 then this field is 0.

CONDTYPE, bits [13:12]

When TRCIDR0.TRCCOND == 1:

Indicates how conditional instructions are traced. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

| CONDTYPE | Meaning |
|----------|---|
| 0b00 | Conditional instructions are traced with an indication of whether they pass or fail their condition code check. |
| 0b01 | Conditional instructions are traced with an indication of the APSR condition flags. |

All other values are reserved.

Otherwise:

Reserved, RES0.

NUMEVENT, bits [11:10]

When TRCIDR4.NUMRSPAIR == 0b0000:

Indicates the number of ETEEvents implemented.

| NUMEVENT | Meaning |
|----------|--------------------------------------|
| 0b00 | The trace unit supports 0 ETEEvents. |

All other values are reserved.

When TRCIDR4.NUMRSPAIR != 0b0000:

Indicates the number of ETEEvents implemented.

| NUMEVENT | Meaning |
|----------|--------------------------------------|
| 0b00 | The trace unit supports 1 ETEEvent. |
| 0b01 | The trace unit supports 2 ETEEvents. |
| 0b10 | The trace unit supports 3 ETEEvents. |
| 0b11 | The trace unit supports 4 ETEEvents. |

Otherwise:

Reserved, RES0.

RETSTACK, bit [9]

Indicates if the trace unit supports the return stack.

| RETSTACK | Meaning |
|----------|-------------------------------|
| 0b0 | Return stack not implemented. |
| 0b1 | Return stack implemented. |

Bit [8]

Reserved, RES0.

TRCCCI, bit [7]

Indicates if the trace unit implements cycle counting.

| TRCCCI | Meaning |
|--------|---------------------------------|
| 0b0 | Cycle counting not implemented. |
| 0b1 | Cycle counting implemented. |

This field reads as 1.

TRCCOND, bit [6]

Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.

| TRCCOND | Meaning |
|---------|--|
| 0b0 | Conditional instruction tracing not implemented. |
| 0b1 | Conditional instruction tracing implemented. |

This field reads as 0.

TRCBB, bit [5]

Indicates if the trace unit implements branch broadcasting.

| TRCBB | Meaning |
|-------|--------------------------------------|
| 0b0 | Branch broadcasting not implemented. |
| 0b1 | Branch broadcasting implemented. |

This field reads as 1.

TRCDATA, bits [4:3]

Indicates if the trace unit implements data tracing. Data tracing is not implemented in ETE and this field is reserved for other trace architectures.

| TRCDATA | Meaning |
|---------|-------------------------------|
| 0b00 | Data tracing not implemented. |
| 0b11 | Data tracing implemented. |

All other values are reserved.

This field reads as 0b00.

INSTP0, bits [2:1]

Indicates if load and store instructions are P0 instructions. Load and store instructions as P0 instructions is not implemented in ETE and this field is reserved for other trace architectures.

| INSTP0 | Meaning |
|--------|--|
| 0b00 | Load and store instructions are not P0 instructions. |
| 0b11 | Load and store instructions are P0 instructions. |

All other values are reserved.

This field reads as 0b00.

Bit [0]

Reserved, RES1.

Accessing TRCIDR0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCIDR0

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b1000 | 0b111 |

Bits [63:32]

Reserved, RES0.

DESIGNER, bits [31:24]

Indicates which company designed the trace unit. The permitted values of this field are the same as [MIDR_EL1.Implementer](#).

Bits [23:16]

Reserved, RES0.

Bits [15:12]

Reserved, RES1.

TRCARCHMAJ, bits [11:8]

Major architecture version.

| TRCARCHMAJ | Meaning |
|------------|---|
| 0b1111 | If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH . |

All other values are reserved.

This field reads as 0b1111.

TRCARCHMIN, bits [7:4]

Minor architecture version.

| TRCARCHMIN | Meaning |
|------------|---|
| 0b1111 | If both TRCARCHMAJ and TRCARCHMIN == 0xF then refer to TRCDEVARCH . |

All other values are reserved.

This field reads as 0b1111.

REVISION, bits [3:0]

Implementation revision.

Returns an IMPLEMENTATION DEFINED value that identifies the revision of the trace unit.

Arm deprecates any use of this field and recommends that implementations set this field to zero.

Accessing TRCIDR1

TRCIDR2, ID Register 2

The TRCIDR2 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

AArch64 System register TRCIDR2 bits [31:0] are architecturally mapped to External register [TRCIDR2\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR2 are UNDEFINED.

Attributes

TRCIDR2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|---------|--------|----|----|----|--------|----|----|----|--------|----|----|----|----------|----|----|----|---------|----|----|----|--------|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| WFXMODE | VMIDOPT | CCSIZE | | | | DVSIZE | | | | DASIZE | | | | VMIDSIZE | | | | CIDSIZE | | | | IASIZE | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

WFXMODE, bit [31]

Indicates whether WFI and WFE instructions are classified as P0 instructions:

| WFXMODE | Meaning |
|---------|---|
| 0b0 | WFI and WFE instructions are not classified as P0 instructions. |
| 0b1 | WFI and WFE instructions are classified as P0 instructions. |

VMIDOPT, bits [30:29]

Indicates the options for Virtual context identifier selection.

| VMIDOPT | Meaning |
|---------|---|
| 0b00 | Virtual context identifier selection not supported. |
| 0b01 | TRCCONFIGR .VMIDOPT is RES0. |
| 0b10 | Virtual context identifier selection supported. |
| 0b11 | TRCCONFIGR .VMIDOPT is implemented. |
| 0b10 | Virtual context identifier selection not supported. |
| 0b11 | TRCCONFIGR .VMIDOPT is RES1. |

All other values are reserved.

If TRCIDR2.VMIDSIZE == 0b000000 then this field is 0b00.

If TRCIDR2.VMIDSIZE != 0b000000 then this field is 0b10.

CCSIZE, bits [28:25]**When TRCIDR0.TRCCCI == 1:**

Indicates the size of the cycle counter.

| CCSIZE | Meaning |
|---------------|---|
| 0b0000 | The cycle counter is 12 bits in length. |
| 0b0001 | The cycle counter is 13 bits in length. |
| 0b0010 | The cycle counter is 14 bits in length. |
| 0b0011 | The cycle counter is 15 bits in length. |
| 0b0100 | The cycle counter is 16 bits in length. |
| 0b0101 | The cycle counter is 17 bits in length. |
| 0b0110 | The cycle counter is 18 bits in length. |
| 0b0111 | The cycle counter is 19 bits in length. |
| 0b1000 | The cycle counter is 20 bits in length. |

All other values are reserved.

Otherwise:

Reserved, RES0.

DVSIZE, bits [24:20]**When TRCIDR0.TRCDATA != 0b00:**

Indicates the data value size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

| DVSIZE | Meaning |
|---------------|---|
| 0b00000 | Data value tracing not implemented. |
| 0b00100 | Data value tracing has a maximum of 32-bit data values. |
| 0b01000 | Data value tracing has a maximum of 64-bit data values. |

All other values are reserved.

Otherwise:

Reserved, RES0.

DASIZE, bits [19:15]**When TRCIDR0.TRCDATA != 0b00:**

Indicates the data address size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

| DASIZE | Meaning |
|---------------|--|
| 0b00000 | Data address tracing not implemented. |
| 0b00100 | Data address tracing has a maximum of 32-bit data addresses. |
| 0b01000 | Data address tracing has a maximum of 64-bit data addresses. |

All other values are reserved.

Otherwise:

Reserved, RES0.

VMIDSIZE, bits [14:10]

Indicates the trace unit Virtual context identifier size.

| VMIDSIZE | Meaning |
|-----------------|--|
| 0b000000 | Virtual context identifier tracing is not supported. |
| 0b000001 | 8-bit Virtual context identifier size. |
| 0b000010 | 16-bit Virtual context identifier size. |
| 0b000100 | 32-bit Virtual context identifier size. |

All other values are reserved.

If the PE does not implement EL2 then this field is 0b000000.

If the PE implements EL2 then this field is 0b000100.

CIDSIZE, bits [9:5]

Indicates the Context identifier size.

| CIDSIZE | Meaning |
|----------------|--|
| 0b000000 | Context identifier tracing is not supported. |
| 0b000100 | 32-bit Context identifier size. |

All other values are reserved.

This field reads as 0b000100.

IASIZE, bits [4:0]

Virtual instruction address size.

| IASIZE | Meaning |
|---------------|---|
| 0b000100 | Maximum of 32-bit instruction address size. |
| 0b010000 | Maximum of 64-bit instruction address size. |

All other values are reserved.

This field reads as 0b010000.

Accessing TRCIDR2

| SYSSTALL | Meaning |
|-----------------|--------------------------------------|
| 0b0 | Stalling of the PE is not permitted. |
| 0b1 | Stalling of the PE is permitted. |

The value of this field might be dynamic and change based on system conditions.

If TRCIDR3.STALLCTL == 0 then this field is 0.

STALLCTL, bit [26]

Indicates if trace unit implements stalling of the PE.

| STALLCTL | Meaning |
|-----------------|--|
| 0b0 | Stalling of the PE is not implemented. |
| 0b1 | Stalling of the PE is implemented. |

SYNCPR, bit [25]

Indicates if an implementation has a fixed synchronization period.

| SYNCPR | Meaning |
|---------------|--|
| 0b0 | TRCSYNCPR is read-write so software can change the synchronization period. |
| 0b1 | TRCSYNCPR is read-only so the synchronization period is fixed. |

This field reads as 0.

TRCERR, bit [24]

Indicates forced tracing of System Error exceptions is implemented.

| TRCERR | Meaning |
|---------------|---|
| 0b0 | Forced tracing of System Error exceptions is not implemented. |
| 0b1 | Forced tracing of System Error exceptions is implemented. |

This field reads as 1.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]

Indicates if Non-secure EL2 is implemented.

| EXLEVEL_NS_EL2 | Meaning |
|-----------------------|------------------------------------|
| 0b0 | Non-secure EL2 is not implemented. |
| 0b1 | Non-secure EL2 is implemented. |

EXLEVEL_NS_EL1, bit [21]

Indicates if Non-secure EL1 is implemented.

| EXLEVEL_NS_EL1 | Meaning |
|-----------------------|------------------------------------|
| 0b0 | Non-secure EL1 is not implemented. |
| 0b1 | Non-secure EL1 is implemented. |

EXLEVEL_NS_EL0, bit [20]

Indicates if Non-secure EL0 is implemented.

| EXLEVEL_NS_EL0 | Meaning |
|----------------|------------------------------------|
| 0b0 | Non-secure EL0 is not implemented. |
| 0b1 | Non-secure EL0 is implemented. |

EXLEVEL_S_EL3, bit [19]

Indicates if EL3 is implemented.

| EXLEVEL_S_EL3 | Meaning |
|---------------|-------------------------|
| 0b0 | EL3 is not implemented. |
| 0b1 | EL3 is implemented. |

EXLEVEL_S_EL2, bit [18]

Indicates if Secure EL2 is implemented.

| EXLEVEL_S_EL2 | Meaning |
|---------------|--------------------------------|
| 0b0 | Secure EL2 is not implemented. |
| 0b1 | Secure EL2 is implemented. |

EXLEVEL_S_EL1, bit [17]

Indicates if Secure EL1 is implemented.

| EXLEVEL_S_EL1 | Meaning |
|---------------|--------------------------------|
| 0b0 | Secure EL1 is not implemented. |
| 0b1 | Secure EL1 is implemented. |

EXLEVEL_S_EL0, bit [16]

Indicates if Secure EL0 is implemented.

| EXLEVEL_S_EL0 | Meaning |
|---------------|--------------------------------|
| 0b0 | Secure EL0 is not implemented. |
| 0b1 | Secure EL0 is implemented. |

Bits [15:14]

Reserved, RES0.

CCITMIN, bits [11:0]

Indicates the minimum value that can be programmed in [TRCCCCTLR](#).THRESHOLD.

If [TRCIDR0](#).TRCCCI == 1 then the minimum value of this field is 0x001.

If [TRCIDR0](#).TRCCCI == 0 then this field is zero.

Accessing TRCIDR3

TRCIDR4, ID Register 4

The TRCIDR4 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

AArch64 System register TRCIDR4 bits [31:0] are architecturally mapped to External register [TRCIDR4\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR4 are UNDEFINED.

Attributes

TRCIDR4 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|---------|----|----|----|---------|----|----|----|-----------|----|----|----|-------|----|----|----|------|----|----|--|---------|--|----|----|--------|----|----|----|------------|----|--|--|

Bits [63:32]

Reserved, RES0.

NUMVMIDC, bits [31:28]

Indicates the number of Virtual Context Identifier Comparators that are available for tracing.

| NUMVMIDC | Meaning |
|----------|--|
| 0b0000 | No Virtual Context Identifier Comparators are available. |
| 0b0001 | The implementation has one Virtual Context Identifier Comparator. |
| 0b0010 | The implementation has two Virtual Context Identifier Comparators. |
| 0b0011 | The implementation has three Virtual Context Identifier Comparators. |
| 0b0100 | The implementation has four Virtual Context Identifier Comparators. |
| 0b0101 | The implementation has five Virtual Context Identifier Comparators. |
| 0b0110 | The implementation has six Virtual Context Identifier Comparators. |
| 0b0111 | The implementation has seven Virtual Context Identifier Comparators. |
| 0b1000 | The implementation has eight Virtual Context Identifier Comparators. |

All other values are reserved.

NUMCIDC, bits [27:24]

Indicates the number of Context Identifier Comparators that are available for tracing.

| NUMC IDC | Meaning |
|----------|--|
| 0b0000 | No Context Identifier Comparators are available. |
| 0b0001 | The implementation has one Context Identifier Comparator. |
| 0b0010 | The implementation has two Context Identifier Comparators. |
| 0b0011 | The implementation has three Context Identifier Comparators. |
| 0b0100 | The implementation has four Context Identifier Comparators. |
| 0b0101 | The implementation has five Context Identifier Comparators. |
| 0b0110 | The implementation has six Context Identifier Comparators. |
| 0b0111 | The implementation has seven Context Identifier Comparators. |
| 0b1000 | The implementation has eight Context Identifier Comparators. |

All other values are reserved.

NUMSSCC, bits [23:20]

Indicates the number of Single-shot Comparator Controls that are available for tracing.

| NUMSSCC | Meaning |
|---------|---|
| 0b0000 | No Single-shot Comparator Controls are available. |
| 0b0001 | The implementation has one Single-shot Comparator Control. |
| 0b0010 | The implementation has two Single-shot Comparator Controls. |
| 0b0011 | The implementation has three Single-shot Comparator Controls. |
| 0b0100 | The implementation has four Single-shot Comparator Controls. |
| 0b0101 | The implementation has five Single-shot Comparator Controls. |
| 0b0110 | The implementation has six Single-shot Comparator Controls. |
| 0b0111 | The implementation has seven Single-shot Comparator Controls. |
| 0b1000 | The implementation has eight Single-shot Comparator Controls. |

All other values are reserved.

NUMRSPAIR, bits [19:16]

Indicates the number of resource selector pairs that are available for tracing.

| NUMRSPAIR | Meaning |
|-----------|--|
| 0b0000 | The implementation has zero resource selectors. |
| 0b0001 | The implementation has two resource selector pairs. |
| 0b0010 | The implementation has three resource selector pairs. |
| 0b0011 | The implementation has four resource selector pairs. |
| 0b0100 | The implementation has five resource selector pairs. |
| 0b0101 | The implementation has six resource selector pairs. |
| 0b0110 | The implementation has seven resource selector pairs. |
| 0b0111 | The implementation has eight resource selector pairs. |
| 0b1000 | The implementation has nine resource selector pairs. |
| 0b1001 | The implementation has ten resource selector pairs. |
| 0b1010 | The implementation has eleven resource selector pairs. |
| 0b1011 | The implementation has twelve resource selector pairs. |
| 0b1100 | The implementation has thirteen resource selector pairs. |
| 0b1101 | The implementation has fourteen resource selector pairs. |
| 0b1110 | The implementation has fifteen resource selector pairs. |
| 0b1111 | The implementation has sixteen resource selector pairs. |

All other values are reserved.

NUMPC, bits [15:12]

Indicates the number of PE Comparator Inputs that are available for tracing.

| NUMPC | Meaning |
|--------|--|
| 0b0000 | No PE Comparator Inputs are available. |
| 0b0001 | The implementation has one PE Comparator Input. |
| 0b0010 | The implementation has two PE Comparator Inputs. |
| 0b0011 | The implementation has three PE Comparator Inputs. |
| 0b0100 | The implementation has four PE Comparator Inputs. |
| 0b0101 | The implementation has five PE Comparator Inputs. |
| 0b0110 | The implementation has six PE Comparator Inputs. |
| 0b0111 | The implementation has seven PE Comparator Inputs. |
| 0b1000 | The implementation has eight PE Comparator Inputs. |

All other values are reserved.

Bits [11:9]

Reserved, RES0.

SUPPDAC, bit [8]

When TRCIDR4.NUMACPAIRS != 0b0000:

Indicates whether data address comparisons are implemented. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

| SUPPDAC | Meaning |
|---------|---|
| 0b0 | Data address comparisons not implemented. |
| 0b1 | Data address comparisons implemented. |

This field reads as 0.

Otherwise:

Reserved, RES0.

NUMDVC, bits [7:4]

Indicates the number of data value comparators. Data value comparators are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

| NUMDVC | Meaning |
|--------|---|
| 0b0000 | No data value comparators implemented. |
| 0b0001 | One data value comparator implemented. |
| 0b0010 | Two data value comparators implemented. |
| 0b0011 | Three data value comparators implemented. |
| 0b0100 | Four data value comparators implemented. |
| 0b0101 | Five data value comparators implemented. |
| 0b0110 | Six data value comparators implemented. |
| 0b0111 | Seven data value comparators implemented. |
| 0b1000 | Eight data value comparators implemented. |

All other values are reserved.

This field reads as 0b0000.

NUMACPAIRS, bits [3:0]

Indicates the number of Address Comparator pairs that are available for tracing.

| NUMACPAIRS | Meaning |
|------------|--|
| 0b0000 | No Address Comparator pairs are available. |
| 0b0001 | The implementation has one Address Comparator pair. |
| 0b0010 | The implementation has two Address Comparator pairs. |
| 0b0011 | The implementation has three Address Comparator pairs. |
| 0b0100 | The implementation has four Address Comparator pairs. |
| 0b0101 | The implementation has five Address Comparator pairs. |
| 0b0110 | The implementation has six Address Comparator pairs. |
| 0b0111 | The implementation has seven Address Comparator pairs. |
| 0b1000 | The implementation has eight Address Comparator pairs. |

All other values are reserved.

Accessing TRCIDR4

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCIDR4

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b1100 | 0b111 |

```

TRCIDR5, ID Register 5

The TRCIDR5 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

AArch64 System register TRCIDR5 bits [31:0] are architecturally mapped to External register [TRCIDR5\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR5 are UNDEFINED.

Attributes

TRCIDR5 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|---------|----|----|----|-------------|----|----|----|------|------------|----|----|----|---------|-------------|----|----|----|------|-------------|----|----|----|----------|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | NUMCNTR | | | | NUMSEQSTATE | | | | RES0 | LPOVERRIDE | | | | ATBTRIG | TRACEIDSIZE | | | | RES0 | NUMEXTINSEL | | | | NUMEXTIN | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:31]

Reserved, RES0.

NUMCNTR, bits [30:28]

Indicates the number of Counters that are available for tracing.

| NUMCNTR | Meaning |
|---------|-----------------------------|
| 0b000 | No Counters are available. |
| 0b001 | One Counter implemented. |
| 0b010 | Two Counters implemented. |
| 0b011 | Three Counters implemented. |
| 0b100 | Four Counters implemented. |

All other values are reserved.

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0b000.

NUMSEQSTATE, bits [27:25]

Indicates if the Sequencer is implemented and the number of Sequencer states that are implemented.

| NUMSEQSTATE | Meaning |
|-------------|--|
| 0b000 | The Sequencer is not implemented. |
| 0b100 | Four Sequencer states are implemented. |

All other values are reserved.

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0b000.

Bit [24]

Reserved, RES0.

LPOVERRIDE, bit [23]

Indicates support for Low-power Override Mode.

| LPOVERRIDE | Meaning |
|-------------------|--|
| 0b0 | The trace unit does not support Low-power Override Mode. |
| 0b1 | The trace unit supports Low-power Override Mode. |

ATBTRIG, bit [22]

Indicates if the implementation can support ATB triggers.

| ATBTRIG | Meaning |
|----------------|---|
| 0b0 | The implementation does not support ATB triggers. |
| 0b1 | The implementation supports ATB triggers. |

If [TRCIDR4](#).NUMRSPAIR == 0b0000 then this field is 0.

TRACEIDSIZE, bits [21:16]

Indicates the trace ID width.

| TRACEIDSIZE | Meaning |
|--------------------|--|
| 0b000000 | The external trace interface is not implemented. |
| 0b000111 | The implementation supports a 7-bit trace ID. |

All other values are reserved.

Note that AMBA ATB requires a 7-bit trace ID width.

Bits [15:12]

Reserved, RES0.

NUMEXTINSEL, bits [11:9]

Indicates how many External Input Selector resources are implemented.

| NUMEXTINSEL | Meaning |
|--------------------|---|
| 0b000 | No External Input Selector resources are available. |
| 0b001 | 1 External Input Selector resource is available. |
| 0b010 | 2 External Input Selector resources are available. |
| 0b011 | 3 External Input Selector resources are available. |
| 0b100 | 4 External Input Selector resources are available. |

All other values are reserved.

NUMEXTIN, bits [8:0]

Indicates how many External Inputs are implemented.

| NUMEXTIN | Meaning |
|-----------------|------------------------------|
| 0b11111111 | Unified PMU event selection. |

All other values are reserved.

Accessing TRCIDR5

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCIDR5

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b1101 | 0b111 |

TRCIDR6, ID Register 6

The TRCIDR6 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

AArch64 System register TRCIDR6 bits [31:0] are architecturally mapped to External register [TRCIDR6\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR6 are UNDEFINED.

Attributes

TRCIDR6 is a 64-bit register.

TRCIDR8, ID Register 8

The TRCIDR8 characteristics are:

Purpose

Returns the maximum speculation depth of the instruction trace element stream.

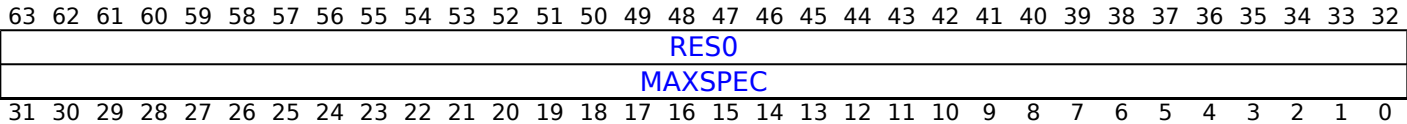

Configuration

AArch64 System register TRCIDR8 bits [31:0] are architecturally mapped to External register [TRCIDR8\[31:0\]](#).
This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIDR8 are UNDEFINED.

Attributes

TRCIDR8 is a 64-bit register.

Field descriptions

Bits [63:32]

Reserved, RES0.

MAXSPEC, bits [31:0]

Indicates the maximum speculation depth of the instruction trace element stream. This is the maximum number of P0 elements in the trace element stream that can be speculative at any time.

Accessing TRCIDR8

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCIDR8

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b0000 | 0b110 |

```

TRCIMSPEC0, IMP DEF Register 0

The TRCIMSPEC0 characteristics are:

Purpose

TRCIMSPEC0 shows the presence of any IMPLEMENTATION DEFINED features, and provides an interface to enable the features that are provided.

Configuration

AArch64 System register TRCIMSPEC0 bits [31:0] are architecturally mapped to External register [TRCIMSPEC0\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCIMSPEC0 are UNDEFINED.

Attributes

TRCIMSPEC0 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |

Bits [63:8]

Reserved, RES0.

EN, bits [7:4]

When TRCIMSPEC0.SUPPORT != 0b0000:

Enable. Controls whether the IMPLEMENTATION DEFINED features are enabled.

| EN | Meaning |
|--------|--|
| 0b0000 | The IMPLEMENTATION DEFINED features are not enabled. The trace unit must behave as if the IMPLEMENTATION DEFINED features are not supported. |
| 0b0001 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b0010 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b0011 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b0100 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b0101 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b0110 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b0111 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1000 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1001 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1010 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1011 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1100 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1101 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1110 | The trace unit behavior is IMPLEMENTATION DEFINED. |
| 0b1111 | The trace unit behavior is IMPLEMENTATION DEFINED. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to 0.

Otherwise:

Reserved, RES0.

SUPPORT, bits [3:0]

Indicates whether the implementation supports IMPLEMENTATION DEFINED features.

| SUPPORT | Meaning |
|---------|---|
| 0b0000 | No IMPLEMENTATION DEFINED features are supported. |
| 0b0001 | IMPLEMENTATION DEFINED features are supported. |
| 0b0010 | IMPLEMENTATION DEFINED features are supported. |
| 0b0011 | IMPLEMENTATION DEFINED features are supported. |
| 0b0100 | IMPLEMENTATION DEFINED features are supported. |
| 0b0101 | IMPLEMENTATION DEFINED features are supported. |
| 0b0110 | IMPLEMENTATION DEFINED features are supported. |
| 0b0111 | IMPLEMENTATION DEFINED features are supported. |
| 0b1000 | IMPLEMENTATION DEFINED features are supported. |
| 0b1001 | IMPLEMENTATION DEFINED features are supported. |
| 0b1010 | IMPLEMENTATION DEFINED features are supported. |
| 0b1011 | IMPLEMENTATION DEFINED features are supported. |
| 0b1100 | IMPLEMENTATION DEFINED features are supported. |
| 0b1101 | IMPLEMENTATION DEFINED features are supported. |
| 0b1110 | IMPLEMENTATION DEFINED features are supported. |
| 0b1111 | IMPLEMENTATION DEFINED features are supported. |

Use of nonzero values requires written permission from Arm.

Access to this field is **RO**.

TRCIMSPEC<n>, IMP DEF Register <n>, n = 1 - 7

The TRCIMSPEC<n> characteristics are:

Purpose

These registers might return information that is specific to an implementation, or enable features specific to an implementation to be programmed. The product Technical Reference Manual describes these registers.

Configuration

AArch64 System register TRCIMSPEC<n> bits [31:0] are architecturally mapped to External register [TRCIMSPEC<n>\[31:0\]](#).

This register is present only when the trace unit implements this OPTIONAL register and FEAT_ETE is implemented. Otherwise, direct accesses to TRCIMSPEC<n> are UNDEFINED.

Attributes

TRCIMSPEC<n> is a 64-bit register.

Field descriptions

TRCOSLSR, Trace OS Lock Status Register

The TRCOSLSR characteristics are:

Purpose

Returns the status of the Trace OS Lock.

Configuration

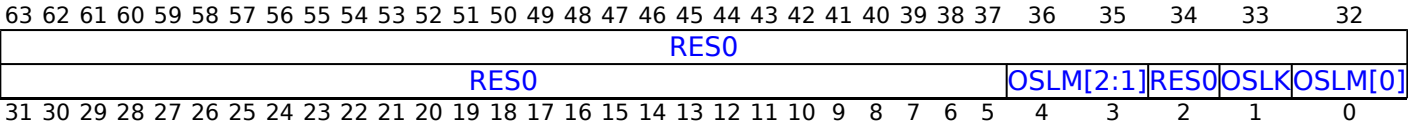

AArch64 System register TRCOSLSR bits [31:0] are architecturally mapped to External register [TRCOSLSR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCOSLSR are UNDEFINED.

Attributes

TRCOSLSR is a 64-bit register.

Field descriptions

Bits [63:5]

Reserved, RES0.

OSLM, bits [4:3, 0]

OS Lock model.

| OSLM | Meaning |
|-------|---|
| 0b000 | Trace OS Lock is not implemented. |
| 0b010 | Trace OS Lock is implemented. |
| 0b100 | Trace OS Lock is not implemented, and the trace unit is controlled by the PE OS Lock. |

All other values are reserved.

This field reads as 0b100.

The OSLM field is split as follows:

- OSLM[2:1] is TRCOSLSR[4:3].
- OSLM[0] is TRCOSLSR[0].

Bit [2]

Reserved, RES0.

OSLK, bit [1]

OS Lock status.

| OSLK | Meaning |
|------|--------------------------|
| 0b0 | The OS Lock is unlocked. |
| 0b1 | The OS Lock is locked. |

Note that this field indicates the state of the PE OS Lock.

Accessing TRCOSLSR

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCOSLSR

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0001 | 0b0001 | 0b100 |

```

```

TRCPRGCTLR, Programming Control Register

The TRCPRGCTLR characteristics are:

Purpose

Enables the trace unit.

Configuration

AArch64 System register TRCPRGCTLR bits [31:0] are architecturally mapped to External register [TRCPRGCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCPRGCTLR are UNDEFINED.

Attributes

TRCPRGCTLR is a 64-bit register.

Field descriptions

| MODE | Meaning |
|------|--|
| 0b0 | Exclude mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit must not generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map. |
| 0b1 | Include Mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0 then Q elements are disabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Specifies whether Address Range Comparator <m> controls Q elements.

| RANGE[<m>] | Meaning |
|------------|---|
| 0b0 | The address range that Address Range Comparator <m> defines, is not selected. |
| 0b1 | The address range that Address Range Comparator <m> defines, is selected. |

This bit is RES0 if $m \geq \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCQCTLR

Must be programmed if [TRCCONFIGR.QE](#) != 0b00.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCQCTLR

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b0001 | 0b001 |

TRCRSCTLR<n>, Resource Selection Control Register <n>, n = 2 - 31

The TRCRSCTLR<n> characteristics are:

Purpose

Controls the selection of the resources in the trace unit.

Configuration

AArch64 System register TRCRSCTLR<n> bits [31:0] are architecturally mapped to External register [TRCRSCTLR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and $((\text{TRCIDR4.NUMRSPAIR} + 1) * 2) > n$. Otherwise, direct accesses to TRCRSCTLR<n> are UNDEFINED.

Resource selector 0 always returns FALSE.

Resource selector 1 always returns TRUE.

Resource selectors are implemented in pairs. Each odd numbered resource selector is part of a pair with the even numbered resource selector that is numbered as one less than it. For example, resource selectors 2 and 3 form a pair.

Attributes

TRCRSCTLR<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | RES0 | | | | | | | | | | SELECT | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:22]

Reserved, RES0.

PAIRINV, bit [21]

When n is even:

Controls whether the combined result from a resource selector pair is inverted.

| PAIRINV | Meaning |
|---------|--|
| 0b0 | Do not invert the combined output of the 2 resource selectors. |
| 0b1 | Invert the combined output of the 2 resource selectors. |

If:

- A is the register TRCRSCTLR<n>.
- B is the register TRCRSCTLR<n+1>.

Then the combined output of the 2 resource selectors A and B depends on the value of (A.PAIRINV, A.INV, B.INV) as follows:

- 0b000 -> A and B.

- 0b001 -> Reserved.
- 0b010 -> not(A) and B.
- 0b011 -> not(A) and not(B).
- 0b100 -> not(A) or not(B).
- 0b101 -> not(A) or B.
- 0b110 -> Reserved.
- 0b111 -> A or B.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

INV, bit [20]

Controls whether the resource, that TRCRSCTLR<n>.GROUP and TRCRSCTLR<n>.SELECT selects, is inverted.

| INV | Meaning |
|-----|--|
| 0b0 | Do not invert the output of this selector. |
| 0b1 | Invert the output of this selector. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

GROUP, bits [19:16]

Selects a group of resources.

| GROUP | Meaning | SELECT |
|--------|---|--|
| 0b0000 | External Input Selectors. | SELECT encoding for External Input Selectors |
| 0b0001 | PE Comparator Inputs. | SELECT encoding for PE Comparator Inputs |
| 0b0010 | Counters and Sequencer. | SELECT encoding for Counters and Sequencer |
| 0b0011 | Single-shot Comparator Controls. | SELECT encoding for Single-shot Comparator Controls |
| 0b0100 | Single Address Comparators. | SELECT encoding for Single Address Comparators |
| 0b0101 | Address Range Comparators. | SELECT encoding for Address Range Comparators |
| 0b0110 | Context Identifier Comparators. | SELECT encoding for Context Identifier Comparators |
| 0b0111 | Virtual Context Identifier Comparators. | SELECT encoding for Virtual Context Identifier Comparators |

All other values are reserved.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT, bits [15:0]

Resource Specific Controls. Contains the controls specific to the resource group selected by GROUP, described in the following sections.

SELECT encoding for External Input Selectors

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|---|---|---|---|---|---|----------|----------|----------|----------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | EXTIN[3] | EXTIN[2] | EXTIN[1] | EXTIN[0] |

Bits [15:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

Selects one or more External Inputs.

| EXTIN[<m>] | Meaning |
|------------|-------------------|
| 0b0 | Ignore EXTIN <m>. |
| 0b1 | Select EXTIN <m>. |

This bit is RES0 if m >= [TRCIDR5](#).NUMEXTINSEL.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for PE Comparator Inputs

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|---|---|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | PECOMP[7] | PECOMP[6] | PECOMP[5] | PECOMP[4] | PECOMP[3] | PECOMP[2] | PECOMP[1] | PECOMP[0] |

Bits [15:8]

Reserved, RES0.

PECOMP[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs.

| PECOMP[<m>] | Meaning |
|-------------|---------------------------------|
| 0b0 | Ignore PE Comparator Input <m>. |
| 0b1 | Select PE Comparator Input <m>. |

This bit is RES0 if m >= [TRCIDR4](#).NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Counters and Sequencer

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|---|---|--------------|--------------|--------------|--------------|-------------|-------------|-------------|-------------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | | |
| RES0 | | | | | | | | SEQUENCER[3] | SEQUENCER[2] | SEQUENCER[1] | SEQUENCER[0] | COUNTERS[3] | COUNTERS[2] | COUNTERS[1] | COUNTERS[0] |

Bits [15:8]

Reserved, RES0.

SEQUENCER[<m>], bit [m+4], for m = 3 to 0

Sequencer states.

| SEQUENCER[<m>] | Meaning |
|----------------|-----------------------------|
| 0b0 | Ignore Sequencer state <m>. |
| 0b1 | Select Sequencer state <m>. |

This bit is RES0 if m >= [TRCIDR5](#).NUMSEQSTATE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COUNTERS[<m>], bit [m], for m = 3 to 0

Counters resources at zero.

| COUNTERS[<m>] | Meaning |
|---------------|-----------------------------|
| 0b0 | Ignore Counter <m>. |
| 0b1 | Select Counter <m> is zero. |

This bit is RES0 if m >= [TRCIDR5](#).NUMCNTR.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single-shot Comparator Controls

| | | | | | | | | | | | | | | | |
|------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | SINGLE_SHOT[7] | SINGLE_SHOT[6] | SINGLE_SHOT[5] | SINGLE_SHOT[4] | SINGLE_SHOT[3] | SINGLE_SHOT[2] | SINGLE_SHOT[1] | SINGLE_SHOT[0] | SINGLE_SHOT[7] | SINGLE_SHOT[6] | SINGLE_SHOT[5] | SINGLE_SHOT[4] | SINGLE_SHOT[3] | SINGLE_SHOT[2] | SINGLE_SHOT[1] |

Bits [15:8]

Reserved, RES0.

SINGLE_SHOT[<m>], bit [m], for m = 7 to 0

Selects one or more Single-shot Comparator Controls.

| SINGLE_SHOT[<m>] | Meaning |
|------------------|--|
| 0b0 | Ignore Single-shot Comparator Control <m>. |
| 0b1 | Select Single-shot Comparator Control <m>. |

This bit is RES0 if m >= [TRCIDR4](#).NUMSSCC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single Address Comparators

| | | | | | | | | | | | | | | | |
|---------|---------|---------|---------|---------|---------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SAC[15] | SAC[14] | SAC[13] | SAC[12] | SAC[11] | SAC[10] | SAC[9] | SAC[8] | SAC[7] | SAC[6] | SAC[5] | SAC[4] | SAC[3] | SAC[2] | SAC[1] | SAC[0] |

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators.

| SAC[<m>] | Meaning |
|----------|---------------------------------------|
| 0b0 | Ignore Single Address Comparator <m>. |
| 0b1 | Select Single Address Comparator <m>. |

This bit is RES0 if m >= 2 × [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Address Range Comparators

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|---|---|--------|--------|--------|--------|--------|--------|--------|--------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | ARC[7] | ARC[6] | ARC[5] | ARC[4] | ARC[3] | ARC[2] | ARC[1] | ARC[0] |

Bits [15:8]

Reserved, RES0.

ARC[<m>], bit [m], for m = 7 to 0

Selects one or more Address Range Comparators.

| ARC[<m>] | Meaning |
|----------|--------------------------------------|
| 0b0 | Ignore Address Range Comparator <m>. |
| 0b1 | Select Address Range Comparator <m>. |

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Context Identifier Comparators

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|---|---|--------|--------|--------|--------|--------|--------|--------|--------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | CID[7] | CID[6] | CID[5] | CID[4] | CID[3] | CID[2] | CID[1] | CID[0] |

Bits [15:8]

Reserved, RES0.

CID[<m>], bit [m], for m = 7 to 0

Selects one or more Context Identifier Comparators.

| CID[<m>] | Meaning |
|----------|---|
| 0b0 | Ignore Context Identifier Comparator <m>. |
| 0b1 | Select Context Identifier Comparator <m>. |

This bit is RES0 if m >= [TRCIDR4](#).NUMCIDC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Virtual Context Identifier Comparators

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|---|---|---------|---------|---------|---------|---------|---------|---------|---------|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | VMID[7] | VMID[6] | VMID[5] | VMID[4] | VMID[3] | VMID[2] | VMID[1] | VMID[0] |

Bits [15:8]

Reserved, RES0.

VMID[<m>], bit [m], for m = 7 to 0

Selects one or more Virtual Context Identifier Comparators.

| VMID[<m>] | Meaning |
|-----------|---|
| 0b0 | Ignore Virtual Context Identifier Comparator <m>. |
| 0b1 | Select Virtual Context Identifier Comparator <m>. |

This bit is RES0 if m >= [TRCIDR4.NUMVMIDC](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCRSCTLR<n>

Must be programmed if any of the following are true:

- [TRCCNTCTLR<a>.RLDEVENT](#).TYPE == 0 and [TRCCNTCTLR<a>.RLDEVENT](#).SEL == n.
- [TRCCNTCTLR<a>.RLDEVENT](#).TYPE == 1 and [TRCCNTCTLR<a>.RLDEVENT](#).SEL == n/2.
- [TRCCNTCTLR<a>.CNTEVENT](#).TYPE == 0 and [TRCCNTCTLR<a>.CNTEVENT](#).SEL == n.
- [TRCCNTCTLR<a>.CNTEVENT](#).TYPE == 1 and [TRCCNTCTLR<a>.CNTEVENT](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT0](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT0](#).SEL == n.
- [TRCEVENTCTL0R.EVENT0](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT0](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT1](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT1](#).SEL == n.
- [TRCEVENTCTL0R.EVENT1](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT1](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT2](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT2](#).SEL == n.
- [TRCEVENTCTL0R.EVENT2](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT2](#).SEL == n/2.
- [TRCEVENTCTL0R.EVENT3](#).TYPE == 0 and [TRCEVENTCTL0R.EVENT3](#).SEL == n.
- [TRCEVENTCTL0R.EVENT3](#).TYPE == 1 and [TRCEVENTCTL0R.EVENT3](#).SEL == n/2.
- [TRCSEQEVR<a>.B](#).TYPE == 0 and [TRCSEQEVR<a>.B](#).SEL == n.
- [TRCSEQEVR<a>.B](#).TYPE == 1 and [TRCSEQEVR<a>.B](#).SEL == n/2.
- [TRCSEQEVR<a>.F](#).TYPE == 0 and [TRCSEQEVR<a>.F](#).SEL == n.
- [TRCSEQEVR<a>.F](#).TYPE == 1 and [TRCSEQEVR<a>.F](#).SEL == n/2.
- [TRCSEQRSTEV.RST](#).TYPE == 0 and [TRCSEQRSTEV.RST](#).SEL == n.
- [TRCSEQRSTEV.RST](#).TYPE == 1 and [TRCSEQRSTEV.RST](#).SEL == n/2.
- [TRCTSCTLR.EVENT](#).TYPE == 0 and [TRCTSCTLR.EVENT](#).SEL == n.
- [TRCTSCTLR.EVENT](#).TYPE == 1 and [TRCTSCTLR.EVENT](#).SEL == n/2.
- [TRCVICTLR.EVENT](#).TYPE == 0 and [TRCVICTLR.EVENT](#).SEL == n.
- [TRCVICTLR.EVENT](#).TYPE == 1 and [TRCVICTLR.EVENT](#).SEL == n/2.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCRSCTLR<n>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-----------|
| 0b10 | 0b001 | 0b0001 | n[3:0] | 0b00:n[4] |

TRCRSR, Resources Status Register

The TRCRSR characteristics are:

Purpose

Use this to set, or read, the status of the resources.

Configuration

AArch64 System register TRCRSR bits [31:0] are architecturally mapped to External register [TRCRSR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCRSR are UNDEFINED.

Attributes

TRCRSR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |

Bits [63:13]

Reserved, RES0.

TA, bit [12]

Tracing active.

| TA | Meaning |
|-----|------------------------|
| 0b0 | Tracing is not active. |
| 0b1 | Tracing is active. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

EVENT[<m>], bit [m+8], for m = 3 to 0

Untraced status of ETEEvents.

| EVENT[<m>] | Meaning |
|------------|--|
| 0b0 | An ETEEvent <m> has not occurred. |
| 0b1 | An ETEEvent <m> has occurred while the resources were in the Paused state. |

This bit is RES0 if [TRCIDR4](#).NUMRSPAIR == 0 || m > [TRCIDR0](#).NUMEVENT.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

The sticky status of the External Input Selectors.

| EXTIN[<m>] | Meaning |
|------------|---|
| 0b0 | An event selected by External Input Selector <m> has not occurred. |
| 0b1 | At least one event selected by External Input Selector <m> has occurred while the resources were in the Paused state. |

This bit is RES0 if m >= [TRCIDR5.NUMEXTINSEL](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCRSR

Must always be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCRSR

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b1010 | 0b000 |

TRCSEQEVR<n>, Sequencer State Transition Control Register <n>, n = 0 - 2

The TRCSEQEVR<n> characteristics are:

Purpose

Moves the Sequencer state:

- Backwards, from state n+1 to state n when a programmed resource event occurs.
- Forwards, from state n to state n+1 when a programmed resource event occurs.

Configuration

AArch64 System register TRCSEQEVR<n> bits [31:0] are architecturally mapped to External register [TRCSEQEVR<n>\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQEVR<n> are UNDEFINED.

Attributes

TRCSEQEVR<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|------|-------|----|----|----|--------|------|-------|----|----|----|----|----|----|----|

| RES0 | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | B_TYPE | RES0 | B_SEL | | | | F_TYPE | RES0 | F_SEL | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:16]

Reserved, RES0.

B_TYPE, bit [15]

Chooses the type of Resource Selector.

Backward field. Defines whether the backward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == 0x14 then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

| B TYPE | Meaning |
|--------|---|
| 0b0 | A single Resource Selector. TRCSEQEVR<n>.B.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.B.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.B.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

B_SEL, bits [12:8]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.B.TYPE controls whether TRCSEQEVR<n>.B.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Backward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

F_TYPE, bit [7]

Chooses the type of Resource Selector.

Backward field. Defines whether the forward resource event is a single Resource Selector or a Resource Selector pair. When the resource event occurs then the Sequencer state moves from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == 0x12 then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

| F_TYPE | Meaning |
|--------|---|
| 0b0 | A single Resource Selector. TRCSEQEVR<n>.F.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.F.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.F.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

F_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.F.TYPE controls whether TRCSEQEVR<n>.F.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

Forward field. Selects the single Resource Selector or Resource Selector pair.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQEVR<n>

Must be programmed if [TRCRSCTLR<a>.GROUP == 0b0010](#) and [TRCRSCTLR<a>.SEQUENCER != 0b0000](#).

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSEQEVR<n>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|-------------|-------|
| 0b10 | 0b001 | 0b0000 | 0b00:n[1:0] | 0b100 |

Chooses the type of Resource Selector.

| RST_TYPE | Meaning |
|----------|--|
| 0b0 | A single Resource Selector. TRCSEQRSTEVR.RST.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCSEQRSTEVR.RST.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQRSTEVR.RST.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

RST_SEL, bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQRSTEV.RST.TYPE controls whether TRCSEQRSTEV.RST.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQRSTEV

Must be programmed if [TRCRSCTLR<a>.GROUP == 0b0010](#) and [TRCRSCTLR<a>.SEQUENCER != 0b0000](#).

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSEQRSTEV

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b0110 | 0b100 |

TRCSEQSTR, Sequencer State Register

The TRCSEQSTR characteristics are:

Purpose

Use this to set, or read, the Sequencer state.

Configuration

AArch64 System register TRCSEQSTR bits [31:0] are architecturally mapped to External register [TRCSEQSTR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR5.NUMSEQSTATE != 0b000. Otherwise, direct accesses to TRCSEQSTR are UNDEFINED.

Attributes

TRCSEQSTR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|

Bits [63:2]

Reserved, RES0.

STATE, bits [1:0]

Set or returns the state of the Sequencer.

| STATE | Meaning |
|-------|----------|
| 0b00 | State 0. |
| 0b01 | State 1. |
| 0b10 | State 2. |
| 0b11 | State 3. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQSTR

Must be programmed if [TRCRSCTLR<a>](#).GROUP == 0b0010 and [TRCRSCTLR<a>](#).SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSEQSTR

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b0111 | 0b100 |

Bits [63:25]

Reserved, RES0.

RST, bit [24]

Selects the Single-shot Comparator Control mode.

| RST | Meaning |
|-----|--|
| 0b0 | The Single-shot Comparator Control is in single-shot mode. |
| 0b1 | The Single-shot Comparator Control is in multi-shot mode. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

ARC[<m>], bit [m+16], for m = 7 to 0

Selects one or more Address Range Comparators for Single-shot control.

| ARC[<m>] | Meaning |
|----------|--|
| 0b0 | The Address Range Comparator <m>, is not selected for Single-shot control. |
| 0b1 | The Address Range Comparator <m>, is selected for Single-shot control. |

This bit is RES0 if m >= [TRCIDR4.NUMACPAIRS](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators for Single-shot control.

| SAC[<m>] | Meaning |
|----------|---|
| 0b0 | The Single Address Comparator <m>, is not selected for Single-shot control. |
| 0b1 | The Single Address Comparator <m>, is selected for Single-shot control. |

This bit is RES0 if $m \geq 2 \times \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSSCCR<n>

Must be programmed if any [TRCRSCTLR<a>](#).GROUP == 0b0011 and [TRCRSCTLR<a>](#).SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSSCCR<n>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|------------|-------|
| 0b10 | 0b001 | 0b0001 | 0b0:n[2:0] | 0b010 |

Bits [63:32]

Reserved, RES0.

STATUS, bit [31]

Single-shot Comparator Control status. Indicates if any of the comparators selected by this Single-shot Comparator control have matched. The selected comparators are defined by [TRCSSCCR<n>.ARC](#), [TRCSSCCR<n>.SAC](#), and [TRCSSPCICR<n>.PC](#).

| STATUS | Meaning |
|--------|---|
| 0b0 | No match has occurred. When the first match occurs, this field takes a value of 1. It remains at 1 until explicitly modified by a write to this register. |
| 0b1 | One or more matches has occurred. If TRCSSCCR<n>.RST == 0 then: <ul style="list-style-type: none"> There is only one match and no more matches are possible. Software must reset this field to 0 to re-enable the Single-shot Comparator Control. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

PENDING, bit [30]

Single-shot pending status. The Single-shot Comparator Control fired while the resources were in the Paused state.

| PENDING | Meaning |
|---------|-----------------------------------|
| 0b0 | No match has occurred. |
| 0b1 | One or more matches has occurred. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [29:4]

Reserved, RES0.

PC, bit [3]

PE Comparator Input support. Indicates if the Single-shot Comparator Control supports PE Comparator Inputs.

| PC | Meaning |
|-----|--|
| 0b0 | This Single-shot Comparator Control does not support PE Comparator Inputs. Selecting any PE Comparator Inputs using the associated TRCSSPCICR<n> results in CONSTRAINED UNPREDICTABLE behavior of the Single-shot Comparator Control resource. The Single-shot Comparator Control might match unexpectedly or might not match. |
| 0b1 | This Single-shot Comparator Control supports PE Comparator Inputs. |

Access to this field is **RO**.

DV, bit [2]

Data value comparator support. Data value comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

| DV | Meaning |
|-----|--|
| 0b0 | This Single-shot Comparator Control does not support data value comparisons. |
| 0b1 | This Single-shot Comparator Control supports data value comparisons. |

This field reads as 0.

Access to this field is **RO**.

DA, bit [1]

Data Address Comparator support. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

| DA | Meaning |
|-----|--|
| 0b0 | This Single-shot Comparator Control does not support data address comparisons. |
| 0b1 | This Single-shot Comparator Control supports data address comparisons. |

This field reads as 0.

Access to this field is **RO**.

INST, bit [0]

Instruction Address Comparator support. Indicates if the Single-shot Comparator Control supports instruction address comparisons.

| INST | Meaning |
|------|---|
| 0b0 | This Single-shot Comparator Control does not support instruction address comparisons. |
| 0b1 | This Single-shot Comparator Control supports instruction address comparisons. |

This field reads as 1.

Access to this field is **RO**.

Accessing TRCSSCSR<n>

Must be programmed if [TRCRSCTLR<a>](#).GROUP == 0b0011 and [TRCRSCTLR<a>](#).SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSSCSR<n>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|------------|-------|
| 0b10 | 0b001 | 0b0001 | 0b1:n[2:0] | 0b010 |

```

TRCSSPCICR<n>, Single-shot Processing Element Comparator Input Control Register <n>, n = 0 - 7

The TRCSSPCICR<n> characteristics are:

Purpose

Returns the status of the corresponding Single-shot Comparator Control.

Configuration

AArch64 System register TRCSSPCICR<n> bits [31:0] are architecturally mapped to External register [TRCSSPCICR<n>\[31:0\]](#).
This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMSSCC > n, TRCIDR4.NUMPC > 0b0000 and TRCSSCSR<n>.PC == 1. Otherwise, direct accesses to TRCSSPCICR<n> are UNDEFINED.

Attributes

TRCSSPCICR<n> is a 64-bit register.

Bits [63:8]

Reserved, RES0.

PC[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs for Single-shot control.

| PC[<m>] | Meaning |
|---------|---|
| 0b0 | The single PE Comparator Input <m>, is not selected as for Single-shot control. |
| 0b1 | The single PE Comparator Input <m>, is selected as for Single-shot control. |

This bit is RES0 if m >= [TRCIDR4.NUMPC](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSSPCICR<n>

Must be programmed if implemented and any [TRCRSCTLR<a>](#).GROUP == 0b0011 and [TRCRSCTLR<a>](#).SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSTALLCTLR, Stall Control Register

The TRCSTALLCTLR characteristics are:

Purpose

Enables trace unit functionality that prevents trace unit buffer overflows.

Configuration

AArch64 System register TRCSTALLCTLR bits [31:0] are architecturally mapped to External register [TRCSTALLCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR3.STALLCTL == 1. Otherwise, direct accesses to TRCSTALLCTLR are UNDEFINED.

Attributes

TRCSTALLCTLR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|------|----|--|----|--------|----|------|--|----|--|-------|----|----|----|----|----|----|----|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | | 45 | | 44 | 43 | 42 | 41 | | 40 | | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | NOOVERFLOW | | | | RES0 | | | | ISTALL | | RES0 | | | | LEVEL | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | | 13 | | 12 | 11 | 10 | 9 | | 8 | | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

Bits [63:14]

Reserved, RES0.

NOOVERFLOW, bit [13]

When TRCIDR3.NOOVERFLOW == 1:

Trace overflow prevention.

| NOOVERFLOW | Meaning |
|------------|--|
| 0b0 | Trace unit buffer overflow prevention is disabled. |
| 0b1 | Trace unit buffer overflow prevention is enabled. |

Note that enabling this feature might cause a significant performance impact.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

ISTALL, bit [8]

Instruction stall control. Controls if a trace unit can stall the PE when the trace buffer space is less than LEVEL.

| ISTALL | Meaning |
|--------|---------------------------------------|
| 0b0 | The trace unit must not stall the PE. |
| 0b1 | The trace unit can stall the PE. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

LEVEL, bits [3:0]

Threshold level field. The field can support 16 monotonic levels from 0b0000 to 0b1111.

The value 0b0000 defines the Minimal invasion level. This setting has a greater risk of a trace unit buffer overflow.

The value 0b1111 defines the Maximum invasion level. This setting has a reduced risk of a trace unit buffer overflow.

Note that for some implementations, invasion might occur at the minimal invasion level.

One or more of the least significant bits of LEVEL are permitted to be RES0. Arm recommends that LEVEL[3:2] are fully implemented. Arm strongly recommends that LEVEL[3] is always implemented. If one or more bits are RES0 and are written with a non-zero value, the effective value of LEVEL is rounded down to the nearest power of 2 value which has the RES0 bits as zero. For example, if LEVEL[1:0] are RES0 and a value of 0b1110 is written to LEVEL, the effective value of LEVEL is 0b1100.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSTALLCTLR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSTALLCTLR

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b1011 | 0b000 |

TRCSTATR, Trace Status Register

The TRCSTATR characteristics are:

Purpose

Returns the trace unit status.

Configuration

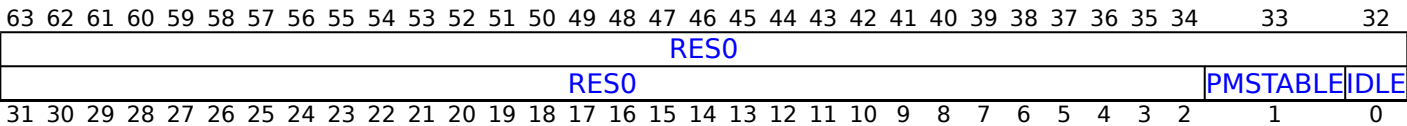

AArch64 System register TRCSTATR bits [31:0] are architecturally mapped to External register [TRCSTATR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCSTATR are UNDEFINED.

Attributes

TRCSTATR is a 64-bit register.

Field descriptions

Bits [63:2]

Reserved, RES0.

PMSTABLE, bit [1]

Programmers' model stable.

| PMSTABLE | Meaning |
|----------|---------------------------------------|
| 0b0 | The programmers' model is not stable. |
| 0b1 | The programmers' model is stable. |

Accessing this field has the following behavior:

- When the trace unit is enabled, access to this field is **UNKNOWN/WI**.
- Otherwise, access to this field is **RO**.

IDLE, bit [0]

Idle status.

| IDLE | Meaning |
|------|-----------------------------|
| 0b0 | The trace unit is not idle. |
| 0b1 | The trace unit is idle. |

Accessing TRCSTATR

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSTATR

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b0011 | 0b000 |

```

TRCSYNCPR, Synchronization Period Register

The TRCSYNCPR characteristics are:

Purpose

Controls how often trace protocol synchronization requests occur.

Configuration

AArch64 System register TRCSYNCPR bits [31:0] are architecturally mapped to External register [TRCSYNCPR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCSYNCPR are UNDEFINED.

Attributes

TRCSYNCPR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | PERIOD | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:5]

Reserved, RES0.

PERIOD, bits [4:0]

Defines the number of bytes of trace between each periodic trace protocol synchronization request.

| PERIOD | Meaning |
|---------|--|
| 0b00000 | Trace protocol synchronization is disabled. |
| 0b01000 | Trace protocol synchronization request occurs after 2^8 bytes of trace. |
| 0b01001 | Trace protocol synchronization request occurs after 2^9 bytes of trace. |
| 0b01010 | Trace protocol synchronization request occurs after 2^{10} bytes of trace. |
| 0b01011 | Trace protocol synchronization request occurs after 2^{11} bytes of trace. |
| 0b01100 | Trace protocol synchronization request occurs after 2^{12} bytes of trace. |
| 0b01101 | Trace protocol synchronization request occurs after 2^{13} bytes of trace. |
| 0b01110 | Trace protocol synchronization request occurs after 2^{14} bytes of trace. |
| 0b01111 | Trace protocol synchronization request occurs after 2^{15} bytes of trace. |
| 0b10000 | Trace protocol synchronization request occurs after 2^{16} bytes of trace. |
| 0b10001 | Trace protocol synchronization request occurs after 2^{17} bytes of trace. |
| 0b10010 | Trace protocol synchronization request occurs after 2^{18} bytes of trace. |
| 0b10011 | Trace protocol synchronization request occurs after 2^{19} bytes of trace. |
| 0b10100 | Trace protocol synchronization request occurs after 2^{20} bytes of trace. |

Other values are reserved. If a reserved value is programmed into PERIOD, then the behavior of the synchronization period counter is CONSTRAINED UNPREDICTABLE and one of the following behaviors occurs:

- No trace protocol synchronization requests are generated by this counter.
- Trace protocol synchronization requests occur at the specified period.
- Trace protocol synchronization requests occur at some other UNKNOWN period which can vary.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSYNCP

Must be programmed if [TRCIDR3](#).SYNCP == 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSYNCP

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b1101 | 0b000 |

Bits [63:7]

Reserved, RES0.

TRACEID, bits [6:0]

Trace ID field. Sets the trace ID value for instruction trace. The width of the field is indicated by the value of [TRCIDR5](#).TRACEIDSIZE. Unimplemented bits are RES0.

If an implementation supports AMBA ATB, then:

- The width of the field is 7 bits.
- Writing a reserved trace ID value does not affect behavior of the trace unit but it might cause UNPREDICTABLE behavior of the trace capture infrastructure.

See the AMBA ATB Protocol Specification for information about which ATID values are reserved.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCTRACEIDR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCTRACEIDR

| op0 | op1 | CRn | CRm | op2 |

TRCTSCTLR, Timestamp Control Register

The TRCTSCTLR characteristics are:

Purpose

Controls the insertion of global timestamps in the trace stream.

Configuration

AArch64 System register TRCTSCTLR bits [31:0] are architecturally mapped to External register [TRCTSCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR0.TSSIZE != 0b00000. Otherwise, direct accesses to TRCTSCTLR are UNDEFINED.

Attributes

TRCTSCTLR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--|----|------------|----|------|----|-----------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | | 39 | | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | EVENT_TYPE | | RES0 | | EVENT_SEL | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | | 7 | | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:8]

Reserved, RES0.

EVENT_TYPE, bit [7] When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

| EVENT_TYPE | Meaning |
|------------|--|
| 0b0 | A single Resource Selector. TRCTSCTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCTSCTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCTSCTLR.EVENT.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors. TRCTSCTLR.EVENT.TYPE controls whether TRCTSCTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCTSCTLR

Must be programmed if [TRCCONFIGR](#).TS == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCTSCTLR

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b1100 | 0b000 |

```

TRCVICTLR, ViewInst Main Control Register

The TRCVICTLR characteristics are:

Purpose

Controls instruction trace filtering.

Configuration

AArch64 System register TRCVICTLR bits [31:0] are architecturally mapped to External register [TRCVICTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented. Otherwise, direct accesses to TRCVICTLR are UNDEFINED.

Attributes

TRCVICTLR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | |
|----------------------|----|----|----|--------------------------------|----|----|----|--------------------------------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 |
| RES0 | | | | EXLEVEL_RL_EL2 | | | | EXLEVEL_RL_EL1 | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 |

Bits [63:27]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [26]

When TRCIDR6.EXLEVEL_RL_EL2 == 1:

Filter instruction trace for EL2 in Realm state.

| EXLEVEL_RL_EL2 | Meaning |
|----------------|--|
| 0b0 | When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit generates instruction trace for EL2 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit does not generate instruction trace for EL2 in Realm state. |
| 0b1 | When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit does not generate instruction trace for EL2 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit generates instruction trace for EL2 in Realm state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [25]**When TRCIDR6.EXLEVEL_RL_EL1 == 1:**

Filter instruction trace for EL1 in Realm state.

| EXLEVEL_RL_EL1 | Meaning |
|----------------|--|
| 0b0 | When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit generates instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit does not generate instruction trace for EL1 in Realm state. |
| 0b1 | When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit does not generate instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit generates instruction trace for EL1 in Realm state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_ELO, bit [24]**When TRCIDR6.EXLEVEL_RL_ELO == 1:**

Filter instruction trace for EL0 in Realm state.

| EXLEVEL_RL_ELO | Meaning |
|----------------|--|
| 0b0 | When TRCVICTLR.EXLEVEL_NS_ELO is 0 the trace unit generates instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_ELO is 1 the trace unit does not generate instruction trace for EL0 in Realm state. |
| 0b1 | When TRCVICTLR.EXLEVEL_NS_ELO is 0 the trace unit does not generate instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_ELO is 1 the trace unit generates instruction trace for EL0 in Realm state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]**When Non-secure EL2 is implemented:**

Filter instruction trace for EL2 in Non-secure state.

| EXLEVEL_NS_EL2 | Meaning |
|----------------|---|
| 0b0 | The trace unit generates instruction trace for EL2 in Non-secure state. |
| 0b1 | The trace unit does not generate instruction trace for EL2 in Non-secure state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [21]

When Non-secure EL1 is implemented:

Filter instruction trace for EL1 in Non-secure state.

| EXLEVEL_NS_EL1 | Meaning |
|----------------|---|
| 0b0 | The trace unit generates instruction trace for EL1 in Non-secure state. |
| 0b1 | The trace unit does not generate instruction trace for EL1 in Non-secure state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_ELO, bit [20]

When Non-secure ELO is implemented:

Filter instruction trace for ELO in Non-secure state.

| EXLEVEL_NS_ELO | Meaning |
|----------------|---|
| 0b0 | The trace unit generates instruction trace for ELO in Non-secure state. |
| 0b1 | The trace unit does not generate instruction trace for ELO in Non-secure state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [19]

When EL3 is implemented:

Filter instruction trace for EL3.

| EXLEVEL_S_EL3 | Meaning |
|---------------|---|
| 0b0 | The trace unit generates instruction trace for EL3. |
| 0b1 | The trace unit does not generate instruction trace for EL3. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [18]

When EL2 is implemented and FEAT_SEL2 is implemented:

Filter instruction trace for EL2 in Secure state.

| EXLEVEL_S_EL2 | Meaning |
|---------------|---|
| 0b0 | The trace unit generates instruction trace for EL2 in Secure state. |
| 0b1 | The trace unit does not generate instruction trace for EL2 in Secure state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [17]

When Secure EL1 is implemented:

Filter instruction trace for EL1 in Secure state.

| EXLEVEL_S_EL1 | Meaning |
|---------------|---|
| 0b0 | The trace unit generates instruction trace for EL1 in Secure state. |
| 0b1 | The trace unit does not generate instruction trace for EL1 in Secure state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [16]

When Secure EL0 is implemented:

Filter instruction trace for EL0 in Secure state.

| EXLEVEL S_ELO | Meaning |
|---------------|---|
| 0b0 | The trace unit generates instruction trace for ELO in Secure state. |
| 0b1 | The trace unit does not generate instruction trace for ELO in Secure state. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:12]

Reserved, RES0.

TRCERR, bit [11]

When TRCIDR3.TRCERR == 1:

Controls the forced tracing of System Error exceptions.

| TRCERR | Meaning |
|--------|--|
| 0b0 | Forced tracing of System Error exceptions is disabled. |
| 0b1 | Forced tracing of System Error exceptions is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCRESET, bit [10]

Controls the forced tracing of PE Resets.

| TRCRESET | Meaning |
|----------|--|
| 0b0 | Forced tracing of PE Resets is disabled. |
| 0b1 | Forced tracing of PE Resets is enabled. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SSSTATUS, bit [9]

ViewInst start/stop function status.

| SSSTATUS | Meaning |
|----------|---|
| 0b0 | Stopped State. The ViewInst start/stop function is in the stopped state. |
| 0b1 | Started State. The ViewInst start/stop function is in the started state. |

Before software enables the trace unit, it must write to this field to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this field to 1. Arm recommends that the value of this field is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR.SSSTATUS is UNKNOWN and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing [TRCPRGCTLR.EN](#) or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- RES1** if all of the following are true:
 - TRCIDR4.NUMACPAIRS == 0b0000
 - TRCIDR4.NUMPC == 0b0000
- Otherwise, access to this field is **RW**.

Bit [8]

Reserved, RES0.

EVENT_TYPE, bit [7]

When TRCIDR4.NUMRSPAIR != 0b0000:

Chooses the type of Resource Selector.

| EVENT_TYPE | Meaning |
|------------|--|
| 0b0 | A single Resource Selector. TRCVICTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event. |
| 0b1 | A Boolean-combined pair of Resource Selectors. TRCVICTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT.SEL[4] is RES0. |

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT_SEL, bits [4:0]

When TRCIDR4.NUMRSPAIR != 0b0000:

Defines the selected Resource Selector or pair of Resource Selectors. TRCVICTLR.EVENT.TYPE controls whether TRCVICTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

When TRCIDR4.NUMRSPAIR == 0b0000:

This field is reserved:

- Bits [4:1] are RES0.
- Bit [0] is RES1.

Otherwise:

Reserved, RES0.

Accessing TRCVICTLR

Must be programmed.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVICTLR

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b0000 | 0b010 |

TRCVIICTRL, ViewInst Include/Exclude Control Register

The TRCVIICTLR characteristics are:

Purpose

Use this to select, or read, the Address Range Comparators for the ViewInst include/exclude function.

Configuration

AArch64 System register TRCVIIECTLR bits [31:0] are architecturally mapped to External register [TRCVIIECTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCVIIECTLR are UNDEFINED.

Attributes

TRCVIIECTLR is a 64-bit register.

|------------------|------------|------------|------------|------------|------------|------------|------------|------------|------|
| 6362616059585756 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 |
| | | | | | | | | | RES0 |
| RES0 | EXCLUDE[7] | EXCLUDE[6] | EXCLUDE[5] | EXCLUDE[4] | EXCLUDE[3] | EXCLUDE[2] | EXCLUDE[1] | EXCLUDE[0] | |
| 3130292827262524 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 |

Bits [63:24]

Reserved, RES0.

EXCLUDE[<m>], bit [m+16], for m = 7 to 0

Exclude Address Range Comparator <m>. Selects whether Address Range Comparator <m> is in use with the ViewInst exclude function.

| EXCLUDE[<m>] | Meaning |
|---------------------------|---|
| 0b0 | The address range that Address Range Comparator <m> defines, is not selected for the ViewInst exclude function. |
| 0b1 | The address range that Address Range Comparator <m> defines, is selected for the ViewInst exclude function. |

This bit is RES0 if $m \geq \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [15:8]

Reserved, RES0.

INCLUDE[<m>], bit [m], for m = 7 to 0

Include Address Range Comparator <m>.

Selects whether Address Range Comparator <m> is in use with the ViewInst include function.

Selecting no comparators for the ViewInst include function indicates that all instructions are included by default.

The ViewInst exclude function then indicates which ranges are excluded.

| INCLUDE[<m>] | Meaning |
|---------------------------|---|
| 0b0 | The address range that Address Range Comparator <m> defines, is not selected for the ViewInst include function. |
| 0b1 | The address range that Address Range Comparator <m> defines, is selected for the ViewInst include function. |

This bit is RES0 if m >= [TRCIDR4](#).NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVIIECTLR

Must be programmed if [TRCIDR4](#).NUMACPAIRS > 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVIIECTLR

| op0 | op1 | CRn | CRm | op2 |
|------------|------------|------------|------------|------------|
| 0b10 | 0b001 | 0b0000 | 0b0001 | 0b010 |

TRCVIPCSSCTLR, ViewInst Start/Stop PE Comparator Control Register

The TRCVIPCSSCTLR characteristics are:

Purpose

Use this to select, or read, which PE Comparator Inputs can control the ViewInst start/stop function.

Configuration

AArch64 System register TRCVIPCSSCTLR bits [31:0] are architecturally mapped to External register [TRCVIPCSSCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMPC > 0b0000. Otherwise, direct accesses to TRCVIPCSSCTLR are UNDEFINED.

Attributes

TRCVIPCSSCTLR is a 64-bit register.

TRCVISSCTLR, ViewInst Start/Stop Control Register

The TRCVISSCTLR characteristics are:

Purpose

Use this to select, or read, the Single Address Comparators for the ViewInst start/stop function.

Configuration

AArch64 System register TRCVISSCTLR bits [31:0] are architecturally mapped to External register [TRCVISSCTLR\[31:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMACPAIRS > 0b0000. Otherwise, direct accesses to TRCVISSCTLR are UNDEFINED.

Attributes

TRCVISSCTLR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | |
|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|--------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|-------------------------|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 |
| STOP[15] | STOP[14] | STOP[13] | STOP[12] | STOP[11] | STOP[10] | STOP[9] | STOP[8] | STOP[7] | STOP[6] | STOP[5] | STOP[4] | STOP[3] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 |

Bits [63:32]

Reserved, RES0.

STOP[<m>], bit [m+16], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of stopping trace.

| STOP[<m>] | Meaning |
|-----------|--|
| 0b0 | The Single Address Comparator <m>, is not selected as a stop resource. |
| 0b1 | The Single Address Comparator <m>, is selected as a stop resource. |

This bit is RES0 if $m \geq 2 \times \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

START[<m>], bit [m], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function, for the purpose of starting trace.

| START[<m>] | Meaning |
|------------|---|
| 0b0 | The Single Address Comparator <m>, is not selected as a start resource. |
| 0b1 | The Single Address Comparator <m>, is selected as a start resource. |

This bit is RES0 if $m \geq 2 \times \text{TRCIDR4.NUMACPAIRS}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVISSCTLR

Must be programmed if $\text{TRCIDR4.NUMACPAIRS} > 0b0000$.

For any 2 comparators selected for the ViewInst start/stop function, the comparator containing the lower address must be a lower numbered comparator.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVISSCTLR

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0000 | 0b0010 | 0b010 |

| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 |
| | | | | | | | | | | |
| COMP3[7] | COMP3[6] | COMP3[5] | COMP3[4] | COMP3[3] | COMP3[2] | COMP3[1] | COMP3[0] | COMP2[7] | COMP2[6] | COMP2[5] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 |

Bits [63:32]

Reserved, RES0.

COMP3[<m>], bit [m+24], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 3:

TRCVMIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR3. Each bit in this field corresponds to a byte in TRCVMIDCVR3.

| COMP3[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if $m \geq \text{TRCIDR2.VMIDSIZE}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0**When TRCIDR4.NUMVMIDC > 2:**

TRCVMIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR2. Each bit in this field corresponds to a byte in TRCVMIDCVR2.

| COMP2[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0**When TRCIDR4.NUMVMIDC > 1:**

TRCVMIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR1. Each bit in this field corresponds to a byte in TRCVMIDCVR1.

| COMP1[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0**When TRCIDR4.NUMVMIDC > 0:**

TRCVMIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR0. Each bit in this field corresponds to a byte in TRCVMIDCVR0.

| COMP0[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCCTLRO

If software uses the [TRCVMIDCVR<n>](#) registers, where n=0-3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCVMIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCVMIDCVR<n>](#) is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVMIDCCTLRO

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0011 | 0b0010 | 0b010 |

```

TRCVMIDCCTL1, Virtual Context Identifier Comparator Control Register 1

The TRCVMIDCCTL1 characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the [TRCVMIDCVR<n>](#) registers, where n=4-7.

Configuration

AArch64 System register TRCVMIDCCTL1R1 bits [31:0] are architecturally mapped to External register [TRCVMIDCCTL1R1\[31:0\]](#).

This register is present only when FEAT_ETE is implemented, TRCIDR4.NUMVMIDC > 0x4 and TRCIDR2.VMIDSIZE > 0b00000. Otherwise, direct accesses to TRCVMIDCCTLR1 are UNDEFINED.

Attributes

TRCVMIDCCTL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | |
|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 |
| | | | | | | | | | | |
| COMP7[7] | COMP7[6] | COMP7[5] | COMP7[4] | COMP7[3] | COMP7[2] | COMP7[1] | COMP7[0] | COMP6[7] | COMP6[6] | COMP6[5] |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 |

Bits [63:32]

Reserved, RES0.

COMP7[<m>], bit [m+24], for m = 7 to 0

When TRCIDR4.NUMVMIDC > 7:

TRCVMIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR7. Each bit in this field corresponds to a byte in TRCVMIDCVR7.

| COMP7[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if $m \geq \text{TRCIDR2.VMIDSIZE}$.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0**When TRCIDR4.NUMVMIDC > 6:**

TRCVMIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR6. Each bit in this field corresponds to a byte in TRCVMIDCVR6.

| COMP6[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0**When TRCIDR4.NUMVMIDC > 5:**

TRCVMIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR5. Each bit in this field corresponds to a byte in TRCVMIDCVR5.

| COMP5[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0**When TRCIDR4.NUMVMIDC > 4:**

TRCVMIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR4. Each bit in this field corresponds to a byte in TRCVMIDCVR4.

| COMP4[<m>] | Meaning |
|------------|--|
| 0b0 | The trace unit includes TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |
| 0b1 | The trace unit ignores TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison. |

This bit is RES0 if m >= [TRCIDR2.VMIDSIZE](#).

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCCTLR1

If software uses the [TRCVMIDCVR<n>](#) registers, where n=4-7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in [TRCVMIDCVR<n>](#) to 0x00.

If any bit is 1 and the relevant byte in [TRCVMIDCVR<n>](#) is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVMIDCCTLR1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b10 | 0b001 | 0b0011 | 0b0011 | 0b010 |

TRCVMIDCVR<n>, Virtual Context Identifier Comparator Value Register <n>, n = 0 - 7

The TRCVMIDCVR<n> characteristics are:

Purpose

Contains the Virtual Context Identifier Comparator value.

Configuration

AArch64 System register TRCVMIDCVR<n> bits [63:0] are architecturally mapped to External register [TRCVMIDCVR<n>\[63:0\]](#).

This register is present only when FEAT_ETE is implemented and TRCIDR4.NUMVMIDC > n. Otherwise, direct accesses to TRCVMIDCVR<n> are UNDEFINED.

Attributes

TRCVMIDCVR<n> is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

VALUE, bits [63:0]

Virtual context identifier value. The width of this field is indicated by [TRCIDR2.VMIDSIZE](#). Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Virtual context identifier is zero until the PE updates the Virtual context identifier .

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVMIDCVR<n>

Must be programmed if any of the following are true:

- [TRCRSCTLR<a>](#).GROUP == 0b0111 and [TRCRSCTLR<a>](#).VMID[n] == 1.
- [TRCACATR<a>](#).CONTEXTTYPE == 0b10 or 0b11 and [TRCACATR<a>](#).CONTEXT == n.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVMIDCVR<n>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|------------|-------|
| 0b10 | 0b001 | 0b0011 | n[2:0]:0b0 | 0b001 |

TRFCR_EL1, Trace Filter Control Register (EL1)

The TRFCR_EL1 characteristics are:

Purpose

Provides EL1 controls for Trace.

Configuration

AArch64 System register TRFCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register [TRFCR\[31:0\]](#).

This register is present only when FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR_EL1 are UNDEFINED.

Attributes

TRFCR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [63:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

| TS | Meaning | Applies when |
|------|---|------------------------------|
| 0b01 | Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF_EL2 . | |
| 0b10 | Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2 : <ul style="list-style-type: none"> • SCR_EL3.ECVEN == 0. • CNTHCTL_EL2.ECV == 0. | When FEAT_ECV is implemented |
| 0b11 | Physical timestamp. The traced timestamp is the physical counter value. | |

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- EL2 is implemented and `TRFCR_EL2.TS != 0b00`.
- `SelfHostedTraceEnabled() == FALSE`.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

| E1TRE | Meaning |
|--------------|-----------------------------|
| 0b0 | Trace is prohibited at EL1. |
| 0b1 | Trace is allowed at EL1. |

This field is ignored if SelfHostedTraceEnabled() == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

E0TRE, bit [0]

EL0 Trace Enable.

| E0TRE | Meaning |
|--------------|-----------------------------|
| 0b0 | Trace is prohibited at EL0. |
| 0b1 | Trace is allowed at EL0. |

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and enabled in the current Security state and [HCR_EL2.TGE](#) == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing TRFCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

TTBR0_EL1, Translation Table Base Register 0 (EL1)

The TTBR0_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR0_EL1 bits [63:0] are architecturally mapped to AArch32 System register [TTBR0\[63:0\]](#).

Attributes

TTBR0_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ASID | | | | | | | | | | | | | | | | BADDR[47:1] | | | | | | | | | | | | | | | |
| BADDR[47:1] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | CnP |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

An ASID for the translation table base address. The [TCR_EL1.A1](#) field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL1.T0SZ](#), the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of [TCR_EL1.IPS](#) is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of [TCR_EL1](#).IPS is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When $x > 6$, register bits[($x-1$):6] are RES0.

Note

[TCR_EL1](#).IPS==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of [ID_AA64MMFR0_EL1](#).PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of [TCR_EL1](#).IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[($x-1$):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1.

| CnP | Meaning |
|-----|---|
| 0b0 | <p>The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> • The value of TTBR0_EL1.CnP on those other PEs. • The value of the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |
| 0b1 | <p>The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply:</p> <ul style="list-style-type: none"> • The translation table entries are pointed to by TTBR0_EL1. • The translation tables relate to the same translation regime. • The ASID is the same as the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR0_EL1 or TTBR0_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

TTBR0_EL2, Translation Table Base Register 0 (EL2)

The TTBR0_EL2 characteristics are:

Purpose

When [HCR_EL2.E2H](#) is 0, holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

When [HCR_EL2.E2H](#) is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL2&0 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR0_EL2 bits [47:1] are architecturally mapped to AArch32 System register [HTTBR\[47:1\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

TTBR0_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ASID | | | | | | | | | | | | | | | | BADDR[47:1] | | | | | | | | | | | | | | | |
| BADDR[47:1] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | CnP |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

When [FEAT_VHE](#) is implemented:

When [HCR_EL2.E2H](#) is 0, this field is RES0.

When [HCR_EL2.E2H](#) is 1, it holds an ASID for the translation table base address. The [TCR_EL2.A1](#) field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL2.T0SZ](#), the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of [TCR_EL2.{I}PS](#) is not 0b110, then:

- Register bits[($x-1$):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of [TCR_EL2.{I}PS](#) is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
 - Register bit[1] is RES0.
 - When $x > 6$, register bits[($x-1$):6] are RES0.
-

Note

The OA size specified by [TCR_EL2.{I}PS](#) is determined as follows:

- The value of [TCR_EL2.PS](#) when the value of [HCR_EL2.E2H](#) is 0.
- The value of [TCR_EL2.IPS](#) when the value of [HCR_EL2.E2H](#) is 1.

[TCR_EL2.{I}PS](#) == 0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of [ID_AA64MMFR0_EL1.PARange](#) indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of [TCR_EL2.{I}PS](#) is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[($x-1$):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1.

| CnP | Meaning |
|-----|--|
| 0b0 | <p>The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> The value of TTBR0_EL2.CnP on those other PEs. When the current translation regime is the EL2&0 regime, the value of the current ASID. |
| 0b1 | <p>The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply:</p> <ul style="list-style-type: none"> The translation table entries are pointed to by TTBR0_EL2. The translation tables relate to the same translation regime. If that translation regime is the EL2&0 regime, the ASID is the same as the current ASID. |

This bit is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR0_EL2 or TTBR0_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

TTBR0_EL3, Translation Table Base Register 0 (EL3)

The TTBR0_EL3 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL3 translation regime, and other information for this translation regime.

Configuration

This register is present only when EL3 is implemented. Otherwise, direct accesses to TTBR0_EL3 are UNDEFINED.

Attributes

TTBR0_EL3 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| RES0 | | | | | | | | | | | | | | | | BADDR[47:1] | | | | | | | | | | | | | | | |
| BADDR[47:1] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | CnP |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:48]

Reserved, RES0.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL3.T0SZ](#), the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of [TCR_EL3.PS](#) is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of [TCR_EL3.PS](#) is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When x>6, register bits[(x-1):6] are RES0.

Note

[TCR_EL3](#).PS==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of [ID_AA64MMFR0_EL1](#).PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of [TCR_EL3](#).PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL3, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL3 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1.

| CnP | Meaning |
|-----|---|
| 0b0 | The translation table entries pointed to by TTBR0_EL3, for the current translation regime, are permitted to differ from corresponding entries for TTBR0_EL3 for other PEs in the Inner Shareable domain. This is not affected by the value of TTBR0_EL3.CnP on those other PEs. |
| 0b1 | The translation table entries pointed to by TTBR0_EL3 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1 and the translation table entries are pointed to by TTBR0_EL3. |

This bit is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL3.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL3s do not point to the same translation table entries the results of translations using TTBR0_EL3 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TTBR0_EL3

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b0010 | 0b0000 | 0b000 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

TTBR1_EL1, Translation Table Base Register 1 (EL1)

The TTBR1_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 stage 1 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR1_EL1 bits [63:0] are architecturally mapped to AArch32 System register [TTBR1\[63:0\]](#).

Attributes

TTBR1_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| ASID | | | | | | | | | | | | | | | | BADDR[47:1] | | | | | | | | | | | | | | | |
| BADDR[47:1] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | CnP |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

An ASID for the translation table base address. The [TCR_EL1.A1](#) field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL1.T1SZ](#), the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of [TCR_EL1.IPS](#) is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of [TCR_EL1](#).IPS is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- When $x > 6$, register bits[($x-1$):6] are RES0.

Note

[TCR_EL1](#).IPS==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of [ID_AA64MMFR0_EL1](#).PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of [TCR_EL1](#).IPS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[($x-1$):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1.

| CnP | Meaning |
|-----|---|
| 0b0 | <p>The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by:</p> <ul style="list-style-type: none"> • The value of TTBR1_EL1.CnP on those other PEs. • The value of the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |
| 0b1 | <p>The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply:</p> <ul style="list-style-type: none"> • The translation table entries are pointed to by TTBR1_EL1. • The translation tables relate to the same translation regime. • The ASID is the same as the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID. |

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR1_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic TTBR1_EL1 or TTBR1_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TTBR1_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0010 | 0b0000 | 0b001 |

```

TTBR1_EL2, Translation Table Base Register 1 (EL2)

The TTBR1_EL2 characteristics are:

Purpose

When [HCR_EL2.E2H](#) is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL2&0 translation regime, and other information for this translation regime.

Note

When [HCR_EL2.E2H](#) is 0, the contents of this register are ignored by the PE, except for a direct read or write of the register.

Configuration

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to TTBR1_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

TTBR1_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|

| BADDR[47:1] | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | CnP |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

ASID, bits [63:48]

An ASID for the translation table base address. The [TCR_EL2.A1](#) field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The smallest permitted value of x is 6. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [TCR_EL2.T1SZ](#), the translation stage, and the translation granule size.

Note

A translation table is required to be aligned to the size of the table. If a table contains fewer than eight entries, it must be aligned on a 64 byte address boundary.

If the value of [TCR_EL2](#).{I}PS is not 0b110, then:

- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs, then bits A[51:48] of the stage 1 translation table base address are 0b0000.

If FEAT_LPA is implemented and the value of [TCR_EL2](#).{I}PS is 0b110, then:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
 - Register bit[1] is RES0.
 - When x>6, register bits[(x-1):6] are RES0.
-

Note

The OA size specified by [TCR_EL2](#).{I}PS is determined as follows:

- The value of [TCR_EL2](#).PS when the value of [HCR_EL2](#).E2H is 0.
- The value of [TCR_EL2](#).IPS when the value of [HCR_EL2](#).E2H is 1.

[TCR_EL2](#).{I}PS==0b110 is permitted when:

- FEAT_LPA is implemented and the 64KB translation granule is used.
- FEAT_LPA2 is implemented and the 4KB or 16KB translation granule is used.

When the value of [ID_AA64MMFR0_EL1](#).PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of [TCR_EL2](#).{I}PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1.

| CnP | Meaning |
|-----|--|
| 0b0 | The translation table entries pointed to by TTBR1_EL2 for the current ASID are permitted to differ from corresponding entries for TTBR1_EL2 for other PEs in the Inner Shareable domain. This is not affected by: <ul style="list-style-type: none"> The value of TTBR1_EL2.CnP on those other PEs. The value of the current ASID. |
| 0b1 | The translation table entries pointed to by TTBR1_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1 and all of the following apply: <ul style="list-style-type: none"> The translation table entries are pointed to by TTBR1_EL2. The ASID is the same as the current ASID. |

This bit is permitted to be cached in a TLB.

Note

- TTBR1_EL2 is accessible only when the value of [HCR_EL2.E2H](#) is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR1_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic TTBR1_EL2 or TTBR1_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TTBR1_EL2

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0010 | 0b0000 | 0b001 |

```

UAO, User Access Override

The UAO characteristics are:

Purpose

Allows access to the User Access Override bit.

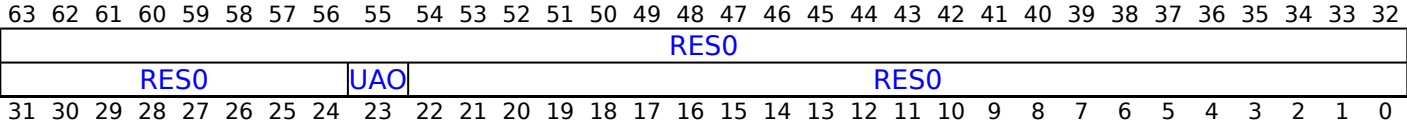

Configuration

This register is present only when FEAT_UAO is implemented. Otherwise, direct accesses to UAO are UNDEFINED.

Attributes

UAO is a 64-bit register.

Field descriptions

Bits [63:24]

Reserved, RES0.

UAO, bit [23]

User Access Override.

| UAO | Meaning |
|-----|---|
| 0b0 | The behavior of LDTR* and STTR* instructions is as defined in the base Armv8 architecture. |
| 0b1 | When executed at EL1, or at EL2 with HCR_EL2 .{E2H, TGE} == {1, 1}, LDTR* and STTR* instructions behave as the equivalent LDR* and STR* instructions. |

When executed at EL3, or at EL2 with [HCR_EL2](#).E2H == 0 or [HCR_EL2](#).TGE == 0, the LDTR* and STTR* instructions behave as the equivalent LDR* and STR* instructions, regardless of the setting of the PSTATE.UAO bit.

Bits [22:0]

Reserved, RES0.

Accessing UAO

For more information about the operation of the MSR (immediate) accessor, see 'MSR (immediate)'.

Accesses to this register use the following encodings in the System register encoding space:

| Vector Base Address | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL1.

Note

If the implementation does not support FEAT_LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

If the implementation supports FEAT_LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL1 must be the same or else the use of the vector address will result in a recursive exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:0]

Reserved, RES0.

Accessing VBAR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic VBAR_EL1 or VBAR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

VBAR_EL2, Vector Base Address Register (EL2)

The VBAR_EL2 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL2.

Configuration

AArch64 System register VBAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [HVBAR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VBAR_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL2.

Note

If FEAT_LVA is implemented:

- If [HCR_EL2.E2H](#) == 0b1:
 - If tagged addresses are being used, bits [55:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
 - If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
- If [HCR_EL2.E2H](#) == 0b0:
 - If tagged addresses are being used, bits [55:52] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
 - If tagged addresses are not being used, bits [63:52] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.

If FEAT_LVA is not implemented:

- If [HCR_EL2.E2H](#) == 0b1:
 - If tagged addresses are being used, bits [55:48] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
 - If tagged addresses are not being used, bits [63:48] of VBAR_EL2 must be the same or else the use of the vector address will result in a recursive exception.
- If [HCR_EL2.E2H](#) == 0b0:

-
- If tagged addresses are being used, bits [55:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
 - If tagged addresses are not being used, bits [63:48] of VBAR_EL2 must be 0 or else the use of the vector address will result in a recursive exception.
-

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:0]

Reserved, RES0.

| Vector Base Address | | | | | | | | | | | RES0 | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:11]

Vector Base Address. Base address of the exception vectors for exceptions taken to EL3.

Note

If the implementation does not support FEAT_LVA, then:

- If tagged addresses are being used, bits [55:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:48] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

If the implementation supports FEAT_LVA, then:

- If tagged addresses are being used, bits [55:52] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.
- If tagged addresses are not being used, bits [63:52] of VBAR_EL3 must be 0 or else the use of the vector address will result in a recursive exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [10:0]

Reserved, RES0.

Accessing VBAR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VBAR_EL3

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b1100 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    return VBAR_EL3;

```

MSR VBAR_EL3, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b110 | 0b1100 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    UNDEFINED;
elsif PSTATE.EL == EL3 then
    VBAR_EL3 = X[t];

```

VDISR_EL2, Virtual Deferred Interrupt Status Register

The VDISR_EL2 characteristics are:

Purpose

Records that a virtual SError interrupt has been consumed by an ESB instruction executed at EL1.

An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value written to be observed by a direct read of [DISR_EL1](#) or [DISR](#) occurring in program order after the ESB instruction.

Configuration

AArch64 System register VDISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VDISR\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VDISR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VDISR_EL2 is a 64-bit register.

Field descriptions

When EL1 is using AArch64:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|------|----|----|----|----|----|----|----|----|----|-----|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:25]

Reserved, RES0.

IDS, bit [24]

The value copied from [VSESR_EL2.IDS](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

The value copied from [VSESR_EL2](#).ISS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When EL1 is using AArch32 and VDISR_EL2.LPAE == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|------|-----|------|-------|------|------|----|----|----|----|----|---------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from [VSESR_EL2](#).AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from [VSESR_EL2](#).ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError interrupt.

| FS | Meaning |
|---------|--------------------------------|
| 0b10110 | Asynchronous SError interrupt. |

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR_EL2[10].
- FS[3:0] is VDISR_EL2[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to [TTBCR](#).EAE when an ESB instruction defers a virtual SError interrupt.

| LPAE | Meaning |
|------|--|
| 0b0 | Using the Short-descriptor translation table format. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When EL1 is using AArch32 and VDISR_EL2.LPAE == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|------|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|------|-----|------|------|------|--------|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| A | RES0 | | | | | | | | | | | | | | AET | RES0 | EXT | RES0 | LPAE | RES0 | STATUS | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from [VSESR_EL2](#).AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from [VSESR_EL2](#).ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

Set to [TTBCR](#).EAE when an ESB instruction defers a virtual SError interrupt.

| LPAE | Meaning |
|------|---|
| 0b1 | Using the Long-descriptor translation table format. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError interrupt.

| STATUS | Meaning |
|----------|--------------------------------|
| 0b010001 | Asynchronous SError interrupt. |

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VDISR_EL2

An indirect write to VDISR_EL2 made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of [DISR_EL1](#) or [DISR](#) occurring in program order after the ESB instruction.

Accesses to this register use the following encodings in the System register encoding space:

VMPIDR_EL2, Virtualization Multiprocessor ID Register

The VMPIDR_EL2 characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by EL1 reads of [MPIDR_EL1](#).

Configuration

AArch64 System register VMPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VMPIDR\[31:0\]](#).

If EL2 is not implemented, reads of this register return the value of the [MPIDR_EL1](#) and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VMPIDR_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|------|----|----|----|----|----|----|------|----|----|----|----|----|----|----|------|----|----|----|----|----|----|------|------|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | Aff3 | | | | | | | |
| RES1 | U | RES0 | | | | | | MT | Aff2 | | | | | | | | Aff1 | | | | | | | | Aff0 | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of VMPIDR_EL2.Aff0 for more information.

Aff3 is not supported in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [31]

Reserved, RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

| U | Meaning |
|-----|---|
| 0b0 | Processor is part of a multiprocessor system. |
| 0b1 | Processor is part of a uniprocessor system. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of VMPIDR_EL2.Aff0 for more information about affinity levels.

| MT | Meaning |
|-----|---|
| 0b0 | Performance of PEs at the lowest affinity level is largely independent. |
| 0b1 | Performance of PEs at the lowest affinity level is very interdependent. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff2, bits [23:16]

Affinity level 2. See the description of VMPIDR_EL2.Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1. See the description of VMPIDR_EL2.Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0. This is the affinity level that is most significant for determining PE behavior. Higher affinity levels are increasingly less significant in determining PE behavior. The assigned value of the MPIDR.{Aff2, Aff1, Aff0} or [MPIDR_EL1](#).{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

```

VNCR_EL2, Virtual Nested Control Register

The VNCR_EL2 characteristics are:

Purpose

When FEAT_NV2 is implemented, holds the base address that is used to define the memory location that is accessed by transformed reads and writes of System registers.

Configuration

This register is present only when FEAT_NV2 is implemented. Otherwise, direct accesses to VNCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VNCR_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|

RESS, bits [63:53]

Reserved, Sign extended. If the bits marked as RESS do not all have the same value, then there is a CONSTRAINED UNPREDICTABLE choice between:

- Generating an EL2 translation regime Translation abort on use of the VNCR_EL2 register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes other than reading back the register.
- Bits[63:49] of VNCR_EL2 are treated as the same value as bit[48] for all purposes.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52] for all purposes other than reading back the register.
- If the virtual address space for EL2 supports more than 48 bits, bits[63:53] of VNCR_EL2 are treated as the same value as bit[52].

Where the EL2 translation regime has upper and lower address ranges, bit[52] is used to select between those address ranges to determine if the address space supports more than 48 bits.

BADDR, bits [52:12]

Base Address. If the virtual address space for EL2 does not support more than 48 bits, then bits [52:49] are RESS.

When a register read/write is transformed to be a Load or Store, the address of the load/store is to SignOffset(VNCR_EL2.BADDR:Offset<11:0>, 64).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing VNCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VNCR_EL2

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0010 | 0b0010 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;

VPIDR_EL2, Virtualization Processor ID Register

The VPIDR_EL2 characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by EL1 reads of [MIDR_EL1](#).

Configuration

AArch64 System register VPIDR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VPIDR\[31:0\]](#).

If EL2 is not implemented, reads of this register return the value of the [MIDR_EL1](#) and writes to the register are ignored.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VPIDR_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------|----|----|----|----|----|----|----|---------|----|----|----|--------------|----|----|----|---------|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| Implementer | | | | | | | | Variant | | | | Architecture | | | | PartNum | | | | | | | | | | | | Revision | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:32]

Reserved, RES0.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm. Assigned codes include the following:

| Implementer | Meaning |
|-------------|--|
| 0x00 | Reserved for software use. |
| 0x41 | Arm Limited. |
| 0x42 | Broadcom Corporation. |
| 0x43 | Cavium Inc. |
| 0x44 | Digital Equipment Corporation. |
| 0x46 | Fujitsu Ltd. |
| 0x49 | Infineon Technologies AG. |
| 0x4D | Motorola or Freescale Semiconductor Inc. |
| 0x4E | NVIDIA Corporation. |
| 0x50 | Applied Micro Circuits Corporation. |
| 0x51 | Qualcomm Inc. |
| 0x56 | Marvell International Ltd. |
| 0x69 | Intel Corporation. |
| 0xC0 | Ampere Computing. |

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Architecture, bits [19:16]

Architecture version. Defined values are:

| Architecture | Meaning |
|--------------|---|
| 0b0001 | Armv4. |
| 0b0010 | Armv4T. |
| 0b0011 | Armv5 (obsolete). |
| 0b0100 | Armv5T. |
| 0b0101 | Armv5TE. |
| 0b0110 | Armv5TEJ. |
| 0b0111 | Armv6. |
| 0b1111 | Architectural features are individually identified in the ID_* registers. |

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VPIDR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VPIDR_EL2

elsif PSTATE.EL == EL3 then
    return MIDR_EL1;

```

VSESR_EL2, Virtual SError Exception Syndrome Register

The VSESR_EL2 characteristics are:

Purpose

Provides the syndrome value reported to software on taking a virtual SError interrupt exception to EL1, or on executing an ESB instruction at EL1.

When the virtual SError interrupt injected using [HCR_EL2.VSE](#) is taken to EL1 using AArch64, then the syndrome value is reported in [ESR_EL1](#).

When the virtual SError interrupt injected using [HCR_EL2.VSE](#) is taken to EL1 using AArch32, then the syndrome value is reported in [DFSR](#), {AET, ExT} and the remainder of [DFSR](#) is set as defined by VMSAv8-32. For more information, see The AArch32 Virtual Memory System Architecture.

When the virtual SError interrupt injected using [HCR_EL2.VSE](#) is deferred by an ESB instruction, then the syndrome value is written to [VDISR_EL2](#).

Configuration

AArch64 System register VSESR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VDFSR\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to VSESR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VSESR_EL2 is a 64-bit register.

Field descriptions

When EL1 is using AArch32:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|------|-----|------|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| RES0 | | | | | | | | | | | | | | | | AET | RES0 | EXT | RES0 | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:16]

Reserved, RES0.

AET, bits [15:14]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[15:4] is set to VSESR_EL2.AET.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR_EL2](#)[15:4] is set to VSESR_EL2.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

When a virtual SError interrupt is taken to EL1 using AArch32, [DFSR](#)[12] is set to VSESR_EL2.ExT.

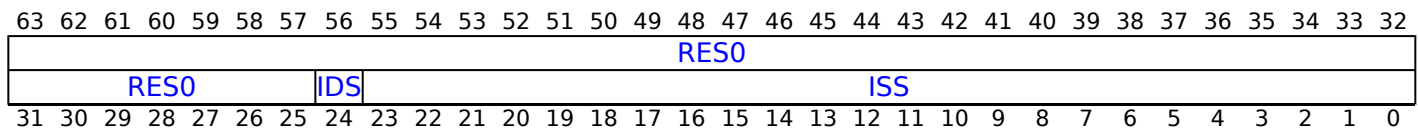

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR_EL2](#)[12] is set to VSESR_EL2.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

When EL1 is using AArch64:**Bits [63:25]**

Reserved, RES0.

IDS, bit [24]

When a virtual SError interrupt is taken to EL1 using AArch64, [ESR_EL1](#)[24] is set to VSESR_EL2.IDS.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR_EL2](#)[24] is set to VSESR_EL2.IDS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [23:0]

When a virtual SError interrupt is taken to EL1 using AArch64, [ESR_EL1](#)[23:0] is set to VSESR_EL2.ISS.

When a virtual SError interrupt is deferred by an ESB instruction, [VDISR_EL2](#)[23:0] is set to VSESR_EL2.ISS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VSESR_EL2

VSTCR_EL2, Virtualization Secure Translation Control Register

The VSTCR_EL2 characteristics are:

Purpose

The control register for stage 2 of the Secure EL1&0 translation regime.

Configuration

This register is present only when FEAT_SEL2 is implemented. Otherwise, direct accesses to VSTCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VSTCR_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|-----|------|----|----|----|----|----|-----|------|----|----|----|----|----|----|----|--|-----|------|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | |

| RES1 | SA | SW | RES0 | | | | | | | | | | | | | TG0 | RES0 | | | | | | SLO | TOSZ | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | |

Any of the bits in VSTCR_EL2 are permitted to be cached in a TLB.

Bits [63:34]

Reserved, RES0.

SL2, bit [33]

When FEAT_LPA2 is implemented:

Starting level of the Secure stage 2 translation lookup controlled by VSTCR_EL2.

If [VTCR_EL2.DS](#) == 1, then VSTCR_EL2.SL2, in combination with VSTCR_EL2.SL0, gives encodings for the Secure stage 2 translation table walk initial lookup level.

If [VTCR_EL2.DS](#) == 0, then VSTCR_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [32]

Reserved, RES0.

Bit [31]

Reserved, RES1.

SA, bit [30]

Secure stage 2 translation output address space.

| SA | Meaning |
|-----|---|
| 0b0 | All stage 2 translations for the Secure IPA space access the Secure PA space. |
| 0b1 | All stage 2 translations for the Secure IPA space access the Non-secure PA space. |

When the value of VSTCR_EL2.SW is 1, this bit behaves as 1 for all purposes other than reading back the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SW, bit [29]

Secure stage 2 translation address space.

| SW | Meaning |
|-----|--|
| 0b0 | All stage 2 translation table walks for the Secure IPA space are to the Secure PA space. |
| 0b1 | All stage 2 translation table walks for the Secure IPA space are to the Non-secure PA space. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [28:16]

Reserved, RES0.

TG0, bits [15:14]

Secure stage 2 granule size for [VSTTBR_EL2](#).

| TG0 | Meaning |
|------|---------|
| 0b00 | 4KB. |
| 0b01 | 64KB. |
| 0b10 | 16KB. |

Other values are reserved.

If FEAT_GTG is implemented, [ID_AA64MMFR0_EL1](#).{TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for stage 2 translation.

If FEAT_GTG is not implemented, [ID_AA64MMFR0_EL1](#).{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value, or a size that has not been implemented, then for all purposes other than read back from this register, the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [13:8]

Reserved, RES0.

SL0, bits [7:6]**When FEAT_TTST is implemented:**

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

| SL0 | Meaning |
|------|--|
| 0b00 | If VSTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> • If FEAT_LPA2 is not implemented, start at level 2. • If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 2. • If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b1, start at level -1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3. |
| 0b01 | If VSTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> • If FEAT_LPA2 is not implemented, start at level 1. • If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 1. • If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 01 and VSTCR_EL2.SL2 == 1 is reserved. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2. |
| 0b10 | If VSTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> • If FEAT_LPA2 is not implemented, start at level 0. • If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 0. • If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 10 and VSTCR_EL2.SL2 == 1 is reserved. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1. |
| 0b11 | If VSTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> • If FEAT_LPA2 is not implemented, start at level 3. • If FEAT_LPA2 is implemented and VSTCR_EL2.SL2 is 0b0, start at level 3. • If FEAT_LPA2 is implemented, the combination of VSTCR_EL2.SL0 == 11 and VSTCR_EL2.SL2 == 1 is reserved. If VSTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0. |

If this field is programmed to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Starting level of the Secure stage 2 translation lookup, controlled by VSTCR_EL2. The meaning of this field depends on the value of VSTCR_EL2.TG0.

| SL0 | Meaning |
|------|---|
| 0b00 | If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3. |
| 0b01 | If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2. |
| 0b10 | If VSTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VSTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1. |

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VSTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [VSTTBR_EL2](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for this field depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VSTCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VSTCR_EL2

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0010 | 0b0110 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if !IsSecure() then
        UNDEFINED;
    elseif EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x048];
    elseif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    if !IsSecure() then
        UNDEFINED;
    else
        return VSTCR_EL2;
elseif PSTATE.EL == EL3 then
    if SCR_EL3.EEL2 == '0' then
        UNDEFINED;
    else
        return VSTCR_EL2;

```

MSR VSTCR_EL2, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0010 | 0b0110 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then
    if !IsSecure() then
        UNDEFINED;
    elseif EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x048] = X[t];
    elseif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elseif PSTATE.EL == EL2 then
    if !IsSecure() then
        UNDEFINED;
    else
        VSTCR_EL2 = X[t];

VSTTBR_EL2, Virtualization Secure Translation Table Base Register

The VSTTBR_EL2 characteristics are:

Purpose

The base register for stage 2 of the Secure EL1&0 translation regime. Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Secure EL1&0 translation regime, and other information for this translation stage.

Configuration

This register is present only when FEAT_SEL2 is implemented. Otherwise, direct accesses to VSTTBR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VSTTBR_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | BADDR | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | BADDR | | | | | | | | | | | | | | | CnP |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:48]

Reserved, RES0.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x].

Note

A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

If the value of [VTCR_EL2](#).PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
 - If $x \geq 6$ then $z=x$.
 - Otherwise, $z=6$.
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When $z > x$ register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When $x > 6$ register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.

Note

When the value of [ID_AA64MMFR0_EL1.PARange](#) indicates that the implementation does not support a 52-bit PA size, if a translation table lookup uses this register with the 64KB translation granule when the Effective value of [VTCR_EL2.PS](#) is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of [VTCR_EL2.PS](#) is not 0b110, then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

If any VSTTBR_EL2[47:1] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VSTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [VSTCR_EL2.T0SZ](#), the stage of translation, and the translation granule size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

Common not Private, for stage 2 of the Secure EL1&0 translation regime. In an implementation that includes FEAT_TTCNP, indicates whether each entry that is pointed to by VSTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1.

| CnP | Meaning |
|-----|--|
| 0b0 | The translation table entries pointed to by VSTTBR_EL2 are permitted to differ from the entries for VSTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID. |
| 0b1 | The translation table entries pointed to by VSTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VSTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID. |

This bit is permitted to be cached in a TLB.

Note

If the value of VSTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VSTTBR_EL2s do not point to the same translation table entries when using the current VMID, then the results of translations using VSTTBR_EL2 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

When this register has an architecturally-defined reset value, this field resets to a value that is architecturally UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VSTTBR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VSTTBR_EL2

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0010 | 0b0110 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if !IsSecure() then
        UNDEFINED;
    elsif EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x030];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if !IsSecure() then
        UNDEFINED;
    else
        return VSTTBR_EL2;
elsif PSTATE.EL == EL3 then
    if SCR_EL3.EEL2 == '0' then
        UNDEFINED;
    else
        return VSTTBR_EL2;

```

MSR VSTTBR_EL2, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0010 | 0b0110 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if !IsSecure() then
        UNDEFINED;
    elsif EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        NVMem[0x030] = X[t];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    if !IsSecure() then
        UNDEFINED;
    else
        VSTTBR_EL2 = X[t];
elsif PSTATE.EL == EL3 then
    if SCR_EL3.EEL2 == '0' then
        UNDEFINED;
    else
        VSTTBR_EL2 = X[t];

```

VTCR_EL2, Virtualization Translation Control Register

The VTCR_EL2 characteristics are:

Purpose

The control register for stage 2 of the EL1&0 translation regime.

Configuration

AArch64 System register VTCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register [VTCR\[31:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VTCR_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

Bits [63:34]

Reserved, RES0.

SL2, bit [33]

When FEAT_LPA2 is implemented:

Starting level of the stage 2 translation lookup controlled by VTCR_EL2.

If VTCR_EL2.DS == 1, then VTCR_EL2.SL2, in combination with VTCR_EL2.SL0, gives encodings for the stage 2 translation table walk initial lookup level.

If VTCR_EL2.DS == 0, then VTCR_EL2.SL2 is RES0.

If the translation granule size is not 4KB, then this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [32]**When FEAT_LPA2 is implemented:**

This field affects 52-bit output addressing when using 4KB and 16KB translation granules in stage 2 of the EL1&0 translation regime.

| DS | Meaning |
|---|---|
| 0b0 | <p>Bits[49:48] of translation descriptors are RES0.</p> <p>Bits[9:8] in block and page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware.</p> <p>The minimum value of VTCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.</p> <p>The minimum value of VSTCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.</p> <p>Output address[51:48] is 0000.</p> |
| 0b1 | <p>Bits[49:48] of translation descriptors hold output address[49:48].</p> <p>Bits[9:8] in translation descriptors hold output address[51:50].</p> <p>The shareability information of block and page descriptors for cacheable locations is determined by VTCR_EL2.SH0.</p> <p>The minimum value of VTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.</p> <p>The minimum value of VSTCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 2 level 0 translation table fault.</p> |
| <p>Note</p> <p>As FEAT_LPA must be implemented if VTCR_EL2.DS == 1, the minimum values of VTCR_EL2.T0SZ and VSTCR_EL2.T0SZ are 12, as determined by that extension.</p> <p>For the TLBI range instructions affecting IPA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 00.</p> <p>Note</p> <p>This forces alignment of the ranges used by the TLBI range instructions.</p> | |

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES1.

NSA, bit [30]**When FEAT_SEL2 is implemented:**

Non-secure stage 2 translation output address space for the Secure EL1&0 translation regime.

| NSA | Meaning |
|-----|--|
| 0b0 | All stage 2 translations for the Non-secure IPA space of the Secure EL1&0 translation regime access the Secure PA space. |
| 0b1 | All stage 2 translations for the Non-secure IPA space of the Secure EL1&0 translation regime access the Non-secure PA space. |

This bit behaves as 1 for all purposes other than reading back the value of the bit when one of the following is true:

- The value of VTCR_EL2.NSW is 1.
- The value of [VSTCR_EL2.SA](#) is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSW, bit [29]

When FEAT_SEL2 is implemented:

Non-secure stage 2 translation table address space for the Secure EL1&0 translation regime.

| NSW | Meaning |
|-----|---|
| 0b0 | All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&0 translation regime are to the Secure PA space. |
| 0b1 | All stage 2 translation table walks for the Non-secure IPA space of the Secure EL1&0 translation regime are to the Non-secure PA space. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

| HWU62 | Meaning |
|-------|---|
| 0b0 | Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU61, bit [27]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

| HWU61 | Meaning |
|-------|---|
| 0b0 | Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU60, bit [26]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

| HWU60 | Meaning |
|-------|---|
| 0b0 | Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU59, bit [25]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

| HWU59 | Meaning |
|-------|---|
| 0b0 | Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [24:23]

Reserved, RES0.

HD, bit [22]

When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 2 translations when EL2 is enabled in the current Security state.

| HD | Meaning |
|-----|---|
| 0b0 | Stage 2 hardware management of dirty state disabled. |
| 0b1 | Stage 2 hardware management of dirty state enabled, only if the VTCR_EL2.HA bit is also set to 1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]

When FEAT_HAFDBS is implemented:

Hardware Access flag update in stage 2 translations when EL2 is enabled in the current Security state.

| HA | Meaning |
|-----|--------------------------------------|
| 0b0 | Stage 2 Access flag update disabled. |
| 0b1 | Stage 2 Access flag update enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

VS, bit [19]

When FEAT_VMID16 is implemented:

VMID Size.

| VS | Meaning |
|-----|---|
| 0b0 | 8-bit VMID. The upper 8 bits of VTTBR_EL2 are ignored by the hardware, and treated as if they are all zeros, for every purpose except when reading back the register. |
| 0b1 | 16-bit VMID. The upper 8 bits of VTTBR_EL2 are used for allocation and matching in the TLB. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PS, bits [18:16]

Physical address Size for the second stage of translation.

| PS | Meaning |
|-------|-----------------|
| 0b000 | 32 bits, 4GB. |
| 0b001 | 36 bits, 64GB. |
| 0b010 | 40 bits, 1TB. |
| 0b011 | 42 bits, 4TB. |
| 0b100 | 44 bits, 16TB. |
| 0b101 | 48 bits, 256TB. |
| 0b110 | 52 bits, 4PB. |

All other values are reserved.

The reserved values behave in the same way as the 0b101 or 0b110 encoding, but software must not rely on this property as the behavior of the reserved values might change in a future revision of the architecture.

If the translation granule is not 64KB and FEAT_LPA2 is not implemented, the value 0b110 is treated as reserved.

It is IMPLEMENTATION DEFINED whether an implementation that does not implement FEAT_LPA supports setting the value of 0b110 for the 64KB translation granule size or whether setting this value behaves as the 0b101 encoding.

In an implementation that supports 52-bit PAs, if the value of this field is not 0b110 or a value treated as 0b110, then bits[51:48] of every translation table base address for the stage of translation controlled by VTCR_EL2 are 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the [VTTBR_EL2](#).

| TG0 | Meaning |
|------|---------|
| 0b00 | 4KB. |
| 0b01 | 64KB. |
| 0b10 | 16KB. |

Other values are reserved.

If FEAT_GTG is implemented, [ID_AA64MMFR0_EL1](#).{TGran4_2, TGran16_2, TGran64_2} indicate which granule sizes are supported for stage 2 translation.

If FEAT_GTG is not implemented, [ID_AA64MMFR0_EL1](#).{TGran4, TGran16, TGran64} indicate which granule sizes are supported.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [VTTBR_EL2](#) or [VSTTBR_EL2](#).

| SH0 | Meaning |
|------|------------------|
| 0b00 | Non-shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGNO, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [VTTBR_EL2](#) or [VSTTBR_EL2](#).

| ORGNO | Meaning |
|-------|---|
| 0b00 | Normal memory, Outer Non-cacheable. |
| 0b01 | Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGNO, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [VTTBR_EL2](#) or [VSTTBR_EL2](#).

| IRGNO | Meaning |
|-------|---|
| 0b00 | Normal memory, Inner Non-cacheable. |
| 0b01 | Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]

When FEAT_TTST is implemented:

Starting level of the stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

| SL0 | Meaning |
|------|---|
| 0b00 | If VTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> • If FEAT_LPA2 is not implemented, start at level 2. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 2. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b1, start at level -1. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3. |
| 0b01 | If VTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> • If FEAT_LPA2 is not implemented, start at level 1. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 1. • If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 01 and VTCR_EL2.SL2 == 1 is reserved. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2. |
| 0b10 | If VTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> • If FEAT_LPA2 is not implemented, start at level 0. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 0. • If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 10 and VTCR_EL2.SL2 == 1 is reserved. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1. |
| 0b11 | If VTCR_EL2.TG0 is 0b00 (4KB granule): <ul style="list-style-type: none"> • If FEAT_LPA2 is not implemented, start at level 3. • If FEAT_LPA2 is implemented and VTCR_EL2.SL2 is 0b0, start at level 3. • If FEAT_LPA2 is implemented, the combination of VTCR_EL2.SL0 == 11 and VTCR_EL2.SL2 == 1 is reserved. If VTCR_EL2.TG0 is 0b10 (16KB granule) and FEAT_LPA2 is implemented, start at level 0. |

If this field is programmed to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Starting level of the stage 2 translation lookup, controlled by VTCR_EL2. The meaning of this field depends on the value of VTCR_EL2.TG0.

| SL0 | Meaning |
|------|---|
| 0b00 | If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 2. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 3. |
| 0b01 | If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 1. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 2. |
| 0b10 | If VTCR_EL2.TG0 is 0b00 (4KB granule), start at level 0. If VTCR_EL2.TG0 is 0b10 (16KB granule) or 0b01 (64KB granule), start at level 1. |

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of VTCR_EL2.T0SZ, then a stage 2 level 0 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [5:0]

The size offset of the memory region addressed by [VTTBR_EL2](#). The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in 'The AArch64 Virtual Memory System Architecture'.

If this field is programmed to a value that is not consistent with the programming of SL0, then a stage 2 level 0 Translation fault is generated.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VTCR_EL2

Any of the bits in VTCR_EL2 are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VTCR_EL2

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0010 | 0b0001 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2.<NV2,NV> == '11' then
        return NVMem[0x040];
    elsif EL2Enabled() && HCR_EL2.NV == '1' then
        AArch64.SystemAccessTrap(EL2, 0x18);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return VTCR_EL2;
elsif PSTATE.EL == EL3 then
    return VTCR_EL2;

```

MSR VTCR_EL2, <Xt>

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0010 | 0b0001 | 0b010 |

```

VTTBR_EL2, Virtualization Translation Table Base Register

The VTTBR_EL2 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the EL1&0 translation regime, and other information for this translation regime.

Configuration

AArch64 System register VTTBR_EL2 bits [63:0] are architecturally mapped to AArch32 System register [VTTBR\[63:0\]](#).

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

VTTBR_EL2 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| VMID | | | | | | | | | | | | | | | | BADDR | | | | | | | | | | | | | | | | |
| BADDR | | | | | | | | | | | | | | | | CnP | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

VMID, bits [63:48]

VMID encoding when FEAT_VMID16 is implemented and VTCR_EL2.VS == 1

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VMID | | | | | | | | | | | | | | | |

VMID, bits [15:0]

The VMID for the translation table.

If the implementation has an 8-bit VMID, bits [15:8] of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VMID encoding when FEAT_VMID16 is not implemented or VTCR_EL2.VS == 0

| | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|---|---|------|---|---|---|---|---|---|---|
| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | VMID | | | | | | | |

Bits [15:8]

Reserved, RES0.

VMID, bits [7:0]

The VMID for the translation table.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCR_EL2](#).VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, A[47:x] or A[51:x], bits[47:1].

Note

A translation table must be aligned to the size of the table, except that when using a translation table base address larger than 48 bits the minimum alignment of a table containing fewer than eight entries is 64 bytes.

In an implementation that includes FEAT_LPA, if the value of [VTCR_EL2](#).PS is 0b110, then:

- Register bits[47:z] hold bits[47:z] of the stage 1 translation table base address, where z is determined as follows:
 - If $x \geq 6$ then $z=x$.
 - Otherwise, $z=6$.
- Register bits[5:2] hold bits[51:48] of the stage 1 translation table base address.
- When $z > x$ register bits[(z-1):x] are RES0, and bits[(z-1):x] of the translation table base address are zero.
- When $x > 6$ register bits[(x-1):6] are RES0.
- Register bit[1] is RES0.
- Bits[5:2] of the stage 1 translation table base address are zero.
- In an implementation that includes FEAT_TTCNP, bit[0] of the stage 1 translation table base address is zero.

Note

When the value of [ID_AA64MMFR0_EL1](#).PARange indicates that the implementation does not support a 52 bit PA size, if a translation table lookup uses this register when the Effective value of [VTCR_EL2](#).PS is 0b110 and the value of register bits[5:2] is nonzero, an Address size fault is generated.

If the Effective value of [VTCR_EL2](#).PS is not 0b110 then:

- Register bits[47:x] hold bits[47:x] of the stage 1 translation table base address.
- Register bits[(x-1):1] are RES0.
- If the implementation supports 52-bit PAs and IPAs then bits[51:48] of the translation table base addresses used in this stage of translation are 0b0000.

If any VTTBR_EL2[47:0] bit that is defined as RES0 has the value 1 when a translation table walk is performed using VTTBR_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits[x-1:0] of the translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of [VTCR_EL2.T0SZ](#), the stage of translation, and the translation granule size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1.

| CnP | Meaning |
|-----|--|
| 0b0 | The translation table entries pointed to by VTTBR_EL2 are permitted to differ from the entries for VTTBR_EL2 for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID. |
| 0b1 | The translation table entries pointed to by VTTBR_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR_EL2.CnP is 1 and the VMID is the same as the current VMID. |

This bit is permitted to be cached in a TLB.

Note

If the value of VTTBR_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBR_EL2s do not point to the same translation table entries when using the current VMID then the results of translations using VTTBR_EL2 are CONstrained UNPREDICTABLE, see 'CONstrained UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing VTTBR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, VTTBR_EL2

| op0 | op1 | CRn | CRm | op2 |

ZCR_EL1, SVE Control Register (EL1)

The ZCR_EL1 characteristics are:

Purpose

This register controls aspects of SVE visible at Exception levels EL1 and EL0.

Configuration

This register is present only when FEAT_SVE is implemented. Otherwise, direct accesses to ZCR_EL1 are UNDEFINED.

This register has no effect if the PE is in Streaming SVE mode.

When [HCR_EL2](#).{E2H, TGE} == {1, 1} and EL2 is enabled in the current Security state, this register has no effect on execution at EL0.

Attributes

ZCR_EL1 is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|-----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

| RES0 | | | | | | | | | | | | | | | | RAZ/WI | | | | | | | | LEN | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Effective SVE Vector Length (VL).

Constrains the effective scalable vector register length for EL1 and EL0 to (LEN+1)*128 bits. VL only takes effect when the PE is not in Streaming SVE mode.

An implementation is permitted to include any set of vector lengths that are multiples of 128 bits, from 128 bits to 2048 bits inclusive, and required to support all vector lengths that are powers of two, from 128 bits up to its maximum implemented vector length.

For all purposes other than returning the result of a direct read of ZCR_EL1, this field selects the effective vector length as follows:

- If the requested length is larger than the effective vector length at the next more privileged Exception level in the current Security state, if any, then the effective vector length at the more privileged Exception level is used.
- If the requested length is not implemented, then the requested length rounded down to the nearest implemented scalable vector length is used.
- Otherwise, the requested length is used.

An indirect read of ZCR_EL1.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ZCR_EL1

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL3 using the mnemonic ZCR_EL1 or ZCR_EL12 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ZCR_EL1

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b000 | 0b0001 | 0b0010 | 0b000 |

ZCR_EL2, SVE Control Register (EL2)

The ZCR_EL2 characteristics are:

Purpose

This register controls aspects of SVE visible at Exception levels EL2, EL1, and EL0.

Configuration

This register is present only when FEAT_SVE is implemented. Otherwise, direct accesses to ZCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state, or if the PE is in Streaming SVE mode.

Attributes

ZCR_EL2 is a 64-bit register.

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Effective SVE Vector Length (VL).

Constrains the effective scalable vector register length for EL2, EL1, and EL0 to (LEN+1)*128 bits when EL2 is enabled in the current Security state. VL only takes effect when the PE is not in Streaming SVE mode.

An implementation is permitted to include any set of vector lengths that are multiples of 128 bits, from 128 bits to 2048 bits inclusive, and required to support all vector lengths that are powers of two, from 128 bits up to its maximum implemented vector length.

For all purposes other than returning the result of a direct read of ZCR_EL2, this field selects the effective vector length as follows:

- If the requested length is larger than the effective vector length at the next more privileged Exception level in the current Security state, if any, then the effective vector length at the more privileged Exception level is used.
- If the requested length is not implemented, then the requested length rounded down to the nearest implemented scalable vector length is used.
- Otherwise, the requested length is used.

An indirect read of ZCR_EL2.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ZCR_EL2

When [HCR_EL2.E2H](#) is 1, without explicit synchronization, access from EL2 using the mnemonic ZCR_EL2 or ZCR_EL1 are not guaranteed to be ordered with respect to accesses using the other mnemonic.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ZCR_EL2

| op0 | op1 | CRn | CRm | op2 |
|------|-------|--------|--------|-------|
| 0b11 | 0b100 | 0b0001 | 0b0010 | 0b000 |

ACTLR, Auxiliary Control Register

The ACTLR characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED configuration and control options for execution at EL1 and EL0.

Configuration

AArch32 System register ACTLR bits [31:0] are architecturally mapped to AArch64 System register [ACTLR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ACTLR are UNDEFINED.

Some bits might define global configuration settings, and be common to the Secure and Non-secure instances of the register.

Attributes

ACTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ACTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0001 | 0b0000 | 0b001 |

```

```

ACTLR2, Auxiliary Control Register 2

The ACTLR2 characteristics are:

Purpose

Provides additional space to the ACTLR register to hold IMPLEMENTATION DEFINED trap functionality for execution at EL1 and EL0.

Configuration

AArch32 System register ACTLR2 bits [31:0] are architecturally mapped to AArch64 System register [ACTLR_EL1\[63:32\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ACTLR2 are UNDEFINED.

In Armv8.0 and Armv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining [ID_MMFR4.AC2](#).

From Armv8.2 this register must be implemented.

Attributes

ACTLR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

```

ADFSR, Auxiliary Data Fault Status Register

The ADFSRR characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED fault status information for Data Abort exceptions taken to EL1 modes, and EL3 modes when EL3 is implemented and is using AArch32.

Configuration

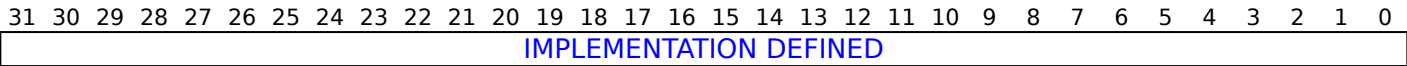

AArch32 System register ADFSRR bits [31:0] are architecturally mapped to AArch64 System register [AFSR0_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ADFSRR are UNDEFINED.

Attributes

ADFSRR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ADFSRR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

AIDR, Auxiliary ID Register

The AIDR characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED identification information.

The value of this register must be used in conjunction with the value of [MIDR](#).

Configuration

AArch32 System register AIDR bits [31:0] are architecturally mapped to AArch64 System register [AIDR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to AIDR are UNDEFINED.

Attributes

AIDR is a 32-bit register.

```

AMAIRO, Auxiliary Memory Attribute Indirection Register 0

The AMAIRO characteristics are:

Purpose

When using the Long-descriptor format translation tables for stage 1 translations, provides IMPLEMENTATION DEFINED memory attributes for the memory regions specified by [MAIRO](#).

Configuration

AArch32 System register AMAIRO bits [31:0] are architecturally mapped to AArch64 System register [AMAIR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to AMAIRO are UNDEFINED.

Attributes

AMAIRO is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

This register is RES0 in the following cases:

- When an implementation does not provide any IMPLEMENTATION DEFINED memory attributes.
- When the Long-descriptor translation table format is not used.

If EL3 is implemented and is using AArch32:

- AMAIRO(S) gives the value for memory accesses from Secure state.
- AMAIRO(NS) gives the value for memory accesses from Non-secure states other than Hyp mode.

Any IMPLEMENTATION DEFINED memory attributes are additional qualifiers for the memory locations and must not change the architected behavior specified by [MAIRO](#) and [MAIR1](#).

In a typical implementation, AMAIRO and [AMAIR1](#) split into eight one-byte fields, corresponding to the MAIRn.Attr<n> fields, but the architecture does not require them to do so.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

Configuration

AArch32 System register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register [AMCFGR_EL0\[31:0\]](#).

AArch32 System register AMCFGR bits [31:0] are architecturally mapped to External register [AMCFGR\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCFGR are UNDEFINED.

Attributes

AMCFGR is a 32-bit register.

Field descriptions

| NCG | | | | RES0 | | HDBG | RAZ | | | | | | | SIZE | | | | N | | | | | | | | | | | | | |

NCG, bits [31:28]

Defines the number of counter groups.

The number of implemented counter groups is [AMCFGR.NCG + 1].

If the number of implemented auxiliary activity monitor event counters is zero, this field has a value of 0b0000. Otherwise, this field has a value of 0b0001.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

This feature must be supported, and so this bit is 0b1.

| HDBG | Meaning |
|------|--|
| 0b0 | AMCR.HDBG is RES0. |
| 0b1 | AMCR.HDBG is read/write. |

Access to this field is **RO**.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of activity monitor event counters.

The size of the activity monitor event counters implemented by the Activity Monitors Extension is [AMCFGR.SIZE + 1].

The counters are 64-bit.

Note

Software also uses this field to determine the spacing of counters in the memory-map. The counters are at doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is **RO**.

N, bits [7:0]

Defines the number of activity monitor event counters.

The total number of counters implemented in all groups by the Activity Monitors Extension is [AMCFGR.N + 1].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing AMCFGR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1101 | 0b0010 | 0b001 |

```

AMCGCR, Activity Monitors Counter Group Configuration Register

The AMCGCR characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configuration

AArch32 System register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register [AMCGCR_EL0\[31:0\]](#).

AArch32 System register AMCGCR bits [31:0] are architecturally mapped to External register [AMCGCR\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCGCR are UNDEFINED.

Attributes

AMCGCR is a 32-bit register.

Field descriptions

| RES0 | | | | | | | | | | | | | | | | CG1NC | | | | | | | | CG0NC | | | | | | | |

Bits [31:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is 0 to 16.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

Reads as 0x04.

Access to this field is **RO**.

Accessing AMCGCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for [AMEVCNTR0<n>](#).

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

| P<n> | Meaning |
|-------------------|--|
| 0b0 | When read, means that AMEVCNTR0<n> is disabled. When written, has no effect. |
| 0b1 | When read, means that AMEVCNTR0<n> is enabled. When written, disables AMEVCNTR0<n> . |

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENCLR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

Purpose

Enable control bits for the architected activity monitors event counters, [AMEVCNTR0<n>](#).

Configuration

AArch32 System register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENSET0_ELO\[31:0\]](#).

AArch32 System register AMCNTENSET0 bits [31:0] are architecturally mapped to External register [AMCNTENSET0\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET0 are UNDEFINED.

Attributes

AMCNTENSET0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|----|----|----|----|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | RAZ/WI | | | | | | | | P3 | P2 | P1 | P0 | | | | |

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter enable bit for [AMEVCNTR0<n>](#).

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

| P<n> | Meaning |
|-------------------|---|
| 0b0 | When read, means that AMEVCNTR0<n> is disabled. When written, has no effect. |
| 0b1 | When read, means that AMEVCNTR0<n> is enabled. When written, enables AMEVCNTR0<n> . |

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMCNTENSET0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|

AMCNTENSET1, Activity Monitors Count Enable Set Register 1

The AMCNTENSET1 characteristics are:

Purpose

Enable control bits for the auxiliary activity monitors event counters, [AMEVCNTR1<n>](#).

Configuration

AArch32 System register AMCNTENSET1 bits [31:0] are architecturally mapped to AArch64 System register [AMCNTENSET1_ELO\[31:0\]](#).

AArch32 System register AMCNTENSET1 bits [31:0] are architecturally mapped to External register [AMCNTENSET1\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCNTENSET1 are UNDEFINED.

Attributes

AMCNTENSET1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

AMCR, Activity Monitors Control Register

The AMCR characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

Configuration

AArch32 System register AMCR bits [31:0] are architecturally mapped to AArch64 System register [AMCR_EL0\[31:0\]](#).

AArch32 System register AMCR bits [31:0] are architecturally mapped to External register [AMCR\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMCR are UNDEFINED.

Attributes

AMCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|------|----|----|----|----|----|------|------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | CG1RZ | RES0 | | | | | | HDBG | RES0 | | | | | | | | | |

Bits [31:18]

Reserved, RES0.

CG1RZ, bit [17]

When FEAT_AMUv1p1 is implemented:

Counter Group 1 Read Zero.

| CG1RZ | Meaning |
|-------|--|
| 0b0 | System register reads of AMEVCNTR1<n> return the event count at all implemented and enabled Exception levels. |
| 0b1 | If the current Exception level is the highest implemented Exception level, system register reads of AMEVCNTR1<n> return the event count. Otherwise, reads of AMEVCNTR1<n> return a zero value. |

Note

Reads from the memory-mapped view are unaffected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

| HDBG | Meaning |
|------|--|
| 0b0 | Activity monitors do not halt counting when the PE is halted in Debug state. |
| 0b1 | Activity monitors halt counting when the PE is halted in Debug state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing AMCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1101 | 0b0010 | 0b000 |

ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 3.

If FEAT_AMUv1p1 is implemented, [HCR_EL2](#).AMVOFFEN is 1, [SCR_EL3](#).AMVOFFEN is 1, [HCR_EL2](#).{E2H, TGE} is not {1,1}, and EL2 is using AArch64 and is implemented in the current Security state, access to these registers at EL0 or EL1 return (PCount<63:0> - [AMEVCNTVOFF0<n>_EL2](#)<63:0>).

PCount is the physical count returned when AMEVCNTR0<n> is read from EL2 or EL3.

If the counter is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On an AMU reset, this field resets to 0.

Accessing AMEVCNTR0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVCNTR0<n> are UNDEFINED.

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

| coproc | CRm | opc1 |

AMEVTYPER0<n>, Activity Monitors Event Type Registers 0, n = 0 - 3

The AMEVTYPER0<n> characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter [AMEVCNTR0<n>](#) counts.

Configuration

AArch32 System register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch64 System register [AMEVTYPER0<n>_EL0\[31:0\]](#).

AArch32 System register AMEVTYPER0<n> bits [31:0] are architecturally mapped to External register [AMEVTYPER0<n>\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMEVTYPER0<n> are UNDEFINED.

Attributes

AMEVTYPER0<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | evtCount | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter [AMEVCNTR0<n>](#). The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

| evtCount | Meaning | Applies when |
|----------|----------------------------|--------------|
| 0x0011 | Processor frequency cycles | When n == 0 |
| 0x4004 | Constant frequency cycles | When n == 1 |
| 0x0008 | Instructions retired | When n == 2 |
| 0x4005 | Memory stall cycles | When n == 3 |

Accessing AMEVTYPER0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads and writes of AMEVTYPER0<n> are UNDEFINED.

Note

[AMCGCR.CG0NC](#) identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b1101 | 0b011:n[3] | n[2:0] |

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter [AMEVCNTR1<n>](#).

It is IMPLEMENTATION DEFINED what values are supported by each counter.

If software writes a value to this field which is not supported by the corresponding counter [AMEVCNTR1<n>](#), then:

- It is UNPREDICTABLE which event will be counted.
- The value read back is UNKNOWN.

The event counted by [AMEVCNTR1<n>](#) might be fixed at implementation. In this case, the field is read-only and writes are UNDEFINED.

If the corresponding counter [AMEVCNTR1<n>](#) is enabled, writes to this register have UNPREDICTABLE results.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMEVTYPER1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads and writes of AMEVTYPER1<n> are UNDEFINED.

Note

[AMCGCR.CG1NC](#) identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|------------|--------|
| 0b1111 | 0b000 | 0b1101 | 0b111:n[3] | n[2:0] |

```

AMUSERENR, Activity Monitors User Enable Register

The AMUSERENR characteristics are:

Purpose

Global user enable register for the activity monitors. Enables or disables EL0 access to the activity monitors. AMUSERENR is applicable to both the architected and the auxiliary counter groups.

Configuration

AArch32 System register AMUSERENR bits [31:0] are architecturally mapped to AArch64 System register [AMUSERENR_ELO\[31:0\]](#).

This register is present only when FEAT_AMUv1 is implemented. Otherwise, direct accesses to AMUSERENR are UNDEFINED.

Attributes

AMUSERENR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | EN |

Bits [31:1]

Reserved, RES0.

EN, bit [0]

Traps EL0 accesses to the activity monitors registers to EL1.

| EN | Meaning |
|-----|--|
| 0b0 | EL0 accesses to the activity monitors registers are trapped to EL1. |
| 0b1 | This control does not cause any instructions to be trapped. Software can access all activity monitor registers at EL0. |

Note

- AMUSERENR can always be read at EL0 and is not governed by this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMUSERENR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

APSR, Application Program Status Register

The APSR characteristics are:

Purpose

Hold program status and control information.

Note

Some of the fields in this register are permitted to return the value of the PSTATE field on a read. This is an exception to the general rule that an UNKNOWN field must not return information that cannot be obtained, at the current Privilege level, by an architected mechanism.

For more information see 'The Application Program Status Register, APSR'.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to APSR are UNDEFINED.

Attributes

APSR is a 32-bit register.

Field descriptions

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|----|----|----|----|----|------|----|-----|----|------|----|----|------|----|----|----|----|----|----|----|------|--------|---|---|---|---|---|---|---|---|---|---|
| N | Z | C | V | Q | RES0 | | PAN | | RES0 | GE | | RES0 | | | | E | A | I | F | RES0 | M[4:0] | | | | | | | | | | |

N, bit [31]

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

Z, bit [30]

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

C, bit [29]

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

V, bit [28]

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

Q, bit [27]

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

Bits [26:23]

Reserved, RES0.

PAN, bit [22]**When FEAT_PAN is implemented:**

Privileged Access Never. This field is UNKNOWN, but is permitted to return the value of PSTATE.PAN field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [21:20]

Reserved, RES0.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

Bits [15:10]

Reserved, RES0.

E, bit [9]

Endianness. This field is UNKNOWN, but is permitted to return the value of PSTATE.E field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError interrupt mask. This field is UNKNOWN, but is permitted to return the value of PSTATE.A field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. This field is UNKNOWN, but is permitted to return the value of PSTATE.I field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. This field is UNKNOWN, but is permitted to return the value of PSTATE.F field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4:0], bits [4:0]

Mode. This field is UNKNOWN, but is permitted to return the value of PSTATE.M[4:0] field. On writes, this field is treated as Do-Not-Modify.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing APSR

APSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.

ATS12NSOPR, Address Translate Stages 1 and 2 Non-secure Only PL1 Read

The ATS12NSOPR characteristics are:

Purpose

Performs stage 1 and 2 address translations as defined for PL1 and the Non-secure state, with permissions as if reading from the given virtual address.

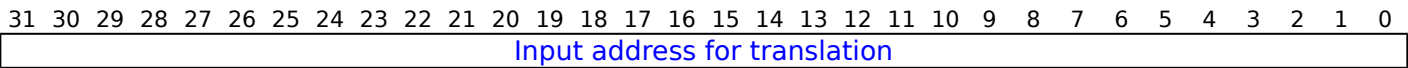

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ATS12NSOPR are UNDEFINED.

Attributes

ATS12NSOPR is a 32-bit System instruction.

Field descriptions

Bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

Executing the ATS12NSOPR instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

ATS12NSOUR, Address Translate Stages 1 and 2 Non-secure Only Unprivileged Read

The ATS12NSOUR characteristics are:

Purpose

Performs stage 1 and 2 address translations as defined for PL0 and the Non-secure state, with permissions as if reading from the given virtual address.

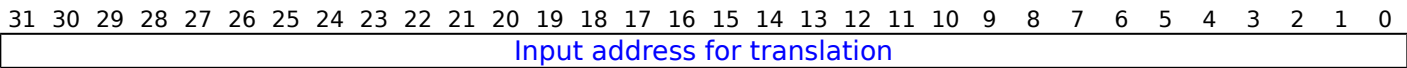

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ATS12NSOUR are UNDEFINED.

Attributes

ATS12NSOUR is a 32-bit System instruction.

Field descriptions

Bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the stage 2 translation.

Executing the ATS12NSOUR instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0111 | 0b1000 | 0b110 |

```

ATS1CPRP, Address Translate Stage 1 Current state PL1 Read PAN

The ATS1CPRP characteristics are:

Purpose

Performs a stage 1 address translation at PL1 and in the current Security state, where the value of PSTATE.PAN determines if a read from a location will generate a Permission fault for a privileged access.

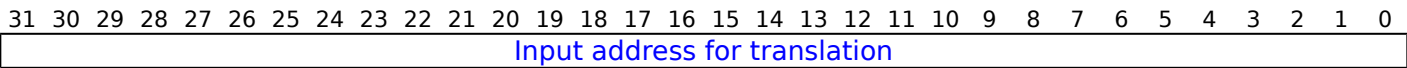

Configuration

This instruction is present only when AArch32 is supported and FEAT_PAN2 is implemented. Otherwise, direct accesses to ATS1CPRP are UNDEFINED.

Attributes

ATS1CPRP is a 32-bit System instruction.

Field descriptions

Bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This System instruction takes a VA as input. If EL2 is implemented and enabled in the current Security state, the resulting address is the IPA that is the output address of the stage 1 translation. Otherwise, the resulting address is a PA.

ATS1HW, Address Translate Stage 1 Hyp mode Write

The ATS1HW characteristics are:

Purpose

Performs stage 1 address translation as defined for PL2 and the Non-secure state, with permissions as if writing to the given virtual address.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ATS1HW are UNDEFINED.

Attributes

ATS1HW is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Input address for translation | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

Input address for translation. The resulting address can be read from the [PAR](#).

This System instruction takes a VA as input. The resulting address is the PA that is the output address of the translation.

Executing the ATS1HW instruction

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b0111 | 0b1000 | 0b001 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T7 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T7 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    AArch32.AT(R[t], TranslationStage_1, EL2, ATAccess_Write);
elsif PSTATE.EL == EL3 then
    AArch32.AT(R[t], TranslationStage_1, EL2, ATAccess_Write);
```

BPIALL, Branch Predictor Invalidate All

The BPIALL characteristics are:

Purpose

Invalidate all entries from branch predictors.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to BPIALL are UNDEFINED.

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

Attributes

BPIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the BPIALL instruction

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [BPIALLIS](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0111 | 0b0101 | 0b110 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T7 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T7 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.FB == '1' then
        BPIALLIS();
    else
        BPIALL();
elsif PSTATE.EL == EL2 then
    BPIALL();
elsif PSTATE.EL == EL3 then
    BPIALL();

```

BPIALLIS, Branch Predictor Invalidate All, Inner Shareable

The BPIALLIS characteristics are:

Purpose

Invalidate all entries from branch predictors Inner Shareable.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to BPIALLIS are UNDEFINED.

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

Attributes

BPIALLIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the BPIALLIS instruction

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0111 | 0b0001 | 0b110 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T7 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T7 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        BPIALLIS();
elsif PSTATE.EL == EL2 then
    BPIALLIS();
elsif PSTATE.EL == EL3 then
    BPIALLIS();

```

BPIMVA, Branch Predictor Invalidate by VA

The BPIMVA characteristics are:

Purpose

Invalidate virtual address from branch predictors.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to BPIMVA are UNDEFINED.

In an implementation where the branch predictors are architecturally invisible, this instruction can execute as a NOP.

Attributes

BPIMVA is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Virtual address to use | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

Virtual address to use.

Executing the BPIMVA instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0111 | 0b0101 | 0b111 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T7 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T7 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        BPIMVA(R[t]);
    elsif PSTATE.EL == EL2 then
        BPIMVA(R[t]);
    elsif PSTATE.EL == EL3 then
        BPIMVA(R[t]);

```

CCSIDR, Current Cache Size ID Register

The CCSIDR characteristics are:

Purpose

Provides information about the architecture of the currently selected cache.

When FEAT_CCIDX is implemented, this register is used in conjunction with [CCSIDR2](#).

Configuration

AArch32 System register CCSIDR bits [31:0] are architecturally mapped to AArch64 System register [CCSIDR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CCSIDR are UNDEFINED.

The implementation includes one CCSIDR for each cache that it can access. [CSSELR](#) and the Security state select which Cache Size ID Register is accessible.

Attributes

CCSIDR is a 32-bit register.

Field descriptions

When FEAT_CCIDX is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|---------------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|----------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | Associativity | | | | | | | | | | | | | | | | | | | | LineSize | | | |

Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [31:24]

Reserved, RES0.

Associativity, bits [23:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log₂(Number of bytes in cache line)) - 4. For example:

For a line length of 16 bytes: Log₂(16) = 4, LineSize entry = 0. This is the minimum line length.

For a line length of 32 bytes: Log₂(32) = 5, LineSize entry = 1.

Otherwise:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|----|---------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------------|----|---|---|---|---|---|---|----------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| UNKNOWN | | | | NumSets | | | | | | | | | | | | | | | | Associativity | | | | | | | | LineSize | | | |

Note

The parameters NumSets, Associativity, and LineSize in these registers define the architecturally visible parameters that are required for the cache maintenance by Set/Way instructions. They are not guaranteed to represent the actual microarchitectural features of a design. You cannot make any inference about the actual sizes of caches based on these parameters.

Bits [31:28]

Reserved, UNKNOWN.

NumSets, bits [27:13]

(Number of sets in cache) - 1, therefore a value of 0 indicates 1 set in the cache. The number of sets does not have to be a power of 2.

Associativity, bits [12:3]

(Associativity of cache) - 1, therefore a value of 0 indicates an associativity of 1. The associativity does not have to be a power of 2.

LineSize, bits [2:0]

(Log₂(Number of bytes in cache line)) - 4. For example:
 For a line length of 16 bytes: Log₂(16) = 4, LineSize entry = 0. This is the minimum line length.
 For a line length of 32 bytes: Log₂(32) = 5, LineSize entry = 1.

Accessing CCSIDR

If [CSSELR](#).Level is programmed to a cache level that is not implemented, then on a read of the CCSIDR the behavior is CONSTRAINED UNPREDICTABLE, and can be one of the following:

- The CCSIDR read is treated as NOP.
- The CCSIDR read is UNDEFINED.
- The CCSIDR read returns an UNKNOWN value.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b001 | 0b0000 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID2 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID4 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TID2 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR2.TID4 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return CCSIDR;
elsif PSTATE.EL == EL2 then
    return CCSIDR;
elsif PSTATE.EL == EL3 then
    return CCSIDR;

```

CFPRCTX, Control Flow Prediction Restriction by Context

The CFPRCTX characteristics are:

Purpose

Control Flow Prediction Restriction by Context applies to all Control Flow Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

Control flow predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when AArch32 is supported and FEAT_SPECRES is implemented. Otherwise, direct accesses to CFPRCTX are UNDEFINED.

Attributes

CFPRCTX is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-------|----|----|----|------|----|----|----|----|----|----|----|------|----|----|----|-------|----|------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | GVMID | | NS | EL | VMID | | | | | | | | RES0 | | | | GASID | | ASID | | | | | | | | | |

Bits [31:28]

Reserved, RES0.

GVMID, bit [27]

Execution of this instruction applies to all VMIDs or a specified VMID.

| GVMID | Meaning |
|-------|---|
| 0b0 | Applies to specified VMID for an EL0 or EL1 target execution context. |
| 0b1 | Applies to all VMIDs for an EL0 or EL1 target execution context. |

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

NS, bit [26]

Security State.

| NS | Meaning |
|-----|-------------------|
| 0b0 | Secure state. |
| 0b1 | Non-secure state. |

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

| EL | Meaning |
|------|---------|
| 0b00 | EL0. |
| 0b01 | EL1. |
| 0b10 | EL2. |
| 0b11 | EL3. |

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

VMID, bits [23:16]

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#) or [ELUsingAArch32\(EL2\)](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==1](#) and [HCR_EL2.TGE==1](#) and [!ELUsingAArch32\(EL2\)](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

Bits [15:9]

Reserved, RES0.

GASID, bit [8]

Execution of this instruction applies to all ASIDs or a specified ASID.

| GASID | Meaning |
|-------|--|
| 0b0 | Applies to specified ASID for an EL0 target execution context. |
| 0b1 | Applies to all ASID for an EL0 target execution context. |

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field is treated as 0.

ASID, bits [7:0]

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

Executing the CFPRCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0111 | 0b0011 | 0b100 |

```

if PSTATE.EL == EL0 then
    if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTLR_EL1.EnRCTX ==
'0' then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
            AArch64.AArch32SystemAccessTrap(EL2, 0x03);
        else
            AArch64.AArch32SystemAccessTrap(EL1, 0x03);
        elsif ELUsingAArch32(EL1) && SCTLR.EnRCTX == '0' then
            if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then
                AArch64.AArch32SystemAccessTrap(EL2, 0x03);
            elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TGE == '1' then
                AArch32.TakeHypTrapException(0x00);

```

CLIDR, Cache Level ID Register

The CLIDR characteristics are:

Purpose

Identifies the type of cache, or caches, that are implemented at each level and can be managed using the architected cache maintenance instructions that operate by set/way, up to a maximum of seven levels. Also identifies the Level of Coherence (LoC) and Level of Unification (LoU) for the cache hierarchy.

Configuration

AArch32 System register CLIDR bits [31:0] are architecturally mapped to AArch64 System register [CLIDR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CLIDR are UNDEFINED.

Attributes

CLIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|------|-----|-------|--------|--------|--------|--------|--------|--------|--------|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ICB | LoUU | LoC | LoUIS | Ctype7 | Ctype6 | Ctype5 | Ctype4 | Ctype3 | Ctype2 | Ctype1 | | | | | | | | | | | | | | | | | | | | | |

ICB, bits [31:30]

Inner cache boundary. This field indicates the boundary for caching Inner Cacheable memory regions.

| ICB | Meaning |
|------|--|
| 0b00 | Not disclosed by this mechanism. |
| 0b01 | L1 cache is the highest Inner Cacheable level. |
| 0b10 | L2 cache is the highest Inner Cacheable level. |
| 0b11 | L3 cache is the highest Inner Cacheable level. |

LoUU, bits [29:27]

Level of Unification Uniprocessor for the cache hierarchy.

Note

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

LoC, bits [26:24]

Level of Coherence for the cache hierarchy.

LoUIS, bits [23:21]

Level of Unification Inner Shareable for the cache hierarchy.

Note

When FEAT_S2FWB is implemented, the architecture requires that this field is zero so that no levels of data cache need to be cleaned in order to manage coherency with instruction fetches.

Ctype<n>, bits [3(n-1)+2:3(n-1)], for n = 7 to 1

Cache Type fields. Indicate the type of cache that is implemented and can be managed using the architected cache maintenance instructions that operate by set/way at each level, from Level 1 up to a maximum of seven levels of cache hierarchy.

| Ctype<n> | Meaning |
|----------|---------------------------------------|
| 0b000 | No cache. |
| 0b001 | Instruction cache only. |
| 0b010 | Data cache only. |
| 0b011 | Separate instruction and data caches. |
| 0b100 | Unified cache. |

All other values are reserved.

If software reads the Cache Type fields from Ctype1 upwards, once it has seen a value of 000, no caches that can be managed using the architected cache maintenance instructions that operate by set/way exist at further-out levels of the hierarchy. So, for example, if Ctype3 is the first Cache Type field with a value of 000, the values of Ctype4 to Ctype7 must be ignored.

Accessing CLIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b001 | 0b0000 | 0b0000 | 0b001 |

```

```

CNTFRQ, Counter-timer Frequency register

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the frequency of the system counter. It must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configuration

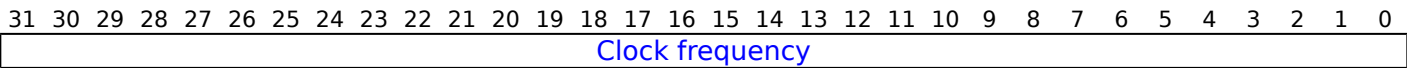

AArch32 System register CNTFRQ bits [31:0] are architecturally mapped to AArch64 System register [CNTFRQ_ELO\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTFRQ are UNDEFINED.

Attributes

CNTFRQ is a 32-bit register.

Field descriptions

Bits [31:0]

Clock frequency. Indicates the system counter clock frequency, in Hz.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFRQ

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1110 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then
    if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') &&
    CNTKCTL_EL1.<EL0PCTEN,EL0VCTEN> == '00' then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then

|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1110 | 0b0000 | 0b000 |

```

if IsHighestEL(PSTATE.EL) then
    CNTFRQ = R[t];
else
    UNDEFINED;

```

CNTHCTL, Counter-timer Hyp Control register

The CNTHCTL characteristics are:

Purpose

Controls the generation of an event stream from the physical counter, and access from Non-secure EL1 modes to the physical counter and the Non-secure EL1 physical timer.

Configuration

AArch32 System register CNTHCTL bits [31:0] are architecturally mapped to AArch64 System register [CNTHCTL_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTHCTL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHCTL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|------|----|----|----|----|----|----|-------|---------|--------|---------|----------|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | EVNTIS | RES0 | | | | | | | EVNTI | EVNTDIR | EVNTEN | PL1PCEN | PL1PCTEN | | | | | |

Bits [31:18]

Reserved, RES0.

EVNTIS, bit [17]

When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

| EVNTIS | Meaning |
|--------|---|
| 0b0 | The CNTHCTL.EVNTI field applies to CNTPCT[15:0] . |
| 0b1 | The CNTHCTL.EVNTI field applies to CNTPCT[23:8] . |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:8]

Reserved, RES0.

EVNTI, bits [7:4]

Selects which bit of [CNTPCT](#), as seen from EL2, is the trigger for the event stream generated from that counter when that stream is enabled.

If FEAT_ECV is implemented, and CNTHCTL.EVNTIS is 1, this field selects a trigger bit in the range 8 to 23 of [CNTPCT](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of [CNTPCT](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the [CNTPCT](#) trigger bit, as seen from EL2 and defined by EVNTI, generates an event when the event stream is enabled.

| EVNTDIR | Meaning |
|---------|---|
| 0b0 | A 0 to 1 transition of the trigger bit triggers an event. |
| 0b1 | A 1 to 0 transition of the trigger bit triggers an event. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from [CNTPCT](#) as seen from EL2.

| EVNTEN | Meaning |
|--------|----------------------------|
| 0b0 | Disables the event stream. |
| 0b1 | Enables the event stream. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL1PCEN, bit [1]

Traps Non-secure EL0 and EL1 accesses to the physical timer registers to Hyp mode.

| PL1PCEN | Meaning |
|---------|--|
| 0b0 | Non-secure EL0 and EL1 accesses to the CNTP_CTL , CNTP_CVAL , and CNTP_TVAL are trapped to Hyp mode, unless the it is trapped by CNTKCTL .PLOPTEN. |
| 0b1 | This control does not cause any instructions to be trapped. |

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PL1PCTEN, bit [0]

Traps Non-secure EL0 and EL1 accesses to the physical counter register to Hyp mode.

| PL1PCTEN | Meaning |
|----------|--|
| 0b0 | Non-secure EL0 and EL1 accesses to the CNTPCT are trapped to Hyp mode, unless it is trapped by CNTKCTL . PL0PCTEN. |
| 0b1 | This control does not cause any instructions to be trapped. |

If EL3 is implemented and EL2 is not implemented, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHCTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b1110 | 0b0001 | 0b000 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    return CNTHCTL;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return CNTHCTL;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b1110 | 0b0001 | 0b000 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    UNDEFINED;
elsif PSTATE.EL == EL2 then
    CNTHCTL = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        CNTHCTL = R[t];
```

CNTHP_CTL, Counter-timer Hyp Physical Timer Control register

The CNTHP_CTL characteristics are:

Purpose

Control register for the Hyp mode physical timer.

Configuration

AArch32 System register CNTHP_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTHP_CTL_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTHP_CTL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_CTL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|-------|----|--------|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | ISTATUS | | | IMASK | | ENABLE | | | | | | | | | | |

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

| ISTATUS | Meaning |
|---------|-----------------------------|
| 0b0 | Timer condition is not met. |
| 0b1 | Timer condition is met. |

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

| IMASK | Meaning |
|-------|---|
| 0b0 | Timer interrupt is not masked by the IMASK bit. |
| 0b1 | Timer interrupt is masked by the IMASK bit. |

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

| ENABLE | Meaning |
|--------|-----------------|
| 0b0 | Timer disabled. |
| 0b1 | Timer enabled. |

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHP_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, when the PE resets into EL2 or EL3, this field resets to 0.

Accessing CNTHP_CTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

CNTHP_CVAL, Counter-timer Hyp Physical CompareValue register

The CNTHP_CVAL characteristics are:

Purpose

Holds the compare value for the Hyp mode physical timer.

Configuration

AArch32 System register CNTHP_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTHP_CVAL_EL2\[63:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTHP_CVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_CVAL is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

| | | | | | | | | | | | | | | | | CompareValue | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | CompareValue | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When [CNTHP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHP_CTL.ISTATUS](#) is set to 1.
- If [CNTHP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CNTHP_TVAL, Counter-timer Hyp Physical Timer TimerValue register

The CNTHP_TVAL characteristics are:

Purpose

Holds the timer value for the Hyp mode physical timer.

Configuration

AArch32 System register CNTHP_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTHP_TVAL_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTHP_TVAL are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

CNTHP_TVAL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| | | | | | | | | | | | | | | | | TimerValue | | | | | | | | | | | | | | | |

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHP_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHP_CTL.ENABLE](#) is 1, the value returned is ([CNTHP_CVAL](#) - [CNTPCT](#)).

On a write of this register, [CNTHP_CVAL](#) is set to ([CNTPCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - [CNTHP_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHP_CTL.ISTATUS](#) is set to 1.
- If [CNTHP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

```

CNTHPS_CTL, Counter-timer Secure Physical Timer Control Register (EL2)

The CNTHPS_CTL characteristics are:

Purpose

Provides AArch32 access from EL0 to the Secure EL2 physical timer.

Configuration

AArch32 System register CNTHPS_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTHPS_CTL_EL2\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CTL are UNDEFINED.

Attributes

CNTHPS_CTL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|-------|---|--------|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | ISTATUS | | | IMASK | | ENABLE | | | | | | | | |

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

| ISTATUS | Meaning |
|---------|-----------------------------|
| 0b0 | Timer condition is not met. |
| 0b1 | Timer condition is met. |

When the value of the CNTHPS_CTL.ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the CNTHPS_CTL.ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

| IMASK | Meaning |
|-------|---|
| 0b0 | Timer interrupt is not masked by the IMASK bit. |
| 0b1 | Timer interrupt is masked by the IMASK bit. |

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

| ENABLE | Meaning |
|--------|-----------------|
| 0b0 | Timer disabled. |
| 0b1 | Timer enabled. |

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHPS_TVAL_EL2](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHPS_CTL

This register is accessed using the encoding for [CNTP_CTL](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1110 | 0b0010 | 0b001 |

```

CNTHPS_CVAL, Counter-timer Secure Physical Timer CompareValue Register (EL2)

The CNTHPS_CVAL characteristics are:

Purpose

Provides AArch32 access from EL0 to the compare value for the Secure EL2 physical timer.

Configuration

AArch32 System register CNTHPS_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTHPS_CVAL_EL2\[63:0\]](#).

This register is present only when AArch32 is supported and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_CVAL are UNDEFINED.

Attributes

CNTHPS_CVAL is a 64-bit register.

CompareValue, bits [63:0]

Holds the EL2 physical timer CompareValue.

When `CNTHPS_CTL_EL2.ENABLE` is 1, the timer condition is met when `(CNTPCT_EL0 - CompareValue)` is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHPS_CTL_EL2](#).ISTATUS is set to 1.
- If [CNTHPS_CTL_EL2](#).IMASK is 0, an interrupt is generated.

When [CNTHPS_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPTCT_EL0](#) continues to count

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHPS CVAL

This register is accessed using the encoding for [CNTF_CVAL](#).

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

| coproc | CRm | opc1 |
|--------|--------|--------|
| 0b1111 | 0b1110 | 0b0010 |

CNTHPS_TVAL, Counter-timer Secure Physical Timer TimerValue Register (EL2)

The CNTHPS_TVAL characteristics are:

Purpose

Provides AArch32 access from EL0 to the timer value for the Secure EL2 physical timer.

Configuration

AArch32 System register CNTHPS_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTHPS_TVAL_EL2\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHPS_TVAL are UNDEFINED.

Attributes

CNTHPS_TVAL is a 32-bit register.

| TimerValue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

TimerValue, bits [31:0]

The TimerValue view of the EL2 physical timer.

On a read of this register:

- If [CNTHPS_CTL_EL2.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHPS_CTL_EL2.ENABLE](#) is 1, the value returned is ([CNTHPS_CVAL_EL2](#) - [CNTPCT_EL0](#)).

On a write of this register, [CNTHPS_CVAL_EL2](#) is set to ([CNTPCT_EL0](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHPS_CTL_EL2.ENABLE](#) is 1, the timer condition is met when ([CNTPCT_EL0](#) - [CNTHPS_CVAL_EL2](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHPS_CTL_EL2.ISTATUS](#) is set to 1.
- If [CNTHPS_CTL_EL2.IMASK](#) is 0, an interrupt is generated.

When [CNTHPS_CTL_EL2.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT_EL0](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

```

CNTHV_CTL, Counter-timer Virtual Timer Control register (EL2)

The CNTHV_CTL characteristics are:

Purpose

Provides AArch32 access to the control register for the EL2 virtual timer.

Configuration

AArch32 System register CNTHV_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTHV_CTL_EL2\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CTL are UNDEFINED.

Attributes

CNTHV_CTL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|-------|---|--------|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | ISTATUS | | | IMASK | | ENABLE | | | | | | | | |

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

| ISTATUS | Meaning |
|---------|-----------------------------|
| 0b0 | Timer condition is not met. |
| 0b1 | Timer condition is met. |

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

| IMASK | Meaning |
|-------|---|
| 0b0 | Timer interrupt is not masked by the IMASK bit. |
| 0b1 | Timer interrupt is masked by the IMASK bit. |

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

| ENABLE | Meaning |
|--------|-----------------|
| 0b0 | Timer disabled. |
| 0b1 | Timer enabled. |

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHV_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHV_CTL

This register is accessed using the encoding for [CNTV_CTL](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

CNTHV_CVAL, Counter-timer Virtual Timer CompareValue register (EL2)

The CNTHV_CVAL characteristics are:

Purpose

Provides AArch32 access to the compare value for the EL2 virtual timer.

Configuration

AArch32 System register CNTHV_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTHV_CVAL_EL2\[63:0\]](#).

This register is present only when FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_CVAL are UNDEFINED.

Attributes

CNTHV_CVAL is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| CompareValue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When [CNTHV_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHV_CTL.ISTATUS](#) is set to 1.
- If [CNTHV_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

Accessing CNTHV_CVAL

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

| coproc | CRm | opc1 |
|--------|--------|--------|
| 0b1111 | 0b1110 | 0b0011 |

CNTHV_TVAL, Counter-timer Virtual Timer TimerValue register (EL2)

The CNTHV_TVAL characteristics are:

Purpose

Provides AArch32 access to the timer value for the EL2 virtual timer.

Configuration

AArch32 System register CNTHV_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTHV_TVAL_EL2\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_VHE is implemented. Otherwise, direct accesses to CNTHV_TVAL are UNDEFINED.

Attributes

CNTHV_TVAL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TimerValue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHV_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHV_CTL.ENABLE](#) is 1, the value returned is ([CNTHV_CVAL](#) - [CNTVCT](#)).

On a write of this register, [CNTHV_CVAL](#) is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHV_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - [CNTHV_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHV_CTL.ISTATUS](#) is set to 1.
- If [CNTHV_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

Accessing CNTHV_TVAL

This register is accessed using the encoding for [CNTV_TVAL](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

```

CNTHVS_CTL, Counter-timer Secure Virtual Timer Control Register (EL2)

The CNTHVS_CTL characteristics are:

Purpose

Provides AArch32 access from EL0 to the Secure EL2 virtual timer.

Configuration

AArch32 System register CNTHVS_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTHVS_CTL_EL2\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CTL are UNDEFINED.

Attributes

CNTHVS_CTL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|-------|---|--------|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | ISTATUS | | | IMASK | | ENABLE | | | | | | | | |

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

| ISTATUS | Meaning |
|---------|-----------------------------|
| 0b0 | Timer condition is not met. |
| 0b1 | Timer condition is met. |

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

| IMASK | Meaning |
|-------|---|
| 0b0 | Timer interrupt is not masked by the IMASK bit. |
| 0b1 | Timer interrupt is masked by the IMASK bit. |

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

| ENABLE | Meaning |
|--------|-----------------|
| 0b0 | Timer disabled. |
| 0b1 | Timer enabled. |

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTHVS_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTHVS_CTL

This register is accessed using the encoding for [CNTV_CTL](#).

Accesses to this register use the following encodings in the System register encoding space:

CNTHVS_CVAL, Counter-timer Secure Virtual Timer CompareValue Register (EL2)

The CNTHVS_CVAL characteristics are:

Purpose

Provides AArch32 access to the compare value for the Secure EL2 virtual timer.

Configuration

AArch32 System register CNTHVS_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTHVS_CVAL_EL2\[63:0\]](#).

This register is present only when AArch32 is supported and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_CVAL are UNDEFINED.

Attributes

CNTHVS_CVAL is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | | |
| CompareValue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| CompareValue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | |

CompareValue, bits [63:0]

Holds the EL2 virtual timer CompareValue.

When [CNTHVS_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTHVS_CTL.ISTATUS](#) is set to 1.
- If [CNTHVS_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHVS_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

Accessing CNTHVS_CVAL

This register is accessed using the encoding for [CNTV_CVAL](#).

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

| coproc | CRm | opc1 |
|--------|--------|--------|
| 0b1111 | 0b1110 | 0b0011 |

CNTHVS_TVAL, Counter-timer Secure Virtual Timer TimerValue Register (EL2)

The CNTHVS_TVAL characteristics are:

Purpose

Provides AArch32 access to the timer value for the Secure EL2 virtual timer.

Configuration

AArch32 System register CNTHVS_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTHVS_TVAL_EL2\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_SEL2 is implemented. Otherwise, direct accesses to CNTHVS_TVAL are UNDEFINED.

Attributes

CNTHVS_TVAL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TimerValue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

TimerValue, bits [31:0]

The TimerValue view of the EL2 virtual timer.

On a read of this register:

- If [CNTHVS_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTHVS_CTL.ENABLE](#) is 1, the value returned is ([CNTHVS_CVAL](#) - [CNTVCT](#)).

On a write of this register, [CNTHVS_CVAL](#) is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTHVS_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - [CNTHVS_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTHVS_CTL.ISTATUS](#) is set to 1.
- If [CNTHVS_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTHVS_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

Accessing CNTHVS_TVAL

This register is accessed using the encoding for [CNTV_TVAL](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|------|-----|-----|------|
|--------|------|-----|-----|------|

| | | | | |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1110 | 0b0011 | 0b000 |
|--------|-------|--------|--------|-------|

```

CNTKCTL, Counter-timer Kernel Control register

The CNTKCTL characteristics are:

Purpose

Controls the generation of an event stream from the virtual counter, and access from EL0 modes to the physical counter, virtual counter, EL1 physical timers, and the virtual timer.

Configuration

AArch32 System register CNTKCTL bits [31:0] are architecturally mapped to AArch64 System register [CNTKCTL_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTKCTL are UNDEFINED.

Attributes

CNTKCTL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|------|----|----|----|----|----|---------|---------|-------|---------|--------|----------|----------|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | EVNTIS | RES0 | | | | | | PLOPTEN | PLOVTEN | EVNTI | EVNTDIR | EVNTEN | PLOVCTEN | PLOPCTEN | | | | |

Bits [31:18]

Reserved, RES0.

EVENTIS, bit [17]

When FEAT_ECV is implemented:

Controls the scale of the generation of the event stream.

| EVENTIS | Meaning |
|---------|---|
| 0b0 | The CNTKCTL.EVNTI field applies to CNTVCT[15:0] . |
| 0b1 | The CNTKCTL.EVNTI field applies to CNTVCT[23:8] . |

This control applies regardless of the value of the [CNTHCTL_EL2](#).ECV bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:10]

Reserved, RES0.

PLOPTEN, bit [9]

Traps PL0 accesses to the physical timer registers to Undefined mode.

| PLOPTEN | Meaning |
|----------------|---|
| 0b0 | PL0 accesses to the CNTP_CTL , CNTP_CVAL , and CNTP_TVAL registers are trapped to Undefined mode. |
| 0b1 | This control does not cause any instructions to be trapped. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PLOVTEN, bit [8]

Traps PL0 accesses to the virtual timer registers to Undefined mode.

| PLOVTEN | Meaning |
|----------------|---|
| 0b0 | PL0 accesses to the CNTV_CTL , CNTV_CVAL , and CNTV_TVAL registers are trapped to Undefined mode. |
| 0b1 | This control does not cause any instructions to be trapped. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTI, bits [7:4]

Selects which bit of [CNTVCT](#), as seen from EL1, is the trigger for the event stream generated from that counter when that stream is enabled.

If FEAT_ECV is implemented, and CNTKCTL.EVENTIS is 1, this field selects a trigger bit in the range 8 to 23 of [CNTVCT](#).

Otherwise, this field selects a trigger bit in the range 0 to 15 of [CNTVCT](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTDIR, bit [3]

Controls which transition of the [CNTVCT](#) trigger bit, as seen from EL1 and defined by EVNTI, generates an event when the event stream is enabled.

| EVNTDIR | Meaning |
|----------------|---|
| 0b0 | A 0 to 1 transition of the trigger bit triggers an event. |
| 0b1 | A 1 to 0 transition of the trigger bit triggers an event. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EVNTEN, bit [2]

Enables the generation of an event stream from [CNTVCT](#) as seen from EL1.

| EVNTEN | Meaning |
|---------------|----------------------------|
| 0b0 | Disables the event stream. |
| 0b1 | Enables the event stream. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PLOVCTEN, bit [1]

Traps PL0 accesses to the frequency register and virtual counter register to Undefined mode.

| PLOVCTEN | Meaning |
|-----------------|---|
| 0b0 | PL0 accesses to the CNTVCT are trapped to Undefined mode. PL0 accesses to the CNTFRQ register are trapped to Undefined mode, if CNTKCTL .PLOPCTEN is also 0. |
| 0b1 | This control does not cause any instructions to be trapped. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PLOPCTEN, bit [0]

Traps PL0 accesses to the frequency register and physical counter register to Undefined mode.

| PLOPCTEN | Meaning |
|-----------------|---|
| 0b0 | PL0 accesses to the CNTPCT are trapped to Undefined mode. PL0 accesses to the CNTFRQ register are trapped to Undefined mode, if CNTKCTL .PLOVCTEN is also 0. |
| 0b1 | This control does not cause any instructions to be trapped. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTKCTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b1110 | 0b0001 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    return CNTKCTL;
elsif PSTATE.EL == EL2 then
    return CNTKCTL;
elsif PSTATE.EL == EL3 then
    return CNTKCTL;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b1110 | 0b0001 | 0b000 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    CNTKCTL = R[t];
elsif PSTATE.EL == EL2 then
    CNTKCTL = R[t];
elsif PSTATE.EL == EL3 then
    CNTKCTL = R[t];
```

CNTP_CTL, Counter-timer Physical Timer Control register

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Configuration

AArch32 System register CNTP_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTP_CTL_EL0\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTP_CTL are UNDEFINED.

Attributes

CNTP_CTL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|-------|----|--------|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | ISTATUS | | | IMASK | | ENABLE | | | | | | | | | | |

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

| ISTATUS | Meaning |
|---------|-----------------------------|
| 0b0 | Timer condition is not met. |
| 0b1 | Timer condition is met. |

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

| IMASK | Meaning |
|-------|---|
| 0b0 | Timer interrupt is not masked by the IMASK bit. |
| 0b1 | Timer interrupt is masked by the IMASK bit. |

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

| ENABLE | Meaning |
|--------|-----------------|
| 0b0 | Timer disabled. |
| 0b1 | Timer enabled. |

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTP_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing CNTP_CTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1110 | 0b0010 | 0b001 |

```

CNTP_CVAL, Counter-timer Physical Timer CompareValue register

The CNTP_CVAL characteristics are:

Purpose

Holds the compare value for the EL1 physical timer.

Configuration

AArch32 System register CNTP_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTP_CVAL_EL0\[63:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTP_CVAL are UNDEFINED.

Attributes

CNTP_CVAL is a 64-bit register.

| CompareValue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| CompareValue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPCT](#) - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTP_CTL.ISTATUS](#) is set to 1.
- If [CNTP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL

Accesses to this register use the following encodings in the System register encoding space:

CNTP_TVAL, Counter-timer Physical Timer TimerValue register

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configuration

AArch32 System register CNTP_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTP_TVAL_EL0\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTP_TVAL are UNDEFINED.

Attributes

CNTP_TVAL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TimerValue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If [CNTP_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTP_CTL.ENABLE](#) is 1, the value returned is ([CNTP_CVAL](#) - [CNTPTCT](#)).

On a write of this register, [CNTP_CVAL](#) is set to ([CNTPTCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTPTCT](#) - [CNTP_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTP_CTL.ISTATUS](#) is set to 1.
- If [CNTP_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTP_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTPTCT](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_TVAL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| | | | | |

CNPCT, Counter-timer Physical Count register

The CNTPCT characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

AArch32 System register CNTPCT bits [63:0] are architecturally mapped to AArch64 System register [CNPCT_EL0\[63:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTPCT are UNDEFINED.

All reads to the CNTPCT occur in program order relative to reads to [CNPCTSS](#) or CNTPCT.

Attributes

CNPCT is a 64-bit register.

CNTPCTSS, Counter-timer Self-Synchronized Physical Count register

The CNTPCTSS characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

AArch32 System register CNTPCTSS bits [63:0] are architecturally mapped to AArch64 System register [CNTPCTSS_ELO\[63:0\]](#).

This register is present only when AArch32 is supported and FEAT_ECV is implemented. Otherwise, direct accesses to CNTPCTSS are UNDEFINED.

All reads to the CNTPCTSS occur in program order relative to reads to [CNTPCT](#) or CNTPCTSS.

This register is a self-synchronised view of the [CNTPCT](#) counter, and cannot be read speculatively.

Attributes

CNTPCTSS is a 64-bit register.

CNTV_CTL, Counter-timer Virtual Timer Control register

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Configuration

AArch32 System register CNTV_CTL bits [31:0] are architecturally mapped to AArch64 System register [CNTV_CTL_EL0\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTV_CTL are UNDEFINED.

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|----|-------|----|--------|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | ISTATUS | | | IMASK | | ENABLE | | | | | | | | | | |

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

| ISTATUS | Meaning |
|---------|-----------------------------|
| 0b0 | Timer condition is not met. |
| 0b1 | Timer condition is met. |

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0 then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is **RO**.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

| IMASK | Meaning |
|-------|---|
| 0b0 | Timer interrupt is not masked by the IMASK bit. |
| 0b1 | Timer interrupt is masked by the IMASK bit. |

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

| ENABLE | Meaning |
|--------|-----------------|
| 0b0 | Timer disabled. |
| 0b1 | Timer enabled. |

Setting this bit to 0 disables the timer output signal, but the timer value accessible from [CNTV_TVAL](#) continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing CNTV_CTL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

CNTV_CVAL, Counter-timer Virtual Timer CompareValue register

The CNTV_CVAL characteristics are:

Purpose

Holds the compare value for the virtual timer.

Configuration

AArch32 System register CNTV_CVAL bits [63:0] are architecturally mapped to AArch64 System register [CNTV_CVAL_EL0\[63:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTV_CVAL are UNDEFINED.

Attributes

CNTV_CVAL is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | | |
| | | | | | | | | | | | | | | | | | CompareValue | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | CompareValue | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |

CompareValue, bits [63:0]

Holds the EL1 virtual timer CompareValue.

When `CNTV_CTL.ENABLE` is 1, the timer condition is met when `(CNTVCT - CompareValue)` is greater than or equal to zero. This means that `CompareValue` acts like a 64-bit upcounter timer. When the timer condition is met:

- [CNTV_CTL](#).ISTATUS is set to 1.
- If [CNTV_CTL](#).IMASK is 0, an interrupt is generated.

When [CNTV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CVAL

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

| coproc | CRm | opc1 |
|---------------|------------|-------------|
| 0b1111 | 0b1110 | 0b0011 |

```

CNTV_TVAL, Counter-timer Virtual Timer TimerValue register

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configuration

AArch32 System register CNTV_TVAL bits [31:0] are architecturally mapped to AArch64 System register [CNTV_TVAL_EL0\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTV_TVAL are UNDEFINED.

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TimerValue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If [CNTV_CTL.ENABLE](#) is 0, the value returned is UNKNOWN.
- If [CNTV_CTL.ENABLE](#) is 1, the value returned is ([CNTV_CVAL](#) - [CNTVCT](#)).

On a write of this register, [CNTV_CVAL](#) is set to ([CNTVCT](#) + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When [CNTP_CTL.ENABLE](#) is 1, the timer condition is met when ([CNTVCT](#) - [CNTP_CVAL](#)) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- [CNTV_CTL.ISTATUS](#) is set to 1.
- If [CNTV_CTL.IMASK](#) is 0, an interrupt is generated.

When [CNTV_CTL.ENABLE](#) is 0, the timer condition is not met, but [CNTVCT](#) continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_TVAL

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

```

CNTVCT, Counter-timer Virtual Count register

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value minus the virtual offset visible in [CNTVOFF](#).

Configuration

AArch32 System register CNTVCT bits [63:0] are architecturally mapped to AArch64 System register [CNTVCT_ELO\[63:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTVCT are UNDEFINED.

The value of this register is the same as the value of [CNTPCT](#) in the following conditions:

- When EL2 is not implemented.
- When EL2 is implemented and is using AArch64, [HCR_EL2](#).{E2H, TGE} is {1, 1}, and this register is read from Non-secure EL0.

All reads to the CNTVCT occur in program order relative to reads to [CNTVCTSS](#) or CNTVCT.

Attributes

CNTVCT is a 64-bit register.

CNTVCTSS, Counter-timer Self-Synchronized Virtual Count register

The CNTVCTSS characteristics are:

Purpose

Holds the 64-bit virtual count value. The virtual count value is equal to the physical count value visible in [CNTPCT](#) minus the virtual offset visible in [CNTVOFF](#).

Configuration

AArch32 System register CNTVCTSS bits [63:0] are architecturally mapped to AArch64 System register [CNTVCTSS_EL0\[63:0\]](#).

This register is present only when AArch32 is supported and FEAT_ECV is implemented. Otherwise, direct accesses to CNTVCTSS are UNDEFINED.

All reads to the CNTVCTSS occur in program order relative to reads to [CNTVCT](#) or CNTVCTSS.

This register is a self-synchronised view of the [CNTVCT](#) counter, and cannot be read speculatively.

Attributes

CNTVCTSS is a 64-bit register.

CNTVOFF, Counter-timer Virtual Offset register

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset. This is the offset between the physical count value visible in [CNTPCT](#) and the virtual count value visible in [CNTVCT](#).

Configuration

AArch32 System register CNTVOFF bits [63:0] are architecturally mapped to AArch64 System register [CNTVOFF_EL2\[63:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CNTVOFF are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3 and the virtual counter uses a fixed virtual offset of zero.

Note

When EL2 is implemented and is using AArch64, if [HCR_EL2](#).{E2H, TGE} is {1, 1}, the virtual counter uses a fixed virtual offset of zero when [CNTVCT](#) is read from Non-secure EL0.

Attributes

CNTVOFF is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| Virtual offset | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Virtual offset | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:0]

Virtual offset.

If the Generic counter is implemented at a size less than 64 bits, then this field is permitted to be implemented at the same width as the counter, and the upper bits are RES0.

The value of this field is treated as zero-extended in all counter calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

CONTEXTIDR, Context ID Register

The CONTEXTIDR characteristics are:

Purpose

Identifies the current Process Identifier and, when using the Short-descriptor translation table format, the Address Space Identifier.

The value of the whole of this register is called the Context ID and is used by:

- The debug logic, for Linked and Unlinked Context ID matching.
- The trace logic, to identify the current process.

The significance of this register is for debug and trace use only.

Configuration

AArch32 System register CONTEXTIDR bits [31:0] are architecturally mapped to AArch64 System register [CONTEXTIDR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CONTEXTIDR are UNDEFINED.

The register format depends on whether address translation is using the Long-descriptor or the Short-descriptor translation table format.

Attributes

CONTEXTIDR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PROCID | | | | | | | | | | | | | | | | | | | | | | | | ASID | | | | | | | |

PROCID, bits [31:8]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ASID, bits [7:0]

Address Space Identifier. This field is programmed with the value of the current ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PROCID | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

PROCID, bits [31:0]

Process Identifier. This field must be programmed with a unique value that identifies the current process.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CONTEXTIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1101 | 0b0000 | 0b001 |

```

CPACR, Architectural Feature Access Control Register

The CPACR characteristics are:

Purpose

Controls access to trace, and to Advanced SIMD and floating-point functionality from EL0, EL1, and EL3.

In an implementation that includes EL2, the CPACR has no effect on instructions executed at EL2.

Configuration

AArch32 System register CPACR bits [31:0] are architecturally mapped to AArch64 System register [CPACR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CPACR are UNDEFINED.

Bits in the [NSACR](#) control Non-secure access to the CPACR fields. See the field descriptions for more information.

Note

In the register field descriptions, controls are described as applying at specified Privilege levels. This is because, in Secure state, a PL1 control:

- Applies to execution in a Secure EL3 mode when EL3 is using AArch32.
- Applies to execution in a Secure EL1 mode when EL3 is using AArch64.

See 'Security state, Exception levels, and AArch32 execution privilege'.

Attributes

CPACR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|------|--------|----|------|----|----|----|------|------|----|----|----|----|----|----|----|----|----|----|----|----|------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ASEDIS | RES0 | TRCDIS | | RES0 | | | | cp11 | cp10 | | | | | | | | | | | | | RES0 | | | | | | | | | |

ASEDIS, bit [31]

Disables PL0 and PL1 execution of Advanced SIMD instructions.

| ASEDIS | Meaning |
|--------|--|
| 0b0 | This control permits execution of Advanced SIMD instructions at PL0 and PL1. |
| 0b1 | All instruction encodings that are Advanced SIMD instruction encodings, but are not also floating-point instruction encodings, are UNDEFINED at PL0 and PL1. |

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of [NSACR.NSASEDIS](#) is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

See the description of CPACR.cp10 for a list of other controls that can disable or trap execution of Advanced SIMD instructions in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [30:29]

Reserved, RES0.

TRCDIS, bit [28]

Traps PL0 and PL1 System register accesses to all implemented trace registers to Undefined mode.

| TRCDIS | Meaning |
|--------|--|
| 0b0 | This control has no effect on PL0 and PL1 System register accesses to trace registers. |
| 0b1 | PL0 and PL1 System register accesses to all implemented trace registers are trapped to Undefined mode. |

If the implementation does not include a PE trace unit, or does not include a System register interface to the PE trace unit registers, this field is RES0. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of [NSACR.NSTRCDIS](#) is 1, this field behaves as RAO/WI in Non-secure state, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

Note

- The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4 or FEAT_ETE, EL0 accesses to the trace registers are UNDEFINED.
- The Arm architecture does not provide traps on trace register accesses through the optional memory-mapped external debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:24]

Reserved, RES0.

cp11, bits [23:22]

The value of this field is ignored. If this field is programmed with a different value to the cp10 field then this field is UNKNOWN on a direct read of the CPACR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of [NSACR.cp10](#) is 0, this field behaves as RAZ/WI, regardless of its actual value.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

cp10, bits [21:20]

Defines the access rights for the Advanced SIMD and floating-point functionality. Possible values of the field are:

| cp10 | Meaning |
|------|---|
| 0b00 | PL0 and PL1 accesses to Advanced SIMD and floating-point registers or instructions are UNDEFINED. |
| 0b01 | PL0 accesses to Advanced SIMD and floating-point registers or instructions are UNDEFINED. |
| 0b10 | Reserved. The effect of programming this field to this value is CONSTRAINED UNPREDICTABLE. See 'Handling of System register control fields for Advanced SIMD and floating-point operation'. |
| 0b11 | This control permits full access to the Advanced SIMD and floating-point functionality from PL0 and PL1. |

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the [FPSCR](#), [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), or [FPEXC](#) System registers.

Note

The [CPACR](#) has no effect on Advanced SIMD and floating-point accesses from PL2. These can be disabled by the [HCPTR](#).TCP10 field.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES0.

In Non-secure state, if EL3 is implemented and is using AArch32, when the value of [NSACR](#).cp10 is 0, this field behaves as RAZ/WI, regardless of its actual value.

Execution of Advanced SIMD and floating-point instructions in AArch32 state can be disabled or trapped by the following controls:

- CPACR.cp10, or, if executing at EL0, [CPACR_EL1](#).FPEN.
- [FPEXC](#).EN.
- If executing in Non-secure state:
 - [HCPTR](#).TCP10, or if EL2 is using AArch64, [CPTR_EL2](#).TFP.
 - [NSACR](#).cp10, or if EL3 is using AArch64, [CPTR_EL3](#).TFP.
- For Advanced SIMD instructions only:
 - CPACR.ASEDIS.
 - If executing in Non-secure state, [HCPTR](#).TASE and [NSACR](#).NSTRCDIS.

See the descriptions of the controls for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [19:0]

Reserved, RES0.

Accessing CPACR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

CPPRCTX, Cache Prefetch Prediction Restriction by Context

The CPPRCTX characteristics are:

Purpose

Cache Prefetch Prediction Restriction by Context applies to all Cache Allocation Resources that predict cache allocations based on information gathered within the target execution context or contexts.

Cache prefetch predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot influence speculative execution occurring after the instruction is complete and synchronized.

This instruction applies to all:

- Instruction caches.
- Data caches.
- TLB prefetching hardware used by the executing PE that applies to the supplied context or contexts.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of Cache Allocation Resources so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when AArch32 is supported and FEAT_SPECRES is implemented. Otherwise, direct accesses to CPPRCTX are UNDEFINED.

Attributes

CPPRCTX is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|---------|----|----|----|----|----|----|----|------|----|----|----|------|----|----|----|-------|----|---|---|------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | GVMIDNS | | | | EL | | | | VMID | | | | RES0 | | | | GASID | | | | ASID | | | | | | | |

Bits [31:28]

Reserved, RES0.

GVMID, bit [27]

Execution of this instruction applies to all VMIDs or a specified VMID.

| GVMID | Meaning |
|--------------|---|
| 0b0 | Applies to specified VMID for an EL0 or EL1 target execution context. |
| 0b1 | Applies to all VMIDs for an EL0 or EL1 target execution context. |

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, then this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

NS, bit [26]

Security State.

| NS | Meaning |
|-----------|-------------------|
| 0b0 | Secure state. |
| 0b1 | Non-secure state. |

If the instruction is executed in Non-secure state, this field is treated as 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

| EL | Meaning |
|-----------|----------------|
| 0b00 | EL0. |
| 0b01 | EL1. |
| 0b10 | EL2. |
| 0b11 | EL3. |

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

VMID, bits [23:16]

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#) or [ELUsingAArch32\(EL2\)](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==1](#) and [HCR_EL2.TGE==1](#) and [!ELUsingAArch32\(EL2\)](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

Bits [15:9]

Reserved, RES0.

GASID, bit [8]

Execution of this instruction applies to all ASIDs or a specified ASID.

| GASID | Meaning |
|--------------|--|
| 0b0 | Applies to specified ASID for an EL0 target execution context. |
| 0b1 | Applies to all ASID for an EL0 target execution context. |

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [7:0]

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

Executing the CPPRCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b0111 | 0b0011 | 0b111 |

```

if PSTATE.EL == EL0 then
    if !ELUsingAArch32(EL1) && !(EL2Enabled() && HCR_EL2.<E2H,TGE> == '11') && SCTL_EL1.EnRCTX ==
'0' then
        if EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TGE == '1' then

CPSR, Current Program Status Register

The CPSR characteristics are:

Purpose

Holds PE status and control information.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to CPSR are UNDEFINED.

Attributes

CPSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|------|------|-----|-----|------|----|------|----|----|----|----|------|------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| N | Z | C | V | Q | RES0 | SSBS | PAN | DIT | RES0 | GE | RES0 | E | A | I | F | RES0 | RES1 | M | | | | | | | | | | | | | |

N, bit [31]

Negative condition flag. Set to bit[31] of the result of the last flag-setting instruction. If the result is regarded as a two's complement signed integer, then N is set to 1 if the result was negative, and N is set to 0 if the result was positive or zero.

Z, bit [30]

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

C, bit [29]

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

V, bit [28]

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

Q, bit [27]

Cumulative saturation bit. Set to 1 to indicate that overflow or saturation occurred in some instructions.

Bits [26:24]

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass Safe.

Prohibits speculative loads or stores that might practically allow a cache timing side channel.

A cache timing side channel might be exploited where a load or store uses an address that is derived from a register that is being loaded from memory using a load instruction speculatively read from a memory location. If PSTATE.SSBS is enabled, the address derived from the load instruction might be from earlier in the coherence order than the latest store to that memory location with the same virtual address.

| SSBS | Meaning |
|------|---|
| 0b0 | Hardware is not permitted to load or store speculatively in the manner described. |
| 0b1 | Hardware is permitted to load or store speculatively in the manner described. |

The value of this bit is usually set to the value described by the [SCTLR.DSSBS](#) bit on exceptions to any mode except Hyp mode, and the value described by [HSTCLR.DSSBS](#) on exceptions to Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never.

| PAN | Meaning |
|-----|---|
| 0b0 | The translation system is the same as Armv8.0. |
| 0b1 | Disables privileged read and write accesses to addresses accessible at EL0. |

The value of this bit is usually preserved on taking an exception, except in the following situations:

- When the target of the exception is EL1, and the value of the [SCTLR.SPAN](#) bit for the current Security state is 0, this bit is set to 1.
- When the target of the exception is EL3, from Secure state, and the value of the Secure [SCTLR.SPAN](#) is 0, this bit is set to 1.
- When the target of the exception is EL3, from Non-secure state, this bit is set to 0 regardless of the value of the Secure [SCTLR.SPAN](#) bit.

Otherwise:

Reserved, RES0.

DIT, bit [21]

When FEAT_DIT is implemented:

Data Independent Timing.

| DIT | Meaning |
|------------|---|
| 0b0 | The architecture makes no statement about the timing properties of any instructions. |
| 0b1 | <p>The architecture requires that:</p> <ul style="list-style-type: none"> • The timing of every load and store instruction is insensitive to the value of the data being loaded or stored. • For certain data processing instructions, the instruction takes a time that is independent of: <ul style="list-style-type: none"> ◦ The values of the data supplied in any of its registers. ◦ The values of the NZCV flags. • For certain data processing instructions, the response of the instruction to asynchronous exceptions does not vary based on: <ul style="list-style-type: none"> ◦ The values of the data supplied in any of its registers. ◦ The values of the NZCV flags. |

The data processing instructions affected by this bit are:

- All cryptographic instructions. These instructions are:
 - AESD, AESE, AESIMC, AESMC, SHA1C, SHA1H, SHA1M, SHA1P, SHA1SU0, SHA1SU1, SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.
- A subset of the instructions that use the general-purpose register file. For these instructions, the effects of CPSR.DIT apply only if they do not use R15 as either their source or destination and pass their condition execution check. These instructions are:
 - BFI, BFC, CLZ, CMN, CMP, MLA, MLAS, MLS, MOVT, MUL, MULS, NOP, PKHBT, PKHTB, RBIT, REV, REV16, REVSH, RRX, SADD16, SADD8, SASX, SBFX, SHADD16, SHADD8, SHASX, SHSAX, SHSUB16, SHSUB8, SMLAL**, SMLAW*, SMLSD*, SMLLA*, SMLLS*, SMMUL*, SMUAD*, SMUL*, SSAX, SSUB16, SSUB8, SXTAB*, SXTAH, SXTB*, SXTH, TEQ, TST, UADD*, UASX, UBFX, UHADD*, UHASX, UHSAX, UHSUB*, UMAAL, UMLAL, UMLALS, UMULL, UMULLS, USADA8, USAX, USUB*, UXTAB*, UXTAH, UXTB*, UXTH, ADC (register-shifted register), ADCS (register-shifted register), ADD (register-shifted register), ADDS (register-shifted register), AND (register-shifted register), ANDS (register-shifted register), ASR (register-shifted register), ASRS (register-shifted register), BIC (register-shifted register), BICS (register-shifted register), EOR (register-shifted register), EORS (register-shifted register), LSL (register-shifted register), LSLS (register-shifted register), LSR (register-shifted register), LSRS (register-shifted register), MOV (register-shifted register), MOVS (register-shifted register), MVN (register-shifted register), MVNS (register-shifted register), ORR (register-shifted register), ORRS (register-shifted register), ROR (register-shifted register), RORS (register-shifted register), RSB (register-shifted register), RSBS (register-shifted register), RSC (register-shifted register), RSCS (register-shifted register), SBC (register-shifted register), SBCS (register-shifted register), SUB (register-shifted register), and SUBS (register-shifted register).
- A subset of the instructions that use the general-purpose register file. For these instructions, the effects of CPSR.DIT do not depend on these instructions passing their condition execution check. These instructions are:
 - ADC (immediate), ADC (register), ADCS (immediate), ADCS (register), ADD (immediate), ADD (register), ADDS (immediate), ADDS (register), AND (immediate), AND (register), ANDS (immediate), ANDS (register), ASR (immediate), ASR (register), ASRS (immediate), ASRS (register), BIC (immediate), BIC (register), BICS (immediate), BICS (register), EOR (immediate), EOR (register), EORS (immediate), EORS (register), LSL (immediate), LSL (register), LSLS (immediate), LSLS (register), LSR (immediate), LSR (register), LSRS (immediate), LSRS (register), MOV (immediate), MOV (register), MOVS (immediate), MOVS (register), MVN (immediate), MVN (register), MVNS (immediate), MVNS (register), ORR (immediate), ORR (register), ORRS (immediate), ORRS (register), ROR (immediate), ROR (register), RORS (immediate), RORS (register), RSB (immediate), RSB (register), RSBS (immediate), RSBS (register), RSC (immediate), RSC (register), RSCS (immediate), RSCS (register), SBC (immediate), SBC (register), SBCS (immediate), SBCS (register), SUB (immediate), SUB (register), SUBS (immediate), and SUBS (register).
 - If FEAT_CRC32 is implemented, CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW.
- A subset of the instructions that use the SIMD&FP register file. For these instructions, the effects of CPSR.DIT apply only if they pass their condition execution check. These instructions are:

- VABA*, VABD* (integer), VADD (integer), VADDHN, VADDL, VADDW, VAND, VBIC, VBIF, VBIT, VBSL, VCLS, VCLZ, VCNT, VDUP, VEOR, VEXT, VHADD, VHSUB, VMAX (integer), VMIN (integer), VMLA (integer), VMLAL, VMLS (integer), VMLS, VMOV, VMOVL, VMOVN, VMUL (integer and polynomial), VMULL (integer and polynomial), VMVN, VORN, VORR, VPADAL, VPADD (integer), VPADDL, VPMAX (integer), VPMIN (integer), VRADDHN, VREV*, VRHADD, VRSHL, VRSHR, VRSRN, VRSRA, VRSUBHN, VSHL, VSHLL, VSHR, VSLI, VSRA, VSRI, VSUB (integer), VSUBHN, VSUBL, VSUBW, VSWP, VTBL, VTBX, VTRN, VTST, VUZP, and VZIP.
- Another subset of the instructions that use the SIMD&FP register file. For these instructions, the effects of CPSR.DIT apply only if they pass their condition execution check and apply only when the instructions are operating on integer vector elements. These instructions are:
 - VABS, VCGE, VCGT, VCLE, VCLT, VMLA (by scalar), VMLS (by scalar), and VNEG.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

GE, bits [19:16]

Greater than or Equal flags, for parallel addition and subtraction.

Bits [15:10]

Reserved, RES0.

E, bit [9]

Endianness state bit. Controls the load and store endianness for data accesses:

| E | Meaning |
|-----|-------------------------|
| 0b0 | Little-endian operation |
| 0b1 | Big-endian operation. |

Instruction fetches ignore this bit.

If an implementation does not provide Big-endian support, this bit is RES0. If it does not provide Little-endian support, this bit is RES1.

If an implementation provides Big-endian support but only at EL0, this bit is RES0 for an exception return to any Exception level other than EL0.

Likewise, if it provides Little-endian support only at EL0, this bit is RES1 for an exception return to any Exception level other than EL0.

When the reset value of the SCTLR.EE bit is defined by a configuration input signal, that value also applies to the CPSR.E bit on reset, and therefore applies to software execution from reset.

A, bit [8]

SError interrupt mask bit.

| A | Meaning |
|-----|-----------------------|
| 0b0 | Exception not masked. |
| 0b1 | Exception masked. |

I, bit [7]

IRQ mask bit.

| I | Meaning |
|----------|-----------------------|
| 0b0 | Exception not masked. |
| 0b1 | Exception masked. |

F, bit [6]

FIQ mask bit.

| F | Meaning |
|----------|-----------------------|
| 0b0 | Exception not masked. |
| 0b1 | Exception masked. |

Bit [5]

Reserved, RES0.

Bit [4]

Reserved, RES1.

M, bits [3:0]

Current PE mode.

| M | Meaning |
|----------|----------------|
| 0b0000 | User. |
| 0b0001 | FIQ. |
| 0b0010 | IRQ. |
| 0b0011 | Supervisor. |
| 0b0110 | Monitor. |
| 0b0111 | Abort. |
| 0b1010 | Hyp. |
| 0b1011 | Undefined. |
| 0b1111 | System. |

Accessing CPSR

CPSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.

30/09/2021 14:53; 092b4e1bbfbb45a293b198f9330c5f529ead2b0f

CSSELR, Cache Size Selection Register

The CSSELR characteristics are:

Purpose

Selects the current Cache Size ID Register, [CCSIDR](#), by specifying the required cache level and the cache type, which is either instruction cache or data cache.

If FEAT_CCIDX is implemented, CSSELR also selects the current [CCSIDR2](#).

Configuration

AArch32 System register CSSELR bits [31:0] are architecturally mapped to AArch64 System register [CSSELR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CSSELR are UNDEFINED.

Attributes

CSSELR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|-----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | Level | | | InD | | | | | | | | | | | | |

Bits [31:4]

Reserved, RES0.

Level, bits [3:1]

Cache level of required cache. Permitted values are:

| Level | Meaning |
|-------|----------------|
| 0b000 | Level 1 cache. |
| 0b001 | Level 2 cache. |
| 0b010 | Level 3 cache. |
| 0b011 | Level 4 cache. |
| 0b100 | Level 5 cache. |
| 0b101 | Level 6 cache. |
| 0b110 | Level 7 cache. |

All other values are reserved.

If CSSELR.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

InD, bit [0]

Instruction not Data bit. Permitted values are:

| InD | Meaning |
|-----|------------------------|
| 0b0 | Data or unified cache. |
| 0b1 | Instruction cache. |

If CSSELR.Level is programmed to a cache level that is not implemented, then the value for this field on a read of CSSELR is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing CSSELR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b010 | 0b0000 | 0b0000 | 0b000 |

```

CTR, Cache Type Register

The CTR characteristics are:

Purpose

Provides information about the architecture of the caches.

Configuration

AArch32 System register CTR bits [31:0] are architecturally mapped to AArch64 System register [CTR_EL0\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to CTR are UNDEFINED.

Attributes

CTR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|------|-----|-----|-----|----|----|----|-----|----|----|----|----------|----|----|----|------|----|----|----|------|----|---|---|---|---|---|---|----------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES1 | RES0 | DIC | IDC | CWG | | | | ERG | | | | DminLine | | | | L1lp | | | | RES0 | | | | | | | | lminLine | | | |

Bit [31]

Reserved, RES1.

Bit [30]

Reserved, RES0.

DIC, bit [29]

Instruction cache invalidation requirements for data to instruction coherence.

| DIC | Meaning |
|-----|---|
| 0b0 | Instruction cache invalidation to the Point of Unification is required for data to instruction coherence. |
| 0b1 | Instruction cache invalidation to the Point of Unification is not required for data to instruction coherence. |

IDC, bit [28]

Data cache clean requirements for instruction to data coherence. The meaning of this bit is:

| IDC | Meaning |
|-----|---|
| 0b0 | Data cache clean to the Point of Unification is required for instruction to data coherence, unless CLIDR.LoC == 0b000 or (CLIDR.LoUIS == 0b000 && CLIDR.LoUU == 0b000). |
| 0b1 | Data cache clean to the Point of Unification is not required for instruction to data coherence. |

CWG, bits [27:24]

Cache writeback granule. Log₂ of the number of words of the maximum size of memory that can be overwritten as a result of the eviction of a cache entry that has had a memory location in it modified.

A value of 0b0000 indicates that this register does not provide Cache writeback granule information and either:

- The architectural maximum of 512 words (2KB) must be assumed.
- The Cache writeback granule can be determined from maximum cache line size encoded in the Cache Size ID Registers.

Values greater than 0b1001 are reserved.

Arm recommends that an implementation that does not support cache write-back implements this field as 0b0001. This applies, for example, to an implementation that supports only write-through caches.

ERG, bits [23:20]

Exclusives reservation granule. Log₂ of the number of words of the maximum size of the reservation granule that has been implemented for the Load-Exclusive and Store-Exclusive instructions.

The use of the value 0b0000 is deprecated.

The value 0b0001 and values greater than 0b1001 are reserved.

DminLine, bits [19:16]

Log₂ of the number of words in the smallest cache line of all the data caches and unified caches that are controlled by the PE.

L1Ip, bits [15:14]

Level 1 instruction cache policy. Indicates the indexing and tagging policy for the L1 instruction cache. Possible values of this field are:

| L1Ip | Meaning | Applies when |
|------|--|--------------------------------|
| 0b00 | VMID aware Physical Index, Physical tag (VPIPT). | When FEAT_VPIPT is implemented |
| 0b01 | ASID-tagged Virtual Index, Virtual Tag (AIVIVT). | |
| 0b10 | Virtual Index, Physical Tag (VIPT). | |
| 0b11 | Physical Index, Physical Tag (PIPT). | |

The value 0b00 is permitted only in an implementation that includes FEAT_VPIPT, otherwise the value is reserved.

The value 0b01 is not permitted in Armv8.

Bits [13:4]

Reserved, RES0.

IminLine, bits [3:0]

Log₂ of the number of words in the smallest cache line of all the instruction caches that are controlled by the PE.

Accessing CTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0000 | 0b0000 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T0 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T0 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TID2 == '1' then

DACR, Domain Access Control Register

The DACR characteristics are:

Purpose

Defines the access permission for each of the sixteen memory domains.

Configuration

AArch32 System register DACR bits [31:0] are architecturally mapped to AArch64 System register [DACR32_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DACR are UNDEFINED.

This register has no function when [TTBCR](#).EAE is set to 1, to select the Long-descriptor translation table format.

Attributes

DACR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | | | | | | | | | | | | | | | | |

D<n>, bits [2n+1:2n], for n = 15 to 0

Domain n access permission, where n = 0 to 15. Permitted values are:

| D<n> | Meaning |
|------|--|
| 0b00 | No access. Any access to the domain generates a Domain fault. |
| 0b01 | Client. Accesses are checked against the permission bits in the translation tables. |
| 0b11 | Manager. Accesses are not checked against the permission bits in the translation tables. |

The value 0b10 is reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DACR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

```

DBGAUTHSTATUS, Debug Authentication Status register

The DBGAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configuration

AArch32 System register DBGAUTHSTATUS bits [31:0] are architecturally mapped to AArch64 System register [DBGAUTHSTATUS_EL1\[31:0\]](#).

AArch32 System register DBGAUTHSTATUS bits [31:0] are architecturally mapped to External register [DBGAUTHSTATUS_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGAUTHSTATUS are UNDEFINED.

This register is required in all implementations.

Attributes

DBGAUTHSTATUS is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|------|-----|-------|------|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | SNID | SID | NSNID | NSID | | | | |

Bits [31:8]

Reserved, RES0.

SNID, bits [7:6]

When FEAT_Debugv8p4 is implemented:

Secure Non-Invasive Debug.

This field has the same value as DBGAUTHSTATUS.SID.

Otherwise:

Secure Non-Invasive Debug.

| SNID | Meaning |
|------|---|
| 0b00 | Not implemented. EL3 is not implemented and the Effective value of SCR.NS is 1. |
| 0b10 | Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE. |
| 0b11 | Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE. |

All other values are reserved.

SID, bits [5:4]

Secure Invasive Debug.

| SID | Meaning |
|------|--|
| 0b00 | Not implemented. EL3 is not implemented and the Effective value of SCR_EL3 .NS is 1. |
| 0b10 | Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE. |
| 0b11 | Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE. |

All other values are reserved.

NSNID, bits [3:2]

When FEAT_Debugv8p4 is implemented:

Non-secure Non-invasive debug.

| NSNID | Meaning |
|-------|---|
| 0b00 | Not implemented. EL3 is not implemented and the Effective value of SCR .NS is 0. |
| 0b11 | Implemented and enabled. EL3 is implemented or the Effective value of SCR .NS is 1. |

All other values are reserved.

Otherwise:

Non-secure Non-Invasive Debug.

| NSNID | Meaning |
|-------|---|
| 0b00 | Not implemented. EL3 is not implemented and the Effective value of SCR .NS is 0 |
| 0b10 | Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE. |
| 0b11 | Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE. |

All other values are reserved.

NSID, bits [1:0]

Non-secure Invasive Debug.

| NSID | Meaning |
|------|---|
| 0b00 | Not implemented. EL3 is not implemented or the Effective value of SCR_EL3 .NS is 0. |
| 0b10 | Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE. |
| 0b11 | Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE. |

All other values are reserved.

Accessing DBGAUTHSTATUS

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

DBGBCR<n>, Debug Breakpoint Control Registers, n = 0 - 15

The DBGBCR<n> characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register [DBGBVR<n>](#). If EL2 is implemented and this breakpoint supports Context matching, [DBGBVR<n>](#) can be associated with a Breakpoint Extended Value Register [DBGBXVR<n>](#) for VMID matching.

Configuration

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGBCR<n>_EL1\[31:0\]](#).

AArch32 System register DBGBCR<n> bits [31:0] are architecturally mapped to External register [DBGBCR<n>_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGBCR<n> are UNDEFINED.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGBCR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|-----|----|-----|------|----|----|---|-----|---|---|------|-----|---|---|---|---|

When the E field is zero, all the other fields in the register are ignored.

Bits [31:24]

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type. Possible values are:

| BT | Meaning |
|--------|---|
| 0b0000 | Unlinked instruction address match. DBGBVR<n> is the address of an instruction. |
| 0b0001 | As 0b0000 with linking enabled. |
| 0b0010 | Unlinked Context ID match. When FEAT_VHE is implemented, EL2 is using AArch64, and the Effective value of HCR_EL2.E2H is 1, if either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>.ContextID must match the CONTEXTIDR_EL2 value. Otherwise, DBGBVR<n>.ContextID must match the CONTEXTIDR value. |
| 0b0011 | As 0b0010 with linking enabled. |
| 0b0100 | Unlinked instruction address mismatch. DBGBVR<n> is the address of an instruction to be stepped. |
| 0b0101 | As 0b0100 with linking enabled. |
| 0b0110 | Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>.ContextID is a Context ID compared against CONTEXTIDR . |
| 0b0111 | As 0b0110 with linking enabled. |
| 0b1000 | Unlinked VMID match. DBGBXVR<n>.VMID is a VMID compared against VTTBR.VMID . |
| 0b1001 | As 0b1000 with linking enabled. |
| 0b1010 | Unlinked VMID and Context ID match. DBGBVR<n>.ContextID is a Context ID compared against CONTEXTIDR , and DBGBXVR<n>.VMID is a VMID compared against VTTBR.VMID . |
| 0b1011 | As 0b1010 with linking enabled. |
| 0b1100 | Unlinked CONTEXTIDR_EL2 match. DBGBXVR<n>.ContextID2 is a Context ID compared against CONTEXTIDR_EL2 . |
| 0b1101 | As 0b1100 with linking enabled. |
| 0b1110 | Unlinked Full Context ID match. DBGBVR<n>.ContextID is compared against CONTEXTIDR , and DBGBXVR<n>.ContextID2 is compared against CONTEXTIDR_EL2 . |
| 0b1111 | As 0b1110 with linking enabled. |

For more information on Breakpoints and their constraints, see 'Breakpoint exceptions' and 'Reserved DBGBCR<n>.BT values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked address matching breakpoints, this specifies the index of the Context-matching breakpoint linked to.

For all other breakpoint types this field is ignored and reads of the register return an UNKNOWN value.

This field is ignored when the value of DBGBCR<n>.E is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields.

For more information, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions' and 'Reserved DBGBCR<n>.{SSC, HMC, PMC} values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the SSC, bits [15:14] description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints, the permitted values are:

| BAS | Match instruction at | Constraint for debuggers |
|--------|------------------------------------|--------------------------|
| 0b0011 | DBGBVR<n> | Use for T32 instructions |
| 0b1100 | DBGBVR<n> +2 | Use for T32 instructions |
| 0b1111 | DBGBVR<n> | Use for A32 instructions |

All other values are reserved. For more information, see 'Reserved DBGBCR<n>.BAS values'.

For more information on using the BAS field in Address Match breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

| BAS | Step instruction at | Constraint for debuggers |
|--------|------------------------------------|-------------------------------------|
| 0b0000 | - | Use for a match anywhere breakpoint |
| 0b0011 | DBGBVR<n> | Use for T32 instructions |
| 0b1100 | DBGBVR<n> +2 | Use for T32 instructions |
| 0b1111 | DBGBVR<n> | Use for A32 instructions |

All other values are reserved. For more information, see 'Reserved DBGBCR<n>.BAS values'.

For more information on using the BAS field in address mismatch breakpoints, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint [DBGBVR<n>](#). Possible values are:

| E | Meaning |
|-----|----------------------|
| 0b0 | Breakpoint disabled. |
| 0b1 | Breakpoint enabled. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>

**DBGBVR<n>, Debug Breakpoint Value Registers, n = 0
- 15**

The DBGBVR<n> characteristics are:

Purpose

Holds a value for use in breakpoint matching, either the virtual address of an instruction or a context ID. Forms breakpoint `n` together with control register [DBGBCR<n>](#). If EL2 is implemented and this breakpoint supports Context matching, [DBGBVR<n>](#) can be associated with a Breakpoint Extended Value Register [DBGBXVR<n>](#) for VMID matching.

Configuration

AArch32 System register DBGBVR<n> bits [31:0] are architecturally mapped to AArch64 System register DBGBVR<n> [EL1\[31:0\]](#).

AArch32 System register DBGBVR<n> bits [31:0] are architecturally mapped to External register [DBGBVR<n>_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGVBR<n> are UNDEFINED.

How this register is interpreted depends on the value of [DBGBCR<n>.BT](#).

- When [DBGBCR<n>](#).BT is 0b0x0x, this register holds a virtual address.
- When [DBGBCR<n>](#).BT is 0bxx1x, this register holds a Context ID.

For other values of [DBGBCR<n>.BT](#), this register is RES0.

Some breakpoints might not support Context ID comparison. For more information, see the description of the [DBGDIDR.CTX CMPs](#) field.

If breakpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGBVR<n> is a 32-bit register.

Field descriptions

When DBGBCR<n>.BT == 0b0x0x:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VA[31:2] | | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | |

VA[31:2], bits [31:2]

Bits[31:2] of the address value for comparison.

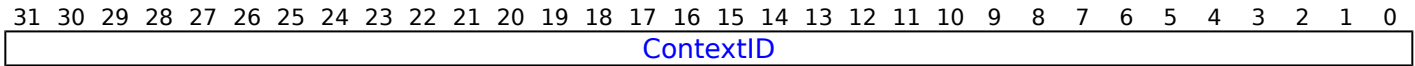

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>.BT == 0b001x:

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against [CONTEXTIDR_EL2](#) when all of the following are true:

- FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented.
- [HCR_EL2](#).{E2H, TGE} is {1,1}.
- The PE is executing at EL0.
- EL2 is using AArch64 and is enabled in the current Security state.

Otherwise, the value is compared against [CONTEXTIDR](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>.BT == 0b101x and EL2 is implemented:

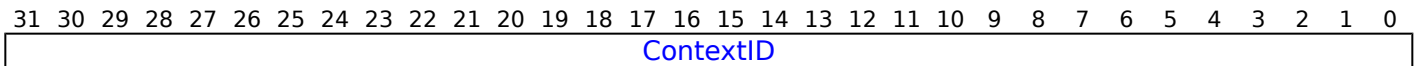

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>.BT == 0bx11x, EL2 is implemented and (FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented):

ContextID, bits [31:0]

Context ID value for comparison against [CONTEXTIDR](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBVR<n>

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

DBGBXVR<n>, Debug Breakpoint Extended Value Registers, n = 0 - 15

The DBGBXVR<n> characteristics are:

Purpose

Holds a value for use in breakpoint matching, to support VMID matching. Used in conjunction with a control register [DBGBCR<n>](#) and a value register [DBGBVR<n>](#), where EL2 is implemented and breakpoint n supports Context matching.

Configuration

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGBVR<n>_EL1\[63:32\]](#).

AArch32 System register DBGBXVR<n> bits [31:0] are architecturally mapped to External register [DBGBVR<n>_EL1\[63:32\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGBXVR<n> are UNDEFINED.

How this register is interpreted depends on the value of [DBGBCR<n>_BT](#).

- When [DBGBCR<n>_BT](#) is 0b10xx, this register holds a VMID.
- When [DBGBCR<n>_BT](#) is 0b11xx, this register holds a Context ID.

For other values of [DBGBCR<n>_BT](#), this register is RES0.

Accesses to this register are UNDEFINED in any of the following cases:

- Breakpoint n is not implemented.
- Breakpoint n does not support Context matching.
- EL2 is not implemented.

For more information, see the description of the [DBGDIDR.CTX_CMPs](#) field.

Attributes

DBGBXVR<n> is a 32-bit register.

Field descriptions

When DBGBCR<n>_BT == 0b10xx and EL2 is implemented:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|----|---|---|-----------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | VMID[15:8] | | | | | | | | VMID[7:0] | | | | | | | |

Bits [31:16]

Reserved, RES0.

VMID[15:8], bits [15:8]

When FEAT_VMID16 is implemented and VTCR_EL2.VS == 1:

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [7:0]

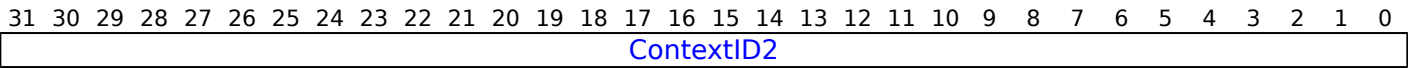

VMID value for comparison. The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- [VTCR_EL2](#).VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>.BT == 0b11xx and EL2 is implemented:

ContextID2, bits [31:0]

When FEAT_VHE is implemented or FEAT_Debugv8p2 is implemented:

Context ID value for comparison against [CONTEXTIDR_EL2](#).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing DBGBXVR<n>

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

DBGCLAIMCLR, Debug CLAIM Tag Clear register

The DBGCLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMSET](#) register.

Configuration

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to AArch64 System register [DBGCLAIMCLR_EL1\[31:0\]](#).

AArch32 System register DBGCLAIMCLR bits [31:0] are architecturally mapped to External register [DBGCLAIMCLR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGCLAIMCLR are UNDEFINED.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|-------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RAZ/WI | | | | | | | | | | | | | | | | | | | | | | | | CLAIM | | | | | | | |

Bits [31:8]

Reserved, RAZ/WI.

CLAIM, bits [7:0]

Read or clear CLAIM tag bits. Reading this field returns the current value of the CLAIM tag bits.

Writing a 1 to one of these bits clears the corresponding CLAIM tag bit to 0. This is an indirect write to the CLAIM tag bits. A single write operation can clear multiple CLAIM tag bits to 0.

Writing 0 to one of these bits has no effect.

The reset behavior of this field is:

- On a Cold reset, this field resets to 0.

Accessing DBGCLAIMCLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

DBGCLAIMSET, Debug CLAIM Tag Set register

The DBGCLAIMSET characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the [DBGCLAIMCLR](#) register.

Configuration

AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to AArch64 System register [DBGCLAIMSET_EL1\[31:0\]](#).

AArch32 System register DBGCLAIMSET bits [31:0] are architecturally mapped to External register [DBGCLAIMSET_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGCLAIMSET are UNDEFINED.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMSET is a 32-bit register.

DBGDCCINT, DCC Interrupt Enable Register

The DBGDCCINT characteristics are:

Purpose

Enables interrupt requests to be signaled based on the DCC status flags.

Configuration

AArch32 System register DBGDCCINT bits [31:0] are architecturally mapped to AArch64 System register [MDCCINT_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGDCCINT are UNDEFINED.

Attributes

DBGDCCINT is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|------|---|---|---|--|--|--|--|--|--|--|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | | | | | | |
| RES0 | RX | TX | | | | | | | | | | | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | |

Bit [31]

Reserved, RES0.

RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

| RX | Meaning |
|-----|---|
| 0b0 | No interrupt request generated by DTRRX. |
| 0b1 | Interrupt request will be generated on RXfull == 1. |

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common **COMMIRQ** interrupt request to be signaled based on the DCC status flags.

| TX | Meaning |
|-----|---|
| 0b0 | No interrupt request generated by DTRTX. |
| 0b1 | Interrupt request will be generated on TXfull == 0. |

If legacy **COMMRX** and **COMMTX** signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [28:0]

Reserved, RES0.

Accessing DBGDCCINT

DBGDEVID, Debug Device ID register 0

The DBGDEVID characteristics are:

Purpose

Adds to the information given by the [DBGDIDR](#) by describing other features of the debug implementation.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGDEVID are UNDEFINED.

This register is required in all implementations.

Attributes

DBGDEVID is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------------|----|----|----|-------------------------|----|----|----|----------------------------|----|----|----|---------------------------|----|----|----|-----------------------------|----|----|----|----------------------------|----|---|---|----------------------------|---|---|---|--------------------------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CIDMask | | | | AuxRegs | | | | DoubleLock | | | | VirtExtns | | | | VectorCatch | | | | BPAddrMask | | | | WPAddrMask | | | | PCSample | | | |

CIDMask, bits [31:28]

Indicates the level of support for the Context ID matching breakpoint masking capability. Defined values are:

| CIDMask | Meaning |
|---------|--|
| 0b0000 | Context ID masking is not implemented. |
| 0b0001 | Context ID masking is implemented. |

All other values are reserved. The value of this for Armv8 is 0b0000.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers. Permitted values for this field are:

| AuxRegs | Meaning |
|---------|--|
| 0b0000 | None supported. |
| 0b0001 | Support for External Debug Auxiliary Control Register, EDACR . |

All other values are reserved.

DoubleLock, bits [23:20]

OS Double Lock implemented. Defined values are:

| DoubleLock | Meaning |
|------------|--|
| 0b0000 | OS Double Lock is not implemented. DBGOSDLR is RAZ/WI. |
| 0b0001 | OS Double Lock is implemented. DBGOSDLR is RW. |

FEAT_DoubleLock implements the functionality identified by the value 0b0001.

All other values are reserved.

VirtExtns, bits [19:16]

Indicates whether EL2 is implemented. Defined values are:

| VirtExtns | Meaning |
|------------------|-------------------------|
| 0b0000 | EL2 is not implemented. |
| 0b0001 | EL2 is implemented. |

All other values are reserved.

VectorCatch, bits [15:12]

Defines the form of Vector Catch exception implemented. Defined values are:

| VectorCatch | Meaning |
|--------------------|--|
| 0b0000 | Address matching Vector Catch exception implemented. |
| 0b0001 | Exception matching Vector Catch exception implemented. |

All other values are reserved.

BPAAddrMask, bits [11:8]

Indicates the level of support for the instruction address matching breakpoint masking capability. Defined values are:

| BPAAddrMask | Meaning |
|--------------------|---|
| 0b0000 | Breakpoint address masking might be implemented. If not implemented, DBGBCR<n> [28:24] is RAZ/WI. |
| 0b0001 | Breakpoint address masking is implemented. |
| 0b1111 | Breakpoint address masking is not implemented. DBGBCR<n> [28:24] is RES0. |

All other values are reserved. The value of this for Armv8 is 0b1111.

WPAAddrMask, bits [7:4]

Indicates the level of support for the data address matching watchpoint masking capability. Defined values are:

| WPAAddrMask | Meaning |
|--------------------|--|
| 0b0000 | Watchpoint address masking might be implemented. If not implemented, DBGWCR<n> .MASK (Address mask) is RAZ/WI. |
| 0b0001 | Watchpoint address masking is implemented. |
| 0b1111 | Watchpoint address masking is not implemented. DBGWCR<n> .MASK (Address mask) is RES0. |

All other values are reserved. The value of this for Armv8 is 0b0001.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers. Defined values are:

| PCSample | Meaning |
|-----------------|---|
| 0b0000 | PC Sample-based Profiling Extension is not implemented in the external debug registers space. |
| 0b0010 | Only EDPCSR and EDCIDS are implemented. This option is only permitted if EL3 and EL2 are not implemented. |
| 0b0011 | EDPCSR , EDCIDS , and EDVIDSR are implemented. |

All other values are reserved.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMDEVID.PCSample](#).

Accessing DBGDEVID

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1110 | 0b000 | 0b0111 | 0b0010 | 0b111 |

```

| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | PCSROffset | | | |

Bits [31:4]

Reserved, RES0.

PCSROffset, bits [3:0]

This field indicates the offset applied to PC samples returned by reads of [EDPCSR](#). Permitted values of this field in Armv8 are:

| PCSROffset | Meaning |
|------------|--|
| 0b0000 | EDPCSR is not implemented. |
| 0b0010 | EDPCSR implemented. Samples have no offset applied and do not sample the instruction set state in AArch32 state. |

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of [PMDEVID](#).PCSample.

Accessing DBGDEVID1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

DBGDIDR, Debug ID Register

The DBGDIDR characteristics are:

Purpose

Specifies which version of the Debug architecture is implemented, and some features of the debug implementation.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGDIDR are UNDEFINED.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|------|----|----|----|----------|----|----|----|---------|----|----|----|------|-----------|------|--------|------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| WRPs | | | | BRPs | | | | CTX_CMPs | | | | Version | | | | RES1 | nSUHD_imp | RES0 | SE_imp | RES0 | | | | | | | | | | | |

WRPs, bits [31:28]

The number of watchpoints implemented, minus 1.

Permitted values of this field are from 0b0001 for 2 implemented watchpoints, to 0b1111 for 16 implemented watchpoints.

The value of 0b0000 is reserved.

If AArch64 is implemented, this field has the same value as [ID_AA64DFR0_EL1](#).WRPs.

BRPs, bits [27:24]

The number of breakpoints implemented, minus 1.

Permitted values of this field are from 0b0001 for 2 implemented breakpoint, to 0b1111 for 16 implemented breakpoints.

The value of 0b0000 is reserved.

If AArch64 is implemented, this field has the same value as [ID_AA64DFR0_EL1](#).BRPs.

CTX_CMPs, bits [23:20]

The number of breakpoints that can be used for Context matching, minus 1.

Permitted values of this field are from 0b0000 for 1 Context matching breakpoint, to 0b1111 for 16 Context matching breakpoints.

The Context matching breakpoints must be the highest addressed breakpoints. For example, if six breakpoints are implemented and two are Context matching breakpoints, they must be breakpoints 4 and 5.

If AArch64 is implemented, this field has the same value as [ID_AA64DFR0_EL1](#).CTX_CMPs.

Version, bits [19:16]

Debug architecture version. Indicates presence of Armv8 debug architecture. Defined values are:

| Version | Meaning |
|----------------|--|
| 0b0000 | Not supported. |
| 0b0001 | Armv6, v6 Debug architecture, with System registers access. |
| 0b0010 | Armv6, v6.1 Debug architecture, with System registers access. |
| 0b0011 | Armv7, v7 Debug architecture, with only baseline System registers. |
| 0b0100 | Armv7, v7 Debug architecture, with all System registers implemented. |
| 0b0101 | Armv7, v7.1 Debug architecture, with System registers access. |
| 0b0110 | Armv8 debug architecture. |
| 0b0111 | Armv8 debug architecture with Virtualization Host Extensions. |
| 0b1000 | Armv8.2 debug architecture, FEAT_Debugv8p2. |
| 0b1001 | Armv8.4 debug architecture, FEAT_Debugv8p4. |
| 0b1010 | Armv8.8 debug architecture, FEAT_Debugv8p8. |

All other values are reserved.

The values 0b0000, 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted in Armv8.

FEAT_VHE adds the functionality identified by the value 0b0111.

FEAT_Debugv8p2 adds the functionality identified by the value 0b1000.

FEAT_Debugv8p4 adds the functionality identified by the value 0b1001.

FEAT_Debugv8p8 adds the functionality identified by the value 0b1010.

From Armv8.1, when FEAT_VHE is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

Bit [15]

Reserved, RES1.

nSUHD_imp, bit [14]

In Armv7-A, was Secure User Halting Debug not implemented.

The value of this bit must match the value of the SE_imp bit.

Bit [13]

Reserved, RES0.

SE_imp, bit [12]

EL3 implemented. The meanings of the values of this bit are:

| SE_imp | Meaning |
|---------------|----------------------|
| 0b0 | EL3 not implemented. |
| 0b1 | EL3 implemented. |

The value of this bit must match the value of the nSUHD_imp bit.

Bits [11:0]

Reserved, RES0.

Accessing DBGDIDR

Arm deprecates any access to this register from EL0.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1110 | 0b000 | 0b0000 | 0b0000 | 0b000 |

```

if Halted() && ConstrainUnpredictableBool(Unpredictable_IGNORETRAPINDEBUG) then
    return DBGDIDR;

```

DBGDRAR, Debug ROM Address Register

The DBGDRAR characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Armv8 deprecates any use of this register.

Configuration

AArch32 System register DBGDRAR bits [63:0] are architecturally mapped to AArch64 System register [MDRAR_EL1\[63:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGDRAR are UNDEFINED.

DBGDRAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDRAR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | | | | | | | | | ROMADDR[47:12] | | | | | | | | | | | | | | | |
| ROMADDR[47:12] | | | | | | | | | | | | | | | | RES0 | | | | | | | | | | | | | | Valid | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:48]

Reserved, RES0.

ROMADDR[47:12], bits [47:12]

Bits[47:12] of the ROM table physical address.

If the physical address size in bits (PAsize) is less than 48 then the register bits corresponding to ROMADDR [47:PAsize] are RES0.

Bits [11:0] of the ROM table physical address are zero.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system that supports AArch32 at the highest implemented Exception level.

In an implementation that includes EL3, ROMADDR is an address in Non-secure memory. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure memory.

If DBGDRAR.Valid == 0b00, then this field is UNKNOWN.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid.

| Valid | Meaning |
|-------|---|
| 0b00 | ROM Table address is not valid. Software must ignore ROMADDR. |
| 0b11 | ROM Table address is valid. |

Other values are reserved.

Arm recommends implementations set this field to zero.

Accessing DBGDRAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

DBGDSAR, Debug Self Address Register

The DBGDSAR characteristics are:

Purpose

In earlier versions of the Arm Architecture, this register defines the offset from the base address defined in [DBGDRAR](#) of the physical base address of the debug registers for the PE. Armv8 deprecates any use of this register.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGDSAR are UNDEFINED.

DBGDSAR is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, bits [31:0] are read.

If EL1 cannot use AArch32 then the implementation of this register is OPTIONAL and deprecated.

Attributes

DBGDSAR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |

Bits [63:2]

Reserved, RES0.

Bits [1:0]

Reserved, RAZ.

This field indicates whether the debug self address offset is valid. For ARMv8, this field is always 0b00, the offset is not valid.

Accessing DBGDSAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1110 | 0b000 | 0b0010 | 0b0000 | 0b000 |

```

DBGDSCRext, Debug Status and Control Register, External View

The DBGDSCRext characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

AArch32 System register DBGDSCRext bits [31:0] are architecturally mapped to AArch64 System register [MDSCR_EL1\[31:0\]](#).

AArch32 System register DBGDSCRext bit [15] is architecturally mapped to AArch32 System register [DBGDSCRint\[15\]](#).

AArch32 System register DBGDSCRext bit [12] is architecturally mapped to AArch32 System register [DBGDSCRint\[12\]](#).

AArch32 System register DBGDSCRext bits [5:2] are architecturally mapped to AArch32 System register [DBGDSCRint\[5:2\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGDSCRext are UNDEFINED.

This register is required in all implementations.

Attributes

DBGDSCRext is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------|------------------------|------------------------|----------------------|------------------------|----------------------|------------------------|---------------------|----------------------|-----------------------|--------------------------|-------------------------|------------------------|---------------------|----------------------|-------------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 |
| TFO | RXfull | TXfull | RES0 | RXOTXU | RES0 | INTdis | TDA | RES0 | SC2NS | SPNIDdis | SPIDdis | MDBGen | HDE | RES0 | UDCCdis | RES0 | ERRM | ERRM | ERRM | ERRM | ERRM | ERRM | ERRM | ERRM | ERRM | ERRM |

TFO, bit [31]

When FEAT_TRF is implemented:

Trace Filter override. Used for save/restore of [EDSCR.TFO](#).

When the OS Lock is unlocked, [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When the OS Lock is locked, [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.TFO](#). Reads and writes of this bit are indirect accesses to [EDSCR.TFO](#).

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Used for save/restore of [EDSCR.RXfull](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.RXfull](#). Reads and writes of this bit are indirect accesses to [EDSCR.RXfull](#).

Arm deprecates use of this bit other than for save/restore. Use [DBGDSCRint](#) to access the DTRRX full status.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

TXfull, bit [29]

DTRTX full. Used for save/restore of [EDSCR.TXfull](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.TXfull](#). Reads and writes of this bit are indirect accesses to [EDSCR.TXfull](#).

Arm deprecates use of this bit other than for save/restore. Use [DBGDSCRint](#) to access the DTRTX full status.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of [EDSCR.RXO](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.RXO](#). Reads and writes of this bit are indirect accesses to [EDSCR.RXO](#).

When [DBGOSLSR.OSLK](#) == 1, if bits [27,6] of the value written to [DBGDSCRext](#) are {1,0}, that is, the RXO bit is 1 and the ERR bit is 0, the PE sets [EDSCR.{RXO,ERR}](#) to UNKNOWN values.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

TXU, bit [26]

Used for save/restore of [EDSCR.TXU](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.TXU](#). Reads and writes of this bit are indirect accesses to [EDSCR.TXU](#).

When [DBGOSLSR.OSLK](#) == 1, if bits [26,6] of the value written to DBGDSCRext are {1,0}, that is, the TXU bit is 1 and the ERR bit is 0, the PE sets [EDSCR.{TXU,ERR}](#) to UNKNOWN values.

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

Bits [25:24]

Reserved, RES0.

INTdis, bits [23:22]

Used for save/restore of [EDSCR.INTdis](#).

When [DBGOSLSR.OSLK](#) == 0, this field is RO, and software must treat it as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this field is RW and holds the value of [EDSCR.INTdis](#). Reads and writes of this field are indirect accesses to [EDSCR.INTdis](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

TDA, bit [21]

Used for save/restore of [EDSCR.TDA](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.TDA](#). Reads and writes of this bit are indirect accesses to [EDSCR.TDA](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

Bit [20]

Reserved, RES0.

SC2, bit [19]

When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented and FEAT_PCSRv8p2 is not implemented:

Used for save/restore of [EDSCR.SC2](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.SC2](#). Reads and writes of this bit are indirect accesses to [EDSCR.SC2](#).

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

Otherwise:

Reserved, RES0.

NS, bit [18]

Non-secure status.

Arm deprecates use of this field.

| NS | Meaning |
|-----|-------------------|
| 0b0 | Secure state. |
| 0b1 | Non-secure state. |

Access to this field is **RO**.

SPNIDdis, bit [17]**When EL3 is implemented:**

Secure privileged profiling disabled status bit.

| SPNIDdis | Meaning |
|----------|--|
| 0b0 | Profiling allowed in Secure privileged modes. |
| 0b1 | Profiling prohibited in Secure privileged modes. |

This field reads as 0 if any of the following applies, and reads as 1 otherwise:

- FEAT_Debugv8p2 is not implemented and ExternalSecureNoninvasiveDebugEnabled() returns TRUE.
- EL3 is using AArch32 and the value of [SDCR.SPME](#) is 1.
- EL3 is using AArch64 and the value of [MDCR_EL3.SPME](#) is 1.

Arm deprecates use of this field.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

SPIDdis, bit [16]**When EL3 is implemented:**

Secure privileged AArch32 invasive self-hosted debug disabled status bit. The value of this bit depends on the value of [SDCR.SPD](#) and the pseudocode function `AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()`.

| SPIDdis | Meaning |
|---------|--|
| 0b0 | Self-hosted debug enabled in Secure privileged AArch32 modes. |
| 0b1 | Self-hosted debug disabled in Secure privileged AArch32 modes. |

This bit reads as 1 if any of the following is true and reads as 0 otherwise:

- EL3 is using AArch32 and [SDCR.SPD](#) has the value 0b10.
- EL3 is using AArch64 and [MDCR_EL3.SPD32](#) has the value 0b10.
- EL3 is using AArch32, [SDCR.SPD](#) has the value 0b00, and `AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()` returns FALSE.
- EL3 is using AArch64, [MDCR_EL3.SPD32](#) has the value 0b00, and `AArch32.SelfHostedSecurePrivilegedInvasiveDebugEnabled()` returns FALSE.

Arm deprecates use of this field.

Access to this field is **RO**.

Otherwise:

Reserved, RES0.

MDBGGen, bit [15]

Monitor debug events enable. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

| MDBGGen | Meaning |
|---------|---|
| 0b0 | Breakpoint, Watchpoint, and Vector Catch exceptions disabled. |
| 0b1 | Breakpoint, Watchpoint, and Vector Catch exceptions enabled. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

HDE, bit [14]

Used for save/restore of [EDSCR.HDE](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.HDE](#). Reads and writes of this bit are indirect accesses to [EDSCR.HDE](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

Bit [13]

Reserved, RES0.

UDCCdis, bit [12]

Traps EL0 accesses to the DCC registers to Undefined mode.

| UDCCdis | Meaning |
|---------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | EL0 accesses to the DBGDSCRint , DBGDTRRXint , DBGDTRTXint , DBGDIDR , DBGDSAR , and DBGDRAR are trapped to Undefined mode. |

Note

All accesses to these registers are trapped, including LDC and STC accesses to [DBGDTRTXint](#) and [DBGDTRRXint](#), and MRRC accesses to [DBGDSAR](#) and [DBGDRAR](#).

Traps of EL0 accesses to the [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of [EDSCR.ERR](#).

When [DBGOSLSR.OSLK](#) == 0, software must treat this bit as UNK/SBZP.

When [DBGOSLSR.OSLK](#) == 1, this bit holds the value of [EDSCR.ERR](#). Reads and writes of this bit are indirect accesses to [EDSCR.ERR](#).

The architected behavior of this field determines the value it returns after a reset.

Accessing this field has the following behavior:

- When [DBGOSLSR.OSLK](#) == 1, access to this field is **RW**.
- When [DBGOSLSR.OSLK](#) == 0, access to this field is **RO**.

MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

| MOE | Meaning |
|--------|---|
| 0b0001 | Breakpoint. |
| 0b0011 | Software breakpoint (BKPT) instruction. |
| 0b0101 | Vector catch. |
| 0b1010 | Watchpoint. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGDSCRext

Individual fields within this register might have restricted accessibility when the OS Lock is unlocked, [DBGOSLSR.OSLK](#) == 0. See the field descriptions for more detail.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1110 | 0b000 | 0b0000 | 0b0010 | 0b010 |

DBGDSCRint, Debug Status and Control Register, Internal View

The DBGDSCRint characteristics are:

Purpose

Main control register for the debug implementation. This is an internal, read-only view.

Configuration

AArch32 System register DBGDSCRint bits [30:29] are architecturally mapped to AArch64 System register [MDCCSR_EL0\[30:29\]](#).

AArch32 System register DBGDSCRint bit [15] is architecturally mapped to AArch64 System register [MDSCR_EL1\[15\]](#).

AArch32 System register DBGDSCRint bit [12] is architecturally mapped to AArch64 System register [MDSCR_EL1\[12\]](#).

AArch32 System register DBGDSCRint bits [5:2] are architecturally mapped to AArch64 System register [MDSCR_EL1\[5:2\]](#).

AArch32 System register DBGDSCRint bit [15] is architecturally mapped to AArch32 System register [DBGDSCRext\[15\]](#).

AArch32 System register DBGDSCRint bit [12] is architecturally mapped to AArch32 System register [DBGDSCRext\[12\]](#).

AArch32 System register DBGDSCRint bits [5:2] are architecturally mapped to AArch32 System register [DBGDSCRext\[5:2\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGDSCRint are UNDEFINED.

This register is required in all implementations.

DBGDSCRint.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} are UNKNOWN when the register is accessed at EL0. However, although these values are not accessible at EL0 by instructions that are neither UNPREDICTABLE nor return UNKNOWN values, it is permissible for an implementation to return the values of DBGDSCRext.{NS, SPNIDdis, SPIDdis, MDBGen, UDCCdis, MOE} for these fields at EL0.

It is also permissible for an implementation to return the same values as defined for a read of DBGDSCRint at EL1 or above. (This is the case even if the implementation does not support AArch32 at EL1 or above.)

Attributes

DBGDSCRint is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|--------|--------|------|----|----|----|----|----------|---------|--------|------|---------|------|----|----|-----|------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | RXfull | TXfull | RES0 | | | | NS | SPNIDdis | SPIDdis | MDBGen | RES0 | UDCCdis | RES0 | | | MOE | RES0 | | | | | | | | | | | | | | |

Bit [31]

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Read-only view of the equivalent bit in the [EDSCR](#).

TXfull, bit [29]

DTRTX full. Read-only view of the equivalent bit in the [EDSCR](#).

Bits [28:19]

Reserved, RES0.

NS, bit [18]

Non-secure status.

Read-only view of the equivalent bit in the [DBGDSCRext](#). Arm deprecates use of this field.

SPNIDdis, bit [17]

Secure privileged non-invasive debug disable.

Read-only view of the equivalent bit in the [DBGDSCRext](#). Arm deprecates use of this field.

SPIDdis, bit [16]

Secure privileged invasive debug disable.

Read-only view of the equivalent bit in the [DBGDSCRext](#). Arm deprecates use of this field.

MDBGen, bit [15]

Monitor debug events enable.

Read-only view of the equivalent bit in the [DBGDSCRext](#).

Bits [14:13]

Reserved, RES0.

UDCCdis, bit [12]

User mode access to Debug Communications Channel disable.

Read-only view of the equivalent bit in the [DBGDSCRext](#). Arm deprecates use of this field.

Bits [11:6]

Reserved, RES0.

MOE, bits [5:2]

Method of Entry for debug exception. When a debug exception is taken to an Exception level using AArch32, this field is set to indicate the event that caused the exception:

| MOE | Meaning |
|--------|--|
| 0b0001 | Breakpoint |
| 0b0011 | Software breakpoint (BKPT) instruction |
| 0b0101 | Vector catch |
| 0b1010 | Watchpoint |

Read-only view of the equivalent bit in the [DBGDSCRext](#).

Bits [1:0]

Reserved, RES0.

DBGDTRRXext, Debug OS Lock Data Transfer Register, Receive, External View

The DBGDTRRXext characteristics are:

Purpose

Used for save/restore of [DBGDTRRXint](#). It is a component of the Debug Communications Channel.

Configuration

AArch32 System register DBGDTRRXext bits [31:0] are architecturally mapped to AArch64 System register [OSDTRRX_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGDTRRXext are UNDEFINED.

Attributes

DBGDTRRXext is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Update DTRRX without side-effect | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

- Update DTRRX without side-effect.
- Writes to this register update the value in DTRRX and do not change RXfull.
- Reads of this register return the last value written to DTRRX and do not change RXfull.
- For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.
- The reset behavior of this field is:
- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRXext

Arm deprecates reads and writes of DBGDTRRXext through the System register interface when the OS Lock is unlocked, [DBGOSLSR.OSLK](#) == 0.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1110 | 0b000 | 0b0000 | 0b0000 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;

DBGDTRRXint, Debug Data Transfer Register, Receive

The DBGDTRRXint characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communications Channel.

Configuration

AArch32 System register DBGDTRRXint bits [31:0] are architecturally mapped to AArch64 System register [DBGDTRRX_EL0\[31:0\]](#).

AArch32 System register DBGDTRRXint bits [31:0] are architecturally mapped to External register [DBGDTRRX_EL0\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGDTRRXint are UNDEFINED.

Attributes

DBGDTRRXint is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Update DTRRX | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

Update DTRRX.

Reads of this register:

- If RXfull is set to 1, return the last value written to DTRRX.
- If RXfull is set to 0, return an UNKNOWN value.

After the read, RXfull is cleared to 0.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRXint

Data can be stored to memory from this register using STC.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| | | | | |
|--------|------|-----|-----|------|
| coproc | opc1 | CRn | CRm | opc2 |
|--------|------|-----|-----|------|

| | | | | |
|--------|-------|--------|--------|-------|
| 0b1110 | 0b000 | 0b0000 | 0b0101 | 0b000 |
|--------|-------|--------|--------|-------|

```

DBGDTRTXext, Debug OS Lock Data Transfer Register, Transmit

The DBGDTRTXext characteristics are:

Purpose

Used for save/restore of [DBGDTRTXint](#). It is a component of the Debug Communication Channel.

Configuration

AArch32 System register DBGDTRTXext bits [31:0] are architecturally mapped to AArch64 System register [OSDTRTX_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGDTRTXext are UNDEFINED.

Attributes

DBGDTRTXext is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Return DTRTX without side-effect | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

Return DTRTX without side-effect.

Reads of this register return the value in DTRTX and do not change TXfull.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTXext

Arm deprecates reads and writes of DBGDTRTXext through the System register interface when the OS Lock is unlocked, [DBGOSLSR](#).OSLK == 0.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1110 | 0b000 | 0b0000 | 0b0011 | 0b010 |

DBGDTRTXint, Debug Data Transfer Register, Transmit

The DBGDTRTXint characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See [DBGDTR_EL0](#) for additional architectural mappings. It is a component of the Debug Communication Channel.

Configuration

AArch32 System register DBGDTRTXint bits [31:0] are architecturally mapped to AArch64 System register [DBGDTRTX_EL0\[31:0\]](#).

AArch32 System register DBGDTRTXint bits [31:0] are architecturally mapped to External register [DBGDTRTX_EL0\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGDTRTXint are UNDEFINED.

Attributes

DBGDTRTXint is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Return DTRTX | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

Return DTRTX.

Writes to this register:

- If TXfull is set to 1, set DTRTX to UNKNOWN.
- If TXfull is set to 0, update the value in DTRTX.

After the write, TXfull is set to 1.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTXint

Data can be loaded from memory into this register using 'LDC (immediate)' and 'LDC (literal)'.

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| | | | | |
|--------|------|-----|-----|------|
| coproc | opc1 | CRn | CRm | opc2 |
|--------|------|-----|-----|------|

| | | | | |
|--------|-------|--------|--------|-------|
| 0b1110 | 0b000 | 0b0000 | 0b0101 | 0b000 |
|--------|-------|--------|--------|-------|

DBGOSDLR, Debug OS Double Lock Register

The DBGOSDLR characteristics are:

Purpose

Locks out the external debug interface.

Configuration

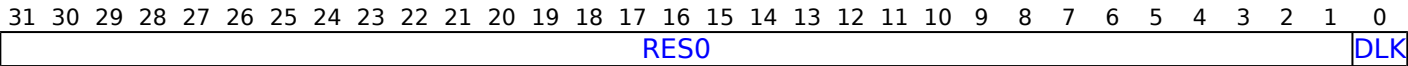

AArch32 System register DBGOSDLR bits [31:0] are architecturally mapped to AArch64 System register [OSDLR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGOSDLR are UNDEFINED.

Attributes

DBGOSDLR is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

DLK, bit [0]

When FEAT_DoubleLock is implemented:

OS Double Lock control bit.

| DLK | Meaning |
|-----|--|
| 0b0 | OS Double Lock unlocked. |
| 0b1 | OS Double Lock locked, if DBGPRCR .CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RAZ/WI.

Accessing DBGOSDLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| | | | | |

DBGOSECCR, Debug OS Lock Exception Catch Control Register

The DBGOSECCR characteristics are:

Purpose

Provides a mechanism for an operating system to access the contents of [EDECCR](#) that are otherwise invisible to software, so it can save/restore the contents of [EDECCR](#) over powerdown on behalf of the external debugger.

Configuration

AArch32 System register DBGOSECCR bits [31:0] are architecturally mapped to AArch64 System register [OSECCR_EL1\[31:0\]](#).

AArch32 System register DBGOSECCR bits [31:0] are architecturally mapped to External register [EDECCR\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGOSECCR are UNDEFINED.

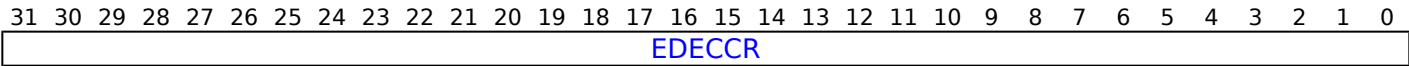

If [DBGOSLSR.OSLK](#) == 0 then DBGOSECCR returns an UNKNOWN value on reads and ignores writes.

Attributes

DBGOSECCR is a 32-bit register.

Field descriptions

When [DBGOSLSR.OSLK](#) == 1:

EDECCR, bits [31:0]

Used for save/restore to [EDECCR](#) over powerdown.

Reads or writes to this field are indirect accesses to [EDECCR](#).

Accessing DBGOSECCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1110 | 0b000 | 0b0000 | 0b0110 | 0b010 |

```

DBGOSLAR, Debug OS Lock Access Register

The DBGOSLAR characteristics are:

Purpose

Provides a lock for the debug registers. The OS Lock also disables some debug exceptions and debug events.

Configuration

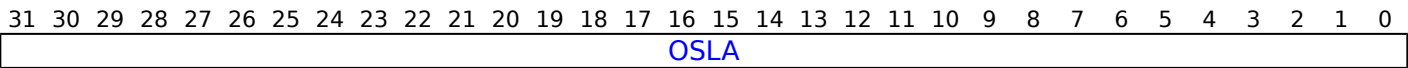

This register is present only when EL1 is capable of using AArch32. Otherwise, direct accesses to DBGOSLAR are UNDEFINED.

The OS Lock can also be locked or unlocked using the AArch64 System register [OSLAR_EL1](#) and External register [OSLAR_EL1](#).

Attributes

DBGOSLAR is a 32-bit register.

Field descriptions

OSLA, bits [31:0]

OS Lock Access. Writing the value 0xC5ACCE55 to the DBGOSLAR sets the OS Lock to 1. Writing any other value sets the OS Lock to 0.

Use [DBGOSLSR.OSLK](#) to check the current status of the lock.

Accessing DBGOSLAR

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

DBGOSLSR, Debug OS Lock Status Register

The DBGOSLSR characteristics are:

Purpose

Provides status information for the OS Lock.

Configuration

AArch32 System register DBGOSLSR bits [31:0] are architecturally mapped to AArch64 System register [OSLSR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGOSLSR are UNDEFINED.

The OS Lock status is also visible in the external debug interface through EDPRSR.

Attributes

DBGOSLSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|---------|----|-----|------|---------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | OSLM[1] | | nTT | OSLK | OSLM[0] | | | | | | | | | | | | | | |

Bits [31:4]

Reserved, RES0.

OSLM, bits [3, 0]

OS Lock model implemented. Identifies the form of OS save and restore mechanism implemented.

| OSLM | Meaning |
|------|--------------------------|
| 0b00 | OS Lock not implemented. |
| 0b10 | OS Lock implemented. |

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is DBGOSLSR[3].
- OSLM[0] is DBGOSLSR[0].

nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

OSLK, bit [1]

OS Lock Status.

| OSLK | Meaning |
|------|-------------------|
| 0b0 | OS Lock unlocked. |
| 0b1 | OS Lock locked. |

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

The reset behavior of this field is:

- On a Cold reset, this field resets to 1.

Accessing DBGOSLSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

DBGPRCR, Debug Power Control Register

The DBGPRCR characteristics are:

Purpose

Controls behavior of the PE on powerdown request.

Configuration

AArch32 System register DBGPRCR bits [31:0] are architecturally mapped to AArch64 System register [DBGPRCR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGPRCR are UNDEFINED.

Bit [0] of this register is mapped to [EDPRCR](#).CORENPDRQ, bit [0] of the external view of this register.

The other bits in these registers are not mapped to each other.

Attributes

DBGPRCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | CORENPDRQ | | | | | | | | | | | | | | | |

Bits [31:1]

Reserved, RES0.

CORENPDRQ, bit [0]

When FEAT_DoPD is implemented:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

| CORENPDRQ | Meaning |
|-----------|--|
| 0b0 | If the system responds to a powerdown request, it powers down Core power domain. |
| 0b1 | If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain. |

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is set to an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Otherwise:

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

| CORENPDRQ | Meaning |
|-----------|--|
| 0b0 | If the system responds to a powerdown request, it powers down Core power domain. |
| 0b1 | If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain. |

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of [EDPRCR.COREPURQ](#) on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in [EDPRCR.COREPURQ](#).

Accessing DBGPRCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

DBGVCR, Debug Vector Catch Register

The DBGVCR characteristics are:

Purpose

Controls Vector Catch debug events.

Configuration

AArch32 System register DBGVCR bits [31:0] are architecturally mapped to AArch64 System register [DBGVCR32_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGVCR are UNDEFINED.

This register is required in all implementations.

Attributes

DBGVCR is a 32-bit register.

Field descriptions

When EL3 is implemented and EL3 is using AArch32:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|-----|------|-----|-----|-----|-----|------|----|----|----|------|----|----|----|----|----|------|----|----|----|------|----|----|------|----|----|----|----|------|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NSF | NSI | RES0 | NSD | NSP | NSS | NSU | RES0 | | | | RES0 | | | | MF | MI | RES0 | MD | MP | MS | RES0 | SF | SI | RES0 | SD | SP | SS | SU | RES0 | | |

NSF, bit [31]

FIQ vector catch enable in Non-secure state.

The exception vector offset is 0x1C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSI, bit [30]

IRQ vector catch enable in Non-secure state.

The exception vector offset is 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

NSD, bit [28]

Data Abort vector catch enable in Non-secure state.

The exception vector offset is 0x10.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSP, bit [27]

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is 0x0C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSS, bit [26]

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is 0x08.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [25]

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is 0x04.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:16]

Reserved, RES0.

MF, bit [15]

FIQ vector catch enable in Monitor mode.

The exception vector offset is 0x1C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MI, bit [14]

IRQ vector catch enable in Monitor mode.

The exception vector offset is 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

MD, bit [12]

Data Abort vector catch enable in Monitor mode.

The exception vector offset is 0x10.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MP, bit [11]

Prefetch Abort vector catch enable in Monitor mode.

The exception vector offset is 0x0C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MS, bit [10]

Secure Monitor Call (SMC) vector catch enable in Monitor mode.

The exception vector offset is 0x08.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:8]

Reserved, RES0.

SF, bit [7]

FIQ vector catch enable in Secure state.

The exception vector offset is 0x1C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SI, bit [6]

IRQ vector catch enable in Secure state.

The exception vector offset is 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SD, bit [4]

Data Abort vector catch enable in Secure state.

The exception vector offset is 0x10.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SP, bit [3]

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is 0x0C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is 0x08.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is 0x04.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

When EL3 is implemented and EL3 is using AArch64:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|-----|------|-----|-----|-----|-----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|----|----|----|------|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| NSF | NSI | RES0 | NSD | NSP | NSS | NSU | RES0 | | | | | | | | | | | | SF | SI | RES0 | SD | SP | SS | SU | RES0 | | | | | |

NSF, bit [31]

FIQ vector catch enable in Non-secure state.

The exception vector offset is 0x1C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSI, bit [30]

IRQ vector catch enable in Non-secure state.

The exception vector offset is 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

NSD, bit [28]

Data Abort vector catch enable in Non-secure state.

The exception vector offset is 0x10.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSP, bit [27]

Prefetch Abort vector catch enable in Non-secure state.

The exception vector offset is 0x0C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSS, bit [26]

Supervisor Call (SVC) vector catch enable in Non-secure state.

The exception vector offset is 0x08.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSU, bit [25]

Undefined Instruction vector catch enable in Non-secure state.

The exception vector offset is 0x04.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [24:8]

Reserved, RES0.

SF, bit [7]

FIQ vector catch enable in Secure state.

The exception vector offset is 0x1C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SI, bit [6]

IRQ vector catch enable in Secure state.

The exception vector offset is 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

SD, bit [4]

Data Abort vector catch enable in Secure state.

The exception vector offset is 0x10.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SP, bit [3]

Prefetch Abort vector catch enable in Secure state.

The exception vector offset is 0x0C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SS, bit [2]

Supervisor Call (SVC) vector catch enable in Secure state.

The exception vector offset is 0x08.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SU, bit [1]

Undefined Instruction vector catch enable in Secure state.

The exception vector offset is 0x04.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

When EL3 is not implemented:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|------|---|---|---|---|------|
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | F | I | RES0 | D | P | S | U | RES0 |

Bits [31:8]

Reserved, RES0.

F, bit [7]

FIQ vector catch enable.

The exception vector offset is 0x1C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [6]

IRQ vector catch enable.

The exception vector offset is 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

D, bit [4]

Data Abort vector catch enable.

The exception vector offset is 0x10.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P, bit [3]

Prefetch Abort vector catch enable.

The exception vector offset 0x0C.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [2]

Supervisor Call (SVC) vector catch enable.

The exception vector offset is 0x08.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

U, bit [1]

Undefined Instruction vector catch enable.

The exception vector offset is 0x04.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing DBGVCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1110 | 0b000 | 0b0000 | 0b0111 | 0b000 |

```

DBGWCR<n>, Debug Watchpoint Control Registers, n = 0 - 15

The DBGWCR<n> characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register [DBGWVR<n>](#).

Configuration

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGWCR<n>_EL1\[31:0\]](#).

AArch32 System register DBGWCR<n> bits [31:0] are architecturally mapped to External register [DBGWCR<n>_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGWCR<n> are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWCR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

When the E field is zero, all the other fields in the register are ignored.

Bits [31:29]

Reserved, RES0.

MASK, bits [28:24]

Address mask. Only objects up to 2GB can be watched using a single mask.

| MASK | Meaning |
|---------|-----------|
| 0b00000 | No mask. |
| 0b00001 | Reserved. |
| 0b00010 | Reserved. |

If programmed with a reserved value, a watchpoint must behave as if either:

- MASK has been programmed with a defined value, which might be 0 (no mask), other than for a direct read of DBGWCRn_EL1.
- The watchpoint is disabled.

Software must not rely on this property because the behavior of reserved values might change in a future revision of the architecture.

Other values mask the corresponding number of address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [23:21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

| WT | Meaning |
|-----|------------------------------|
| 0b0 | Unlinked data address match. |
| 0b1 | Linked data address match. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked breakpoint number. For Linked data address watchpoints, this specifies the index of the Context-matching breakpoint linked to.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions', and 'Reserved DBGWCR<n>.{SSC, HMC, PAC} values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by [DBGWVR<n>](#) is being watched.

| BAS | Description |
|------------|--|
| 0bxxxxxxx1 | Match byte at DBGWVR<n> |
| 0bxxxxxx1x | Match byte at DBGWVR<n> +1 |
| 0bxxxxx1xx | Match byte at DBGWVR<n> +2 |
| 0bxxxx1xxx | Match byte at DBGWVR<n> +3 |

In cases where [DBGWVR<n>](#) addresses a double-word:

| BAS | Description, if DBGWVR<n>[2] == 0 |
|------------|---|
| 0bxxx1xxxx | Match byte at DBGWVR<n>+4 |
| 0bxx1xxxxx | Match byte at DBGWVR<n>+5 |
| 0bx1xxxxxx | Match byte at DBGWVR<n>+6 |
| 0b1xxxxxxx | Match byte at DBGWVR<n>+7 |

If [DBGWVR<n>\[2\] == 1](#), only BAS[3:0] are used and BAS[7:4] are ignored. Arm deprecates setting [DBGWVR<n>\[2\] == 1](#).

The valid values for BAS are non-zero binary numbers all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>.BAS values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

| LSC | Meaning |
|------|---|
| 0b01 | Match instructions that load from a watchpointed address. |
| 0b10 | Match instructions that store to a watchpointed address. |
| 0b11 | Match instructions that load from or store to a watchpointed address. |

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n. Possible values are:

| E | Meaning |
|-----|----------------------|
| 0b0 | Watchpoint disabled. |
| 0b1 | Watchpoint enabled. |

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGWCR<n>

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|------|-----|-----|------|
|--------|------|-----|-----|------|

| | | | | |
|--------|-------|--------|--------|-------|
| 0b1110 | 0b000 | 0b0000 | n[3:0] | 0b111 |
|--------|-------|--------|--------|-------|

```

DBGWFAR, Debug Watchpoint Fault Address Register

The DBGWFAR characteristics are:

Purpose

Previously returned information about the address of the instruction that accessed a watchpointed address. Is now deprecated and RES0.

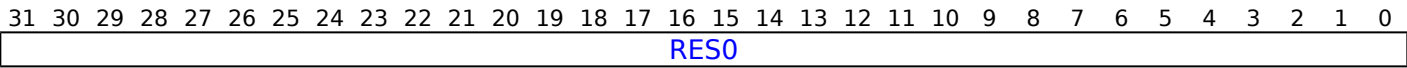

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGWFAR are UNDEFINED.

Attributes

DBGWFAR is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing DBGWFAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1110 | 0b000 | 0b0000 | 0b0110 | 0b000 |

```

DBGWVR<n>, Debug Watchpoint Value Registers, n = 0 - 15

The DBGWVR<n> characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register [DBGWCR<n>](#).

Configuration

AArch32 System register DBGWVR<n> bits [31:0] are architecturally mapped to AArch64 System register [DBGWVR<n>_EL1\[31:0\]](#).

AArch32 System register DBGWVR<n> bits [31:0] are architecturally mapped to External register [DBGWVR<n>_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DBGWVR<n> are UNDEFINED.

If watchpoint n is not implemented then accesses to this register are UNDEFINED.

Attributes

DBGWVR<n> is a 32-bit register.

Field descriptions

DCCIMVAC, Data Cache line Clean and Invalidate by VA to PoC

The DCCIMVAC characteristics are:

Purpose

Clean and Invalidate data or unified cache line by virtual address to PoC.

Configuration

AArch32 System instruction DCCIMVAC performs the same function as AArch64 System instruction [DC CIVAC](#).

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to DCCIMVAC are UNDEFINED.

Attributes

DCCIMVAC is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Virtual address to use | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DCCIMVAC instruction

Execution of this instruction might require an address translation from VA to PA, and that translation might fault.

If FEAT_CMOW is implemented, [HCRX_EL2](#).CMOW is 1, and EL1 or EL0 access is enabled, when executed at EL1 or EL0, the instruction has stage 2 read permission to the VA but does not have stage 2 write permission to the VA, the instruction generates a stage 2 Permission fault.

For more information, see 'AArch32 data cache maintenance instructions (DC*)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0111 | 0b1110 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

DCCISW, Data Cache line Clean and Invalidate by Set/Way

The DCCISW characteristics are:

Purpose

Clean and Invalidate data or unified cache line by set/way.

Configuration

AArch32 System instruction DCCISW performs the same function as AArch64 System instruction [DC C1SW](#).

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to DCCISW are UNDEFINED.

Attributes

DCCISW is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|------|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SetWay | | | | | | | | | | | | | | | | Level | | | RES0 | | | | | | | | | | | | |

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$, $L = \text{Log}_2(\text{LINELEN})$, $B = (L + S)$, $S = \text{Log}_2(\text{NSETS})$.

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DCCISW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.

- Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0111 | 0b1110 | 0b010 |

```

elseif PSTATE.EL == EL3 then
    AArch32.DC(R[t], CacheOp_Clean, CacheOpScope_PoC);

```

DCCMVAU, Data Cache line Clean by VA to PoU

The DCCMVAU characteristics are:

Purpose

Clean data or unified cache line by virtual address to PoU.

Configuration

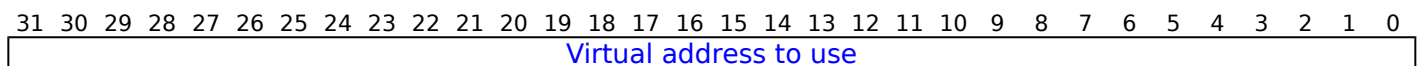

AArch32 System instruction DCCMVAU performs the same function as AArch64 System instruction [DC CVAU](#).

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to DCCMVAU are UNDEFINED.

Attributes

DCCMVAU is a 32-bit System instruction.

Field descriptions

Bits [31:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DCCMVAU instruction

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'AArch32 data cache maintenance instructions (DC*)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0111 | 0b1011 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T7 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T7 == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TPU == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && !ELUsingAArch32(EL2) && HCR_EL2.TOCU == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR.TPU == '1' then
        AArch32.TakeHypTrapException(0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HCR2.TOCU == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        AArch32.DC(R[t], CacheOp_Clean, CacheOpScope_PoU);
elsif PSTATE.EL == EL2 then
    AArch32.DC(R[t], CacheOp_Clean, CacheOpScope_PoU);
elsif PSTATE.EL == EL3 then
    AArch32.DC(R[t], CacheOp_Clean, CacheOpScope_PoU);

```

DCCSW, Data Cache line Clean by Set/Way

The DCCSW characteristics are:

Purpose

Clean data or unified cache line by set/way.

Configuration

AArch32 System instruction DCCSW performs the same function as AArch64 System instruction [DC CSW](#).

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to DCCSW are UNDEFINED.

Attributes

DCCSW is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|-------|------|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| SetWay | | | | | | | | | | | | | | | | | | | | | | | | | | | | Level | RES0 | | |

SetWay, bits [31:4]

Contains two fields:

- Way, bits[31:32-A], the number of the way to operate on.
- Set, bits[B-1:L], the number of the set to operate on.

Bits[L-1:4] are RES0.

$A = \text{Log}_2(\text{ASSOCIATIVITY})$, $L = \text{Log}_2(\text{LINELEN})$, $B = (L + S)$, $S = \text{Log}_2(\text{NSETS})$.

ASSOCIATIVITY, LINELEN (line length, in bytes), and NSETS (number of sets) have their usual meanings and are the values for the cache level being operated on. The values of A and S are rounded up to the next integer.

Level, bits [3:1]

Cache level to operate on, minus 1. For example, this field is 0 for operations on L1 cache, or 1 for operations on L2 cache.

Bit [0]

Reserved, RES0.

Executing the DCCSW instruction

If this instruction is executed with a set, way or level argument that is larger than the value supported by the implementation then the behavior is CONSTRAINED UNPREDICTABLE and one of the following occurs:

- The instruction is UNDEFINED
- The instruction performs cache maintenance on one of:
 - No cache lines.
 - A single arbitrary cache line.
 - Multiple arbitrary cache lines.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0111 | 0b1010 | 0b010 |

```

if PSTATE.EL == EL0 then

DCIMVAC, Data Cache line Invalidate by VA to PoC

The DCIMVAC characteristics are:

Purpose

Invalidate data or unified cache line by virtual address to PoC.

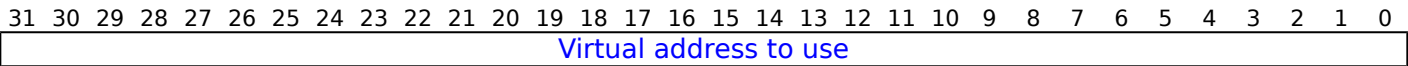

Configuration

AArch32 System instruction DCIMVAC performs the same function as AArch64 System instruction [DC IVAC](#).
This instruction is present only when AArch32 is supported. Otherwise, direct accesses to DCIMVAC are UNDEFINED.

Attributes

DCIMVAC is a 32-bit System instruction.

Field descriptions

Bits [31:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the DCIMVAC instruction

It is IMPLEMENTATION DEFINED whether, when this instruction is executed, it can generate a watchpoint. If this instruction can generate a watchpoint this is prioritized in the same way as other watchpoints.
Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'AArch32 data cache maintenance instructions (DC*)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0111 | 0b0110 | 0b001 |

```

DFAR, Data Fault Address Register

The DFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception.

Configuration

AArch32 System register DFAR bits [31:0] are architecturally mapped to AArch64 System register [FAR_EL1\[31:0\]](#).

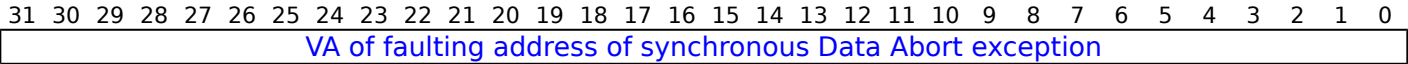

AArch32 System register DFAR bits [31:0] (S) are architecturally mapped to AArch32 System register [HDFAR\[31:0\]](#) when EL2 is implemented, EL3 is implemented and the implementation only supports execution in AArch32 state.

This register is present only when AArch32 is supported. Otherwise, direct accesses to DFAR are UNDEFINED.

Attributes

DFAR is a 32-bit register.

Field descriptions

Bits [31:0]

VA of faulting address of synchronous Data Abort exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DFAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0110 | 0b0000 | 0b000 |

```

elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        DFAR_S = R[t];
    else
        DFAR_NS = R[t];

```

DFSR, Data Fault Status Register

The DFSR characteristics are:

Purpose

Holds status information about the last data fault.

Configuration

AArch32 System register DFSR bits [31:0] are architecturally mapped to AArch64 System register [ESR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DFSR are UNDEFINED.

The current translation table format determines which format of the register is used.

Attributes

DFSR is a 32-bit register.

Field descriptions

When TTBCR.EAE == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|-----|-------|-----|-------|------|------|--------|---|---|---------|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | FnV | AET | CMExt | WnR | FS[4] | LPAE | RES0 | Domain | | | FS[3:0] | | | | | | |

Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

| FnV | Meaning |
|-----|--|
| 0b0 | DFAR is valid. |
| 0b1 | DFAR is not valid, and holds an UNKNOWN value. |

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AET, bits [15:14]

When FEAT_RAS is implemented:

Asynchronous Error Type. When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception. Possible values are:

| AET | Meaning |
|------|----------------------------|
| 0b00 | Uncontainable (UC). |
| 0b01 | Unrecoverable state (UEU). |
| 0b10 | Restartable state (UEO). |
| 0b11 | Recoverable state (UER). |

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other aborts.

In the event of multiple errors taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CM, bit [13]

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault.

| CM | Meaning |
|-----|---|
| 0b0 | Abort not caused by execution of a cache maintenance instruction. |
| 0b1 | Abort caused by execution of a cache maintenance instruction, or on an address translation. |

On a synchronous Data Abort on a translation table walk, this bit is UNKNOWN.

On an asynchronous fault, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [11]

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction.

| WnR | Meaning |
|-----|--------------------------------------|
| 0b0 | Abort caused by a read instruction. |
| 0b1 | Abort caused by a write instruction. |

For faults on the cache maintenance and address translation System instructions in the (coproc==0b1111) encoding space this bit always returns a value of 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FS, bits [10, 3:0]

Fault status bits. Possible values of FS[4:0] are:

| FS | Meaning | Applies when |
|-----------|--|----------------------------------|
| 0b000001 | Alignment fault. | |
| 0b000010 | Debug exception. | |
| 0b000011 | Access flag fault, level 1. | |
| 0b000100 | Fault on instruction cache maintenance. | |
| 0b000101 | Translation fault, level 1. | |
| 0b000110 | Access flag fault, level 2. | |
| 0b000111 | Translation fault, level 2. | |
| 0b01000 | Synchronous External abort, not on translation table walk. | |
| 0b01001 | Domain fault, level 1. | |
| 0b01011 | Domain fault, level 2. | |
| 0b01100 | Synchronous External abort, on translation table walk, level 1. | |
| 0b01101 | Permission fault, level 1. | |
| 0b01110 | Synchronous External abort, on translation table walk, level 2. | |
| 0b01111 | Permission fault, level 2. | |
| 0b10000 | TLB conflict abort. | |
| 0b10100 | IMPLEMENTATION DEFINED fault (Lockdown fault). | |
| 0b10101 | IMPLEMENTATION DEFINED fault (Unsupported Exclusive access fault). | |
| 0b10110 | SError interrupt. | |
| 0b11000 | SError interrupt, from a parity or ECC error on memory access. | When FEAT_RAS is not implemented |
| 0b11001 | Synchronous parity or ECC error on memory access, not on translation table walk. | When FEAT_RAS is not implemented |
| 0b11100 | Synchronous parity or ECC error on translation table walk, level 1. | When FEAT_RAS is not implemented |
| 0b11110 | Synchronous parity or ECC error on translation table walk, level 2. | When FEAT_RAS is not implemented |

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is DFSR[10].
- FS[3:0] is DFSR[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

| LPAE | Meaning |
|-------------|---|
| 0b0 | Using the Short-descriptor translation table formats. |
| 0b1 | Using the Long-descriptor translation table formats. |

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

Domain, bits [7:4]

The domain of the fault address.

Arm deprecates any use of this field, see 'The Domain field in the DFSR'.

This field is UNKNOWN for certain faults where the DFSR is updated and reported using the Short-descriptor FSR encodings, see 'Validity of Domain field on faults that update the DFSR when using the Short-descriptor encodings'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|-----|----|--------|------|------|------|--------|---|---|---|---|---|---|---|---|--|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| RES0 | | | | | | | | | | | | | | | | FnV | AET | CM | ExtWnR | RES0 | LPAE | RES0 | STATUS | | | | | | | | | |

Bits [31:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

| FnV | Meaning |
|-----|--|
| 0b0 | DFAR is valid. |
| 0b1 | DFAR is not valid, and holds an UNKNOWN value. |

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Data Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AET, bits [15:14]

When FEAT_RAS is implemented:

Asynchronous Error Type. When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception. Possible values are:

| AET | Meaning |
|------|----------------------------|
| 0b00 | Uncontainable (UC). |
| 0b01 | Unrecoverable state (UEU). |
| 0b10 | Restartable state (UEO). |
| 0b11 | Recoverable state (UER). |

This field is valid only if the DFSC code is 0b010001. It is RES0 for all other aborts.

In the event of multiple errors taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CM, bit [13]

Cache maintenance fault. For synchronous faults, this bit indicates whether a cache maintenance instruction generated the fault.

| CM | Meaning |
|-----|---|
| 0b0 | Abort not caused by execution of a cache maintenance instruction. |
| 0b1 | Abort caused by execution of a cache maintenance instruction. |

On a synchronous Data Abort on a translation table walk, this bit is UNKNOWN.

On an asynchronous fault, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [11]

Write not Read bit. Indicates whether the abort was caused by a write or a read instruction.

| WnR | Meaning |
|-----|--------------------------------------|
| 0b0 | Abort caused by a read instruction. |
| 0b1 | Abort caused by a write instruction. |

For faults on the cache maintenance and address translation System instructions in the (coproc==0b1111) encoding space this bit always returns a value of 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [10]

Reserved, RES0.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

| LPAE | Meaning |
|-------------|---|
| 0b0 | Using the Short-descriptor translation table formats. |
| 0b1 | Using the Long-descriptor translation table formats. |

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

| STATUS | Meaning | Applies when |
|----------|--|---|
| 0b000000 | Address size fault in translation table base register. | |
| 0b000001 | Address size fault, level 1. | |
| 0b000010 | Address size fault, level 2. | |
| 0b000011 | Address size fault, level 3. | |
| 0b000101 | Translation fault, level 1. | |
| 0b000110 | Translation fault, level 2. | |
| 0b000111 | Translation fault, level 3. | |
| 0b001001 | Access flag fault, level 1. | |
| 0b001010 | Access flag fault, level 2. | |
| 0b001011 | Access flag fault, level 3. | |
| 0b001101 | Permission fault, level 1. | |
| 0b001110 | Permission fault, level 2. | |
| 0b001111 | Permission fault, level 3. | |
| 0b010000 | Synchronous External abort, not on translation table walk. | |
| 0b010001 | Asynchronous SError interrupt. | |
| 0b010101 | Synchronous External abort on translation table walk, level 1. | |
| 0b010110 | Synchronous External abort on translation table walk, level 2. | |
| 0b010111 | Synchronous External abort on translation table walk, level 3. | |
| 0b011000 | Synchronous parity or ECC error on memory access, not on translation table walk. | When FEAT_RAS is not implemented |
| 0b011001 | Asynchronous SError interrupt, from a parity or ECC error on memory access. | When FEAT_RAS is not implemented |
| 0b011101 | Synchronous parity or ECC error on memory access on translation table walk, level 1. | When FEAT_RAS is not implemented |
| 0b011110 | Synchronous parity or ECC error on memory access on translation table walk, level 2. | When FEAT_RAS is not implemented |
| 0b011111 | Synchronous parity or ECC error on memory access on translation table walk, level 3. | When FEAT_RAS is not implemented |
| 0b100001 | Alignment fault. | |
| 0b100010 | Debug exception. | |
| 0b110000 | TLB conflict abort. | |
| 0b110100 | IMPLEMENTATION DEFINED fault (Lockdown). | |
| 0b110101 | IMPLEMENTATION DEFINED fault (Unsupported Exclusive access). | |

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DFSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0101 | 0b0000 | 0b000 |

```

```

DISR, Deferred Interrupt Status Register

The DISR characteristics are:

Purpose

Records that an SError interrupt has been consumed by an ESB instruction.

Configuration

AArch32 System register DISR bits [31:0] are architecturally mapped to AArch64 System register [DISR_EL1\[31:0\]](#) when the highest implemented Exception level is using AArch64.

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to DISR are UNDEFINED.

Attributes

DISR is a 32-bit register.

Field descriptions

When the ESB instruction is executed at EL2:

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
|----|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|------|---|---|------|---|---|---|---|---|---|--|
| A | RES0 | | | | | | | | | | | | | | | | | | | AET | EA | RES0 | | | DFSC | | | | | | | |

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:12]

Reserved, RES0.

AET, bits [11:10]

Asynchronous Error Type. See the description of [HSR.AET](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort Type. See the description of [HSR.EA](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

DFSC, bits [5:0]

Fault Status Code. See the description of [HSR.DFSC](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 0:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|------|----|----|----|----|----|----|----|----|----|-----|------|-----|------|-------|------|------|----|----|----|----|---------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| A | RES0 | | | | | | | | | | AET | RES0 | EXT | RES0 | FS[4] | LPAE | RES0 | | | | | FS[3:0] | | | | | | | | | |

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

Asynchronous Error Type. See the description of [DFSR.AET](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

External abort Type. See the description of [DFSR.ExT](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault Status Code. See the description of [DFSR.FS](#) for an SError interrupt.

The FS field is split as follows:

- FS[4] is DISR[10].

- FS[3:0] is DISR[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

| LPAE | Meaning |
|------|--|
| 0b0 | Using the Short-descriptor translation table format. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When the ESB instruction is executed at EL0 or EL1 and where TTBCR.EAE == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|------|----|----|----|----|----|----|----|----|----|-----|------|-----|------|------|------|--------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| A | RES0 | | | | | | | | | | AET | RES0 | ExT | RES0 | LPAE | RES0 | STATUS | | | | | | | | | | | | | | |

A, bit [31]

Set to 1 when an ESB instruction defers an asynchronous SError interrupt. If the implementation does not include any sources of SError interrupt that can be synchronized by an Error Synchronization Barrier, then this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

Asynchronous Error Type. See the description of [DFSR.AET](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

External abort Type. See the description of [DFSR.ExT](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

| LPAE | Meaning |
|------|---|
| 0b1 | Using the Long-descriptor translation table format. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault Status Code. See the description of [DFSR.FS](#) for an SError interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DISR

An indirect write to DISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

DISR is RAZ/WI if EL3 is implemented, the PE is in Non-debug state, and any of the following apply:

- EL3 is using AArch64, [SCR_EL3.EA](#) == 1, and any of the following apply:
 - The PE is executing at EL2.
 - The PE is executing at EL1 and (([SCR_EL3.NS](#) == 0 && [SCR_EL3.EEL2](#) == 0) || [HCR_EL2.AMO](#) == 0).
- EL3 is using AArch32, [SCR.EA](#) == 1, and any of the following apply:
 - The PE is executing at EL2.
 - The PE is executing at EL1 and ([SCR.NS](#) == 0 || [HCR.AMO](#) == 0).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b0001 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elseif PSTATE.EL == EL1 then

    DISR = R[t];

```

DLR, Debug Link Register

The DLR characteristics are:

Purpose

In Debug state, holds the address to restart from.

Configuration

AArch32 System register DLR bits [31:0] are architecturally mapped to AArch64 System register [DLR_EL0\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DLR are UNDEFINED.

Attributes

DLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

```
if !Halted() then
    UNDEFINED;
else
    DLR = R[t];
```

DSPSR, Debug Saved Program Status Register

The DSPSR characteristics are:

Purpose

Holds the saved process state for Debug state. On entering Debug state, PSTATE information is written to this register. On exiting Debug state, values are copied from this register to PSTATE.

Configuration

AArch32 System register DSPSR bits [31:0] are architecturally mapped to AArch64 System register [DSPSR_EL0\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to DSPSR are UNDEFINED.

Attributes

DSPSR is a 32-bit register.

|----|----|----|----|----|---------|-----|----|------|----|----|----|----|----|---------|----|----|----|----|----|----|----|--------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| N | Z | C | V | Q | IT[1:0] | DIT | SS | SPAN | SS | IL | | GE | | IT[7:2] | | E | A | I | F | T | | M[4:0] | | | | | | | | | |

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on entering Debug state, and copied to PSTATE.N on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on entering Debug state, and copied to PSTATE.Z on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on entering Debug state, and copied to PSTATE.C on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on entering Debug state, and copied to PSTATE.V on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on entering Debug state, and copied to PSTATE.Q on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on entering Debug state, and copied to PSTATE.IT on exiting Debug state.

DSPSR.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is DSPSR[26:25].
- IT[7:2] is DSPSR[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]

When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on entering Debug state, and copied to PSTATE.DIT on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]

When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on entering Debug state, and copied to PSTATE.SSBS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]

When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on entering Debug state, and copied to PSTATE.PAN on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on entering Debug state, and conditionally copied to PSTATE.SS on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on entering Debug state, and copied to PSTATE.IL on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on entering Debug state, and copied to PSTATE.GE on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on entering Debug state, and copied to PSTATE.E on exiting Debug state.

If the implementation does not support big-endian operation, DSPSR.E is RES0. If the implementation does not support little-endian operation, DSPSR.E is RES1. On exiting Debug state, if the implementation does not support big-endian operation at the Exception level being returned to, DSPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, DSPSR.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

Error interrupt mask. Set to the value of PSTATE.A on entering Debug state, and copied to PSTATE.A on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on entering Debug state, and copied to PSTATE.I on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on entering Debug state, and copied to PSTATE.F on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on entering Debug state, and copied to PSTATE.T on exiting Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on entering Debug state, and copied to PSTATE.M[4:0] on exiting Debug state.

| M[4:0] | Meaning |
|---------------|----------------|
| 0b10000 | User. |
| 0b10001 | FIQ. |
| 0b10010 | IRQ. |
| 0b10011 | Supervisor. |
| 0b10110 | Monitor. |
| 0b10111 | Abort. |
| 0b11010 | Hyp. |
| 0b11011 | Undefined. |
| 0b11111 | System. |

Other values are reserved. If DPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, exiting Debug state is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing DPSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b011 | 0b0100 | 0b0101 | 0b000 |

```
if !Halted() then
    UNDEFINED;
else
    return DPSR;
```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b011 | 0b0100 | 0b0101 | 0b000 |

```
if !Halted() then
    UNDEFINED;
else
    DSPSR = R[t];
```

DTLBIALL, Data TLB Invalidate All

The DTLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from data TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
 - Would be required for the EL1&0 translation regime.
 - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the Non-secure PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to DTLBIALL are UNDEFINED.

Attributes

DTLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the DTLBIALL instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1000 | 0b0110 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T8 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T8 == '1' then

DTLBIASID, Data TLB Invalidate by ASID match

The DTLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from data TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
 - Is from a level of lookup above the final level.
 - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to DTLBIASID are UNDEFINED.

Attributes

DTLBIASID is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | ASID | | | | | | | |

Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing the DTLBIASID instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| | | | | |

DTLBIMVA, Data TLB Invalidate by VA

The DTLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from data TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
 - The entry is from a level of lookup above the final level and matches the specified ASID.
 - The entry is a global entry from the final level of lookup.
 - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Arm deprecates the use of this System instruction. It is only provided for backwards compatibility with earlier versions of the Arm architecture.

Configuration

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to DTLBIMVA are UNDEFINED.

Attributes

DTLBIMVA is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

DVPRCTX, Data Value Prediction Restriction by Context

The DVPRCTX characteristics are:

Purpose

Data Value Prediction Restriction by Context applies to all Data Value Prediction Resources that predict execution based on information gathered within the target execution context or contexts.

Data value predictions determined by the actions of code in the target execution context or contexts appearing in program order before the instruction cannot exploitatively control speculative execution occurring after the instruction is complete and synchronized.

This instruction is guaranteed to be complete following a DSB that covers both read and write behavior on the same PE as executed the original restriction instruction, and a subsequent context synchronization event is required to ensure that the effect of the completion of the instructions is synchronized to the current execution.

Note

This instruction does not require the invalidation of prediction structures so long as the behavior described for completion of this instruction is met by the implementation.

On some implementations the instruction is likely to take a significant number of cycles to execute. This instruction is expected to be used very rarely, such as on the roll-over of an ASID or VMID, but should not be used on every context switch.

Configuration

This instruction is present only when AArch32 is supported and FEAT_SPECRES is implemented. Otherwise, direct accesses to DVPRCTX are UNDEFINED.

Attributes

DVPRCTX is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-------|----|----|------|----|----|----|----|----|----|----|------|----|----|----|-------|------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | GVMID | NS | EL | VMID | | | | | | | | RES0 | | | | GASID | ASID | | | | | | | | | | | |

Bits [31:28]

Reserved, RES0.

GVMID, bit [27]

Execution of this instruction applies to all VMIDs or a specified VMID.

| GVMID | Meaning |
|-------|---|
| 0b0 | Applies to specified VMID for an EL0 or EL1 target execution context. |
| 0b1 | Applies to all VMIDs for an EL0 or EL1 target execution context. |

For target execution contexts other than EL0 or EL1, this field is RES0.

If the instruction is executed at EL0 or EL1, this field has an Effective value of 0.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

NS, bit [26]

Security State.

| NS | Meaning |
|-----|-------------------|
| 0b0 | Secure state. |
| 0b1 | Non-secure state. |

If the instruction is executed in Non-secure state, this field has an Effective value of 1.

EL, bits [25:24]

Exception Level. Indicates the Exception level of the target execution context.

| EL | Meaning |
|------|---------|
| 0b00 | EL0. |
| 0b01 | EL1. |
| 0b10 | EL2. |
| 0b11 | EL3. |

If the instruction is executed at an Exception level lower than the specified level, this instruction is treated as a NOP.

VMID, bits [23:16]

Only applies when bit[27] is 0 and the target execution context is either:

- EL1.
- EL0 when ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#)) or EL2 is using AArch32 state.

Otherwise this field is RES0.

When the instruction is executed at EL1, this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==0](#) or [HCR_EL2.TGE==0](#) or [ELUsingAArch32\(EL2\)](#)), this field is treated as the current VMID.

When the instruction is executed at EL0 and ([HCR_EL2.E2H==1](#) and [HCR_EL2.TGE==1](#) and [!ELUsingAArch32\(EL2\)](#)), this field is ignored.

If EL2 is not implemented or not enabled for the target Security state, this field is RES0.

Bits [15:9]

Reserved, RES0.

GASID, bit [8]

Execution of this instruction applies to all ASIDs or a specified ASID.

| GASID | Meaning |
|-------|--|
| 0b0 | Applies to specified ASID for an EL0 target execution context. |
| 0b1 | Applies to all ASID for an EL0 target execution context. |

For target execution contexts other than EL0, this field is RES0.

If the instruction is executed at EL0, this field has an Effective value of 0.

ASID, bits [7:0]

Only applies for an EL0 target execution context and when bit[8] is 0.

Otherwise, this field is RES0.

When the instruction is executed at EL0, this field is treated as the current ASID.

Executing the DVPRCTX instruction

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0111 | 0b0011 | 0b101 |

```

```

ELR_hyp, Exception Link Register (Hyp mode)

The ELR_hyp characteristics are:

Purpose

When taking an exception to Hyp mode, holds the address to return to.

Configuration

AArch32 System register ELR_hyp bits [31:0] are architecturally mapped to AArch64 System register [ELR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to ELR_hyp are UNDEFINED.

Attributes

ELR_hyp is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Return address | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

Return address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ELR_hyp

ELR_hyp is accessible only at Hyp mode and Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, ELR_hyp

| R | M | M1 |
|-----|-----|--------|
| 0b0 | 0b1 | 0b1110 |

MSR{<c>}{<q>} ELR_hyp, <Rn>

| R | M | M1 |
|-----|-----|--------|
| 0b0 | 0b1 | 0b1110 |

ERRIDR, Error Record ID Register

The ERRIDR characteristics are:

Purpose

Defines the highest numbered index of the error records that can be accessed through the Error Record System registers.

Configuration

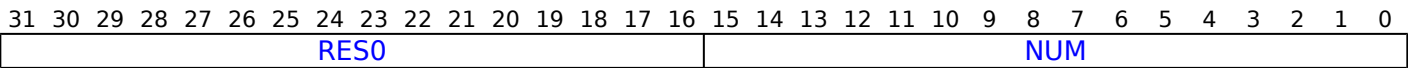

AArch32 System register ERRIDR bits [31:0] are architecturally mapped to AArch64 System register [ERRIDR_EL1\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRIDR are UNDEFINED.

Attributes

ERRIDR is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

NUM, bits [15:0]

Highest numbered index of the records that can be accessed through the Error Record System registers plus one. Zero indicates that no records can be accessed through the Error Record System registers.

Each implemented record is owned by a node. A node might own multiple records.

Accessing ERRIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

ERRSELR, Error Record Select Register

The ERRSELR characteristics are:

Purpose

Selects an error record to be accessed through the Error Record System registers.

Configuration

AArch32 System register ERRSELR bits [31:0] are architecturally mapped to AArch64 System register [ERRSELR_EL1\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERRSELR are UNDEFINED.

If [ERRIDR](#) indicates that zero error records are implemented, then it is IMPLEMENTATION DEFINED whether ERRSELR is UNDEFINED or RES0.

Attributes

ERRSELR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | SEL | | | | | | | | | | | | | | | |

Bits [31:16]

Reserved, RES0.

SEL, bits [15:0]

Selects the error record accessed through the ERX registers.

For example, if ERRSELR.SEL is 0x0004, then direct reads and writes of [ERXSTATUS](#) access ERR4STATUS.

If ERRSELR.SEL is greater than or equal to [ERRIDR.NUM](#), then all of the following apply:

- The value read back from ERRSELR.SEL is UNKNOWN.
- One of the following occurs:
 - An UNKNOWN error record is selected.
 - The ERX* registers are RAZ/WI.
 - ERX* register reads and writes are NOPs.
 - ERX* register reads and writes are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ERRSELR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| | | | | |

ERXADDR, Selected Error Record Address Register

The ERXADDR characteristics are:

Purpose

Accesses bits [31:0] of [ERR<n>ADDR](#) for the error record <n> selected by [ERRSEL](#).SEL.

Configuration

AArch32 System register ERXADDR bits [31:0] are architecturally mapped to AArch64 System register [ERXADDR_EL1\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR are UNDEFINED.

Attributes

ERXADDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bits [31:0] of ERR<n>ADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

ERXADDR accesses bits [31:0] of [ERR<n>ADDR](#), where <n> is the value in [ERRSEL](#).SEL.

Accessing ERXADDR

If [ERRIDR](#).NUM is 0x0000 or [ERRSEL](#).SEL is greater than or equal to [ERRIDR](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR is RAZ/WI.
- Direct reads and writes of ERXADDR are NOPs.
- Direct reads and writes of ERXADDR are UNDEFINED.

[ERR<n>ADDR](#) describes additional constraints that also apply when [ERR<n>ADDR](#) is accessed through ERXADDR.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

ERXADDR2, Selected Error Record Address Register 2

The ERXADDR2 characteristics are:

Purpose

Accesses bits [63:32] of [ERR<n>ADDR](#) for the error record <n> selected by [ERRSEL](#).SEL.

Configuration

AArch32 System register ERXADDR2 bits [31:0] are architecturally mapped to AArch64 System register [ERXADDR_EL1\[63:32\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXADDR2 are UNDEFINED.

Attributes

ERXADDR2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bits [63:32] of ERR<n>ADDR | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

ERXADDR2 accesses bits [63:32] of [ERR<n>ADDR](#), where <n> is the value in [ERRSEL](#).SEL.

Accessing ERXADDR2

If [ERRIDR](#).NUM is 0x0000 or [ERRSEL](#).SEL is greater than or equal to [ERRIDR](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXADDR2 is RAZ/WI.
- Direct reads and writes of ERXADDR2 are NOPs.
- Direct reads and writes of ERXADDR2 are UNDEFINED.

[ERR<n>ADDR](#) describes additional constraints that also apply when [ERR<n>ADDR](#) is accessed through ERXADDR2.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

ERXCTLR, Selected Error Record Control Register

The ERXCTRLR characteristics are:

Purpose

Accesses bits [31:0] of [ERR<n>CTRL](#) for the error record <n> selected by [ERRSEL](#).SEL.

Configuration

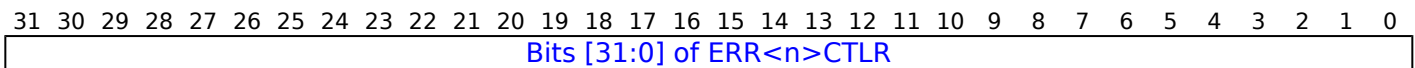

AArch32 System register ERXCTLR bits [31:0] are architecturally mapped to AArch64 System register [ERXCTLR_EL1\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXCTLR are UNDEFINED.

Attributes

ERXCTLR is a 32-bit register.

Field descriptions

Bits [31:0]

ERXCTLR accesses bits [31:0] of [ERR<n>CTLR](#), where <n> is the value in [ERRSEL](#).SEL.

Accessing ERXCTLR

If [ERRIDR.NUM](#) is 0x0000 or [ERRSEL.SEL](#) is greater than or equal to [ERRIDR.NUM](#), then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTL is RAZ/WI.
- Direct reads and writes of ERXCTL are NOPs.
- Direct reads and writes of ERXCTL are UNDEFINED.

If [ERRSEL](#).SEL is not the index of the first error record owned by a node, then [ERR<n>CTL](#)R[31:0] is not present, meaning reads and writes of [ERXCTL](#)R are RES0.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b0101 | 0b0100 | 0b001 |

ERXCTLR2, Selected Error Record Control Register 2

The ERXCTLR2 characteristics are:

Purpose

Accesses bits [63:32] of [ERR<n>CTLR](#) for the error record <n> selected by [ERRSELR](#).SEL.

Configuration

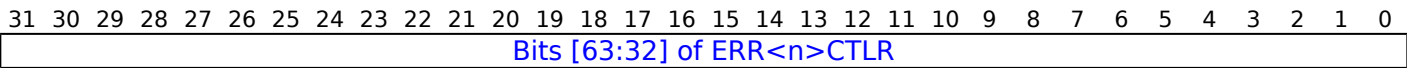

AArch32 System register ERXCTLR2 bits [31:0] are architecturally mapped to AArch64 System register [ERXCTLR_EL1\[63:32\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXCTLR2 are UNDEFINED.

Attributes

ERXCTLR2 is a 32-bit register.

Field descriptions

Bits [31:0]

ERXCTLR2 accesses bits [63:32] of [ERR<n>CTLR](#), where <n> is the value in [ERRSELR](#).SEL.

Accessing ERXCTLR2

If [ERRIDR](#).NUM is 0x0000 or [ERRSELR](#).SEL is greater than or equal to [ERRIDR](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXCTLR2 is RAZ/WI.
- Direct reads and writes of ERXCTLR2 are NOPs.
- Direct reads and writes of ERXCTLR2 are UNDEFINED.

If [ERRSELR](#).SEL is not the index of the first error record owned by a node, then [ERR<n>CTLR](#)[63:32] is not present, meaning reads and writes of ERXCTLR2 are RES0.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0101 | 0b0100 | 0b101 |

ERXMISC0, Selected Error Record Miscellaneous Register 0

The ERXMISC0 characteristics are:

Purpose

Accesses bits [31:0] of [ERR<n>MISC0](#) for the error record <n> selected by [ERRSELR](#).SEL.

Configuration

AArch32 System register ERXMISC0 bits [31:0] are architecturally mapped to AArch64 System register [ERXMISC0_EL1\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC0 are UNDEFINED.

Attributes

ERXMISC0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bits [31:0] of ERR<n>MISC0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

ERXMISC0 accesses bits [31:0] of [ERR<n>MISC0](#), where <n> is the value in [ERRSELR](#).SEL.

Accessing ERXMISC0

If [ERRIDR](#).NUM is 0x0000 or [ERRSELR](#).SEL is greater than or equal to [ERRIDR](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC0 is RAZ/WI.
- Direct reads and writes of ERXMISC0 are NOPs.
- Direct reads and writes of ERXMISC0 are UNDEFINED.

[ERR<n>MISC0](#) describes additional constraints that also apply when [ERR<n>MISC0](#) is accessed through ERXMISC0.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0101 | 0b0101 | 0b000 |

ERXMISC1, Selected Error Record Miscellaneous Register 1

The ERXMISC1 characteristics are:

Purpose

Accesses bits [63:32] of [ERR<n>MISC0](#) for the error record <n> selected by [ERRSELR](#).SEL.

Configuration

AArch32 System register ERXMISC1 bits [31:0] are architecturally mapped to AArch64 System register [ERXMISC0_EL1\[63:32\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC1 are UNDEFINED.

Attributes

ERXMISC1 is a 32-bit register.

Field descriptions

ERXMISC2, Selected Error Record Miscellaneous Register 2

The ERXMISC2 characteristics are:

Purpose

Accesses bits [31:0] of [ERR<n>MISC1](#) for the error record <n> selected by [ERRSELR](#).SEL.

Configuration

AArch32 System register ERXMISC2 bits [31:0] are architecturally mapped to AArch64 System register [ERXMISC1_EL1\[31:0\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC2 are UNDEFINED.

Attributes

ERXMISC2 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bits [31:0] of ERR<n>MISC1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

ERXMISC2 accesses bits [31:0] of [ERR<n>MISC1](#), where <n> is the value in [ERRSELR](#).SEL.

Accessing ERXMISC2

If [ERRIDR](#).NUM is 0x0000 or [ERRSELR](#).SEL is greater than or equal to [ERRIDR](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC2 is RAZ/WI.
- Direct reads and writes of ERXMISC2 are NOPs.
- Direct reads and writes of ERXMISC2 are UNDEFINED.

[ERR<n>MISC1](#) describes additional constraints that also apply when [ERR<n>MISC1](#) is accessed through ERXMISC2.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

ERXMISC3, Selected Error Record Miscellaneous Register 3

The ERXMISC3 characteristics are:

Purpose

Accesses bits [63:32] of [ERR<n>MISC1](#) for the error record <n> selected by [ERRSELR](#).SEL.

Configuration

AArch32 System register ERXMISC3 bits [31:0] are architecturally mapped to AArch64 System register [ERXMISC1_EL1\[63:32\]](#).

This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERXMISC3 are UNDEFINED.

Attributes

ERXMISC3 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bits [63:32] of ERR<n>MISC1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

ERXMISC3 accesses bits [63:32] of [ERR<n>MISC1](#), where <n> is the value in [ERRSELR](#).SEL.

Accessing ERXMISC3

If [ERRIDR](#).NUM is 0x0000 or [ERRSELR](#).SEL is greater than or equal to [ERRIDR](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC3 is RAZ/WI.
- Direct reads and writes of ERXMISC3 are NOPs.
- Direct reads and writes of ERXMISC3 are UNDEFINED.

[ERR<n>MISC1](#) describes additional constraints that also apply when [ERR<n>MISC1](#) is accessed through ERXMISC3.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

ERXMISC5, Selected Error Record Miscellaneous Register 5

The ERXMISC5 characteristics are:

Purpose

Accesses bits [63:32] of [ERR<n>MISC2](#) for the error record <n> selected by [ERRSELR](#).SEL.

Configuration

AArch32 System register ERXMISC5 bits [31:0] are architecturally mapped to AArch64 System register [ERXMISC2_EL1\[63:32\]](#).

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC5 are UNDEFINED.

Attributes

ERXMISC5 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bits [63:32] of ERR<n>MISC2 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

ERXMISC5 accesses bits [63:32] of [ERR<n>MISC2](#), where <n> is the value in [ERRSELR](#).SEL.

Accessing ERXMISC5

If [ERRIDR](#).NUM is 0x0000 or [ERRSELR](#).SEL is greater than or equal to [ERRIDR](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC5 is RAZ/WI.
- Direct reads and writes of ERXMISC5 are NOPs.
- Direct reads and writes of ERXMISC5 are UNDEFINED.

[ERR<n>MISC2](#) describes additional constraints that also apply when [ERR<n>MISC2](#) is accessed through ERXMISC5.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0101 | 0b0101 | 0b011 |

ERXMISC7, Selected Error Record Miscellaneous Register 7

The ERXMISC7 characteristics are:

Purpose

Accesses bits [63:32] of [ERR<n>MISC3](#) for the error record <n> selected by [ERRSELR](#).SEL.

Configuration

AArch32 System register ERXMISC7 bits [31:0] are architecturally mapped to AArch64 System register [ERXMISC3_EL1\[63:32\]](#).

This register is present only when FEAT_RASv1p1 is implemented. Otherwise, direct accesses to ERXMISC7 are UNDEFINED.

Attributes

ERXMISC7 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bits [63:32] of ERR<n>MISC3 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

ERXMISC7 accesses bits [63:32] of [ERR<n>MISC3](#), where <n> is the value in [ERRSELR](#).SEL.

Accessing ERXMISC7

If [ERRIDR](#).NUM is 0x0000 or [ERRSELR](#).SEL is greater than or equal to [ERRIDR](#).NUM, then one of the following occurs:

- An UNKNOWN error record is selected.
- ERXMISC7 is RAZ/WI.
- Direct reads and writes of ERXMISC7 are NOPs.
- Direct reads and writes of ERXMISC7 are UNDEFINED.

[ERR<n>MISC3](#) describes additional constraints that also apply when [ERR<n>MISC3](#) is accessed through ERXMISC7.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0101 | 0b0101 | 0b111 |

FCSEIDR, FCSE Process ID register

The FCSEIDR characteristics are:

Purpose

Identifies whether the Fast Context Switch Extension (FCSE) is implemented.

From Armv8, the FCSE is not implemented, so this register is RAZ/WI. Software can access this register to determine that the implementation does not include the FCSE.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to FCSEIDR are UNDEFINED.

Attributes

FCSEIDR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| | | | | | | | | | | | | | | | | RAZ/WI | | | | | | | | | | | | | | | |

Bits [31:0]

Reserved, RAZ/WI.

Accessing FCSEIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1101 | 0b0000 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T13 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T13 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        return FCSEIDR;
elsif PSTATE.EL == EL2 then
    return FCSEIDR;
elsif PSTATE.EL == EL3 then
    return FCSEIDR;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|------|-----|-----|------|
|--------|------|-----|-----|------|

| | | | | |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1101 | 0b0000 | 0b000 |
|--------|-------|--------|--------|-------|

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T13 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T13 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        FCSEIDR = R[t];
elsif PSTATE.EL == EL2 then
    FCSEIDR = R[t];
elsif PSTATE.EL == EL3 then
    FCSEIDR = R[t];
```

FPEXC, Floating-Point Exception Control register

The FPEXC characteristics are:

Purpose

Provides a global enable for the implemented Advanced SIMD and floating-point functionality, and reports floating-point status information.

Configuration

AArch32 System register FPEXC bits [31:0] are architecturally mapped to AArch64 System register [FPEXC32_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to FPEXC are UNDEFINED.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPEXC is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|-----|------|----|-----|------|----|----|----|----|----|----|----|----|----|--------|----|----|-----|------|-----|-----|-----|-----|-----|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| EX | EN | DEX | FP2V | VV | TFV | RES0 | | | | | | | | | | VECITR | | | IDF | RES0 | IXF | UFF | OFF | DZF | IOF | | | | | | |

EX, bit [31]

Exception bit. From Armv8, this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [30]

Enables access to the Advanced SIMD and floating-point functionality from all Exception levels, except that setting this field to 0 does not disable the following:

- VMSR accesses to the [FPEXC](#) or [FPSID](#).
- VMRS accesses from the [FPEXC](#), [FPSID](#), [MVFR0](#), [MVFR1](#), or [MVFR2](#).

| EN | Meaning |
|-----|--|
| 0b0 | Accesses to the FPSCR , and any of the SIMD and floating-point registers Q0-Q15, including their views as D0-D31 registers or S0-S31 registers, are UNDEFINED at all Exception levels. |
| 0b1 | This control permits access to the Advanced SIMD and floating-point functionality at all Exception levels. |

Execution of Advanced SIMD and floating-point instructions in AArch32 state can be disabled or trapped by the following controls:

- [CPACR](#).cp10, or, if executing at EL0, [CPACR_EL1](#).FPEN.
- FPEXC.EN.
- If executing in Non-secure state:
 - [HCPTR](#).TCP10, or if EL2 is using AArch64, [CPTR_EL2](#).TFP.
 - [NSACR](#).cp10, or if EL3 is using AArch64, [CPTR_EL3](#).TFP.
- For Advanced SIMD instructions only:
 - CPACR.ASEDIS.

- If executing in Non-secure state, [HCPTR.TASE](#) and [NSACR.NSTRCDIS](#).

See the descriptions of the controls for more information.

Note

When executing at EL0 using AArch32:

- If EL1 is using AArch64, then the Effective value of FPEXC.EN is 1. This includes when EL2 is using AArch64 and is enabled in the current Security state, [HCR_EL2.TGE](#) is 1, and the Effective value of [HCR_EL2.RW](#) is 1.
 - If EL2 is using AArch64 and is enabled in the current Security state, [HCR_EL2.TGE](#) is 1, and the Effective value of [HCR_EL2.RW](#) is 0, then it is IMPLEMENTATION DEFINED whether the Effective value of FPEXC.EN is 1 or the value written to FPEXC.EN. However, Arm deprecates using the value of FPEXC.EN to determine behavior.
-

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

DEX, bit [29]

Defined synchronous exception on floating-point execution.

This field identifies whether a synchronous exception generated by the attempted execution of an instruction was generated by an unallocated encoding. The instruction must be in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr() returning TRUE. This field also indicates whether the FPEXC.TFV field is valid.

The meaning of this bit is:

| DEX | Meaning |
|-----|---|
| 0b0 | The exception was generated by the attempted execution of an unallocated instruction in the encoding space that is identified by the pseudocode function ExecutingCP10or11Instr(). If FPEXC.TFV is RW then it is invalid and UNKNOWN. If FPEXC.{IDE, IXF, UFF, OFF, DZF, IOF} are RW then they are invalid and UNKNOWN. |
| 0b1 | The exception was generated during the execution of an allocated encoding. FPEXC.TFV is valid and indicates the cause of the exception. |

On an exception that sets this bit to 1 the exception-handling routine must clear this bit to 0.

On an implementation that both does not support trapping of floating-point exceptions and implements the [FPSCR](#).{Stride, Len} fields as RAZ, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FP2V, bit [28]

FPINST2 instruction valid bit. From Armv8, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VV, bit [27]

VECITR valid bit. From Armv8, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TFV, bit [26]

Trapped Fault Valid bit. Valid only when the value of FPEXC.DEX is 1. When valid, it indicates the cause of the exception and therefore whether the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are valid.

| TFV | Meaning |
|-----|---|
| 0b0 | The exception was caused by the execution of a floating-point VABS, VADD, VDIV, VFMA, VFMS, VFNMA, VFNMS, VMLA, VMLS, VMOV, VMUL, VNEG, VNMLA, VNMLS, VNMUL, VSQRT, or VSUB instruction when one or both of FPSCR .{Stride, Len} was non-zero. If the FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} bits are RW then they are invalid and UNKNOWN. |
| 0b1 | FPEXC.{IDF, IXF, UFF, OFF, DZF, IOF} indicate the presence of trapped floating-point exceptions that had occurred at the time of the exception. Bits are set for all trapped exceptions that had occurred at the time of the exception. |

This bit returns a status value and ignores writes.

When the value of FPEXC.DEX is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

On an implementation that supports the trapping of floating-point exceptions and implements [FPSCR](#).{Stride, Len} as RAZ, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:11]

Reserved, RES0.

VECITR, bits [10:8]

Vector iteration count. From Armv8, this field is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDF, bit [7]

Input Denormal trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Input Denormal exception occurred while [FPSCR](#).IDE was 1:

| IDF | Meaning |
|-----|--|
| 0b0 | Input Denormal exception has not occurred. |
| 0b1 | Input Denormal exception has occurred. |

Input Denormal exceptions can occur only when [FPSCR](#).FZ is 1.

Note

A half-precision floating-point value that is flushed to zero because the value of [FPSCR](#).FZ16 is 1 does not generate an Input Denormal exception.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXF, bit [4]

Inexact trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Inexact exception occurred while [FPSCR.IXE](#) was 1:

| IXF | Meaning |
|-----|-------------------------------------|
| 0b0 | Inexact exception has not occurred. |
| 0b1 | Inexact exception has occurred. |

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFF, bit [3]

Underflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Underflow exception occurred while [FPSCR.UFE](#) was 1:

| UFF | Meaning |
|-----|---------------------------------------|
| 0b0 | Underflow exception has not occurred. |
| 0b1 | Underflow exception has occurred. |

Underflow trapped exceptions can occur:

- On half-precision data-processing instructions only when [FPSCR.FZ16](#) is 0.
- Otherwise only when [FPSCR.FZ](#) is 0.

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFF, bit [2]

Overflow trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Overflow exception occurred while [FPSCR.OFE](#) was 1:

| OFF | Meaning |
|-----|--------------------------------------|
| 0b0 | Overflow exception has not occurred. |
| 0b1 | Overflow exception has occurred. |

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZF, bit [1]

Divide by Zero trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether a Divide by Zero exception occurred while [FPSCR.DZE](#) was 1:

| DZF | Meaning |
|------------|--|
| 0b0 | Divide by Zero exception has not occurred. |
| 0b1 | Divide by Zero exception has occurred. |

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOF, bit [0]

Invalid Operation trapped exception bit. Valid only when the value of FPEXC.TFV is 1. When valid, it indicates whether an Invalid Operation exception occurred while [FPSCR.IOE](#) was 1:

| IOF | Meaning |
|------------|---|
| 0b0 | Invalid Operation exception has not occurred. |
| 0b1 | Invalid Operation exception has occurred. |

This bit must be cleared to 0 by the exception-handling routine.

When the value of FPEXC.TFV is 0 and this bit is RW, this bit is invalid and UNKNOWN.

On an implementation that does not support the trapping of floating-point exceptions this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FPEXC

Accesses to this register use the following encodings in the System register encoding space:

VMRS{<c>}{<q>} <Rt>, <spec_reg>

| reg |
|------------|
| 0b1000 |

FPSCR, Floating-Point Status and Control Register

The FPSCR characteristics are:

Purpose

Provides floating-point system status information and control.

Configuration

AArch32 System register FPSCR bits [31:27] are architecturally mapped to AArch64 System register [FPSR\[31:27\]](#).

AArch32 System register FPSCR bit [7] is architecturally mapped to AArch64 System register [FPSR\[7\]](#).

AArch32 System register FPSCR bits [4:0] are architecturally mapped to AArch64 System register [FPSR\[4:0\]](#).

AArch32 System register FPSCR bits [26:15] are architecturally mapped to AArch64 System register [FPSR\[26:15\]](#).

AArch32 System register FPSCR bits [12:8] are architecturally mapped to AArch64 System register [FPSR\[12:8\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to FPSCR are UNDEFINED.

It is IMPLEMENTATION DEFINED whether the Len and Stride fields can be programmed to non-zero values, which will cause some AArch32 floating-point instruction encodings to be UNDEFINED, or whether these fields are RAZ.

Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPSCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|------|--------|----|----|-----|----|------|-----|-----|----|----|-----|-----|----|-------|-----|-----|----|----|-----|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |
| N | Z | C | V | Q | A | H | P | D | N | F | Z | R | Mode | Stride | FZ | 16 | Len | ID | RES0 | IXE | UFE | OF | ED | DZE | IOE | ID | CRES0 | IXC | UFC | OF | CD | DZC | IOC |

N, bit [31]

Negative condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow condition flag. This is updated by floating-point comparison operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

QC, bit [27]

Cumulative saturation bit, Advanced SIMD only. This bit is set to 1 to indicate that an Advanced SIMD integer operation has saturated since 0 was last written to this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AHP, bit [26]

Alternative half-precision control bit:

| AHP | Meaning |
|------------|---|
| 0b0 | IEEE half-precision format selected. |
| 0b1 | Alternative half-precision format selected. |

This bit is used only for conversions between half-precision floating-point and other floating-point formats.

The data-processing instructions added as part of the FEAT_FP16 extension always use the IEEE half-precision format, and ignore the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DN, bit [25]

Default NaN mode control bit:

| DN | Meaning |
|-----------|---|
| 0b0 | NaN operands propagate through to the output of a floating-point operation. |
| 0b1 | Any operation involving one or more NaNs returns the Default NaN. |

The value of this bit controls only scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Default NaN setting, regardless of the value of the DN bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ, bit [24]

Flush-to-zero mode control bit:

| FZ | Meaning |
|-----------|---|
| 0b0 | Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard. |
| 0b1 | Flush-to-zero mode enabled. |

The value of this bit controls only scalar floating-point arithmetic. Advanced SIMD arithmetic always uses the Flush-to-zero setting, regardless of the value of the FZ bit.

This bit has no effect on half-precision calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RMode, bits [23:22]

Rounding Mode control field. The encoding of this field is:

| RMode | Meaning |
|-------|---|
| 0b00 | Round to Nearest (RN) mode. |
| 0b01 | Round towards Plus Infinity (RP) mode. |
| 0b10 | Round towards Minus Infinity (RM) mode. |
| 0b11 | Round towards Zero (RZ) mode. |

The specified rounding mode is used by almost all scalar floating-point instructions. Advanced SIMD arithmetic always uses the Round to Nearest setting, regardless of the value of the RMode bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Stride, bits [21:20]

It is IMPLEMENTATION DEFINED whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FZ16, bit [19]

When FEAT_FP16 is implemented:

Flush-to-zero mode control bit on half-precision data-processing instructions:

| FZ16 | Meaning |
|------|---|
| 0b0 | Flush-to-zero mode disabled. Behavior of the floating-point system is fully compliant with the IEEE 754 standard. |
| 0b1 | Flush-to-zero mode enabled. |

The value of this bit applies to both scalar and Advanced SIMD floating-point half-precision calculations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Len, bits [18:16]

It is IMPLEMENTATION DEFINED whether this field is RW or RAZ.

If this field is RW and is set to a value other than zero, some floating-point instruction encodings are UNDEFINED. The instruction pseudocode identifies these instructions.

Arm strongly recommends that software never sets this field to a value other than zero.

The value of this field is ignored when processing Advanced SIMD instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDE, bit [15]

Input Denormal floating-point exception trap enable.

| IDE | Meaning |
|-----|--|
| 0b0 | Untrapped exception handling selected. If the floating-point exception occurs, the IDC bit is set to 1. |
| 0b1 | Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IDC bit. |

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

IXE, bit [12]

Inexact floating-point exception trap enable.

| IXE | Meaning |
|-----|--|
| 0b0 | Untrapped exception handling selected. If the floating-point exception occurs, the IXC bit is set to 1. |
| 0b1 | Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IXC bit. |

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFE, bit [11]

Underflow floating-point exception trap enable.

| UFE | Meaning |
|-----|---|
| 0b0 | Untrapped exception handling selected. If the floating-point exception occurs, the UFC bit is set to 1. |
| 0b1 | Trapped exception handling selected. If the floating-point exception occurs and Flush-to-zero is not enabled, the PE does not update the UFC bit. |

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFE, bit [10]

Overflow floating-point exception trap enable.

| OFE | Meaning |
|-----|--|
| 0b0 | Untrapped exception handling selected. If the floating-point exception occurs, the OFC bit is set to 1. |
| 0b1 | Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the OFC bit. |

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZE, bit [9]

Divide by Zero floating-point exception trap enable.

| DZE | Meaning |
|-----|--|
| 0b0 | Untrapped exception handling selected. If the floating-point exception occurs, the DZC bit is set to 1. |
| 0b1 | Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the DZC bit. |

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOE, bit [8]

Invalid Operation floating-point exception trap enable.

| IOE | Meaning |
|-----|--|
| 0b0 | Untrapped exception handling selected. If the floating-point exception occurs, the IOC bit is set to 1. |
| 0b1 | Trapped exception handling selected. If the floating-point exception occurs, the PE does not update the IOC bit. |

This bit is RW only if the implementation supports the trapping of floating-point exceptions. In an implementation that does not support floating-point exception trapping, this bit is RAZ/WI.

When this bit is RW, it applies only to floating-point operations. Advanced SIMD operations always use untrapped floating-point exception handling in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IDC, bit [7]

Input Denormal cumulative floating-point exception bit. This bit is set to 1 to indicate that the Input Denormal floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IDE bit.

Advanced SIMD instructions set this bit if the Input Denormal floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IDE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IXC, bit [4]

Inexact cumulative floating-point exception bit. This bit is set to 1 to indicate that the Inexact floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IXE bit.

Advanced SIMD instructions set this bit if the Inexact floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IXE bit.

The criteria for the Inexact floating-point exception to occur are different in Flush-to-zero mode. For more information, see 'Flush-to-zero'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UFC, bit [3]

Underflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Underflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the UFE bit.

Advanced SIMD instructions set this bit if the Underflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, if FPSCR.UFE is 0 or if Flush-to-zero is enabled.

The criteria for the Underflow floating-point exception to occur are different in Flush-to-zero mode. For more information, see 'Flush-to-zero'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

OFC, bit [2]

Overflow cumulative floating-point exception bit. This bit is set to 1 to indicate that the Overflow floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the OFE bit.

Advanced SIMD instructions set this bit if the Overflow floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the OFE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DZC, bit [1]

Divide by Zero cumulative floating-point exception bit. This bit is set to 1 to indicate that the Divide by Zero floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the DZE bit.

Advanced SIMD instructions set this bit if the Divide by Zero floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the DZE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IOC, bit [0]

Invalid Operation cumulative floating-point exception bit. This bit is set to 1 to indicate that the Invalid Operation floating-point exception has occurred since 0 was last written to this bit.

How VFP instructions update this bit depends on the value of the IOE bit.

Advanced SIMD instructions set this bit if the Invalid Operation floating-point exception occurs in one or more of the floating-point calculations performed by the instruction, regardless of the value of the IOE bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing FPSCR

Accesses to this register use the following encodings in the System register encoding space:

```
VMRS{<c>}{<q>} <Rt>, <spec_reg>
```

| reg |
|--------|
| 0b0001 |

```

if PSTATE.EL == EL0 then

FPSID, Floating-Point System ID register

The FPSID characteristics are:

Purpose

Provides top-level information about the floating-point implementation.
This register largely duplicates information held in the [MIDR](#). Arm deprecates use of it.

Configuration

This register is present only when AArch32 is supported. Otherwise, direct accesses to FPSID are UNDEFINED.
Implemented only if the implementation includes the Advanced SIMD and floating-point functionality.

Attributes

FPSID is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Implementer | | | | | | | | SW | Subarchitecture | | | | | | | PartNum | | | | | | Variant | | | | Revision | | | | | |

Implementer, bits [31:24]

Implementer codes are the same as those used for the [MIDR](#).
For an implementation by Arm this field is 0x41, the ASCII code for A.
This field has an IMPLEMENTATION DEFINED value.
Access to this field is **RO**.

SW, bit [23]

Software bit. Defined values are:

| SW | Meaning |
|-----|---|
| 0b0 | The implementation provides a hardware implementation of the floating-point instructions. |
| 0b1 | The implementation supports only software emulation of the floating-point instructions. |

In Armv8-A, the only permitted value is 0b0.
Access to this field is **RO**.

Subarchitecture, bits [22:16]

Subarchitecture version number. For an implementation by Arm, defined values are:

| Subarchitecture | Meaning |
|-----------------|--|
| 0b0000000 | VFPv1 architecture with an IMPLEMENTATION DEFINED subarchitecture. |
| 0b0000001 | VFPv2 architecture with Common VFP subarchitecture v1. |
| 0b0000010 | VFPv3 architecture, or later, with Common VFP subarchitecture v2. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers. |
| 0b0000011 | VFPv3 architecture, or later, with Null subarchitecture. The entire floating-point implementation is in hardware, and no software support code is required. The VFP architecture version is indicated by the MVFR0 and MVFR1 registers. This value can be used only by an implementation that does not support the trap enable bits in the FPSCR . |
| 0b0000100 | VFPv3 architecture, or later, with Common VFP subarchitecture v3, and support for trap enable bits in FPSCR . The VFP architecture version is indicated by the MVFR0 and MVFR1 registers. |

For a subarchitecture designed by Arm the most significant bit of this field, register bit[22], is 0. Values with a most significant bit of 0 that are not listed here are reserved.

When the subarchitecture designer is not Arm, the most significant bit of this field, register bit[22], must be 1. Each implementer must maintain its own list of subarchitectures it has designed, starting at subarchitecture version number 0x40.

In Armv8-A, the permitted values are 0b0000011 and 0b0000100.

Access to this field is **RO**.

PartNum, bits [15:8]

Part Number for the floating-point implementation, assigned by the implementer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Variant, bits [7:4]

Variant number. Typically, this field distinguishes between different production variants of a single product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Revision, bits [3:0]

Revision number for the floating-point implementation.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is **RO**.

Accessing FPSID

Accesses to this register use the following encodings in the System register encoding space:

VMRS{<c>}{<q>} <Rt>, <spec_reg>

| reg |

HACR, Hyp Auxiliary Configuration Register

The HACR characteristics are:

Purpose

Controls trapping to Hyp mode of IMPLEMENTATION DEFINED aspects of Non-secure EL1 or EL0 operation.

Configuration

AArch32 System register HACR bits [31:0] are architecturally mapped to AArch64 System register [HACR_EL2\[31:0\]](#).

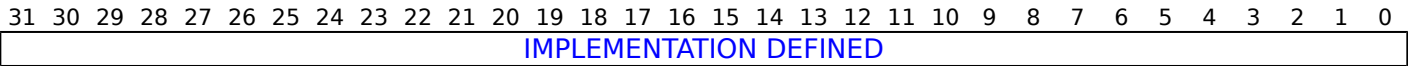

This register is present only when AArch32 is supported. Otherwise, direct accesses to HACR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HACR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HACR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

HACTLR2, Hyp Auxiliary Control Register 2

The HACTLR2 characteristics are:

Purpose

Provides additional space to the HACTLR register to hold IMPLEMENTATION DEFINED trap functionality.

Configuration

AArch32 System register HACTLR2 bits [31:0] are architecturally mapped to AArch64 System register [ACTLR_EL2\[63:32\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HACTLR2 are UNDEFINED.

In Armv8.0 and Armv8.1, it is IMPLEMENTATION DEFINED whether this register is implemented, or whether it causes UNDEFINED exceptions when accessed. The implementation of this register can be detected by examining [ID_MMFR4.AC2](#).

From Armv8.2 this register must be implemented.

Attributes

HACTLR2 is a 32-bit register.

Field descriptions

HAMAIRO, Hyp Auxiliary Memory Attribute Indirection Register 0

The HAMAIRO characteristics are:

Purpose

Provides IMPLEMENTATION DEFINED memory attributes for the memory attribute encodings defined by [HMAIRO](#). These IMPLEMENTATION DEFINED attributes can only provide additional qualifiers for the memory attribute encodings, and cannot change the memory attributes defined in [HMAIRO](#).

Configuration

AArch32 System register HAMAIRO bits [31:0] are architecturally mapped to AArch64 System register [AMAIR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HAMAIRO are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HAMAIRO is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

HCPTR, Hyp Architectural Feature Trap Register

The HCPTR characteristics are:

Purpose

Controls:

- Trapping to Hyp mode of Non-secure access, at EL1 or EL0, to trace, and to Advanced SIMD and floating-point functionality.
- Hyp mode access to trace, and to Advanced SIMD and floating-point functionality.

Note

Accesses to this functionality:

- From Non-secure modes other than Hyp mode are also affected by settings in the [CPACR](#) and [NSACR](#).
- From Hyp mode are also affected by settings in the [NSACR](#).

Exceptions generated by the [CPACR](#) and [NSACR](#) controls are higher priority than those generated by the HCPTR controls.

Configuration

AArch32 System register HCPTR bits [31:0] are architecturally mapped to AArch64 System register [CPTR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HCPTR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HCPTR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|------|----|----|----|----|----|-----|----|------|----|----|----|----------|----|------|----|-------|----|-------|----|------|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| TCPACTAM | | RES0 | | | | | | TTA | | RES0 | | | | TASERES0 | | RES1 | | TCP11 | | TCP10 | | RES1 | | | | | | | | | |

TCPAC, bit [31]

Traps Non-secure EL1 accesses to the [CPACR](#) to Hyp mode.

| TCPAC | Meaning |
|-------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 accesses to the CPACR are trapped to Hyp mode. |

Note

The [CPACR](#) is not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TAM, bit [30]

When FEAT_AMUv1 is implemented:

Trap Activity Monitor access. Traps Non-secure EL1 and EL0 accesses to all Activity Monitor registers to EL2.

| TAM | Meaning |
|-----|---|
| 0b0 | Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are not trapped. |
| 0b1 | Accesses from Non-secure EL1 and EL0 to Activity Monitor registers are trapped to Hyp mode. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [29:21]

Reserved, RES0.

TTA, bit [20]

Traps Non-secure System register accesses to all implemented trace registers to Hyp mode.

| TTA | Meaning |
|-----|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Any Non-secure System register access to an implemented trace register is trapped to Hyp mode, unless the access is trapped to EL1 by a CPACR or NSACR control, or the access is from Non-secure EL0 and the definition of the register in the appropriate trace architecture specification indicates that the register is not accessible from EL0. A trapped instruction generates: <ul style="list-style-type: none"> A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1. An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode. |

If the implementation does not include a PE trace unit, or does not include a System register interface to the PE trace unit registers, it is IMPLEMENTATION DEFINED whether this bit:

- Is RES0.
- Is RES1.
- Can be written from Hyp mode, and from Secure Monitor mode when [SCR](#).NS is 1.

If EL3 is implemented and is using AArch32, and the value of [NSACR](#).NSTRCDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

Note

- The ETMv4 architecture and ETE do not permit EL0 to access the trace registers. If the PE trace unit implements FEAT_ETMv4 or FEAT_ETE, EL0 accesses to the trace registers are UNDEFINED, and a resulting Undefined Instruction exception is higher priority than a HCPTR.TTA Hyp Trap exception.
- The Arm architecture does not provide traps on trace register accesses through the optional memory-mapped debug interface.

System register accesses to the trace registers can have side-effects. When a System register access is trapped, any side-effects that are normally associated with the access do not occur before the exception is taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Bits [19:16]

Reserved, RES0.

TASE, bit [15]

Traps Non-secure execution of Advanced SIMD instructions to Hyp mode when the value of HCPTR.TCP10 is 0.

| TASE | Meaning |
|------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | When the value of HCPTR.TCP10 is 0, any attempt to execute an Advanced SIMD instruction in Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates: <ul style="list-style-type: none"> A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1. An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode. |

When the value of HCPTR.TCP10 is 1, the value of this field is ignored.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1. Otherwise, it is IMPLEMENTATION DEFINED whether this field is implemented as a RW field. If it is not implemented as a RW field, then it is RAZ/WI.

If EL3 is implemented and is using AArch32, and the value of [NSACR](#).NSASEDIS is 1, in Non-secure state this field behaves as RAO/WI, regardless of its actual value. This applies even if the field is implemented as RAZ/WI.

For the list of instructions affected by this field, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Bit [14]

Reserved, RES0.

Bits [13:12]

Reserved, RES1.

TCP11, bit [11]

The value of this field is ignored. If this field is programmed with a different value to the TCP10 bit then this field is UNKNOWN on a direct read of the HCPTR.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of [NSACR](#).cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TCP10, bit [10]

Trap Non-secure accesses to Advanced SIMD and floating-point functionality to Hyp mode:

| TCP10 | Meaning |
|-------|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Any attempted access to Advanced SIMD and floating-point functionality from Non-secure state is trapped to Hyp mode, unless it is trapped to EL1 by a CPACR or NSACR control. A trapped instruction generates: <ul style="list-style-type: none"> • A Hyp Trap exception, if the exception is taken from Non-secure EL0 or EL1. • An Undefined Instruction exception taken to Hyp mode, if the exception is taken from Hyp mode. |

The Advanced SIMD and floating-point features controlled by these fields are:

- Execution of any floating-point or Advanced SIMD instruction.
- Any access to the Advanced SIMD and floating-point registers D0-D31 and their views as S0-S31 and Q0-Q15.
- Any access to the [FPSCR](#), [FPSID](#), [MVFR0](#), [MVFR1](#), [MVFR2](#), or [FPEXC](#) System registers.

If the implementation does not include Advanced SIMD and floating-point functionality, this field is RES1.

If EL3 is implemented and is using AArch32, and the value of [NSACR](#).cp10 is 0, in Non-secure state this field behaves as RAO/WI, regardless of its actual value.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Bits [9:0]

Reserved, RES1.

Accessing HCPTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

HCR, Hyp Configuration Register

The HCR characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various Non-secure operations are trapped to Hyp mode.

Configuration

AArch32 System register HCR bits [31:0] are architecturally mapped to AArch64 System register [HCR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|------|-----|------|-----|-----|------|-----|-----|-----|------|-------|------|------|------|------|------|------|------|-------|----|------|------|-----|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 |

Bit [31]

Reserved, RES0.

TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps Non-secure EL1 reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

The registers for which read accesses are trapped are as follows:

[SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIR0](#), [MAIR1](#), [AMAIRO](#), [AMAIR1](#), [CONTEXTIDR](#).

| TRVM | Meaning |
|------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 read accesses to the specified Virtual Memory controls are trapped to EL2. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

HCD, bit [29]

When EL3 is not implemented:

HVC instruction disable. Disables Non-secure EL1 and EL2 execution of HVC instructions, when EL2 is enabled in the current Security state.

| HCD | Meaning |
|-----|--|
| 0b0 | HVC instruction execution is enabled at EL2 and EL1. |
| 0b1 | HVC instructions are UNDEFINED at EL2 and Non-secure EL1. The Undefined Instruction exception is taken to the Exception level at which the HVC instruction is executed. |

Note

HVC instructions are always UNDEFINED at EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [28]

Reserved, RES0.

TGE, bit [27]

Trap General Exceptions, from Non-secure EL0.

| TGE | Meaning |
|-----|---|
| 0b0 | This control has no effect on execution at EL0. |
| 0b1 | When EL2 is not enabled in the current Security state, this control has no effect on execution at EL0. When EL2 is enabled in the current Security state, then: <ul style="list-style-type: none"> All exceptions that would be routed to EL1 are routed to EL2. The SCTLR.M bit is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR. The HCR.{FMO, IMO, AMO} bits are treated as being 1 for all purposes other than returning the result of a direct read of HCR. All virtual interrupts are disabled. Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled. An exception return to EL1 is treated as an illegal exception return. Monitor mode execution of an MSR or CPS instruction that changes PSTATE.M to a Non-secure EL1 mode is an illegal change to PSTATE.M. For more information see 'Illegal changes to PSTATE.M'. |

Also, when HCR.TGE is 1:

- If EL3 is using AArch32, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing [SCR.NS](#) from 0 to 1 results in [SCR.NS](#) remaining as 0.
- The [HDCR](#).{TDRA, TDOSA, TDA, TDE} bits are ignored and treated as being 1 other than for the purpose of a direct read of [HDCR](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TVM, bit [26]

Trap Virtual Memory controls. Traps Non-secure EL1 writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state.

The registers for which write accesses are trapped are as follows:

[SCTLR](#), [TTBR0](#), [TTBR1](#), [TTBCR](#), [TTBCR2](#), [DACR](#), [DFSR](#), [IFSR](#), [DFAR](#), [IFAR](#), [ADFSR](#), [AIFSR](#), [PRRR](#), [NMRR](#), [MAIRO](#), [MAIR1](#), [AMAIRO](#), [AMAIR1](#), [CONTEXTIDR](#).

| TVM | Meaning |
|------------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 write accesses to the specified virtual memory control registers are trapped to EL2. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TTLB, bit [25]

Trap TLB maintenance instructions. Traps Non-secure EL1 execution of a TLBI instruction to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

[TLBIALLIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAAIS](#), [TLBIMVALIS](#), [TLBIMVAALIS](#), [ITLBIALL](#), [ITLBIMVA](#), [ITLBIASID](#), [DTLBIALL](#), [DTLBIMVA](#), [DTLBIASID](#), [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [TLBIMVAA](#), [TLBIMVAL](#), [TLBIMVAAL](#)

| TTLB | Meaning |
|-------------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 accesses to the specified TLB maintenance instructions are trapped to EL2. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- [ICIMVAU](#), [ICIALLU](#), [ICIALLUIS](#), [DCCMVAU](#).

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

| TPU | Meaning |
|------------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2. |

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TPC, bit [23]

Trap data or unified cache maintenance instructions that operate to the Point of Coherency. Traps Non-secure EL1 execution of those cache maintenance instructions to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- [DCIMVAC](#), [DCCIMVAC](#), [DCCMVAC](#).

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

| TPC | Meaning |
|-----|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2. |

If the Point of Coherency is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean, invalidate, or clean and invalidate instruction that operates by VA to the point of coherency can be trapped when the value of this control is 1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps Non-secure EL1 execution of those cache maintenance instructions by set/way to EL2, when EL2 is enabled in the current Security state.

This applies to the following instructions:

- [DCISW](#), [DCCSW](#), [DCCISW](#).

Note

An Undefined Instruction exception generated at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

| TSW | Meaning |
|-----|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TAC, bit [21]

Trap Auxiliary Control Registers. Traps Non-secure EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, from both Execution states.

This applies to the following register accesses:

[ACTLR](#) and, if implemented, [ACTLR2](#).

| TAC | Meaning |
|-----|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 accesses to the specified registers are trapped to EL2. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps Non-secure EL1 accesses to the encodings for IMPLEMENTATION DEFINED System Registers to EL2, when EL2 is enabled in the current Security state.

MCR and MRC instructions accessing the following encodings:

- All coproc==p15, CRn==c9, Opcode1 = {0-7}, CRm == {c0-c2, c5-c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c10, Opcode1 =={0-7}, CRm == {c0, c1, c4, c8}, opcode2 == {0-7}.
- All coproc==p15, CRn==c11, Opcode1=={0-7}, CRm == {c0-c8, c15}, opcode2 == {0-7}.

When HCR.TIDCP is set to 1, it is IMPLEMENTATION DEFINED whether any of this functionality accessed from Non-secure EL0 is trapped to EL2. Otherwise, it is UNDEFINED and the PE takes an Undefined Instruction exception to Non-secure Undefined mode.

| TIDCP | Meaning |
|-------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 accesses to the specified System register encodings for IMPLEMENTATION DEFINED functionality are trapped to EL2. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TSC, bit [19]

Trap SMC instructions. Traps Non-secure EL1 execution of SMC instructions to Hyp mode.

| TSC | Meaning |
|-----|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Any attempt to execute an SMC instruction at Non-secure EL1 is trapped to Hyp mode, regardless of the value of SCR.SCD . |

The Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

Note

- This trap is only implemented if the implementation includes EL3.
- SMC instructions are always UNDEFINED at PL0.
- This bit traps execution of the SMC instruction. It is not a routing control for the SMC exception. Hyp Trap exceptions and SMC exceptions have different preferred return addresses.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TID3, bit [18]

Trap ID group 3. Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- VMRS access to [MVFR0](#), [MVFR1](#), and [MVFR2](#), reported using EC syndrome value 0x08, unless access is also trapped by [HCPTR](#) which takes priority.
- MRC access to the following registers are reported using EC syndrome value 0x03:
 - [ID_PFR0](#), [ID_PFR1](#), [ID_PFR2](#), [ID_DFR0](#), [ID_AFR0](#), [ID_MMFR0](#), [ID_MMFR1](#), [ID_MMFR2](#), [ID_MMFR3](#), [ID_ISAR0](#), [ID_ISAR1](#), [ID_ISAR2](#), [ID_ISAR3](#), [ID_ISAR4](#), and [ID_ISAR5](#).
 - If FEAT_FGT is implemented:
 - [ID_MMFR4](#) and [ID_MMFR5](#) are trapped to EL2.
 - [ID_ISAR6](#) is trapped to EL2.
 - [ID_DFR1](#) is trapped to EL2.

- This field traps all MRC accesses to registers in the following range that are not already mentioned in this field description: coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.
- If FEAT_FGT is not implemented:
 - [ID_MMFR4](#) and [ID_MMFR5](#) are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID_MMFR4](#) or [ID_MMFR5](#) are trapped.
 - [ID_ISAR6](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID_ISAR6](#) are trapped to EL2.
 - [ID_DFR1](#) is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to [ID_DFR1](#) are trapped to EL2.
 - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps MRC accesses to registers not already mentioned, with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

| TID3 | Meaning |
|------|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | The specified Non-secure EL1 read accesses to ID group 3 registers are trapped to EL2. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 and EL0 reads of the [CTR](#), [CCSIDR](#), [CCSIDR2](#), [CLIDR](#), and [CSSELR](#).
- Non-secure EL1 and EL0 writes to the [CSSELR](#).

| TID2 | Meaning |
|------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | The specified Non-secure EL1 and EL0 accesses to ID group 2 registers are trapped to EL2. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TID1, bit [16]

Trap ID group 1. Traps Non-secure EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state:

[TCMTR](#), [TLBTR](#), [REVIDR](#), [AIDR](#).

| TID1 | Meaning |
|------|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | The specified Non-secure EL1 read accesses to ID group 1 registers are trapped to EL2. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TID0, bit [15]

Trap ID group 0. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

- Non-secure EL1 reads of the [JIDR](#) and [FPSID](#).
- If the [JIDR](#) is RAZ from Non-secure EL0, Non-secure EL0 reads of the [JIDR](#).

Note

- It is IMPLEMENTATION DEFINED whether the [JIDR](#) is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0 then the Undefined Instruction exception takes precedence over this trap.
- The [FPSID](#) is not accessible at EL0.
- Writes to the [FPSID](#) are ignored, and not trapped by this control.

| TID0 | Meaning |
|------|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | The specified Non-secure EL1 read accesses to ID group 0 registers are trapped to EL2. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TWE, bit [14]

Traps Non-secure EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state.

| TWE | Meaning |
|-----|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Any attempt to execute a WFE instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE . |

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TWI, bit [13]

Traps Non-secure EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state.

| TWI | Meaning |
|-----|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Any attempt to execute a WFI instruction at Non-secure EL0 or EL1 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI . |

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

DC, bit [12]

Default Cacheability.

| DC | Meaning |
|-----|--|
| 0b0 | This control has no effect on the Non-secure EL1&0 translation regime. |
| 0b1 | In Non-secure state: <ul style="list-style-type: none"> The SCTLR.M field behaves as 0 for all purposes other than a direct read of the value of the field. The HCR.VM field behaves as 1 for all purposes other than a direct read of the value of the field. The memory type produced by the first stage of the EL1&0 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate. |

This field has no effect on the EL2 and EL3 translation regimes.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

BSU, bits [11:10]

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from Non-secure EL1 or Non-secure EL0:

| BSU | Meaning |
|------|------------------|
| 0b00 | No effect. |
| 0b01 | Inner Shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Full system. |

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

FB, bit [9]

Force broadcast. Causes the following instructions to be broadcast within the Inner Shareable domain when executed from Non-secure EL1:

[BPIALL](#), [TLBIALL](#), [TLBIMVA](#), [TLBIASID](#), [DTLBIALL](#), [DTLBIMVA](#), [DTLBIASID](#), [ITLBIALL](#), [ITLBIMVA](#), [ITLBIASID](#), [TLBIMVAA](#), [ICIALLU](#), [TLBIMVAL](#), [TLBIMVAAL](#).

| FB | Meaning |
|-----|---|
| 0b0 | This field has no effect on the operation of the specified instructions. |
| 0b1 | When one of the specified instruction is executed at Non-secure EL1, the instruction is broadcast within the Inner Shareable shareability domain. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

VA, bit [8]

Virtual SError interrupt exception.

| VA | Meaning |
|-----|--|
| 0b0 | This mechanism is not making a virtual SError interrupt pending. |
| 0b1 | A virtual SError interrupt is pending because of this mechanism. |

The virtual SError interrupt is enabled only when the value of HCR.{TGE, AMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

VI, bit [7]

Virtual IRQ exception.

| VI | Meaning |
|-----|---|
| 0b0 | This mechanism is not making a virtual IRQ pending. |
| 0b1 | A virtual IRQ is pending because of this mechanism. |

The virtual IRQ is enabled only when the value of HCR.{TGE, IMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

VF, bit [6]

Virtual FIQ exception.

| VF | Meaning |
|-----|---|
| 0b0 | This mechanism is not making a virtual FIQ pending. |
| 0b1 | A virtual FIQ is pending because of this mechanism. |

The virtual FIQ is enabled only when the value of HCR.{TGE, FMO} is {0, 1}.

The Guest OS cannot distinguish the virtual exception from the corresponding physical exception.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

AMO, bit [5]

SError interrupt Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.A, and enables virtual exception signaling by the VA bit.

If the value of HCR.TGE is 0, then virtual SError interrupts are enabled in Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.AMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

IMO, bit [4]

IRQ Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.I, and enables virtual exception signaling by the VI bit.

If the value of HCR.TGE is 0, then Virtual IRQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.IMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

FMO, bit [3]

FIQ Mask Override. When this bit is set to 1, it overrides the effect of PSTATE.F, and enables virtual exception signaling by the VF bit.

If the value of HCR.TGE is 0, then Virtual FIQ interrupts are enabled in the Non-secure state.

If the value of HCR.TGE is 1, then in Non-secure state the HCR.FMO bit behaves as 1 for all purposes other than a direct read of the value of the bit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

PTW, bit [2]

Protected Table Walk. In the Non-secure PL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs then the value of this bit determines the behavior:

| PTW | Meaning |
|-----|--|
| 0b0 | The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively. |
| 0b1 | The memory access generates a stage 2 Permission fault. |

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

SWIO, bit [1]

Set/Way Invalidation Override. Causes Non-secure EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way.

| SWIO | Meaning |
|------|---|
| 0b0 | This control has no effect on the operation of data cache invalidate by set/way instructions. |
| 0b1 | Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way. |

When this bit is set to 1, [DCISW](#) performs the same invalidation as a [DCCISW](#) instruction.

As a result of changes to the behavior of [DCISW](#), this bit is redundant in Armv8. This bit can be implemented as RES1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the Non-secure EL1&0 translation regime.

| VM | Meaning |
|-----|--|
| 0b0 | Non-secure EL1&0 stage 2 address translation disabled. |
| 0b1 | Non-secure EL1&0 stage 2 address translation enabled. |

If the HCR.DC bit is set to 1, then the behavior of the PE when executing in a Non-secure mode other than Hyp mode is consistent with HCR.VM being 1, regardless of the actual value of HCR.VM, other than the value returned by an explicit read of HCR.VM.

When the value of this bit is 1, data cache invalidate instructions executed at Non-secure EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR.SWIO bit.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Accessing HCR

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b0001 | 0b0001 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HCR;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HCR;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b0001 | 0b0001 | 0b000 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HCR = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HCR = R[t];
```

HCR2, Hyp Configuration Register 2

The HCR2 characteristics are:

Purpose

Provides additional configuration controls for virtualization.

Configuration

AArch32 System register HCR2 bits [31:0] are architecturally mapped to AArch64 System register [HCR_EL2\[63:32\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HCR2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HCR2 is a 32-bit register.

Field descriptions

Bits [31:23]

Reserved, RES0.

TTLBIS, bit [22]

When FEAT_EVT is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of the following TLB maintenance instructions at EL1 to EL2:

[TLBIALIS](#), [TLBIMVAIS](#), [TLBIASIDIS](#), [TLBIMVAAIS](#), [TLBIMVALIS](#), [TLBIMVAALIS](#)

| TTLBIS | Meaning |
|--------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 execution of the specified TLB maintenance instructions is trapped to EL2. |

When FEAT_VHE and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

Bit [21]

Reserved, RES0.

TOCU, bit [20]**When FEAT_EVT is implemented:**

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions at EL1 or EL0 using AArch64, and at EL1 using AArch32, to EL2.

This applies to the following instructions:

- When Non-secure EL0 is using AArch64, [IC IVAU](#), [DC CVAU](#). However, if the value of [SCTLR_EL1](#).UCI is 0 these instructions are UNDEFINED at EL0 and any resulting exception is higher priority than this trap to EL2.
- When EL1 is using AArch64, [IC IVAU](#), [IC IALLU](#), [DC CVAU](#).
- When Non-secure EL1 is using AArch32, [ICIMVAU](#), [ICIALLU](#), [DCCMVAU](#).

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- [IC IALLUIS](#) and [IC IALLU](#) are always UNDEFINED at EL0 using AArch64.
- [ICIMVAU](#), [ICIALLU](#), [ICIALLUIS](#), and [DCCMVAU](#) are always UNDEFINED at EL0 using AArch32.

| TOCU | Meaning |
|------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure execution of the specified cache maintenance instructions is trapped to EL2. |

If the Point of Unification is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of any data or unified cache clean by VA to the Point of Unification instruction can be trapped when the value of this control is 1.

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE is implemented, and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

Bit [19]

Reserved, RES0.

TICAB, bit [18]**When FEAT_EVT is implemented:**

Trap ICIALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2.

This applies to the following instructions:

[ICIALLUIS](#).

| TICAB | Meaning |
|-------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 execution of the specified cache maintenance instructions is trapped to EL2. |

If the Point of Unification is before any level of instruction cache, it is IMPLEMENTATION DEFINED whether the execution of any instruction cache invalidate to the Point of Unification instruction can be trapped when the value of this control is 1.

When FEAT_VHE and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

TID4, bit [17]

When FEAT_EVT is implemented:

Trap ID group 4. Traps the following register accesses to EL2:

- EL1 reads of [CCSIDR](#), [CCSIDR2](#), [CLIDR](#), and [CSSELR](#).
- EL1 writes to [CSSELR](#).

| TID4 | Meaning |
|------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | The specified Non-secure EL1 and EL0 accesses to ID group 4 registers are trapped to EL2. |

When FEAT_VHE is implemented and the value of [HCR_EL2](#).{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

Otherwise:

Reserved, RES0.

Bits [16:7]

Reserved, RES0.

MIOCNCNCE, bit [6]

Mismatched Inner/Outer Cacheable Non-Coherency Enable, for the Non-secure PL1&0 translation regime.

| MIOCNCNCE | Meaning |
|-----------|--|
| 0b0 | For the Non-secure PL1&0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there must be no loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute. |
| 0b1 | For the Non-secure PL1&0 translation regime, for permitted accesses to a memory location that use a common definition of the Shareability and Cacheability of the location, there might be a loss of coherency if the Inner Cacheability attribute for those accesses differs from the Outer Cacheability attribute. |

For more information, see 'Mismatched memory attributes'.

This field can be implemented as RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

TEA, bit [5]

When FEAT_RAS is implemented:

Route synchronous External abort exceptions from EL0 and EL1 to EL2.

| TEA | Meaning |
|-----|---|
| 0b0 | Does not route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2. |
| 0b1 | Route synchronous External abort exceptions from Non-secure EL0 and EL1 to EL2, if not routed to EL3. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

TERR, bit [4]

When FEAT_RAS is implemented:

Trap Error record accesses from EL1 to EL2. Trap accesses to the following registers from EL1 to EL2:

[ERRIDR](#), [ERRSELR](#), [ERXADDR](#), [ERXADDR2](#), [ERXCTLR](#), [ERXCTLR2](#), [ERXFR](#), [ERXFR2](#), [ERXMISC0](#), [ERXMISC1](#), [ERXMISC2](#), [ERXMISC3](#), and [ERXSTATUS](#).

When FEAT_RASv1p1 is implemented, [ERXMISC4](#), [ERXMISC5](#), [ERXMISC6](#), and [ERXMISC7](#).

| TERR | Meaning |
|------|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Accesses to the specified registers from EL1 generate a Trap exception to EL2. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [3:2]

Reserved, RES0.

ID, bit [1]

Stage 2 Instruction access cacheability disable. For the Non-secure PL1&0 translation regime, when [HCR.VM](#)==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

| ID | Meaning |
|-----|---|
| 0b0 | This control has no effect on stage 2 of the Non-secure PL1&0 translation regime. |
| 0b1 | For the Non-secure PL1&0 translation regime, forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable. |

This bit has no effect on the EL2 translation regime.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

CD, bit [0]

Stage 2 Data access cacheability disable. When [HCR.VM](#)==1, this forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable for the Non-secure PL1&0 translation regime.

| CD | Meaning |
|-----|--|
| 0b0 | This control has no effect on stage 2 of the Non-secure PL1&0 translation regime for data accesses and translation table walks. |
| 0b1 | For the Non-secure PL1&0 translation regime, forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable. |

This bit has no effect on the EL2 translation regime.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Accessing HCR2

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b0001 | 0b0001 | 0b100 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HCR2;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HCR2;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b0001 | 0b0001 | 0b100 |

```
if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HCR2 = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HCR2 = R[t];
```

HDCR, Hyp Debug Control Register

The HDCR characteristics are:

Purpose

Controls the trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to functions provided by the debug and trace architectures and the Performance Monitors Extension.

Configuration

AArch32 System register HDCR bits [31:0] are architecturally mapped to AArch64 System register [MDCR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HDCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3, and other than for a direct read of the register, the PE behaves as if `HDCR.HPMN == PMCR.N`.

Attributes

HDCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|--------|-------|------|-----|------|------|------|------|------|------|------|------|------|------|------|-------|-----|-------|----|----|----|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 |
| RES0 | HPMFZO | MTPME | TDCC | HLP | RES0 | HCCD | RES0 | TTRF | RES0 | HPMD | RES0 | TDRA | DOSA | TDAT | DEHP | MPMET | TPM | TPMCR | | | | | | | | | |

Bits [31:30]

Reserved, RES0.

HPMFZO, bit [29]

When `FEAT_PMUv3p7` is implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

| HPMFZO | Meaning |
|--------|---|
| 0b0 | Do not freeze on overflow. |
| 0b1 | Event counters do not count when PMOVSr[(PMCR.N-1):HDCR.HPMN] is nonzero. |

If `HDCR.HPMN` is less than [PMCR.N](#), this field affects the operation of event counters in the range [`HDCR.HPMN` .. ([PMCR.N](#)-1)].

This field does not affect the operation of other event counters and [PMCCNTR](#).

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTPME, bit [28]**When FEAT_MTPMU is implemented and EL3 is not implemented:**

Multi-threaded PMU Enable. Enables use of the [PMEVTYPER<n>](#).MT bits.

| MTPME | Meaning |
|-------|--|
| 0b0 | FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n> .MT is zero. |
| 0b1 | PMEVTYPER<n> .MT bits not affected by this bit. |

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this bit is 0b0.

The reset behavior of this field is:

- On a Cold reset, in a system where the PE resets into EL2 or EL3, this field resets to 1.

Otherwise:

Reserved, RES0.

TDCC, bit [27]**When FEAT_FGT is implemented:**

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

| TDCC | Meaning |
|------|---|
| 0b0 | This control does not cause any register accesses to be trapped. |
| 0b1 | If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Hyp Trap exception, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state. |

The DCC registers trapped by this control are:

- [DBGDTRRXext](#), [DBGDTRTXext](#), [DBGDSCRint](#), [DBGDCCINT](#), and, when the PE is in Non-debug state, [DBGDTRRXint](#) and [DBGDTRTXint](#).

The traps are reported with EC syndrome value:

- 0x05 for trapped MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped LDC to [DBGDTRTXint](#) and STC from [DBGDTRRXint](#).

When the PE is in Debug state, HDCR.TDCC does not trap any accesses to:

- [DBGDTRRXint](#) and [DBGDTRTXint](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

HLP, bit [26]**When FEAT_PMUv3p5 is implemented:**

Hypervisor Long event counter enable. Determines when unsigned overflow is recorded by an event counter overflow bit.

| HLP | Meaning |
|-----|--|
| 0b0 | Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n> [31:0]. |
| 0b1 | Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n> [63:0]. |

If the highest implemented Exception level is using AArch32, it is IMPLEMENTATION DEFINED whether this bit is read/write or RAZ/WI.

If HDCR.HPMN is less than PMCR.N, this bit affects the operation of event counters in the range [HDCR.HPMN..[\(PMCR.N-1\)](#)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

Note

[PMEVCNTR<n>](#)[63:32] cannot be accessed directly in AArch32 state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [25:24]

Reserved, RES0.

HCCD, bit [23]

When FEAT_PMUv3p5 is implemented:

Hypervisor Cycle Counter Disable. Prohibits [PMCCNTR](#) from counting at EL2.

| HCCD | Meaning |
|------|--|
| 0b0 | Cycle counting by PMCCNTR is not affected by this mechanism. |
| 0b1 | Cycle counting by PMCCNTR is prohibited at EL2. |

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

TTRF, bit [19]

When FEAT_TRF is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2.

| TTRF | Meaning |
|------|--|
| 0b0 | Accesses to TRFCR at EL1 are not affected by this control bit. |
| 0b1 | Accesses to TRFCR at EL1 generate a Hyp Trap exception. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]

When **FEAT_PMUv3p1** is implemented and **FEAT_Debugv8p2** is implemented:

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

| HPMD | Meaning |
|------|--|
| 0b0 | Event counting and PMCCNTR are not affected by this mechanism. |
| 0b1 | Event counting by some event counters is prohibited in Hyp mode. If PMCR.DP is 1, PMCCNTR is disabled in Hyp mode. Otherwise, PMCCNTR is not affected by this mechanism. |

If HDCR.HPMN is not 0, this field affects the operation of event counters in the range [0 .. (HDCR.HPMN-1)].

This field does not affect the operation of other event counters.

If [PMCR.DP](#) is 1, this field affects [PMCCNTR](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

When **FEAT_PMUv3p1** is implemented:

Guest Performance Monitors Disable. Controls event counting by some event counters at EL2.

| HPMD | Meaning |
|------|--|
| 0b0 | Event counting and PMCCNTR are not affected by this mechanism. |
| 0b1 | If <code>ExternalSecureNoninvasiveDebugEnabled()</code> is FALSE, event counting by some event counters is prohibited in Hyp mode, and if PMCR.DP is 1, PMCCNTR is disabled in Hyp mode. |

If `ExternalSecureNoninvasiveDebugEnabled()` is TRUE, this field does not affect the event counters and does not affect [PMCCNTR](#).

Otherwise:

- If HDCR.HPMN is not 0, this field affects the operation of event counters in the range [0 .. (HDCR.HPMN-1)].
- This field does not affect the operation of other event counters.
- If [PMCR.DP](#) is 1, this field affects [PMCCNTR](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

Bits [16:12]

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps Non-secure EL0 and EL1 System register accesses to the Debug ROM registers to Hyp mode.

| TDRA | Meaning |
|------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL0 and EL1 System register accesses to the DBGDRAR or DBGDSAR are trapped to Hyp mode, unless it is trapped by DBGDSCRext.UDCCdis . |

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDOSA, bit [10]

When **FEAT_DoubleLock** is implemented:

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

| TDOSA | Meaning |
|-------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode. |

The registers for which accesses are trapped are as follows:

- [DBGOSLSR](#), [DBGOSLAR](#), [DBGOSDLR](#), and [DBGPRCR](#).
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

Note

These registers are not accessible at EL0.

If [HCR.TGE](#) or [HDCR.TDE](#) is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Trap debug OS-related register access. Traps Non-secure EL1 System register accesses to the powerdown debug registers to Hyp mode.

| TDOSA | Meaning |
|-------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL1 System register accesses to the powerdown debug registers are trapped to Hyp mode. |

The registers for which accesses are trapped are as follows:

- [DBGOSLSR](#), [DBGOSLAR](#), and [DBGPRCR](#).
- Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to [DBGOSDLR](#) are trapped.

Note

These registers are not accessible at EL0.

If [HCR](#).TGE or [HDCR](#).TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDA, bit [9]

Trap debug access. Traps Non-secure EL0 and EL1 System register accesses to those debug System registers in the (coproc==0b1110) encoding space that are not trapped by either of the following:

- [HDCR](#).TDRA.
- [HDCR](#).TDOSA.

| TDA | Meaning |
|-----|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL0 or EL1 System register accesses to the debug registers, other than the registers trapped by HDCR .TDRA and HDCR .TDOSA, are trapped to Hyp mode, unless it is trapped by DBGDSCRext .UDCCdis. |

Traps of AArch32 accesses to [DBGDTRRXint](#) and [DBGDTRTXint](#) are ignored in Debug state.

If [HCR](#).TGE or [HDCR](#).TDE is 1, behavior is as if this bit is 1 other than for the purpose of a direct read.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

TDE, bit [8]

Trap Debug exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D.

| TDE | Meaning |
|-----|--|
| 0b0 | The debug target Exception level is EL1. |
| 0b1 | If EL2 is enabled for the current Effective value of SCR .NS, the debug target Exception level is EL2, otherwise the debug target Exception level is EL1. The HDCR .{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register. |

For more information, see 'Routing debug exceptions'.

When [HCR](#).TGE == 1, the PE behaves as if the value of this field is 1 for all purposes other than returning the value of a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

HPME, bit [7]

When FEAT_PMuV3 is implemented:

[[HDCR](#).HPMN..(N-1)] event counters enable.

| HPME | Meaning |
|------|---|
| 0b0 | Event counters in the range [HDCR.HPMN.. PMCR.N-1] are disabled. |
| 0b1 | Event counters in the range [HDCR.HPMN.. PMCR.N-1] are enabled by PMCNTENSET . |

If HDCR.HPMN is less than [PMCR.N](#), this field affects the operation of event counters in the range [HDCR.HPMN..[PMCR.N-1](#)].

This field does not affect the operation of other event counters.

The operation of this field applies even when EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPM, bit [6]

When FEAT_PMUv3 is implemented:

Trap Performance Monitors accesses. Traps Non-secure EL0 and EL1 accesses to all Performance Monitors registers to Hyp mode.

| TPM | Meaning |
|-----|--|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL0 and EL1 accesses to all Performance Monitors registers are trapped to Hyp mode. |

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

TPMCR, bit [5]

When FEAT_PMUv3 is implemented:

Trap [PMCR](#) accesses. Traps Non-secure EL0 and EL1 accesses to the [PMCR](#) to Hyp mode.

| TPMCR | Meaning |
|-------|---|
| 0b0 | This control does not cause any instructions to be trapped. |
| 0b1 | Non-secure EL0 and EL1 accesses to the PMCR are trapped to Hyp mode, unless it is trapped by PMUSERENR.EN . |

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Otherwise:

Reserved, RES0.

HPMN, bits [4:0]**When FEAT_PMUv3 is implemented:**

Defines the number of event counters that are accessible from Non-secure EL1 modes, and from Non-secure EL0 modes if unprivileged access is enabled.

If HPMN is not 0 and is less than [PMCR.N](#), HPMN divides the event counters into a first range [0..(HPMN-1)], and a second range [HPMN..([PMCR.N](#)-1)].

If FEAT_HPMN0 is implemented and this field is 0, all event counters are in the second range and none are in the first range.

If HPMN is equal to [PMCR.N](#), all event counters are in the first range, and none are in the second range.

For an event counter <n> in the first range:

- The counter is accessible from EL1, EL2, EL3.
- The counter is accessible from EL0 if permitted by [PMUSERENR](#).
- If FEAT_PMUv3p5 is implemented, [PMCR.LP](#) determines whether the counter overflows at [PMEVCNTR<n>\[31:0\]](#) or [PMEVCNTR<n>\[63:0\]](#).
- [PMCR.E](#) and [PMCNTENSET\[n\]](#) enable the operation of event counter n.

For an event counter <n> in the second range:

- The counter is accessible from EL2 and EL3.
- If EL2 is disabled in the current Security state, the event counter is also accessible from EL1, and from EL0 if permitted by [PMUSERENR](#).
- If FEAT_PMUv3p5 is implemented, [HDCR.HLP](#) determines whether the counter overflows at [PMEVCNTR<n>\[31:0\]](#) or [PMEVCNTR<n>\[63:0\]](#).
- [HDCR.HPME](#) and [PMCNTENSET\[n\]](#) enable the operation of event counter n.

If HPMN is larger than [PMCR.N](#), or if FEAT_HPMN0 is not implemented and HPMN is 0, the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of [HDCR.HPMN](#) is UNKNOWN.
- Either:
 - An UNKNOWN number of counters are reserved for EL2 use. That is, the PE behaves as if [HDCR.HPMN](#) is set to an UNKNOWN non-zero value less than or equal to [PMCR.N](#).
 - All counters are reserved for EL2 use, meaning no counters are accessible from Non-secure EL1 and Non-secure EL0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to the value in [PMCR.N](#).

Otherwise:

Reserved, RES0.

Accessing HDCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

HDFAR, Hyp Data Fault Address Register

The HDFAR characteristics are:

Purpose

Holds the virtual address of the faulting address that caused a synchronous Data Abort exception that is taken to Hyp mode.

Configuration

AArch32 System register HDFAR bits [31:0] are architecturally mapped to AArch64 System register [FAR_EL2\[31:0\]](#).

AArch32 System register HDFAR bits [31:0] are architecturally mapped to AArch32 System register [DFAR\[31:0\]](#) (S) when EL2 is implemented, EL3 is implemented and the implementation only supports execution in AArch32 state.

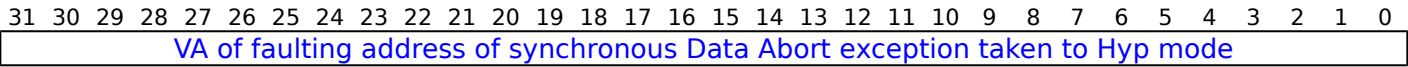

This register is present only when AArch32 is supported. Otherwise, direct accesses to HDFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HDFAR is a 32-bit register.

Field descriptions

Bits [31:0]

VA of faulting address of synchronous Data Abort exception taken to Hyp mode.

On a Prefetch Abort exception, this register is UNKNOWN.

Any execution in a Non-secure EL1 or Non-secure EL0 mode makes this register UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HDFAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b0110 | 0b0000 | 0b000 |

```

HMAIR0, Hyp Memory Attribute Indirection Register 0

The HMAIR0 characteristics are:

Purpose

Along with [HMAIR1](#), provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:

- When AttrIndx[2] is 0, HMAIR0 is used.
- When AttrIndx[2] is 1, [HMAIR1](#) is used.

Configuration

AArch32 System register HMAIR0 bits [31:0] are architecturally mapped to AArch64 System register [MAIR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HMAIR0 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HMAIR0 is a 32-bit register.

Field descriptions

When TTBCR.EAE == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----------------------|----|----|----|----|----|----|----|-----------------------|----|----|----|----|----|----|----|-----------------------|----|----|----|----|----|---|---|-----------------------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Attr3 | | | | | | | | Attr2 | | | | | | | | Attr1 | | | | | | | | Attr0 | | | | | | | |

Attr<n>, bits [8n+7:8n], for n = 3 to 0

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

| Attr<n>[7:4] | Meaning |
|---------------------|--|
| 0b0000 | Device memory. See encoding of Attr<n>[3:0] for the type of Device memory. |
| 0b00RW, RW not 0b00 | Normal memory, Outer Write-Through Transient. |
| 0b0100 | Normal memory, Outer Non-cacheable. |
| 0b01RW, RW not 0b00 | Normal memory, Outer Write-Back Transient. |
| 0b10RW | Normal memory, Outer Write-Through Non-transient. |
| 0b11RW | Normal memory, Outer Write-Back Non-transient. |

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

| Attr<n>[3:0] | Meaning when Attr<n>[7:4] is 0b0000 | Meaning when Attr<n>[7:4] is not 0b0000 |
|------------------------|---|--|
| 0b0000 | Device-nGnRnE memory | UNPREDICTABLE |
| 0b00RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Through Transient |
| 0b0100 | Device-nGnRE memory | Normal memory, Inner Non-cacheable |
| 0b01RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Back Transient |
| 0b1000 | Device-nGRE memory | Normal memory, Inner Write-Through Non-transient (RW=0b00) |
| 0b10RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Through Non-transient |
| 0b1100 | Device-GRE memory | Normal memory, Inner Write-Back Non-transient (RW=0b00) |
| 0b11RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Back Non-transient |

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

| R or W | Meaning |
|--------|-------------|
| 0b0 | No Allocate |
| 0b1 | Allocate |

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HMAIR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

HMAIR1, Hyp Memory Attribute Indirection Register 1

The HMAIR1 characteristics are:

Purpose

Along with [HMAIR0](#), provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations for memory accesses from Hyp mode.

AttrIndx[2] indicates the HMAIR register to be used:

- When AttrIndx[2] is 0, [HMAIR0](#) is used.
- When AttrIndx[2] is 1, HMAIR1 is used.

Configuration

AArch32 System register HMAIR1 bits [31:0] are architecturally mapped to AArch64 System register [MAIR_EL2\[63:32\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HMAIR1 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HMAIR1 is a 32-bit register.

Field descriptions

When TTBCR.EAE == 1:

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|-------|----|----|----|----|----|---|---|-------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Attr7 | | | | | | | | Attr6 | | | | | | | | Attr5 | | | | | | | | Attr4 | | | | | | | |

Attr<n>, bits [8(n-4)+7:8(n-4)], for n = 7 to 4

The memory attribute encoding for an AttrIndx[2:0] entry in a Long descriptor format translation table entry, where:

- AttrIndx[2:0] gives the value of <n> in Attr<n>.
- AttrIndx[2] defines which MAIR to access. Attr7 to Attr4 are in MAIR1, and Attr3 to Attr0 are in MAIR0.

Bits [7:4] are encoded as follows:

| Attr<n>[7:4] | Meaning |
|---------------------|--|
| 0b0000 | Device memory. See encoding of Attr<n>[3:0] for the type of Device memory. |
| 0b00RW, RW not 0b00 | Normal memory, Outer Write-Through Transient. |
| 0b0100 | Normal memory, Outer Non-cacheable. |
| 0b01RW, RW not 0b00 | Normal memory, Outer Write-Back Transient. |
| 0b10RW | Normal memory, Outer Write-Through Non-transient. |
| 0b11RW | Normal memory, Outer Write-Back Non-transient. |

R = Outer Read-Allocate policy, W = Outer Write-Allocate policy.

The meaning of bits [3:0] depends on the value of bits [7:4]:

| Attr<n>[3:0] | Meaning when Attr<n>[7:4] is 0b0000 | Meaning when Attr<n>[7:4] is not 0b0000 |
|------------------------|---|--|
| 0b0000 | Device-nGnRnE memory | UNPREDICTABLE |
| 0b00RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Through Transient |
| 0b0100 | Device-nGnRE memory | Normal memory, Inner Non-cacheable |
| 0b01RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Back Transient |
| 0b1000 | Device-nGRE memory | Normal memory, Inner Write-Through Non-transient (RW=0b00) |
| 0b10RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Through Non-transient |
| 0b1100 | Device-GRE memory | Normal memory, Inner Write-Back Non-transient (RW=0b00) |
| 0b11RW, RW not 0b00 | UNPREDICTABLE | Normal memory, Inner Write-Back Non-transient |

R = Inner Read-Allocate policy, W = Inner Write-Allocate policy.

The R and W bits in some Attr<n> fields have the following meanings:

| R or W | Meaning |
|--------|-------------|
| 0b0 | No Allocate |
| 0b1 | Allocate |

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HMAIR1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b1010 | 0b0010 | 0b001 |

```

if PSTATE.EL == EL0 then

HPFAR, Hyp IPA Fault Address Register

The HPFAR characteristics are:

Purpose

Holds the faulting IPA for some aborts on a stage 2 translation taken to Hyp mode.

Configuration

AArch32 System register HPFAR bits [31:0] are architecturally mapped to AArch64 System register [HPFAR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HPFAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HPFAR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| <div><div>FIPA[39:12]</div><div>RES0</div></div> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Execution in any Non-secure mode other than Hyp mode makes this register UNKNOWN.

FIPA[39:12], bits [31:4]

Bits [39:12] of the faulting intermediate physical address.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:0]

Reserved, RES0.

Accessing HPFAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

HRMR, Hyp Reset Management Register

The HRMR characteristics are:

Purpose

If EL2 is the highest implemented Exception level and this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch32 System register HRMR bits [31:0] are architecturally mapped to AArch64 System register [RMR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HRMR are UNDEFINED.

Only implemented if EL2 is the highest implemented Exception level. In this case:

- If EL2 can use AArch32 and AArch64 then this register must be implemented.
- If EL2 cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Attributes

HRMR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|------|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | RR | | | | | | | | | | | | AA64 | | | |

Bits [31:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

AA64, bit [0]

When EL2 can use AArch64, determines which Execution state the PE boots into after a Warm reset:

| AA64 | Meaning |
|------|----------|
| 0b0 | AArch32. |
| 0b1 | AArch64. |

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL2 cannot use AArch64 this bit is RAZ/WI.

When implemented as a RW field, this field resets to 0 on a Cold reset.

Accessing HRMR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b1100 | 0b0000 | 0b010 |

```

if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T12 ==
'1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
elsif PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && ELUsingAArch32(EL2) && HSTR.T12 ==
'1' then
    AArch32.TakeHypTrapException(0x03);
elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    return HRMR;
else
    UNDEFINED;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b1100 | 0b0000 | 0b010 |

```

if PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && !ELUsingAArch32(EL2) && HSTR_EL2.T12 ==
'1' then
    AArch64.AArch32SystemAccessTrap(EL2, 0x03);
elsif PSTATE.EL == EL1 && EL2Enabled() && IsHighestEL(EL2) && ELUsingAArch32(EL2) && HSTR.T12 ==
'1' then
    AArch32.TakeHypTrapException(0x03);
elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    HRMR = R[t];
else
    UNDEFINED;

```

HSCTLR, Hyp System Control Register

The HSCTLR characteristics are:

Purpose

Provides top level control of the system operation in Hyp mode.

Configuration

AArch32 System register HSCTLR bits [31:0] are architecturally mapped to AArch64 System register [SCTLR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HSCTLR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HSCTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|------|------|----|------|------|------|-----|------|------|------|------|----|------|------|-----|-----|------|------|-----|--------|---|----|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 |
| DSSBS | TE | RES1 | RES0 | EE | RES0 | RES1 | RES0 | WXN | RES1 | RES0 | RES1 | RES0 | I | RES1 | RES0 | SED | ITD | RES0 | CP15 | BEN | LSMAOE | h | TL | S | | | | |

DSSBS, bit [31]

When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

| DSSBS | Meaning |
|-------|--|
| 0b0 | PSTATE.SSBS is set to 0 on an exception to Hyp mode. |
| 0b1 | PSTATE.SSBS is set to 1 on an exception to Hyp mode. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to EL2 are taken to A32 or T32 state:

| TE | Meaning |
|-----|--|
| 0b0 | Exceptions, including reset, taken to A32 state. |
| 0b1 | Exceptions, including reset, taken to T32 state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [29:28]

Reserved, RES1.

Bits [27:26]

Reserved, RES0.

EE, bit [25]

The value of the PSTATE.E bit on entry to Hyp mode, the endianness of stage 1 translation table walks in the EL2 translation regime, and the endianness of stage 2 translation table walks in the PL1&0 translation regime.

| EE | Meaning |
|-----|---|
| 0b0 | Little-endian. PSTATE.E is cleared to 0 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&0 translation regime are little-endian. |
| 0b1 | Big-endian. PSTATE.E is set to 1 on entry to Hyp mode. Stage 1 translation table walks in the EL2 translation regime, and stage 2 translation table walks in the PL1&0 translation regime are big-endian. |

If an implementation does not provide Big-endian support at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support at Exception levels higher than EL0, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

Bits [23:22]

Reserved, RES1.

Bits [21:20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 translation regime, this bit can force all memory regions that are writable to be treated as XN.

| WXN | Meaning |
|-----|--|
| 0b0 | This control has no effect on memory access permissions. |
| 0b1 | Any region that is writable in the EL2 translation regime is forced to XN for accesses from software executing at EL2. |

This bit applies only when HSCTLR.M bit is set.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:13]

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2:

| I | Meaning |
|-----|--|
| 0b0 | All instruction access to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. If the value of HSTCLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory. |
| 0b1 | All instruction access to Normal memory from EL2 can be cached at all levels of instruction and unified cache. If the value of HSTCLR.M is 0, instruction accesses from stage 1 of the EL2 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory. |

This bit has no effect on the PL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Bit [11]

Reserved, RES1.

Bits [10:9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at EL2.

| SED | Meaning |
|-----|---|
| 0b0 | SETEND instruction execution is enabled at EL2. |
| 0b1 | SETEND instructions are UNDEFINED at EL2. |

If the implementation does not support mixed-endian operation at EL2, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at EL2.

| ITD | Meaning |
|-----|--|
| 0b0 | All IT instruction functionality is enabled at EL2. |
| 0b1 | Any attempt at EL2 to execute any of the following is UNDEFINED: <ul style="list-style-type: none"> All encodings of the IT instruction with hw1[3:0]≠1000. All encodings of the subsequent instruction with the following values for hw1: <ul style="list-style-type: none"> 11xxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. 1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'. 10100xxxxxxxxxxxx: ADD Rd, PC, #imm 01001xxxxxxxxxxxx: LDR Rd, [PC, #imm] 0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. 010001xx1xxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. <p>These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block.</p> <p>It is IMPLEMENTATION DEFINED whether the IT instruction is treated as:</p> <ul style="list-style-type: none"> A 16-bit instruction, that can only be followed by another 16-bit instruction. The first half of a 32-bit instruction. <p>This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED.</p> <p>An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.</p> |

If an instruction in an active IT block that would be disabled by this field sets this field to 1 then behavior is CONSTRAINED UNPREDICTABLE. For more information, see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the HSCTLR then it must also be implemented in the [SCTLR_EL1](#), [SCTLR_EL2](#), and [SCTLR](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement ITD, access to this field is **RAZ/WI**.

Bit [6]

Reserved, RES0.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL2:

| CP15BEN | Meaning |
|---------|---|
| 0b0 | EL2 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is UNDEFINED. |
| 0b1 | EL2 execution of the CP15DMB , CP15DSB , and CP15ISB instructions is enabled. |

CP15BEN is optional, but if it is implemented in the HSCTLR then it must also be implemented in the [SCTLR_EL1](#), [SCTLR_EL2](#), and [SCTLR](#).

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

When an implementation does not implement CP15BEN, access to this field is **RAO/WI**.

LSMAOE, bit [4]

When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

| LSMAOE | Meaning |
|--------|---|
| 0b0 | For all memory accesses at EL2, A32 and T32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered. |
| 0b1 | The ordering and interrupt behavior of A32 and T32 Load Multiple and Store Multiple at EL2 is as defined for Armv8.0. |

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 1.

Otherwise:

Reserved, RES1.

nTLSMD, bit [3]

When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

| nTLSMD | Meaning |
|--------|--|
| 0b0 | All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault. |
| 0b1 | All memory accesses by A32 and T32 Load Multiple and Store Multiple at EL2 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped. |

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 1.

Otherwise:

Reserved, RES1.

C, bit [2]

Cacheability control, for data accesses at EL2:

| C | Meaning |
|----------|--|
| 0b0 | All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, are Non-cacheable for all levels of data and unified cache. |
| 0b1 | All data access to Normal memory from EL2, and all accesses to the EL2 translation tables, can be cached at all levels of data and unified cache. |

This bit has no effect on the PL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2:

| A | Meaning |
|----------|---|
| 0b0 | Alignment fault checking disabled when executing at EL2. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element or data elements being accessed. |
| 0b1 | Alignment fault checking enabled when executing at EL2. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element or data elements being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception. |

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL2 stage 1 address translation. Possible values of this bit are:

| M | Meaning |
|----------|---|
| 0b0 | EL2 stage 1 address translation disabled. See the HSCTLR.I field for the behavior of instruction accesses to Normal memory. |
| 0b1 | EL2 stage 1 address translation enabled. |

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2, this field resets to 0.

Accessing HSCTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|

HSR, Hyp Syndrome Register

The HSR characteristics are:

Purpose

Holds syndrome information for an exception taken to Hyp mode.

Configuration

AArch32 System register HSR bits [31:0] are architecturally mapped to AArch64 System register [ESR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HSR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HSR is a 32-bit register.

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|-----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| EC | | | | | | IL | ISS | | | | | | | | | | | | | | | | | | | | | | | | |

Execution in any Non-secure PE mode other than Hyp mode makes this register UNKNOWN.

When an UNPREDICTABLE instruction is treated as UNDEFINED, and the exception is taken to EL2, the value of HSR is UNKNOWN. The value written to HSR must be consistent with a value that could be created as a result of an exception from the same Exception level that generated the exception as a result of a situation that is not UNPREDICTABLE at that Exception level, in order to avoid the possibility of a privilege violation.

EC, bits [31:26]

Exception Class. Indicates the reason for the exception that this register holds information about. Possible values of this field are:

| EC | Meaning | ISS |
|----------|---|---|
| 0b000000 | Unknown reason. | ISS encoding for exceptions with an unknown reason |
| 0b000001 | Trapped WFI or WFE instruction execution. Conditional WFE and WFI instructions that fail their condition code check do not cause an exception. | ISS encoding for Exception from a WFI or WFE instruction |
| 0b000011 | Trapped MCR or MRC access with (coproc==0b1111) that is not reported using EC 0b000000. | ISS encoding for Exception from an MCR or MRC access |
| 0b000100 | Trapped MCRR or MRRC access with (coproc==0b1111) that is not reported using EC 0b000000. | ISS encoding for Exception from an MCRR or MRRC access |
| 0b000101 | Trapped MCR or MRC access with (coproc==0b1110). | ISS encoding for Exception from an MCR or MRC access |
| 0b000110 | Trapped LDC or STC access. The only architected uses of these instructions are: <ul style="list-style-type: none"> An STC to write data to memory from DBGDTRRXint. An LDC to read data from memory to DBGDTRTXint. | ISS encoding for Exception from an LDC or STC instruction |
| 0b000111 | Access to Advanced SIMD or floating-point functionality trapped by a HCPTR .{TASE, TCP10} control. Excludes exceptions generated because Advanced SIMD and floating-point are not implemented. These are reported with EC value 0b000000. | ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR |
| 0b001000 | Trapped VMRS access, from ID group trap, that is not reported using EC 0b000111. | ISS encoding for Exception from an MCR or MRC access |
| 0b001100 | Trapped MRRC access with (coproc==0b1110). | ISS encoding for Exception from an MCRR or MRRC access |
| 0b001110 | Illegal exception return to AArch32 state. | ISS encoding for Exception from an Illegal state or PC alignment fault |
| 0b010001 | Exception on SVC instruction execution in AArch32 state routed to EL2. | ISS encoding for Exception from HVC or SVC instruction execution |
| 0b010010 | HVC instruction execution in AArch32 state, when HVC is not disabled. | ISS encoding for Exception from HVC or SVC instruction execution |
| 0b010011 | Trapped execution of SMC instruction in AArch32 state. | ISS encoding for Exception from SMC instruction execution |
| 0b100000 | Prefetch Abort from a lower Exception level. | ISS encoding for Exception from a Prefetch Abort |
| 0b100001 | Prefetch Abort taken without a change in Exception level. | ISS encoding for Exception from a Prefetch Abort |
| 0b100010 | PC alignment fault exception. | ISS encoding for Exception from an |

| | | |
|----------|---|--|
| 0b100100 | Data Abort from a lower Exception level. | Illegal state or PC alignment fault |
| 0b100101 | Data Abort taken without a change in Exception level. | ISS encoding for Exception from a Data Abort |

All other EC values are reserved by Arm, and:

- Unused values in the range 0b000000 - 0b101100 (0x00 - 0x2C) are reserved for future use for synchronous exceptions.
- Unused values in the range 0b101101 - 0b111111 (0x2D - 0x3F) are reserved for future use, and might be used for synchronous or asynchronous exceptions.

The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [25]

Instruction length bit. Indicates the size of the instruction that has been trapped to Hyp mode. When this bit is valid, possible values of this bit are:

| IL | Meaning |
|-----|-----------------------------|
| 0b0 | 16-bit instruction trapped. |
| 0b1 | 32-bit instruction trapped. |

This field is RES1 and not valid for the following cases:

- When the EC field is 0b000000, indicating an exception with an unknown reason.
- Prefetch Aborts.
- Data Aborts for which the HSR.ISS.ISV field is 0.
- When the EC value is 0b001110, indicating an Illegal state exception.

Note

This is a change from the behavior in Armv7, where the IL field is UNK/SBZP for the corresponding cases.

The IL field is not valid and is UNKNOWN on an exception from a PC alignment fault.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISS, bits [24:0]

Instruction Specific Syndrome. Architecturally, this field can be defined independently for each defined Exception class. However, in practice, some ISS encodings are used for more than one Exception class.

ISS encoding for exceptions with an unknown reason

| | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [24:0]

Reserved, RES0.

This EC code is used for all exceptions that are not covered by any other EC value. This includes exceptions that are generated in the following situations:

- The attempted execution of an instruction bit pattern that has no allocated instruction or is not accessible in the current PE mode in the current Security state, including:
 - A read access using a System register encoding pattern that is not allocated for reads or that does not permit reads in the current PE mode and Security state.
 - A write access using a System register encoding pattern that is not allocated for writes or that does not permit writes in the current PE mode and Security state.
 - Instruction encodings that are unallocated.
 - Instruction encodings for instructions not implemented in the implementation.
- In Debug state, the attempted execution of an instruction bit pattern that is not accessible in Debug state.
- In Non-debug state, the attempted execution of an instruction bit pattern that is not accessible in Non-debug state.
- The attempted execution of a short vector floating-point instruction.
- In an implementation that does not include Advanced SIMD and floating-point functionality, an attempted access to Advanced SIMD or floating-point functionality under conditions where that access would be permitted if that functionality was present. This includes the attempted execution of an Advanced SIMD or floating-point instruction, and attempted accesses to Advanced SIMD and floating-point System registers.
- An exception generated because of the value of one of the [SCTLR](#).{ITD, SED, CP15BEN} control bits.
- Attempted execution of:
 - An HVC instruction when disabled by [HCR](#).HCD, [SCR](#).HCE, or [SCR_EL3](#).HCE.
 - An SMC instruction when disabled by [SCR](#).SCD or [SCR_EL3](#).SMD.
 - An HLT instruction when disabled by [EDSCR](#).HDE.
- An HVC instruction when disabled by [HCR](#).HCD, [SCR](#).HCE, or [SCR_EL3](#).HCE. An SMC instruction when disabled by [SCR](#).SCD or [SCR_EL3](#).SMD. An HLT instruction when disabled by [EDSCR](#).HDE.
- An exception generated because of the attempted execution of an MSR (Banked register) or MRS (Banked register) instruction that would access a Banked register that is not accessible from the Security state and PE mode at which the instruction was executed.

Note

An exception is generated only if the `CONSTRAINED UNPREDICTABLE` behavior of the instruction is that it is `UNDEFINED`, see 'MSR (banked register) and MRS (banked register)'.

- Attempted execution, in Debug state, of:
 - A DCPS1 instruction in Non-secure state from EL0 when EL2 is using AArch32 and the value of [HCR](#).TGE is 1.
 - A DCPS2 instruction at EL1 or EL0 when EL2 is not implemented, or when EL3 is using AArch32 and the value of [SCR](#).NS is 0, or when EL3 is using AArch64 and the value of [SCR_EL3](#).NS is 0.
 - A DCPS3 instruction when EL3 is not implemented, or when the value of [EDSCR](#).SDD is 1.
- In Debug state when the value of [EDSCR](#).SDD is 1, the attempted execution at EL2, EL1, or EL0 of an instruction that is configured to trap to EL3.

'Undefined Instruction exception, when the value of [HCR](#).TGE is 1' describes the configuration settings for a trap that returns an [HSR](#).EC value of 0b000000.

ISS encoding for Exception from a WFI or WFE instruction

| | | | | | | | | | | | | | | | | | | | | | | | | |
|----|------|----|----|----|------|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|----|
| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CV | COND | | | | RES0 | | | | | | | | | | | | | | | | | | | TI |

CV, bit [24]

Condition code valid. Possible values of this bit are:

| CV | Meaning |
|-----|------------------------------|
| 0b0 | The COND field is not valid. |
| 0b1 | The COND field is valid. |

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is `IMPLEMENTATION DEFINED` whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:1]

Reserved, RES0.

TI, bit [0]

Trapped instruction. Possible values of this bit are:

| TI | Meaning |
|-----|--------------|
| 0b0 | WFI trapped. |
| 0b1 | WFE trapped. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

'Traps to Hyp mode of Non-secure EL0 and EL1 execution of WFE and WFI instructions' describes the configuration settings for this trap.

ISS encoding for Exception from an MCR or MRC access

| | | | | | | | | | | | | | | | | | | | | | | | | |
|----|------|----|----|----|------|----|----|------|----|----|-----|----|----|------|----|---|---|-----|---|---|-----------|---|---|---|
| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CV | COND | | | | Opc2 | | | Opc1 | | | CRn | | | RES0 | Rt | | | CRm | | | Direction | | | |

CV, bit [24]

Condition code valid. Possible values of this bit are:

| CV | Meaning |
|-----|------------------------------|
| 0b0 | The COND field is not valid. |
| 0b1 | The COND field is valid. |

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc2, bits [19:17]

The Opc2 value from the issued instruction.

For a trapped VMRS access, holds the value 0b000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [16:14]

The Opc1 value from the issued instruction.

For a trapped VMRS access, holds the value 0b111.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRn, bits [13:10]

The CRn value from the issued instruction.

For a trapped VMRS access, holds the reg field from the VMRS instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

Rt, bits [8:5]

The Rt value from the issued instruction, the general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

For a trapped VMRS access, holds the value 0b0000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

| Direction | Meaning |
|-----------|---|
| 0b0 | Write to System register space. MCR instruction. |
| 0b1 | Read from System register space. MRC or VMRS instruction. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for traps that are reported using EC value 0b000011:

- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the ID registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to lockdown, DMA, and TCM operations'.
- 'Traps to Hyp mode of Non-secure EL1 execution of cache maintenance instructions'.
- 'Traps to Hyp mode of Non-secure EL1 execution of TLB maintenance instructions'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to the Auxiliary Control Register'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Activity Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to the CPACR'.
- 'Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers'.
- 'General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the (coproc == 1111) encoding space'.

The following sections describe configuration settings for traps that are reported using EC value 0b000101:

- 'ID group 0, Primary device identification registers'.
- 'Traps to Hyp mode of Non-secure System register accesses to trace registers'.
- 'Trapping Non-secure System register accesses to Debug ROM registers'.
- 'Trapping Non-secure System register accesses to powerdown debug registers'.
- 'Trapping general Non-secure System register accesses to debug registers'.

The following sections describes configuration settings for traps that are reported using EC value 0b001000:

- 'ID group 0, Primary device identification registers'.
- 'ID group 3, Detailed feature identification registers'.

ISS encoding for Exception from an MCRR or MRRC access

| | | | | | | | | | | | | | | | | | | | | | | | | |
|----|------|----|----|----|------|----|----|----|------|-----|----|----|----|------|----|---|---|---|-----|---|---|---|-----------|---|
| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CV | COND | | | | Opc1 | | | | RES0 | Rt2 | | | | RES0 | Rt | | | | CRm | | | | Direction | |

CV, bit [24]

Condition code valid. Possible values of this bit are:

| CV | Meaning |
|-----|------------------------------|
| 0b0 | The COND field is not valid. |
| 0b1 | The COND field is valid. |

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Opc1, bits [19:16]

The Opc1 value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:14]

Reserved, RES0.

Rt2, bits [13:10]

The Rt2 value from the issued instruction, the second general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

Rt, bits [8:5]

The Rt value from the issued instruction, the first general-purpose register used for the transfer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CRm, bits [4:1]

The CRm value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

| Direction | Meaning |
|-----------|--|
| 0b0 | Write to System register space. MCRR instruction. |
| 0b1 | Read from System register space. MRRC instruction. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe configuration settings for traps that are reported using EC value 0b000100:

- 'Traps to Hyp mode of Non-secure EL1 accesses to virtual memory control registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Performance Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to Activity Monitors registers'.
- 'Traps to Hyp mode of Non-secure EL0 and EL1 accesses to the Generic Timer registers'.
- 'General trapping to Hyp mode of Non-secure EL0 and EL1 accesses to System registers in the (coproc == 1111) encoding space'.

The following sections describe configuration settings for traps that are reported using EC value 0b001100:

- 'Traps to Hyp mode of Non-secure System register accesses to trace registers'.
- 'Trapping Non-secure System register accesses to Debug ROM registers'.

ISS encoding for Exception from an LDC or STC instruction

| | | | | | | | | | | | | | | | | | | | | | | | | |
|----|------|----|----|----|------|----|----|----|----|----|----|----|------|----|---|----|---|---|--------|----|---|-----------|---|---|
| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CV | COND | | | | imm8 | | | | | | | | RES0 | | | Rn | | | Offset | AM | | Direction | | |

CV, bit [24]

Condition code valid. Possible values of this bit are:

| CV | Meaning |
|-----|------------------------------|
| 0b0 | The COND field is not valid. |
| 0b1 | The COND field is valid. |

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

imm8, bits [19:12]

The immediate value from the issued instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:9]

Reserved, RES0.

Rn, bits [8:5]

The Rn value from the issued instruction. Valid only when AM[2] is 0, indicating an immediate form of the LDC or STC instruction.

When AM[2] is 1, indicating a literal form of the LDC or STC instruction, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Offset, bit [4]

Indicates whether the offset is added or subtracted:

| Offset | Meaning |
|--------|------------------|
| 0b0 | Subtract offset. |
| 0b1 | Add offset. |

This bit corresponds to the U bit in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AM, bits [3:1]

Addressing mode. The permitted values of this field are:

| AM | Meaning |
|-------|---|
| 0b000 | Immediate unindexed. |
| 0b001 | Immediate post-indexed. |
| 0b010 | Immediate offset. |
| 0b011 | Immediate pre-indexed. |
| 0b100 | Literal unindexed. LDC instruction in A32 instruction set only. For a trapped STC instruction or a trapped T32 LDC instruction this encoding is reserved. |
| 0b110 | Literal offset. LDC instruction only. For a trapped STC instruction, this encoding is reserved. |

The values 0b101 and 0b111 are reserved. The effect of programming this field to a reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

Bit [2] in this subfield indicates the instruction form, immediate or literal.

Bits [1:0] in this subfield correspond to the bits {P, W} in the instruction encoding.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Direction, bit [0]

Indicates the direction of the trapped instruction.

| Direction | Meaning |
|-----------|------------------------------------|
| 0b0 | Write to memory. STC instruction. |
| 0b1 | Read from memory. LDC instruction. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

'Trapping general Non-secure System register accesses to debug registers' describes the configuration settings for the trap that is reported using EC value 0b000110.

ISS encoding for Exception from an access to SIMD or floating-point functionality, resulting from HCPTR

| | | | | | | | | | | | | | | | | | | | | | | | | |
|----|------|----|----|----|------|----|----|----|----|----|----|----|----|----|---------|---|--------|---|---|---|---|---|---|---|
| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CV | COND | | | | RES0 | | | | | | | | | | TA RES0 | | coproc | | | | | | | |

Excludes exceptions that occur because Advanced SIMD and floating-point functionality is not implemented, or because the value of [HCR.TGE](#) or [HCR_EL2.TGE](#) is 1. These are reported with EC value 0b000000.

CV, bit [24]

Condition code valid. Possible values of this bit are:

| CV | Meaning |
|-----|------------------------------|
| 0b0 | The COND field is not valid. |
| 0b1 | The COND field is valid. |

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:6]

Reserved, RES0.

TA, bit [5]

Indicates trapped use of Advanced SIMD functionality.

| TA | Meaning |
|-----|---|
| 0b0 | Exception was not caused by trapped use of Advanced SIMD functionality. |
| 0b1 | Exception was caused by trapped use of Advanced SIMD functionality. |

Any use of an Advanced SIMD instruction that is not also a floating-point instruction that is trapped to Hyp mode because of a trap configured in the [HCPTR](#) sets this bit to 1.

For a list of these instructions, see 'Controls of Advanced SIMD operation that do not apply to floating-point operation'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RES0.

coproc, bits [3:0]

When the [HSR.TA](#) field returns the value 1, this field returns the value 0b1010. Otherwise, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe the configuration settings for the traps that are reported using EC value 0b000111:

- 'General trapping to Hyp mode of Non-secure accesses to the SIMD and floating-point registers'.
- 'Traps to Hyp mode of Non-secure accesses to Advanced SIMD functionality'.

ISS encoding for Exception from HVC or SVC instruction execution

| | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | imm16 | | | | | | | | | | | | | | |

Bits [24:16]

Reserved, RES0.

imm16, bits [15:0]

The value of the immediate field from the HVC or SVC instruction.

For an HVC instruction, this is the value of the imm16 field of the issued instruction.

For an SVC instruction:

- If the instruction is unconditional, then:
 - For the T32 instruction, this field is zero-extended from the imm8 field of the instruction.
 - For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- For the T32 instruction, this field is zero-extended from the imm8 field of the instruction. For the A32 instruction, this field is the bottom 16 bits of the imm24 field of the instruction.
- If the instruction is conditional, this field is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The HVC instruction is unconditional, and a conditional SVC instruction generates an exception only if it passes its condition code check. Therefore, the syndrome information for these exceptions does not require conditionality information.

'Supervisor Call exception, when the value of HCR.TGE is 1' describes the configuration settings for the trap reported with EC value 0b010001.

ISS encoding for Exception from SMC instruction execution

| | | | | | | | | | | | | | | | | | | | | | | | | |
|----|------|----|----|----|-------------|------|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| CV | COND | | | | CCKNOWNPASS | RES0 | | | | | | | | | | | | | | | | | | |

CV, bit [24]

Condition code valid. Possible values of this bit are:

| CV | Meaning |
|-----|------------------------------|
| 0b0 | The COND field is not valid. |
| 0b1 | The COND field is valid. |

When an A32 instruction is trapped, CV is set to 1.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether CV is set to 1 or set to 0. For more information, see the description of the COND field.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COND, bits [23:20]

The condition code for the trapped instruction.

When an A32 instruction is trapped, CV is set to 1 and:

- If the instruction is conditional, COND is set to the condition code field value from the instruction.
- If the instruction is unconditional, COND is set to 0b1110.

A conditional A32 instruction that is known to pass its condition code check can be presented either:

- With COND set to 0b1110, the value for unconditional.
- With the COND value held in the instruction.

When a T32 instruction is trapped, it is IMPLEMENTATION DEFINED whether:

- CV is set to 0 and COND is set to an UNKNOWN value. Software must examine the SPSR.IT field to determine the condition, if any, of the T32 instruction.
- CV is set to 1 and COND is set to the condition code for the condition that applied to the instruction.

For an implementation that, for both A32 and T32 instructions, takes an exception on a trapped conditional instruction only if the instruction passes its condition code check, these definitions mean that when CV is set to 1 it is IMPLEMENTATION DEFINED whether the COND field is set to 0b1110, or to the value of any condition that applied to the instruction.

This field is valid only if CCKNOWNPASS is 1, otherwise it is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CCKNOWNPASS, bit [19]

Indicates whether the instruction might have failed its condition code check.

| CCKNOWNPASS | Meaning |
|-------------|--|
| 0b0 | The instruction was unconditional, or was conditional and passed its condition code check. |
| 0b1 | The instruction was conditional, and might have failed its condition code check. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [18:0]

Reserved, RES0.

'Traps to Hyp mode of Non-secure EL1 execution of SMC instructions' describes the configuration settings for this trap, for instructions executed in Non-secure EL1.

ISS encoding for Exception from a Prefetch Abort

| | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|----|------|-------|------|------|---|---|---|---|---|--|--|
| 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |
| RES0 | | | | | | | | | | | | | | FnV | EA | RES0 | S1PTW | RES0 | IFSC | | | | | | | |

Bits [24:11]

Reserved, RES0.

FnV, bit [10]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

| FnV | Meaning |
|-----|---|
| 0b0 | HIFAR is valid. |
| 0b1 | HIFAR is not valid, and holds an UNKNOWN value. |

This field is valid only if the IFSC code is 0b010000. It is RES0 for all other aborts.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

| S1PTW | Meaning |
|--------------|---|
| 0b0 | Fault not on a stage 2 translation for a stage 1 translation table walk. |
| 0b1 | Fault on the stage 2 translation of an access for a stage 1 translation table walk. |

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

IFSC, bits [5:0]

Instruction Fault Status Code. Possible values of this field are:

| IFSC | Meaning | Applies when |
|-------------|--|----------------------------------|
| 0b000000 | Address size fault in translation table base register. | |
| 0b000001 | Address size fault, level 1. | |
| 0b000010 | Address size fault, level 2. | |
| 0b000011 | Address size fault, level 3. | |
| 0b000101 | Translation fault, level 1. | |
| 0b000110 | Translation fault, level 2. | |
| 0b000111 | Translation fault, level 3. | |
| 0b001001 | Access flag fault, level 1. | |
| 0b001010 | Access flag fault, level 2. | |
| 0b001011 | Access flag fault, level 3. | |
| 0b001101 | Permission fault, level 1. | |
| 0b001110 | Permission fault, level 2. | |
| 0b001111 | Permission fault, level 3. | |
| 0b010000 | Synchronous External abort, not on translation table walk. | |
| 0b010101 | Synchronous External abort on translation table walk, level 1. | |
| 0b010110 | Synchronous External abort on translation table walk, level 2. | |
| 0b010111 | Synchronous External abort on translation table walk, level 3. | |
| 0b011000 | Synchronous parity or ECC error on memory access, not on translation table walk. | When FEAT_RAS is not implemented |
| 0b011101 | Synchronous parity or ECC error on memory access on translation table walk, level 1. | When FEAT_RAS is not implemented |
| 0b011110 | Synchronous parity or ECC error on memory access on translation table walk, level 2. | When FEAT_RAS is not implemented |
| 0b011111 | Synchronous parity or ECC error on memory access on translation table walk, level 3. | When FEAT_RAS is not implemented |
| 0b100010 | Debug exception. | |
| 0b110000 | TLB conflict abort. | |

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following sections describe cases where Prefetch Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100000:

- 'Abort exceptions, when the value of HCR.TGE is 1'.
- 'Routing debug exceptions to EL2 using AArch32'.

ISS encoding for Exception from an Illegal state or PC alignment fault

Bits [24:0]

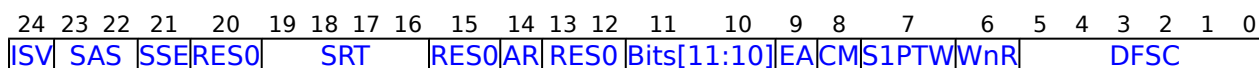

Reserved, RES0.

For more information about the Illegal state exception, see:

- 'Illegal changes to PSTATE.M'.
- 'Illegal return events from AArch32 state'.
- 'Legal returns that set PSTATE.IL to 1'.
- 'The Illegal Execution state exception'.

For more information about the PC alignment fault exception, see 'Branching to an unaligned PC'.

ISS encoding for Exception from a Data Abort

ISV, bit [24]

Instruction syndrome valid. Indicates whether the syndrome information in ISS[23:14] is valid.

| ISV | Meaning |
|-----|---|
| 0b0 | No valid instruction syndrome. ISS[23:14] are RES0. |
| 0b1 | ISS[23:14] hold a valid instruction syndrome. |

This bit is 0 for all faults except Data Aborts generated by stage 2 address translations for which all the following apply to the instruction that generated the Data Abort exception:

- The instruction is an LDR, LDA, LDRT, LDRSH, LDRSHT, LDRH, LDAH, LDRHT, LDRSB, LDRSBT, LDRB, LDAB, LDRBT, STR, STL, STRT, STRH, STLH, STRHT, STRB, STLB, or STRBT instruction.
- The instruction is not performing register writeback.
- The instruction is not using the PC as a source or destination register.

For these cases, ISV is UNKNOWN if the exception was generated in Debug state in memory access mode, as described in 'Data Aborts in Memory access mode', and otherwise indicates whether ISS[23:14] hold a valid syndrome.

Note

In the A32 instruction set, LDR*T and STR*T instructions always perform register writeback and therefore never return a valid instruction syndrome.

When FEAT_RAS is implemented, ISV is 0 for any synchronous External abort.

ISV is set to 0 on a stage 2 abort on a stage 1 translation table walk.

When FEAT_RAS is not implemented, it is IMPLEMENTATION DEFINED whether ISV is set to 1 or 0 on a synchronous External abort on a stage 2 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SAS, bits [23:22]

Syndrome Access Size. When ISV is 1, indicates the size of the access attempted by the faulting operation.

| SAS | Meaning |
|------|------------|
| 0b00 | Byte |
| 0b01 | Halfword |
| 0b10 | Word |
| 0b11 | Doubleword |

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SSE, bit [21]

Syndrome Sign Extend. When ISV is 1, for a byte, halfword, or word load operation, indicates whether the data item must be sign extended. For these cases, the possible values of this bit are:

| SSE | Meaning |
|-----|----------------------------------|
| 0b0 | Sign-extension not required. |
| 0b1 | Data item must be sign-extended. |

For all other operations this bit is 0.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [20]

Reserved, RES0.

SRT, bits [19:16]

Syndrome Register transfer. When ISV is 1, the register number of the Rt operand of the faulting instruction.

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

AR, bit [14]

Acquire/Release. When ISV is 1, the possible values of this bit are:

| AR | Meaning |
|-----|---|
| 0b0 | Instruction did not have acquire/release semantics. |
| 0b1 | Instruction did have acquire/release semantics. |

This field is UNKNOWN when the value of ISV is UNKNOWN.

This field is RES0 when the value of ISV is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [13:12]

Reserved, RES0.

AET, bits [11:10]

When FEAT_RAS is implemented:

Asynchronous Error Type. When DFSC is 0b010001, describes the PE error state after taking the SError interrupt exception.

| AET | Meaning |
|------|----------------------------|
| 0b00 | Uncontainable (UC). |
| 0b01 | Unrecoverable state (UEU). |
| 0b10 | Restartable state (UEO). |
| 0b11 | Recoverable state (UER). |

On a synchronous Data Abort, this field is RES0.

In the event of multiple errors taken as a single SError interrupt exception, the overall PE error state is reported.

Note

Software can use this information to determine what recovery might be possible. The recovery software must also examine any implemented fault records to determine the location and extent of the error.

When FEAT_RAS is not implemented, or when DFSC is not 0b010001:

- Bit[11] is RES0.
- Bit[10] forms the FnV field.

Note

Armv8.2 requires the implementation of FEAT_RAS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

| FnV | Meaning |
|-----|--|
| 0b0 | HDFAR is valid. |
| 0b1 | HDFAR is not valid, and holds an UNKNOWN value. |

When FEAT_RAS is not implemented, this field is valid only if DFSC is 0b010000. It is RES0 for all other aborts.

When FEAT_RAS is implemented:

- If DFSC is 0b010000, this field is valid.
- If DFSC is 0b010001, this bit forms part of the AET field, becoming AET[0].
- This field is RES0 for all other aborts.

Note

Armv8.2 requires the implementation of FEAT_RAS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [9]

External abort type. This bit can provide an IMPLEMENTATION DEFINED classification of External aborts.

For any abort other than an External abort this bit returns a value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CM, bit [8]

Cache maintenance. For a synchronous fault, identifies fault that comes from a cache maintenance or address translation instruction. For synchronous faults, the possible values of this bit are:

| CM | Meaning |
|-----|--|
| 0b0 | Fault not generated by a cache maintenance or address translation instruction. |
| 0b1 | Fault generated by a cache maintenance or address translation instruction. |

For an asynchronous Data Abort exception, this bit is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S1PTW, bit [7]

For a stage 2 fault, indicates whether the fault was a stage 2 fault on an access made for a stage 1 translation table walk:

| S1PTW | Meaning |
|-------|---|
| 0b0 | Fault not on a stage 2 translation for a stage 1 translation table walk. |
| 0b1 | Fault on the stage 2 translation of an access for a stage 1 translation table walk. |

For any abort other than a stage 2 fault this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WnR, bit [6]

Write not Read. Indicates whether a synchronous abort was caused by a write instruction or a read instruction.

| WnR | Meaning |
|------------|--------------------------------------|
| 0b0 | Abort caused by a read instruction. |
| 0b1 | Abort caused by a write instruction. |

For faults on cache maintenance and address translation instructions, this bit always returns a value of 1.

On an asynchronous Data Abort:

- When FEAT_RAS is not implemented, this bit is UNKNOWN.
- When FEAT_RAS is implemented, this bit is RES0.

Note

Armv8.2 requires the implementation of FEAT_RAS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DFSC, bits [5:0]

Data Fault Status Code. Possible values of this field are:

| DFSC | Meaning | Applies when |
|----------|--|----------------------------------|
| 0b000000 | Address size fault in translation table base register. | |
| 0b000001 | Address size fault, level 1. | |
| 0b000010 | Address size fault, level 2. | |
| 0b000011 | Address size fault, level 3. | |
| 0b000101 | Translation fault, level 1. | |
| 0b000110 | Translation fault, level 2. | |
| 0b000111 | Translation fault, level 3. | |
| 0b001001 | Access flag fault, level 1. | |
| 0b001010 | Access flag fault, level 2. | |
| 0b001011 | Access flag fault, level 3. | |
| 0b001101 | Permission fault, level 1. | |
| 0b001110 | Permission fault, level 2. | |
| 0b001111 | Permission fault, level 3. | |
| 0b010000 | Synchronous External abort, not on translation table walk. | |
| 0b010001 | Asynchronous SError interrupt. | |
| 0b010101 | Synchronous External abort on translation table walk, level 1. | |
| 0b010110 | Synchronous External abort on translation table walk, level 2. | |
| 0b010111 | Synchronous External abort on translation table walk, level 3. | |
| 0b011000 | Synchronous parity or ECC error on memory access, not on translation table walk. | When FEAT_RAS is not implemented |
| 0b011001 | Asynchronous SError interrupt, from a parity or ECC error on memory access. | When FEAT_RAS is not implemented |
| 0b011101 | Synchronous parity or ECC error on memory access on translation table walk, level 1. | When FEAT_RAS is not implemented |
| 0b011110 | Synchronous parity or ECC error on memory access on translation table walk, level 2. | When FEAT_RAS is not implemented |
| 0b011111 | Synchronous parity or ECC error on memory access on translation table walk, level 3. | When FEAT_RAS is not implemented |
| 0b100001 | Alignment fault. | |
| 0b100010 | Debug exception. | |
| 0b110000 | TLB conflict abort. | |
| 0b110100 | IMPLEMENTATION DEFINED fault (Lockdown). | |
| 0b110101 | IMPLEMENTATION DEFINED fault (Unsupported Exclusive access). | |

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

If the S1PTW bit is set, then the level refers the level of the stage2 translation that is translating a stage 1 translation walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

The following describe cases where Data Abort exceptions can be routed to Hyp mode, generating exceptions that are reported in the HSR with EC value 0b100100:

- 'Abort exceptions, when the value of HCR.TGE is 1'.
- 'Routing debug exceptions to EL2 using AArch32'.

The following describe cases that can cause a Data Abort exception that is taken to Hyp mode, and reported in the HSR with EC value of 0b100000 or 0b100100:

- 'Hyp mode control of Non-secure access permissions'.
- 'Memory fault reporting in Hyp mode'.

Accessing HSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b0101 | 0b0010 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T5 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T5 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HSR;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HSR;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b0101 | 0b0010 | 0b000 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T5 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T5 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HSR = R[t];
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        HSR = R[t];

```

HSTR, Hyp System Trap Register

The HSTR characteristics are:

Purpose

Controls trapping to Hyp mode of Non-secure accesses, at EL1 or lower, to System registers in the coproc == 0b1111 encoding space:

- By the CRn value used to access the register using MCR or MRC instruction.
- By the CRm value used to access the register using MCRR or MRRC instruction.

Configuration

AArch32 System register HSTR bits [31:0] are architecturally mapped to AArch64 System register [HSTR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HSTR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HSTR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|------|-----|-----|-----|-----|----|----|----|----|----|------|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | T15 | RES0 | T13 | T12 | T11 | T10 | T9 | T8 | T7 | T6 | T5 | RES0 | T3 | T2 | T1 | T0 |

Bits [31:16, 14, 4]

Reserved, RES0.

T<n>, bit [n], for n = 15, 13 to 5, 3 to 0

The remaining fields control whether Non-secure EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 0b1111 encoding space are trapped to Hyp mode:

| T<n> | Meaning |
|------|--|
| 0b0 | This control has no effect on Non-secure EL0 or EL1 accesses to System registers. |
| 0b1 | Any Non-secure EL1 MCR or MRC access with coproc == 0b1111 and CRn == <n> is trapped to Hyp mode. A Non-secure EL0 MCR or MRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0. Any Non-secure EL1 MCRR or MRRC access with coproc == 0b1111 and CRm == <n> is trapped to Hyp mode. A Non-secure EL0 MCRR or MRRC access with these values is trapped to Hyp mode only if the access is not UNDEFINED when the value of this field is 0. |

For example, when HSTR.T7 is 1, for instructions executed at Non-secure EL1:

- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to Hyp mode.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to Hyp mode.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Accessing HSTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b0001 | 0b0001 | 0b011 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    return HSTR;
elsif PSTATE.EL == EL3 then
    if SCR.NS == '0' then
        UNDEFINED;
    else
        return HSTR;

```

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b0001 | 0b0001 | 0b011 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T1 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T1 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else
        UNDEFINED;
elsif PSTATE.EL == EL2 then
    HSTR = R[t];
elsif PSTATE.EL == EL3 then

HTCR, Hyp Translation Control Register

The HTCR characteristics are:

Purpose

The control register for stage 1 of the EL2 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configuration

AArch32 System register HTCR bits [31:0] are architecturally mapped to AArch64 System register [TCR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HTCR is a 32-bit register.

Field descriptions

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |
|------|---------------------------|------|-------|-------|-------|-------|-----|------|------|----|----|----|-----|-------|-------|------|-----|----|----|----|----|---|---|---|---|---|---|---|---|---|
| RES1 | IMPLEMENTATION DEFINED | RES0 | HWU62 | HWU61 | HWU60 | HWU59 | HPD | RES1 | RES0 | | | | SH0 | ORGN0 | IRGN0 | RES0 | T0S | | | | | | | | | | | | | |

Bit [31]

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [30]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

HWU62, bit [28]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

| HWU62 | Meaning |
|-------|--|
| 0b0 | Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1. |

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU61, bit [27]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

| HWU61 | Meaning |
|-------|--|
| 0b0 | Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1. |

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU60, bit [26]

When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

| HWU60 | Meaning |
|-------|--|
| 0b0 | Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1. |

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HWU59, bit [25]**When FEAT_HPDS2 is implemented:**

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

| HWU59 | Meaning |
|-------|--|
| 0b0 | Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose. |
| 0b1 | Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of HTCR.HPD is 1. |

The Effective value of this field is 0 if the value of HTCR.HPD is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

HPD, bit [24]**When FEAT_AA32HPD is implemented:**

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the PL2 translation regime.

| HPD | Meaning |
|-----|--|
| 0b0 | Hierarchical permissions are enabled. |
| 0b1 | Hierarchical permissions are disabled. |

When disabled, the permissions are treated as if the bits are zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

Bits [22:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using [HTTBR](#).

| SH0 | Meaning |
|------|------------------|
| 0b00 | Non-shareable. |
| 0b10 | Outer Shareable. |
| 0b11 | Inner Shareable. |

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using [HTTBR](#).

| ORGN0 | Meaning |
|-------|---|
| 0b00 | Normal memory, Outer Non-cacheable. |
| 0b01 | Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using [HTTBR](#).

| IRGN0 | Meaning |
|-------|---|
| 0b00 | Normal memory, Inner Non-cacheable. |
| 0b01 | Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable. |
| 0b10 | Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable. |
| 0b11 | Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:3]

Reserved, RES0.

T0SZ, bits [2:0]

The size offset of the memory region addressed by [HTTBR](#). The region size is $2^{(32-T0SZ)}$ bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HTCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b0010 | 0b0000 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;

        UNDEFINED;
    else
        HTCR = R[t];

```

HTPIDR, Hyp Software Thread ID Register

The HTPIDR characteristics are:

Purpose

Provides a location where software running in Hyp mode can store thread identifying information that is not visible to Non-secure software executing at EL0 or EL1, for hypervisor management purposes.

The PE makes no use of this register.

Configuration

AArch32 System register HTPIDR bits [31:0] are architecturally mapped to AArch64 System register [TPIDR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HTPIDR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

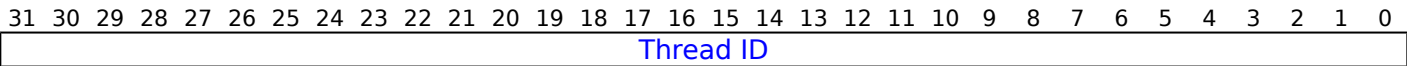

Note

The PE never updates this register.

Attributes

HTPIDR is a 32-bit register.

Field descriptions

Bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HTPIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b1101 | 0b0000 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T13 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T13 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else

HTRFCR, Hyp Trace Filter Control Register

The HTRFCR characteristics are:

Purpose

Provides EL2 controls for Trace.

Configuration

AArch32 System register HTRFCR bits [31:0] are architecturally mapped to AArch64 System register [TRFCR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_TRF is implemented. Otherwise, direct accesses to HTRFCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from Monitor mode when [SCR.NS](#) == 1.

Attributes

HTRFCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|------|-------|--------|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | TS | RES0 | CX | RES0 | E2TRE | E0HTRE | | | | | | | | | | | | |

Bits [31:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

| TS | Meaning |
|------|--|
| 0b00 | The timestamp is controlled by TRFCR.TS . |
| 0b01 | Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF . |
| 0b11 | Physical timestamp. The traced timestamp is the physical counter value. |

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Bit [4]

Reserved, RES0.

CX, bit [3]

VMID Trace Enable.

| CX | Meaning |
|-----|------------------------------|
| 0b0 | VMID tracing is not allowed. |
| 0b1 | VMID tracing is allowed. |

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Bit [2]

Reserved, RES0.

E2TRE, bit [1]

EL2 Trace Enable.

| E2TRE | Meaning |
|-------|-------------------------------|
| 0b0 | Tracing is prohibited at EL2. |
| 0b1 | Tracing is allowed at EL2. |

When SelfHostedTraceEnabled() == FALSE, this field is ignored.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

EOHTRE, bit [0]

EL0 Trace Enable.

| EOHTRE | Meaning |
|--------|---|
| 0b0 | Tracing is prohibited at EL0 when HCR.TGE == 1. |
| 0b1 | Tracing is allowed at EL0 when HCR.TGE == 1. |

This field is ignored if any of the following are true:

- The PE is in Secure state.
- SelfHostedTraceEnabled() == FALSE.
- [HCR.TGE](#) == 0.

The reset behavior of this field is:

- On a Warm reset, in a system where the PE resets into EL2 or EL3, this field resets to 0.

Accessing HTRFCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

HTTBR, Hyp Translation Table Base Register

The HTTBR characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

Configuration

AArch32 System register HTTBR bits [47:1] are architecturally mapped to AArch64 System register [TTBR0_EL2\[47:1\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HTTBR is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 | |
| RES0 | | | | | | | | | | | | | | | | BADDR | | | | | | | | | | | | | | | | |
| BADDR | | | | | | | | | | | | | | | | CnP | | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |

Bits [63:48]

Reserved, RES0.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of [HTCR.T0SZ](#) as follows:

- If [HTCR.T0SZ](#) is 0 or 1, $x = 5 - \text{HTCR.T0SZ}$.
- If [HTCR.T0SZ](#) is greater than 1, $x = 14 - \text{HTCR.T0SZ}$.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

When [FEAT_TTCNP](#) is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by HTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1.

| CnP | Meaning |
|-----|--|
| 0b0 | The translation table entries pointed to by HTTBR are permitted to differ from corresponding entries for HTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of HTTBR.CnP on those other PEs. |
| 0b1 | The translation table entries pointed to by HTTBR are the same as the translation table entries pointed to by HTTBR on every other PE in the Inner Shareable domain for which the value of HTTBR.CnP is 1. |

Note

If the value of the HTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those HTTBRs do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are **CONSTRAINED UNPREDICTABLE**, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing HTTBR

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

HVBAR, Hyp Vector Base Address Register

The HVBAR characteristics are:

Purpose

Holds the vector base address for any exception that is taken to Hyp mode.

Configuration

AArch32 System register HVBAR bits [31:0] are architecturally mapped to AArch64 System register [VBAR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported. Otherwise, direct accesses to HVBAR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HVBAR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

ICC_AP0R<n>, Interrupt Controller Active Priorities Group 0 Registers, n = 0 - 3

The ICC_AP0R<n> characteristics are:

Purpose

Provides information about Group 0 active priorities.

Configuration

AArch32 System register ICC_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register [ICC_AP0R<n>_EL1\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_AP0R<n> are UNDEFINED.

Attributes

ICC_AP0R<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing ICC_AP0R<n>

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP0R1 is only implemented in implementations that support 6 or more bits of preemption. ICC_AP0R2 and ICC_AP0R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by [ICH_VTR](#).PREbits.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICC_AP0R<n>.

- Secure [ICC_AP1R<n>](#).
- Non-secure [ICC_AP1R<n>](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b1100 | 0b1000 | 0b1:n[1:0] |

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing ICC_AP1R<n>

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP1R1 is only implemented in implementations that support 6 or more bits of preemption. ICC_AP1R2 and ICC_AP1R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by [ICH_VTR](#).PREbits.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- [ICC_AP0R<n>](#)
- Secure ICC_AP1R<n>
- Non-secure ICC_AP1R<n>

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b1100 | 0b1001 | 0b0:n[1:0] |

```

ICC_ASGI1R, Interrupt Controller Alias Software Generated Interrupt Group 1 Register

The ICC_ASGI1R characteristics are:

Purpose

Generates Group 1 SGIs for the Security state that is not the current Security state.

Configuration

AArch32 System register ICC_ASGI1R performs the same function as AArch64 System register [ICC_ASGI1R_EL1](#).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_ASGI1R are UNDEFINED.

Under certain conditions a write to ICC_ASGI1R can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_ASGI1R is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-------|----|----|----|------|----|----|----|----|----|----|----|------------|----|----|----|------|----|-----|------|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | Aff3 | | | | | | | | RS | | | | RES0 | | IRM | Aff2 | | | | | | | | |
| RES0 | | | | INTID | | | | Aff1 | | | | | | | | TargetList | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value $((RS * 16) + n)$.

When [ICC_CTLR_EL1](#).RSS==0, RS is RES0.

When [ICC_CTLR_EL1](#).RSS==1 and [GICD_TYPER](#).RSS==0, writing this register with $RS \neq 0$ is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

| IRM | Meaning |
|-----|---|
| 0b0 | Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>. |
| 0b1 | Interrupts routed to all PEs in the system, excluding "self". |

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing ICC_ASGI1R

This register allows software executing in a Secure state to generate Non-secure Group 1 SGIs. It will also allow software executing in a Non-secure state to generate Secure Group 1 SGIs, if permitted by the settings of [GICR_NSACR](#) in the Redistributor corresponding to the target PE.

When [GICD_CTLR.DS](#)=0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the [GICR_NSACR](#) register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.

Accesses to this register use the following encodings in the System register encoding space:

MCCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

| coproc | CRm | opc1 |
|---------------|------------|-------------|
| 0b1111 | 0b1100 | 0b0001 |

```

ICC_BPR0, Interrupt Controller Binary Point Register 0

The ICC_BPR0 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

Configuration

AArch32 System register ICC_BPR0 bits [31:0] are architecturally mapped to AArch64 System register [ICC_BPR0_EL1\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_BPR0 are UNDEFINED.

Attributes

ICC_BPR0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | BinaryPoint | | | | | | | | | | | | | | |

Bits [31:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

| Binary point value | Group priority field | Subpriority field | Field with binary point |
|--------------------|----------------------|-------------------|-------------------------|
| 0 | [7:1] | [0] | ggggggg.s |
| 1 | [7:2] | [1:0] | gggggg.ss |
| 2 | [7:3] | [2:0] | ggggg.sss |
| 3 | [7:4] | [3:0] | gggg.ssss |
| 4 | [7:5] | [4:0] | ggg.sssss |
| 5 | [7:6] | [5:0] | gg.ssssss |
| 6 | [7] | [6:0] | g.sssssss |
| 7 | No preemption | [7:0] | .ssssssss |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_BPR0

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by [ICC_CTLR.PRIBits](#) and [ICC_MCTLR.PRIBits](#).

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is set to the minimum supported value.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|---------------|-------------|------------|------------|-------------|
| 0b1111 | 0b000 | 0b1100 | 0b1000 | 0b011 |

```

```

| HCR.IMO | SCR_IRQ | Behavior |
|---------|---------|--|
| 0b0 | 0b0 | Non-secure EL1 and EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored. |
| 0b0 | 0b1 | Non-secure EL1 and EL2 accesses trap to EL3. |
| 0b1 | 0b0 | Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL2 writes are ignored. |
| 0b1 | 0b1 | Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 accesses trap to EL3. |

If EL3 is not implemented and [ICC_CTLR](#).CBPR is 1, Non-secure accesses to this register at EL1 or EL2 behave as follows, depending on the values of HCR.IMO:

| HCR.IMO | Behavior |
|---------|--|
| 0b0 | Non-secure EL1 and EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored. |
| 0b1 | Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0 + 1 saturated to 0b111. Non-secure EL2 writes are ignored. |

This field resets to an IMPLEMENTATION DEFINED non-zero value.

Accessing ICC_BPR1

When the PE resets into an Exception level that is using AArch32, the reset value is equal to:

- For the Secure copy of the register, the minimum value of [ICC_BPR0](#) plus one.
- For the Non-secure copy of the register, the minimum value of [ICC_BPR0](#).

Where the minimum value of [ICC_BPR0](#) is IMPLEMENTATION DEFINED.

If EL3 is not implemented:

- If the PE is Secure this reset value is (minimum value of [ICC_BPR0](#) plus one).
- If the PE is Non-secure this reset value is (minimum value of [ICC_BPR0](#)).

An attempt to program the binary point field to a value less than the reset value sets the field to the reset value.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b1100 | 0b011 |

ICC_CTLR, Interrupt Controller Control Register

The ICC_CTLR characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Configuration

AArch32 System register ICC_CTLR bits [31:0] (S) are architecturally mapped to AArch64 System register [ICC_CTLR_EL1\[31:0\]](#) (S).

AArch32 System register ICC_CTLR bits [31:0] (NS) are architecturally mapped to AArch64 System register [ICC_CTLR_EL1\[31:0\]](#) (NS).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_CTLR are UNDEFINED.

Attributes

ICC_CTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | ExtRange | RSS | RES0 | A3V | SEIS | IDbits | PRIbits | RES0 | PMHE | RES0 | EOImode | CBPR | | | | | | | | |

Bits [31:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

| ExtRange | Meaning |
|----------|--|
| 0b0 | CPU interface does not support INTIDs in the range 1024..8191. Behaviour is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. Note Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them. |
| 0b1 | CPU interface supports INTIDs in the range 1024..8191. All INTIDs in the range 1024..8191 are treated as requiring deactivation. |

If EL3 is implemented, ICC_CTLR_EL1.ExtRange is an alias of [ICC_CTLR_EL3.ExtRange](#).

RSS, bit [18]

Range Selector Support. Possible values are:

| RSS | Meaning |
|-----|--|
| 0b0 | Targeted SGIs with affinity level 0 values of 0 - 15 are supported. |
| 0b1 | Targeted SGIs with affinity level 0 values of 0 - 255 are supported. |

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

| A3V | Meaning |
|-----|---|
| 0b0 | The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers. |
| 0b1 | The CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers. |

If EL3 is implemented and using AArch32, this bit is an alias of [ICC_MCTLR.A3V](#).

If EL3 is implemented and using AArch64, this bit is an alias of [ICC_CTLR_EL3.A3V](#).

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

| SEIS | Meaning |
|------|--|
| 0b0 | The CPU interface logic does not support local generation of SEIs. |
| 0b1 | The CPU interface logic supports local generation of SEIs. |

If EL3 is implemented and using AArch32, this bit is an alias of [ICC_MCTLR.SEIS](#).

If EL3 is implemented and using AArch64, this bit is an alias of [ICC_CTLR_EL3.SEIS](#).

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

| IDbits | Meaning |
|--------|----------|
| 0b000 | 16 bits. |
| 0b001 | 24 bits. |

All other values are reserved.

If EL3 is implemented and using AArch32, this field is an alias of [ICC_MCTLR.IDbits](#).

If EL3 is implemented and using AArch64, this field is an alias of [ICC_CTLR_EL3.IDbits](#).

PRibits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of [GICD_CTLR.DS](#).

The division between group priority and subpriority is defined in the binary point registers [ICC_BPR0](#) and [ICC_BPR1](#).

If EL3 is implemented and using AArch32, physical accesses return the value from [ICC_MCTLR.PRIBits](#).

If EL3 is implemented and using AArch64, physical accesses return the value from [ICC_CTLR_EL3.PRIBits](#).

If EL3 is not implemented, physical accesses return the value from this field.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

| PMHE | Meaning |
|------|---|
| 0b0 | Disables use of ICC_PMR as a hint for interrupt distribution. |
| 0b1 | Enables use of ICC_PMR as a hint for interrupt distribution. |

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of [ICC_MCTLR.PMHE](#).
- If EL3 is using AArch64, this bit is an alias of [ICC_CTLR_EL3.PMHE](#).
- If [GICD_CTLR.DS](#) == 0, this bit is read-only.
- If [GICD_CTLR.DS](#) == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

Bits [5:2]

Reserved, RES0.

EOImode, bit [1]

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

| EOImode | Meaning |
|---------|---|
| 0b0 | ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE. |
| 0b1 | ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality. |

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of [ICC_MCTLR.EOImode_EL1](#){S, NS} where S or NS corresponds to the current Security state.
- If EL3 is using AArch64, this bit is an alias of [ICC_CTLR_EL3.EOImode_EL1](#){S, NS} where S or NS corresponds to the current Security state.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

| CBPR | Meaning |
|------|---|
| 0b0 | ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Group 1 interrupts. |
| 0b1 | ICC_BPR0 determines the preemption group for both Group 0 and Group 1 interrupts. |

If EL3 is implemented:

- If EL3 is using AArch32, this bit is an alias of [ICC_MCTLR.CBPR_EL1](#){S,NS} where S or NS corresponds to the current Security state.
- If EL3 is using AArch64, this bit is an alias of [ICC_CTLR_EL3.CBPR_EL1](#){S,NS} where S or NS corresponds to the current Security state.
- If [GICD_CTLR.DS](#) == 0, this bit is read-only.
- If [GICD_CTLR.DS](#) == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read-write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

Accessing ICC_CTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b1100 | 0b100 |

ICC_DIR, Interrupt Controller Deactivate Interrupt Register

The ICC_DIR characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

Configuration

AArch32 System register ICC_DIR performs the same function as AArch64 System register [ICC_DIR_EL1](#).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_DIR are UNDEFINED.

Attributes

ICC_DIR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-------|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICC_CTLR.IDbits](#) and [ICC_MCTLR.IDbits](#). If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_DIR

There are two cases when writing to [ICC_DIR_EL1](#) that were UNPREDICTABLE for a corresponding GICv2 write to [GICC_DIR](#):

- When EOImode == 0. GICv3 implementations must ignore such writes. In systems supporting system error generation, an implementation might generate an SEI.
- When EOImode == 1 but no EOI has been issued. The interrupt will be de-activated by the Distributor, however the active priority in the CPU interface for the interrupt will remain set (because no EOI was issued).

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b1011 | 0b001 |

```

ICC_EOIR0, Interrupt Controller End Of Interrupt Register 0

The ICC_EOIR0 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

Configuration

AArch32 System register ICC_EOIR0 performs the same function as AArch64 System register [ICC_EOIR0_EL1](#).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_EOIR0 are UNDEFINED.

Attributes

ICC_EOIR0 is a 32-bit register.

| RES0 | | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding [ICC_IAR0](#) access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICC_CTLR.IDbits](#) and [ICC_MCTLR.IDbits](#). If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to [ICC_DIR](#) to deactivate the interrupt.

The appropriate EOImode bit varies as follows:

- If EL3 is not implemented, the appropriate bit is [ICC_CTLR.EOImode](#).
- If EL3 is implemented and the software is executing in Monitor mode, the appropriate bit is [ICC_MCTLR.EOImode_EL3](#).
- If EL3 is implemented and the software is not executing in Monitor mode, the bit depends on the current Security state:
 - If the software is executing in Secure state, the bit is [ICC_CTLR.EOImode](#) in the Secure instance of [ICC_CTLR](#). This is an alias of [ICC_MCTLR.EOImode_EL1S](#).
 - If the software is executing in Non-secure state, the bit is [ICC_CTLR.EOImode](#) in the Non-secure instance of [ICC_CTLR](#). This is an alias of [ICC_MCTLR.EOImode_EL1NS](#).

Accessing ICC_EOIR0

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from [ICC_IAR0](#), otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b1000 | 0b001 |

```

ICC_EOIR1, Interrupt Controller End Of Interrupt Register 1

The ICC_EOIR1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 1 interrupt.

Configuration

AArch32 System register ICC_EOIR1 performs the same function as AArch64 System register [ICC_EOIR1_EL1](#).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_EOIR1 are UNDEFINED.

Attributes

ICC_EOIR1 is a 32-bit register.

Field descriptions

| RES0 | | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding [ICC_IAR1](#) access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICC_CTLR.IDbits](#) and [ICC_MCTLR.IDbits](#). If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to [ICC_DIR](#) to deactivate the interrupt.

The appropriate EOImode bit varies as follows:

- If EL3 is not implemented, the appropriate bit is [ICC_CTLR.EOImode](#).
- If EL3 is implemented and the software is executing in Monitor mode, the appropriate bit is [ICC_MCTLR.EOImode_EL3](#).
- If EL3 is implemented and the software is not executing in Monitor mode, the bit depends on the current Security state:
 - If the software is executing in Secure state, the bit is [ICC_CTLR.EOImode](#) in the Secure instance of [ICC_CTLR](#). This is an alias of [ICC_MCTLR.EOImode_EL1S](#).
 - If the software is executing in Non-secure state, the bit is [ICC_CTLR.EOImode](#) in the Non-secure instance of [ICC_CTLR](#). This is an alias of [ICC_MCTLR.EOImode_EL1NS](#).

Accessing ICC_EOIR1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from [ICC_IAR1](#), otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings in the System register encoding space:

ICC_HSRE, Interrupt Controller Hyp System Register Enable register

The ICC_HSRE characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL2.

Configuration

AArch32 System register ICC_HSRE bits [31:0] are architecturally mapped to AArch64 System register [ICC_SRE_EL2\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICC_HSRE are UNDEFINED.

Attributes

ICC_HSRE is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|-----|-----|-----|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | Enable | | DIB | DFB | SRE | | | | | | | | | |

Bits [31:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to [ICC_SRE](#).

| Enable | Meaning |
|--------|--|
| 0b0 | Non-secure EL1 accesses to ICC_SRE trap to EL2. |
| 0b1 | Non-secure EL1 accesses to ICC_SRE do not trap to EL2. |

If ICC_HSRE.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_HSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIB, bit [2]

Disable IRQ bypass.

| DIB | Meaning |
|-----|----------------------|
| 0b0 | IRQ bypass enabled. |
| 0b1 | IRQ bypass disabled. |

If EL3 is implemented and [GICD_CTLR](#).DS is 0, this field is a read-only alias of [ICC_MSRE](#).DIB.

If EL3 is implemented and [GICD_CTLR.DS](#) is 1, this field is a read-write alias of [ICC_MSRE.DIB](#).

In systems that do not support IRQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

DFB, bit [1]

Disable FIQ bypass.

| DFB | Meaning |
|-----|----------------------|
| 0b0 | FIQ bypass enabled. |
| 0b1 | FIQ bypass disabled. |

If EL3 is implemented and [GICD_CTLR.DS](#) is 0, this field is a read-only alias of [ICC_MSRE.DFB](#).

If EL3 is implemented and [GICD_CTLR.DS](#) is 1, this field is a read-write alias of [ICC_MSRE.DFB](#).

In systems that do not support FIQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SRE, bit [0]

System Register Enable.

| SRE | Meaning |
|-----|--|
| 0b0 | The memory-mapped interface must be used. Accesses at EL2 or below to any ICH_* System register, or any EL1 or EL2 ICC_* register other than ICC_SRE or ICC_HSRE, are UNDEFINED. |
| 0b1 | The System register interface to the ICH_* registers and the EL1 and EL2 ICC_* registers is enabled for EL2. |

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and using AArch64:

- When [ICC_SRE_EL3.SRE](#)==0 this bit is RAZ/WI.

If EL3 is implemented using AArch32:

- When [ICC_MSRE.SRE](#)==0 this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICC_HSRE

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while [ICC_HSRE.SRE](#)==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b1100 | 0b1001 | 0b101 |

ICC_IAR0, Interrupt Controller Interrupt Acknowledge Register 0

The ICC_IAR0 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 0 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch32 System register ICC_IAR0 performs the same function as AArch64 System register [ICC_IAR0_EL1](#).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_IAR0 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when $PSTATE.\{I,F\} == \{0,0\}$). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_IAR0 is a 32-bit register.

Field descriptions

| RES0 | | | | | | | | INTID | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. These special INTIDs can be one of: 1020, 1021, or 1023. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in [ICC_CTLR.IDbits](#) and [ICC_MCTLR.IDbits](#). If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_IAR0

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

```

ICC_IAR1, Interrupt Controller Interrupt Acknowledge Register 1

The ICC_IAR1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 1 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch32 System register ICC_IAR1 performs the same function as AArch64 System register [ICC_IAR1_EL1](#).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_IAR1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronising when interrupts are masked by the PE (that is when $PSTATE.\{I,F\} == \{0,0\}$). This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_IAR1 is a 32-bit register.

Field descriptions

ICC_IGRPEN0, Interrupt Controller Interrupt Group 0 Enable register

The ICC_IGRPEN0 characteristics are:

Purpose

Controls whether Group 0 interrupts are enabled or not.

Configuration

AArch32 System register ICC_IGRPEN0 bits [31:0] are architecturally mapped to AArch64 System register [ICC_IGRPEN0_EL1\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_IGRPEN0 are UNDEFINED.

Attributes

ICC_IGRPEN0 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| RES0 | | | | | | | | | | | | | | | | Enable | | | | | | | | | | | | | | | |

Bits [31:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 0 interrupts.

| Enable | Meaning |
|--------|----------------------------------|
| 0b0 | Group 0 interrupts are disabled. |
| 0b1 | Group 0 interrupts are enabled. |

Virtual accesses to this register update [ICH_VMCR.VENG0](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICC_IGRPEN0

The lowest Exception level at which this register can be accessed is governed by the Exception level to which FIQ is routed. This routing depends on SCR.FIQ, SCR.NS and HCR.FMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b1100 | 0b110 |

ICC_IGRPEN1, Interrupt Controller Interrupt Group 1 Enable register

The ICC_IGRPEN1 characteristics are:

Purpose

Controls whether Group 1 interrupts are enabled for the current Security state.

Configuration

AArch32 System register ICC_IGRPEN1 bits [31:0] (S) are architecturally mapped to AArch64 System register [ICC_IGRPEN1_EL1\[31:0\]](#) (S).

AArch32 System register ICC_IGRPEN1 bits [31:0] (NS) are architecturally mapped to AArch64 System register [ICC_IGRPEN1_EL1\[31:0\]](#) (NS).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_IGRPEN1 are UNDEFINED.

Attributes

ICC_IGRPEN1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|--------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | Enable |

Bits [31:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 1 interrupts for the current Security state.

| Enable | Meaning |
|--------|---|
| 0b0 | Group 1 interrupts are disabled for the current Security state. |
| 0b1 | Group 1 interrupts are enabled for the current Security state. |

Virtual accesses to this register update [ICH_VMCR.VENG1](#).

If EL3 is present:

- This bit is a read/write alias of [ICC_MGRPEN1](#).EnableGrp1{S, NS} as appropriate if EL3 is using AArch32, or [ICC_IGRPEN1_EL3](#).EnableGrp1{S, NS} as appropriate if EL3 is using AArch64.
- When this register is accessed at EL3, the copy of this register appropriate to the current setting of SCR.NS is accessed.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICC_IGRPEN1

The lowest Exception level at which this register can be accessed is governed by the Exception level to which IRQ is routed. This routing depends on SCR.IRQ, SCR.NS and HCR.IMO.

If an interrupt is pending within the CPU interface when Enable becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

        UNDEFINED;
    else
        if SCR.NS == '0' then
            ICC_IGRPEN1_S = R[t];
        else
            ICC_IGRPEN1_NS = R[t];

```

ICC_MCTLR, Interrupt Controller Monitor Control Register

The ICC_MCTLR characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Configuration

AArch32 System register ICC_MCTLR bits [31:0] can be mapped to AArch64 System register [ICC_CTLR_EL3\[31:0\]](#), but this is not architecturally mandated.

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL3 is implemented. Otherwise, direct accesses to ICC_MCTLR are UNDEFINED.

Attributes

ICC_MCTLR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----------|-----|-----|------|-----|------|--------|---------|------|------|----|-------------|----|-------------|----|-------------|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 |
| RES0 | | | | | | | | | | | | ExtRange | RSS | nDS | RES0 | A3V | SEIS | IDbits | PRIbits | RES0 | PMHE | RM | EOImode_EL1 | NS | EOImode_EL1 | NS | EOImode_EL1 | NS |

Bits [31:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

| ExtRange | Meaning |
|----------|--|
| 0b0 | <p>CPU interface does not support INTIDs in the range 1024..8191. Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface.</p> <p>Note Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.</p> |
| 0b1 | <p>CPU interface supports INTIDs in the range 1024..8191 All INTIDs in the range 1024..8191 are treated as requiring deactivation.</p> |

RSS, bit [18]

Range Selector Support. Possible values are:

| RSS | Meaning |
|------------|--|
| 0b0 | Targeted SGIs with affinity level 0 values of 0 - 15 are supported. |
| 0b1 | Targeted SGIs with affinity level 0 values of 0 - 255 are supported. |

This bit is read-only.

nDS, bit [17]

Disable Security not supported. Read-only and writes are ignored.

| nDS | Meaning |
|------------|---|
| 0b0 | The CPU interface logic supports disabling of security. |
| 0b1 | The CPU interface logic does not support disabling of security, and requires that security is not disabled. |

Bit [16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored.

| A3V | Meaning |
|------------|--|
| 0b0 | The CPU interface logic does not support non-zero values of the Aff3 field in SGI generation System registers. |
| 0b1 | The CPU interface logic supports non-zero values of the Aff3 field in SGI generation System registers. |

If EL3 is present, [ICC_CTLR.A3V](#) is an alias of ICC_MCTLR.A3V

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs.

| SEIS | Meaning |
|-------------|--|
| 0b0 | The CPU interface logic does not support generation of SEIs. |
| 0b1 | The CPU interface logic supports generation of SEIs. |

If EL3 is present, [ICC_CTLR.SEIS](#) is an alias of ICC_MCTLR.SEIS

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. Indicates the number of physical interrupt identifier bits supported.

| IDbits | Meaning |
|---------------|----------------|
| 0b000 | 16 bits. |
| 0b001 | 24 bits. |

All other values are reserved.

If EL3 is present, [ICC_CTLR.IDbits](#) is an alias of ICC_MCTLR.IDbits

PRibits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the value of SCR.NS or the value of [GICD_CTLR.DS](#).

The division between group priority and subpriority is defined in the binary point registers [ICC_BPR0](#) and [ICC_BPR1](#).

This field determines the minimum value of ICC_BPR0.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable.

| PMHE | Meaning |
|------|--|
| 0b0 | Disables use of the priority mask register as a hint for interrupt distribution. |
| 0b1 | Enables use of the priority mask register as a hint for interrupt distribution. |

Software must write [ICC_PMR](#) to 0xFF before clearing this field to 0.

An implementation might choose to make this field RAO/WI.

If EL3 is present, [ICC_CTLR](#).PMHE is an alias of ICC_MCTLR.PMHE.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

RM, bit [5]

SBZ.

The equivalent bit in AArch64 is the Routing Modifier bit. This feature is not supported when EL3 is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1NS, bit [4]

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

| EOImode_EL1NS | Meaning |
|---------------|---|
| 0b0 | ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE. |
| 0b1 | ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality. |

If EL3 is present, [ICC_CTLR\(NS\)](#).EOImode is an alias of ICC_MCTLR.EOImode_EL1NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1S, bit [3]

EOI mode for interrupts handled at Secure EL1. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

| EOImode_EL1S | Meaning |
|--------------|---|
| 0b0 | ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE. |
| 0b1 | ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality. |

If EL3 is present, [ICC_CTLR\(S\)](#).EOImode is an alias of ICC_MCTLR.EOImode_EL1S.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL3, bit [2]

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

| EOImode_EL3 | Meaning |
|-------------|---|
| 0b0 | ICC_EOIR0 and ICC_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR are UNPREDICTABLE. |
| 0b1 | ICC_EOIR0 and ICC_EOIR1 provide priority drop functionality only. ICC_DIR provides interrupt deactivation functionality. |

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1NS, bit [1]

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.

| CBPR_EL1NS | Meaning |
|------------|--|
| 0b0 | ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Non-secure Group 1 interrupts. |
| 0b1 | ICC_BPR0 determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1 access the state of ICC_BPR0 . |

If EL3 is present, [ICC_CTLR\(NS\)](#).CBPR is an alias of ICC_MCTLR.CBPR_EL1NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts in Secure non-Monitor modes.

| CBPR_EL1S | Meaning |
|-----------|--|
| 0b0 | ICC_BPR0 determines the preemption group for Group 0 interrupts only. ICC_BPR1 determines the preemption group for Secure Group 1 interrupts. |
| 0b1 | ICC_BPR0 determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 accesses, or EL3 accesses when not in Monitor mode, to ICC_BPR1 access the state of ICC_BPR0 . |

If EL3 is present, [ICC_CTLR\(S\)](#).CBPR is an alias of ICC_MCTLR.CBPR_EL1S.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_MCTLR

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

ICC_MGRPEN1, Interrupt Controller Monitor Interrupt Group 1 Enable register

The ICC_MGRPEN1 characteristics are:

Purpose

Controls whether Group 1 interrupts are enabled or not.

Configuration

AArch32 System register ICC_MGRPEN1 bits [31:0] can be mapped to AArch64 System register [ICC_IGRPEN1_EL3\[31:0\]](#), but this is not architecturally mandated.

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL3 is implemented. Otherwise, direct accesses to ICC_MGRPEN1 are UNDEFINED.

Attributes

ICC_MGRPEN1 is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------------|----|--------------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | EnableGrp1S | | EnableGrp1NS | | | | | | | | | | | | | |

Bits [31:2]

Reserved, RES0.

EnableGrp1S, bit [1]

Enables Group 1 interrupts for the Secure state.

| EnableGrp1S | Meaning |
|-------------|---|
| 0b0 | Secure Group 1 interrupts are disabled. |
| 0b1 | Secure Group 1 interrupts are enabled. |

The Secure [ICC_IGRPEN1](#).Enable bit is a read/write alias of the ICC_MGRPEN1.EnableGrp1S bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EnableGrp1NS, bit [0]

Enables Group 1 interrupts for the Non-secure state.

| EnableGrp1NS | Meaning |
|--------------|---|
| 0b0 | Non-secure Group 1 interrupts are disabled. |
| 0b1 | Non-secure Group 1 interrupts are enabled. |

The Non-secure [ICC_IGRPEN1](#).Enable bit is a read/write alias of the ICC_MGRPEN1.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICC_MGRPEN1

If an interrupt is pending within the CPU interface when an Enable bit becomes 0, the interrupt must be released to allow the Distributor to forward the interrupt to a different PE.

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

    else
        ICC_MGRPEN1 = R[t];

```

ICC_MSRE, Interrupt Controller Monitor System Register Enable register

The ICC_MSRE characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

Configuration

AArch32 System register ICC_MSRE bits [31:0] can be mapped to AArch64 System register [ICC_SRE_EL3\[31:0\]](#), but this is not architecturally mandated.

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL3 is implemented. Otherwise, direct accesses to ICC_MSRE are UNDEFINED.

Attributes

ICC_MSRE is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|-----|-----|-----|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | Enable | | DIB | DFB | SRE | | | | | | | | | |

Bits [31:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to [ICC_SRE](#) and [ICC_HSRE](#).

| Enable | Meaning |
|--------|--|
| 0b0 | Secure EL1 accesses to Secure ICC_SRE trap to EL3. EL2 accesses to Non-secure ICC_SRE and ICC_HSRE trap to EL3. Non-secure EL1 accesses to ICC_SRE trap to EL3, unless these accesses are trapped to EL2 as a result of ICC_HSRE.Enable == 0 . |
| 0b1 | Secure EL1 accesses to Secure ICC_SRE do not trap to EL3. EL2 accesses to Non-secure ICC_SRE and ICC_HSRE do not trap to EL3. Non-secure EL1 accesses to ICC_SRE do not trap to EL3. |

If ICC_MSRE.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_MSRE.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIB, bit [2]

Disable IRQ bypass.

| DIB | Meaning |
|-----|----------------------|
| 0b0 | IRQ bypass enabled. |
| 0b1 | IRQ bypass disabled. |

In systems that do not support IRQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

DFB, bit [1]

Disable FIQ bypass.

| DFB | Meaning |
|-----|----------------------|
| 0b0 | FIQ bypass enabled. |
| 0b1 | FIQ bypass disabled. |

In systems that do not support FIQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SRE, bit [0]

System Register Enable.

| SRE | Meaning |
|-----|---|
| 0b0 | The memory-mapped interface must be used. Accesses at EL3 or below to any ICH_* System register, or any EL1, EL2, or EL3 ICC_* register other than ICC_SRE , ICC_HSRE , or ICC_MSRE, are UNDEFINED. |
| 0b1 | The System register interface to the ICH_* registers and the EL1, EL2, and EL3 ICC_* registers is enabled for EL3. |

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICC_MSRE

This register is always System register accessible.

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while ICC_MSRE.SRE==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

This register is only accessible when executing in Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|------|-----|-----|------|
|--------|------|-----|-----|------|

| | | | | |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b110 | 0b1100 | 0b1100 | 0b101 |
|--------|-------|--------|--------|-------|

```

if PSTATE.EL == EL0 then
    UNDEFINED;

ICC_PMR, Interrupt Controller Interrupt Priority Mask Register

The ICC_PMR characteristics are:

Purpose

Provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Configuration

AArch32 System register ICC_PMR bits [31:0] are architecturally mapped to AArch64 System register [ICC_PMR_EL1\[31:0\]](#).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_PMR are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_PMR is a 32-bit register.

| RES0 | | | | | | | | | | | | | | | | | | | | | | | | Priority | | | | | | | |

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

The possible priority field values are as follows:

| Implemented priority bits | Possible priority field values | Number of priority levels |
|---------------------------|-------------------------------------|---------------------------|
| [7:0] | 0x00-0xFF (0-255), all values | 256 |
| [7:1] | 0x00-0xFE (0-254), even values only | 128 |
| [7:2] | 0x00-0xFC (0-252), in steps of 4 | 64 |
| [7:3] | 0x00-0xF8 (0-248), in steps of 8 | 32 |
| [7:4] | 0x00-0xF0 (0-240), in steps of 16 | 16 |

Unimplemented priority bits are RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICC_PMR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0100 | 0b0110 | 0b000 |

ICC_RPR, Interrupt Controller Running Priority Register

The ICC_RPR characteristics are:

Purpose

Indicates the Running priority of the CPU interface.

Configuration

AArch32 System register ICC_RPR performs the same function as AArch64 System register [ICC_RPR_EL1](#).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_RPR are UNDEFINED.

Attributes

ICC_RPR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|----------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | Priority | | | | | | | |

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

Note

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

Accessing ICC_RPR

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

ICC_SGI0R, Interrupt Controller Software Generated Interrupt Group 0 Register

The ICC_SGI0R characteristics are:

Purpose

Generates Secure Group 0 SGIs.

Configuration

AArch32 System register ICC_SGI0R performs the same function as AArch64 System register [ICC_SGI0R_EL1](#).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_SGI0R are UNDEFINED.

Attributes

ICC_SGI0R is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-------|----|----|----|------|----|----|----|----|----|----|----|------------|----|----|----|------|----|-----|------|----|----|----|----|----|----|----|----|

| RES0 | | | | | | | | Aff3 | | | | | | | | RS | | | | RES0 | | IRM | Aff2 | | | | | | | | |
| RES0 | | | | INTID | | | | Aff1 | | | | | | | | TargetList | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value $((RS * 16) + n)$.

When [ICC_CTLR_EL1](#).RSS==0, RS is RES0.

When [ICC_CTLR_EL1](#).RSS==1 and [GICD_TYPER](#).RSS==0, writing this register with $RS \neq 0$ is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

| IRM | Meaning |
|-----|---|
| 0b0 | Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>. |
| 0b1 | Interrupts routed to all PEs in the system, excluding "self". |

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing ICC_SGI0R

This register allows software executing in a Secure state to generate Group 0 SGIs. It will also allow software executing in a Non-secure state to generate Group 0 SGIs, if permitted by the settings of [GICR_NSACR](#) in the Redistributor corresponding to the target PE.

When [GICD_CTLR](#).DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the [GICR_NSACR](#) register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.

Accesses to this register use the following encodings in the System register encoding space:

MCCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

| coproc | CRm | opc1 |
|---------------|------------|-------------|
| 0b1111 | 0b1100 | 0b0010 |

```

ICC_SGI1R, Interrupt Controller Software Generated Interrupt Group 1 Register

The ICC_SGI1R characteristics are:

Purpose

Generates Group 1 SGIs for the current Security state.

Configuration

AArch32 System register ICC_SGI1R performs the same function as AArch64 System register [ICC_SGI1R_EL1](#).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_SGI1R are UNDEFINED.

Under certain conditions a write to ICC_SGI1R can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_SGI1R is a 64-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|-------|----|----|----|------|----|----|----|----|----|----|----|------------|----|----|----|------|----|-----|------|----|----|----|----|----|----|----|----|
| 63 | 62 | 61 | 60 | 59 | 58 | 57 | 56 | 55 | 54 | 53 | 52 | 51 | 50 | 49 | 48 | 47 | 46 | 45 | 44 | 43 | 42 | 41 | 40 | 39 | 38 | 37 | 36 | 35 | 34 | 33 | 32 |
| RES0 | | | | | | | | Aff3 | | | | | | | | RS | | | | RES0 | | IRM | Aff2 | | | | | | | | |
| RES0 | | | | INTID | | | | Aff1 | | | | | | | | TargetList | | | | | | | | | | | | | | | |
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value $((RS * 16) + n)$.

When [ICC_CTLR_EL1](#).RSS==0, RS is RES0.

When [ICC_CTLR_EL1](#).RSS==1 and [GICD_TYPER](#).RSS==0, writing this register with $RS \neq 0$ is a CONSTRAINED UNPREDICTABLE choice of :

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

| IRM | Meaning |
|-----|---|
| 0b0 | Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>. |
| 0b1 | Interrupts routed to all PEs in the system, excluding "self". |

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Note

If SRE is set only for Secure EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

Accessing ICC_SGI1R**Note**

Accesses from Secure Monitor mode are treated as Secure regardless of the value of SCR.NS.

Accesses to this register use the following encodings in the System register encoding space:

MCCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

| coproc | CRm | opc1 |
|---------------|------------|-------------|
| 0b1111 | 0b1100 | 0b0000 |

```

ICC_SRE, Interrupt Controller System Register Enable register

The ICC_SRE characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL0 and EL1.

Configuration

AArch32 System register ICC_SRE bits [31:0] (S) are architecturally mapped to AArch64 System register [ICC_SRE_EL1\[31:0\]](#) (S).

AArch32 System register ICC_SRE bits [31:0] (NS) are architecturally mapped to AArch64 System register [ICC_SRE_EL1\[31:0\]](#) (NS).

This register is present only when AArch32 is supported and FEAT_GICv3 is implemented. Otherwise, direct accesses to ICC_SRE are UNDEFINED.

Attributes

ICC_SRE is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|-----|-----|-----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | DIB | DFB | SRE |

Bits [31:3]

Reserved, RES0.

DIB, bit [2]

Disable IRQ bypass.

| DIB | Meaning |
|-----|----------------------|
| 0b0 | IRQ bypass enabled. |
| 0b1 | IRQ bypass disabled. |

If EL3 is implemented and [GICD_CTLR](#).DS == 0, this field is a read-only alias of [ICC_MSRE](#).DIB.

If EL3 is implemented and [GICD_CTLR](#).DS == 1, and EL2 is not implemented, this field is a read-write alias of [ICC_MSRE](#).DIB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of [ICC_HSRE](#).DIB.

If [GICD_CTLR](#).DS == 1 and EL2 is implemented, this field is a read-only alias of [ICC_HSRE](#).DIB.

In systems that do not support IRQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

DFB, bit [1]

Disable FIQ bypass.

| DFB | Meaning |
|-----|----------------------|
| 0b0 | FIQ bypass enabled. |
| 0b1 | FIQ bypass disabled. |

If EL3 is implemented and [GICD_CTLR.DS](#) == 0, this field is a read-only alias of [ICC_MSRE.DFB](#).

If EL3 is implemented and [GICD_CTLR.DS](#) == 1, and EL2 is not implemented, this field is a read-write alias of [ICC_MSRE.DFB](#).

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of [ICC_HSRE.DFB](#).

If [GICD_CTLR.DS](#) == 1 and EL2 is implemented, this field is a read-only alias of [ICC_HSRE.DFB](#).

In systems that do not support FIQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

SRE, bit [0]

System Register Enable.

| SRE | Meaning |
|-----|--|
| 0b0 | The memory-mapped interface must be used. Accesses at EL1 to any ICC_* System register other than ICC_SRE are UNDEFINED. |
| 0b1 | The System register interface for the current Security state is enabled. |

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and using AArch64:

- When [ICC_SRE_EL3.SRE](#)==0 the Secure copy of this bit is RAZ/WI.
- When [ICC_SRE_EL3.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI.

If EL3 is implemented and using AArch32:

- When [ICC_MSRE.SRE](#)==0 the Secure copy of this bit is RAZ/WI.
- When [ICC_MSRE.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch64:

- When [ICC_SRE_EL2.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI.

If EL2 is implemented and using AArch32:

- When [ICC_HSRE.SRE](#)==0 the Non-secure copy of this bit is RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICC_SRE

The GIC architecture permits, but does not require, that registers can be shared between memory-mapped registers and the equivalent System registers. This means that if the memory-mapped registers have been accessed while [ICC_SRE.SRE](#)==0, then the System registers might be modified. Therefore, software must only rely on the reset values of the System registers if there has been no use of the GIC functionality while the memory-mapped registers are in use. Otherwise, the System register values must be treated as UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b1100 | 0b1100 | 0b101 |

```

ICH_AP0R<n>, Interrupt Controller Hyp Active Priorities Group 0 Registers, n = 0 - 3

The ICH_AP0R<n> characteristics are:

Purpose

Provides information about Group 0 active priorities for EL2.

Configuration

AArch32 System register ICH_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register [ICH_AP0R<n>_EL2\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_AP0R<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_AP0R<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

P<x>, bit [x], for x = 31 to 0

Provides the access to the virtual active priorities for Group 0 interrupts. Possible values of each bit are:

| P<x> | Meaning |
|------|---|
| 0b0 | There is no Group 0 interrupt active at the priority corresponding to that bit. |
| 0b1 | There is a Group 0 interrupt active at the priority corresponding to that bit. |

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP0R0 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP0R0 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP0R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP0R0 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP0R1 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP0R2 in the bits corresponding to 10:Priority[5:1].

- The active state of preemption levels 192 - 254 are held in ICH_AP0R3 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n> and [ICH_AP1R<n>](#) might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICH_AP0R<n>

ICH_AP0R1 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP0R2 and ICH_AP0R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by [ICH_VTR.PREbits](#)

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICH_AP0R<n>
- [ICH_AP1R<n>](#)

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|------------|
| 0b1111 | 0b100 | 0b1100 | 0b1000 | 0b0:n[1:0] |

```

ICH_AP1R<n>, Interrupt Controller Hyp Active Priorities Group 1 Registers, n = 0 - 3

The ICH_AP1R<n> characteristics are:

Purpose

Provides information about Group 1 active priorities for EL2.

Configuration

AArch32 System register ICH_AP1R<n> bits [31:0] are architecturally mapped to AArch64 System register [ICH_AP1R<n>_EL2\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_AP1R<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_AP1R<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| P31 | P30 | P29 | P28 | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 | P19 | P18 | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 | P9 | P8 | P7 | P6 | P5 | P4 | P3 | P2 | P1 | P0 |

P<x>, bit [x], for x = 31 to 0

Group 1 interrupt active priorities. Possible values of each bit are:

| P<x> | Meaning |
|------|---|
| 0b0 | There is no Group 1 interrupt active at the priority corresponding to that bit. |
| 0b1 | There is a Group 1 interrupt active at the priority corresponding to that bit. |

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP1R0 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP1R0 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP1R1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP1R0 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP1R1 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP1R2 in the bits corresponding to 10:Priority[5:1].

- The active state of preemption levels 192 - 254 are held in ICH_AP1R3 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both [ICH_AP0R<n>](#) and ICH_AP1R<n> might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICH_AP1R<n>

ICH_AP1R1 is only implemented in implementations that support 6 or more bits of preemption. ICH_AP1R2 and ICH_AP1R3 are only implemented in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by [ICH_VTR.PREbits](#)

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- [ICH_AP0R<n>](#)
- ICH_AP1R<n>

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |

ICH_EISR, Interrupt Controller End of Interrupt Status Register

The ICH_EISR characteristics are:

Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

Configuration

AArch32 System register ICH_EISR bits [31:0] are architecturally mapped to AArch64 System register [ICH_EISR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_EISR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_EISR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----------|----------|----------|----------|----------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

EOI maintenance interrupt status bit for List register <n>:

| Status<n> | Meaning |
|-----------|--|
| 0b0 | List register <n>, ICH_LR<n> , does not have an EOI maintenance interrupt. |
| 0b1 | List register <n>, ICH_LR<n> , has an EOI maintenance interrupt that has not been handled. |

For any ICH_LR<n>, the corresponding status bit is set to 1 if all of the following are true:

- [ICH_LRC<n>](#).State is 0b00.
- [ICH_LRC<n>](#).HW is 0.
- [ICH_LRC<n>](#).EOI (bit [9]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICH_EISR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

ICH_ELRSR, Interrupt Controller Empty List Register Status Register

The ICH_ELRSR characteristics are:

Purpose

Indicates which List registers contain valid interrupts.

Configuration

AArch32 System register ICH_ELRSR bits [31:0] are architecturally mapped to AArch64 System register [ICH_ELRSR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_ELRSR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_ELRSR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|----------|----------|----------|----------|----------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| RES0 | | | | | | | | | | | | | | | | Status15 | Status14 | Status13 | Status12 | Status11 | Status10 | Status9 | Status8 | Status7 | Status6 | Status5 | Status4 | Status3 | Status2 | Status1 | Status0 |

Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>, [ICH_LR<n>](#):

| Status<n> | Meaning |
|-----------|--|
| 0b0 | List register ICH_LR<n> , if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt. |
| 0b1 | List register ICH_LR<n> does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt. |

For any List register <n>, the corresponding status bit is set to 1 if [ICH_LRC<n>](#).State is 0b00 and either [ICH_LRC<n>](#).HW is 1 or [ICH_LRC<n>](#).EOI (bit [9]) is 0.

Accessing ICH_ELRSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| | | | | |
|--------|------|-----|-----|------|

ICH_HCR, Interrupt Controller Hyp Control Register

The ICH_HCR characteristics are:

Purpose

Controls the environment for VMs.

Configuration

AArch32 System register ICH_HCR bits [31:0] are architecturally mapped to AArch64 System register [ICH_HCR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_HCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_HCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|------|------|-------|-------|--------|--------------|----------|----------|----------|----------|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 |
| EOIcount | | | | | | | | | | | | | | | | | RES0 | TDIR | TSEI | TALL1 | TALL0 | TCRES0 | vSGIEOIcount | VGrp1DIE | VGrp1IEI | VGrp0DIE | VGrp0IEI |

EOIcount, bits [31:27]

This field is incremented whenever a successful write to a virtual EOIR or DIR register would have resulted in a virtual interrupt deactivation. That is either:

- A virtual write to EOIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is zero and no List Register was found.
- A virtual write to DIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is one and no List Register was found.

This allows software to manage more active interrupts than there are implemented List Registers.

It is CONSTRAINED UNPREDICTABLE whether a virtual write to EOIR that does not clear a bit in the Active Priorities registers ([ICH_AP0R<n>](#)/[ICH_AP1R<n>](#)) increments EOIcount. Permitted behaviors are:

- Increment EOIcount.
- Leave EOIcount unchanged.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [26:15]

Reserved, RES0.

TDIR, bit [14]

When FEAT_GICv3_TDIR is implemented:

Trap Non-secure EL1 writes to [ICC_DIR](#) and [ICV_DIR](#).

| TDIR | Meaning |
|-------------|--|
| 0b0 | Non-secure EL1 writes of ICC_DIR and ICV_DIR are not trapped to EL2, unless trapped by other mechanisms. |
| 0b1 | Non-secure EL1 writes of ICV_DIR are trapped to EL2. It is IMPLEMENTATION DEFINED whether Non-secure writes of ICC_DIR are trapped. Not trapping ICC_DIR writes is DEPRECATED. |

Arm deprecates not including this trap bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

TSEI, bit [13]

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at Non-secure EL1.

| TSEI | Meaning |
|-------------|--|
| 0b0 | Locally generated SEIs do not cause a trap to EL2. |
| 0b1 | Locally generated SEIs trap to EL2. |

If [ICH_VTR](#).SEIS is 0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TALL1, bit [12]

Trap all Non-secure EL1 accesses to ICC_* and ICV_* System registers for Group 1 interrupts to EL2.

| TALL1 | Meaning |
|--------------|--|
| 0b0 | Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal. |
| 0b1 | Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TALL0, bit [11]

Trap all Non-secure EL1 accesses to ICC_* and ICV_* System registers for Group 0 interrupts to EL2.

| TALL0 | Meaning |
|--------------|--|
| 0b0 | Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal. |
| 0b1 | Non-secure EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

TC, bit [10]

Trap all Non-secure EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.

| TC | Meaning |
|-----|--|
| 0b0 | Non-secure EL1 accesses to common registers proceed as normal. |
| 0b1 | Non-secure EL1 accesses to common registers trap to EL2. |

This affects accesses to [ICC_SGI0R](#), [ICC_SGI1R](#), [ICC_ASGI1R](#), [ICC_CTLR](#), [ICC_DIR](#), [ICC_PMR](#), [ICC_RPR](#), [ICV_CTLR](#), [ICV_DIR](#), [ICV_PMR](#), and [ICV_RPR](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bit [9]

Reserved, RES0.

vSGIEOICount, bit [8]

When FEAT_GICv4p1 is implemented:

Controls whether deactivation of virtual SGIs can increment ICH_HCR_EL2.EOICount

| vSGIEOICount | Meaning |
|--------------|---|
| 0b0 | Deactivation of virtual SGIs can increment ICH_HCR.EOICount. |
| 0b1 | Deactivation of virtual SGIs does not increment ICH_HCR.EOICount. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Otherwise:

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

| VGrp1DIE | Meaning |
|----------|--|
| 0b0 | Maintenance interrupt disabled. |
| 0b1 | Maintenance interrupt signaled when ICH_VMCR.VENG1 is 0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:

| VGrp1EIE | Meaning |
|----------|--|
| 0b0 | Maintenance interrupt disabled. |
| 0b1 | Maintenance interrupt signaled when ICH_VMCR.VENG1 is 1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

| VGrp0DIE | Meaning |
|----------|--|
| 0b0 | Maintenance interrupt disabled. |
| 0b1 | Maintenance interrupt signaled when ICH_VMCR.VENG0 is 0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:

| VGrp0EIE | Meaning |
|----------|--|
| 0b0 | Maintenance interrupt disabled. |
| 0b1 | Maintenance interrupt signaled when ICH_VMCR.VENG0 is 1. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

NPIE, bit [3]

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to 0b01 (pending):

| NPIE | Meaning |
|------|---|
| 0b0 | Maintenance interrupt disabled. |
| 0b1 | Maintenance interrupt signaled while the List registers contain no interrupts in the pending state. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

| LRENPIE | Meaning |
|---------|--|
| 0b0 | Maintenance interrupt disabled. |
| 0b1 | Maintenance interrupt is asserted while the EOICount field is not 0. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

UIE, bit [1]

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

| UIE | Meaning |
|-----|--|
| 0b0 | Maintenance interrupt disabled. |
| 0b1 | Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

En, bit [0]

Enable. Global enable bit for the virtual CPU interface:

| En | Meaning |
|-----|---|
| 0b0 | Virtual CPU interface operation disabled. |
| 0b1 | Virtual CPU interface operation enabled. |

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of [ICV_IAR0](#), [ICV_IAR1](#), [GICV_IAR](#) or [GICV_AIAR](#) returns a spurious interrupt ID.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICH_HCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

ICH_LRC<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH_LRC<n> characteristics are:

Purpose

Provides interrupt context information for the virtual CPU interface.

Configuration

AArch32 System register ICH_LRC<n> bits [31:0] are architecturally mapped to AArch64 System register [ICH_LR<n>_EL2\[63:32\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_LRC<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

Attributes

ICH_LRC<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------|----|----|----|----|-------|----|------|----|----|----|----------|----|----|----|----|----|------|----|----|----|--------|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| State | | | HW | | Group | | RES0 | | | | Priority | | | | | | RES0 | | | | pINTID | | | | | | | | | | |

State, bits [31:30]

The state of the interrupt:

| State | Meaning |
|-------|---------------------|
| 0b00 | Invalid (Inactive). |
| 0b01 | Pending. |
| 0b10 | Active. |
| 0b11 | Pending and active. |

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the invalid state are ignored, except for the purpose of generating virtual maintenance interrupts.

For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

HW, bit [29]

Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the INTID that the pINTID field indicates.

| HW | Meaning |
|-----|--|
| 0b0 | The interrupt is triggered entirely by software. No notification is sent to the Distributor when the virtual interrupt is deactivated. |
| 0b1 | The interrupt maps directly to a hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using the pINTID field from this register to indicate the physical INTID. If ICH_VMCR.VEOIM is 0, this request corresponds to a write to ICC_EOIR0 or ICC_EOIR1 . Otherwise, it corresponds to a write to ICC_DIR . |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Group, bit [28]

Indicates the group for this virtual interrupt.

| Group | Meaning |
|-------|---|
| 0b0 | This is a Group 0 virtual interrupt. ICH_VMCR.VFIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and ICH_VMCR.VENG0 enables signaling of this interrupt to the virtual machine. |
| 0b1 | This is a Group 1 virtual interrupt, signaled as a virtual IRQ. ICH_VMCR.VENG1 enables the signaling of this interrupt to the virtual machine. If ICH_VMCR.VCBPR is 0, then ICC_BPR1 determines if a pending Group 1 interrupt has sufficient priority to preempt current execution. Otherwise, ICH_LR<n> determines preemption. |

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [27:24]

Reserved, RES0.

Priority, bits [23:16]

The priority of this interrupt.

It is IMPLEMENTATION DEFINED how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit[16] up to bit[18]. The number of implemented bits can be discovered from [ICH_VTR.PRIBits](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Bits [15:13]

Reserved, RES0.

pINTID, bits [12:0]

Physical INTID, for hardware interrupts.

When ICH_LRC<n>.HW is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[12:10] : RES0.

- Bit[9] : EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits[8:0] : Reserved, RES0.

When ICH_LRC<n>.HW is 1 (there is a corresponding physical interrupt):

- This field indicates the physical INTID. This field is only required to implement enough bits to hold a valid value for the implemented INTID size. Any unused higher order bits are RES0.
- When [ICC_CTLR_EL1.ExtRange](#) is 0, then bits[44:42] of this field are RES0.
- If the value of pINTID is not a valid INTID, behavior is UNPREDICTABLE. If the value of pINTID indicates a PPI, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 13 bits of Physical INTID are required, regardless of the number specified by [ICC_CTLR.IDbits](#).

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICH_LRC<n>

[ICH_LR<n>](#) and ICH_LRC<n> can be updated independently.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|------------|--------|
| 0b1111 | 0b100 | 0b1100 | 0b111:n[3] | n[2:0] |

```

ICH_LR<n>, Interrupt Controller List Registers, n = 0 - 15

The ICH_LR<n> characteristics are:

Purpose

Provides interrupt context information for the virtual CPU interface.

Configuration

AArch32 System register ICH_LR<n> bits [31:0] are architecturally mapped to AArch64 System register [ICH_LR<n>_EL2\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_LR<n> are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

Attributes

ICH_LR<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | | | | | | | | | | | | | | | | vINTID | | | | | | | | | | | | | | | |

vINTID, bits [31:0]

Virtual INTID of the interrupt.

If the value of vINTID is 1020-1023 and [ICH_LRC<n>.State!=0b00](#) (Inactive), behavior is UNPREDICTABLE.

Behavior is UNPREDICTABLE if two or more List Registers specify the same vINTID when:

- [ICH_LRC<n>.State == 01.](#)
- [ICH_LRC<n>.State == 10.](#)
- [ICH_LRC<n>.State == 11.](#)

It is IMPLEMENTATION DEFINED how many bits are implemented, though at least 16 bits must be implemented. Unimplemented bits are RES0. The number of implemented bits can be discovered from [ICH_VTR.IDbits](#).

Note

When a VM is using memory-mapped access to the GIC, software must ensure that the correct source PE ID is provided in bits[12:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICH_LR<n>

ICH_LR<n> and [ICH_LRC<n>](#) can be updated independently.

```

ICH_MISR, Interrupt Controller Maintenance Interrupt State Register

The ICH_MISR characteristics are:

Purpose

Indicates which maintenance interrupts are asserted.

Configuration

AArch32 System register ICH_MISR bits [31:0] are architecturally mapped to AArch64 System register [ICH_MISR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_MISR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_MISR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:8]

Reserved, RES0.

VGrp1D, bit [7]

vPE Group 1 Disabled.

| VGrp1D | Meaning |
|--------|--|
| 0b0 | vPE Group 1 Disabled maintenance interrupt not asserted. |
| 0b1 | vPE Group 1 Disabled maintenance interrupt asserted. |

This maintenance interrupt is asserted when [ICH_HCR.VGrp1DIE](#) is 1 and [ICH_VMCR.VENG0](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp1E, bit [6]

vPE Group 1 Enabled.

| VGrp1E | Meaning |
|--------|---|
| 0b0 | vPE Group 1 Enabled maintenance interrupt not asserted. |
| 0b1 | vPE Group 1 Enabled maintenance interrupt asserted. |

This maintenance interrupt is asserted when [ICH_HCR.VGrp1EIE](#) is 1 and [ICH_VMCR.VENG1](#) is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp0D, bit [5]

vPE Group 0 Disabled.

| VGrp0D | Meaning |
|--------|--|
| 0b0 | vPE Group 0 Disabled maintenance interrupt not asserted. |
| 0b1 | vPE Group 0 Disabled maintenance interrupt asserted. |

This maintenance interrupt is asserted when [ICH_HCR.VGrp0DIE](#) is 1 and [ICH_VMCR.VENG0](#) is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

VGrp0E, bit [4]

vPE Group 0 Enabled.

| VGrp0E | Meaning |
|--------|---|
| 0b0 | vPE Group 0 Enabled maintenance interrupt not asserted. |
| 0b1 | vPE Group 0 Enabled maintenance interrupt asserted. |

This maintenance interrupt is asserted when [ICH_HCR.VGrp0EIE](#) is 1 and [ICH_VMCR.VENG0](#) is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

NP, bit [3]

No Pending.

| NP | Meaning |
|-----|--|
| 0b0 | No Pending maintenance interrupt not asserted. |
| 0b1 | No Pending maintenance interrupt asserted. |

This maintenance interrupt is asserted when [ICH_HCR.NPIE](#) is 1 and no List register is in pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

LREN, bit [2]

List Register Entry Not Present.

| LREN | Meaning |
|------|---|
| 0b0 | List Register Entry Not Present maintenance interrupt not asserted. |
| 0b1 | List Register Entry Not Present maintenance interrupt asserted. |

This maintenance interrupt is asserted when [ICH_HCR.LRENPIE](#) is 1 and [ICH_HCR.EOIcount](#) is non-zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

U, bit [1]

Underflow.

| U | Meaning |
|-----|---|
| 0b0 | Underflow maintenance interrupt not asserted. |
| 0b1 | Underflow maintenance interrupt asserted. |

This maintenance interrupt is asserted when [ICH_HCR](#).UIE is 1 and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding [ICH_LRC<n>](#).State bits do not equal 0x0.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

EOI, bit [0]

End Of Interrupt.

| EOI | Meaning |
|-----|--|
| 0b0 | End Of Interrupt maintenance interrupt not asserted. |
| 0b1 | End Of Interrupt maintenance interrupt asserted. |

This maintenance interrupt is asserted when at least one bit in [ICH_EISR](#) is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

Accessing ICH_MISR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b1100 | 0b1011 | 0b010 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T12 == '1' then
        AArch64.AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && ELUsingAArch32(EL2) && HSTR.T12 == '1' then
        AArch32.TakeHypTrapException(0x03);
    else

    else
        return ICH_MISR;

```

ICH_VMCR, Interrupt Controller Virtual Machine Control Register

The ICH_VMCR characteristics are:

Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state.

Configuration

AArch32 System register ICH_VMCR bits [31:0] are architecturally mapped to AArch64 System register [ICH_VMCR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_VMCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_VMCR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------|----|----|----|----|----|----|----|-------|-------|------|----|----|----|-------|------|-------|--------|---------|-------|-------|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| VPMR | | | | | | | | VBPR0 | VBPR1 | RES0 | | | | VEOIM | RES0 | VCBPR | VFIQEn | VackCtI | VENG1 | VENG0 | | | | | | | | | | | |

VPMR, bits [31:24]

Virtual Priority Mask. The priority mask level for the virtual CPU interface. If the priority of a pending virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

This field is an alias of [ICV_PMR](#).Priority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if ICH_VMCR.VCBPR == 1.

This field is an alias of [ICV_BPR0](#).BinaryPoint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption if [ICH_VMCR](#).VCBPR == 0.

This field is an alias of [ICV_BPR1](#).BinaryPoint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [17:10]

Reserved, RES0.

VEOIM, bit [9]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

| VEOIM | Meaning |
|-------|---|
| 0b0 | ICV_EOIR0 and ICV_EOIR1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR are UNPREDICTABLE. |
| 0b1 | ICV_EOIR0 and ICV_EOIR1 provide priority drop functionality only. ICV_DIR provides interrupt deactivation functionality. |

This bit is an alias of [ICV_CTLR](#).EOImode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

| VCBPR | Meaning |
|-------|--|
| 0b0 | ICV_BPR0 determines the preemption group for virtual Group 0 interrupts only. ICV_BPR1 determines the preemption group for virtual Group 1 interrupts. |
| 0b1 | ICV_BPR0 determines the preemption group for both virtual Group 0 and virtual Group 1 interrupts. Reads of ICV_BPR1 return ICV_BPR0 plus one, saturated to 0b111. Writes to ICV_BPR1 are ignored. |

This field is an alias of [ICV_CTLR](#).CBPR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

| VFIQEn | Meaning |
|--------|---|
| 0b0 | Group 0 virtual interrupts are presented as virtual IRQs. |
| 0b1 | Group 0 virtual interrupts are presented as virtual FIQs. |

This bit is an alias of [GICV_CTLR](#).FIQEn.

In implementations where the Non-secure copy of [ICC_SRE](#).SRE is always 1, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

| VAckCtl | Meaning |
|---------|--|
| 0b0 | If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022. |
| 0b1 | If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt. |

This bit is an alias of [GICV_CTLR](#).AckCtl.

This field is supported for backwards compatibility with GICv2. Arm deprecates the use of this field.

In implementations where the Non-secure copy of [ICC_SRE](#).SRE is always 1, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VENG1, bit [1]

Virtual Group 1 interrupt enable. Possible values of this bit are:

| VENG1 | Meaning |
|-------|--|
| 0b0 | Virtual Group 1 interrupts are disabled. |
| 0b1 | Virtual Group 1 interrupts are enabled. |

This bit is an alias of [ICV_IGRPEN1](#).Enable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VENG0, bit [0]

Virtual Group 0 interrupt enable. Possible values of this bit are:

| VENG0 | Meaning |
|-------|--|
| 0b0 | Virtual Group 0 interrupts are disabled. |
| 0b1 | Virtual Group 0 interrupts are enabled. |

This bit is an alias of [ICV_IGRPEN0](#).Enable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICH_VMCR

When EL2 is using System register access, EL1 using either System register or memory-mapped access must be supported.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b1100 | 0b1011 | 0b111 |

```

if PSTATE.EL == EL0 then

ICH_VTR, Interrupt Controller VGIC Type Register

The ICH_VTR characteristics are:

Purpose

Reports supported GIC virtualization features.

Configuration

AArch32 System register ICH_VTR bits [31:0] are architecturally mapped to AArch64 System register [ICH_VTR_EL2\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and (EL2 is implemented or EL3 is implemented). Otherwise, direct accesses to ICH_VTR are UNDEFINED.

If EL2 is not implemented, all bits in this register are RES0 from EL3, except for nV4, which is RES1 from EL3.

Attributes

ICH_VTR is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------|----|----|---------|----|----|--------|----|----|---------------|----|----|------|----|----|----|----|----|----|----|----|----|---|---|----------|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| PRIbits | | | PREbits | | | IDbits | | | SEISA3VnV4TDS | | | RES0 | | | | | | | | | | | | ListRegs | | | | | | | |

PRibits, bits [31:29]

Priority bits. The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

This field is an alias of [ICV_CTLR.PRibits](#).

PREbits, bits [28:26]

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH_VTR.PRibits.

IDbits, bits [25:23]

The number of virtual interrupt identifier bits supported:

| IDbits | Meaning |
|--------|----------|
| 0b000 | 16 bits. |
| 0b001 | 24 bits. |

All other values are reserved.

This field is an alias of [ICV_CTLR.IDbits](#).

SEIS, bit [22]

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:

| SEIS | Meaning |
|------|--|
| 0b0 | The virtual CPU interface logic does not support generation of SEIs. |
| 0b1 | The virtual CPU interface logic supports generation of SEIs. |

This bit is an alias of [ICV_CTLR](#).SEIS.

A3V, bit [21]

Affinity 3 Valid. Possible values are:

| A3V | Meaning |
|-----|---|
| 0b0 | The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers. |
| 0b1 | The virtual CPU interface logic supports non-zero values of Affinity 3 in SGI generation System registers. |

This bit is an alias of [ICV_CTLR](#).A3V.

nV4, bit [20]

Direct injection of virtual interrupts not supported. Possible values are:

| nV4 | Meaning |
|-----|--|
| 0b0 | The CPU interface logic supports direct injection of virtual interrupts. |
| 0b1 | The CPU interface logic does not support direct injection of virtual interrupts. |

In GICv3, the only permitted value is 0b1.

TDS, bit [19]

Separate trapping of Non-secure EL1 writes to [ICV_DIR](#) supported.

| TDS | Meaning |
|-----|--|
| 0b0 | Implementation does not support ICH_HCR .TDIR. |
| 0b1 | Implementation supports ICH_HCR .TDIR. |

FEAT_GICv3_TDIR implements the functionality added by the value 0b1.

Bits [18:5]

Reserved, RES0.

ListRegs, bits [4:0]

The number of implemented List registers, minus one. For example, a value of 0b01111 indicates that the maximum of 16 List registers are implemented.

Accessing ICH_VTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b100 | 0b1100 | 0b1011 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then

ICIALLU, Instruction Cache Invalidate All to PoU

The ICIALLU characteristics are:

Purpose

Invalidate all instruction caches of the PE executing the instruction to the Point of Unification. If branch predictors are architecturally visible, also flush branch predictors.

Configuration

AArch32 System instruction ICIALLU performs the same function as AArch64 System instruction [IC IALLU](#).

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ICIALLU are UNDEFINED.

Attributes

ICIALLU is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the ICIALLU instruction

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

When [HCR.FB](#) is 1, at Non-secure EL1 this instruction executes as a [ICIALLUIS](#).

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0111 | 0b0101 | 0b000 |

```

if PSTATE.EL == EL0 then

ICIALLUIS, Instruction Cache Invalidate All to PoU, Inner Shareable

The ICIALLUIS characteristics are:

Purpose

Invalidate all instruction caches in the Inner Shareable domain of the PE executing the instruction to the Point of Unification. If branch predictors are architecturally visible, also flush branch predictors.

Configuration

AArch32 System instruction ICIALLUIS performs the same function as AArch64 System instruction [IC IALLUIS](#).

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ICIALLUIS are UNDEFINED.

Attributes

ICIALLUIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing the ICIALLUIS instruction

The PE ignores the value of <Rt>. Software does not have to write a value to this register before issuing this instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|

ICIMVAU, Instruction Cache line Invalidate by VA to PoU

The ICIMVAU characteristics are:

Purpose

Invalidate instruction cache line by virtual address to PoU.

Configuration

AArch32 System instruction ICIMVAU performs the same function as AArch64 System instruction [IC IVAU](#).

This instruction is present only when AArch32 is supported. Otherwise, direct accesses to ICIMVAU are UNDEFINED.

Attributes

ICIMVAU is a 32-bit System instruction.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Virtual address to use | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Bits [31:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing the ICIMVAU instruction

Execution of this instruction might require an address translation from VA to PA, and that translation might fault.

If FEAT_CMOW is implemented, [HCRX_EL2](#).CMOW is 1, and EL1 or EL0 access is enabled, when executed at EL1 or EL0, the instruction has stage 2 read permission to the VA but does not have stage 2 write permission to the VA, the instruction generates a stage 2 Permission fault.

For more information, see 'AArch32 instruction cache maintenance instructions (IC*)'.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|-------|
| 0b1111 | 0b000 | 0b0111 | 0b0101 | 0b001 |

```

if PSTATE.EL == EL0 then
    UNDEFINED;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && !ELUsingAArch32(EL2) && HSTR_EL2.T7 == '1' then

ICV_AP0R<n>, Interrupt Controller Virtual Active Priorities Group 0 Registers, n = 0 - 3

The ICV_AP0R<n> characteristics are:

Purpose

Provides information about virtual Group 0 active priorities.

Configuration

AArch32 System register ICV_AP0R<n> bits [31:0] are architecturally mapped to AArch64 System register [ICV_AP0R<n>_EL1\[31:0\]](#).

This register is present only when AArch32 is supported, FEAT_GICv3 is implemented and EL2 is implemented. Otherwise, direct accesses to ICV_AP0R<n> are UNDEFINED.

Attributes

ICV_AP0R<n> is a 32-bit register.

Field descriptions

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|------------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|

| IMPLEMENTATION DEFINED | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to 0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing ICV_AP0R<n>

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICV_AP0R1 is only implemented in implementations that support 6 or more bits of priority. ICV_AP0R2 and ICV_AP0R3 are only implemented in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>.
- [ICV_AP1R<n>](#).

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

| coproc | opc1 | CRn | CRm | opc2 |
|--------|-------|--------|--------|------------|
| 0b1111 | 0b000 | 0b1100 | 0b1000 | 0b1:n[1:0] |

```
